YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Table of Contents

	About the Documentation	xxiii
	Documentation and Release Notes	xxiii
	Supported Platforms	xxiii
	Using the Examples in This Manual	xxiii
	Merging a Full Example	xxiv
	Merging a Snippet	xxiv
	Documentation Conventions	xxv
	Documentation Feedback	xxvii
	Requesting Technical Support	xxvii
	Self-Help Online Tools and Resources	xxvii
	Opening a Case with JTAC	xxviii
Part 1	Autoinstallation	
Chapter 1	Understanding Autoinstallation	3
	Understanding Autoinstallation of Configuration Files	3
	Typical Uses for Autoinstallation	3
	Autoinstallation Configuration Files and IP Addresses	4
	Typical Autoinstallation Process on a New Switch	4
	Configuring Autoinstallation of Configuration Files (CLI Procedure)	5
	Upgrading Software by Using Automatic Software Download	7
	Verifying Autoinstallation Status	8
	Verifying That Automatic Software Download Is Working Correctly	9
Part 2	Basic System Management	
Chapter 2	Understanding Basic System Management	13
	Compressing the Current Configuration File	14
	Configuring a DNS Name Server for Resolving a Hostname into Addresses	15
	Configuring Console and Auxiliary Port Properties	15
	Configuring the Hostname of a Router or Switch by Using a Configuration Group	16
	Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types	18
	System Utilization Alarms	18
	Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch	19
	Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses	19
	Configuring Junos OS to Extend the Default Port Address Range	20

Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets	20
Configuring System Alarms to Appear Automatically Upon Login	21
Configuring Time-Based User Access	21
Configuring the Timeout Value for Idle Login Sessions	22
Including the Year or Millisecond in Timestamps	23
Mapping the Hostname of the Switch to IP Addresses	24
Modifying the Default Time Zone for a Router or Switch Running Junos OS	24
Rebooting and Halting a Device	25
Reaching a Domain Name System Server	27
Reverting to the Default Factory Configuration by Using the request system zeroize Command	29
Saving Core Files Generated by Junos OS Processes	29
Specifying the Physical Location of the Switch	30
Specifying Access Privileges for Junos OS Operational Mode Commands	31
Updating the IANA Time Zone Database on Junos OS Devices	32
Importing and Installing Time Zone Files	33
Configuring a Custom Time Zone	34
Viewing Core Files from Junos OS Processes	34
Example: Configuring the Name of the Switch, IP Address, and System ID	35

Part 3

Chapter 3

Command Line Interface (CLI)

Understanding the CLI	39
CLI User Interface Overview	39
CLI Overview	39
CLI Key Features	40
CLI Command Modes	40
Configuring Login Tips	42
Format for Specifying Filenames and URLs in Junos OS CLI Commands	42
Junos OS Operational Mode Commands That Combine Other Commands	44
Overview of Junos OS CLI Operational Mode Commands	44
CLI Command Categories	44
Commonly Used Operational Mode Commands	46
Overview of Navigating the CLI	47
CLI Command Hierarchy	47
CLI Configuration Statements	48
Moving Among Hierarchy Levels	48
Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands	48
Understanding Junos OS CLI Configuration Mode	49
Configuration Mode Commands	51
Configuration Statements and Identifiers	52
Configuration Statement Hierarchy	54

Part 4	Dynamic Host Control Protocol (DHCP)	
Chapter 4	Understanding DHCP	59
	Understanding DHCP Services for Switches	59
	DHCP Client/Server Model	59
	Using DHCP	60
	DHCP Relay Servers and DHCP Servers	60
	Legacy DHCP and Extended DHCP for Server Versions	61
	Configuring DHCP on a Switch	62
	How DHCP Works	62
	Configuring a DHCP Client (CLI Procedure)	63
	Configuring a DHCP Server on Switches (CLI Procedure)	64
	Configuring an Extended DHCP Server on a Switch	65
	Configuring a Legacy DHCP Server on a Switch (CLI Procedure)	65
Part 5	Internet Control Message Protocol (ICMP)	
Chapter 5	Understanding ICMP	71
	Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses	71
	Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets	72
	Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages	72
	Configuring Junos OS to Disable Sending Protocol Redirect Messages on EX Series Switches (CLI Procedure)	72
Part 6	Guest Virtual Machines (VMs)	
Chapter 6	Understanding Guest VMs	77
	Launching a Guest Virtual Machine (VM) to Run a Third Party Application on Junos OS Release 13.2X51-D15	77
	Understanding Guest VMs	78
	Prerequisites for Setting up a Virtual Build Environment in the JunosV App Engine	78
	Setting up the Virtual Build Environment for the JunosV App Engine	80
	Downloading and Installing the JunosV App Engine Software	81
	Launching the VNC Server	82
	Launching the FreeBSD Virtual Build Environment (VBE) Virtual Machine (VM)	82
	Installing the Junos SDK Packages on the Virtual Build Environment	83
	Prerequisites for Using the Virtual Build Environment	83
	Obtaining Junos SDK Certificate Request File and Certificate Key File for the Virtual Build Environment	83
	Processing and Obtaining the Certificate File	84
	Prerequisites for Packaging the Guest VM	85
	Launching the Guest VM on the CentOS Server	85
	Copying Required Application to Package with the Guest VM	86
	Editing Packaging Tool Scripts	86
	Executing Packaging Scripts	89

	Copying the Third Party Application to the Switch	89
	Configure the Provider Name, License Type, and Deployment Scope	89
	Configure the Guest VM Options	90
	Launching a Guest Virtual Machine (VM) to Run a Third Party Application on	
	Junos OS Release 13.2X51-D20 and Later	94
	Understanding Guest VMs	95
	Troubleshooting Tips	95
	Copying the Third Party Application to the Switch	95
	Install the Third Party Application on the Switch	95
	Configure the Guest VM Options to Launch the Guest VM on the Host	96
Part 7	Junos OS With Upgraded FreeBSD	
Chapter 7	Understanding Junos OS With Upgraded FreeBSD	105
	Understanding Junos OS with Upgraded FreeBSD	105
	Understanding Junos OS with Upgraded FreeBSD Package Names	108
	Understanding Junos OS with Upgraded FreeBSD Disk Volumes	110
	Understanding Junos OS with Upgraded FreeBSD Snapshots	111
	Upgrading Junos OS with Upgraded FreeBSD	112
	To Install Junos OS with Upgraded FreeBSD Over a Plain Junos OS	114
	To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded	
	FreeBSD of an Earlier Release	117
	To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded	
	FreeBSD of a Later Release	118
	Downgrading Junos OS from Upgraded FreeBSD	118
	Downgrading from Junos OS with Upgraded FreeBSD to Junos OS	119
	Downgrading from Junos OS with Upgraded FreeBSD to an Earlier Release	
	of Junos OS with Upgraded FreeBSD	120
Part 8	In-Service Software Upgrade (ISSU)	
Chapter 8	Understanding ISSU	125
	In-Service Software Upgrade (ISSU) System Requirements	125
	In-Service Software Upgrade (ISSU) Protocol and Process Support	125
	Understanding In-Service Software Upgrade (ISSU)	127
	In-Service Software Upgrade Process	127
	Performing an In-Service Software Upgrade (ISSU)	128
	Preparing the Switch for Software Installation	128
	Upgrading the Software Using ISSU	129
	Verifying a Unified ISSU	130
Part 9	Non-Stop Software Upgrade (NSSU)	
Chapter 9	Understanding NSSU	135
	Understanding Nonstop Software Upgrade on a Virtual Chassis and Mixed Virtual	
	Chassis	135
	Requirements for Performing an NSSU	136
	How an NSSU Works	137
	Virtual Chassis and Mixed Virtual Chassis	137
	NSSU Limitations	137

	NSSU and Junos OS Release Support	138
	Overview of NSSU Configuration and Operation	138
	Understanding Nonstop Software Upgrade on a Virtual Chassis Fabric	138
	Requirements for Performing an NSSU	139
	How an NSSU Works	140
	Virtual Chassis Fabric	140
	NSSU Limitations	141
	NSSU and Junos OS Release Support	141
	Overview of NSSU Configuration and Operation	141
	Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade (CLI Procedure)	142
	Upgrading Software on a Virtual Chassis and Mixed Virtual Chassis Using Nonstop Software Upgrade	144
	Preparing the Switch for Software Installation	144
	Upgrading the Software Using NSSU	145
	Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade	147
	Preparing the Switch for Software Installation	147
	Upgrading the Software Using NSSU	149
Part 10	Licenses	
Chapter 10	Using Licenses	159
	Junos OS Feature Licenses	159
	Disaggregated Software Features That Require Licenses on the QFX Series	160
	Disaggregated Software Feature Licenses on QFX5200 Switches	160
	Software Features That Require Licenses on the QFX Series	161
	Junos OS Feature License Keys	164
	Release-Tied License Keys and Upgrade Licenses on MX Series Routers	164
	Licensable Ports on MX5, MX10, and MX40 Routers	165
	Port Activation on MX104 Routers	166
	Generating License Keys	167
	Adding New Licenses (CLI Procedure)	169
	Deleting a License (CLI Procedure)	170
	Saving License Keys	171
	Verifying Junos OS License Installation	172
	Displaying Installed Licenses	172
	Displaying License Usage	173
Part 11	Login Classes	
Chapter 11	Understanding Login Classes	177
	Configuring Junos OS User Accounts	177
	Configuring the Junos OS to Display a System Login Announcement	178
	Configuring Junos OS to Display a System Login Message	178

Part 12	Network Time Protocol (NTP)	
Chapter 12	Understanding NTP	183
	Understanding NTP Time Servers	183
	Configuring NTP Authentication Keys	184
	Configuring the NTP Time Server and Time Services	185
	Configuring the Switch to Operate in Client Mode	185
	Configuring the Router or Switch to Operate in Symmetric Active Mode	186
	Configuring the Router or Switch to Operate in Broadcast Mode	186
	Configuring the Router or Switch to Operate in Server Mode	187
	Configuring the Switch to Listen for Broadcast Messages Using NTP	187
	Configuring the Switch to Listen for Multicast Messages Using NTP	188
	Setting the Date and Time	188
	Synchronizing and Coordinating Time Distribution Using NTP	189
	Configuring NTP	189
	Configuring the NTP Boot Server	189
	Specifying a Source Address for an NTP Server	190
	Example: Configuring NTP	191
	Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization	194
Part 13	Passwords	
Chapter 13	Understanding Passwords	197
	Configuring the Root Password	197
	Recovering the Root Password	199
	Example: Changing the Requirements for Junos OS Plain-Text Passwords	200
Part 14	Recovery Installation	
Chapter 14	Understanding Recovery Installation	205
	Creating an Emergency Boot Device	205
	Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch	206
	Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch	207
	Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch	207
	Creating a Snapshot on the Alternate Slice of the Boot Media	208
	Creating a Snapshot and Using It to Boot a Device	208
	Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Device	209
	Performing a Recovery Installation Using an Emergency Boot Device	211
	Recovering from a Failed Software Installation	212
Part 15	Routine Monitoring	
Chapter 15	Understanding Routine Monitoring	217
	Monitoring System Process Information	217
	Monitoring System Properties	218

	Monitoring Interface Status and Traffic	219
	Other Tools to Configure and Monitor Devices Running Junos OS	220
Part 16	Standard Software Installation and Upgrade	
Chapter 16	Understanding Standard Software Installation and Upgrade	223
	Junos OS Package Names	223
	Software Installation Overview	224
	Creating an Emergency Boot Device	225
	Installing and Recovering Software Using the Open Network Install Environment (ONIE)	226
	Understanding the Open Network Install Environment	228
	Downloading Software Files with a Browser	228
	Connecting to the Console Port	229
	Backing Up the Current Configuration Files	229
	Uninstalling the Existing Version of Junos OS	230
	Installing a Junos OS Software Package That Resides on a Webserver or DHCP Server with DHCP Options Configured	230
	Installing Junos OS Software Using Secure Copy Protocol (SCP)	231
	Installing Junos OS Software Using FTP or TFTP Without a Webserver	232
	Installing Junos OS Software Using DHCP Server with No DHCP Options Configured	232
	Installing Junos OS Software Using Webserver Without DHCP Configured	234
	Installing Junos OS Software Using USB Media	235
	Verifying Software Installation	235
	Troubleshooting Unsupported Network Operating System	237
	Troubleshooting ONIE ISO Files	237
	Creating an Emergency Boot Device for ONIE Software and Network Operating System	237
	Performing a Recovery Installation	238
	Upgrading Jloader Software on QFX Series Devices	239
	Jloader Software Version 1.1.4 Guidelines	241
	Upgrading Jloader Software on a QFX3500 Switch	242
	Upgrading Jloader Software on a QFabric System	245
	Upgrading Software	250
	Downloading Software Files with a Browser	251
	Accessing Software Downloaded to a Remote Location	252
	Connecting to the Console Port	252
	Backing Up the Current Configuration Files	252
	Installing a Standard Software Package on QFX10002 Switches	253
	Installing a Standard Software Package on QFX10008 and QFX10016 Switches	255

Part 17	System Snapshot	
Chapter 17	Understanding System Snapshot	261
	Understanding System Snapshot	261
	Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch	262
	Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch	262
	Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch	263
	Creating a Snapshot on the Alternate Slice of the Boot Media	263
	Creating a Snapshot and Using It to Boot a Device	264
	Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Device	264
	Verifying That a System Snapshot Was Created on a QFX Series Switch	265
Part 18	Zero Touch Provisioning (ZTP)	
Chapter 18	Understanding ZTP	269
	Understanding Zero Touch Provisioning	269
	Understanding Zero Touch Provisioning	269
	Zero Touch Provisioning Process	271
	Zero Touch Provisioning Restart Process Triggers	274
	Configuring Zero Touch Provisioning	276
	Monitoring Zero Touch Provisioning	281
	Using the Console to Monitor Zero Touch Provisioning	281
	Using System Log Alerts to Monitor Zero Touch Provisioning	282
	Using Error Messages to Monitor Zero Touch Provisioning	282
	Using System Log Files to Monitor Zero Touch Provisioning	282
	Using the show dhcp client binding Command	283
	Using the show dhcp client statistics Command	283
Part 19	Configuration Statements and Operational Commands	
Chapter 19	Basic System Management Configuration Statements	287
	arp (System)	289
	auxiliary	290
	checksum	291
	compress-configuration-files (System)	292
	console (Physical Port)	293
	default-address-selection	294
	domain-name	295
	domain-search	295
	ethernet (Alarm)	296
	host-name	296
	icmpv4-rate-limit	297
	internet-options	298
	link-down	299
	location	300
	login-alarms	301
	management-ethernet (Alarm)	302

	max-configurations-on-flash	303
	name-server	303
	no-ping-record-route	304
	no-ping-time-stamp	304
	no-redirects (IPv4 Traffic)	305
	optional	306
	ports	306
	retry	307
	saved-core-context	308
	saved-core-files	308
	source-port (Port Addresses)	309
	static-host-mapping	310
	system	311
	time-format	316
	time-zone	317
	traceoptions (Layer 2 Learning)	319
	uid	321
	use-imported-time-zones	321
Chapter 20	DHCP Configuration Statements	323
	client-identifier (DHCP Client)	323
	lease-time	324
	retransmission-attempt	324
	retransmission-interval	325
	server-address	325
	update-server	326
	vendor-option	326
Chapter 21	ICMP Configuration Statements	327
	no-multicast-echo	327
Chapter 22	Junos OS With Upgraded FreeBSD Operational Commands	329
	request system reboot (Junos OS with Upgraded FreeBSD)	330
	request system snapshot (Junos OS with Upgraded FreeBSD)	333
	show system snapshot (Junos OS with Upgraded FreeBSD)	335
Chapter 23	Login Classes Configuration Statements	337
	access-end	338
	access-start	338
	allow-commands	339
	allow-configuration	340
	allowed-days	340
	announcement	341
	authentication (Login)	342
	class (Defining Login Classes)	343
	class (Assigning a Class to an Individual User)	344
	deny-commands	344
	deny-configuration	345
	idle-timeout	346
	load-key-file	347

	login	348
	login-tip	349
	message	349
	user (Access)	350
Chapter 24	NTP Configuration Statements	351
	authentication-key	352
	boot-server (NTP)	353
	broadcast	354
	broadcast-client	355
	multicast-client	355
	ntp	356
	peer	357
	server (NTP)	358
	source-address (NTP, RADIUS, System Logging, or TACACS+)	359
	trusted-key	360
Chapter 25	Password Configuration Statements	361
	authentication (Login)	362
	change-type	363
	format	364
	maximum-length	365
	minimum-changes	366
	minimum-length	367
	minimum-lower-cases	368
	minimum-numeric	369
	minimum-punctuations	370
	minimum-upper-cases	371
	password (Login)	372
	permissions	372
	retry-options	373
	root-authentication	375
	ssh-dsa	376
	ssh-rsa	376
	user (Access)	377
Chapter 26	Autoinstallation Operational Commands	379
	show system autoinstallation status	380
Chapter 27	Basic System Management Operational Commands	383
	commit	385
	clear log	391
	clear chassis display message	392
	clear system commit	395
	clear system reboot	396
	file	400
	file archive	401
	file checksum md5	403
	file checksum sha1	404
	file checksum sha-256	405

	file compare	406
	file delete	410
	file list	411
	file rename	413
	file show	415
	load	417
	ping	419
	request chassis beacon	423
	request chassis fpc	425
	request chassis pic	430
	request chassis routing-engine master	435
	request message	440
	request system configuration rescue delete	441
	request system configuration rescue save	442
	request system halt	443
	request system logout	449
	request system power-off	450
	request system reboot	455
	request system storage cleanup	458
	request system zeroize	468
	restart	473
	save	484
Chapter 28	CLI Operational Commands	487
	show cli	488
	show cli authorization	490
	show cli directory	494
	show cli history	495
Chapter 29	Guest VM Operational Commands	497
	show app-engine arp	498
	show app-engine bridge	500
	show app-engine crash	502
	show app-engine info	504
	show app-engine logs	507
	show app-engine netstat	509
	show app-engine resource-usage	511
	show app-engine routing-instance compute-clusters	518
	show app-engine routing-instance virtual-machines	520
	show app-engine status	522
	show app-engine virtual-machine instance	525
	show app-engine packages system	528
Chapter 30	ISSU Operational Commands	531
	request system software in-service-upgrade	532
	show chassis in-service-upgrade	545
Chapter 31	NSSU Operational Commands	549
	request system software nonstop-upgrade	550
	show chassis nonstop-upgrade	560

Chapter 32	Licensing Operational Commands	563
	request system license add	564
	request system license delete	565
	request system license save	566
	show system license	567
Chapter 33	NTP Operational Commands	575
	show ntp associations	576
	show ntp status	578
Chapter 34	Routine Monitoring Operational Commands	581
	show chassis alarms	583
	show chassis beacon	598
	show chassis environment	600
	show chassis environment fpc	664
	show chassis environment pem	691
	show chassis environment routing-engine	700
	show chassis fan	705
	show chassis firmware	719
	show chassis fpc	730
	show chassis hardware	770
	show chassis lcd	952
	show chassis led	966
	show chassis location	976
	show chassis mac-addresses	980
	show chassis pic	985
	show chassis routing-engine	1002
	show chassis temperature-thresholds	1028
	show chassis zones	1048
	show host	1054
	show log	1055
	show subscribers	1059
	show system alarms	1080
	show system audit	1083
	show system boot-messages	1091
	show system buffers	1098
	show system certificate	1105
	show system commit	1107
	show system configuration archival	1110
	show system configuration rescue	1111
	show system connections	1113
	show system core-dumps	1132
	show system directory-usage	1146
	show system processes	1150
	show system reboot	1179
	show system resource-cleanup processes	1182
	show system services service-deployment	1184
	show system snapshot	1185
	show system software	1186

	show system statistics	1194
	show system storage	1231
	show system uptime	1239
	show system users	1244
	show system virtual-memory	1249
	show version	1307
	start shell	1320
	test configuration	1322
	traceroute	1323
	traceroute monitor	1327
Chapter 35	Standard Software Installation and Upgrade Operational Commands . .	1329
	request system software add	1330
	request system software delete	1340
	request system software download	1344
	request system software rollback	1346
	request system software validate	1351
	rollback	1355
	show system rollback	1356
Chapter 36	System Snapshot Operational Commands	1359
	request system snapshot	1360
	show system snapshot	1362

List of Figures

Part 3	Command Line Interface (CLI)	
Chapter 3	Understanding the CLI	39

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- [QFX Series](#)

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

Documentation Conventions

[Table 1 on page xxv](#) defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

[Table 2 on page xxv](#) defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	<code>user@host> show chassis alarms</code> <code>No alarms currently active</code>
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric metric>;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (string1 string2 string3)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page of the Juniper Networks TechLibrary site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <http://www.juniper.net/techpubs/feedback/>.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

PART 1

Autoinstallation

CHAPTER 1

Understanding Autoinstallation

- [Understanding Autoinstallation of Configuration Files on page 3](#)
- [Configuring Autoinstallation of Configuration Files \(CLI Procedure\) on page 5](#)
- [Upgrading Software by Using Automatic Software Download on page 7](#)
- [Verifying Autoinstallation Status on page 8](#)
- [Verifying That Automatic Software Download Is Working Correctly on page 9](#)

Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

NOTE: The QFX5200 switches only work with HTTP for autoinstallation. TFTP and FTP protocols are not supported.

This topic describes:

- [Typical Uses for Autoinstallation on page 3](#)
- [Autoinstallation Configuration Files and IP Addresses on page 4](#)
- [Typical Autoinstallation Process on a New Switch on page 4](#)

Typical Uses for Autoinstallation

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

Autoinstallation Configuration Files and IP Addresses

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- **hostname.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, **hostname** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

Typical Autoinstallation Process on a New Switch

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.

2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
 - a. If the DHCP server specifies the host-specific configuration file **hostname.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
 - b. If the switch does not locate a **hostname.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
 - c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.
 - d. If the switch determines its hostname, it sends a TFTP request for the **hostname.conf** file.
 - e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.
3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically deploy multiple devices from a central location in the network.

To specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a switch to operate as a DHCP server. For more information, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 64](#).
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
 - A host-specific file with the name **hostname.conf** for each switch undergoing autoinstallation. Replace **hostname** with the name of a switch. The **hostname.conf** file typically contains all the configuration information necessary for the switch with this hostname.
 - A default configuration file named **switch.conf** with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.
- Physically attach the switch to the network using a Gigabit Ethernet port.
- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.
- If the switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the switch.
- If you are using **hostname.conf** files for autoinstallation, you must also complete the following tasks:
 - Configure the DHCP server to provide a **hostname.conf** filename to each switch. Each switch uses its **hostname.conf** filename to request a configuration file from the TFTP server. Copy the necessary **hostname.conf** configuration files to the TFTP server.
 - Create a default configuration file named **network.conf**, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a **hostname.conf** filename to a new switch, the switch uses **network.conf** to resolve its hostname based on its IP address.

Alternatively, you can add the IP-address-to-hostname mapping entry for the switch to a DNS database file.

The switch uses the hostname to request a **hostname.conf** file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@switch# set autoinstallation configuration-servers tftp://tftpconfig.example.com
```

NOTE: You can also use an FTP address, for example, `ftp://user:password@sftpconfig.example.com`.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

```
[edit system]
user@switch# set autoinstallation interfaces ge-0/0/0 bootp
```

Upgrading Software by Using Automatic Software Download

The automatic software download feature uses the Dynamic Host Configuration Protocol (DHCP) message exchange process to download and install software packages. You configure the automatic software download feature on switches that act as DHCP clients. You must enable automatic software download on a switch before the software upgrade can occur.

You configure a path to a software package file on the DHCP server. The server communicates the path to the software package file through DHCP server messages.

If you enable automatic software download, the DHCP client switch compares the software package name in the DHCP server message with the name of the software package that booted the switch. If the software packages are different, the DHCP client switch downloads and installs the software package specified in the DHCP server message.

Before you upgrade software by using automatic software download, ensure that you have configured DHCP services for the switch, including configuring a path to a boot server and a boot file.

To configure a path to a boot server and a boot file:

1. Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete DHCP setup. This configuration is equivalent to DHCP Option 66:

```
[edit system services dhcp]
user@switch# set boot-server (address | hostname)
```

2. Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete the DHCP setup. This configuration is equivalent to DHCP Option 67:

```
[edit system services dhcp]
```

```
user@switch# set boot-file filename
```

To enable automatic software download on a switch that acts as a DHCP client:

```
[edit chassis]  
user@switch# set auto-image-upgrade
```

After automatic software download is enabled on your DHCP client switch and after DHCP services are enabled on your network, an automatic software download can occur at any time as part of the DHCP message exchange process.

If an automatic software download occurs, you see the following message on the switch:

```
Auto-image upgrade started  
On successful installation system will reboot automatically
```

The switch reboots automatically to complete the upgrade.

**Related
Documentation**

Verifying Autoinstallation Status

Purpose Display the status of the autoinstallation feature.

Action From the CLI, enter the **show system autoinstallation status** command.

Sample Output

```
user@switch> show system autoinstallation status  
Autoinstallation status:  
Master state: Active  
Last committed file: None  
Configuration server of last committed file: 10.25.100.1  
Interface:  
  Name: ge-0/0/0  
  State: Configuration Acquisition  
  Acquired:  
    Address: 192.168.124.75  
    Hostname: host-ge-000  
    Hostname source: DNS  
    Configuration filename: switch-ge-000.conf  
    Configuration filename server: 10.25.100.3  
  Address acquisition:  
    Protocol: DHCP Client  
    Acquired address: None  
    Protocol: RARP Client  
    Acquired address: None  
Interface:  
  Name: ge-0/0/1  
  State: None  
  Address acquisition:  
    Protocol: DHCP Client  
    Acquired address: None
```

Protocol: RARP Client
Acquired address: None

Meaning The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

Related Documentation

- [Configuring Autoinstallation of Configuration Files \(CLI Procedure\) on page 5](#)

Verifying That Automatic Software Download Is Working Correctly

Purpose Verify that the automatic software download feature is working correctly.

Action Use the `show system services dhcp client interface-name` command to verify that the automatic software download feature has been used to install a software package.

```
user@switch> show system services dhcp client ge-0/0/1.0
Logical Interface Name      ge-0/0/1.0
Hardware address           00:0a:12:00:12:12
Client Status              bound
Vendor Identifier          ether
Server Address             10.1.1.1
Address obtained           10.1.1.89
Lease Obtained at          2009-08-20 18:13:04 PST
Lease Expires at           2009-08-22 18:13:04 PST

DHCP Options :
Name: name-server, Value: [ 10.209.194.131, 2.2.2.2, 3.3.3.3 ]
Name: server-identifier, Value: 10.1.1.1
Name: router, Value: [ 10.1.1.80 ]
Name: boot-image,
Value: jinstall-ex-4200-9.6R1.5-domestic-signed.tgz
Name: boot-image-location,
Value: 10.1.1.25:/bootfiles/
```

Meaning The output from this command shows the name and location of the software package under DHCP options when automatic software download was last used to install a software package. The sample output in DHCP options shows that the last DHCP server message to arrive on the DHCP client had a boot server address of 192.168.1.165 and a boot file named jinstall-ex-4200-9.6R1.5-domestic-signed.tgz. If automatic software download was enabled on this client switch during the last DHCP message exchange, these values were used by the switch to upgrade the software.

Compressing the Current Configuration File

By default, the current operational configuration file is compressed and is stored in the file **juniper.conf.gz** the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

NOTE: We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```

- Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
user@host# commit
commit complete
user@host# commit
commit complete
```

- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```

- Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

- Related Documentation**
- *Junos OS Commit Model for Router or Switch Configuration*
 - [compress-configuration-files on page 292](#)

Configuring a DNS Name Server for Resolving a Hostname into Addresses

To have the router or switch resolve hostnames into addresses, you must configure one or more Domain Name System (DNS) name servers by including the **name-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
name-server {
    address;
}
```

The following example shows how to configure two DNS name servers:

```
[edit]
user@switch# set system name-server 192.168.1.253
[edit]
user@switch# set system name-server 192.168.1.254
[edit]
user@switch# show
system {
    name server {
        192.168.1.253;
        192.168.1.254;
    }
}
```

- Related Documentation**
- [name-server on page 303](#)

Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data terminal may be connected to the switch. The console port is enabled by default. The console port speed is 9600 baud, except on OCX Series devices, on which it is 115200 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

```
[edit system ports]
user@switch# set console log-out-on-disconnect
```

2. To specify the auxiliary port terminal type:

```
[edit system ports]
user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
```

For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

```
[edit system ports]
user@switch# set auxiliary type xterm
```

3. To check the configuration:

```
[edit system ports]
user@switch# show
console log-out-on-disconnect;
auxiliary type xterm;
```

Configuring the Hostname of a Router or Switch by Using a Configuration Group

The hostname of a device is its identification. A router or switch must have its identity established to be accessible on the network to other devices. That is perhaps the most important reason to have a hostname, but a hostname has other purposes: Junos OS uses the configured hostname as part of the command prompt, to prepend log files and other accounting information, as well as in other places where knowing the device identity is useful. We recommend that the hostname be descriptive and memorable.

You can configure the hostname at the **[edit system]** hierarchy level, a procedure shown in *Example: Configuring the Unique Identity of a Router for Making it Accessible on the Network*. Optionally, instead of configuring the hostname at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the hostname, especially if the device has dual Routing Engines. This procedure uses groups called **re0** and **re1** as an example.

NOTE: If you configure hostnames that are longer than the CLI screen width, regardless of the terminal screen width setting, the commit operation occurs successfully, starting with Junos OS release 13.2R3. Even if the terminal screen width is less than the hostname length, commit is successful. In Junos OS releases earlier than Release 13.2R3, if you configured such hostnames by using the `host-name hostname` statement at the `[edit system]` hierarchy level and the terminal screen width was less than the length of the hostname by using the `set cli screen-width` statement, a foreign file propagation (ffp) failure error message is displayed when you attempt to commit the configuration. In such a case, because of the ffp failure, the commit operation does not complete and you cannot recover the router unless you make the modification in the backend in the `juniper.conf.gz` file and commit the change from the shell prompt.

To set the hostname using a configuration group:

1. Include the **host-name** statement in the configuration at the `[edit groups group-name system]` hierarchy level.

The name value must be less than 256 characters.

```
[edit groups group-name system]
host-name hostname;
```

For example:

```
[edit groups re0 system]
root@# set host-name san-jose-router

[edit groups re1 system]
root@# set host-name san-jose-router1
```

2. If you used one or more configuration groups, apply the configuration groups, substituting the appropriate group names.

For example:

```
[edit]
user@host# set apply-groups [re0 re1]
```

3. Commit the changes.

```
[edit]
root@# commit
```

The hostname subsequently appears in the device CLI prompt.

```
san-jose-router@#
```

Related Documentation

- [Understanding Hostnames](#)

Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

NOTE: By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

alarm-name is the name of an alarm.

Related Documentation

- *System-Wide Alarms and Alarms for Each Interface Type*
- *Chassis Conditions That Trigger Alarms*
- *Silencing External Devices Connected to Alarm Relay Contacts*

System Utilization Alarms

QFX Series devices provide system alarms that alert you when disk usage in the **/var** partition exceeds acceptable levels.

You can display the messages for these alarms by issuing the **show system alarms** operational mode command if the **/var** partition usage exceeds 75 percent. A usage level between 76 and 90 percent indicates high usage and raises a minor alarm condition, whereas a usage level above 90 percent indicates that the partition is full and raises a major alarm condition.

The following sample output from the **show system alarms** command shows system alarm messages that are displayed when disk usage is exceeded on the switch.

```
user@host> show system alarms
4 alarms currently active
Alarm time          Class  Description
2013-10-08 20:08:20 UTC  Minor  RE 0 /var partition usage is high
2013-10-08 20:08:20 UTC  Major  RE 0 /var partition is full
2013-10-08 20:08:08 UTC  Minor  FPC 1 /var partition usage is high
2013-10-08 20:08:08 UTC  Major  FPC 1 /var partition is full
```

BEST PRACTICE: We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch and prevent generating system alarms.

Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch

By default, the router or switch sends protocol redirect messages. To disable the sending of redirect messages by the router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-redirects;
```

To reenable the sending of redirect messages on the router or switch, delete the **no-redirects** statement from the configuration.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces interface-name unit logical-unit-number family family]** hierarchy level.

Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

**Related
Documentation**

- [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 72](#)

Configuring Junos OS to Extend the Default Port Address Range

By default, the upper range of a port address is 5000. You can increase the range from which the port number can be selected to decrease the probability that someone can determine your port number.

- To configure the Junos OS to extend the default port address range, include the **source-port** statement at the **[edit system internet-options]** hierarchy level:

```
[edit system internet-options]
source-port upper-limit upper-limit;
```

upper-limit *upper-limit* is the upper limit of a source port address and can be a value from 5000 through 65,355.

Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets

By default, the source address included in locally generated Transmission Control Protocol/IP (TCP/IP) packets, such as FTP traffic, and in User Datagram Protocol (UDP) and IP packets, such as Network Time Protocol (NTP) requests, is chosen as the local address for the interface on which the traffic is transmitted. This means that the local address chosen for packets to a particular destination might change from connection to connection based on the interface that the routing protocol has chosen to reach the destination when the connection is established. If multiple equal-cost next hops are present for a destination, locally generated packets use the **lo0** address as a source.

- To configure the software to select a fixed address to use as the source for locally generated IP packets, include the **default-address-selection** statement at the **[edit system]** hierarchy level:

```
[edit system]
```

`default-address-selection;`

If you include the **default-address-selection** statement in the configuration, the Junos OS chooses the system default address as the source for most locally generated IP packets. The default address is usually an address configured on the **lo0** loopback interface. For example, if you specified that SSH and telnet use a particular address, but you also have **default-address selection** configured, the system default address is used.

Related Documentation

- [default-address-selection on page 294](#)

Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]
login-alarms;
```

For more information on the **show system alarms** command, see the [CLI Explorer](#).

Related Documentation

- [show system alarms on page 1080](#)

Configuring Time-Based User Access

The Junos OS enables you to configure time-based restrictions for user access to log in to a device. This is useful for restricting the time and duration of user logins for all users belonging to a login class. You can specify the days of the week when users can log in, the access start time, and the access end time.

- To configure user access on specific days of the week, without any restrictions on the duration of login, include the **allowed-days** statement only.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
  }
}
```

- To configure user access on all the days of the week for a specific duration, include the **access-start** and **access-end** statements only.

```
[edit system]
login {
  class class-name {
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

- To configure user access on specific days of the week for a specified duration, include the **allowed-days**, **access-start**, and **access-end** statements.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

Specify the start time and end time in **HH:MM** (24-hour) format, where **HH** represents the hours and **MM** represents the minutes.

NOTE: Access start time and end time that spans across 12:00 AM on a specified day results in the user having access until the next day, even if the access day is not explicitly configured. For instance, the following configuration results in the user having access until 6:00 AM on Tuesday and Thursday, although the **allowed-days** statement specifies access only on Monday and Wednesday:

```
[edit system]
login {
  class operator-night-shift {
    allowed-days [ monday wednesday ];
    access-start 2000;
    access-end 0600;
  }
}
```

Related Documentation

Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.  
Warning: session will be closed in 1 minute if there is no activity  
Warning: session will be closed in 10 seconds if there is no activity  
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

- Related Documentation**
- *Defining Junos OS Login Classes*
 - *idle-timeout (System-Login)*

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]  
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

```
Aug 21 12:36:30.401 2006
```

NOTE: Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the `[edit system syslog file filename]` hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Reference for Security Devices*.

Related Documentation

- [Single-Chassis System Logging Configuration Overview](#)
- [Examples: Configuring System Logging](#)

Mapping the Hostname of the Switch to IP Addresses

To map a hostname of a switch to one or more IP addresses, include the `inet` statement at the `[edit system static-host-mapping hostname]` hierarchy level:

```
[edit system]
static-host-mapping {
  hostname {
    inet [ addresses ];
    alias [ aliases ];
  }
}
```

hostname is the name specified by the `host-name` statement at the `[edit system]` hierarchy level.

For each host, you can specify one or more aliases.

Related Documentation

- [Reaching a Domain Name System Server on page 27](#)
- [Example: Configuring the Unique Identity of a Router for Making it Accessible on the Network](#)
- [static-host-mapping on page 310](#)

Modifying the Default Time Zone for a Router or Switch Running Junos OS

The default local time zone on the router or switch is UTC (Coordinated Universal Time, formerly known as Greenwich Mean Time, or GMT).

- To modify the local time zone, include the `time-zone` statement at the `[edit system]` hierarchy level:

```
[edit system]
time-zone (GMT hour-offset | time-zone);
```

You can use the **GMT hour-offset** option to set the time zone relative to UTC (GMT) time. By default, **hour-offset** is 0. You can configure this to be a value from -14 to +12.

You can also specify the **time-zone** value as a string such as PDT (Pacific Daylight Time) or WET (Western European Time), or specify the continent and major city.

NOTE: Junos OS complies with the POSIX time-zone standard, which is counter-intuitive to the way time zones are generally indicated relative to UTC. A time zone ahead of UTC (east of the Greenwich meridian) is commonly indicated as GMT +*n*; for example, the Central European Time (CET) zone is indicated as GMT +1. However, this is not true for POSIX time zone designations. POSIX indicates CET as GMT-1. If you include the **set system time-zone GMT+1** statement for a router in the CET zone, your router time will be set to one hour behind GMT, or two hours behind the actual CET time. For this reason, you might find it easier to use the POSIX time-zone strings, which you can list by entering **set system time-zone ?**.

For the time zone change to take effect for all processes running on the router or switch, you must reboot the router or switch.

The following example shows how to change the current time zone to **America/New_York**:

```
[edit]
user@host# set system time-zone America/New_York
[edit]
user@host# show
system {
    time-zone America/New_York;
}
```

Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>          Execute this command
all-members        Reboot all virtual chassis members
at                 Time at which to perform the operation
both-routing-engines Reboot both the Routing Engines
fast-boot          Enable fast reboot
hypervisor         Reboot Junos OS, host OS, and Hypervisor
in                 Number of minutes to delay before operation
local             Reboot local virtual chassis member
member            Reboot specific virtual chassis member (0..9)
message           Message to display to all users
other-routing-engine Reboot the other Routing Engine
|                 Pipe through a command
{master:0}
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

NOTE: Not all options shown in the preceding command output are available on all QFX Series, OCX Series, and EX4600 switches. See the documentation for the [request system reboot](#) command for details about options.

NOTE: When you issue the `request system reboot hypervisor` command on QFX10000 switches, the reboot takes longer than a standard Junos OS reboot.

Similarly, to halt the switch, issue the `request system halt` command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
all-members    Halt all virtual chassis members
at             Time at which to perform the operation
backup-routing-engine  Halt backup Routing Engine
both-routing-engines  Halt both Routing Engines
in            Number of minutes to delay before operation
local         Halt local virtual chassis member
member        Halt specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine  Halt other Routing Engine
|             Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the `request system halt` command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Reaching a Domain Name System Server

Domain name system (DNS) servers are used for resolving hostnames to IP addresses.

For redundancy, it is a best practice to configure access to multiple DNS servers. You can configure a maximum of three DNS servers. The approach is similar to the way Web browsers resolve the names of a Web site to its network address. Additionally, Junos OS enables you to configure one or more domain names, which it uses to resolve hostnames that are not fully qualified (in other words, the domain name is missing). This is convenient because you can use a hostname in configuring and operating Junos OS without the need to reference the full domain name. After adding DNS server addresses and domain names to your Junos OS configuration, you can use DNS resolvable hostnames in your configuration and commands instead of IP addresses.

Optionally, instead of configuring the name server at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the name server. This procedure uses a group called **global** as an example.

Before you begin, configure your DNS servers with the hostname and an IP address for your Junos OS device. It does not matter which IP address you assign as the address of your Junos OS device in the DNS server, as long it is an address that reaches your device. Normally, you would use the management interface IP address, but you can choose the loopback interface IP address, or a network interface IP address, or even configure multiple addresses on the DNS server.

To configure the router or switch to resolve hostnames into addresses:

1. Reference the IP addresses of your DNS servers.

```
[edit groups group-name system]
name-server {
  address;
}
```

The following example shows how to reference two DNS servers:

```
[edit groups global system]
user@host# set name-server 192.168.1.253
user@host# set name-server 192.168.1.254
```

```
user@host# show
name server {
  192.168.1.253;
  192.168.1.254;
}
```

2. (Optional) Configure the name of the domain in which the device itself is located.

This is a good practice. Junos OS then uses this configured domain name as the default domain name to append to hostnames that are not fully qualified.

```
[edit system]
domain-name domain-name;
```

The following example shows how to configure the domain name:

```
[edit groups global system]
user@host# set domain-name company.net
```

```
user@host# show
domain-name company.net;
```

3. (Optional) Configure a list of domains to be searched.

If your device can reach several different domains, you can configure these as a list of domains to be searched. Junos OS then uses this list to set an order in which it appends domain names when searching for the IP address of a host.

```
[edit groups global system]
domain-search [ domain-list ];
```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched. This example configures Junos OS to search the company.net domain and then the domainone.net domain and then the domainonealternate.com domain when attempting to resolve unqualified hosts.

```
[edit groups global system]
domain-search [ company.net domainone.net domainonealternate.com ]
```

4. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
user@host# set apply-groups global
```

5. Commit the configuration.

```
user@host# commit
```

6. Verify the configuration.

If you have configured your DNS server with the hostname and an IP address for your Junos OS device, you can issue the following commands to confirm that DNS is working and reachable. You can either use the configured hostname to confirm resolution to the IP address or use the IP address of your device to confirm resolution to the configured hostname.

```
user@host> show host host-name
user@host> show host host-ip-address
```

For example:

```
user@host> show host san-jose-router1
san-jose-router1.company.net
san-jose-router1.company.net has address 192.168.187.1
```

```
user@host> show host 192.168.187.1
1.187.168.192.in-addr.arpa domain name pointer san-jose-router1.company.net.
```

Reverting to the Default Factory Configuration by Using the `request system zeroize` Command

The `request system zeroize` command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the `request system zeroize media` command.

CAUTION: Before issuing `request system zeroize`, use the `request system snapshot` command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the `request system zeroize` command:

1. `user@switch> request system zeroize`
warning: System will be rebooted and may not boot without configuration
Erase all data, including configuration and log files? [yes,no] (yes)
2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch.

Related Documentation • [request system zeroize on page 468](#)

Saving Core Files Generated by Junos OS Processes

By default, when an internal Junos OS process generates a core file, the file and associated context information are saved for debugging purposes in a compressed tar file named `/var/tmp/process-name.core.core-number.tgz`. The contextual information includes the configuration and system log message files.

- To disable the saving of core files and associated context information:

```
[edit system]
no-saved-core-context;
```

- To save the core files only:

```
[edit system]
saved-core-files number;
```

Where *number* is the number of core files to save and can be a value from 1 through 10.

- To save the core files along with the contextual information:

```
[edit system]
saved-core-context;
```

- Related Documentation**
- [Viewing Core Files from Junos OS Processes on page 34](#)

Specifying the Physical Location of the Switch

To specify the physical location of the switch, specify the following options for the **location** statement at the **[edit system]** hierarchy level:

- **altitude *feet***—Number of feet above sea level.
- **building *name***—Name of the building, 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code *code***—Two-letter country code.
- **floor *number***—Floor in the building.
- **hcoord *horizontal-coordinate***—Bellcore Horizontal Coordinate.
- **lata *service-area***—Long-distance service area.
- **latitude *degrees***—Latitude in degree format.
- **longitude *degrees***—Longitude in degree format.
- **npa-nxx *number***—First six digits of the phone number (area code and exchange).
- **postal-code *postal-code***—Postal code.
- **rack *number***—Rack number.
- **vcoord *vertical-coordinate***—Bellcore Vertical Coordinate.

The following example shows how to specify the physical location of the switch:

```
[edit system]
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

- Related Documentation**
- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 35](#)

Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
  deny-commands "regular-expression";
```

NOTE: The regular expression to allow/deny commands for any login class is supported at the command level but not at the argument level. For example, you can completely block ping but not ping *argument1*.

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

NOTE: Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command **set protocols** does not match anything, whereas **protocols** matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can

perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

allow-commands = "(monitor.*)"|(ping.*)"|(show.*)"|(exit)". Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

Updating the IANA Time Zone Database on Junos OS Devices

Junos OS devices use the tz database, also known as the IANA Time Zone Database to manage time zones. This database is periodically updated by IANA to reflect political and time changes. As such, you may need from time to time to update this file to ensure

the Junos devices continue to accurately reflect worldwide time zones and daylight savings time intervals.

To update the IANA Time Zone Database, perform the following steps:

1. [Importing and Installing Time Zone Files on page 33](#)
2. [Configuring a Custom Time Zone on page 34](#)

Importing and Installing Time Zone Files

The IANA Time Zone Database is maintained by the Internet Assigned Numbers Authority (IANA), which is a department of the Internet Corporation for Assigned Names and Numbers (ICANN). You can download the latest IANA Time Zone Database file from the following URL: <http://www.iana.org/time-zones>.

The following steps will guide you through one method of installing the file to your device. However, depending on your network access and other preferences, you may need to modify these steps.

1. Log into the Junos device.
2. If you are in the CLI interface, open the shell interface.
`device@user# start shell`
3. Create a **tz** directory in the **/var/tmp** and navigate to that directory.
`# mkdir /var/tmp/tz`
`# cd /var/tmp/tz`
4. Using FTP, download the time zone files archive.

NOTE: FTP must be enabled on your device before you can use FTP. FTP is enabled by adding the `ftp` statement into the `[edit system services]` hierarchy.

```
# ftp ftp.iana.org/tz
# bin
# get tzdata-latest.tar.gz
```

NOTE: If needed, you can edit the above untarred files to create or modify the time zones.

5. Select the names of time zone files to compile and feed them to the following script. For example, to generate **northamerica** and **asia** tz files:
`# /usr/libexec/ui/compile-tz northamerica asia`
6. Enable the use of the generated tz files using the CLI:
`[edit]`
`# set system use-imported-time-zones`
`[edit]`
`# set system time-zone ?`

This should show the newly generated tz files in `/var/db/zoneinfo/`.

7. Set the time zone and commit the configuration:

```
[edit]
# set system time-zone <your-time-zone>
# commit
```

8. Verify that the time zone change has taken effect:

```
[edit]
# run show system uptime
```

Configuring a Custom Time Zone

To use a custom time zone, follow these steps:

1. Download a time zones archive (from a known or designated source) to the router or switch. Compile the time zone archive using the `zic` time zone compiler, which generates `tz` files.
2. Using the CLI, configure the router or switch to enable the use of the generated `tz` files as follows:

```
[edit]
user@host# set system use-imported-time-zones
```

3. Display the imported time zones (saved in the directory `/var/db/zoneinfo/`):

```
[edit]
user@host# set system time-zone ?
```

If you do not configure the router to use imported time zones, the Junos OS default time zones are shown (saved in the directory `/usr/share/zoneinfo/`).

Viewing Core Files from Junos OS Processes

When an internal Junos OS process generates a core file, the output found at `/var/crash/` and `/var/tmp/` can now be viewed. This provides a quick method of finding core issues across large networks.

Use the CLI command `show system core-dumps` to view core files.

```
root@host> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

Related Documentation • *Saving Core Files from Junos OS Processes*

Example: Configuring the Name of the Switch, IP Address, and System ID

The following example shows how to configure the switch name, map the name to an IP address and alias, and configure a system identifier:

```
[edit]
user@switch# set system host-nameswitch-sjl
[edit]
user@switch# set system static-host-mapping switch-sjl inet 192.168.1.77
[edit]
user@switch# set system static-host-mapping switch-sjl alias sjl
[edit]
user@switch# set system static-host-mapping switch-sjl sysid 1921.6800.1077
[edit]
user@switch# show
system {
  host-name switch-sjl;
  static-host-mapping {
    switch-sjl {
      inet 192.168.1.77;
      alias sjl;
      sysid 1921.6800.1077;
    }
  }
}
```

Command Line Interface (CLI)

- [Understanding the CLI on page 39](#)

CHAPTER 3

Understanding the CLI

- [CLI User Interface Overview on page 39](#)
- [Configuring Login Tips on page 42](#)
- [Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 42](#)
- [Junos OS Operational Mode Commands That Combine Other Commands on page 44](#)
- [Overview of Junos OS CLI Operational Mode Commands on page 44](#)
- [Overview of Navigating the CLI on page 47](#)
- [Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands on page 48](#)
- [Understanding Junos OS CLI Configuration Mode on page 49](#)

CLI User Interface Overview

- [CLI Overview on page 39](#)
- [CLI Key Features on page 40](#)
- [CLI Command Modes on page 40](#)

CLI Overview

The command-line interface (CLI) is the software interface you use to access, monitor, configure, troubleshoot, and manage a device running Junos OS. You can access the CLI either from the console or through a network connection. The CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel.

The CLI provides a variety of UNIX utilities, such as Emacs-style keyboard sequences, which allows you to perform the following actions:

- Move around on a command line and scroll through recently executed commands.
- Match regular expressions to locate and replace values and identifiers in a configuration.
- Filter command output.
- Log file entries.
- Store and archive device files on a UNIX-based file system.

You can exit the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage processes, and perform other tasks.

CLI Key Features

The CLI commands and statements follow a hierarchical organization and have consistent syntax. The CLI provides the following features for ease of use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with the Junos OS, you can use many of the CLI commands without referring to the documentation.
- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press Tab or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

CLI Command Modes

The CLI has two modes, operational mode and configuration mode.

- Operational mode—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot Junos OS and devices and network connectivity. Operational mode is indicated by the > prompt—for example, **user@switch> clear**
- Configuration mode—A Junos OS device configuration is stored as a hierarchy of statements. In configuration mode, you can define all properties of the Juniper Networks Junos OS, including interfaces, VLANs, Virtual Chassis information, user access, and several system hardware properties. To enter configuration mode, enter the **configure** command. Configuration mode is indicated by the # prompt and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]  
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration,

the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you must issue another **commit** command within the defined period of time (10 minutes by default), or the system reverts to the previous configuration.

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (>) and the configuration mode prompt is a pound sign (#).

When you log in to the switch and type the **cli** command, you are automatically in operational mode. To switch to configuration mode, type the **configure** command or the **edit** command.

The CLI prompt changes from **user@switch>** to **user@switch#**, and a banner appears to indicate the hierarchy level.

To return to operational mode as well as commit your changes, enter **command and-quit**. To return to operational mode without committing any of your changes, enter **exit**.

To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command.

Related Documentation

- [Configuring Login Tips on page 42](#)
- [Overview of Navigating the CLI on page 47](#)
- *CLI User Guide*
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 220](#)

Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

Related Documentation

- *Defining Junos OS Login Classes*

Format for Specifying Filenames and URLs in Junos OS CLI Commands

In some CLI commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication *load-key-file***, and **request system software add**—you can include a filename. On a routing matrix, you can include chassis information (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**) as part of the filename.

A *routing matrix* is a multichassis architecture composed of either one TX Matrix router and from one to four T640 routers connected to the TX Matrix router, or one TX Matrix Plus router and from one to four T1600 routers connected to the TX Matrix Plus router. From the perspective of the user interface, the routing matrix appears as a single router. On a routing matrix composed of the TX Matrix router and T640 routers, the TX Matrix router controls all the T640 routers. On a routing matrix composed of a TX Matrix Plus router and T1600 routers, the TX Matrix Plus router controls all the T1600 routers.

WARNING: Starting with Junos OS Release 15.1, the **sslv3-support** option is not available for configuration with the **set system services xnm-ssl** and **file copy** commands. SSLv3 is no longer supported and available.

For all releases prior to and including Junos OS Release 14.2, SSLv3 is disabled by default at runtime. The **sslv3-support** option is hidden and deprecated in Junos OS Release 14.2 and earlier releases. However, you can use the **set system services xnm-ssl sslv3-support** command to enable SSLv3 for a Junos XML protocol client application to use as the protocol to connect to the Junos XML protocol server on a router, and you can use the **file copy source destination sslv3-support** command to enable the copying of files from an SSLv3 URL.

Using SSLv3 presents a potential security vulnerability, and we recommend that you not use SSLv3. For more details about this security vulnerability, go to <http://kb.juniper.net/InfoCenter/index?page=content&id=JSA10656>.

You can specify a filename or URL in one of the following ways:

- **filename**—File in the user's current directory on the local CompactFlash card (not applicable on the QFX Series). You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in HTTP or FTP.

NOTE: Wildcards are supported only by the **file** (**compare** | **copy** | **delete** | **list** | **rename** | **show**) commands. When you issue the **file show** command with a wildcard, it must resolve to one filename.

- **path/filename**—File on the local flash disk.
- **/var/filename** or **/var/path/filename**—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> file delete lcc0-re0:/var/tmp/junk
```

- **a:filename** or **a:path/filename**—File on the local removable media. The default path is **/** (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- **hostname:/path/filename**, **hostname:filename**, **hostname:path/filename**, or **"scp://hostname/path/filename"**—File on an **scp/ssh** client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify **hostname** as **username@hostname**.
- **ftp://hostname/path/filename**—File on an FTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. The default path is the user's home directory. To specify an absolute path, the path must start with **%2F**; for example, **ftp://hostname/%2Fpath/filename**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net/filename
file copy ftp.hostname.net: Not logged in.
```

```
user@host> file copy ftp://username:prompt@ftp.hostname.net/filename
Password for username@ftp.hostname.net:
```

- **re0:/path/filename** or **re1:/path/filename**—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> show log lcc0-re1:chassisd
```

NOTE: You cannot specify a URL for a file on an HTTP server, because HTTP URLs are not writable.

Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in [Figure 1 on page 44](#).

Figure 1: Commands That Combine Other Commands

Related Documentation

- [Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands on page 48](#)

Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 44](#)
- [Commonly Used Operational Mode Commands on page 46](#)

CLI Command Categories

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.
 - **clear**—Clear statistics and protocol database information.
 - **mtrace**—Trace mtrace packets from source to receiver.
 - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
 - **ping**—Determine the reachability of a remote network host.
 - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
 - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
 - **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the [CLI Explorer](#).
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the [CLI Explorer](#).
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the [CLI Explorer](#).
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the [CLI Explorer](#).
- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the [CLI Explorer](#).
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see “[Understanding Junos OS CLI Configuration Mode](#)” on page 49.
- A command—**quit**—to exit the CLI. For information about this command, see the [CLI Explorer](#).
- For more information about the CLI operational mode commands, see the [CLI Explorer](#).

Commonly Used Operational Mode Commands

Table 3 on page 46 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

Table 3: Commonly Used Operational Mode Commands

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	show version
Log files	Contents of the log files	monitor
	Log files and their contents and recent user logins	show log
Remote systems	Host reachability and network connectivity	ping
	Route to a network system	traceroute
Configuration	Current system configuration	show configuration
Manipulate files	List of files and directories on the router or switch	file list
	Contents of a file	file show
Interface information	Detailed information about interfaces	show interfaces
Chassis	Chassis alarm status	show chassis alarms
	Information currently on craft display	show chassis craft-interface
	Router or switch environment information	show chassis environment
	Hardware inventory	show chassis hardware
Routing table information	Information about entries in the routing tables	show route
Forwarding table information	Information about data in the kernel's forwarding table	show route forwarding-table
IS-IS	Adjacent routers or switches	show isis adjacency
OSPF	Display standard information about OSPF neighbors	show ospf neighbor
BGP	Display information about BGP neighbors	show bgp neighbor

Table 3: Commonly Used Operational Mode Commands (*continued*)

Items to Check	Description	Command
MPLS	Status of interfaces on which MPLS is running	show mpls interface
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	show mpls lsp
	Routes that form a label-switched path	show route label-switched-path
RSVP	Status of interfaces on which RSVP is running	show rsvp interface
	Currently active RSVP sessions	show rsvp session
	RSVP packet and error counters	show rsvp statistics

Overview of Navigating the CLI

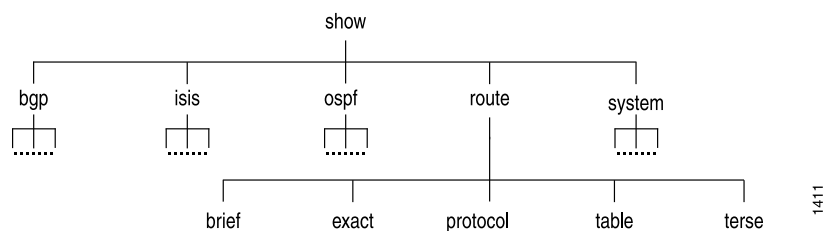

This topic describes how to navigate the CLI.

- [CLI Command Hierarchy on page 47](#)
- [CLI Configuration Statements on page 48](#)
- [Moving Among Hierarchy Levels on page 48](#)

CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command. [Figure 2 on page 47](#) illustrates a portion of the **show** command hierarchy.

Figure 2: CLI Command Hierarchy

To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of your Ethernet switching options for your interfaces, use the command **show ethernet-switching-options interfaces**.

CLI Configuration Statements

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

Moving Among Hierarchy Levels

You can use the CLI commands to navigate the levels of the configuration statement hierarchy:

- **edit**— Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
- **exit**— Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the **edit** command. Alternatively, you can use the **quit** command. The **exit** and **quit** commands are interchangeable.
- **up**— Moves up the hierarchy one level at a time.
- **top**— Moves directly to the top level of the hierarchy.

Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

1. Use the **?** prompt to list options available for the command. For example:

```
user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>          Execute this command
brief              Display brief output
descriptions       Display interface description strings
detail             Display detailed output
extensive          Display extensive output
media              Display media information
snmp-index         SNMP index of interface
```

statistics	Display statistics and detailed output
terse	Display terse output
	Pipe through a command

2. Choose the option you wish to use with the command. (See Figure 3 on page 49.)

Figure 3: Command Output Options

Command output with the **brief** option.

Command output with the **terse** option.

Command output with the **extensive** option.

```
user@host> show interfaces fe-1/1/1 brief
Physical interface: fe-1/1/1, Enabled, Physical link is Down
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
Disabled, Source filtering: Disabled,
Flow control: Enabled
Device flags : Present Running Down
Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
Link flags : None

user@host> show interfaces fe-1/1/1 terse
Interface      Admin Link Proto  Local      Remote
fe-1/1/1      up      down

user@host> show interfaces fe-1/1/1 extensive
Physical interface: fe-1/1/1, Enabled, Physical link is Down
Interface index: 141, SNMP ifIndex: 33, Generation: 24
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
Disabled, Source filtering: Disabled,
Flow control: Enabled
Device flags : Present Running Down
Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
Link flags : None
CoS queues : 4 supported, 4 maximum usable queues
Hold-times : Up 0 ms, Down 0 ms
Current address: 00:90:69:d0:f8:9e, Hardware address: 00:90:69:d0:f8:9e
Last flapped : 2007-02-02 09:26:25 PST (2w0d 03:40 ago)
Statistics last cleared: Never
Traffic statistics:
Input bytes :          0          0 bps
Output bytes :          0          0 bps
Input packets:          0          0 pps
Output packets:          0          0 pps

Understanding Junos OS CLI Configuration Mode

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*, a router configuration is stored as a hierarchy of statements. In configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- [Configuration Mode Commands on page 51](#)
- [Configuration Statements and Identifiers on page 52](#)
- [Configuration Statement Hierarchy on page 54](#)

Configuration Mode Commands

Table 4 on page 51 summarizes each CLI configuration mode command. The commands are organized alphabetically.

Table 4: Summary of Configuration Mode Commands

Command	Description
activate	Remove the inactive: tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the commit command.
annotate	Add comments to a configuration. You can add comments only at the current hierarchy level.
commit	Commit the set of changes to the database and cause the changes to take operational effect.
copy	Make a copy of an existing statement in the configuration.
deactivate	Add the inactive: tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the commit command.
delete	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
edit	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
exit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The quit and exit commands are synonyms.
extension	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
help	Display help about available configuration statements.
insert	Insert an identifier into an existing hierarchy.
load	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 4: Summary of Configuration Mode Commands (*continued*)

Command	Description
quit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The quit and exit commands are synonyms.
rename	Rename an existing configuration statement or identifier.
replace	Replace identifiers or values in a configuration.
rollback	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the commit configuration command.
run	Run a top-level CLI command without exiting from configuration mode.
save	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
set	Create a statement hierarchy and set identifier values. This is similar to edit except that your current level in the hierarchy does not change.
show	Display the current configuration.
status	Display the users currently editing the configuration.
top	Return to the top level of configuration command mode, which is indicated by the [edit] banner.
up	Move up one level in the statement hierarchy.
update	Update a private database.
wildcard	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 5 on page 53 describes top-level CLI configuration mode statements.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

Table 5: Configuration Mode Top-Level Statements

Statement	Description
access	Configure the Challenge Handshake Authentication Protocol (CHAP). For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
accounting-options	Configure accounting statistics data collection for interfaces and firewall filters. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
chassis	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
class-of-service	Configure class-of-service parameters. For information about the statements in this hierarchy, see the Junos OS Class of Service Feature Guide for Routing Devices .
firewall	Define filters that select packets based on their contents. For information about the statements in this hierarchy, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i> .
forwarding-options	Define forwarding options, including traffic sampling options. For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
groups	Configure configuration groups. For information about statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
interfaces	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
policy-options	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. For information about the statements in this hierarchy, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i> .

Table 5: Configuration Mode Top-Level Statements (*continued*)

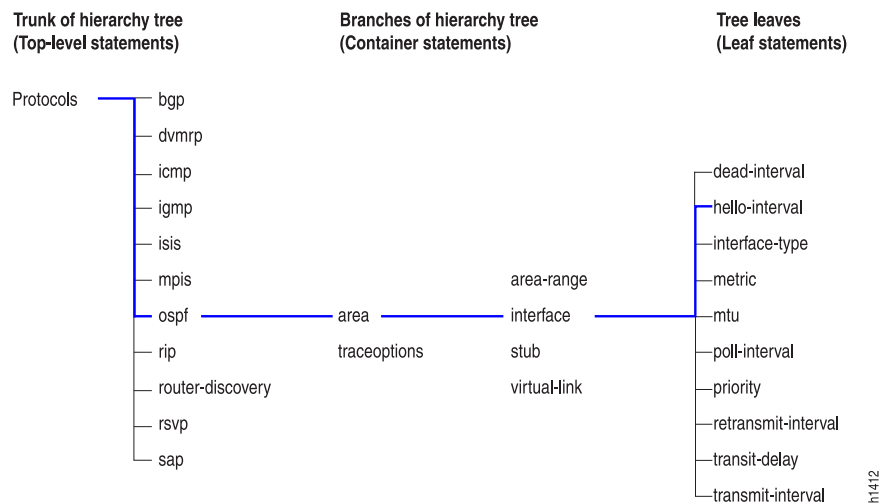

Statement	Description
protocols	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the <i>Junos OS Routing Protocols Library for Routing Devices</i> and the MPLS Applications Feature Guide for Routing Devices .
routing-instances	Configure multiple routing instances. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
routing-options	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
security	Configure IP Security (IPsec) services. For information about the statements in this hierarchy see the <i>Junos OS Administration Library for Routing Devices</i> .
snmp	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
system	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .

For specific information on configuration statements, see the Junos OS configuration guides.

Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see [Figure 4 on page 55](#)). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 4: Configuration Mode Hierarchy of Statements

Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. [Figure 4 on page 55](#) illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in [Figure 4 on page 55](#) as **[edit protocols ospf area *area-number* interface *interface-name*]** and displays the configuration as follows:

```
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
      interface so-0/0/1 {
        hello-interval 5;
      }
    }
  }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain “oneliners” at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric 10** is a oneliner because the **level** container statement with identifier **1**, its child statement **metric**, and its corresponding attribute **10** all appear on a single line in the hierarchy:

```
[edit protocols]
  isis {
    interface ge-0/0/0.0 {
      level 1 metric 10;
    }
  }
}
```

Likewise, in the following example, **dynamic-profile *dynamic-profile-name* aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier ***dynamic-profile-name***, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

- [Configuring a DHCP Client \(CLI Procedure\) on page 63](#)
- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 64](#)

Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

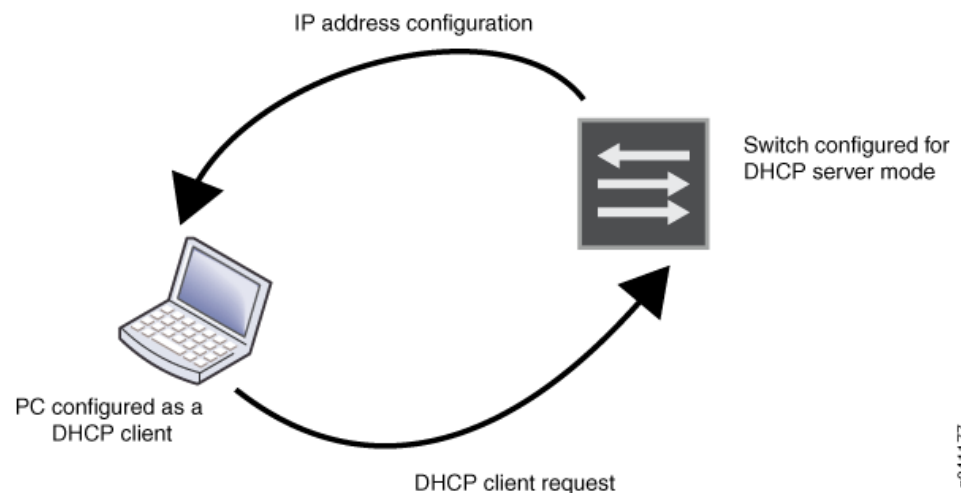

This topic describes:

- [DHCP Client/Server Model on page 59](#)
- [Using DHCP on page 60](#)
- [DHCP Relay Servers and DHCP Servers on page 60](#)
- [Legacy DHCP and Extended DHCP for Server Versions on page 61](#)
- [Configuring DHCP on a Switch on page 62](#)
- [How DHCP Works on page 62](#)

DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See [Figure 5 on page 60](#).

Figure 5: DHCP Client/Server Model

Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, the new software is downloaded and installed. See [“Upgrading Software by Using Automatic Software Download” on page 7](#).

DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server. For directions on configuring a DHCP relay server, see *DHCP/BOOTP Relay for Switches Overview*.

Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series, QFX Series, and OCX Series switches. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch. See *EX Series Switch Software Features Overview* for a list of switches that support the extended DHCP server.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients. For details, see *High Availability Features for EX Series Switches Overview*.
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see *Understanding Virtual Routing Instances on EX Series Switches*.

NOTE: Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See *EX Series Switch Software Features Overview* for a list of switches that support extended DHCP (VR-aware DHCP).

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in [Table 6 on page 61](#):

Table 6: Legacy DHCP and Extended DHCP Server Hierarchy Levels

DHCP Service	Hierarchy
Extended DHCP server	<code>edit system services dhcp-local-server</code>
Extended DHCP address pool	<code>edit access address-assignment pool</code>
Legacy DHCP server	<code>edit system services dhcp</code>
Legacy DHCP relay	<code>edit forwarding-options helpers bootp</code>
Extended DHCP relay	<code>edit forwarding-options dhcp-relay</code>
Legacy DHCP address pool	<code>edit system services dhcp pool</code>

DHCP clients on a switch are always configured at the hierarchy level `[edit interfaces interface-name family dhcp]`.

Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

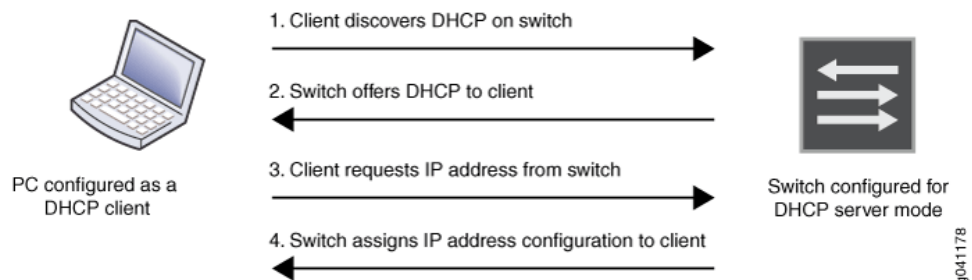

For directions for configuring either a legacy DHCP server or an extended DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 64](#).

To configure a DHCP client, set the client's DHCP interface address in the **[edit interfaces interface-name unit 0 family inet dhcp]** hierarchy. For directions for configuring a DHCP client on a switch, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 63](#).

How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See [Figure 6 on page 62](#).

Figure 6: DHCP Four-Step Transfer

NOTE: Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

- [Configuring an Extended DHCP Relay Server on EX Series Switches \(CLI Procedure\)](#)
- [Configuring a DHCP SIP Server \(CLI Procedure\)](#)
- [Upgrading Software by Using Automatic Software Download on page 7](#)
- [Monitoring DHCP Services](#)

Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 64](#) or [Configuring a DHCP Server on Switches \(CLI Procedure\)](#).

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in [Table 7 on page 63](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

Table 7: DHCP Client Settings

Configuration Statement	Description
client-identifier	Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcc.
lease-time	Time in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.
retransmission-attempt	Number of times the client attempts to retransmit a DHCP packet.
retransmission-interval	Time between transmission attempts.
server-address	IP address of the server that the client queries for an IP address.

Table 7: DHCP Client Settings (*continued*)

Configuration Statement	Description
update-server	TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.
vendor-option	Vendor class ID (CPU's manufacturer ID string) for the DHCP client.

**Related
Documentation**

- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 64](#)
- [Understanding DHCP Services for Switches on page 59](#)

Configuring a DHCP Server on Switches (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring a DHCP Server on Switches (CLI Procedure)*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

A DHCP configuration consists of two components—an optional reconfiguration of default settings on DHCP clients and the configuration of a DHCP server. This topic covers configuration of the DHCP server. For information about reconfiguring a DHCP client, see “[Configuring a DHCP Client \(CLI Procedure\)](#)” on page 63.

You can configure either of two versions of a DHCP server on a switch— the extended server version or the legacy server version. We recommend that you configure the extended server unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 65](#)
2. [Configuring a Legacy DHCP Server on a Switch \(CLI Procedure\) on page 65](#)

Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before it assigns them to clients.

1. Create an address pool for DHCP IP addresses:

```
[edit]
user@switch# set access address-pool address-pool
```

2. Configure an address-assignment pool that can be used by different client applications for DHCP dynamic assignment:

```
[edit access address-assignment]
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface name for DHCP:

```
[edit system services dhcp-local-server]
user@switch# set group group-name interface interface-name
```

4. (Optional) Process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]
user@switch# set overrides process-inform
```

5. (Optional) Redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first
```

6. (Optional) Enable dynamic reconfiguration triggered by the DHCP extended server for all DHCP clients or only for the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]
user@switch# set reconfigure

[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure
```

Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

```
[edit system services dhcp]
user@switch# set pool network-range
```

NOTE: Step 2 through Step 15 are for assigning global values at the `[edit system services dhcp]` hierarchy level. You can also assign the same values to a specific pool by using those same commands at the `[edit system services dhcp pool network-range]` hierarchy level.

2. (Optional) Change the domain search list used to resolve hostnames:

```
[edit system services dhcp]
user@switch# set domain-search [ domain-list ]
```

3. (Optional) Change the domain name server (DNS) name that the DHCP server advertises to clients:

```
[edit system services dhcp]
user@switch# set name-server address
```

4. (Optional) Change the DHCP options:

```
[edit system services dhcp]
user@switch# set option id-number
```

5. (Optional) Change the devices advertised to clients:

```
[edit system services dhcp]
user@switch# set router address
```

6. (Optional) Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete the DHCP setup. This configuration step is equivalent to DHCP Option 66:

```
[edit system services dhcp]
user@switch# set boot-server (address | hostname)
```

7. (Optional) Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. This configuration step is equivalent to DHCP Option 67:

```
[edit system services dhcp]
user@switch# set boot-file filename
```

8. (Optional) Change the SIP server:

```
[edit system services dhcp]
user@switch# set sip-server addresses-or-names
```

For more information, see *Configuring a DHCP SIP Server (CLI Procedure)*.

9. (Optional) Change the DHCP client's hardware address:

```
[edit system services dhcp]
user@switch# set static-binding mac-address
```

10. (Optional) Change the NetBIOS name server:

```
[edit system services dhcp]
user@switch# set wins-server address
```

Internet Control Message Protocol (ICMP)

- [Understanding ICMP on page 71](#)

CHAPTER 5

Understanding ICMP

- [Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 71](#)
- [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 72](#)
- [Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages on page 72](#)
- [Configuring Junos OS to Disable Sending Protocol Redirect Messages on EX Series Switches \(CLI Procedure\) on page 72](#)

Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]  
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]  
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

- Related Documentation**
- [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 72](#)

Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets

By default, the Routing Engine responds to Internet Control Message Protocol (ICMP) echo requests sent to multicast group addresses. To disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses, include the **no-multicast-echo** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-multicast-echo;
```

By configuring the Routing Engine to ignore multicast ping packets, you can prevent unauthorized persons from discovering the list of provider edge (PE) routers or switches in the network.

- Related Documentation**
- [Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 19](#)

Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

To limit the rate at which ICMPv4 messages can be generated and received by the Routing Engine, include the **icmpv4-rate-limit** statement at the **[edit system internet-options]** hierarchy level:

```
icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
```

The bucket size is the number of seconds in the rate-limiting bucket. The packet rate is the rate-limiting packets earned per second. Specify a **bucket-size** from 0 through 4294967295 seconds. The default value is 5 seconds. Specify a **packet-rate** from 0 through 4,294,967,295. The default value is 1000.

- Related Documentation**
- [icmpv4-rate-limit on page 297](#)

Configuring Junos OS to Disable Sending Protocol Redirect Messages on EX Series Switches (CLI Procedure)

EX series switches support sending ICMP redirect messages for both IPv4 and IPv6 traffic. By default, the switch sends protocol redirect messages. For security reasons, you may want to disable the switch from sending protocol redirect messages.

To disable the sending of redirect messages by the switch:

- Disable sending protocol redirect messages for the entire switch:

For IPv4 traffic:

```
[edit system]
user@switch# set no-redirects
```

For IPv6 traffic:

```
[edit system]
user@switch# set no-redirects-ipv6
```

- Disable sending the protocol redirect messages on a specific interface:

For IPv4 traffic:

```
[edit interfaces interface-name unit logical-unit-number family family]
user@switch# set no-redirects
```

For IPv6 traffic:

```
[edit interfaces interface-name unit logical-unit-number family family]
user@switch# set no-redirects-ipv6
```

To re-enable the sending of redirect messages on the switch, delete the **no-redirects** statement (for IPv4 traffic) or the **no-redirects-ipv6** statement (for IPv6 traffic) from the configuration.

Understanding Guest VMs

You can use a guest virtual machine (VM) to run third party software applications. Guest VMs provide a native environment in which third party applications can be executed, and eliminate the need for porting or adapting third party applications to work on the host OS. You can use the Junos SDK Virtual Build Environment in the JunosV App Engine to package the guest VM images. Once the guest VMs are packaged, you can launch them from the Junos OS CLI.

NOTE: Only one guest VM is supported at this time.

Prerequisites for Setting up a Virtual Build Environment in the JunosV App Engine

Make sure the following prerequisites are met before you set up a Virtual Build Environment in the JunosV App Engine:

- Dedicated server running CentOS 6.2 with a 64-bit processor capable of full hardware virtualization

To find out if the server running CentOS is capable of full hardware virtualization, issue the following command at the shell:

```
egrep '(vmx|svm)' --color=always /proc/cpuinfo
```

If you receive a result with `vmx` or `svm`, the server is capable of virtualization. If you receive a null result, then the server is not capable of virtualization.

The server must have access to the Internet to download and install various Linux, Junos SDK, and JVAE packages.

- CentOS packages installed on the server:

- `kvm`
- `vnc`
- `gcc`
- `make`
- `wget`
- `libvirt`
- `dhcp`
- `dnsmasq`
- `bridge-utils`
- `flex`
- `bison`
- `gcc-c++`
- `glib2-devel`

- vnc-server
- which
- xterm
- xorg-x11-twm
- xorg-x11-server-utils
- libXfont

You can install these packages using the **yum** tool in CentOS.

NOTE: For **yum** to work properly, the server must have Internet connectivity, and the DNS servers must be configured.

To see which packages are installed, issue the following command:

yum list installed

To install all of the packages in the list, issue the following command:

yum install kvm vnc gcc make wget libvirt dhcp dnsmasq bridge-utils flex bison gcc-c++ glib2-devel vnc-server which xterm xorg-x11-twm xorg-x11-server-utils libXfont

- Quick Emulator (QEMU) installed for managing VMs.

Issue the following commands to download and install QEMU on your server:

```
wget http://wiki.qemu.org/download/qemu-1.0.1.tar.gz
tar xvf *.gz
cd qemu-1.0.1
./configure
make
make install
```

- Virtual bridge for VM network connectivity is created.

To ensure network connectivity for the Virtual Build Environment (VBE) VM, create a virtual bridge. The virtual bridge allows you to connect the VM to the physical Ethernet interface of the host machine. After performing the following steps, you will have a virtual bridge interface named `virbr0`, which links to the `eth0` interface of the system. When the VM is created, the `virbr0` interface is added to the bridge, and the IP address of the `eth0` is assigned to the `virbr0` interface.

1. Before you configure a virtual bridge, make sure there are no virtual bridges already configured. Issue the following commands to remove any virtual bridges that have been created previously:

```
rm /etc/sysconfig/network-scripts/ifcfg-virbr0
virsh net-destroy default
virsh net-undefine default
service libvirtd restart
```

2. To create a bridge interface named `virbr0` for the virtual bridge and then link it to the physical interface of the system (`eth0`), issue the following commands:

For example:

```

echo 10 > /var/tmp/tapno
chmod 644 /var/tmp/tapno
/etc/sysconfig/network-scripts/qifup
!/bin/sh
/sbin/ifconfig \${1} 0.0.0.0 promisc up
/usr/sbin/brctl addif virbr0 \${1}
/etc/sysconfig/network-scripts/qifdown
!/bin/sh
/sbin/ifconfig \${1} down
/usr/sbin/brctl delif virbr0 \${1}
chmod 755 /etc/sysconfig/network-scripts/qif*
/usr/sbin/brctl addbr virbr0
/usr/sbin/brctl addif virbr0 eth0
cd /etc/sysconfig/network-scripts
cp ifcfg-eth0 ifcfg-virbr0

```

3. Edit the ifcfg-eth0 file located at the **/etc/sysconfig/network-scripts/** directory and add the following line to specify that the virbr0 interface is being used as the bridge interface:

```
BRIDGE="virbr0"
```

4. Edit the ifcfg-virbr0 file located at the **/etc/sysconfig/network-scripts/** directory and modify the following values:

```

DEVICE="virbr0"
TYPE="Bridge"

```

5. Enable the VNC connection to the VM by adding the following lines to the iptables file located at the **/etc/sysconfig/** directory:

```

-A INPUT -i eth0 -j ACCEPT
-A INPUT -i virbr0 -j ACCEPT

```

6. Issue the following command to restart the network and iptables service for the changes to take effect:

```
/sbin/service iptables restart
```

7. Issue the following command to verify that all the changes have taken effect:

```
/usr/sbin/brctl show
```

The output of this command should show that the virbr0 interface is configured. Verify that there is still network connectivity to the server.

Setting up the Virtual Build Environment for the JunosV App Engine

The JunosV App Engine (JVAE) enables third party applications—applications written in Linux—to run on a guest VM. JunosV App Engine also enables third party applications to run in their native environment without porting to Junos OS.

JVAE provides a virtualized environment with a Kernel-based Virtual Machine (KVM) hypervisor, which runs on the host OS. The host OS controls the creation of virtual machines (VMs) on top of the hypervisor. The hypervisor and host OS run within a compute node. The compute node is connected to a device running Junos OS. In this case, the compute node is connected to a QFX5100 switch.

Downloading and Installing the JunosV App Engine Software

Download the following JunosV App Engine development tools, packaging tools, and sample guest OS packages located at <http://www.juniper.net/support/csc/swdist-junos-sdk/#sw> to your server:

- junos-sdk-remote-devtools-13.1R1.6.tgz
- junos-sdk-remote-pkgtools-13.1R1.6.tgz
- junos-sdk-os-13.1R1.6.tgz

1. Copy the junos-sdk-remote-devtools-13.1R1.6.tgz file to the **/usr/src/remote-devtools/** directory.

For example:

```
scp junos-sdk-remote-devtools-13.1R1.6.tgz /usr/src/remote-devtools/
```

2. Extract the junos-sdk-remote-devtools-13.1R1.6.tgz file.

For example:

```
tar -zxvf junos-sdk-remote-devtools-13.1R1.6.tgz
```

3. Install the junos-sdk-remote-devtools-13.1R1.6.

For example:

```
./setup
```

4. Copy the junos-sdk-remote-pkgtools-13.1R1.6.tgz file to the **/usr/src/remote-pkgtools** directory.

For example:

```
scp junos-sdk-remote-pkgtools-13.1R1.6.tgz /usr/src/remote-pkgtools
```

5. Extract the junos-sdk-remote-pkgtools-13.1R1.6.tgz file.

For example:

```
tar -zxvf junos-sdk-remote-pkgtools-13.1R1.6.tgz
```

6. Install the junos-sdk-remote-pkgtools-13.1R1.6 software.

For example:

```
./setup
```

7. Copy the junos-sdk-os-13.1R1.6.tgz file to the **/usr/src/sdk-os** directory.

For example:

```
scp junos-sdk-os-13.1R1.6.tgz /usr/src/sdk-os
```

8. Extract the junos-sdk-os-13.1R1.6.tgz file.

For example:

```
tar -zxvf junos-sdk-os-13.1R1.6.tgz
```

9. Install the junos-sdk-os-13.1R1.6 software.

For example:

```
./setup
```

Launching the VNC Server

Launch a VNC server, so you can access a VM.

1. Before you can launch the VNC server, use **yum** to install the **Desktop** package.

For example:

```
yum groupinstall -y Desktop
```

2. Issue the following command to set the VNC password.

You need to set the password when you use VNC for the first time.

For example:

```
vncpasswd
```

3. Issue the following command to launch the VNC server.

For example:

```
vncserver &
```

The name of the desktop is displayed.

For example:

```
vnc-test.device.net:1
```

4. Issue the following command to verify that the VNC viewer is working correctly.

For example:

```
vncviewer vnc-device.net:1
```

A VNC session is created on the server.

Launching the FreeBSD Virtual Build Environment (VBE) Virtual Machine (VM)

Use the Kernel-based Virtual Machine (KVM) hypervisor to launch the VBE VM.

1. Issue the following commands to launch the VBE VM.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
./start_vm --img /usr/src/sdk-os/junos-sdk-20110408a1/junos-sdk-20110408.img
```

This command launches the VM and returns a port number. The port number is used to establish a VNC connection to the VM.

2. Issue the following command to access the VM.

For example:

```
vncviewer localhost::<port> &
```

This command generates a VNC session to the FreeBSD VBE VM and enables the root password of **letmein**.

Installing the Junos SDK Packages on the Virtual Build Environment

Before you install the Junos SDK packages, configure an IP address and default gateway on the VBE VM, and ensure that the VBE has proper network connectivity. Also, use the **adduser** tool to create user profiles for the VBE.

1. Issue the following commands to configure the IP address and default gateway on the VBE VM:

For example:

```
ipconfig em0 inet 10.204.42.20 netmask 255.255.255.0
route add default 10.204.42.20
```

2. Issue the **adduser** command to add user profiles for the VBE.

The **adduser** command provides an interactive guided procedure.

3. Download the following Junos SDK packages located at <http://www.juniper.net/support/csc/swdist-junos-sdk/> to the VBE:

- junos-sdk-ui-sim-13.1R1.6-signed.tgz
- junos-sdk-toolchain-13.1R1.6-signed.tgz
- junos-sdk-sb-13.1R1.6-signed.tgz

4. Issue the following commands to install the Junos SDK packages.

For example:

```
pkg_add junos-sdk-sb-13.1R1.6-signed.tgz
pkg_add junos-sdk-toolchain-13.1R1.6-signed.tgz
pkg_add junos-sdk-ui-sim-13.1R1.6-signed.tgz
```

Prerequisites for Using the Virtual Build Environment

Before you can use the Virtual Build Environment to create sandboxes for development, you need to meet the following hardware and software requirements:

- Dedicated server running CentOS 6.2 with a 64-bit processor capable of full hardware virtualization
- Junos SDK Virtual Build Environment (VBE) Virtual Machine (VM) running with access to the Internet on a dedicated server
- Junos SDK packages installed on the VBE VM:
 - junos-sdk-ui-sim-13.1R1.6-signed.tgz
 - junos-sdk-toolchain-13.1R1.6-signed.tgz
 - junos-sdk-sb-13.1R1.6-signed.tgz

Obtaining Junos SDK Certificate Request File and Certificate Key File for the Virtual Build Environment

1. Log into Virtual Build Environment (VBE) Virtual Machine (VM) as root.
2. Issue the following command to launch the **sdk-certificate-request** script.

For example:

`/usr/local/junos-sdk/13.1R1.6/bin/sdk-certificate-request`

3. Provide the following information when the script prompts you. Press **Enter** after you provide a response.

- City, state, and country
- Organization and unit
- Provider prefix

This is the unique provider name assigned by Juniper to each SDK partner

- User string

The user string can be a project name, product name, or any generic word.

- Deployment scope

Juniper assigns this string to differentiate multiple certificate for the same partner. If Juniper did not assign this string, you can leave this field empty

- Index number

This number is also referred to as a certificate generations number. The number 1 is used for the initial certificate. After the certificate expires and a new one is requested, this number is increased incrementally.

After you provide all of the information, the script will generate the following files in the `/usr/local/junos-sdk/cert` directory:

- Certificate Key *filename_key.pem*

This file contains the Junos SDK package-signing key. Ensure that no one outside of the development organization has access to the certificate key. Do not send this file to Juniper

- Certificate Request File *filename_req.pem*

This file contains the certificate request. Send this file to Juniper for processing

Processing and Obtaining the Certificate File

1. Send the certificate request file to Juniper Junos SDK Certificate Processing Team at `sdk-cert@juniper.net`

Once the processing is complete, the Junos SDK Certificate Processing Team will send you the certificate.

2. When you receive the certificate, rename the certificate file as ***filename.pem*** and copy it to the `/usr/local/junos-sdk/certs` directory in the VBE VM.
3. Delete the Certificate Request File from the directory.

There should only be one key and certificate pair in the `/usr/local/junos-sdk/certs` directory.

Prerequisites for Packaging the Guest VM

Before you can package the guest VM, make sure you meet the following hardware and software requirements:

- Dedicated server running CentOS 6.2 with a 64-bit processor capable of full hardware virtualization.
- Junos SDK Virtual Build Environment (VBE) Virtual Machine (VM) running with access to the Internet on a dedicated server.
 - You must be able to issue a successful ping request to the VBE VM, and SSH and SCP must be enabled on the VBE VM.
 - The VBE VM must have a valid Junos SDK certificate-and-key pair in the `/usr/local/junos-sdk/certs` directory.
- Junos SDK packages installed on the VBE VM:
 - `junos-sdk-ui-sim-13.1R1.6-signed.tgz`
 - `junos-sdk-toolchain-13.1R1.6-signed.tgz`
 - `junos-sdk-sb-13.1R1.6-signed.tgz`

Launching the Guest VM on the CentOS Server

1. Issue the **start_vm** script from the Junos SDK Remote Packaging tools directory to launch the guest VM.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
./start_vm --img <path>/third-party-app.img -- tapno 1
```

This command launches the VM and returns a port number to which a VNC connection to the VM can be established.

2. Issue the following command to launch the guest VM

For example:

```
vncviewer localhost::port-number &
```

This command generates a VNC session to the Guest VM.

Copying Required Application to Package with the Guest VM

Before you use `scp` to copy the required applications contained in the **junos-sdk-remote-devtools-13.1R1.6.tgz** file to the Guest VM, configure an IP address and default gateway on the VBE VM, and ensure that the VBE has proper network connectivity.

In this example, an IP address of 10.204.42.40 has been assigned to the Guest VM, and the required application is **remote-helloworld**.

1. Issue the following commands to configure the IP address and default gateway on the VBE VM:

For example:

```
ipconfig em0 inet 10.204.42.20 netmask 255.255.255.0
route add default 10.204.42.20
```

2. Copy the **remote-helloworld** binary to the `/usr/local/bin` directory and the script to the `/etc/init.d` directory in the Guest VM.

For example:

```
scp /usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld
root@10.204.42.40:/usr/local/bin
scp /usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld.sh
root@10.204.42.40:/etc/init.d
```

3. Rename the **remote-helloworld.sh** script in the `/etc/init.d` folder to **remote-helloworld**.

For example:

```
cd /etc/init.d
mv remote-helloworld.sh remote-helloworld
```

4. You can now add the **remote-helloworld** application as a startup service.

For example:

```
chkconfig --add remote-helloworld
chkconfig remote-helloworld on
```

5. Shutdown the VM before packaging the application.

For example:

```
shutdown -h now
```

Editing Packaging Tool Scripts

Before you package the software, you need to modify the **sample.manifest** and **export-user-data.sh** files.

1. Modify the **sample.manifest** file to include the source and destination pairs of the application binaries and scripts to be packaged into the Guest VM.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
vi sample.manifest
```

Here is an example of a `sample.manifest` file:

```
# $Id: sample.manifest 131 2013-02-19 19:24:45Z tomwright $
```

```
# Copyright (c) 2012, Juniper Networks
# All rights reserved

# blank lines and lines beginning with # ignored

# dest (guest OS VM) user and host/IP are specified in export-user-data.sh
# dest ending with slash indicates directory

# src dest

/usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld
/usr/local/bin/
/usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld.sh
/etc/init.d/remote-helloworld
```

2. Modify the export-user-data.sh file to include details about the Guest VM .img file, DDL, ODL, and VBE VM details. In this example, an IP address of 10.204.42.20 has been assigned to the VBE VM

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
vi export-user-data.sh
```

Modify the following values with the correct values:

- APP_CMD

Name of the command DDL file, including the path (.cmd.dd). Leave this variable undefined if your application does not require a user interface.

In this example,

```
APP_CMD=/usr/src/remote-devtools/examples/remote-helloworld/extensions/libcd/input/remote-helloworldcmd
```

- APP_CNF

Name of config DDL file, including the path (.cnf.dd). Leave this variable undefined if your application does not require a user interface.

In this example,

```
APP_CNF=/usr/src/remote-devtools/examples/remote-helloworld/extensions/libcd/input/remote-helloworldcnf
```

- APP_MANIFEST

Name of application manifest file, including the path.

In this example,

```
APP_MANIFEST=/usr/src/remote-pkgtools/junos-sdk-remote-pkgtools/sample.manifest
```

- APP_ODL

Name of ODL file, including the path (.odl). Leave this variable undefined if your application does not require formatted output.

In this example,

```
APP_ODL=/usr/src/remote-devtools/examples/remote-helloworld/extensions/libcd/input/remote-helloworldodl
```

- LOG_DIR

Path on development system for log files.

In this example, LOG_DIR=/var/tmp

- **ROUTER_PLATFORM**
router platform (aka machine) can be i386 (default), octeon, powerpc or xlr
In this example, ROUTER_PLATFORM=i386
- **VBE_BSB_PATH**
Path to the Junos SDK Backing Sandbox (BSB) on the VBE.
In this example, VBE_BSB_PATH=/usr/local/junos-sdk/13.1R1.6
- **VBE_DSB_PATH**
Path to your application code on the VBE.
In this example, VBE_DSB_PATH=/usr/home/<user1>/sandboxes/hello-world
- **VBE_IP**
VBE IP address or hostname.
In this example, VBE_IP=10.204.42.20
- **VBE_USER**
VBE user account.
In this example, VBE_USER=<user1>
- **VE_SDK_DATA_DEFINED**
Set this to 1.
In this example, VE_SDK_DATA_DEFINED=1
- **VM_IMG**
Guest OS VM file name, including the path.
In this example, VM_IMG=/root/test/third-party-app.img
- **VM_IP**
Guest OS VM IP address or hostname.
In this example, VM_IP=10.204.42.40
- **VM_USER**
Guest OS VM user account
In this example, VM_USER=root

Executing Packaging Scripts

You can now execute the Junos SDK packaging scripts to package the guest VM with the required applications into a .tgz file. The Junos SDK VBE VM must be running on the server, with SCP and SSH enabled. The scripts will prompt for the VBE VM user password that you entered in the export-user-data.sh file.

1. Issue the following commands to execute the packaging scripts.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
./mksb-vbe-dsb.sh
./do-setup-re-ve-pkg.sh
./update-vbe-dsb.sh
./mk-vbe-dsb.sh
```

The guest VM application packages are now available in the ship directory in the VBE VM in the sandbox location you specified in the VBE_DSB_PATH in the export-user-data.sh file.

```
cd /usr/home/user1/sandboxes/hello-world/13.1R1.6-obj/ship
ls -lrt
-rw-r--r--  1 user1 wheel          21040 Aug 22 12:44
third-party-app-i386-13.1I20130822_1944.tgz
-rw-r--r--  1 user1 wheel    223695254 Aug 22 12:45
third-party-app-i386-13.1I20130822_1944.gz
-rw-r--r--  1 user1 wheel    223767502 Aug 22 12:46
third-party-app-bundle-i386-13.1I20130822_1944.gz
```

Copying the Third Party Application to the Switch

1. Copy the third party application to the switch using either FTP or SCP:

For example:

```
root% scp //hostname/pathname/third-party-app.gz /var/tmp
```

Configure the Provider Name, License Type, and Deployment Scope

1. Configure the provider name, the license type, and the deployment scope (describes the certificate associated with the third party application), at the **[edit system]** hierarchy. The certificate contains parameters regarding the provider's partnership with Juniper Networks. Configure these options to ensure that the third party application is installed.

For example:

```
{master:0}
root# set extensions providers [ Provider Name ] license-type customer deployment-scope
[ private commercial ]
```

2. Commit the configuration.

For example:

```
{master:0}
root# commit
```

Here are the results of your configuration:

```
system {
  extensions {
    providers {
      [Provider Name] {
        license-type customer deployment-scope [ private commercial ]
      }
    }
  }
}
```

Configure the Guest VM Options

1. Configure the following options for guest VM support in the Junos OS CLI at the **[edit]** hierarchy.
 - Compute cluster name
 - Compute node name
 - Virtual machine instance name
 - Dedicated management interface for guest VM
 - Third party package name
 - Internal IP address of the guest VM

2. Configure the name of the compute cluster and compute node.

The name of the compute cluster must be default-cluster, and the name of the name of the compute node must be default-node, otherwise launching the guest VM fails.

For example:

```
{master:0}
root# set services app-engine compute-cluster default-cluster compute-node default-node
hypervisor
```

3. Configure the name of the virtual machine instance and the name of the third party application.

NOTE: The package names in the `show app-engine virtual-machine-package` and `show version` commands should match.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name package
package-name
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test package third-party-app ve
```

4. Associate the virtual machine instance with the configured compute cluster and compute node.

NOTE: The name of the compute cluster must be `default-cluster`, and the name of the compute node must be `default-node`, otherwise launching the guest VM fails.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name compute-cluster
name compute-node name
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test compute-cluster default-cluster
compute-node default-node
```

5. Configure the local management IP address.

This IP address is used for the internal bridging interface. The host uses this IP address to check the availability of the guest VM. The IP address must be 192.168.1.X, where X is from 100 to 200.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name local-management
family inet address 192.168.1.X
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test local-management family inet
address 192.168.1.100
```

6. Configure the management interface for the guest VM.

This management interface is separate from the one used for Junos OS.

NOTE: The management interface name must be either `em0` or `em1`. The configuration will fail if you do not configure a management interface and then commit the configuration.

For example:

```
{master:0}
root # set services app-engine virtual-machines instance test management-interface em1
```

The new management interface is provisioned for the guest VM.

7. Commit the configuration.

For example:

```
{master:0}
root# commit
```

Here are the results of the configuration:

```
services {
  app-engine {
    compute-cluster default-cluster {
      compute-node default-node {
        hypervisor;
      }
    }
  }
}
```

```

virtual-machines {
  instance test {
    package third-party-app;
    local-management {
      family inet {
        address 192.168.1.100;
      }
    }
    compute-cluster default-cluster {
      compute-node default-node;
    }
    management-interface em1;
  }
}

```

8. Configure the internal IP address of the guest VM.

- (Preferred method) Log into the guest VM:

```
shell% request app-engine virtual-machine-shell guest VM name
```

For example:

```
shell% request app-engine virtual-machine-shell third-party-app
```

- (Alternate method) Log into the host shell by specifying the internal management IP address:

For example:

```
shell% ssh -JU _juniper_private4_ 192.168.1.1
```

Issue the **virsh list** command to see which VMs are running. From the output, you can see that the guest VM (named **test** in this example) is running:

```

{master:0}
shell# virsh list

```

Id	Name	State
3	vjunos1	running
4	test	running

Log into the guest VM console (named 4 in this example).

For example:

```

shell# virsh console 4
Connected to domain test
Escape character is ^]
CentOS release 6.4 (Final)
Kernel 2.6.32-358.el6.x86_64 on an x86_64

```

```
[root@localhost ~]
```

From the output, you can see that you are connected to the guest VM console (root@localhost)

Enter a valid username and password combination for the guest VM.

9. Configure the internal IP address of the guest VM on the Ethernet interface.

- Issue the **ifconfig -a** command to see the name of the management interface that is used to access the guest VM from outside of the network, and the name of the management interface that is used for internal use.

The interface names are either eth6 or eth7, or eth7 or eth8. You can associate one of the interfaces to the guest VM by issuing the **set services app-engine virtual-machines instance *name* management-interface *interface-name*** command. Use the same IP address as the one you configured using the **set services app-engine virtual-machines instance test local-management family inet address 192.168.1.100**. The MAC addresses associated with these interfaces are used for internal bridging.

For example:

```
root@localhost ifconfig -a
eth6      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:01
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)
eth7      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:02
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)
```

In this example, eth6 is a management interface that is used to access the guest VM, and eth7 is a management interface that is used for internal use.

- Issue the **ifconfig** command to configure the internal IP address on the Ethernet interface. This is the same IP address you configured in the Junos OS CLI.

For example:

```
root@localhost ifconfig eth7 192.168.1.100 netmask 255.255.255.0
```

10. Issue the following show commands to verify that everything is working correctly:

For example:

- root# **show app-engine status**

```
Compute cluster: default-cluster
                  Compute node      Status
                  default-node      Online
```

The status should be Online.

- root# **show app-engine virtual-machine instance**

```
VM name          Compute cluster      VM status
                  test                  default-cluster      ACTIVE
```

The VM status should be active.

- root# **show app-engine virtual-machine instances show app-engine virtual-machine package**

```
VM package: cust-vm-ve
              VM disk image:
third-party-app-ve/20140409_015447/third-party-app.img.gz
```

Compute cluster	Package download status
default-cluster	DOWNLOADED

The package downloaded status should be either download in progress or downloaded.

- root# show interfaces terse *management-interface*
error: device em1 not found

This interface should be detached from Junos OS.

11. To remove the guest VM, delete the configuration statements and uninstall the third party software package.

For example, to remove the **app-engine** statement:

```
root # delete services app-engine
```

Commit the configuration.

For example:

```
root# commit
```

Issue the **show version** command to see what the name of the third party application package is.

Issue the **request system software delete <package-name>** command to uninstall the third party application:

For example:

```
root> request system software delete third-party-app.tgz
fpc0:
```

```
-----
Notifying sdk-vmmd ...
```

```
{master:0}
```

Launching a Guest Virtual Machine (VM) to Run a Third Party Application on Junos OS Release 13.2X51-D20 and Later

- [Understanding Guest VMs on page 95](#)
- [Troubleshooting Tips on page 95](#)
- [Copying the Third Party Application to the Switch on page 95](#)
- [Install the Third Party Application on the Switch on page 95](#)
- [Configure the Guest VM Options to Launch the Guest VM on the Host on page 96](#)

Understanding Guest VMs

You can use a guest virtual machine (VM) to run third party software applications. Guest VMs provide a native environment in which third party applications can be executed, and eliminate the need for porting or adapting third party applications to work on the host OS. You can use the Junos SDK Virtual Build Environment in the JunosV App Engine to package the guest VM images. Once the guest VMs are packaged, you can launch them from the Junos OS CLI.

NOTE: Only one guest VM is supported at this time. Only QFX5100 switches support guest VMs.

Troubleshooting Tips

Configure traceoption and System Log options to troubleshoot issues that occur while you are launching a guest VM:

- `set system processes app-engine-virtual-machine-management-service traceoptions level all`
- `set system processes app-engine-virtual-machine-management-service traceoptions flag all`
- `set system syslog file messages any any`

Copying the Third Party Application to the Switch

1. Copy the third party application to the switch using any file transfer protocol:

For example:

```
root% scp //hostname/pathname/third-party-app.img.gz /var/tmp
```

Install the Third Party Application on the Switch

1. Install the third party application package on the switch.

This might take a few minutes.

For example:

```
{master:0}
root> request system software add virtual-machine-package /var/tmp/third-party-app.img.gz
Installing virtual-machine package..
Copying virtual-machine package..
Uncompressing virtual-machine package..
Finished virtual-machine package installation.
```

2. Issue the **show version** command to verify that the installation was successful.

For example:

```
{master:0}
root> show version
Apr 02 09:12:13
fpc0:
```

```

```

The CLI output shows that the application named third-party-app was installed.

Configure the Guest VM Options to Launch the Guest VM on the Host

1. Configure the following options for guest VM support in the Junos OS CLI at the **[edit]** hierarchy.
 - Compute cluster name
 - Compute node name
 - Virtual machine instance name
 - Dedicated management interface for guest VM
 - Third party package name
 - Internal IP address of the guest VM

2. Configure the name of the compute cluster and compute node.

The name of the compute cluster must be default-cluster, and the name of the name of the compute node must be default-node, otherwise launching the guest VM fails.

For example:

```

{master:0}
root# set services app-engine compute-cluster default-cluster compute-node default-node
hypervisor

```

3. Configure the name of the virtual machine instance and the name of the third party application.

NOTE: The package names in the `show app-engine virtual-machine-package` and `show version` commands should match.

```

{master:0}
root# set services app-engine virtual-machines instance instance-name package
package-name

```

For example:

```

{master:0}
root# set services app-engine virtual-machines instance test package third-party-app ve

```

- Associate the virtual machine instance with the configured compute cluster and compute node.

NOTE: The name of the compute cluster must be default-cluster, and the name of the compute node must be default-node, otherwise launching the guest VM fails.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name compute-cluster
name compute-node name
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test compute-cluster default-cluster
compute-node default-node
```

- Configure the local management IP address.

This IP address is used for the internal bridging interface. The host uses this IP address to check the availability of the guest VM. The IP address must be 192.168.1.X, where X is from 100 to 200.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name local-management
family inet address 192.168.1.X
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test local-management family inet
address 192.168.1.100
```

- Configure the management interface for the guest VM.

This management interface is separate from the one used for Junos OS.

NOTE: The management interface name must be either em0 or em1. The configuration will fail if you do not configure a management interface and then commit the configuration.

For example:

```
{master:0}
root # set services app-engine virtual-machines instance test management-interface em1
```

The new management interface is provisioned for the guest VM.

- Commit the configuration.

For example:

```
{master:0}
root# commit
```

Here are the results of the configuration:

```
services {
  app-engine {
    compute-cluster default-cluster {
      compute-node default-node {
```

```

        hypervisor;
    }
}
virtual-machines {
    instance test {
        package third-party-app;
        local-management {
            family inet {
                address 192.168.1.100;
            }
        }
        compute-cluster default-cluster {
            compute-node default-node;
        }
        management-interface em1;
    }
}
}
}

```

8. Configure the internal IP address of the guest VM.

- (Preferred method) Log into the guest VM:

```
root> request app-engine virtual-machine-shell guest VM name
```

For example:

```
root> request app-engine virtual-machine-shell third-party-app
```

- (Alternate method) Log into the host shell by specifying the internal management IP address:

For example:

```
shell% ssh -JU __juniper_private4__ 192.168.1.1
```

Issue the **virsh list** command to see which VMs are running. From the output, you can see that the guest VM (named **test** in this example) is running:

```
{master:0}
shell# virsh list

```

Id	Name	State
3	vjunos1	running
4	test	running

Log into the guest VM console (named **4** in this example).

For example:

```
shell# virsh console 4
Connected to domain test
Escape character is ^]
CentOS release 6.4 (Final)
Kernel 2.6.32-358.el6.x86_64 on an x86_64
```

```
[root@localhost ~]
```

From the output, you can see that you are connected to the guest VM console (root@localhost)

Enter a valid username and password combination for the guest VM.

9. Configure the internal IP address of the guest VM on the Ethernet interface.

- Issue the **ifconfig -a** command to see the name of the management interface that is used to access the guest VM from outside of the network, and the name of the management interface that is used for internal use.

The interface names are either eth6 or eth7, or eth7 or eth8. You can associate one of the interfaces to the guest VM by issuing the **set services app-engine virtual-machines instance *name* management-interface *interface-name*** command. Use the same IP address as the one you configured using the **set services app-engine virtual-machines instance test local-management family inet address 192.168.1.100**. The MAC addresses associated with these interfaces are used for internal bridging.

For example:

```
root@localhost ifconfig -a
eth6      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:01
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)

eth7      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:02
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)
```

In this example, eth6 is a management interface that is used to access the guest VM, and eth7 is a management interface that is used for internal use.

- Issue the **ifconfig** command to configure the internal IP address on the Ethernet interface. This is the same IP address you configured in the Junos OS CLI.

For example:

```
root@localhost ifconfig eth7 192.168.1.100 netmask 255.255.255.0
```

10. Issue the following show commands to verify that everything is working correctly:

For example:

- root# **show app-engine status**

```
Compute cluster: default-cluster
Compute node    Status
default-node    Online
```

The status should be Online.

- root# **show app-engine virtual-machine instance**

```
VM name      Compute cluster  VM status
test         default-cluster  ACTIVE
```

The VM status should be active.

- root# **show app-engine virtual-machine instances show app-engine virtual-machine package**

```
VM package: cust-vm-ve
VM disk image:
```

```

third-party-app-ve/20140409_015447/third-party-app.img.gz
Compute cluster          Package download status

default-cluster          DOWNLOADED

```

The package downloaded status should be either download in progress or downloaded.

- root# show interfaces terse *management-interface*

```
error: device em1 not found
```

This interface should be detached from Junos OS.

11. To remove the guest VM, delete the configuration statements and uninstall the third party software package.

For example, to remove the **app-engine** statement:

```
root # delete services app-engine
```

Commit the configuration.

For example:

```
root# commit
```

Issue the **show version** command to see what the name of the third party application package is.

For example:

```

{master:0}
root> show version
fpc0:
-----
Hostname: host

JUNOS Host Software [13.2-20140406_x_132_x51_vjunos.0]

```

Issue the **request system software delete virtual-machine-package <package-name>** command to uninstall the third party application:

For example:

```
root> request system software delete virtual-machine-package third-party-app-ve
fpc0:
```

```
-----
Deleted virtual-machine package cust-vm-ve ...
```

- [Downgrading Junos OS from Upgraded FreeBSD on page 118](#)

Understanding Junos OS with Upgraded FreeBSD

Starting with Junos OS Release 15.1, certain hardware platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD. Basing Junos OS on the newer kernel provides Junos OS with sophisticated processing, efficiency, and security features which do not then have to be reproduced in Junos OS.

NOTE: Upgrading to Junos OS Release 15.1 reformats the file system. Only specific files and directories are preserved unless precautions are taken. For details, see [“Upgrading Junos OS with Upgraded FreeBSD” on page 112](#).

Junos OS with an upgraded FreeBSD kernel provides a clean-slate implementation of Junos OS on top of a pristine (minimally modified) and current version of the FreeBSD OS.

NOTE: In Junos OS releases earlier than 15.1, the partition swap pages were counted as part of the memory file system partition. Using this method leaves 4 GB of memory as the maximum that is theoretically accessible when you are using a 32-bit image. However, when Junos OS with upgraded FreeBSD is run, the system only counts the actual partition size, which leaves around 3.4 GB of available physical address space, or only 3 GB of usable RAM. Therefore, we recommend you use a 64-bit image with Junos OS with upgraded FreeBSD.

The platforms currently running Junos OS with upgraded FreeBSD are listed in [Table 8 on page 106](#).

Table 8: Upgraded FreeBSD Kernel Support by Hardware Platform

Platforms	CPU Type	Release Introduced
MX240, MX460, MX960, MX2010, MX2020	Intel	15.1
EX9200	Intel	15.1
QFX5200	Intel	15.1X53-D30
QFX10000 switches	Intel	15.1X53-D60

The major processing changes are as follows:

- Interactions between Junos OS and the upgraded FreeBSD kernel use well-established interfaces because Junos OS is now layered on a minimally modified and current version of FreeBSD.
- Symmetric multiprocessing (SMP) is enabled by default.
- FreeBSD provides a consistent runtime environment for all Junos OS platforms.

There are also major changes in file structures and software packages. These changes are as follows:

- New packages use XML description files instead of scripts.
- Hybrid packages are used to install legacy or replacement build images in the general form **junos-upgrade-x.tgz** where x is a variable such as **mx-x86-64-15.1-20150114** (the whole package name is **junos-upgrade-mx-x86-64-15.1-20150114.tgz**).
- Multiple package sets (a collection of installed packages) are stored on the router at the same time. Sets can be either active (the currently used set), pending (the set that should be used at the next reboot), or previous (a formerly active set). Non-recovery snapshots (but not recoverable image snapshots) are available for the package sets to preserve package content lists.

There is now a separate Operations, Administration, and Maintenance (OAM) volume (**oam**) distinct from the Junos OS volume (**junos**). This provides support for downgrades from replacement build images (that is, those using the upgraded FreeBSD kernel) to the legacy Junos OS with a different kernel. The OAM volume allows you to recover the Junos OS volume using recovery snapshots.

One major change is the distinction between recovery snapshots and non-recovery snapshots.

The major characteristics of the recovery snapshots are as follows:

- Recovery snapshots are full copies of the packages and configuration taken at the time the snapshot command is issued.

- Recovery snapshots reside on the OAM volume or USB medium.

The major characteristics of the non-recovery snapshots are as follows:

- Non-recovery snapshots are snapshots residing on the Junos OS volume that refer to the current running set of packages and a copy of the configuration at the time the snapshot command is issued.
- Non-recovery snapshots do not need to copy the whole Junos OS installation and so are very fast.
- Non-recovery snapshots can be requested as the boot image for the next reboot.

The upgraded FreeBSD kernel requires changes to several commands and statements and their related parameters. The new and changed actions are summarized in [Table 9 on page 107](#). For details on the changes, see the topics covering the specific command or statement.

Table 9: New and Changed Commands and Statements for Junos OS with Upgraded FreeBSD

Command or Statement	Release Introduced	Change
<code>request system snapshot delete <i>snapshot</i></code>	15.1	New action
<code>request system snapshot recovery</code>	15.1	New action
<code>request system snapshot load <i>snapshot</i></code>	15.1	New action
<code>request system recover <i>volume</i></code>	15.1	New action: <i>volume</i> is either <code>/junos-volume</code> or <code>/oam-volume</code>
<code>request system snapshot</code>	15.1	Changed action
<code>show system snapshot</code>	15.1	Changed action
<code>request system reboot <i>media</i></code>	15.1	Changed action with new media options

The new FreeBSD kernel also requires that several commands and statements are now deprecated. In some cases, these commands and statements generate an error, and, in other cases, the result is appropriate for the new kernel. The deprecated commands and statements are summarized in [Table 10 on page 107](#). For details, see the topics covering the specific command or statement.

Table 10: Deprecated Commands and Statements for Junos OS with Upgraded FreeBSD

Deprecated Command or Configuration Statement	Release Deprecated
Deprecated Command	
<code>request system partition abort</code>	15.1
<code>request system partition compact-flash</code>	15.1

Table 10: Deprecated Commands and Statements for Junos OS with Upgraded FreeBSD (*continued*)

Deprecated Command or Configuration Statement	Release Deprecated
<code>request system partition hard-disk</code>	15.1
<code>request system snapshot <config-partition></code>	15.1
<code>request system snapshot <root-partition></code>	15.1
<code>request system snapshot <slice></code>	15.1
<code>request system software delete-backup</code>	15.1
<code>request system software rollback <force></code>	15.1
<code>show system processes providers</code>	15.1
<code>show system snapshot <slice></code>	15.1
Deprecated Configuration Statement	
<code>set system mirror-flash-on-disk</code>	15.1

Understanding Junos OS with Upgraded FreeBSD Package Names

Starting with Junos OS Release 15.1, certain hardware platforms run a Junos OS based on an upgraded FreeBSD kernel (hereafter called Junos OS with upgraded FreeBSD). In releases earlier than Junos OS Release 15.1, software packages came in several major software package categories, such as domestic, worldwide, or Federal Information Processing Standard (FIPS). However, Junos OS with upgraded FreeBSD has a new naming convention: There is only one category, and FIPS, instead of being a separate category, is an option you select on installation. This topic describes the simplified naming convention for Junos OS with upgraded FreeBSD.

If your hardware platform is listed in the table in [“Understanding Junos OS with Upgraded FreeBSD” on page 105](#), then you must use the new package names for download and installation.

The components of the new package naming conventions are as follows:

- **Prefix**—This is **junos-install**. This prefix takes the place of the prefix **jinstall** and the bundle **bundle**. We still use the term *bundle* in the new package-naming convention.
- **Media keyword**—Added to the prefix, a media keyword is only used when the image is not for use with the **request system software add** command. Values for the **media** keyword include **usb** for images installed from a USB drive or **net** for images installed over a network; for example, the entire prefix of your package might be **junos-install-usb-**.
- **Platform**—This field indicates the major product group, such as **mx** or **qfx**.
- **Architecture**—This field indicates the CPU architecture of the platforms. Values include **x86** for Intel and **arm** for Advanced RISC Machines CPUs.
- **Application Binary Interface (ABI)**—This field indicates the “word length” of the CPU architecture. Values include **32** for 32-bit architectures and **64** for 64-bit architectures.
- **Release**—This field indicates the release number, such as **15.1R1.9**.
- **Edition**—The edition field is null (empty) for the standard (domestic) images. For jurisdictions with limits on dataplane encryption, this field is set to **limited**.

As before, all images are in tarred and gzipped (**.tgz**) format.

NOTE: There are no longer “export” worldwide images or separate FIPS images. The keyword “signed” no longer appears because all Junos OS images are signed for validation.

Examples of valid Junos OS software package names include the following:

- **junos-install-mx-x86-32-15.1R1.9.tgz**—An image for a supported MX Series platform outside the RTZ.
- **junos-install-mx-x86-32-15.1R1.9-limited.tgz**—An image for a supported MX Series platform used in the RTZ.
- **junos-install-usb-mx-x86-32-15.1R1.9.tgz**—An image stored on and installed from a USB drive for a supported MX Series platform outside the RTZ.

Because an upgrade to Junos OS with upgraded FreeBSD from a release earlier than Junos OS 15.1 restructures the disk file system, you can lose many configuration and log files that you might want to keep. Items that are essential can be preserved by moving or copying them to the **/var/preserve** directory.

Understanding Junos OS with Upgraded FreeBSD Disk Volumes

Starting with Junos OS Release 15.1, certain hardware platforms have a new disk naming convention. These platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD.

The hardware platforms listed in the table in [“Understanding Junos OS with Upgraded FreeBSD” on page 105](#) have two volumes. The main device is the **/junos** volume and contains all of the software and files needed for the day-to-day running of the device. The compact flash drive is the **/oam** volume and stores recovery snapshot backup information. In case of failure of the main drive (that is, the **/junos** volume), the **/oam** volume can be used to boot the system.

Because the **/junos** and **/oam** volumes have very different purposes, their content is different. Technically, these volumes are **dev/gpt/oam** and **dev/gpt/junos**, but the short forms (**/junos** and **/oam**) are used in this topic. Essentially, the **/junos** volume is used for the running device software and holds configuration information and logs, whereas the **/oam** volume is used for backup copies of everything needed in the event that the **/junos** volume fails.

The **/junos** volume contains a directory named **/packages/db** that has all the components present on the device, such as **os-kernel-123**, **os-kernel-456**, and so on. A sibling directory named **/package-sets** is also present. Package sets are an important concept in Junos OS with upgraded FreeBSD.

The **/package-sets** directory contains a package listing that gathers all the components of the running Junos OS into an XML format in the **/active** subdirectory. So **os-kernel-123** could be a component in the **/package-sets/active** subdirectory, but then **os-kernel-456** could not be in the same XML package. Package sets do not contain the kernel software itself (for example), but tell the device where to find the kernel component needed for the software package. The same kernel can be present in several package listings, but only one package can be active and running on the device at any given time.

There are several directories on the **/junos** volume where a particular software package listing can be found:

- **/previous**—The package set in this directory contains the list of all the components that ran on the device before the last upgrade.
- **/active**—The package set in this directory contains the list of all the software components currently running on the device.
- **/pending**—The package set in this directory contains the list of all the software components on the device that will run after the next reboot.

NOTE: After a successful reboot, the package set in the **/pending** directory becomes the active package set, and the package set in the **/active** directory becomes the previous set.

The **/junos** volume also contains non-recovery snapshots taken with the **request system snapshot** command. These types of snapshots are new to Junos OS with upgraded FreeBSD and cannot be used for recovery of a failed system. Non-recovery snapshots are a special type of package set that includes a copy of the configuration. There can be many non-recovery snapshots on the device, and the files can be renamed. Multiple non-recovery snapshots, essentially lists of software components and configuration files, can be helpful when major software or configuration changes are occurring and establishment of a known stable system baseline is required.

On the other hand, a recovery snapshot, created with the **request system snapshot recovery** command, is stored on the **/oam** volume and is always replaced when a new recovery snapshot is taken.

The **/oam** volume should contain all the information needed to reboot the system if there is a failure of the **/junos** volume and restore the system to the state running at the time of the failure. In order to perform this reboot, the **/oam** volume needs to have all of the information required to provide the system with a running configuration. This information is provided by the recovery snapshot, created with the **request system snapshot recovery** command. Although it can take a while to perform, the recovery snapshot establishes an **.izo** or **.iso** image of the running Junos OS.

In the case of a total failure of the **/junos** volume, the system can be booted from the **/oam** volume. The recovery snapshot can then restore the repaired system.

Understanding Junos OS with Upgraded FreeBSD Snapshots

Starting with Junos OS Release 15.1, certain hardware platforms have two types of snapshots. These platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD. The two types of snapshots have different content, locations, and purposes, so it is important that they are created and maintained properly. One major change is the distinction between recovery snapshots and non-recovery snapshots. The hardware platforms listed in the table in “[Understanding Junos OS with Upgraded FreeBSD](#)” on page 105 have these two different types of snapshots.

Recovery snapshots are full copies of the packages and configuration taken at the time the snapshot command is issued. Recovery snapshots reside on the OAM volume or USB medium. Recovery snapshots take some time to complete because of the level of detail captured. Recovery snapshots can be used to recover the Junos OS volume. There is only ever one recovery snapshot on the system.

On the other hand, non-recovery snapshots are snapshots residing on the Junos OS volume that refer to the current running set of packages and a copy of the configuration at the time the snapshot command is issued. Non-recovery snapshots do not need to copy the whole Junos OS installation and so are very fast. They also consume little space, except for the **config.tgz** file. Non-recovery snapshots can be requested as the boot image for the next reboot. You can rename non-recovery snapshots and retain more than one.

You rename the non-recovery snapshots with the same procedure used to rename any other file on the system.

NOTE: We recommend that you generate both a non-recovery and a recovery snapshot after you successfully upgrade to Junos OS with upgraded FreeBSD. These snapshots should be refreshed periodically.

Package sets relate to non-recovery and recovery snapshots. The **/active**, **/pending**, and **/previous** sets are all package sets. A non-recovery snapshot is also a package set in a sense, with the addition of a copy of the configuration at the time that the non-recovery snapshot is taken.

Packages that are no longer referenced by any package set or non-recovery snapshot are automatically deleted. We recommend deleting any old non-recovery snapshots after an upgrade so that old packages can be deleted and space recovered.

Some helpful commands for non-recovery snapshots are:

- **request system snapshot**—Use this command to create a non-recovery snapshot.
- **show system snapshot**—Use this command to list all the available non-recovery snapshots.
- **request system snapshot delete**—Use this command to delete a non-recovery snapshot.
- **request system snapshot recovery**—Use this command to create a recovery snapshot. You can use other parameters to determine the details of the recovery snapshot created. There is only ever one recovery snapshot on the system.

Upgrading Junos OS with Upgraded FreeBSD

Starting with Junos OS Release 15.1, certain hardware platforms run an upgraded FreeBSD kernel instead of older versions of FreeBSD.

Before you begin:

1. Verify that the upgrade applies to your router or switch model, as listed in [“Understanding Junos OS with Upgraded FreeBSD” on page 105](#).
2. Download the Junos OS package.
3. Determine the upgrade path to follow.

The current Junos OS release determines the upgrade path to Junos OS with upgraded FreeBSD, as shown in [Table 11 on page 113](#). Other upgrade paths might work, but they are not supported.

Table 11: Upgrade Path to Junos OS with the Upgraded FreeBSD

Current Router's Junos OS Release	Upgrade Path
12.3 or earlier	Upgrade to 13.3. or 14.2 first, then upgrade to 15.1 or later (multiple steps).
13.3 or later	Use upgrade package to upgrade from the current Junos OS release to Junos OS with upgraded FreeBSD (single step).
15.1 or later	Use upgrade package to upgrade from the current Junos OS release to Junos OS with upgraded FreeBSD (single step).

NOTE: You can also downgrade from Junos OS Release 15.1 to an earlier release of Junos OS, as long as the path complies with the Junos OS policy of skipping at most two releases earlier.

4. Understand that direct validation of running configuration does not work for upgrading to Junos OS with upgraded FreeBSD from Junos OS based on older versions of the FreeBSD kernel.

When upgrading or downgrading between Junos OS and Junos OS with upgraded FreeBSD, you might have to validate on a different host. It does not matter where that other host is, as long as you can reach it with NETCONF over SSH. See *Establishing an SSH Connection for a NETCONF Session*. The target system uses the network to contact the other host, run the validation and authentication, and return the result.

The upgrade process only preserves the following directories:

- `/config`
- `/etc/localtime`
- `/var/db`
- `/var/etc/master.passwd`
- `/var/etc/inetd.conf`
- `/var/etc/pam.conf`
- `/var/etc/resolv.conf`

- `/var/etc/syslog.conf`
- `/var/etc/localtime`
- `/var/etc/exports`
- `/var/etc/extensions.allow`
- `/var/preserve`
- `/var/tmp/baseline-config.conf`
- `/var/tmp/preinstall_boot_loader.conf`

NOTE: On EX2300 and EX3400 switches, the following directories are not applicable:

- `/etc/localtime`
- `/var/etc/localtime`
- `/var/etc/exports`
- `/var/preserve`
- `/var/tmp/preinstall_boot_loader.conf`

For specific installation procedures, see the following:

- [To Install Junos OS with Upgraded FreeBSD Over a Plain Junos OS on page 114](#)
- [To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of an Earlier Release on page 117](#)
- [To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of a Later Release on page 118](#)

To Install Junos OS with Upgraded FreeBSD Over a Plain Junos OS

NOTE: If you have important files in other directories, copy them from the router or switch to a secure location before upgrading the router or switch.

NOTE: The following procedure refers to routers, but it also applies to switches.

To install Junos OS with upgraded FreeBSD over a plain Junos OS:

1. Enter the **request system software add *package-name* no-validate** command from the operational mode in the CLI:

NOTE: The **no-copy** option is enabled by default.

Use the **no-validate** option with the **request system software add** command. If you leave out the **no-validate** option, the command uses the **validate** option by default, and direct validation of running configuration does not work for upgrading to Junos OS with upgraded FreeBSD from Junos OS based on older versions of the FreeBSD kernel.

NOTE: You can also use **reboot** option along with **request system software add** command, but it is not recommended to do this in a single step while upgrading from a FreeBSD 6.1 based Junos OS to FreeBSD 10 based Junos OS.

NOTE: To validate current configuration on an upgrade to Junos OS with upgraded FreeBSD from Junos OS, use the **request system software validate on (Junos OS with Upgraded FreeBSD)** command.

```
user@host>request system software add
/var/tmp/junos-install-mx-x86-32-15.1R1.9.tgz no-validate
Installing package '/var/tmp/junos-install-mx-x86-32-15.1R1.9.tgz' ...
Verified manifest signed by PackageProductionEc_2015
Verified manifest signed by PackageProductionRSA_2015
Verified contents.iso
Verified issu-indb.tgz
Verified junos-x86-32.tgz
Verified kernel
Verified metatags
Verified package.xml
Verified pkgtools.tgz
camcontrol: not found
camcontrol: not found
Verified manifest signed by PackageProductionEc_2015
Saving the config files ...
NOTICE: uncommitted changes have been saved in
/var/db/config/juniper.conf.pre-install
Saving package file in
/var/sw/pkg/junos-install-x86-32-domestic-20150618.043753_builder_junos_151_r1.tgz
...
Saving state for rollback ...
```

The new Junos OS image is installed on the router.

2. Reboot the device to start the new software using the **request system reboot** command:

```
user@host> request system reboot
Reboot the system? [yes, no] (no) yes
```

NOTE: You must reboot the device to load the newly installed version of Junos OS on the device.

To abort the installation, do not reboot the device. Instead, finish the installation and then issue the `request system software delete package-name` command where package is, for example, `junos-install-mx-x86-32-15.1R1.9.tgz`. This is your last chance to stop the installation (not applicable on EX2300 and EX3400 platforms).

The software is loaded when you reboot the system. Installation can take between 5 and 10 minutes. The device then reboots from the boot device on which the software was just installed. When the reboot is complete, the device displays the login prompt.

While the software is being upgraded, the Routing Engine on which you are performing the installation does not route traffic.

3. Log in and issue the **show version** command to verify the version of the software installed.

```
user@host> show version
Hostname: host

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of an Earlier Release

NOTE: If you have important files in other directories, copy them from the router or switch to a secure location before upgrading the router or switch.

NOTE: The following procedure refers to routers, but it also applies to switches.

To install Junos OS with upgraded FreeBSD over Junos OS with upgraded FreeBSD of an earlier release:

1. Enter the **request system software add *package-name* validate reboot** command from the operational mode in the CLI:

NOTE: The **no-copy** option is enabled by default.

Use the **validate** and **reboot** options with the **request system software add** command. The command uses the **validate** option by default. We encourage users to validate using the **validate** option when upgrading from Junos OS to Junos OS or from Junos OS with upgraded FreeBSD to Junos OS with upgraded FreeBSD.

If you leave out the **reboot** option, you can take care of that in a separate reboot step.

The new Junos OS image is installed on the router.

2. Verify the installation of Junos OS with upgraded FreeBSD.

```
user@host> show version
```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of a Later Release

NOTE: If you have important files in other directories, copy them from the router or switch to a secure location before upgrading the router or switch.

NOTE: The following procedure refers to routers, but it also applies to switches.

To install Junos OS with upgraded FreeBSD over Junos OS with upgraded FreeBSD of a later release:

1. Enter the **request system software add *package-name* validate reboot** command from the operational mode in the CLI:

NOTE: The **no-copy** option is enabled by default.

Use the **validate** and **reboot** options with the **request system software add** command. The command uses the **validate** option by default. We encourage users to validate using the **validate** option when upgrading from Junos OS to Junos OS or from Junos OS with upgraded FreeBSD to Junos OS with upgraded FreeBSD.

If you leave out the **reboot** option, you can take care of that in a separate reboot step.

The new Junos OS image is installed on the router.

2. Verify the installation of Junos OS with upgraded FreeBSD.

```
user@host> show version
```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

Downgrading Junos OS from Upgraded FreeBSD

Starting with Junos OS Release 15.1, certain hardware platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD. If you have previously upgraded to Junos OS with upgraded FreeBSD, you can downgrade to earlier versions

versions of Junos OS, as long as the downgrade conforms to the Junos OS policy of skipping at most two earlier releases.

Before you begin:

1. Verify that you have previously upgraded to Junos OS with the upgraded FreeBSD kernel, as described in [“Upgrading Junos OS with Upgraded FreeBSD” on page 112](#).
2. Download the Junos OS package.

Select and perform the procedure that matches your conditions:

- [Downgrading from Junos OS with Upgraded FreeBSD to Junos OS on page 119](#)
- [Downgrading from Junos OS with Upgraded FreeBSD to an Earlier Release of Junos OS with Upgraded FreeBSD on page 120](#)

Downgrading from Junos OS with Upgraded FreeBSD to Junos OS

This example uses the package `/var/tmp/install-13.3R2.7-domestic-signed.tgz` to install Junos OS with a pre-upgraded FreeBSD kernel on the master Routing Engine (re0).

NOTE: The following procedure refers to routers, but it also applies to switches.

To downgrade from Junos OS with upgraded FreeBSD to Junos OS:

1. Enter the `request system software add package-name no-validate reboot` command from the operational mode in the CLI.

Use the `no-validate` and `reboot` options with the `request system software add` command. If you leave out the `no-validate` option, the command uses the `validate` option by default, and direct validation of running configuration does not work for downgrading to Junos OS from Junos OS with upgraded FreeBSD.

NOTE: To validate current configuration on an downgrade to Junos OS from Junos OS with upgraded FreeBSD, use the `request system software validate on (Junos OS with Upgraded FreeBSD)` command.

If you leave out the `reboot` option, you can take care of that in a separate reboot step.

The following example uses the `re0` option:

```
user@host>request system software add
/var/tmp/install-13.3R2.7-domestic-signed.tgz re0 no-validate reboot
THIS IS A SIGNED PACKAGE Saving the config files ...

```

2. Verify the downgrade of the software package.

```
user@host> show version
```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

Downgrading from Junos OS with Upgraded FreeBSD to an Earlier Release of Junos OS with Upgraded FreeBSD

This example uses the package `/var/tmp/jinstall-13.3R2.7-domestic-signed.tgz` to install Junos OS with a pre-upgraded FreeBSD kernel on the master Routing Engine (re0).

NOTE: The following procedure refers to routers, but it also applies to switches.

To downgrade from Junos OS with upgraded FreeBSD to an earlier release of Junos OS with upgraded FreeBSD:

1. Enter the **request system software add *package-name* validate reboot** command from the operational mode in the CLI:

Use the **validate** and **reboot** options with the **request system software add** command. The command uses the **validate** option by default.

If you leave out the **reboot** option, you can take care of that in a separate reboot step.

2. Verify the downgrade of the software package.

```
user@host> show version
```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

- [Performing an In-Service Software Upgrade \(ISSU\) on page 128](#)

Understanding In-Service Software Upgrade (ISSU)

An in-service software upgrade (ISSU) enables you to upgrade between two different Junos OS releases with minimal disruption on the control plane and with minimal disruption of traffic. During an ISSU, the Junos OS runs in two separate virtual machines (VMs)—one VM is in the master role acting as the master Routing Engine, and the other VM is in the backup role acting as the backup Routing Engine. The Junos OS is upgraded on the backup VM. After a successful software upgrade, the backup VM then becomes the master VM, and the original master VM is no longer needed and is shut down.

Video: [How Does ISSU Work on the QFX5100?](#)

NOTE: ISSU is supported in Junos OS Release 13.2X51-D15 and later.

ISSU provides the following benefits:

- Eliminates network downtime during software image upgrades
- Reduces operating costs, while delivering higher service levels
- Allows fast implementation of new features
- [In-Service Software Upgrade Process on page 127](#)

In-Service Software Upgrade Process

When you request an ISSU on a standalone device:

1. The management process (mgd) verifies that non-stop routing (NSR), graceful Routing Engine switchover (GRES), and non-stop bridging (NSB) are enabled.
2. The switch downloads and validates the software package.
3. The ISSU state machine spawns the backup Routing Engine (RE) with the newer software.
4. The ISSU state machine checks to see if the backup RE has synchronized all of the data with the master RE.
5. The ISSU state machine moves the devices (for example, forwarding ASIC, FPGA, management port and serial console) from the master RE to the backup RE.
6. The mastership is switched between the REs, so the backup RE becomes the master RE.
7. The old master RE is shut down.

Related Documentation

- [In-Service Software Upgrade \(ISSU\) System Requirements on page 125](#)
- [Performing an In-Service Software Upgrade \(ISSU\) on page 128](#)

Performing an In-Service Software Upgrade (ISSU)

You can use an in-service software upgrade to upgrade the software running on the switch with minimal traffic disruption during the upgrade.

NOTE: ISSU is supported in Junos OS Release 13.2X51-D15 and later on QFX5100 switches, and in Junos OS Release 13.2X51-D25 and later on EX4600 switches.

This topic covers:

1. [Preparing the Switch for Software Installation on page 128](#)
2. [Upgrading the Software Using ISSU on page 129](#)

Preparing the Switch for Software Installation

Before you begin software installation using ISSU:

NOTE: Before you perform an in-service software upgrade, if applicable, remove the `set system internet-options no-tcp-reset drop-all-tcp` command from the configuration, otherwise the upgrade will fail and an error message will be displayed.

- Ensure that nonstop active routing (NSR) and nonstop bridging (NSB) are enabled. If enabled, disable graceful restart (GR), because NSR and GR cannot be enabled simultaneously. NSB and GR enable NSB-supported Layer 2 protocols to synchronize protocol information between the master and backup Routing Engines.

```
user@switch> show task replication
Stateful Replication: Enabled
RE mode: Master
```

-->

If nonstop active routing is not enabled (**Stateful Replication is Disabled**), see *Configuring Nonstop Active Routing on Switches* for information on how to enable it.

- Enable nonstop bridging (NSB). See *Configuring Nonstop Bridging on Switches (CLI Procedure)* for information on how to enable it.
- (Optional) Back up the system software—Junos OS, the active configuration, and log files—on the switch to an external storage device with the [request system snapshot](#) command.

Upgrading the Software Using ISSU

This procedure describes how to upgrade the software running on a standalone switch:

NOTE: If the Host OS software needs to be updated, you cannot perform an ISSU. Instead, perform a standard software upgrade.

To upgrade the switch using ISSU:

1. Download the software package by following the procedure in the Downloading Software Files with a Browser section in [“Upgrading Software” on page 250](#).
2. Copy the software package or packages to the switch. We recommend that you copy the file to the `/var/tmp` directory.
3. Log in to the console connection. Using a console connection allows you to monitor the progress of the upgrade.
4. Start the ISSU:
 - On the switch, enter:

```
user@switch> request system software in-service-upgrade /var/tmp/package-name.tgz
```

where **package-name.tgz** is, for example, `jinstall-132_x51_vjunos.domestic.tgz`.

NOTE: During the upgrade, you will not be able to access the Junos OS CLI.

The switch displays status messages similar to the following messages as the upgrade executes:

```
warning: Do NOT use /user during ISSU. Changes to /user during ISSU may get
lost!
ISSU: Validating Image
ISSU: Preparing Backup RE
Prepare for ISSU
ISSU: Backup RE Prepare Done

  FPC 0          Online (ISSU)
Send ISSU done to chassisd on backup RE
Chassis ISSU Completed
ISSU: IDLE
Initiate em0 device handoff

```

NOTE: An ISSU might stop instead of abort if the FPC is at the warm boot stage. Also, any links that go down and up will not be detected during a warm boot of the Packet Forwarding Engine (PFE).

NOTE: If the ISSU process stops, you can look at the log files to diagnose the problem. The log files are located at `/var/log/vjunos-log.tgz`.

- Log in after the reboot of the switch completes. To verify that the software has been upgraded, enter the following command:

```
user@switch> show version
```

- Disable nonstop active routing (NSR) and enable graceful Routing Engine (GRES).

See *Configuring Nonstop Active Routing on Switches* for more information.

PART 9

Non-Stop Software Upgrade (NSSU)

- [Understanding NSSU on page 135](#)

CHAPTER 9

Understanding NSSU

- [Understanding Nonstop Software Upgrade on a Virtual Chassis and Mixed Virtual Chassis on page 135](#)
- [Understanding Nonstop Software Upgrade on a Virtual Chassis Fabric on page 138](#)
- [Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade \(CLI Procedure\) on page 142](#)
- [Upgrading Software on a Virtual Chassis and Mixed Virtual Chassis Using Nonstop Software Upgrade on page 144](#)
- [Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade on page 147](#)

Understanding Nonstop Software Upgrade on a Virtual Chassis and Mixed Virtual Chassis

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member switches in a Virtual Chassis or mixed Virtual Chassis with minimal network traffic disruption during the upgrade. For information on which switches are supported on a mixed Virtual Chassis, see *Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric*. For information on how to perform a nonstop software upgrade on a Virtual Chassis Fabric, see [“Understanding Nonstop Software Upgrade on a Virtual Chassis Fabric” on page 138](#).

NOTE: The QFX5200 switches do not support NSSU.

Performing an NSSU provides these benefits:

- No disruption to the control plane—NSSU uses graceful Routing Engine switchover (GRES) to ensure no disruption to the control plane. During the upgrade process, interface, kernel, and routing protocol information is preserved.
- Minimal disruption to network traffic—An NSSU minimizes network traffic disruption by:
 - Upgrading line cards one at a time permits traffic to continue to flow through the line cards that are not being upgraded.

- Upgrading member switches one at a time enables the master and backup to maintain their master and backup roles (although mastership will change) without disruption to traffic.

To achieve minimal disruption to traffic, you must configure link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards or Virtual Chassis members. When one member link of a LAG is down, the remaining links are up, and traffic continues to flow through the LAG.

NOTE: Because NSSU upgrades the software on each line card or on each Virtual Chassis and mixed Virtual Chassis member one at a time, an upgrade using NSSU can take longer than an upgrade using the `request system software add` command.

This topic covers:

- [Requirements for Performing an NSSU on page 136](#)
- [How an NSSU Works on page 137](#)
- [NSSU Limitations on page 137](#)
- [NSSU and Junos OS Release Support on page 138](#)
- [Overview of NSSU Configuration and Operation on page 138](#)

Requirements for Performing an NSSU

The following requirements apply to Virtual Chassis or mixed Virtual Chassis:

- All Virtual Chassis or mixed Virtual Chassis members and all Routing Engines must be running the same Junos OS release.
- Graceful Routing Engine switchover (GRES) must be enabled.
- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis or mixed Virtual Chassis members or on different line cards.

The following are requirements for Virtual Chassis or mixed Virtual Chassis members:

- The Virtual Chassis or mixed Virtual Chassis members must be connected in a ring topology so that no member is isolated as a result of another member being rebooted. This topology prevents the Virtual Chassis from splitting during an NSSU.
- The Virtual Chassis or mixed Virtual Chassis master and backup must be adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
- The Virtual Chassis or mixed Virtual Chassis must be preprovisioned so that the linecard role has been explicitly assigned to member switches acting in a linecard role. During an NSSU, the Virtual Chassis and mixed Virtual Chassis members must maintain their

roles—the master and backup must maintain their master and backup roles (although mastership will change), and the remaining switches must maintain their linecard roles.

- A two-member Virtual Chassis or mixed Virtual Chassis must have **no-split-detection** configured so that the Virtual Chassis or mixed Virtual Chassis does not split when an NSSU upgrades a member.

How an NSSU Works

This section describes what happens when you request an NSSU on these switches and Virtual Chassis or mixed Virtual Chassis:

- [Virtual Chassis and Mixed Virtual Chassis on page 137](#)

Virtual Chassis and Mixed Virtual Chassis

When you request an NSSU on a Virtual Chassis or mixed Virtual Chassis:

1. The Virtual Chassis or mixed Virtual Chassis master verifies that:
 - The backup is online and running the same software version.
 - Graceful Routing Engine switchover (GRES) is enabled.
 - The Virtual Chassis or mixed Virtual Chassis member has a preprovisioned configuration.
2. The master installs the new software image on the backup and reboots it.
3. The master resynchronizes the backup.
4. The master installs the new software image on member switches that are in the line card role and reboots them, one at a time. The master waits for each member to become online and active before starting the software upgrade on the next member.
5. When all members that are in the line card role have been upgraded, the master performs a graceful Routing Engine switchover, and the upgraded backup becomes the master.
6. The software on the original master is upgraded and the original master is automatically rebooted. After the original master has rejoined the Virtual Chassis, you can optionally return control to it by requesting a graceful Routing Engine switchover.

NSSU Limitations

You cannot use an NSSU to downgrade the software—that is, to install an earlier version of the software than is currently running on the switch. To install an earlier software version, use the **request system software add** command.

You cannot roll back to the previous software version after you perform an upgrade using NSSU. If you need to rollback to the previous software version, you can do so by rebooting from the alternate root partition if you have not already copied the new software version into the alternate root partition.

NSSU and Junos OS Release Support

A Virtual Chassis or mixed Virtual Chassis must be running a Junos OS release that supports NSSU before you can perform an NSSU. If a Virtual Chassis or mixed Virtual Chassis is running a software version that does not support NSSU, use the **request system software add** command. See *Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric* for information on which switches are supported on a mixed Virtual Chassis.

Overview of NSSU Configuration and Operation

You must ensure that the configuration of the switch or Virtual Chassis meets the requirements described in “Requirements for Performing an NSSU” on page 136. NSSU requires no additional configuration.

You perform an NSSU by executing the **request system software nonstop-upgrade** command. For detailed instructions on how to perform an NSSU, see the topics in Related Documentation.

Related Documentation

- [Upgrading Software on a Virtual Chassis and Mixed Virtual Chassis Using Nonstop Software Upgrade on page 144](#)
- [Configuring Graceful Routing Engine Switchover in a Virtual Chassis \(CLI Procedure\)](#)

Understanding Nonstop Software Upgrade on a Virtual Chassis Fabric

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member switches on a Virtual Chassis Fabric with minimal network traffic disruption during the upgrade. A Virtual Chassis Fabric can contain up to 20 members—up to 2 members can be in the routing engine role, and up to 18 members can be configured in the line card role. You can upgrade software for a fixed configuration or for a mixed mode of switches in a Virtual Chassis Fabric. For information on performing a nonstop software upgrade on a Virtual Chassis, see “Understanding Nonstop Software Upgrade on a Virtual Chassis and Mixed Virtual Chassis” on page 135.

Performing an NSSU provides these benefits:

- No disruption to the control plane—NSSU uses graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) to ensure no disruption to the control plane. During the upgrade process, interface, kernel, and routing protocol information is preserved.
- Minimal disruption to network traffic—An NSSU minimizes network traffic disruption by:
 - Upgrading line cards one at a time, or in groups, permits traffic to continue to flow through the line cards that are not being upgraded.
 - Upgrading member switches one at a time enables the master and backup to maintain their master and backup roles (although mastership will change) without disruption to traffic.

To achieve minimal disruption to traffic, you must configure link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards or Virtual Chassis Fabric members. When one member link of a LAG is down, the remaining links are up, and traffic continues to flow through the LAG.

NOTE: Because NSSU upgrades the software on each line card or on each Virtual Chassis Fabric member one at a time, an upgrade using NSSU can take longer than an upgrade using the `request system software add` command.

You can reduce the amount of time an upgrade takes by configuring line-card upgrade groups. The line cards in an upgrade group are upgraded simultaneously, reducing the amount of time it takes to complete an upgrade. See “[Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade \(CLI Procedure\)](#)” on page 142.

This topic covers:

- [Requirements for Performing an NSSU on page 139](#)
- [How an NSSU Works on page 140](#)
- [NSSU Limitations on page 141](#)
- [NSSU and Junos OS Release Support on page 141](#)
- [Overview of NSSU Configuration and Operation on page 141](#)

Requirements for Performing an NSSU

The following requirements apply to Virtual Chassis Fabric:

- Graceful Routing Engine switchover (GRES) must be enabled.
- Nonstop active routing (NSR) and nonstop bridging (NSB) must be enabled.

NOTE: Using NSB is recommended for any mode of VCF (pre-provisioned, auto-provisioned, and non-provisioned) to avoid loss of Layer 2 control protocol adjacency during a routing engine switchover..

NOTE: Issue the `commit synchronize` command to enable NSB and NSR.

- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis Fabric members.

The following are requirements for Virtual Chassis Fabric members:

- Only two pre-provisioned members in the routing engine role are supported. If more than two routing engines are configured, a warning will be issued, and NSSU will stop.
- The Virtual Chassis Fabric members are connected in a spine and leaf topology. A spine and leaf topology prevents the Virtual Chassis Fabric from splitting during an NSSU. Each leaf device must be connected to both spine devices.
- The Virtual Chassis Fabric must be preprovisioned so that the line card role has been explicitly assigned to member switches acting in a line card role, and that the routing engine role has been explicitly assigned to member switches acting in a routing engine role. During an NSSU, the Virtual Chassis Fabric members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), the member switches must remain their routing engine roles, and the remaining switches must maintain their linecard roles.
- A two-member Virtual Chassis Fabric must have **no-split-detection** configured so that the Virtual Chassis Fabric does not split when an NSSU upgrades a member.

How an NSSU Works

This section describes what happens when you request an NSSU on a Virtual Chassis Fabric:

- [Virtual Chassis Fabric on page 140](#)

Virtual Chassis Fabric

When you request an NSSU on an a Virtual Chassis Fabric:

1. The Virtual Chassis Fabric master verifies that:
 - The backup is online.
 - Graceful Routing Engine switchover (GRES) , nonstop active routing (NSR), and nonstop bridging (NSB) is enabled.
 - The Virtual Chassis Fabric has a preprovisioned configuration.
2. The master installs the new software image on the backup and reboots it.
3. The backup resynchronizes with the master.
4. The master installs the new software image on member switches that are in the linecard role and reboots them, one at a time. The master waits for each member to become online and active before starting the software upgrade on the next member.
5. If you have configured upgrade groups, the line cards in the first upgrade group (or the line card in slot 0, if no upgrade groups are defined) download the new image and then restart. Traffic continues to flow through the line cards in the other upgrade groups during this process.
6. When line cards restarted are online again, the line cards in the next upgrade group download the new image and restart. This process continues until all online line cards have restarted with the new software.

7. The master becomes the backup, and the upgraded backup becomes the master.
8. The software on the original master is upgraded and the original master is automatically rebooted. After the original master has rejoined the Virtual Chassis Fabric, you can optionally return control to it by requesting a graceful Routing Engine switchover.

NSSU Limitations

You cannot use an NSSU to downgrade the software—that is, to install an earlier version of the software than is currently running on the switch. To install an earlier software version, use the **request system software add** command.

You cannot roll back to the previous software version after you perform an upgrade using NSSU. If you need to rollback to the previous software version, you can do so by rebooting from the alternate root partition if you have not already copied the new software version into the alternate root partition.

NSSU and Junos OS Release Support

A Virtual Chassis Fabric must be running a Junos OS release that supports NSSU before you can perform an NSSU. If a Virtual Chassis Fabric is running a software version that does not support NSSU, use the **request system software add** command.

[Table 13 on page 141](#) lists the QFX Series switches and Virtual Chassis that support NSSU and the Junos OS release at which they began supporting it.

Table 13: Platform and Release Support for NSSU on a Virtual Chassis Fabric

Platform	Junos OS Release
Virtual Chassis Fabric	13.2X51-D20 or later

Overview of NSSU Configuration and Operation

You must ensure that the configuration meets the requirements described in [“Requirements for Performing an NSSU” on page 136](#). NSSU requires no additional configuration.

You perform an NSSU by executing the **request system software nonstop-upgrade** command. For detailed instructions on how to perform an NSSU, see the topics in Related Documentation.

Related Documentation

- [Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade on page 147](#)

- [Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade \(CLI Procedure\)](#) on page 142

Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade (CLI Procedure)

Nonstop software upgrade (NSSU) enables you to upgrade the software running on an EX Series switch with redundant Routing Engines, on most EX Series Virtual Chassis, QFX3500, QFX3600, and QFX5100 Virtual Chassis, and Virtual Chassis Fabric by using a single command and with minimal disruption to network traffic.

In its default configuration, NSSU upgrades each line card in a switch or Virtual Chassis or Virtual Chassis Fabric one at a time. Traffic continues to flow through the other line cards while a line card is being restarted as part of the upgrade. This behavior allows you to minimize disruption to traffic by configuring link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards. When one member link of a LAG is down, the remaining links are up, and traffic continues to flow through the LAG.

To reduce the time an NSSU takes, you can configure line-card upgrade groups on an EX6200 or EX8200 switch with redundant Routing Engines, EX8200 Virtual Chassis, QFX3500, QFX3600, and QFX5100 Virtual Chassis, and Virtual Chassis Fabric.

NOTE: NSSU line-card upgrade groups are not supported for NSSUs on EX3300 Virtual Chassis, EX4200 Virtual Chassis, EX4300 Virtual Chassis, EX4500 Virtual Chassis, EX4550 Virtual Chassis, or any mixed Virtual Chassis composed of EX4200, EX4500, or EX4550 switches.

When you define an upgrade group, NSSU upgrades the line cards in the upgrade group at the same time instead of sequentially. To achieve minimal traffic disruption, you must define the line-card upgrade groups such that the member links of the LAGs reside on line cards that are in different upgrade groups. For information on how to configure LAGs, see *Configuring Aggregated Ethernet Links (CLI Procedure)*.

To configure line-card upgrade groups on a standalone EX6200 or EX8200 switch:

- To create an upgrade group and add a line card to it:

```
[edit chassis]
user@switch# set nssu upgrade-group group-name fpcs slot-number
```

For example, to create an upgrade group called **group3** and add the line card in slot 5 to it:

```
[edit chassis]
user@switch# set nssu upgrade-group group3 fpcs 5
```

If **group3** already exists, this command adds line card 5 to **group3**.

- To create an upgrade group and add multiple line cards to it:

```
[edit chassis]
user@switch# set nssu upgrade-group group-name fpcs [list-of-slot-numbers]
```

For example, to create an upgrade group called **primary** and add line cards in slots 1, 4, and 7 to it:

```
[edit chassis]
user@switch# set nssu upgrade-group primary fpcs [1 4 7]
```

If **primary** already exists, this command adds line cards in slots 1, 4, and 7 to **primary**.

To configure line-card upgrade groups on an EX8200 Virtual Chassis:

- To create an upgrade group and add a line card on a Virtual Chassis member to it:

```
[edit chassis]
user@switch# set nssu upgrade-group group-name member member-id fpcs slot-number
```

For example, to create an upgrade group called **primary-ny** and add the line card on member 1 in slot 5 to it:

```
[edit chassis]
user@switch# set nssu upgrade-group primary-ny member 1 fpcs 5
```

If **primary-ny** already exists, this command adds line card 5 on member 1 to **primary-ny**.

- To create an upgrade group that contains multiple line cards on a Virtual Chassis member:

```
[edit chassis]
user@switch# set nssu upgrade-group group-name member member-id fpcs
[list-of-slot-numbers]
```

For example, to create an upgrade group called **primary-ny** that contains the line cards in slots 1 and 2 on member 0 and in slots 3 and 4 on member 1:

```
[edit chassis]
user@switch# set nssu upgrade-group primary-ny member 0 fpcs [1 2]
```

```
[edit chassis]
user@switch# set nssu upgrade-group primary-ny member 1 fpcs [3 4]
```

To configure line-card upgrade groups on a Virtual Chassis Fabric:

- To create an upgrade group and add a line card member on a Virtual Chassis Fabric to the upgrade group:

```
[edit chassis]
user@switch# set nssu upgrade-group group-name fpcs value
```

For example, to create an upgrade group called **vcf** and add a line card member:

```
[edit chassis]
user@switch# set nssu upgrade-group vcf fpcs 2
```

If **vcf** already exists, this command adds line card 2 to **vcf**.

- To create an upgrade group that contains multiple line cards on a Virtual Chassis Fabric:

```
[edit chassis]
user@switch# set nssu upgrade-group group-name fpcs [list-of-slot-numbers]
```

For example, to create an upgrade group called **vcf** that contains line cards 1 and 2:

```
[edit chassis]
user@switch# set nssu upgrade-group vcf fpcs [1 2]
```

Upgrading Software on a Virtual Chassis and Mixed Virtual Chassis Using Nonstop Software Upgrade

You can use nonstop software upgrade (NSSU) to upgrade the software running on all member switches with minimal traffic disruption during the upgrade.

This topic covers:

- [Preparing the Switch for Software Installation on page 144](#)
- [Upgrading the Software Using NSSU on page 145](#)

Preparing the Switch for Software Installation

Before you begin software installation using NSSU:

- Ensure that the Virtual Chassis or mixed Virtual Chassis is configured correctly to support NSSU. Verify that:
 - The Virtual Chassis or mixed Virtual Chassis members are connected in a ring topology. A ring topology prevents the Virtual Chassis from splitting during an NSSU.
 - The Virtual Chassis or mixed Virtual Chassis master and backup are adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
 - The Virtual Chassis or mixed Virtual Chassis is preprovisioned so that the linecard role has been explicitly assigned to member switches acting in the linecard role. During an NSSU, the Virtual Chassis or mixed Virtual Chassis members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), and the other member switches must maintain their linecard roles.
 - A two-member Virtual Chassis has **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.
- Verify that the members are running the same version of the software:
`user@switch> show version`

If the Virtual Chassis or mixed Virtual Chassis members are not running the same version of the software, use the `request system software add` command to upgrade the software on the inconsistent members.

- Ensure that graceful Routing Engine switchover (GRES) is enabled.
- (Optional) Back up the system software—Junos OS, the active configuration, and log files—on each member to an external storage device with the `request system snapshot` command.

Upgrading the Software Using NSSU

This procedure describes how to upgrade the software running on all Virtual Chassis or mixed Virtual Chassis members using NSSU. When the upgrade completes, all members are running the new version of the software. Because a graceful Routing Engine switchover occurs during the upgrade, the original Virtual Chassis or mixed Virtual Chassis backup is the new master.

NOTE: Junos OS software images with enhanced automation are only supported on a non-mixed Virtual Chassis with QFX5100 switches. Also, performing an NSSU from a standard Junos OS software image to a Junos OS software image with enhanced automation or from a Junos OS software image with enhanced automation to a standard Junos OS software image is not supported.

To upgrade all members using NSSU:

1. Download the software package by following the procedure in the Downloading Software Files with a Browser section in “Upgrading Software” on page 250.
2. Copy the software package or packages to the Virtual Chassis or mixed Virtual Chassis. We recommend that you copy the file to the `/var/tmp` directory on the master.
3. Log in to the Virtual Chassis or mixed Virtual Chassis using the console connection or the virtual management Ethernet (VME) interface. Using a console connection allows you to monitor the progress of the master switch reboot.
4. Start the NSSU:
 - On a Virtual Chassis or mixed Virtual Chassis, enter:

```
user@switch> request system software nonstop-upgrade force-host
/var/tmp/package-name.tgz
```

where `package-name.tgz` is, for example,
`jinstall-qfx-3-13.2X50-D15.3-domestic-signed.tgz`.

The switch displays status messages similar to the following messages as the upgrade executes:

```
Chassis ISSU Check Done

relinquish mastership

NSSU: IDLE

*** FINAL System shutdown message from user@switch ***

System going down IMMEDIATELY

Shutdown NOW!

[pid 9336]

- Log in after the reboot of the original master switch completes. To verify that the software on all Routing Engines in the Virtual Chassis or mixed Virtual Chassis members has been upgraded, enter the following command:

```
user@switch> show version
```

- To ensure that the resilient dual-root partitions feature operates correctly, copy the new Junos OS image into the alternate root partitions of all members:

```
user@switch> request system snapshot slice alternate all-members
```

Resilient dual-root partitions allow the switch to boot transparently from the alternate root partition if the system fails to boot from the primary root partition.

Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member switches on a Virtual Chassis Fabric with minimal network traffic disruption during the upgrade. A Virtual Chassis Fabric can contain 20 members—up to 2 members can be in the routing engine role, and up to 18 line cards can be configured in the line-card role. You can upgrade software for a fixed configuration of switches or for a mixed mode of switches in a Virtual Chassis Fabric.

This topic covers:

- [Preparing the Switch for Software Installation on page 147](#)
- [Upgrading the Software Using NSSU on page 149](#)

Preparing the Switch for Software Installation

Before you begin software installation using NSSU:

- Ensure that the Virtual Chassis Fabric is configured correctly to support NSSU. Verify that:
 - The Virtual Chassis Fabric members are connected in a spine and leaf topology. A spine and leaf topology prevents the Virtual Chassis from splitting during an NSSU. Each leaf device must be connected to both spine devices.
 - The Virtual Chassis Fabric must be preprovisioned so that the line card role has been explicitly assigned to member switches acting in a line card role, and that the routing engine role has been explicitly assigned to member switches acting in a routing engine role. During an NSSU, the Virtual Chassis Fabric members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), the member switches must remain their routing engine roles, and the remaining switches must maintain their line card roles.
 - Only two pre-provisioned members in the routing engine role are supported. If more than two routing engines are configured, a warning will be issued, and NSSU will stop.
 - A two-member Virtual Chassis has **no-split-detection** configured so that the Virtual Chassis Fabric does not split when an NSSU upgrades a member.
- Verify that the members are running the same version of the software:

```
user@switch> show version
```

If you are going to perform an NSSU on a fixed configuration of switches or a mixed mode configuration of switches that are not running the same version of the software, use the `request system software nonstop-upgrade force-host <set [package-name package-name]> reboot` command to upgrade the software on the inconsistent members.

NOTE: This command can require up to three software images depending on devices configured in the Virtual Chassis Fabric.

For example:

```
user@switch> request system software nonstop-upgrade add force-host set
[jinstall-qfx5100.tgz jinstall-qfx3500.tgz jinstall-ex-4300.tgz] reboot
```

- Ensure that graceful Routing Engine switchover (GRES) is enabled. To verify that they are enabled, you need to check only the state of nonstop active routing—if nonstop active routing is enabled, then graceful Routing Engine switchover is enabled.

To verify that nonstop active routing is enabled:

```
user@switch> show task replication
Stateful Replication: Enabled
RE mode: Master
```

Protocol	Synchronization Status
OSPF	Complete
BGP	Complete
PIM	Complete

If nonstop active routing is not enabled (**Stateful Replication is Disabled**), see *Example: Configuring Nonstop Active Routing on Switches* for information on how to enable it.

- Enable nonstop bridging (NSB). Enabling NSB ensures that all NSB-supported Layer 2 protocols operate seamlessly during the Routing Engine switchover that is part of the NSSU.
- (Optional) Back up the system software—Junos OS, the active configuration, and log files—on each member to an external storage device with the [request system snapshot](#) command.

Upgrading the Software Using NSSU

This procedure describes how to upgrade the software running on all Virtual Chassis Fabric members using NSSU. When the upgrade completes, all members are running the new version of the software. Because a graceful Routing Engine switchover occurs during the upgrade, the original Virtual Chassis Fabric backup is the new master.

NOTE: Junos OS software images with enhanced automation are only supported on a non-mixed Virtual Chassis Fabric with QFX5100 switches. Also, performing an NSSU from a standard Junos OS software image to a Junos OS software image with enhanced automation or from a Junos OS software image with enhanced automation to a standard Junos OS software image is not supported.

To upgrade all members using NSSU:

1. Download the software package by following the procedure in the Downloading Software Files with a Browser section in [“Upgrading Software” on page 250](#) and *Downloading Software Packages from Juniper Networks*. If you are upgrading the software running on a mixed mode Virtual Chassis Fabric, download the software packages for each switch type.
2. Copy the software package or packages to the Virtual Chassis Fabric. We recommend that you copy the file to the `/var/tmp` directory on the master.
3. Log in to the Virtual Chassis Fabric using the console connection of the master or the virtual management Ethernet (VME) interface. Without the console connection, you will not be able to view any CLI output during an NSSU reboot. The console connection enables you to view CLI output during an NSSU reboot and monitor the progress of the master switch reboot.
4. Start the NSSU:
 - To perform an NSSU on a fixed configuration of switches (QFX3500/QFX3600, QFX5100, or EX4300 switches), enter:

```
user@switch> request system software nonstop-upgrade force-host
/var/tmp/package-name.tgz
```

where `package-name.tgz` is, for example, `jinstall-qfx5100.tgz`.

- To perform an NSSU on a mixed mode configuration of switches (QFX3500/QFX3600, QFX5100, or EX4300 switches), enter:

```
user@switch> request system software nonstop-upgrade force-host set
[package-name package-name
package-name]
```

where `[package-name.tgz package-name.tgz package-name.tgz]` is, for example, `[jinstall-qfx5100.tgz jinstall-qfx3500.tgz jinstall-ex-4300.tgz]`.

The switch displays status messages similar to the following messages as the upgrade executes:

```
switch# request system software nonstop-upgrade force-host[
jinstall-qfx-3-mixed_vc-1-domestic.tgz jinstall-qfx-5-mixed_vc-1-domestic-img.tgz
jinstall-ex-4300-mixed_vc-1-domestic.tgz ]

Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

Disaggregated Software Feature Licenses on QFX5200 Switches

NOTE: For information on standard Junos OS feature licenses, see [“Software Features That Require Licenses on the QFX Series” on page 161](#).

The Junos OS software is disaggregated from the hardware. With disaggregated Junos OS, you can purchase the following feature licenses, which are available on a perpetual basis:

- Junos Base Software (JBS) license:

Includes basic layer 2 switching, basic layer 3 routing, multicast, automation, programmability, Zero Touch Provisioning (ZTP) and basic monitoring.

NOTE: You must purchase the JBS license to use basic functions, but you do not need to install the license key in Junos OS Release 15.1X53-D30. JBS basic functions work with this release without installing the license key. However, you will need to install the license key in a future release of Junos OS to be determined, so make sure to retain the authorization code you received from the License Management System to generate a license key for the JBS license.

- Junos Advanced Software (JAS) license:

Includes features supported in JBS license and Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Virtual Extensible Local Area Network (VXLAN). You need to install the license key to use these features. You need to install the license key to use these features.

- Junos Premium Software (JPS) license:

Includes features supported in JAS license and Multi-protocol Label Switching (MPLS) feature set. You need to install the license key to use these features.

For information about how to purchase a software feature license, contact your Juniper Networks sales representative.

Table 14: Disaggregated Junos OS Feature Licenses and Associated SKU's

Licensed Software Features	SKU's
Junos base software (JBS) license	QFX5000-35-JBS
Junos advanced software (JAS) license	QFX5000-35-JAS
Junos premium software (JPS) license	QFX5000-35-JPS

Software Features That Require Licenses on the QFX Series

NOTE: If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

NOTE: Virtual Extensible Local Area Network (VXLAN) is not supported on QFX3500 and QFX3600 devices. When you issue the `show licenses` command, you will see VXLAN in the CLI output, but the feature is not enabled.

NOTE: There is no separate license for Virtual Chassis like there is for Virtual Chassis Fabric.

Table 15 on page 162 lists the standard Junos OS features licenses and supported QFX Series devices. For information on disaggregated Junos OS feature licenses on the QFX5200-32C switch, see [“Disaggregated Software Features That Require Licenses on the QFX Series” on page 160](#).

For information about how to purchase a software license, contact your Juniper Networks sales representative.

Table 15: Standard Junos OS Feature Licenses and Model Numbers for QFX Series Devices

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series premium feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Virtual Extensible Local Area Network (VXLAN), and Open vSwitch Database (OVSDB)	QFX10002-36Q switch	One per switch	QFX10002-36Q-PFL
	QFX10002-72Q switch		QFX10002-72Q-PFL
	QFX10008 switch		QFX10008-PFL
	QFX10016 switch		QFX10016-PFL
	QFX5110-48S switch		QFX5K-C1-PFL
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Multi-protocol Label Switching (MPLS), and Virtual Extensible Local Area Network (VXLAN), and Open vSwitch Database (OVSDB)	QFX10002-36Q switch	One per switch	QFX10002-36Q-AFL
	QFX10002-72Q switch		QFX10002-72Q-AFL
	QFX10008 switch		QFX10008-AFL
	QFX10016 switch		QFX10016-AFL
	QFX5110-48S switch		QFX5K-C1-AFL
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Multi-protocol Label Switching (MPLS), and Virtual Extensible Local Area Network (VXLAN), and Open vSwitch Database (OVSDB)	QFX3500, QFX3600, QFX5100-48S, and QFX5100-48T switch	One per switch, two per Virtual Chassis, and two per Virtual Chassis Fabric	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Multi-protocol Label Switching (MPLS), and Virtual Extensible Local Area Network (VXLAN) and Open vSwitch Database (OVSDB)	QFX5100-24Q and QFX5100-96S switch	One per switch, two per Virtual Chassis, and two per Virtual Chassis Fabric	QFX5100-HDNSE-LIC

Table 15: Standard Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB
QFX and EX Series feature license for enabling Media Access Control security (MACsec)	QFX switches that support MACsec. See <i>Understanding Media Access Control Security (MACsec)</i> .	One per switch, two per Virtual Chassis,	EX-QFX-MACSEC-AGG
Virtual Chassis Fabric (VCF)	All member devices in a Virtual Chassis Fabric (VCF)	Two per Virtual Chassis Fabric (VCF)	QFX-VCF-LIC

Junos OS Feature License Keys

Some Junos OS software features require a license to be activated. To enable each licensed feature, you must purchase, install, manage, and verify a license key that corresponds to the licensed feature.

Release-Tied License Keys and Upgrade Licenses on MX Series Routers

The Junos OS licensing infrastructure currently associates a license feature with attributes such as date, platform, and validity. In addition to these attributes, for MX Series routers running Junos OS Release 12.2 and later, a licensed feature can be associated with a release number at the time of generating the license key. This type of release-tied license key is used to validate a particular licensed feature while attempting a software upgrade. The upgrade process aborts if the release number in the license key is earlier than the Junos OS release number to which the system is being upgraded.

Additionally, an upgrade license key can be generated for a release-tied licensed feature. An upgrade license key is used for carrying forward a capacity license to the upgrade release. Although an upgrade license might be an acceptable license on the current release, it does not add to the existing capacity limit. The capacity added in the upgrade license key is valid for the upgrade software release only.

The release number embedded in the license key indicates the maximum release number up to which Junos OS can be upgraded.

As an example, assume that your system is running Junos OS Release 12.2 and is using the **scale-subscriber** licensed feature with a later release-tied upgrade license key installed. If you request a software upgrade to the later release of Junos OS, the software upgrade operation fails and the following error message is displayed:

```
mgd: error: No valid upgrade license found for feature 'scale-subscriber'.  
Aborting Software upgrade.  
Validation failed
```

In this example, to successfully upgrade to the later release of Junos OS, the release number included in the upgrade license key should be greater than or equal to the later release number. Also, you can perform software upgrades up to the previous release without any additional license keys to retain the existing scale limit.

**NOTE:**

When you install a release-tied license, the following apply:

- You can purchase an upgrade capacity license only if a base capacity license for the same scale-tier has already been generated or purchased.
- You cannot install an upgrade license if the capacity does not match any of the existing base capacity licenses on the system.
- The license installation fails when you install a lower release number license key on a higher software release number.
- A release-tied license can be installed on a Junos OS release number that is lower than or equal to the release number included in the license key. For example, a 12.2 license key is valid on Junos OS Release 12.1.
- An upgrade license is valid only on the target release number specified in the license key, but can be installed on an earlier Junos OS release. For example, a 4 K scale-tier upgrade license for Junos OS Release 12.2 can be installed on an earlier release, and the installed count of licenses remains unaltered.
- Release-tied licenses of the previous release are not deleted on upgrading Junos OS to a newer release version.

Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity.

[Table 16 on page 166](#) displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

Table 16: Upgrade Licenses for Enhancing Port Capacity

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 <ul style="list-style-type: none"> • 1/MIC0 	f1—MX5 to MX10 upgrade	Slot 1 and 2 <ul style="list-style-type: none"> • 1/MIC0 • 1/MIC1
MX10	40G	0x555	Slot 1 and 2 <ul style="list-style-type: none"> • 1/MIC0 • 1/MIC1 	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> • 1/MIC1 • First 2 ports on 0/MIC0
MX40	60G	0x554	Slot 1, Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> • 1/MIC0 • 1/MIC1 • First 2 ports on 0/MIC0 	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 <ul style="list-style-type: none"> • 1/MIC1 • All 4 ports on 0/MIC0

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
 - An f1 feature ID on an MX10 upgrade license key rejects the license.
 - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

Port Activation on MX104 Routers

Starting with Junos OS Release 13.3, license keys are available to activate the ports on the MX104 router. MX104 routers have four built-in ports. By default, in the absence of valid licenses, all four built-in ports are deactivated. By installing licenses, you can activate any two of the four or all of the four built-in ports. For instance, you can install a license to activate the first two built-in ports (xe-2/0/0 and xe-2/0/1) or you can install a license to activate the next two built-in ports (xe-2/0/2 and xe-2/0/3). You can also install a license to activate all four built-in ports (xe-2/0/0, xe-2/0/1, xe-2/0/2, and xe-2/0/3). If you have already activated two of the built-in ports, you can install an additional license to activate the other two built-in ports on the MX104 router.

A feature ID is assigned to every license for activating the built-in ports on the MX104 router. The port license model with the feature ID is described in [Table 17 on page 167](#).

Table 17: Port Activation License Model for MX104 Routers

Feature ID	Feature Name	Functionality
F1	MX104 2X10G Port Activate (0 and 1)	Ability to activate first two built-in ports (xe-2/0/0 and xe-2/0/1)
F2	MX104 2X10G Port Activate (2 and 3)	Ability to activate next two built-in ports (xe-2/0/2 and xe-2/0/3)

Both the features are also provided in a single license key for ease of use. To activate all four ports, you must either install the licenses for both the features listed in [Table 17 on page 167](#) or the single license key for both features. If you install the single license key when feature IDs F1 and F2 are already installed, the license does not get rejected. Also, MX104 routers do not support the graceful license expiry policy. A graceful license expiry policy allows the use of a feature for a certain period of time (usually a grace period of 30 days), and reverts if the license for that feature is not installed after the grace period.

Generating License Keys

When you purchase a Junos OS software feature license for a device, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the device's serial number) for the device, and then add the license key on the device.

Before generating the license keys for a device:

- Purchase the required licenses for the device. See [“Software Features That Require Licenses on the QFX Series” on page 161](#) and [“Disaggregated Software Features That Require Licenses on the QFX Series” on page 160](#).
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Determine the serial number of the device. For instructions, see *Locating the Serial Number on a QFX3500 Device or Component*.

To generate the license keys for a device:

NOTE: This procedure shows you how to generate license keys on a QFX Series device, but you can follow the same procedure for any device.

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

NOTE: To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Device** option button, and click **Continue**.

The Generate Licenses - QFX Series Product Devices page appears.

4. In the **Device Serial Number** field, enter the serial number for the device.
5. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
6. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
7. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

8. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Devices page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

9. Select the file format in which you want to obtain your new license keys.
10. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

Related Documentation

- [Software Features That Require Licenses on the QFX Series on page 161](#)
- [Adding New Licenses \(CLI Procedure\) on page 169](#)
- [Locating the Serial Number on a QFX3500 Device or Component](#)

Adding New Licenses (CLI Procedure)

Before adding new licenses, complete the following tasks:

- Purchase the required licenses.
- Establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your device.

NOTE: On QFabric systems, install your licenses in the default partition of the QFabric system and not on the individual components (Node devices and Interconnect devices).

To add a new license key to the device using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To add a license key from a file or URL, enter the following command, specifying the filename or the URL where the key is located:

```
user@host> request system license add filename | url
```

- To add a license key from the terminal, enter the following command:

```
user@host> request system license add terminal
```

2. When prompted, enter the license key, separating multiple license keys with a blank line.

If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit license entry mode.

3. Go on to [“Verifying Junos OS License Installation” on page 172](#).

On routers that have graceful Routing Engine switchover (GRES) enabled, after successfully adding the new license on the master Routing Engine, the license keys are automatically synchronized on the backup Routing Engine as well. However, in case GRES is not enabled, the new license is added on each Routing Engine separately. This ensures

that the license key is enabled on the backup Routing Engine during changeover of mastership between the Routing Engines.

To add a new license key to a router with dual Routing Engines without GRES:

1. After adding the new license key on the master Routing Engine, use the **request chassis routing-engine master switch** command to have the backup Routing Engine become the master Routing Engine.
2. Log in to the active Routing Engine and add the new license key, repeat the same step.

NOTE: Adding a license key to the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-adding operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

Related Documentation

- [Deleting a License \(CLI Procedure\) on page 170](#)
- [Junos OS Feature Licenses on page 159](#)
- [Verifying Junos OS License Installation on page 172](#)
- [request system license add on page 564](#)

Deleting a License (CLI Procedure)

Before deleting a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

You have the options to delete a single license, delete all licenses, or delete a list of licenses enclosed in brackets.

1. Display the licenses available to be deleted.

```
user@host> request system license delete license-identifier-list ?
```

Possible completions:

E00468XXX4	License key identifier
JUNOS10XXX1	License key identifier
JUNOS10XXX2	License key identifier
JUNOS10XXX3	License key identifier
JUNOS10XXX4	License key identifier
[Open a set of values

2. To delete a license key or keys from a device using the CLI operational mode, select one of the following methods:
 - Delete a single license by specifying the license ID. Using this option, you can delete only one license at a time.

```
user@host> request system license delete license-identifier
```

- Delete all license keys from the current device.

```
user@host> request system license delete all
```

- Delete multiple license keys from the current device. Specify the license identifier for each key and enclose the list of identifiers in brackets.

```
user@host> request system license delete license-identifier-list [JUNOS10XXX1
JUNOS10XXX3 JUNOS10XXX4 ...]
```

```
Delete license(s) ?
[yes,no] (no) yes
```

3. Go on to “[Verifying Junos OS License Installation](#)” on page 172.

NOTE: Deleting a license key from the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-deleting operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

Saving License Keys

Before saving a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To save the licenses installed on a device to a file using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To save the installed license keys to a file or URL, enter the following command:

```
user@host> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named `license.config`:

- To save a license key from the terminal, enter the following command:

```
user@host> request system license save ftp://user@host/license.config
```

2. Go on to “[Verifying Junos OS License Installation](#)” on page 172.

- Related Documentation**
- [Adding New Licenses \(CLI Procedure\) on page 169](#)
 - [Deleting a License \(CLI Procedure\) on page 170](#)
 - [Junos OS Feature Licenses on page 159](#)
 - [Verifying Junos OS License Installation on page 172](#)

Verifying Junos OS License Installation

To verify Junos OS license management, perform the following tasks:

- [Displaying Installed Licenses on page 172](#)
- [Displaying License Usage on page 173](#)

Displaying Installed Licenses

Purpose Verify that the expected licenses are installed and active on the router or switch.

Action From the CLI, enter the **show system license** command.

Sample Output

```
user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-acct	0	1	0	permanent
subscriber-auth	0	1	0	permanent
subscriber-addr	0	1	0	permanent
subscriber-vlan	0	1	0	permanent
subscriber-ip	0	1	0	permanent
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

```

Licenses installed:
License identifier: E000185416
License version: 2
Features:
subscriber-acct - Per Subscriber Radius Accounting
permanent
subscriber-auth - Per Subscriber Radius Authentication
permanent
subscriber-addr - Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
permanent
subscriber-ip - Dynamic and Static IP
permanent
```

Meaning The output shows a list of the license usage and a list of the licenses installed on the router or switch. Verify the following information:

- Each license is present. Licenses are listed in ascending alphanumeric order by license ID.
- The state of each license is **permanent**.

NOTE: A state of invalid indicates that the license key is not a valid license key. Either it was entered incorrectly or it is not valid for the specific device.

- The feature for each license is the expected feature. The features enabled are listed by license. An all-inclusive license has all features listed.
- All configured features have the required licenses installed. The Licenses needed column must show that no licenses are required.

Displaying License Usage

Purpose Verify that the licenses fully cover the feature configuration on the router or switch.

Action From the CLI, enter the **show system license usage** command.

Sample Output

```
user@host> show system license usage
```

	Licenses used	Licenses installed	Licenses needed	Expiry
Feature name				
subscriber-addr	1	0	1	29 days
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

Meaning The output shows any licenses installed on the router or switch and how they are used. Verify the following information:

- Any configured licenses appear in the output. The output lists features in ascending alphabetical order by license name. The number of licenses appears in the third column. Verify that you have installed the appropriate number of licenses.
- The number of licenses used matches the number of configured features. If a licensed feature is configured, the feature is considered used. The sample output shows that the subscriber address pooling feature is configured.
- A license is installed on the router or switch for each configured feature. For every feature configured that does not have a license, one license is needed.

For example, the sample output shows that the subscriber address feature is configured but that the license for the feature has not yet been installed. The license must be installed within the remaining grace period to be in compliance.

PART 11

Login Classes

- [Understanding Login Classes on page 177](#)

CHAPTER 11

Understanding Login Classes

- [Configuring Junos OS User Accounts on page 177](#)
- [Configuring the Junos OS to Display a System Login Announcement on page 178](#)
- [Configuring Junos OS to Display a System Login Message on page 178](#)

Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
  class class-name;
  class {
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
  full-name complete-name;
  uid uid-value;
  class class-name;
}
```

Related Documentation

- [Example: Configuring User Accounts](#)
- [Configuring a Local Administrator Account](#)
- [Junos OS User Accounts Overview](#)
- [Limiting the Number of User Login Attempts for SSH and Telnet Sessions](#)

Configuring the Junos OS to Display a System Login Announcement

By default, no login announcement is displayed. To configure a system login announcement, include the **announcement** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
announcement text;
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

TIP: You can use the same special characters described to format your system login announcement.

Related Documentation

- *Defining Junos OS Login Classes*
- *Configuring the Junos OS to Display a System Login Message*

Configuring Junos OS to Display a System Login Message

By default, no login message is displayed on the router or switch. To configure a system login message, include the **message** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
message text;
```

If the message text contains any spaces, enclose it in quotation marks.

You can format the message using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

The following is a sample login message configuration:

```
[edit]
system {
  login {
    message "\n\n\n\tUNAUTHORIZED USE OF THIS SYSTEM\n\tIS STRICTLY PROHIBITED!\n\n\tPlease contact\n\t'company-noc@company.com\t' to gain\n\taccess to this equipment if you need authorization.\n\n\n";
  }
}
```

```
    }  
}
```

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet router1  
Trying 1.1.1.1...  
Connected to router1.  
Escape character is '^['.
```

```
UNAUTHORIZED USE OF THIS SYSTEM  
IS STRICTLY PROHIBITED!
```

```
Please contact 'company-noc@company.com' to gain  
access to this equipment if you need authorization.
```

```
router1 (tty0)
```

```
login:
```

A system login message appears before the user logs in. A system login announcement appears after the user logs in.

- [Example: Configuring NTP on page 191](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 194](#)

Understanding NTP Time Servers

The IETF defined the Network Time Protocol (NTP) to synchronize the clocks of computer systems connected to each other over a network. Most large networks have an NTP server that ensures that time on all devices is synchronized, regardless of the device location. If you use one or more NTP servers on your network, ensure you include the NTS server addresses in your Junos OS configuration.

When configuring the NTP, you can specify which system on the network is the authoritative time source, or time server, and how time is synchronized between systems on the network. To do this, you configure the router, switch, or security device to operate in one of the following modes:

- **Client mode**—In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.
- **Symmetric active mode**—In this mode, the local router or switch and the remote system can synchronize with each other. You use this mode in a network in which either the local router or switch or the remote system might be a better source of time.

NOTE: Symmetric active mode can be initiated by either the local or the remote system. Only one system needs to be configured to do so. This means that the local system can synchronize with any system that offers symmetric active mode without any configuration whatsoever. However, we strongly encourage you to configure authentication to ensure that the local system synchronizes only with known time servers.

- Broadcast mode—In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the local router or switch is operating as a transmitter.
- Server mode—In this mode, the local router or switch operates as an NTP server.

NOTE: In NTP server mode, the Junos OS supports authentication as follows:

- If the NTP request from the client comes with an authentication key (such as a key ID and message digest sent with the packet), the request is processed and answered based on the authentication key match.
- If the NTP request from the client comes without any authentication key, the request is processed and answered without authentication.

**Related
Documentation**

- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 194](#)

Configuring NTP Authentication Keys

Time synchronization can be authenticated to ensure that the switch obtains its time services only from known sources. By default, network time synchronization is unauthenticated. The switch will synchronize to whatever system appears to have the most accurate time. We strongly encourage you to configure authentication of network time services.

To authenticate other time servers, include the **trusted-key** statement at the **[edit system ntp]** hierarchy level. Only time servers that transmit network time packets containing one of the specified key numbers are eligible to be synchronized. Additionally, the key needs to match the value configured for that key number. Other systems can synchronize to the local switch without being authenticated.

```
[edit system ntp]  
trusted-key [ key-numbers ];
```

Each key can be any 32-bit unsigned integer except 0. Include the **key** option in the **peer**, **server**, or **broadcast** statements to transmit the specified authentication key when

transmitting packets. The key is necessary if the remote system has authentication enabled so that it can synchronize to the local system.

To define the authentication keys, include the **authentication-key** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
```

number is the key number, **type** is the authentication type (only Message Digest 5 [MD5] is supported), and **password** is the password for this key. The key number, type, and password must match on all systems using that particular key for authentication.

Related Documentation

- [Understanding NTP Time Servers on page 183](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 194](#)
- [trusted-key on page 360](#)
- *authentication-key*

Configuring the NTP Time Server and Time Services

When you use NTP, configure the switch to operate in one of the following modes:

- Client mode
- Symmetric active mode
- Broadcast mode
- Server mode

The following topics describe how to configure these modes of operation:

1. [Configuring the Switch to Operate in Client Mode on page 185](#)
2. [Configuring the Router or Switch to Operate in Symmetric Active Mode on page 186](#)
3. [Configuring the Router or Switch to Operate in Broadcast Mode on page 186](#)
4. [Configuring the Router or Switch to Operate in Server Mode on page 187](#)

Configuring the Switch to Operate in Client Mode

To configure the local router or switch to operate in client mode, include the **server** statement and other optional statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
server address <key key-number> <version value> <prefer>;
authentication-key key-number type type value password;
boot-server address;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement, as described in .

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in client mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$ABC123";
boot-server 10.1.1.1;
server 10.1.1.1 key 1 prefer;
trusted-key 1;
```

Configuring the Router or Switch to Operate in Symmetric Active Mode

To configure the local router or switch to operate in symmetric active mode, include the **peer** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
peer address <key key-number> <version value> <prefer>;
```

Specify the address of the remote system. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2 or 3, include the **version** option.

If you configure more than one remote system, you can mark one system preferred by including the **prefer** option:

```
peer address <key key-number> <version value> prefer;
```

Configuring the Router or Switch to Operate in Broadcast Mode

To configure the local router or switch to operate in broadcast mode, include the **broadcast** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast address <key key-number> <version value> <ttl value>;
```

Specify the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2, or 3, include the **version** option.

Configuring the Router or Switch to Operate in Server Mode

In server mode, the router or switch acts as an NTP server for clients when the clients are configured appropriately. The only prerequisite for “server mode” is that the router or switch must be receiving time from another NTP peer or server. No other configuration is necessary on the router or switch.

To configure the local router or switch to operate as an NTP server, include the following statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
server address <key key-number> <version value> <prefer>;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, or 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in server mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$ABC123";
server 172.17.27.46 prefer;
trusted-key 1;
```

Related Documentation

- [Understanding NTP Time Servers on page 183](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 194](#)

Configuring the Switch to Listen for Broadcast Messages Using NTP

When you are using NTP, you can configure the local switch to listen for broadcast messages on the local network to discover other servers on the same subnet by including the **broadcast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
broadcast-client;
```

When the switch detects a broadcast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *broadcast client* mode, in which it listens for, and synchronizes to, succeeding broadcast messages.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related
Documentation**

- [Configuring the Switch to Listen for Multicast Messages Using NTP on page 188](#)
- [Configuring the NTP Time Server and Time Services on page 185](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 194](#)

Configuring the Switch to Listen for Multicast Messages Using NTP

When you are using NTP, you can configure the local switch to listen for multicast messages on the local network to discover other servers on the same subnet by including the **multicast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
multicast-client <address>;
```

When the switch receives a multicast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *multicast client* mode, in which it listens for, and synchronizes to, succeeding multicast messages.

You can specify one or more IP addresses. (You must specify an address, not a hostname.) If you do, the router or switch joins those multicast groups. If you do not specify any addresses, the software uses **224.0.1.1**.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related
Documentation**

Setting the Date and Time

1. Enter operational mode in the CLI.
2. Enter the following command:

```
user@switch> set date YYYYMMDDHHMM.ss source-address
```

For example, the following command sets the date and time.

```
user@switch# set date 201102151010.55
```

3. To set the date and time from an NTP server, enter the following command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from an NTP server:

```
user@switch# set date ntp 200.40.40.1
```

4. To set the date and time from more than one NTP server, enter the same command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from more than one NTP server:

```
user@switch# set date ntp 200.40.40.1 200.40.40.2
```

Related Documentation

- [set date](#)

Synchronizing and Coordinating Time Distribution Using NTP

Using NTP to synchronize and coordinate time distribution in a large network involves these tasks:

1. [Configuring NTP on page 189](#)
2. [Configuring the NTP Boot Server on page 189](#)
3. [Specifying a Source Address for an NTP Server on page 190](#)

Configuring NTP

- To configure NTP on the switch, include the **ntp** statement at the **[edit system]** hierarchy level:

```
[edit system]
ntp {
  authentication-key number type type value password;
  boot-server (address | hostname);
  broadcast <address> <key key-number> <version value> <tll value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

Configuring the NTP Boot Server

When you boot the switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the switch uses to determine the time when the switch boots. Otherwise, NTP will not be able to

synchronize to a time server if the server's time appears to be very far off of the local switch's time.

- To configure the NTP boot server, include the **boot-server** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
boot-server (address | hostname);
```

Specify either the IP address or the hostname of the network server.

Specifying a Source Address for an NTP Server

For IP version 4 (IPv4), you can specify that if the NTP server configured at the **[edit system ntp]** hierarchy level is contacted on one of the loopback interface addresses, the reply always uses a specific source address. This is useful for controlling which source address NTP uses to access your network when it is either responding to or sending an NTP client request from your network.

To configure the specific source address that the reply will always use, and the source address that requests initiated by NTP server will use, include the **source-address** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
source-address source-address;
```

source-address is a valid IP address configured on one of the switch interfaces.

NOTE: If a firewall filter is applied on the loopback interface, ensure that the source address specified for the NTP server at the **[edit system ntp]** hierarchy level is explicitly included as one of the match criteria in the firewall filter. This enables the Junos OS to accept traffic on the loopback interface from the specified source address.

The following example shows a firewall filter with the source address 10.0.10.100 specified in the **from** statement included at the **[edit firewall filter firewall-filter-name]** hierarchy:

```
[edit firewall filter Loopback-Interface-Firewall-Filter]
term Allow-NTP {
  from {
    source-address {
      172.17.27.46/32; // IP address of the NTP server
      10.0.10.100/32; // Source address specified for the NTP server
    }
  }
  then accept;
}
```

If no source address is configured for the NTP server, include the primary address of the loopback interface in the firewall filter.

- Related Documentation**
- [Understanding NTP Time Servers on page 183](#)
 - [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 194](#)

Example: Configuring NTP

The Network Time Protocol (NTP) provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network. NTP uses a returnable-time design in which a distributed subnet of time servers operating in a self-organizing, hierarchical primary-secondary configuration synchronizes local clocks within the subnet and to national time standards by means of wire or radio. The servers also can redistribute reference time using local routing algorithms and time daemons.

This example shows how to configure NTP:

- [Requirements on page 191](#)
- [Overview on page 191](#)
- [Configuration on page 191](#)
- [Verification on page 192](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later
- A switch connected to a network on which an NTP boot server and NTP server reside

Overview

Debugging and troubleshooting are much easier when the timestamps in the log files of all switches are synchronized, because events that span a network can be correlated with synchronous entries in multiple logs. We recommend using the Network Time Protocol (NTP) to synchronize the system clocks of your switch and other network equipment.

In this example, an administrator wants to synchronize the time in a switch to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date are obtained when the switch boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme is used to hash the key value for authentication, which prevents the switch from synchronizing with an attacker's host that is posing as the time server.

Configuration

To configure NTP:

CLI Quick Configuration	<p>To quickly configure NTP, copy the following commands and paste them into the switch's terminal window:</p> <pre>[edit system] set ntp boot-server 10.1.4.1 set ntp server 10.1.4.2 set ntp authentication-key 2 type md5 value "\$ABC123"</pre>
Step-by-Step Procedure	<p>To configure NTP :</p> <ol style="list-style-type: none"> Specify the boot server: <pre>[edit system] user@switch# set ntp boot-server 10.1.4.1</pre> Specify the NTP server: <pre>[edit system] user@switch# set ntp server 10.1.4.2</pre> Specify the key number, authentication type (MD5), and key for authentication: <pre>[edit system] user@switch# set ntp authentication-key 2 type md5 value "\$ABC123"</pre>
Results	<p>Check the results:</p> <pre>[edit system] user@switch# show ntp { boot-server 10.1.4.1; authentication-key 2 type md5 value "\$ABC123"; ## SECRET-DATA server 10.1.4.2; }</pre>

Verification

To confirm that the configuration is correct, perform these tasks:

- [Checking the Time on page 192](#)
- [Displaying the NTP Peers on page 193](#)
- [Displaying the NTP Status on page 193](#)

Checking the Time

Purpose	Check the time that has been set on the switch.
Action	<p>Enter the show system uptime operational mode command to display the time.</p> <pre>user@switch> show system uptime fpc0: ----- Current time: 2009-06-12 12:49:03 PDT System booted: 2009-05-15 06:24:43 PDT (4w0d 06:24 ago) Protocols started: 2009-05-15 06:27:08 PDT (4w0d 06:21 ago) Last configured: 2009-05-27 14:57:03 PDT (2w1d 21:52 ago) by admin1 12:49PM up 28 days, 6:24, 1 user, load averages: 0.05, 0.06, 0.01</pre>

Meaning The output shows that the current date and time are June 12, 2009 and 12:49:03 PDT. The switch booted 4 weeks, 6 hours, and 24 minutes ago, and its protocols were started approximately 3 minutes before it booted. The switch was last configured by user **admin1** on May 27, 2009, and there is currently one user logged in to the switch.

The output also shows that the load average is 0.05 seconds for the last minute, 0.06 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

Displaying the NTP Peers

Purpose Verify that the time has been obtained from an NTP server.

Action Enter the **show ntp associations** operational mode command to display the NTP server from switch obtained its time.

```
user@switch> show ntp associations
      remote      refid      st t when poll reach  delay  offset  jitter
=====
*ntp5.domain1.ne .GPS.          1 u  414 1024  377   3.435   4.002   0.765
```

Meaning The asterisk (*) in front of the NTP server name, or peer, indicates that the time is synchronized and obtained from this server. The delay, offset, and jitter are displayed in milliseconds.

Displaying the NTP Status

Purpose View the configuration of the NTP server and the status of the system.

Action Enter the **show ntp status** operational mode command to view the status of the NTP.

```
user@switch> show ntp status
status=0644 leap_none, sync_ntp, 4 events, event_peer/strat_chg,
version="ntpd 4.2.0-a Mon Apr 13 19:09:05 UTC 2009 (1)",
processor="powerpc", system="JUNOS9.5R1.8", leap=00, stratum=2,
precision=-18, rootdelay=2.805, rootdispersion=42.018, peer=48172,
refid=172.17.28.5,
reftime=cddd397a.60e6d7bf Fri, Jun 12 2009 13:30:50.378, poll=10,
clock=cddd3b1b.ec5a2bb4 Fri, Jun 12 2009 13:37:47.923, state=4,
offset=3.706, frequency=-23.018, jitter=1.818, stability=0.303
```

Meaning The output shows status information about the switch and the NTP.

 - [Configuring the NTP Time Server and Time Services on page 185](#)
 - [CLI Explorer](#)
 - *Junos OS Baseline Network Operations Guide*

Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization

Debugging and troubleshooting are much easier when the timestamps in the log files of all the routers or switches are synchronized, because events that span the network can be correlated with synchronous entries in multiple logs. We strongly recommend using the Network Time Protocol (NTP) to synchronize the system clocks of routers, switches, and other network equipment.

By default, NTP operates in an entirely unauthenticated manner. If a malicious attempt to influence the accuracy of a router or switch's clock succeeds, it could have negative effects on system logging, make troubleshooting and intrusion detection more difficult, and impede other management functions.

The following sample configuration synchronizes all the routers or switches in the network to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date is obtained when the router boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme should be used to hash the key value for authentication, which prevents the router or switch from synchronizing with an attacker's host posing as the time server.

```
[edit]
system {
  ntp {
    authentication-key 2 type md5 value "$ABC123"; # SECRET-DATA
    boot-server 10.1.4.1;
    server 10.1.4.2;
  }
}
```

PART 13

Passwords

- [Understanding Passwords on page 197](#)

CHAPTER 13

Understanding Passwords

- [Configuring the Root Password on page 197](#)
- [Recovering the Root Password on page 199](#)
- [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 200](#)

Configuring the Root Password

The Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user **root** with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as the *root user*. The root user (also referred to as *superuser*) has unrestricted access and full permissions within the system. The expression “log in as root” is commonly used when an action requires the user to log into the device as the root user.

NOTE: If you configure a blank password using the `encrypted-password` statement at the `[edit system root-authentication]` hierarchy level for root authentication, you can commit a configuration but you *cannot* log in as the root user and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the `[edit system]` hierarchy level and configuring one of the password options:

```
[edit system]
root-authentication {
  (encrypted-password "password"| plain-text-password);
  load-key-file URL filename;
  ssh-dsa "public-key" <from hostname>;
  ssh-ecdsa "public-key" <from hostname>;
  ssh-rsa "public-key" <from hostname>;
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
```

```
user@host# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
 - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
 - Valid passwords must contain at least one change of case or character class.

You can use the **load-key-file** *URL filename* statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file** *URL* statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Optionally, you can use the **ssh-dsa**, **ssh-ecdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@host# set root-authentication load-key-file my-host:.ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
    ssh-rsa "$ABC123"; # SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

- *Recovering the Root Password*

Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
 - Bits per second: 9600
 - Data bits: 8
 - Parity: None
 - Stop bits: 1
 - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot-s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: test1  
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit  
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

Related Documentation

- *Configuring the Root Password*

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 201](#)
- [Overview on page 201](#)
- [Configuration on page 201](#)

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**s, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
set system login password maximum-length 22
set system login password minimum-numeric 1
set system login password minimum-upper-cases 1
set system login password minimum-lower-cases 1
set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the **[system login password]** hierarchy level.

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

```
[edit system login password]
```

```
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```

4. Require users to set a password that has at least one punctuation-class character and at least one number.

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

- Recovering from a Failed Software Installation on page 212

Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

NOTE: You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```
4. Switch to the root account using the **su** command:

```
% su
Password: password
```

NOTE: The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the device:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=install-media-qfx-5e-15.1X53-D30.5-domestic.img of=/dev/da0
bs=1m
1399+0 records in
1399+0 records out
1466957824 bytes transferred in 394.081902 secs (3722469 bytes/sec)
```

6. Enter the following command:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

NOTE: The device automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Related Documentation

- [Performing a Recovery Installation Using an Emergency Boot Device on page 211](#)

Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

The system snapshot feature is especially effective as a bootup option after a partition corruption, as it is the only recovery option that allows you to completely restore the Junos OS and configuration in the event of a corrupted partition.

NOTE: System snapshot is not supported on the QFX10000 and QFX5200 switches.

This topic includes the following tasks:

- [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 207](#)
- [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 207](#)
- [Creating a Snapshot on the Alternate Slice of the Boot Media on page 208](#)

Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the QFX Series switch USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

```
user@switch> request system snapshot partition
```

NOTE: This example uses the partition option. If you have already created a partition for the snapshot, you don't need to use the partition option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.

- To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```

- To reboot the switch using a snapshot in a specific partition on the USB flash drive:

```
user@switch> request system reboot slice 1
```

Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:

```
user@switch> request system snapshot partition
```

NOTE: This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.

- To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```

- To reboot the switch using a snapshot in a specific partition in internal memory:

```
user@switch> request system reboot slice 1
```

Creating a Snapshot on the Alternate Slice of the Boot Media

The alternate slice of the boot media contains a backup software image that the switch can boot from if it is unable to boot from the primary slice. When you upgrade software, the new software image gets copied only to the primary slice of the boot media.

To create a snapshot of the currently booted software image on the backup slice of the boot media:

```
user@switch> request system reboot slice alternate
```

After the system boots up, you will see the following message before the login prompt:

WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted up from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

The system will generate an alarm indicating that the switch has booted from the backup slice.

Related Documentation

- [Verifying That a System Snapshot Was Created on a QFX Series Switch on page 265](#)
- [Understanding System Snapshot on page 261](#)

Creating a Snapshot and Using It to Boot a Device

The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the `/config` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive.

You can use the snapshot to boot the device at the next bootup or as a backup boot option.

The system snapshot feature is especially effective as a bootup option after a partition corruption, as it is the only recovery option that allows you to completely restore the Junos OS and configuration in the event of a corrupted partition on a switch.

NOTE: System snapshot is not supported on QFX10000 switches.

This topic includes the following tasks:

- [Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Device on page 209](#)

Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Device

A snapshot can be created on an external USB flash drive after a device is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on an external USB flash drive:

- An external USB flash drive that meets the device USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on the external USB flash drive and use it to boot the device:

1. Insert the external USB flash drive.
2. Issue the **request system snapshot** command.

```
user@device> request system snapshot
fpc0:
```

```
-----
Starting snapshot to usb (/dev/da0)
Creating snapshot on the host ..
Copying bootable disk image from host ..
Writing to usb (/dev/da0) ..
Copying 'Host OS' to '/dev/da0s1' .. (this may take a few minutes)
Copying 'JUNOS' to '/dev/da0s1' .. (this may take a few minutes)
The following filesystems were archived: / /config Host-OS
```

3. (Optional) Perform this step if you want to boot the device now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.

- Insert the external USB flash drive.
- Power cycle the device.

The external USB flash drive is detected.

- The software prompts you with the following options:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
Install Junos Snapshot [13.2-20131115_x_132_x51_vjunos.0
Boot to host shell [debug]
```

- Select **Install Junos Snapshot** to install the snapshot located on the external USB flash drive to the device.

The device copies the software from the external USB flash drive, occasionally displaying status messages. When the software is finished being copied from the external USB flash drive to the device, the device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the Junos OS login prompt:

```
root@device#
```

- [Understanding System Snapshot on page 261](#)

Performing a Recovery Installation Using an Emergency Boot Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 205](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

You can use the system snapshot feature to complete this step. The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into a memory source. See [“Creating a Snapshot and Using It to Boot a Device” on page 208](#).

NOTE: System snapshot is not supported on the QFX10000 and QFX5200 switches.

WARNING: The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the device.
2. Power cycle the device.

The emergency boot device is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following option if you have a snapshot saved on the emergency boot device:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
Install Junos Snapshot [14.1X53-D11_vjunos.61]
Boot to host shell [debug]
```

Select **Install Junos Snapshot** install the snapshot.

The software prompts you with the following option if you have Junos OS software from the factory installed on the emergency boot device.

```
Juniper Linux Installer - (c) Juniper Networks 2014
Reboot
Install Juniper Linux Platform
Boot to host shell [debug]
```

Select **Install Juniper Linux Platform** to install the Junos OS software from the emergency boot device.

4. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the software is finished being copied from the emergency device to the device, the device reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the Junos OS login prompt:

```
root@switch#
```

5. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.
6. Remove the emergency boot device.

Related Documentation

- [Creating an Emergency Boot Device on page 205](#)

Recovering from a Failed Software Installation

Problem	Description: If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.
Solution	If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

NOTE: QFX5100, EX4600, and OCX Series switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See [“Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch” on page 206](#) or [“Creating a Snapshot and Using It to Boot a Device” on page 208](#).

System snapshot is not supported on QFX10002 switches.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

Hit [Enter] to boot immediately, or space bar for command prompt.

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

NOTE: The loader prompt does not appear on QFX5100, QFX5200, EX4600, and OCX Series switches.

On QFX5100, QFX5200, EX4600, and OCX Series switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100, QFX5200, EX4600, or OCX Series switch.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
 - Network address of the server and the path on the server; for example,
`tftp://192.171.28/junos/jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz`
 - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example,
`file:///jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz`.

The installation now proceeds normally and ends with a login prompt.

Meaning [Table 19 on page 218](#) summarizes key output fields in the system properties display.

Table 19: Summary of Key System Properties Output Fields

Field	Values	Additional Information
General Information		
Serial Number	Serial number of device.	
Junos OS Version	Version of Junos OS active on the switch, including whether the software is for domestic or export use.	Export software is for use outside the USA and Canada.
Hostname	Name of the device.	
IP Address	IP address of the device.	
Loopback Address	Loopback address.	
Domain Name Server	Address of the domain name server.	
Time Zone	Time zone on the device.	
Time		
Current Time	Current system time, in Coordinated Universal Time (UTC).	
System Booted Time	Date and time when the device was last booted and how long it has been running.	
Protocol Started Time	Date and time when the protocols were last started and how long they have been running.	

Table 19: Summary of Key System Properties Output Fields (*continued*)

Field	Values	Additional Information
Last Configured Time	Date and time when a configuration was last committed. This field also shows the name of the user who issued the last commit command.	
Load Average	CPU load average for 1, 5, and 15 minutes.	
Storage Media		
Internal Flash Memory	Usage details of internal flash memory.	
External Flash Memory	Usage details of external USB flash memory.	
Logged in Users Details		
User	Username of any user logged in to the switch.	
Terminal	Terminal through which the user is logged in.	
From	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.	
Login Time	Time when the user logged in.	This is the user@switch field in show system users command output.
Idle Time	How long the user has been idle.

Monitoring Interface Status and Traffic

Purpose View interface status to monitor interface bandwidth utilization and traffic statistics.

- Action**
- To view interface status for all the interfaces, enter **show interfaces xe**.
 - To view status and statistics for a specific interface, enter **show interfaces xe interface-name**.
 - To view status and traffic statistics for all interfaces, enter either **show interfaces xe detail** or **show interfaces xe extensive**.

Meaning For details about output from the CLI commands, see *show interfaces xe*.

Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- Junos XML Management Protocol Application Programming Interface (API)—Application programmers can use the Junos XML Management Protocol API to monitor and configure Juniper Networks devices. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring the devices.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF API to monitor and configure Juniper Networks devices.
- Junos OS commit scripts—You can define scripts to enforce custom configuration tasks, enforce consistency, prevent common mistakes, and more. Every time you commit a new candidate configuration, the active commit scripts are called to inspect the new candidate configuration. If a configuration violates your custom rules, the script can instruct the Junos OS to perform various actions, including making changes to the configuration and generating custom, warning, and system log messages.
- Junos OS Op scripts—You can add your own commands to the operation-mode CLI. You can use these scripts to automate troubleshooting of known network problems and correct them.
- Junos OS event scripts—You can use event scripts to diagnose and fix issues, monitor the overall status of the system, and examine errors periodically. Event scripts are similar to op scripts except that certain events on the switch will trigger these scripts.
- CHEF—You can use CHEF automate the provisioning and management of compute, networking, and storage resources. Chef for Junos OS provides support for Chef on selected Junos OS devices, allowing you to automate common switching network configurations.
- Puppet—You can use PUPPET for configuration management. Puppet provides an efficient and scalable solution for managing the configurations of large numbers of devices. System administrators take advantage of Puppet to manage compute resources such as physical and virtual servers.

- [Upgrading Software on page 250](#)

Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the switch by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

package-name-m.nZx.y-domestic-signed.tgz

where:

- ***package-name*** is the name of the package—for example, ***jinstall-qfx***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***15.1***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, ***1.5***.

A sample switch software package name is:

```
jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz
```

NOTE: The image in the .tgz file is not automatically cleaned up after the image is successfully installed. If necessary, you can free up the storage space by using the `request system storage cleanup` command.

Software Installation Overview

A device is delivered with the Junos OS preinstalled. As new features and software fixes become available, you can upgrade your software to use them.

When you power on the switch, it starts (boots) using the installed software.

You upgrade the Junos OS on a switch by copying a software package to a switch or other system on your local network and then using the CLI to install the new software on the switch. You then reboot the switch, which boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the installation package removes all files from the `/var/tmp` directory of the switch and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

If you encounter any difficulties during software installation or an upgrade, you can use the recovery installation procedure to install the Junos OS on the switch.

Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

NOTE: You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the `/var/tmp` directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the `su` command:

```
% su
Password: password
```

NOTE: The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the device:

```
root@device% dd if=/var/tmp/filename of=/dev/dal bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=install-media-qfx-5e-15.1X53-D30.5-domestic.img of=/dev/da0
bs=1m
1399+0 records in
1399+0 records out
1466957824 bytes transferred in 394.081902 secs (3722469 bytes/sec)
```

6. Enter the following command:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

NOTE: The device automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Installing and Recovering Software Using the Open Network Install Environment (ONIE)

NOTE: ONIE is not supported on QFX10002 and QFX10008 switches in Junos OS Release 15.1X53-D30.

ONIE, the open network install environment from Cumulus Networks, is a network OS installer that installs Junos OS and third party applications on a switch. Juniper Network switches come preinstalled with ONIE. When you turn on a switch, the ONIE discovery and execution (ODE) application locates the management Ethernet interface and the Junos OS software package, which can be found either locally on the switch or on the network using HTTP, FTP, or TFTP. After the switch discovers and downloads the Junos OS software package, the switch installs the Junos OS software, reboots, and then boots from Junos OS. Junos OS then becomes the default software image .

NOTE: If you want to use the Junos OS CLI to install software, see [“Upgrading Software” on page 250](#).

Upgrading involves these tasks:

Understanding the Open Network Install Environment

Juniper Network switches come preinstalled with Junos OS, which is designed to be used with the Junos OS CLI. The Junos OS CLI uses .tgz files; an example filename is `jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz`. However, if you want to use ONIE to install Junos OS, you need to uninstall the existing Junos OS and reinstall the Junos OS image that has a .bin extension—for example, `jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin` file. When you uninstall the existing Junos OS image (.tgz file) and reinstall with the image that ONIE requires (.bin file), any existing configuration information is destroyed. ONIE only supports the ability to install a fresh version of Junos OS or reinstall the Junos OS software. ONIE does not support upgrading to a different version of Junos OS.

When you log into the switch with ONIE, you see the install boot menu:

- Juniper Linux (This is a default menu option.)
- Juniper Linux Debug
- Juniper Linux Recovery
- Go to ONIE Loader
 - ONIE: Install OS (This is a default menu option.)
 - ONIE: Rescue
 - ONIE: Uninstall OS
 - ONIE: Update ONIE
 - ONIE: Embed ONIE

You can use the following commands to install and uninstall Junos OS and start and stop the ONIE ODE application:

- **onie-nos-install**

Installs Junos OS from any URL, such as `http://`, `ftp://`, and `file://`.

- **onie-uninstaller**

Uninstalls Junos OS.

- **onie-discovery-start**

The discovery process starts automatically. However, if you stop the discovery process by issuing the **onie-discovery-stop** command, you can restart the discovery process by issuing the **onie-discovery-start** command.

- **onie-discovery-stop**

Stops the discovery process. To restart the discovery process, issue the **onie-discovery-start** command.

Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website at <http://www.juniper.net/support/>.

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

This procedure shows you how to upgrade software on a QFX Series device, but you can follow the same procedure for any device unless otherwise specified.

To download a software package:

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the By Technology box, click **Switching > QFXSeries > QFX5200**.
4. In the QFXSeries section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the install package from the Install Package box.
A login screen appears.
6. Enter your name and password and press Enter.
7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Save the `jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin` file to your computer.
9. Open or save the installation package either to the local system in the `var/tmp` directory or to a remote location. If you are copying the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or SCP.

Connecting to the Console Port

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that might occur.

Backing Up the Current Configuration Files

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

```
user@switch# save filename
```

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

Uninstalling the Existing Version of Junos OS

The switch comes preinstalled with a version of Junos OS that is to be used with the Junos OS CLI. However, if you want to use ONIE to install Junos OS, you need to uninstall the existing Junos OS and reinstall the Junos OS image that has a .bin extension—for example, jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin file.

To uninstall your existing Junos OS version:

1. Select **Go to ONIE Loader** from the GNU GRUB menu.
2. Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured DHCP or webserver and the management IP address of the switch and the IP address of the default gateway. If you want to manually configure static addressing for the management IP address of the switch, issue **onie-discovery-stop** command at the ONIE prompt, and then manually configure the management IP address and IP address of the default gateway.

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

To restart the ONIE discovery and execution (ODE) application, issue the **onie-discovery-start** command.

For example:

```
ONIE:/ # onie-discovery-start
```

Installing a Junos OS Software Package That Resides on a Webserver or DHCP Server with DHCP Options Configured

To install a Junos OS software package residing on a webserver or DHCP server:

1. Copy the software image with the filename **onie-installer** to the **var/www/html** directory of the webserver or DHCP server.
2. Configure the DHCP option 114 in the DHCP server to redirect to the webserver to fetch the Junos OS software image.
3. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

4. Configure DHCP option 114 and other DHCP options as necessary.

Here is a sample Windows Open DHCP server configuration with DHCP option 114 configured.

```
#Following are range-specific DHCP options.
#You can copy more option names from [GLOBAL_OPTIONS]
IP=10.204.42.250
SubnetMask=255.255.240.0
Router=10.204.47.254
114="http://10.207.66.147/onie-installer"
```

Here is a sample boot initialization log, showing the options you just configured:

```
Info: Trying DHCPv4 on interface: eth0
ONIE: Using DHCPv4 addr: eth0: 10.204.42.250 / 255.255.240.0
ONIE: Starting ONIE Service Discovery
Info: Fetching http://10.207.66.147/onie-installer ...
ONIE: Executing installer: http://10.207.66.147/onie-installer  <-----
automatically redirects to web sever to fetch Junos OS image.
Verifying image checksum ... OK.
Preparing image archive ... OK.
Installing Juniper NOS...
```

The log shows that the installation process has fetched the Junos OS software image from the DHCP server and is installing the Junos OS software.

The switch reboots and the GNU GRUB menu is displayed.

Installing Junos OS Software Using Secure Copy Protocol (SCP)

To install Junos OS software using SCP:

1. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured webserver. If you do not have DHCP configured, you will need to stop the ONIE discovery and execution (ODE) application and manually configure static addressing for the management IP address of the switch,

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

2. Use SCP to copy the Junos OS image from a server or other location to the `/var/tmp` directory on the switch.

For example:

```
user@server scp jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
root@10.204.32.196:/var/tmp/
```

3. Issue the `onie-nos-install` command in the `/var/tmp` directory to install Junos OS software.

```
ONIE:/var/tmp # onie-nos-install file:///var/tmp/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

The switch reboots and displays the GNU GRUB menu.

Installing Junos OS Software Using FTP or TFTP Without a Webserver

To install Junos OS software using FTP or TFTP:

1. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured webserver. If you do not have DHCP configured, you will need to stop the ONIE discovery and execution (ODE) application and manually configure static addressing for the management IP address of the switch,

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

2. Copy the Junos OS image to an FTP or TFTP directory.
3. Issue the **onie-nos-install** command at the ONIE prompt to install the Junos OS software.

If you are using FTP:

```
ONIE:/ # onie-nos-install ftp://<username>:<password>@10.209.152.22/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

If you are using TFTP:

NOTE: The software image should be located in the `/tftp/boot` directory.

```
ONIE:/ # onie-nos-install tftp://10.207.66.147/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

The switch reboots and displays the GNU GRUB menu.

Installing Junos OS Software Using DHCP Server with No DHCP Options Configured

Use this installation method if you cannot modify or set the DHCP options on your DHCP server.

To install the Junos OS software using a DHCP server with no DHCP options configured:

1. Copy the software image with the filename **jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin** to the **var/www/html** directory of the webserver or DHCP server.
2. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.

- Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

3. Issue the **onie-nos-install** command at the ONIE prompt to install the Junos OS software.

For example:

```
ONIE:/ # onie-nos-install http://10.207.66.147/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

Here is sample log with the options you just configured:

```
ONIE:/ # ifconfig
eth0      Link encap:Ethernet  HWaddr 94:DE:80:AA:F2:E1
          inet addr:10.204.42.250  Bcast:10.204.47.255  Mask:255.255.240.0
<<<---- --> Received IP address from DHCP server, but auto redirected to web
server. Installation will not happen because DHCP option (114) is not
configured.
```

```

```

The switch reboots and the GNU GRUB menu is displayed.

Installing Junos OS Software Using Webserver Without DHCP Configured

Use this installation method if you do not have a DHCP server.

To install the Junos OS software using a webserver without DHCP configured:

1. Because the switch comes preinstalled with the Junos OS to be used with the Junos OS CLI, you need to uninstall this version of software before you can install the Junos OS image to be used with ONIE.

- Select **Go to ONIE Loader** from the GNU GRUB menu.
- Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

2. Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured webserver. Because you do not have DHCP configured, you will need to stop the ONIE discovery and execution (ODE) application and manually configure static addressing for the management IP address of the switch.

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

3. Copy the software image to the **var/www/html** directory of the webserver.
4. Issue the **onie-nos-install** command at the ONIE prompt to install the Junos OS software.

For example:

```
ONIE:/ # onie-nos-install http://10.204.35.100/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

Here is sample log:

```
Stopping: discover... done.
Info: Fetching http://10.204.35.100/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin ...

Verifying image checksum ... OK.
Preparing image archive ... OK.
Installing Juniper NOS...
```

The log shows that the installation process has fetched the Junos OS software image from the webserver and is installing the Junos OS software.

The switch reboots and the GNU GRUB menu is displayed.

Installing Junos OS Software Using USB Media

NOTE: This installation method is not supported on the QFX5200 switches.

To install the Junos OS software using USB media:

1. Make sure the USB stick is formatted as VFAT or ext2.
2. Copy the software image with the filename **onie-installer** to the USB stick and insert the USB stick into the front USB port of the switch.
3. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, the switch reboots, and the software is installed from the USB stick.

Here is a sample log showing the USB installation process:

```

JUNOS Host qfx-5e platform package [15.1X53-D30.5]
JUNOS Host qfx-5e control-plane flex package [15.1X53-D30.5]
JUNOS Host qfx-5e base package [15.1X53-D30.5]
JUNOS Host qfx-5e data-plane package [15.1X53-D30.5]
```

In this example, the CLI output shows that Junos OS Release Software 15.1X53-D30.5 was installed on the switch.

Troubleshooting Unsupported Network Operating System

Problem **Description:** ONIE has detected an unsupported network operating system.

Solution You can only run the Junos OS network operating system with the .bin file extension on the switch. If you receive a message that says, “**NOS Updater has detected incompatible NOS. Please uninstall it manually before proceeding. Exiting...**,” you must uninstall the unsupported network operating system from the switch. The following procedure explains how to uninstall the unsupported network operating system.

1. Select **Go to ONIE Loader** from the GNU GRUB menu.
2. Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The network operating system is uninstalled, and the switch reboots.

Troubleshooting ONIE ISO Files

Problem **Description:** In the event that you cannot get ONIE ISO file sources from Alpha Networks, you can perform this procedure to get ISO files sources from an open source.

Solution 1. Download the ONIE ISO files by issuing the **git clone** <https://github.com/opencomputeproject/onie> command.

For example:

```
$ git clone https://github.com/opencomputeproject/onie
```

2. To compile ONIE, make sure you are in the **build-config** directory and then issue the **make -j4 MACHINEROOT=../machine/alpha_networks MACHINE=alpha_networks_snx60a0_486f all** command.

For example:

```
$ cd build-config
$ make -j4 MACHINEROOT=../machine/alpha_networks
MACHINE=alpha_networks_snx60a0_486f all
```

3. Download the built image located in the **build/images/onie-recovery-x86_64-alpha_networks_snx60a0_486f-r0.iso** directory.

Creating an Emergency Boot Device for ONIE Software and Network Operating System

If the Open Network Install Environment (ONIE) software is damaged or corrupted in some way, or the switch went into rescue mode, you can use an emergency boot device to repartition the primary disk and load a fresh installation of ONIE. Use the following procedure to create an emergency boot device.

Before you begin, you need to have the 201502181747 version of ONIE software.

NOTE: In the following procedure, we assume that you are creating the emergency boot device on a switch. You can create the emergency boot device on any PC or laptop that supports Linux. The emergency boot device will contain both ONIE software and the Network Operating Software (NOS).

To create an emergency boot device:

1. Insert the USB stick into the front USB port of the switch.
2. Issue the following command from the directory on the switch in which the ISO file is located:

```
ONIE:/ # dd if=onie-recovery-x86_64-alpha_networks_snx60a0_486f-r0.iso
of=<usb-detected-drive> bs=1M count=20
```

You can also issue the **dd** command using the full path to where the ISO file is located.

For example, if the ISO file is located in the **/var/tmp/** directory:

```
root@device%dd if=jnpr-qfx-5e-flex-onie-usb-15.1X53-D30.5.iso of=<usb-detected-drive>
/dev/da0 bs=1m
```

The switch writes the installation media image to the USB device:

3. Remove the USB stick from the USB port of the switch.

Performing a Recovery Installation

In the event that the Open Network Install Environment (ONIE) is corrupted, the switch goes into rescue mode, or you need to reinstall ONIE software for any reason, you need to perform a recovery installation.

NOTE: All Junos OS partitions are destroyed during a recovery installation.

NOTE: Before you can perform a recovery installation, make sure you have an emergency boot device loaded with ONIE software.

1. Insert the emergency boot device into the device.
2. Power cycle the device.
3. Press the **ESC** button to go into the Boot Manager menu.
4. Select **Boot Manager**, and then press **Enter**.
5. Select **Unigen PQS1000** under **Legacy USB**, and then press **Enter**.
6. Select **ONIE: Embed ONIE** from the **ONIE Installer** menu, and then press **Enter**.

The recovery installation proceeds using the emergency boot device.

7. Remove the emergency boot device.
8. Verify that the ONIE software was installed by looking at the installation log file.

For example:

```
Info: Found static url: file:///lib/onie/onie-updater
ONIE: Executing installer: file:///lib/onie/onie-updater
Verifying image checksum ... OK.
Preparing image archive ... OK.
ONIE: Version          : master-201502181747
```

Installation log files are displayed automatically during the installation process, but if you want to verify installation log files at a different time, you can find them in the `/var/log/` directory. To view an installation log file, issue the **tail -f /var/log/onie.log** command.

9. Issue the **var/tmp # parted /dev/sda print** command to verify that the ONIE partitions have been created.

For example:

```
ONIE:/ var/tmp # parted /dev/sda print
Model: ATA TS32GMTS400 (scsi)
Disk /dev/sda: 32.0GB
Sector size (logical/physical): 512B/512B
Partition Table: gpt
Disk Flags:
```

Number	Start	End	Size	File system	Name	Flags
1	1049kB	3146kB	2097kB		GRUB-B00T	hidden, bios_grub
2	3146kB	137MB	134MB	ext4	ONIE-B00T	hidden

Upgrading Jloader Software on QFX Series Devices

Jloader software contains a boot loader (Uboot), which is used to bring up QFX Series devices and load the Junos OS from the flash memory of these devices. You can upgrade Jloader software on QFX3500 switches, QFX3500 and QFX3600 Node devices, and QFX3600-I and QFX3008-I Interconnect devices.

NOTE: Before you upgrade the Jloader software, see [Table 20 on page 240](#), [Table 21 on page 240](#), and [Table 22 on page 240](#) to make sure that you are upgrading to the right version of Jloader software for the Junos OS software release running on your QFX3500 switches, or Node devices and Interconnect devices in your QFabric system.

See [Table 23 on page 241](#) to see which Uboot software versions are available and the filenames of the Jloader software packages.

Table 20: Junos OS and Jloader Software Compatibility Matrix for the QFX3500 Switch and QFX3500 Node Device

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
11.3R1 and later (QFX3500 switch)	Supported	Supported	Not supported	Supported and recommended
11.3X30.6 and later (QFX3500 Node device)	Supported	Supported	Not supported	Supported and recommended
12.1X49-D1 and later (QFX3500 switch)	Supported	Supported	Not supported	Supported and recommended
12.2X50-D1 and later (QFX3500 switch and QFX3500 Node device)	Supported	Supported	Not supported	Supported and recommended

NOTE: An en dash means that the item is not applicable.

Table 21: Junos OS and Jloader Software Compatibility Matrix for the QFX3008-I Interconnect Device

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
11.3X30.9 and later (QFX3008-I Interconnect device)	Supported	Supported	Not supported	Supported and recommended
11.3X30.6 and later (QFX3008-I Interconnect device)	Supported	Supported	Not supported	Supported and recommended
12.2X50-D10.3 and later (QFX3008-I Interconnect device)	Supported	Supported	Not supported	Supported and recommended

NOTE: An en dash means that the item is not applicable.

Table 22: Junos OS and Jloader Software Compatibility Matrix for the QFX3600-I Interconnect Device and QFX3600 Node Device

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
12.2X50-D10.3 and later (QFX3600-I Interconnect Device and QFX3600 Node Device)	-	-	Supported	Supported and recommended
12.2X50-D20 and later (QFX3600 switch)	-	-	Supported	Supported and recommended

Table 23: Uboot Software Release and Jloader Software Compatibility Matrix

Uboot Software Release Number	Jloader Software Package Name
1.1.2	jloader-qfx-11.3X30.9-signed.tgz
1.1.4 (11.3R3 and 11.3R2 releases only. Not supported on 11.3R1)	jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz
1.1.4 (12.1R1 release and later)	jloader-qfx-12.1-20120125_pr.0-signed.tgz
1.1.5 (12.2X50-D10.3 and later)	jloader-qfx-12.2X50.D10.3-signed.tgz
1.1.8 (13.1X50-D15.1 and later)	jloader-qfx-13.3-20130831_pr_branch_qfd.0.tgz

Jloader Software Version 1.1.4 Guidelines

Jloader Release 1.1.4 is compatible with Junos OS Release 11.3R3 and 11.3R2, and Junos OS Release 12.1R1 and later. Jloader Release 1.1.4 is not compatible with Junos OS Release 11.3R1. The Jloader software package names are different for versions 1.1.4 (Junos OS 11.3R3 and 11.3R2) and 1.1.4 (Junos OS 12.2R1 release and later), but the binaries are the same. Because the binaries are the same, you can upgrade or downgrade to any Junos OS release.

- If you have Junos OS Release 11.3 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz** software package.
- If you have Junos OS Release 11.3R2 installed and want to upgrade to Junos OS Release 12.1, you do not need to upgrade the Jloader Release and can continue to use Jloader Release 1.1.2.
- If you have Junos OS Release 12.1 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-12.1-20120125_pr.0-signed.tgz** software package.
- If you upgrade to Junos OS Release 12.1, you can upgrade to Jloader Release 1.1.4 using the **jloader-qfx-12.1-20120125_pr.0-signed.tgz** software package.

Upgrading Jloader Software on a QFX3500 Switch

The Jloader software for a QFX3500 switch resides in two flash memory banks. At any time, one bank acts as the primary bank, and the QFX3500 switch boots from it. The other bank is the backup bank—if the QFX3500 switch cannot boot from the primary bank, it boots from the backup bank. When you upgrade the Jloader software, the upgraded software is installed in the backup bank, which then becomes the new primary bank. Thus the primary and backup banks alternate each time you upgrade the Jloader software, with the primary bank containing the most recently installed version of the software, and the backup bank containing the previous version. To upgrade the Jloader software on a QFX3500 switch, you must perform the upgrade twice: once for each bank. Each upgrade requires that you to reboot the QFX3500 switch.

NOTE: If you are running Junos OS Release 11.3R1 or Junos OS Release 11.3R2, you must use the `no-validate` option when you issue the `request system software add` command to upgrade the Jloader software. Otherwise, the installation will fail and you receive a configuration error. The `no-validate` option is not required for Junos OS Release 11.3R3 and later.

NOTE: After you upgrade the Jloader software on the first bank, the software package is deleted after you reboot. Make sure that you have either downloaded the Jloader software package to either a remote site or in a local directory on the switch, such as the `/var/tmp` directory on the QFX3500 device.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html> .
The Junos Platforms Download Software page appears.
2. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
4. Select the Software tab and then select the install package you want to download in the Install Package section.
5. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
6. Enter your name and password and press **Enter**.
7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Open or save the `jloader-qfx-version-signed.tgz` file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

9. Log in to the QFX3500 switch and enter the shell. We recommend using a console connection.
10. Determine the version of the Jloader software package installed on the switch.

For example:

```
root@switch% ls
gres-tp krt_gencfg_filter.txt
jloader-qfx-11.3-20110510.0-signed.tgz
```

11. Determine the version of the Uboot software that is running in the bank:

For example:

```
root@switch% kenv | grep boot.version
boot.version="1.0.7"
```

12. Enter the CLI and install the Jloader software package.

- To install a Jloader software package that is located in the `/var/tmp` directory, issue the **request system software add /var/tmp/jloader-qfx-version.tgz no-validate** command:

For example:

```
user@switch> request system software add
/var/tmp/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

You see the following messages during the installation:

```
Verified jloader-qfx-11.3-20110510.0.tgz signed by PackageProduction_11_3_0
Adding jloader-qfx...
Installation in progress, please wait...
Mounted jloader-qfx package on /dev/md8...
Verified manifest signed by PackageProduction_11_3_0
Verified jloader-qfx-11.3-20110510.0 signed by PackageProduction_11_3_0
Registering jloader-qfx as unsupported
```

```
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3-20110510.0-signed.tgz
...
Saving state for rollback ...
```

```
juniper@qfx3500>
```

- To install a Jloader software package located on a remote server using FTP, issue the **request system software add /ftp://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

For example:

```
user@switch> request system software add
/ftp://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

- To install a Jloader software package located on a remote server using HTTP, issue the **request system software add /http://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

For example:

```
user@switch> request system software add
/http://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

13. When prompted, reboot the Control Board by issuing the **request system reboot** command.

For example:

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
```

14. Enter the shell and verify that the version of the Uboot software in the primary bank is the version you just installed.

For example:

```
root@switch% kenv | grep boot.version
boot.version="1.1.1"
```

15. To install the Jloader software package on the current backup bank, repeat Step 10 through Step 14.

Upgrading Jloader Software on a QFabric System

This procedure explains how to upgrade the Jloader software on your Node devices and Interconnect devices. The example shows how to upgrade the Jloader Release 1.1.1 to 1.1.2 on a Node device with the serial number BBAK1186.

NOTE: Before you upgrade the Jloader software, make sure you have the serial numbers of the Node devices, Interconnect devices, and Control Boards in the Interconnect devices you want to upgrade.

1. Issue the **show chassis hardware node-device ?** command to view the serial numbers of the Node devices.

For example:

```
user@qfabric> show chassis hardware node-device ?
<node-device>      Node device identifier
BBAK1186            Node device
BBAK3149            Node device
BBAK3177            Node device
BBAK8063            Node device
BBAK8799            Node device
P2443-C             Node device
P2515-C             Node device
P3708-C             Node device
P3885-C             Node device
P3916-C             Node device
node0               Node device
node1               Node device
node2               Node device
node3               Node device
node4               Node device
node5               Node device
node6               Node device
node7               Node device
node8               Node device
```

An example of a Node device serial number is BBAK1186.

2. Issue the **show chassis hardware interconnect-device ?** command to view the serial numbers of the Interconnect devices.

For example:

```
user@qfabric> show chassis hardware interconnect-device ?
Possible completions:
interconnect-device  Interconnect device identifier
IC-F1052             Interconnect device
IC-F3947             Interconnect device
```

The Interconnect device serial numbers are IC-F1052 and IC-F3947.

3. Issue the **show chassis hardware interconnect-device name** command to view the serial numbers of the Control Boards in the Interconnect device.

For example:

```
user@qfabric> show chassis hardware interconnect-device IC-F3947
```

Hardware inventory:

Item	Version	Part number	Serial number	Description
Chassis	REV 10		F3947	QFXC08-3008
Midplane	REV 10	750-035835	F3947-C	QFX Midplane
CB 0 Board	REV 14	750-035855	ZJ9432	QFX Chassis Control
Routing Engine 0		BUILTIN	BUILTIN	QFX Routing Engine
CB 1 Board	REV 14	750-035855	ZJ9404	QFX Chassis Control

The Control Board serial numbers are ZJ9432 and ZJ9404.

4. Issue the **show chassis firmware node-device *name*** command to see which version of Uboot software you have installed on your Node device.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
```

Part	Type	Version
node4	U-Boot	1.1.6 (May 10 2011 - 04:52:59) 1.1.1
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.1. The loader software version appears after the timestamp for U-Boot 1.1.6.

5. Issue the **show chassis firmware interconnect-device *name*** command to see which version of Uboot software you have installed on the Routing Engines located on the Control Boards of the Interconnect device.

For example:

```
user@qfabric> show chassis firmware interconnect-device IC-F3947
```

Part	Type	Version
Routing Engine 0	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1
Routing Engine 1	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.4. The loader software version appears after the timestamp for U-Boot 1.1.6.

6. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms Download Software page appears.

7. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
8. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
9. Select the **Software** tab and then select the install package you want to download in the Install Package section.

10. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
11. Enter your username and password, and press **Enter**.
12. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
13. Open or save the **jloader-qfx-version-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
14. Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download /path/package-name** command.

For example:

```
user@qfabric> request system software download
ftp://server/files/jloader-qfx-11.3X30.9-signed.tgz
```

15. Log in to the Director device as root and enter the shell to verify that you have downloaded the Jloader software package. We recommend using a console connection. The software package is copied from where you downloaded it and is placed locally on the QFabric system in the **/pbdata/packages** directory.

For example:

```
[root@dg0] # pwd
/pbdata/packages

[root@dg0] # ls
jloader-qfx-11.3X30.9-signed.tgz
```

16. Before you copy over the Jloader software package to the Node device or Interconnect device, determine the directory that matches the serial number of the Node device or Interconnect device that you want to upgrade. View the remote logs and the Node device and Interconnect device serial numbers by issuing the **ls /pbdata/export/rlogs** command at the command line of the Director device before you copy the software package over to the device.

NOTE: The **/pbdata/export/rlogs/node-device-serial-ID** and **/pbdata/export/rlogs/interconnect-device-serial-ID** directories on the Director device are NFS mounted as the **/tftpboot/logfiles** directories on the Node device and Interconnect device. These directories are created for all Node devices and Interconnect devices in a QFabric system. The Jloader files are stored in the **/tftpboot/logfiles** directories for each Node device and Interconnect device.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs
02de4930-828b-11e1-a319-00e081c57938 c9898afe-828b-11e1-956c-00e081c57938
04103b2a-29d5-e011-bf8a-0e6bdf3aa1e6 eeba4aac-828b-11e1-85e2-00e081c57938
1e2739e0-828b-11e1-bf74-00e081c57938 F1052
8d8a978c-828b-11e1-a833-00e081c57938 F3947
ad55b89e-828b-11e1-b70e-00e081c57938 P2443-C
BBAK1186 P2515-C
```

BBAK3149	P3708-C
BBAK3177	P3885-C
BBAK8063	P3916-C
BBAK8799	

BBAK1186 is the serial number of the Node device that needs to be upgraded.

17. Copy the Jloader software package from the `/var/tmp` directory to the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # cp jloader-qfx-11.3X30.9-signed.tgz /pbdata/export/rlogs/BBAK1186
```

18. Confirm that the Jloader software package you copied over is in the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs/BBAK1186
jloader-qfx-11.3X30.9-signed.tgz
```

19. Issue the `/root/dns.dump` command to find out the internal IP addresses of the Node device or Interconnect device.

```
[root@dg0 tmp] # /root/dns.dump
; <<>> DiG 9.3.6-P1-RedHat-9.3.6-4.P1.e15 <<>> -t axfr pkg.test.device.net
@169.254.0.1
;; global options: printcmd
pkg.test.device.net. 600 IN SOA ns.pkg.test.device.net.
mail.pkg.test.device.net. 152 3600 600 7200 3600
pkg.test.device.net. 600 IN NS ns.pkg.test.device.net.
pkg.test.device.net. 600 IN A 169.254.0.1
pkg.test.device.net. 600 IN MX 1 mail.pkg.test.device.net.
dcfnode---DCF-R00T.pkg.test.device.net. 45 IN A 169.254.192.17
dcfnode---DRE-0.pkg.test.device.net. 45 IN A 169.254.3.3
dcfnode-8d8a978c-828b-11e1-a833-00e081c57938.pkg.test.device.net. 45 IN A
169.254.128.19
dcfnode-ad55b89e-828b-11e1-b70e-00e081c57938.pkg.test.device.net. 45 IN A
169.254.128.20
dcfnode-BBAK1186.pkg.test.device.net. 45 IN A 169.254.128.14
```

The internal IP address for BBAK1186 is 169.254.128.14.

20. Upgrade the Jloader software on the Node device or Interconnect device.

Before you can upgrade the Jloader software, you need to use SSH to log in to the Node device or Interconnect device and verify that the software is in the `/tftpboot/logfiles` directory.

- a. Use SSH to log in to the Node device or Interconnect device.

For example:

```
[root@dg0 tmp] # ssh 160.254.128.14
root@169.254.128.14's password:
--- JUNOS 11.3X30.10 built 2012-03-11 22:55:43 UTC
At least one package installed on this device has limited support.
Run 'file show /etc/notices/unsupported.txt' for details.
root@sng3%
```

- b. Verify that the Jloader software package is in the `tftpboot/logfiles` directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /tftpboot/logfiles
.index                               jloader-qfx-11.3X30.9-signed.tgz
```

- c. Copy the Jloader software package from the **/tftpboot/logfiles** directory to the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% cp /tftpboot/logfiles/jloader-qfx-11.3X30.9-signed.tgz /var/tmp
```

- d. Verify that the Jloader software package is in the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /var/tmp
.snap                               jloader-qfx-11.3X30.9-signed.tgz
    tmp
gres-tp                             krt_gencfg_filter.txt
    vc-autoupgrade
if-rtbdb                             rtsdb
```

- e. Enter CLI mode and issue the **request system software add /var/tmp/jloader-qfx-version-signed.tgz** command.

For example:

```
root@sng3% cli
root@sng3> request system software add /var/tmp/jloader-qfx-11.3X30.9-signed.tgz

#####
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3X30.9-signed.tgz ...
Saving state for rollback ...
```

Upgrade has completed successfully.
Reboot is now required.

- f. Reboot both the Node device and Interconnect device twice, because they each contain two partitions.

For example:

```
root@sng3> request system reboot
Reboot the system ? [yes,no] (no) yes
Shutdown NOW!
[pid 37663]
```

```
root@sng3>
```

```
*** FINAL System shutdown message from root@sng3 ***
```

```
System going down IMMEDIATELY
```

- g. Verify that the Uboot software on the Node device or Interconnect device has been upgraded to the new Uboot software by logging in to the QFabric CLI and issuing either the **show chassis firmware node-device *name*** command or the **show chassis firmware interconnect-device *name*** command.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
Part                Type      Version
node4               U-Boot   1.1.6 (Nov 19 2011 - 11:42:07) 1.1.2
                                loader    FreeBSD/MIPS U-Boot bootstrap loader
0.1
```

The Uboot software version is now 1.1.2. The loader software version appears after the timestamp for U-Boot 1.1.6.

Upgrading Software

To upgrade Junos OS, you need to install the appropriate upgrade package on the device. Upgrading involves these tasks:

NOTE: If you want to use the Open Network Install Environment (ONIE) to install software, see “Installing and Recovering Software Using the Open Network Install Environment (ONIE)” on page 226.

1. Downloading Software Files with a Browser on page 251
2. Accessing Software Downloaded to a Remote Location on page 252
3. Connecting to the Console Port on page 252
4. Backing Up the Current Configuration Files on page 252
5. Installing a Standard Software Package on QFX10002 Switches on page 253
6. Installing a Standard Software Package on QFX10008 and QFX10016 Switches on page 255

Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website, go to <http://www.juniper.net/support/>.

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

This procedure shows you how to upgrade software on a QFX Series device, but you can follow the same procedure for any device unless otherwise specified.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. In the **Install Package** section of the **Software** tab, select the **Install Package** for the release.
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.

9. Save the **jinstall-qfx-<version>-secure-domestic.tgz** file on your computer.
10. Open or save the installation package either to the local system in the **var/tmp** directory or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

Accessing Software Downloaded to a Remote Location

To access the installation package if you downloaded it to a remote location (for example, any system other than the switch):

1. From the command line, make sure you are in the **/var/tmp** directory of the switch.
2. Start the shell interface:

```
user@switch> start shell
```

3. Initiate an FTP, TFTP, or scp session.

In this example, FTP is used.

```
>ftp
```

4. Use FTP to access the remote location where the installation package resides.

For example:

```
ftp ftp://<hostname>/<pathname>/<package-name-m.mZx-distribution>.tgz.
```

where **<package-name-m.mZx-distribution>.tgz** is

jinstall-qfx-m-15.1X53-D33.secure-domestic.tgz

5. When prompted, enter your username and password.
6. Use the **get** command to transfer the installation package from the remote location to your **/var/tmp** directory on your switch.

```
get <package-name-m.mZx-distribution>.tgz
```

7. Close the FTP session:

```
bye
```

Connecting to the Console Port

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that may occur.

Backing Up the Current Configuration Files

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

```
user@switch# save filename
```

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

Installing a Standard Software Package on QFX10002 Switches

NOTE: Before you install the software, back up any critical files in `/var/home`. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

NOTE: If you want to downgrade from Junos OS Release 15.1X53-D60 to a previous release, pay attention to these caveats:

Table 24: Caveats for Downgrading from Junos OS Release 15.1X53-D60 to Previous Software Releases

Junos OS Software Releases	Using the CLI	Using a USB Stick
15.1X53-D33	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded.	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded.
15.1X53-D32	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded. NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D30.	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded. NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D32.
15.1X53-D30	No	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded. NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D30.

Table 24: Caveats for Downgrading from Junos OS Release 15.1X53-D60 to Previous Software Releases (*continued*)

Junos OS Software Releases	Using the CLI	Using a USB Stick
Releases prior to 15.1X53-D30	No	<p>Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded.</p> <p>NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D30.</p>

Install the software in one of two ways:

If the installation package resides locally on the switch, execute the **request system software add <pathname><source> reboot** command.

For example:

```
user@switch> request system software add  
/var/tmp/jinstall-qfx-m-15.1X53-D33.secure-domestic.tgz reboot
```

If the Install Package resides remotely, execute the **request system software add <pathname><source> reboot** command.

For example:

```
user@switch> request system software add  
ftp://ftpsrvr/directory/jinstall-qfx-m-15.1X53-D33.secure-domestic.tgz reboot
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

Installing a Standard Software Package on QFX10008 and QFX10016 Switches

NOTE: Before you install the software, back up any critical files in `/var/home`. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

NOTE: On the switch, use the `force-host` option to force-install the latest version of the Host OS. However, by default, if the Host OS version is different from the one that is already installed on the switch, the latest version is installed without using the `force-host` option.

NOTE: If you want to downgrade from Junos OS Release 15.1X53-D60 to a previous release, pay attention to these caveats:

Table 25: Caveats for Downgrading from Junos OS Release 15.1X53-D60 to Previous Software Releases

Junos OS Software Releases	Using the CLI	Using a USB Stick
15.1X53-D33	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded.	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded.
15.1X53-D32	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded. NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D30.	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded. NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D32.
15.1X53-D30	No	Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded. NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D30.

Table 25: Caveats for Downgrading from Junos OS Release 15.1X53-D60 to Previous Software Releases (*continued*)

Junos OS Software Releases	Using the CLI	Using a USB Stick
Releases prior to 15.1X53-D30	No	<p>Yes, but the configuration is lost, and there is no workaround. We recommend that you save the configuration to an external location, such as a remote server, and then load the configuration after you have successfully downgraded.</p> <p>NOTE: You must downgrade to Junos OS Release 15.1X53-D33 before you downgrade to Junos OS Release 15.1X53-D30.</p>

The switch contains two routing engines, so you will need to install the software on each routing engine (re0 and re1).

If the installation package resides locally on the switch, execute the **request system software add <pathname><source> (re0 | re1)** command.

To install the software on re0:

```
user@switch> request system software add
/var/tmp/jinstall-qfx-m-15.1X53-D33.secure-domestic.tgz re0
```

If the Install Package resides remotely from the switch, execute the **request system software add <pathname><source> re0** command.

For example:

```
user@switch> request system software add
ftp://ftpserver/directory/jinstall-qfx-m-15.1X53-D33.secure-domestic.tgz re0
```

To install the software on re1:

```
user@switch> request system software add
/var/tmp/jinstall-qfx-m-15.1X53-D33.secure-domestic.tgz re1
```

If the Install Package resides remotely from the switch, execute the **request system software add <pathname><source> re1** command.

For example:

```
user@switch> request system software add
ftp://ftpserver/directory/jinstall-qfx-10-m-flex-15.1X53-D60-secure-domestic-signed.tgz re1
```

Reboot both routing engines.

For example:

```
user@switch> request system reboot both-routing-engines
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

- [Verifying That a System Snapshot Was Created on a QFX Series Switch on page 265](#)

Understanding System Snapshot

NOTE: On QFX3500 and QFX3600 switches running Enhanced Layer 2 Software, all of the directories that reside in the “/” partition are read only.

NOTE: System snapshot is not supported on QFX10002 switches.

You can create copies of the software running on a switch using the system snapshot feature. The system snapshot feature takes a “snapshot” of the files currently used to run the switch—the complete contents of the `/config` and `/var` directories, which include the running Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use this snapshot to boot the switch at the next boot up or as a backup boot option.

You can only use snapshots to move files to external memory if the switch was booted from internal memory, or to move files to internal memory if the switch was booted from external memory. You cannot create a snapshot in the memory source that booted the switch even if the snapshot is being created on a different partition in the same memory source.

Snapshots are particularly useful for moving files onto USB flash drives. You cannot use the `copy` command or any other file-moving technique to move files from an internal memory source to USB memory on the switch.

System snapshots on the switch have the following limitations:

- You cannot use snapshots to move files to any destination outside of the switch other than an installed external USB flash drive.

- Snapshot commands are always executed on a local switch.

**Related
Documentation**

- [Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch on page 206](#)

Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

The system snapshot feature is especially effective as a bootup option after a partition corruption, as it is the only recovery option that allows you to completely restore the Junos OS and configuration in the event of a corrupted partition.

NOTE: System snapshot is not supported on the QFX10000 and QFX5200 switches.

This topic includes the following tasks:

- [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 262](#)
- [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 263](#)
- [Creating a Snapshot on the Alternate Slice of the Boot Media on page 263](#)

Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the QFX Series switch USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

```
user@switch> request system snapshot partition
```

NOTE: This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.
 - To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```
 - To reboot the switch using a snapshot in a specific partition on the USB flash drive:

```
user@switch> request system reboot slice 1
```

Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:

```
user@switch> request system snapshot partition
```

NOTE: This example uses the partition option. If you have already created a partition for the snapshot, you don't need to use the partition option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.
 - To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```
 - To reboot the switch using a snapshot in a specific partition in internal memory:

```
user@switch> request system reboot slice 1
```

Creating a Snapshot on the Alternate Slice of the Boot Media

The alternate slice of the boot media contains a backup software image that the switch can boot from if it is unable to boot from the primary slice. When you upgrade software, the new software image gets copied only to the primary slice of the boot media.

To create a snapshot of the currently booted software image on the backup slice of the boot media:

```
user@switch> request system reboot slice alternate
```

After the system boots up, you will see the following message before the login prompt:

WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted up from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

The system will generate an alarm indicating that the switch has booted from the backup slice.

- [Understanding System Snapshot on page 261](#)

Creating a Snapshot and Using It to Boot a Device

The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the `/config` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive.

You can use the snapshot to boot the device at the next bootup or as a backup boot option.

The system snapshot feature is especially effective as a bootup option after a partition corruption, as it is the only recovery option that allows you to completely restore the Junos OS and configuration in the event of a corrupted partition on a switch.

NOTE: System snapshot is not supported on QFX10000 switches.

This topic includes the following tasks:

- [Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Device on page 264](#)

Creating a Snapshot on an External USB Flash Drive and Using It to Boot the Device

A snapshot can be created on an external USB flash drive after a device is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on an external USB flash drive:

- An external USB flash drive that meets the device USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on the external USB flash drive and use it to boot the device:

1. Insert the external USB flash drive.
2. Issue the **request system snapshot** command.

```
user@device> request system snapshot
fpc0:
```

```
-----
Starting snapshot to usb (/dev/da0)
Creating snapshot on the host ..
Copying bootable disk image from host ..
Writing to usb (/dev/da0) ..
Copying 'Host OS' to '/dev/da0s1' .. (this may take a few minutes)
```

Copying 'JUNOS' to '/dev/da0s1' .. (this may take a few minutes)
 The following filesystems were archived: / /config Host-OS

3. (Optional) Perform this step if you want to boot the device now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.

- Insert the external USB flash drive.
- Power cycle the device.

The external USB flash drive is detected.

- The software prompts you with the following options:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
Install Junos Snapshot [13.2-20131115_x_132_x51_vjunos.0
Boot to host shell [debug]
```

- Select **Install Junos Snapshot** to install the snapshot located on the external USB flash drive to the device.

The device copies the software from the external USB flash drive, occasionally displaying status messages. When the software is finished being copied from the external USB flash drive to the device, the device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the Junos OS login prompt:

```
root@device#
```

Related Documentation

- [Verifying That a System Snapshot Was Created on a QFX Series Switch on page 265](#)
- [Understanding System Snapshot on page 261](#)

Verifying That a System Snapshot Was Created on a QFX Series Switch

Purpose Verify that a system snapshot was created with the proper files on a QFX Series switch.

NOTE: System snapshot is not supported on QFX10000 switches.

Action View the snapshot on a switch:

show system snapshot slice 1

```
user@switch> show system snapshot slice 1
Information for snapshot on external (da1s1)
Creation date: Sep 28 15:39:47 2011
JUNOS version on snapshot:
jbase : qfx-11.3-20110922.0
jcrypto: qfx-11.3-20110922.0
jdocs : qfx-11.3-20110922.0
jkernel: qfx-11.3-20110922.0
jroute : qfx-11.3-20110922.0
jswitch: qfx-11.3-20110922.0
jpfe : qfx-e9xxx-11.3-20110922.0
```

View the snapshot on a QFX5100 switch:

`show system snapshot`

```
user@switch show system snapshot
fpc0:
-----
Valid Junos snapshot found
Information for snapshot on      usb (/dev/da0s1)
Creation date: Oct 31 16:02:35 2013
JUNOS version on snapshot:
  JUNOS   : 13.2-20131030_x_132_x51_exdc.0
```

Meaning The output shows the date and time when the snapshot was created and the packages that are part of the snapshot. The date and time match the time when you created the snapshot.

You can compare the output of this command to the output of the **show system software** command to ensure that the snapshot contains the same packages as the software currently running the switch.

- [Configuring Zero Touch Provisioning on page 276](#)
- [Monitoring Zero Touch Provisioning on page 281](#)

Understanding Zero Touch Provisioning

- [Understanding Zero Touch Provisioning on page 269](#)
- [Zero Touch Provisioning Process on page 271](#)
- [Zero Touch Provisioning Restart Process Triggers on page 274](#)

Understanding Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning (ZTP) in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, ZTP was called EZ Touchless Provisioning.

NOTE: QFX5200 switches only work with HTTP in 15.1X53-D30. FTP and TFTP protocols are not supported.

ZTP allows you to provision new Juniper Networks switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default factory configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If the DHCP server does not respond or provide the software image and configuration files, the switch boots with the preinstalled software and default factory configuration. On switches running Enhanced Layer 2 Software, Junos Extended Dynamic Host Configuration Protocol (JDHCP) is used instead of legacy DHCP. JDHCP supports

the same functionality as DHCP, and all configuration options remain the same. JDHCP is an enhanced version of legacy DHCP software.

NOTE: For detailed information regarding the DHCP and DHCP options, refer to RFC2131 (<http://www.ietf.org/rfc/rfc2131.txt>) and RFC2132 (www.ietf.org/rfc/rfc2132.txt). Also, this document refers to Internet Systems Consortium (ISC) DHCP version 4.2. For more information regarding this version, refer to <http://www.isc.org/software/dhcp/documentation>.

The Zero Touch Provisioning process will either upgrade or downgrade the Junos OS version. During a downgrade:

- On an EX Series switch, If you downgrade to a software version earlier than Junos OS Release 12.2, in which ZTP is not supported, the configuration file autoinstall phase of the Zero Touch Provisioning process does not happen.
- On an EX Series switch, to downgrade to a software version that does not support resilient dual-root partitions (Junos OS Release 10.4R2 or earlier), you must perform some manual work on the switch. For more information, see *Understanding Resilient Dual-Root Partitions on Switches*.

NOTE: On QFX3500 and QFX3600 switches running the original CLI, you cannot use ZTP to upgrade from Junos OS Release 12.2 or later to Junos OS Release 13.2X51-D15 or later.

Zero Touch Provisioning Process

When you boot a switch with the default factory configuration, the following process happens:

NOTE: If you are performing Zero Touch Provisioning (ZTP) with a Junos OS image that contains enhanced automation for the QFX5100 switch, configure root authentication, and the provider name, license type, and deployment scope for Chef and Puppet at the [edit system] hierarchy in the configuration file that is fetched from the server:

```
{master:0}
root# set root-authentication (encrypted-password password | plain-text-password
password | ssh-dsa public-key | ssh-rsa public-key)
root# set extensions providers juniper license-type customer deployment-scope
commercial
root# set extensions providers chef license-type customer deployment-scope
commercial
```

1. If DHCP option 43, suboption 00 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

2. If DHCP option 43, suboption 02 (a symbolic link to the software image file on the FTP, HTTP, or TFTP server), the switch compares the version of the provided software image to the version of the software installed on the switch.
 - If the Junos OS versions are different, the switch downloads the software image from the FTP, HTTP, or TFTP server, installs the Junos OS, and reboots using the default factory configuration.
 - If the software versions are the same, the switch does not upgrade the software.
3. If DHCP option 43, suboption 01 (the name of the configuration file on the FTP, TFTP, or HTTP server) is configured:

If DHCP option 43 suboption 01 is not specified, the switch uses the default factory configuration.

If both DHCP option 43 suboption 01 and suboption 2 are specified, suboption 01 is processed before suboption 02. The Junos OS is upgraded, and then the configuration file is applied.

NOTE: On EX4300 and QFX5100 switches running Enhanced Layer 2 Software, and QFX5100 switches running a Junos OS image that contains enhanced automation, you can specify the name of a script file or a configuration file in suboption 01. ZTP determines if the file is a script file based on the first line that is included in the file. If the first line contains

`#!` characters followed by an interpreter path—for example, `#!/usr/libexec/ui/cscript`—ZTP determines that the file is a script file, and executes the script file with the specified interpreter path. If the script returns an error, ZTP will fetch the script file and execute the script file until the script executes successfully. If the file does not contain special characters or an interpreter path, ZTP determines that the file is a configuration file.

4. If DHCP option 43, suboption 03 (the transfer mode setting) is configured, the switch accesses the FTP, HTTP, or TFTP server using the specified transfer mode setting—for example, FTP.

If DHCP option 43, suboption 03, is not configured, TFTP becomes the transfer mode automatically.

5. If DHCP option 43, suboption 04 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

NOTE: DHCP option 43 suboptions 05 through 255 are reserved.

6. If DHCP option 150 or option 66 is specified, the IP address of the FTP, HTTP, or TFTP server is configured.

NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

7. (Optional) If DHCP option 7 is specified, you can configure one or more system log (syslog) servers.

8. (Optional) If DHCP option 42 is specified, you can configure one or more NTP servers.
9. (Optional) If DHCP option 12 is specified, you can configure the hostname of the switch.

Zero Touch Provisioning Restart Process Triggers

ZTP restarts when any of the following events occur:

- Request for configuration file, script file, or image file fails.
- Configuration file is incorrect, and commit fails.
- No configuration file and no image file is available.
- Image file is corrupted, and installation fails.
- No file server information is available.
- DHCP client does not have valid ZTP parameters configured.
- When none of the DHCP client interfaces goes to a bound state.
- ZTP transaction fails after six attempts to fetch configuration file or image file.

When any of these events occur, ZTP resets the DHCP client state machine on all of the DHCP client-configured interfaces (management and network) and then restarts the state machine. Restarting the state machine enables the DHCP client to get the latest DHCP server-configured parameters.

Before ZTP restarts, approximately 15 to 30 seconds must elapse to allow enough time to build a list of bound and unbound DHCP client interfaces.

The list of bound and unbound DHCP client interfaces can contain:

- No entries.
- Multiple DHCP client interfaces.

Priority is given to the DHCP client interfaces that have received all ZTP parameters (software image file, configuration file, and file server information) from the DHCP server.

After the lists of bound and unbound client interfaces are created, and a DHCP client gets selected for ZTP activity, then any existing default route is deleted, and the DHCP client interface that was selected adds a new default route. In order to add a new default route, only one ZTP instance can be active.

After ZTP restarts, the DHCP client attempts fetching files from the DHCP server for up to six times, with ten to fifteen seconds elapsing between attempts. Every attempt, whether successful or not, is logged and can be seen on the console.

If there is a failure, or the number of attempts exceeds the limit, ZTP stops. ZTP then clears the DHCP client bindings and restarts state machine on the DHCP-configured interfaces.

The ZTP restart process continues until there is either a successful software upgrade, or an operator manually commits a user configuration and deletes the ZTP configuration.

Documentation**

- [Configuring Zero Touch Provisioning on page 276](#)
- [Monitoring Zero Touch Provisioning on page 281](#)

Configuring Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning (ZTP), in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning.

Zero Touch Provisioning allows you to provision new devices in your network automatically, without manual intervention. When you physically connect a device to the network and boot it with a default configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The device uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If the DHCP server does not respond or provide the software image and configuration files, the device continues using the preinstalled Junos OS software and default factory configuration. On switches running Enhanced Layer 2 Software, Junos Extended Dynamic Host Configuration Protocol (JDHCP) is used instead of legacy DHCP. JDHCP supports the same functionality as DHCP, and all configuration options remain the same. JDHCP is an enhanced version of legacy DHCP software. If you are performing Zero Touch Provisioning with a Junos OS image that contains enhanced automation for the QFX5100 switch, you can use DHCP option 43 suboption 01 to run script files, not just load configuration files. Using scripts, you can create device-specific configuration files, and perform HTTP request operations to web servers to download specific configuration files or Junos OS software.

NOTE: If the ZTP configuration is enabled, the switch broadcasts DHCP DISCOVER packets on its interfaces. If the DHCP server on the network responds with DHCP vendor options set with the necessary values to initiate ZTP, then ZTP proceeds. To disable broadcasting the DHCP DISCOVER packets without performing the ZTP process, manually delete the `auto-image-upgrade` statement located at the `[edit chassis]` hierarchy. If ZTP completes without errors, the `auto-image-upgrade` statement is automatically deleted.

Before you begin, ensure that the switch has access to the following network resources:

- A DHCP server to lease IP addresses and information on software images and configuration files on the network.

Refer to your DHCP server documentation for configuration instructions.

- The File Transfer Protocol (anonymous FTP), Hypertext Transfer Protocol (HTTP), Trivial File Transfer Protocol (TFTP) server on which the software image and configuration files are stored

NOTE: Although TFTP is supported, we recommend that you use FTP or HTTP instead, because these transport protocols are more reliable.

- A Domain Name System (DNS) server to perform reverse DNS lookup
- (Optional) An NTP server to perform time synchronization on the network
- (Optional) A system log (syslog) server to manage system log messages and alerts

CAUTION: We recommend that you do not commit a user configuration while the device is performing ZTP activity—for example, updating the software image or applying a configuration file.

Perform the following steps to configure ZTP:

1. Boot the device.

The device continues to use the preinstalled Junos OS software and default factory configuration.

2. Issue the **request system zeroize** command on the device.
3. Download the software image file and the configuration file to the FTP, HTTP, TFTP server that the device will download these files from.

You can download either one or both of these files.

NOTE: If you are performing Zero Touch Provisioning with a Junos OS image that contains enhanced automation for the QFX5100 device, configure root authentication, and the provider name, license type, and deployment scope for Chef and Puppet at the [edit system] hierarchy in the configuration file that is fetched from the server:

```
{master:0}
root# set root-authentication (encrypted-password password |
plain-text-password password | ssh-dsa public-key | ssh-rsa public-key)
root# set extensions providers juniper license-type customer deployment-scope
commercial
root# set extensions providers chef license-type customer deployment-scope
commercial
```

4. Configure the DHCP server to provide the necessary information to the device.

Configure IP address assignment.

You can configure dynamic or static IP address assignment for the device's management address. To determine the device's management MAC address for static IP address mapping, add 1 to the last byte of the device's MAC address, which you noted before you began this procedure.

5. Define the format of the vendor-specific information for DHCP option 43 in the dhcpd.conf file.

Here is an example of an ISC DHCP 4.2 server `dhcpd.conf` file:

```
option space NEW_OP; option;
option NEW_OP.image-file-name code 0 = text;
option NEW_OP.config-file-name code 1 = text;
option NEW_OP.image-file-type code 2 = text;
option NEW_OP.transfer-mode code 3 = text;
option NEW_OP.alt-image-file-name code 4 = text;
option NEW_OP-encapsulation code 43 = encapsulate NEW_OP;
```

6. Configure the following DHCP option 43 suboptions:

- Suboption 00: The name of the software image file to install

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

```
option NEW_OP.image-file-name
"/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
```

- Suboption 01: The name of the configuration file to install

NOTE: On EX4300 and QFX5100 devices running Enhanced Layer 2 Software, and QFX5100 devices running a Junos OS image that contains enhanced automation, you can specify the name of a script file or a configuration file. ZTP determines if the file is a script file based on the first line that is included in the file. If the first line contains `#!` characters followed by an interpreter path, ZTP determines that the file is a script file, and executes the script file with the specified interpreter path. In order for a script to execute, the script file must provide the ability to fetch and load a valid configuration file on the device during the ZTP process.

The following list provides the types of scripts and their associated interpreter paths:

- Shell script interpreter path: `#!/bin/sh`
- SLAX script interpreter path: `#!/usr/libexec/ui/cscript`
- Python script interpreter path: `#!/usr/bin/python`

Unsigned Python scripts are only supported on limited platforms, such as the QFX5100 device. If you try to execute unsigned Python scripts on devices that do not provide support, error messages will be issued.

If the file does not contain special characters (`#!`), ZTP determines that the file is a configuration file and loads the configuration file.

```
option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
```

- Suboption 02: The symbolic link to the software image file to install

```
option NEW_OP.image-file-type "symlink";
```

NOTE: If you do not specify suboption 2, the Zero Touch Provisioning process handles the software image as a filename, not a symbolic link.

- Suboption 03: The transfer mode that the device uses to access the TFTP/FTP/HTTP server

```
option NEW_OP.transfer-mode "ftp";
```

NOTE: If suboption 03 is not configured, TFTP becomes the transfer mode by default.

- Suboption 04: The name of the software image file to install

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

NOTE: DHCP option 43 suboptions 05 through 255 are reserved.

```
option NEW_OP.alt-image-file-name
"/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
```

7.

NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

Configure DHCP option 150 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option option-150 code 150 "10.100.31.71";
```

8. Configure DHCP option 66 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option tftp-server-name "10.100.31.71";
```

9. (Optional) Configure DHCP option 7 to specify one or more system log (syslog) servers.

```
option log-servers 10.100.31.72;
```

10. (Optional) Configure DHCP option 42 to specify one or more NTP servers.

```
option ntp-servers 10.100.31.73;
```

11. (Optional) Configure DHCP option 12 to specify the hostname of the device.

```
option hostname "switch35";
```

The following sample configuration shows the DHCP options you just configured:

```
host switch35 {
  hardware ethernet ac:4b:c8:29:5d:02;
  fixed-address 10.100.31.36;
  option tftp-server-name "10.100.31.71";
  option host-name "switch35";
  option log-servers 10.100.31.72;
  option ntp-servers 10.100.31.73;
  option NEW_OP.image-file-name
    "/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
  option NEW_OP.transfer-mode "ftp";
  option NEW_OP.config-file-name "/dist/config/switch35.config";
}
```

Based on the DHCP options you just configured, the following statements are appended to the Junos OS configuration file (for example, **switch35.config**):

```
system {
  host-name switch35;
  syslog {
    host 10.100.31.72 {
      any any;
    }
  }
  ntp {
    server 10.100.31.73;
  }
}
```

12. Connect the device to the network that includes the DHCP server and the FTP, HTTP, or TFTP server.
13. Boot the device with the default configuration.
14. Monitor the ZTP process by looking at the following log files.

NOTE: When SLAX (live operating system based on Linux) scripts are issued, the **op-script.log** and **event-script.log** files are produced.

- /var/log/dhcp_logfile
- /var/log/event-script.log
- /var/log/image_load_log
- /var/log/messages
- /var/log/op-script.log
- /var/log/script_output

You can also monitor the ZTP process by looking at error messages and issuing operational commands. See [“Monitoring Zero Touch Provisioning” on page 281](#) for more information.

- Related Documentation**
- [Understanding Zero Touch Provisioning on page 269](#)
 - [Understanding NTP Time Servers on page 183](#)
 - [Op Script Overview](#)
 - [Monitoring Zero Touch Provisioning on page 281](#)
 - [Understanding DHCP Services for Switches on page 59](#)
 - [Reverting to the Default Factory Configuration by Using the request system zeroize Command on page 29](#)

Monitoring Zero Touch Provisioning

You can use the console and operational commands to monitor Zero Touch Provisioning.

1. [Using the Console to Monitor Zero Touch Provisioning on page 281](#)
2. [Using System Log Alerts to Monitor Zero Touch Provisioning on page 282](#)
3. [Using Error Messages to Monitor Zero Touch Provisioning on page 282](#)
4. [Using System Log Files to Monitor Zero Touch Provisioning on page 282](#)
5. [Using the show dhcp client binding Command on page 283](#)
6. [Using the show dhcp client statistics Command on page 283](#)

Using the Console to Monitor Zero Touch Provisioning

The following Zero Touch Provisioning (ZTP) activities are displayed on the console during the ZTP process:

- Starting and ending times of ZTP process.
- Lists of bound and unbound DHCP client interfaces.
- DHCP options that DHCP servers send to DHCP clients.
- Logs indicating which interfaces are used for ZTP.
- ZTP parameters that DHCP clients obtain from DHCP servers.
- File names of configuration and image files, names of file servers, protocols used to fetch files, and times when DHCP servers fetch configuration and image files.
- Failure states caused by files not being on servers, or unreachable servers, and time outs.
- Number of attempts made, and number of attempts remaining, for retry in current ZTP cycle.
- Completion of file transfers.
- Installation, reboot, and state of ZTP process.
- Internal state errors and termination of ZTP process.
- Logs for when default routes were added or deleted.

Using System Log Alerts to Monitor Zero Touch Provisioning

- Purpose** In this example, the system log alert alerts you that the auto-image upgrade will start.
- Action** Use the following system log alert to monitor the auto-image upgrade process.
- ```

"ALERT:Auto-image upgrade will start. This can terminate config CLI session(s).
Modified configuration will be lost. To stop Auto-image, in CLI do the
following: 'edit; delete chassis auto-image-upgrade; commit'."

"Checking whether image upgrade is already invoked"

```
- Meaning** This system log alert indicates that the auto-image upgrade will start, and provides information on how to stop the auto-image upgrade process.

## Using Error Messages to Monitor Zero Touch Provisioning

- Purpose** Error messages provide information on which DHCP options are not configured.
- Action** Use the information in the following error message to find out which DHCP options are not configured.
- ```

"DHCP Log Server Option"
"DHCP Host Name Option"
"DHCP NTP Server Option"
    
```
- Meaning** The error message indicates that the DHCP log server, hostname, and NTP server options are not configured.

Using System Log Files to Monitor Zero Touch Provisioning

- Purpose** System log files provide information on the state of the auto-upgrade process, lists of bound and unbound DHCP client interfaces, IP addresses of file servers, names and locations of image and configuration files, and successful and failed attempts at fetching configuration and image files.
- Action** Use the information in the following system log files to monitor the auto-upgrade process.
- ```

Auto Image Upgrade: Start fetching config-file file from server 1.1.1.1 through
irb using ftp

Auto Image Upgrade: Tried [2] attempts to fetch config-file file from server
1.1.1.1 through irb. Summary: "Retrieving /config-file
:: Failed to open file.". To retry [4] times.

Auto Image Upgrade: Tried [4] attempts to fetch config-file file from server
1.1.1.1 through irb. Summary: "Retrieving /config-fileconfig-file
:: Failed to open file.". To retry [2] times.

Auto Image Upgrade: Tried [6] attempts to fetch config-file file from server
1.1.1.1 through irb. Summary: "Retrieving /config-file
:: Failed to open file.". To retry [0] times.

```

Auto Image Upgrade: All [6] attempts to fetch config-file file from server 1.1.1.1 through irb FAILED. Start retry again in few minutes.

**Meaning** These system log files indicate that there were six failed attempts to fetch the configuration file from the file server, the IP address of the file server, the DHCP client interface name, and the number of times the retry process occurred.

## Using the show dhcp client binding Command

**Purpose** Issue the **show dhcp client binding** command to display DHCP client binding information

**Action** Issue the **show dhcp client binding** command to display the IP address of the DHCP client, the hardware address of the DHCP client, number of seconds in which the DHCP client's IP address lease expires, state of the DHCP client IP address in the binding table, and the name of the interface that has active client bindings.

### show dhcp client binding

```
user@switch# show dhcp client binding
IP address Hardware address Expires State Interface
0.0.0.0 00:22:83:2a:db:dc 0 SELECTING irb.0
10.6.6.13 00:22:83:2a:db:dd 49201 BOUND vme.0
0.0.0.0 00:22:83:2a:db:df 0 SELECTING xe-0/0/0.0
0.0.0.0 00:22:83:2a:db:e0 0 SELECTING xe-0/0/1.0
```

**Meaning** The output of this command shows that there is one client interface that is bound, and that there are three interfaces that are receiving DHCP offers from the DHCP server.

## Using the show dhcp client statistics Command

**Purpose** Issue the **show dhcp client statistics** command to display DHCP client statistics.

**Action** Issue the **show dhcp client statistics** command to display DHCP client statistics, such as the number of packets dropped, and the number DHCP and BOOTP messages sent and received.

### show dhcp client statistics

```
user@switch# show dhcp client statistics
Packets dropped:
 Total 14
 Send error 14
Messages received:
 BOOTREPLY 5
 DHCPOFFER 1
 DHCPACK 4
 DHCPNAK 0
 DHCPFORCERENEW 0
Messages sent:
 BOOTREQUEST 6751
 DHCPDECLINE 0
 DHCPDISCOVER 6747
 DHCPREQUEST 4
 DHCPINFORM 0
 DHCPRELEASE 0
```

|            |   |
|------------|---|
| DHCPRENEW  | 0 |
| DHCPREBIND | 0 |

**Meaning** The output of this command displays how many packets were dropped with errors, the number of BOOTREPLY and DHCPOFFER messages that were received, and the number of BOOTREQUEST and DHCPREQUEST messages that were sent.

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.</p> <p>For EX-Series switches, set only the time interval between ARP updates.</p>                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>aging-timer</b>—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.</p> <p><b>passive-learning</b> (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.</p> <p><b>Default:</b> 20 minutes</p> <p><b>Range:</b> 1 to 240 minutes</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | For Junos commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event or commit script, the Junos OS verifies the authenticity of the script by using the configured checksum hash.                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>md5 <i>hash</i></b>—MD5 checksum of this script.</p> <p><b>sha-256 <i>hash</i></b>—SHA-256 checksum of this script.</p> <p><b>sha1 <i>hash</i></b>—SHA-1 checksum of this script.</p>                                                                                                                                                                                                                                 |

| <b>Description</b>                                                                                                                                                                                                                    | Compress the current operational configuration file. The file is stored in the file <b>juniper.conf</b> , in the <b>/config</b> file system, along with the last three committed versions of the configuration. However, with large networks, the current configuration file might exceed the available space in the <b>/config</b> file system. Compressing the current configuration file allows the file to fit in the file system, typically reducing the size of the file by 90 percent. The current configuration file is compressed on the second commit of the configuration after the first commit is made to include the <b>compress-configuration-files</b> statement. |
| <div> <b>NOTE:</b> We recommend that you enable compression of the configuration files to minimize the amount of disk space that they require.</div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Configure the characteristics of the console port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>                  | The console port is enabled and its speed is 9600 baud.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>disable</b>—Disable console login connections.</p> <p><b>insecure</b>—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.</p> <p><b>log-out-on-disconnect</b>—Log out the session when the data carrier on the console port is lost.</p> <p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port: <b>ansi</b>, <b>vt100</b>, <b>small-xterm</b>, or <b>xterm</b>.</p> |
| <b>Required Privilege Level</b> | <p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Use the loopback interface, <b>lo0</b> , as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as <b>fxp0</b> . The <b>lo0</b> interface is the interface to the switch's Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | <p>The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:</p> <ul style="list-style-type: none"> <li>• The primary address on the loopback interface <b>lo0</b> that is <i>not</i> <b>127.0.0.1</b> is used.</li> <li>• The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.</li> </ul> <p>By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.</p> <p>An interface's <i>primary address</i> is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's <i>preferred address</i> is the default local address used for packets sourced by the local switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.</p> <p>To configure a different primary address or preferred address, include the <b>primary</b> or <b>preferred</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] or [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] hierarchy levels.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>alias <i>alias</i></b>—Alias for the hostname.</p> <p><b>hostname</b>—Fully qualified hostname.</p> <p><b>inet <i>address</i></b>—IP address. You can specify one or more IP addresses for the host.</p> <p><b>sysid <i>system-identifier</i></b>—ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address <b>208.197.169.18</b> is <b>2081.9716.9018</b> in BCD.</p> |

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure system management properties.

**NOTE:** The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

---

## time-format

---

**Syntax** `time-format (year | millisecond | year millisecond);`

**Hierarchy Level** [edit system syslog]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a `file`, `console`, or `user` statement at the [edit system syslog] hierarchy level, but not to destinations configured by a `host` statement.

**Default** The timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, **Aug 21 12:36:30**.

**NOTE:** When the `structured-data` statement is included at the [edit system syslog file *filename*] hierarchy level, this statement is ignored for the file.

**Options** `millisecond`—Include the millisecond in the timestamp.

`year`—Include the year in the timestamp.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- [Including the Year or Millisecond in Timestamps on page 23](#)

| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>         | Define tracing operations for Layer 2 learning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>             | The <b>traceoptions</b> feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p>You can specify the following options:</p> <ul style="list-style-type: none"> <li>• <b>no-world-readable</b>—(Optional) Restrict file access to the user who created the file.</li> <li>• <b>size <i>size</i></b> —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>files</b> option. Use <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify gigabytes.</li> <li>• <b>world-readable</b>—(Optional) Enable unrestricted file access.</li> </ul> <p><b>flag <i>flag</i></b> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>bmac-next-hop</b>—Trace backbone MAC next hop operations.</li> <li>• <b>bridge-bmac-next-hop</b>—Trace backbone MAC next hop bridge operations.</li> <li>• <b>bridging-interface</b>—Trace interface bridge operations.</li> <li>• <b>bridging-domain</b>—Trace bridging domain operations.</li> <li>• <b>configuration</b>—Trace configuration operations.</li> <li>• <b>flood-next-hop</b>—Trace flood next hop operations.</li> <li>• <b>initialization</b>—Trace initialization operations.</li> <li>• <b>interface-device</b>—Trace interface device operations.</li> <li>• <b>interface-family</b>—Trace interface family operations.</li> </ul> |

- **interface-logical**—Trace logical interface operations.
- **ipc**—Trace inter-process communications operations.
- **irb**—Trace integrated routing and bridging operations.
- **isid**—Trace i-tagged service ID operations.
- **kack**—Trace kernel-acknowledgment.
- **learning-domain**—Trace learning domain operations.
- **logical-system**—Trace logical system operations.
- **mac-learning**—Trace MAC address learning.
- **mc-ae**—Trace multichassis aggregated Ethernet interface operations.
- **redundant-trunk-group**—Trace redundant trunk group operations.
- **routing-instance**—Trace routing instance operations.
- **routing-socket**—Trace routing socket operations.
- **storm-control**—Trace storm control operations.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vpls-ping**—Trace Virtual Private VLAN Service (VPLS) ping operations.

**in-memory-debug**—Enable trace parameters in the memory.

**level**—Specify level of debugging output.

**no-remote-trace**—Disable remote tracing.

- [retransmission-interval on page 325](#)
- [server-address on page 325](#)
- [update-server on page 326](#)
- [vendor-option on page 326](#)

### client-identifier (DHCP Client)

---

|                                 |                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | client-identifier (ascii <i>ascii</i>   hexadecimal <i>hexadecimal</i> );                                                                                                                                                                   |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]                                                                                                                                                    |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                            |
| <b>Description</b>              | Specify an ASCII or hexadecimal identifier for the Dynamic Host Configuration Protocol (DHCP) client. The DHCP server identifies a client by a client-identifier value, which must be unique for each client.                               |
| <b>Default</b>                  | If you do not include client-identifier in the configuration, the DHCP server uses the client hardware type and MAC address to identify the client.                                                                                         |
| <b>Options</b>                  | <b>ascii <i>ascii</i></b> —Identifier consisting of ASCII characters, such as a fully qualified domain name.<br><br><b>hexadecimal <i>hexadecimal</i></b> —Identifier consisting of hexadecimal numbers (0-9, a-f, A-F). Do not use colons. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                     |
| <b>Related Documentation</b>    | • <a href="#">Configuring a DHCP Client (CLI Procedure) on page 63</a>                                                                                                                                                                      |

## lease-time

---

|                                 |                                                                                                                                                                                        |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>lease-time (<i>length</i>   infinite);</code>                                                                                                                                    |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]                                                                                               |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.                                                                                                                                          |
| <b>Description</b>              | Request a specific lease time for the IP address.                                                                                                                                      |
| <b>Default</b>                  | If no lease time is requested by client, then the server sends the lease time. The default lease time on a Junos OS DHCP server is one day.                                            |
| <b>Options</b>                  | <b><i>seconds</i></b> —Request a lease time of a specific duration.<br><b>Range:</b> 60 through 2147483647 seconds<br><br><b><i>infinite</i></b> —Request that the lease never expire. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <i>Understanding Interfaces</i></li></ul>                                                                                                      |

## retransmission-attempt

---

|                                 |                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>retransmission-attempt <i>number</i>;</code>                                                                                                                                                                                                                                             |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]                                                                                                                                                                                                       |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.5 for J Series devices.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 9.2 for SRX Series devices.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series. |
| <b>Description</b>              | Specify the number of times the device retransmits a Dynamic Host Control Protocol (DHCP) packet if a DHCP server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.                                                                 |
| <b>Options</b>                  | <b><i>number</i></b> —Number of retransmit attempts.<br><b>Range:</b> 0 through 6<br><b>Default:</b> 4                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                        |

## retransmission-interval

|                                 |                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>retransmission-interval <i>seconds</i>;</code>                                                                                             |
| <b>Hierarchy Level</b>          | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]                                                         |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series. |
| <b>Description</b>              | Specify the time between successive retransmissions of the client DHCP request if a DHCP server fails to respond.                                |
| <b>Options</b>                  | <b><i>seconds</i></b> —Number of seconds between successive retransmissions.<br><b>Range:</b> 4 through 64 seconds<br><b>Default:</b> 4 seconds  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                          |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 63</a></li> </ul>                         |

## server-address

|                                 |                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b> | Statement introduced before Junos OS Release 12.1 for EX Series switches.<br>Statement deprecated in Junos OS Release 12.3 for EX Series switches.                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | Configure the match criteria when you use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers. The extended DHCP relay agent compares the option 60 vendor-specific strings received in DHCP client packets against the match criteria that you specify. If there is a match, you can define certain actions for the associated DHCP client packets. |

**NOTE:** The `vendor-option` statement has been deprecated and might be removed from future product releases. We recommend that you phase out its use. See *option-number*.

| <b>Release Information</b> | <p>Command introduced in Junos OS Release 15.1 for MX240, MX480, MX960, MX2010, and MX2020 routers and EX9200 switches.</p> <p>Command introduced in Junos OS Release 15.1X53-D30 for QFX5200 switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | Reboot the software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>none</b>—Reboot the software immediately.</p> <p><b>all-members</b>—(Optional) Reboot the software on all members of the Virtual Chassis configuration.</p> <p><b>at <i>time</i></b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"><li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li><li>• <b>+<i>minutes</i></b>—Number of minutes from now to reboot the software.</li><li>• <b><i>yymmddhhmm</i></b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute. Omitting a value will default to the current date for that value.</li><li>• <b><i>hh:mm</i></b>—Absolute time on the current day at which to stop the software, specified in 24-hour time.</li></ul> <p><b>both-routing-engines</b>—(Optional) Reboot both Routing Engines at the same time.</p> <p><b>in <i>minutes</i></b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +<i>minutes</i></b> option.</p> <p><b>local</b>—(Optional) Reboot the software on the local Virtual Chassis member.</p> <p><b>media (oam   junos   network   usb)</b>—(Optional) Reboot the boot media:</p> <ul style="list-style-type: none"><li>• <b>oam</b>—Reboot from the <b>oam</b> volume.</li><li>• <b>junos</b>—Reboot from the <b>junos</b> volume.</li><li>• <b>network</b>—Reboot from the network.</li><li>• <b>usb</b>—Reboot from the USB device.</li></ul> |

**member *member-id***—(Optional) Reboot the software on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

**NOTE:** To reboot a router or switch that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**List of Sample Output**

[request system reboot on page 331](#)  
[request system reboot \(at 2300\) on page 331](#)  
[request system reboot \(in 2 Hours\) on page 332](#)  
[request system reboot \(Immediately\) on page 332](#)  
[request system reboot \(at 1:20 AM\) on page 332](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message "Maintenance time!"
```

```
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
```

```
*** System shutdown message from root@berry.network.net ***
```

```
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
```

```
user@host> request system reboot in 120
```

```
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
```

```
request system reboot at 120
```

```
Reboot the system at 120? [yes,no] (no) yes
```

## request system snapshot (Junos OS with Upgraded FreeBSD)

|                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Sample Output

### [request system snapshot recovery](#)

```
user@host> request system snapshot recovery
Creating image ...
Compressing image . . .
Image size is 777MB

Recovery snapshot created successfully
```

### [request system snapshot delete](#)

```
user@host> request system snapshot delete snap.20150112.122106
NOTICE: Snapshot 'snap.20150112.122106' deleted successfully
```

### [request system snapshot](#)

```
user@host> request system snapshot
NOTICE: Snapshot snap.20150119.122106 created successfully
```

## show system snapshot (Junos OS with Upgraded FreeBSD)

| <b>Description</b>              | Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>encrypted-password "<i>password</i>"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file</b>—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.</p> <p><b>plain-text-password</b>—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>remote-debug-permission</b> (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.</p> <p><b>ssh-dsa "<i>public-key</i>"</b>—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "<i>public-key</i>"</b>—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Configure the server that NTP queries when the router or switch boots to determine the local date and time.</p> <p>When you boot the router or switch, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local router's or switch's time. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the router or switch boots up.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Configure the local router or switch to operate in broadcast mode with the remote system at the specified address to send periodic broadcast messages to a client population. Normally, you include this statement only when the local router or switch is operating as a transmitter.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>address</b>—Broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be <b>224.0.1.1</b>.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer).</p> <p><b>tll value</b>—(Optional) Time-to-live (TTL) value to use.<br/><b>Range:</b> 1 through 255<br/><b>Default:</b> 1</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.<br/><b>Range:</b> 1 through 4<br/><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>encrypted-password "<i>password</i>"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file</b>—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.</p> <p><b>plain-text-password</b>—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>remote-debug-permission</b> (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.</p> <p><b>ssh-dsa "<i>public-key</i>"</b>—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "<i>public-key</i>"</b>—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | <p>Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement is used in combination with the <b>change-type</b> statement. If the change type is <b>character-sets</b>, then the number of character sets included in the password is checked against the specified minimum. If the change type is <b>set-transitions</b>, then the number of character set changes in the password is checked against the specified minimum.</p> |
| <b>Default</b>                  | For Junos OS, the minimum number of changes is 1. For Junos-FIPS software, the minimum number of changes is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <i>number</i> —Minimum number of character sets (or character set changes) required for the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Configure the authentication methods for the root-level user, whose username is <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>encrypted-password "password"</b>— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for the <b>encrypted-password</b> option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p>                                                                                                                                 |
|                                 | <div>  <p><b>CAUTION:</b> Do not use the <b>encrypted-password</b> option unless the password is <i>already</i> encrypted, and you are entering the encrypted version of the password. If you commit the <b>encrypted-password</b> option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as root, and you will need to use the password recovery process.</p> </div> |
|                                 | <p><b>plain-text-password</b>—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p>                                                                                                                                                                                                                                           |
|                                 | <p><b>ssh-dsa "public-key"</b>—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.</p>                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | <p><b>ssh-rsa "public-key"</b>—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.</p>                                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### show system autoinstallation status

```
user@host> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 0.0.0.0
Interface:
 Name: ge-0/0/1
 State: None
 Address acquisition:
 Protocol: DHCP Client
 Acquired address: None
 Protocol: RARP Client
 Acquired address: None
```

## CHAPTER 27

# Basic System Management Operational Commands

- commit
- clear log
- clear chassis display message
- clear system commit
- clear system reboot
- file
- file archive
- file checksum md5
- file checksum sha1
- file checksum sha-256
- file compare
- file delete
- file list
- file rename
- file show
- load
- ping
- request chassis beacon
- request chassis fpc
- request chassis pic
- request chassis routing-engine master
- request message
- request system configuration rescue delete
- request system configuration rescue save
- request system halt
- request system logout

- `request system power-off`
- `request system reboot`

## commit

**Syntax** commit <<at <"string">> <and-quit> <check> <comment <"comment-string">>  
<confirmed> <display detail> <fast-synchronize> <minutes> <peers-synchronize >  
<synchronize <force> <scripts>>>

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 11.1 for the QFX Series.  
Option **fast-synchronize** added in Junos OS Release 12.2.  
Option **synchronize scripts** introduced in Junos OS Release 13.2.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
Option **peers-synchronize** introduced in Junos OS Release 14.2R6.

**Description** Commit the set of changes to the database and cause the changes to take operational effect.

**NOTE:** The **fast-synchronize** option is not supported in a QFX Series Virtual Chassis.

**NOTE:** Beginning in Junos OS 12.3, it is possible that FPCs brought offline using the **request chassis fpc slot fpc-slot offline** operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the **set fpc fpc-slot power off** configuration-mode command at the [edit chassis] hierarchy level to ensure that the FPCs remain offline.

**Options** at <"string">—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.

**string** is **reboot** or the future time to activate the configuration changes. Enclose the **string** value (including **reboot**) in quotation marks (" "). You can specify time in two formats:

- A time value in the form **hh:mm[:ss]** (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the **commit at** configuration command is issued. Use 24-hour time for the **hh** value; for example, **04:30:00** is 4:30:00 AM, and **20:00** is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.
- A date and time value in the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the **commit at** command is issued. Use 24-hour time for the **hh** value. For example, **2003-08-21 12:30:00** is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.

For example, **commit at "18:00:00"**. For date and time, include both values in the same set of quotation marks. For example, **commit at "2005-03-10 14:00:00"**.

A *commit check* is performed when you issue the **commit at** configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.

**NOTE:** If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at** configuration command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see the [CLI Explorer](#).

**and-quit**—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

**check**—(Optional) Verify the syntax of the configuration, but do not activate it.

**comment** <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab"**.

**confirmed** <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to

all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is 1 through 65,535 minutes, and the default is 10 minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

**display detail**—(Optional) Monitors the commit process.

**NOTE:** In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the more pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

**fast-synchronize**—(Optional) Configure the commits to run in parallel on both the master and backup Routing Engines to reduce the time taken for commit synchronization.

**NOTE:** The **fast-synchronize** statement is not supported on QFX Series devices when used in a Virtual Chassis.

**peers-synchronize**—(Optional) Automatically synchronizes and commits MC-LAG configurations across the peers. The local peer (the requesting peer) on which you enable the **peers-synchronize** statement copies and loads its configuration to the remote (the responding) peer. Each peer then performs a syntax check on the configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both peers.

**synchronize <force> <scripts>**—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the **commit synchronize** command. The Routing Engine on which you execute this command (the request Routing Engine) copies and loads its candidate configuration to the other Routing Engine (the responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

It can happen that the **commit synchronize** command is initiated at the same time from both Routing Engines, which causes the process to hang. As of Junos OS Release 15.1, this is a temporary (20 seconds) anomaly, after which the user can try the **commit synchronize** command again.

The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on

the other Routing Engine are terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

When you issue the **commit synchronize** command with the **scripts** option, the device synchronizes all commit, event, lib, op, and SNMP scripts from the requesting Routing Engine to the responding Routing Engine and also commits and synchronizes the configuration. If the commit check operation fails for the requesting Routing Engine, the process stops, and the scripts are not copied to the responding Routing Engine. If the commit check or commit operation fails for the responding Routing Engine, the scripts are still synchronized, since the synchronization occurs prior to the commit check operation on the responding Routing Engine.

If the **load-scripts-from-flash** statement is configured for the requesting Routing Engine, the device synchronizes the scripts from flash memory on the requesting Routing Engine to flash memory on the responding Routing Engine. Otherwise, the device synchronizes the scripts from the hard disk on the requesting Routing Engine to the hard disk on the responding Routing Engine. The device synchronizes all scripts regardless of whether they are enabled in the configuration or have been updated since the last synchronization.

**NOTE:** When you issue the **commit synchronize** command, you must use the **apply-groups re0** and **re1** commands. For information about how to use groups, see *Disabling Inheritance of a Junos OS Configuration Group*.

The responding Routing Engine must use Junos OS Release 5.0 or later.

---

**Required Privilege Level**

configure—To enter configuration mode.

---

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:

-rw-r----- 1 root wheel 26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:

-rw-r----- 1 root wheel 57 Sep 15 03:44 /var/log/sampled
total 1

```

## clear chassis display message

| <b>Description</b>                    | (M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.                                                                                           |
| <b>Options</b>                        | <b>none</b> —Clear or stop a text message on the craft interface display.<br><br><b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.<br><br><b>lcc <i>number</i></b> —(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.<br>Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul> |

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**node-device name**—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

**scc**—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with 0.

**Required Privilege Level** clear

**List of Sample Output** [clear chassis display message on page 393](#)

**Output Fields** See *show chassis craft-interface* for an explanation of output fields.

## Sample Output

### clear chassis display message

The following example displays and then clears the text message on the craft interface display:

```
user@host> show chassis craft-interface
Red alarm: LED off, relay off
Yellow alarm: LED off, relay off
Host OK LED: On
Host fail LED: Off
FPCs 0 1 2 3 4 5 6 7

Green .. *.. * *.

| <b>Description</b>                    | Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.                                                                                                                            |
| <b>Options</b>                        | <p><b>none</b>—Clear all pending system software reboots or halts.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.</p> |

**all-members**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

**infrastructure *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

**scc**—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level**    maintenance

| <b>Output Fields</b>         | When you enter this command, you are provided feedback on the status of your request.                                                                                                 |

## Sample Output

### clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

### clear system reboot (TX Matrix Router)

```
user@host> clear system reboot
scc-re0:

No shutdown/reboot scheduled.
lcc0-re0:

No shutdown/reboot scheduled.
lcc2-re0:

No shutdown/reboot scheduled.
```

### clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

| <b>Description</b>              | <p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"><li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li><li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li><li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li></ul> |
| <b>Options</b>                  | <p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Display a list of files on the local router or switch.                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>              |
| <b>Additional Information</b>   | The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command. |

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```

```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

## load

|                            |                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | load (factory-default   merge   override   patch   replace   set   update)<br>load ( <i>filename</i>   terminal) <relative>                                                                              |
| <b>QFX Series</b>          | load (dhcp-snooping <i>filename</i> )                                                                                                                                                                    |
| <b>Release Information</b> | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.             |
| <b>Description</b>         | Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs. |

**NOTE:** **load** can be run from configuration mode only.

**Options** **dhcp-snooping**—(QFX Series switches) Loads DHCP snooping entries.

**factory-default**—Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on.

**NOTE:** To load the factory default configuration, you must first *unprotect* any protected hierarchies in the configuration.

**filename**—Name of the file to load. For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

**merge**—Combine the configuration that is currently shown in the CLI with the configuration.

**override**—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.

**patch**—Change part of the configuration and mark only those parts as changed.

**replace**—Look for a **replace** tag in *filename*, delete the existing statement of the same name, and replace it with the configuration.

**set**—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**.

**relative**—(Optional) Execute set of commands until the current edit point.

**terminal**—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.

**update**—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

---

**Required Privilege Level**      configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

| <b>Description</b>         | <p>Check host reachability and network connectivity. The <b>ping</b> command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>host</b>—IP address or hostname of the remote system to ping.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p><b>count requests</b>—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.</p> <p><b>detail</b>—(Optional) Include in the output the interface on which the ping reply was received.</p> <p><b>do-not-fragment</b>—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>NOTE:</b> In Junos OS Release 11.1 and later, when issuing the <b>ping</b> command for an IPv6 route with the <b>do-not-fragment</b> option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.</p> </div> <p><b>inet</b>—(Optional) Ping Packet Forwarding Engine IPv4 routes.</p> <p><b>inet6</b>—(Optional) Ping Packet Forwarding Engine IPv6 routes.</p> <p><b>interface source-interface</b>—(Optional) Interface to use to send the ping requests.</p> <p><b>interval seconds</b>—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.</p> <p><b>logical-system logical-system-name</b>—(Optional) Name of logical system from which to send the ping requests.</p> <p>Alternatively, enter the <b>set cli logical-system logical-system-name</b> command and then run the <b>ping</b> command. To return to the main router or switch, enter the <b>clear cli logical-system</b> command.</p> |

**loose-source *value***—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point *value*** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

| <b>Output Fields</b>            | <p>When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.</p> |

## Sample Output

### ping hostname

```
user@host> ping device
PING device.net (192.168.169.254): 56 data bytes
64 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.028 ms
64 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=1.053 ms

## Sample Output

### request chassis beacon fpc 0 on (QFX Series)

```
user@switch> request chassis beacon fpc 0 on

Beacon set to ON
```

### request chassis beacon node-device (QFabric System)

```
user@switch> request chassis beacon node-device node1 on
```

node1 ON

**request chassis beacon on interconnect-device fpc (QFabric System)**

user@switch> request chassis beacon on interconnect-device fpc 2

FPC 2 ON

## request chassis fpc

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>                                   | <p>(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i>.</p>                                                                                                                                                                                               |

**NOTE:** Beginning in Junos OS Release 12.3, it is possible that FPCs brought offline using the request chassis fpc slot *fpc-slot* offline operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the set fpc *fpc-slot* power off configuration-mode command at the [edit chassis] hierarchy level to ensure that the FPCs remain offline.

**NOTE:** In releases before Junos OS Release 15.1F3, offline FPCs in the PTX5000 router might be powered on by the router during a reboot, or when triggered by other power management events on the router, such as when you take another FPC offline.

Beginning in Junos OS Release 15.1F3 offline FPCs do not come online during reboots or other power management events. To bring such an FPC online:

1. Delete the fpc *fpc-slot* power off statement from the [edit chassis] hierarchy level, if that statement is configured, and commit the configuration.
2. Either issue the request chassis fpc online slot *fpc-slot* operational-mode CLI command or press and hold the FPC ONLINE/OFFLINE button for about 5 seconds until the green OK LED next to the button lights steadily.

**NOTE:** If a CLI-based firmware upgrade is in progress, it prevents the specified FPC from restarting. Starting in Junos OS Release 15.1, the following message is displayed:

```
user@host> request chassis fpc slot 0 restart
FPC 0 Firmware update in progress. Wait!!!
```

**NOTE:** The command request chassis fpc (offline | online | restart) slot *slot-number* is not supported on PTX1000 router.

**Options**    **offline**—Take the FPC offline.

**online**—Bring the FPC online.

**interconnect-device *name***—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

**restart**—Restart the FPC.

**slot slot-number**—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace **slot-number** with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9.
  - EX6210 switches—Replace **slot-number** with a value from 0 through 9.

**NOTE:** These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace **slot-number** with a value from 0 through 7.
- EX8216 switches—Replace **slot-number** with a value from 0 through 15.
- PTX5000 Packet Transport Router—Replace **slot-number** with a value from 0 through 7.

**all-members**—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request chassis fpc](#)

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

### [request chassis fpc \(MX Series Routers with Media Services Blade \[MSB\]\)](#)

```
user@host> request chassis fpc slot 0
Possible completions:
offline Take FPC offline
online Bring FPC online
restart Restart FPC
```

### [request chassis fpc \(MX2020 Router\)](#)

```
user@host >request chassis fpc online slot 2
FPC 2 already online
```

### [request chassis fpc \(MX2010 Router\)](#)

```
user@host >request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
```

## request chassis pic

|                                                      |                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>                                   | Control the operation of the PIC.                                                                                                                                                                                                                                                                                                                                      |

**NOTE:** The `request chassis pic (offline | online) fpc-slot slot number pic-slot slot-number` command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the `show chassis hardware` command.

**NOTE:** This command is not supported on MX960 and MX2020 routers with MPC5EQ.

**NOTE:** T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only online and offline command options to PIC slot 0 are allowed. Use of the online and offline command options for PIC slot 1 with the described router and PIC combination is not allowed.

**NOTE:** In T Series routers, when the PIC state is set from offline to online or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC offline or online:

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify
```

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
```

**NOTE:** If a CLI-based firmware upgrade is in progress, it prevents the specified PIC from restarting. Starting in Junos OS Release 15.1, the following message is displayed:

```
user@host> request chassis pic fpc-slot 0 pic-slot 1 offline
PIC's Firmware update in progress. Wait!!!
```

**NOTE:** The command `request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number` is not supported on PTX1000 routers.

**Options**    **offline**—Take the PIC offline.

**online**—Bring the PIC online.

**fpc-slot slot-number**—Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—0.
  - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
  - EX8208 switches—0 through 7 (line card).
  - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.

- M40 and M40e routers—0 through 7.
- M120 routers—0 through 5.
- M160 routers—0 through 7.
- M320 routers—0 through 7.
- MX 5, MX10, and MX40 routers—0 or 1.
- MX80 routers—0 or 1.
- MX240 routers—0 through 2
- MX480 routers—0 through 5
- MX2020 routers—0 through 19.
- MX2010 routers—0 through 9.
- MX960 routers—0 through 11.
- PTX5000 routers—0 or 1.
- T Series routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the **number** of the T1600 or T4000 router by using the lcc number option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, for the FPC slot number, replace **slot-number** with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline
```

- QFX5100 standalone switches—0.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Change the PIC status on the specified member of the Virtual Chassis configuration. Replace *member-id* with the value that is assigned to the specified member.

**offline**—Take the PIC offline.

**online**—Bring the PIC online.

**pic-slot *slot-number***—PIC slot number.

- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—***slot-number*** corresponds to the slot number of the Packet Forwarding Engine.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- T1600 router —0, 1, 2, or 3.
- T4000 router—0, 1, 2, or 3.
- QFX5100 standalone switches—0, 1, or 2. PIC 0 is used for all interfaces that are not configured on expansion modules, and PIC 1 and PIC 2 are used for interfaces configured on expansion modules.

## Sample Output

### request chassis pic

```
user@host> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

### request chassis pic online member (MX Series Routers)

```
user@host> request chassis pic online member 1 fpc-slot 11 pic-slot 3
```

```
fpc 11 pic 3 online initiated
```

#### **request chassis pic offline member (MX Series Routers)**

```
user@host> request chassis pic offline member 1 fpc-slot 11 pic-slot 3
fpc 11 pic 3 offline initiated
```

| <b>Description</b>                                    | For routers or switches with multiple Routing Engines, control which Routing Engine is the master.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the *Junos OS High Availability Library for Routing Devices*.

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

**Options**    **acquire**—Attempt to become the master Routing Engine.

**release**—Request that the other Routing Engine become the master.

**switch**—Toggle mastership between Routing Engines.

**NOTE:** The **acquire** option should be used with caution because acquiring a Routing Engine may result in a corrupted database. If possible, use the **switch** option instead.

The **acquire**, **release**, and **switch** options have the following suboptions:

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX104, MX480, MX960, MX2010, and MX2020 routers, and PTX5000 routers only) (Optional) Available with the **switch**, **release**, and **acquire** options. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**Additional Information** Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (**RE0**) is the master and the Routing Engine in slot 1 (**RE1**) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the *Junos OS Administration Library for Routing Devices*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

**NOTE:** Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

**Required Privilege Level** maintenance

**List of Sample Output**

[request chassis routing-engine master acquire on page 438](#)  
[request chassis routing-engine master switch on page 438](#)  
[request chassis routing-engine master switch check on page 439](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### [request chassis routing-engine master acquire](#)

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

### [request chassis routing-engine master switch](#)

```
user@host> request chassis routing-engine master switch
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes
```

```
Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes
```

```
Resolving mastership...
Complete. The local routing engine becomes the master.
```

#### **request chassis routing-engine master switch check**

Usage shown for M Series, MX Series, and T Series routers.

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
```

```
warning: Standby Routing Engine is not ready for graceful switchover.
```

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
Switchover Ready
```

You can similarly check the backup Routing Engine.

## request message

| <b>Description</b>               | <p>Stop the router or switch software.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**NOTE:** When you issue this command on an individual component—for example, a Node device—in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, issue this command with the **member** option on the Node device CLI, because you cannot issue this command from the QFabric CLI. Also, issuing this command might cause traffic loss on an individual component.

When you issue this command on a QFX5100 switch, you are not prompted to reboot. You must power cycle the switch to reboot.

**Options** **none**—Stop the router or switch software immediately.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Halt all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

**at time** —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- **+minutes**—Number of minutes from now to stop the software.
- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

**backup-routing-engine**—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

**both-routing-engines**—(Optional) Halt both Routing Engines at the same time.

**director-device** *director-device-id*—(QFabric systems only) Halt a specific Director device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

**in *minutes***—(Optional) Number of minutes from now to stop the software. This option is an alias for the **at +*minutes*** option.

**media (compact-flash | disk)**—(Optional) Boot medium for the next boot.

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

**Required Privilege Level** maintenance

**List of Sample Output**

- [request system halt on page 448](#)
- [request system halt \(In 2 Hours\) on page 448](#)
- [request system halt \(Immediately\) on page 448](#)
- [request system halt \(At 1:20 AM\) on page 448](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

### request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

### request system halt (Immediately)

```
user@host> request system halt at now
```

### request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

## request system logout

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | Power off the software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                            | <p> <b>NOTE:</b> When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the <code>member</code> option. You cannot issue this command from the QFabric CLI.</p>                                                                                                                                                                                                                                 |
|                            | <p> <b>NOTE:</b> For a standalone chassis (such as MX Series, PTX Series, and T Series routers), the request to power off the system is applicable only to the Routing Engines. When you request to power off both Routing Engines, all the FPCs in the chassis shut down after approximately 10 minutes and the chassis fans run at full speed. The FPCs shut down because they no longer have communication with the Routing Engines and an Inter-Integrated Circuit (I2C) timeout occurred.</p>                                                                              |
| <b>Options</b>             | <p><b>none</b>—Power off the router or switch software immediately.</p> <p><b>all-chassis</b>—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.</p> <p><b>all-lcc</b>—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.</p> |

**at *time***—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- **+*minutes***—Number of minutes from now to power off the software.
- ***yymmddhhmm***—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to power off the software.

**both-routing-engines**—(Optional) Power off both Routing Engines at the same time.

**in *minutes***—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +*minutes*** option.

**lcc *number***—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

**media (compact-flash | disk)**—(Optional) Boot medium for the next boot.

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before powering off the software.

**other-routing-engine**—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

**sfc number**—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

**slice slice**—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

**Required Privilege Level** maintenance

**List of Sample Output** [request system power-off on page 454](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system power-off

```
user@host> request system power-off message "This router will be powered off in 30 minutes.
Please save your data and log out immediately."
warning: This command will not halt the other routing-engine.
If planning to switch off power, use the both-routing-engines option.
Power Off the system ? [yes,no] (no) yes

*** FINAL System shutdown message from remote@nutmeg ***
System going down IMMEDIATELY

This router will be powered off in 30 minutes. Please save your data and log out
immediately.

Shutdown NOW!
[pid 5177]
```

## request system reboot

**Syntax (QFX Series)**    request system reboot  
                                  <all <graceful>>  
                                  <at time>  
                                  <director-device *name*>  
                                  <director-group <graceful>>  
                                  <fabric <graceful>>  
                                  <fast-boot>  
                                  <in minutes>  
                                  <hypervisor>  
                                  <media >  
                                  <message "text">  
                                  <node-group *name*>  
                                  <slice (1 | 2 | alternate)>

**Release Information**    Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**            Reboot the Junos OS.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

**Options**                **none**—Reboots the software immediately.

**all**—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

**at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **+minutes**—Number of minutes from now to reboot the software.
- **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

**director-device *name***—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

**director-group**—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**fast-boot**—(QFX5100 switches only) (Optional) Enable fast reboot.

**graceful**—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**hypervisor**—(Optional) Reboot Junos OS, host OS, and any installed guest VMs.

**media (external | internal)**—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before rebooting the software.

**node-group name**—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

**routing-engine**—(Optional) Reboot the Routing Engine.

**slice (1 | 2 | alternate)**—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

**NOTE:** The slice option is not supported on the QFX5100 switch, because there is no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to previous version of Junos OS, issue the **request system software rollback** command.

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level** maintenance

**Related Documentation**

- [clear system reboot on page 396](#)
- [Rebooting and Halting a Device on page 25](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (At 2300)

```
user@switch> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@switch> request system reboot at now
```

### request system reboot (At 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

### request system reboot director-device

```
user@switch> request system reboot director-device Node1
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

### request system reboot director-group

```
user@switch> request system reboot director-group
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

### request system reboot director-group graceful

```
user@switch> request system reboot director-group graceful
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

## request system storage cleanup

| <b>Description</b>                 | Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.                                                                                                                                                                                                                                            |

**Options** **all-members**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the Virtual Chassis master Routing Engine only.

**NOTE:** To delete files on the other members of the Virtual Chassis configuration, log in to each backup Routing Engine and delete the files using the **request system storage cleanup local** command.

**component** (*UUID | serial number | all*)—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

**director-group** *name*—(QFabric systems only) (Optional) Delete files on the Director group.

**dry-run**—(Optional) List files proposed for deletion (without deleting them).

**infrastructure** *name*—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device** *name*—(QFabric systems only) (Optional) Delete files on the Interconnect device.

**local**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

**member** *member-id*—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**name-tag** *name-tag*—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

**node-group** *name*—(QFabric systems only) (Optional) Delete files on the Node group.

**prune**—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

**qfabric component** *name*—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

**repository** (*core | log*)—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

**satellite** [*slot-id slot-id | device-alias alias-name*]—(Junos Fusion only) (Optional) Specify the satellite device in the Junos Fusion by FPC ID or device alias name for which you want to delete debug files.

**Additional Information** If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

**Required Privilege Level** maintenance

## request system zeroize

**Syntax**    request system zeroize  
                  <media>  
                  <local>

**Release Information**    Command introduced before Junos OS Release 9.0.  
                                  Command introduced in Junos OS Release 11.2 for EX Series switches.  
                                  Option **media** added in Junos OS Release 11.4 for EX Series switches.  
                                  Command introduced in Junos OS Release 12.2 for MX Series routers.  
                                  Command introduced in Junos OS Release 12.3 for the QFX Series.  
                                  Option **local** added in Junos OS Release 14.1.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

### Description

**NOTE:** The **media** option is not available on the QFX Series.

Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as **root** and start the Junos OS CLI by typing **cli** at the prompt.

**NOTE:** If you configure the **commit synchronize** statement at the **[edit system]** hierarchy level and issue a **commit** in the master Routing Engine, the master configuration is automatically synchronized with the backup. However, if the backup Routing Engine is down when you issue the **commit**, the Junos OS displays a warning and commits the candidate configuration in the master Routing Engine. When the backup Routing Engine comes up, its configuration will automatically be synchronized with the master. A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

To completely erase user-created data so that it is unrecoverable, use the **media** option.

**Options**    **media**—(Optional) In addition to removing all configuration and log files, causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and so on. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the **request system zeroize media**

operation can take considerably more time than the **request system zeroize** operation. However, the critical security parameters are all removed at the beginning of the process.

**local**—(Optional) Remove all the configuration information and restore all the key values on the active Routing Engine.

**Required Privilege Level** maintenance

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dls** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options** **none**—Same as **gracefully**.

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only)  
(Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only)  
(Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**— (M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**— (MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**— (Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**— (TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**— (EX Series switches only) (Optional) Restart the feature license management process.

**link-management**— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**— (EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**— (MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***— (MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**mib-process**— (Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**— (Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**moundd-service**— (EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**— (Optional) Restart the MPLS Periodic Traceroute process.

**mspd**— (Optional) Restart the Multiservice process.

**multicast-snooping**— (EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**— (Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**— (QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**— (Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**— (Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**— (Optional) Restart the Peer Selection Service process.

**pgcp-service**— (Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**— (Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**— (Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway gateway-name**—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(MX Series routers) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level**    reset

**List of Sample Output**    [restart interfaces on page 483](#)

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## save

| <b>Description</b>         | <p>Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.</p> <p>When saving a file to a remote system, the software uses the <b>scp/ssh</b> protocol.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b><i>filename</i></b>—Name of the saved file. You can specify a filename in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b><i>filename</i></b>—File in the user's home directory (the current directory) on the local flash drive.</li> <li>• <b><i>path/filename</i></b>—File on the local flash drive.</li> <li>• <b><i>/var/filename</i></b> or <b><i>/var/path/filename</i></b>—File on the local hard disk.</li> <li>• <b><i>a:filename</i></b> or <b><i>a:path/filename</i></b>—File on the local drive. The default path is <b>/</b> (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.</li> <li>• <b><i>hostname:/path/filename</i></b>, <b><i>hostname:filename</i></b>, <b><i>hostname:path/filename</i></b>, or <b><i>scp://hostname/path/filename</i></b>—File on an <b>scp/ssh</b> client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify <b><i>hostname</i></b> as <b><i>username@hostname</i></b>.</li> <li>• <b><i>ftp://hostname/path/filename</i></b>—File on an FTP server. You can also specify <b><i>hostname</i></b> as <b><i>username @hostname</i></b> or <b><i>username:password @hostname</i></b>. The default path is the user's home directory. To specify an absolute path, the path must start with the string <b>%2F</b>; for example, <b><i>ftp://hostname/%2Fpath/filename</i></b>. To have the system prompt you for the password, specify <b><i>prompt</i></b> in place of the password. If a password is required, and you do not specify the password or <b><i>prompt</i></b>, an error message is displayed: <pre> user@host&gt; file copy ftp://username@ftp.hostname.net//filename file copy ftp.hostname.net: Not logged in. user@host&gt; file copy ftp://username:prompt@ftphostname.net//filename </pre> <p>Password for <b><i>username@ftp.hostname.net</i></b>:</p> </li> <li>• <b><i>http://hostname/path/filename</i></b>—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify <b><i>hostname</i></b> as <b><i>username@hostname</i></b> or <b><i>username:password@hostname</i></b>. If a password is required and you omit it, you are prompted for it.</li> <li>• <b><i>re0:/path/filename</i></b> or <b><i>re1:/path/filename</i></b>—File on a local Routing Engine.</li> </ul> |

**Required Privilege Level**    configure—To enter configuration mode.

**Table 28: show cli Output Fields**

| Field Name             | Field Description                                                                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI complete-on-space  | Capability to complete a partial command entry when you type a space or a tab: <b>on</b> or <b>off</b> .                                                                                                                 |
| CLI idle-timeout       | Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is <b>disabled</b> . |
| CLI restart-on-upgrade | CLI is set to prompt you to restart the router or switch after upgrading the software: <b>on</b> or <b>off</b> .                                                                                                         |
| CLI screen-length      | Number of lines of text that the terminal screen displays.                                                                                                                                                               |
| CLI screen-width       | Number of characters in a line on the terminal screen.                                                                                                                                                                   |
| CLI terminal           | Terminal type.                                                                                                                                                                                                           |
| CLI is operating in    | Mode: <b>enhanced</b> .                                                                                                                                                                                                  |
| CLI timestamp          | Date and time format for the timestamp. If the timestamp is not set, the state is <b>disabled</b> .                                                                                                                      |
| CLI working directory  | Pathname of the working directory.                                                                                                                                                                                       |

## Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/tmp'
```

## show cli authorization

|                                 |                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> |
| <b>Description</b>              | Display the permissions for the current user.                                                                                                                                                                                                                                         |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                  |
| <b>List of Sample Output</b>    | <a href="#">show cli authorization on page 492</a>                                                                                                                                                                                                                                    |
| <b>Output Fields</b>            | <p><a href="#">Table 29 on page 490</a> lists the output fields for the <b>show cli authorization</b> command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.</p>                                                           |

**Table 29: show cli authorization Output Fields**

| Field Name       | Field Description                              |
|------------------|------------------------------------------------|
| access           | Can view access configuration information.     |
| access-control   | Can modify access configuration.               |
| admin            | Can view user account information.             |
| admin-control    | Can modify user account information.           |
| clear            | Can clear learned network information.         |
| configure        | Can enter configuration mode.                  |
| control          | Can modify any configuration.                  |
| edit             | Can edit configuration files.                  |
| field            | Reserved for field (debugging) support.        |
| firewall         | Can view firewall configuration information.   |
| firewall-control | Can modify firewall configuration information. |
| floppy           | Can read from and write to removable media.    |
| flow-tap         | Can view flow-tap configuration information.   |

Table 29: show cli authorization Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>flow-tap-control</b>               | Can configure flow-tap configuration information.                                                                 |
| <b>idp-profiler-operation</b>         | Can configure Profiler data.                                                                                      |
| <b>interface</b>                      | Can view interface configuration information.                                                                     |
| <b>interface-control</b>              | Can modify interface configuration information.                                                                   |
| <b>maintenance</b>                    | Can perform system maintenance.                                                                                   |
| <b>network</b>                        | Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands. |
| <b>pgcp-session-mirroring</b>         | Can view Packet Gateway Control Protocol session mirroring configuration.                                         |
| <b>pgcp-session-mirroring-control</b> | Can modify Packet Gateway Control Protocol session mirroring configuration all-control.                           |
| <b>reset</b>                          | Can reset or restart interfaces and system processes.                                                             |
| <b>rollback</b>                       | Can roll back to previous configurations.                                                                         |
| <b>routing</b>                        | Can view routing configuration information.                                                                       |
| <b>routing-control</b>                | Can modify routing configuration information.                                                                     |
| <b>secret</b>                         | Can view passwords and authentication keys in the configuration.                                                  |
| <b>secret-control</b>                 | Can modify passwords and authentication keys in the configuration.                                                |
| <b>security</b>                       | Can view security configuration information.                                                                      |
| <b>security-control</b>               | Can modify security configuration information.                                                                    |
| <b>shell</b>                          | Can start a local shell.                                                                                          |
| <b>snmp</b>                           | Can view SNMP configuration information.                                                                          |
| <b>snmp-control</b>                   | Can modify SNMP configuration information.                                                                        |
| <b>system</b>                         | Can view system configuration information.                                                                        |
| <b>system-control</b>                 | Can modify system configuration information.                                                                      |
| <b>trace</b>                          | Can view trace file settings information.                                                                         |

Table 29: show cli authorization Output Fields (*continued*)

| Field Name                | Field Description                                               |
|---------------------------|-----------------------------------------------------------------|
| <b>trace-control</b>      | Can modify trace file settings information.                     |
| <b>view</b>               | Can view current values and statistics.                         |
| <b>view-configuration</b> | Can view all configuration information (not including secrets). |

## Sample Output

### show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
 admin -- Can view user accounts
 admin-control-- Can modify user accounts
 clear -- Can clear learned network information
 configure -- Can enter configuration mode
 control -- Can modify any configuration
 edit -- Can edit full files
 field -- Special for field (debug) support
 floppy -- Can read and write from the floppy
 interface -- Can view interface configuration
 interface-control-- Can modify interface configuration
 network -- Can access the network
 reset -- Can reset/restart interfaces and daemons
 routing -- Can view routing configuration
 routing-control-- Can modify routing configuration
 shell -- Can start a local shell
 snmp -- Can view SNMP configuration
 snmp-control-- Can modify SNMP configuration
 system -- Can view system configuration
 system-control-- Can modify system configuration
 trace -- Can view trace file settings
 trace-control-- Can modify trace file settings
 view -- Can view current values and statistics
 maintenance -- Can become the super-user
 firewall -- Can view firewall configuration
 firewall-control-- Can modify firewall configuration
 secret -- Can view secret configuration
 secret-control-- Can modify secret configuration
 rollback -- Can rollback to previous configurations
 security -- Can view security configuration
 security-control-- Can modify security configuration
 access -- Can view access configuration
 access-control-- Can modify access configuration
 view-configuration-- Can view all configuration (not including secrets)
 flow-tap -- Can view flow-tap configuration
 flow-tap-control-- Can configure flow-tap service
Individual command authorization:
 Allow regular expression: none
 Deny regular expression: none
 Allow configuration regular expression: none
 Deny configuration regular expression: none

```

## show cli directory

| <b>Output Fields</b>            | <a href="#">Table 31 on page 495</a> lists the output fields for the <b>show cli history</b> command. Output fields are listed in the approximate order in which they appear.                                                                                      |

**Table 31: show cli history Output Fields**

| Field Name            | Field Description                      |
|-----------------------|----------------------------------------|
| <i>timestamp</i>      | Time at which the command was entered. |
| <i>command-syntax</i> | Command that was entered.              |

## Sample Output

### show cli history

```
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history
```

## CHAPTER 29

# Guest VM Operational Commands

- `show app-engine arp`
- `show app-engine bridge`
- `show app-engine crash`
- `show app-engine info`
- `show app-engine logs`
- `show app-engine netstat`
- `show app-engine resource-usage`
- `show app-engine routing-instance compute-clusters`
- `show app-engine routing-instance virtual-machines`
- `show app-engine status`
- `show app-engine virtual-machine instance`
- `show app-engine packages system`

## show app-engine arp

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | Display all entries in the Address Resolution Protocol (ARP) table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <ul style="list-style-type: none"> <li><b>compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i></b>—Name of the compute cluster and name of the compute node. On the QFX5100 switch, the default name of the compute cluster is default-cluster, and the default name of the compute node is default-node.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Additional Information</b>   | <p>In the operational mode of the CLI when you type ? for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b>compute-cluster <i>compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b>compute-node <i>compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> |

| Release Information      | Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Shows information regarding the bridge interface. The bridge interface allows you to connect the VM to the physical Ethernet interface of the host machine. Displays the name of the bridge, the bridge ID, whether or not Spanning Tree Protocol is enabled, and the interfaces used as bridge interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Options                  | <ul style="list-style-type: none"><li><code>compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i></code>—Name of the compute cluster and name of the compute node. On the QFX5100 switch, the default name of the compute cluster is default-cluster, and the default name of the compute node is default-node.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Additional Information   | <p>In the operational mode of the CLI when you type <code>?</code> for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <code>compute-cluster <i>compute-cluster-name</i></code> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <code>compute-node <i>compute-node-name</i></code> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> |
| Required Privilege Level | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Displays information regarding crashes on the Junos V App Engine or host OS. The command displays the list of files present in the <code>/var/crash/</code> directory, as well as some core files located in the <code>/var/tmp/</code> directory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

On QFX switches with a host OS, the default compute cluster and compute node names are default-cluster and default-node, and the command applies to the host OS by default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Additional Information</b>   | <p>In the operational mode of the CLI when you type <code>?</code> for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b>compute-cluster <i>compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b>compute-node <i>compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> |

| <b>Output Fields</b>            | For a description of the output fields, see <a href="#">Table 34 on page 502</a> . Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 34: show app-engine crash Output Fields**

| Field Name      | Field Description        |
|-----------------|--------------------------|
| Compute Cluster | Name of compute cluster. |
| Compute Node    | Name of compute node.    |
| Crash Info      | List of core files.      |

## Sample Output

### show app-engine crash (QFX5100 Switches)

```
user@host> show app-engine crash

Compute cluster: default-cluster

Compute node: default-node

Crash Info
=====
total 0
```

## show app-engine info

---

| Description              | Show the basic information of a compute node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Options                  | <b><i>compute-cluster-name</i></b> —(Optional) Name of the compute cluster.<br><br><b><i>compute-node-name</i></b> —(Optional) Name of the compute node. Specifying a <i>compute-node</i> alone will not return any result. Always specify the <i>compute-cluster</i> with a <i>compute node</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Additional Information   | <p>In the operational mode of the CLI when you type <code>?</code> for a name, for example a <i>compute-node</i> name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, , if you specify <i>compute cluster</i> and <i>compute node</i> in the operational command, the auto-complete works only if the <i>compute cluster</i> is put before the <i>compute node</i>.</p> <p>For commands with an optional <b><i>compute-cluster <i>compute-cluster-name</i></i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b><i>compute-node <i>compute-node-name</i></i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified <i>compute cluster</i>.</p> |

| Output Fields            | For a description of the output fields, see <a href="#">Table 35 on page 505</a> . Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 35: show app-engine info Output Fields

| Field Name      | Field Description                                              |
|-----------------|----------------------------------------------------------------|
| Compute cluster | Name of the compute cluster.                                   |
| Compute node    | Name of the compute node.                                      |
| Model           | Model name of the compute node.                                |
| Kernel release  | Kernel release of the Linux which the compute node is running. |
| Machine         | The machine architecture of the compute node.                  |
| Management IP   | The management IP address of the compute node.                 |

## Sample Output

### show app-engine info

In the following example, notice there are multiple compute clusters and multiple compute nodes shown because there was no compute cluster or compute node specified in the command.

```
user@host> show app-engine info
Compute cluster: cluster1
 Compute node Model Kernel release Machine Management IP
 cn2 VXE1001 2.6.18-238.el5 x86_64 192.168.1.29/24

Compute cluster: new-cluster
 Compute node Model Kernel release Machine Management IP
 new-node --- Offline --- 10.1.1.1/24
```

### show app-engine info compute-cluster compute-node

The output when the optional **compute-cluster** and **compute-node** options are used is the same (both online and offline) as for the **show app-engine info** command except that basic information is displayed for only the compute node specified in the command.

```
user@host> show app-engine info compute-cluster cluster1 compute-node cn2
Compute cluster: cluster1
 Compute node Model Kernel release Machine Management IP
 cn2 VXE1001 2.6.18-238.el5 x86_64 192.168.1.29/24

user@host> show app-engine info compute-cluster new-cluster compute-node new-node
Compute cluster: new-cluster
 Compute node Model Kernel release Machine Management IP
 new-node --- Offline --- 10.1.1.1/24
```

### show app-engine info (Command failed)

```
user@host> show app-engine info compute-cluster new-cluster compute-node new-node
```

```

Compute cluster: new-cluster
Compute node Model Kernel release Machine Management IP
new-node --- Error getting information --- 10.1.1.1/24

```

#### show app-engine info (QFX5100 Switch)

```

user@switch> show app-engine info
Compute cluster: default-cluster
Compute node Model Kernel release Machine Management IP
default-node QFX 2.6.32-279.22.1.e16.x86_64x86_64 192.168.1.1/24

```

## show app-engine logs

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Displays log files regarding the state of the specified Guest VM or host OS, located in the <code>/var/log/</code> directory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <ul style="list-style-type: none"> <li><b>compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i></b>—Name of the compute cluster and name of the compute node. On QFX switches with a host OS, the default compute cluster and compute node names are default-cluster and default-node, and the command applies to the host OS by default.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Additional Information</b>   | <p>In the operational mode of the CLI when you type <code>?</code> for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b>compute-cluster <i>compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b>compute-node <i>compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Displays the active network connections and other traffic statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <ul style="list-style-type: none"> <li><b>compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i></b>—Name of the compute cluster and name of the compute node. On the host OS of the QFX5100 switch, the default name of the compute cluster is default-cluster, and the default name of the compute node is default-node.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Additional Information</b>   | <p>In the operational mode of the CLI when you type ? for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b>compute-cluster <i>compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b>compute-node <i>compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Additional Information</b>   | <p>In the operational mode of the CLI when you type ? for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, , if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b>compute-cluster <i>compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b>compute-node <i>compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> |

| Compute Cluster | Name of compute cluster                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Compute Node    | Name of compute node                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| CPU Usage       | <p>This section of the display shows the CPU utilization since system startup. Each row displays the CPU utilization of individual CPUs.</p> <ul style="list-style-type: none"> <li>• First column—No heading. This column shows the time at which the CPU usage was taken.</li> <li>• <b>CPU</b>—Processor number. The keyword <b>all</b> indicates that statistics are calculated as averages among all processors.</li> <li>• <b>%use</b>—Percentage of CPU utilization that occurred while executing at the user level (application).</li> <li>• <b>%nice</b>—Percentage of CPU utilization that occurred while executing at the user level with nice priority. UNIX "niceness" value. A lower number indicates a higher priority.</li> <li>• <b>%sys</b>—Percentage of CPU utilization that occurred while executing at the system level (kernel). Note that this does not include time spent servicing interrupts or softirqs. A softirq (software interrupt) is one of up to 32 enumerated software interrupts which can run on multiple CPUs at one time.</li> <li>• <b>%iowait</b>—Percentage of time that the CPU or CPUs were idle during which the system had an outstanding disk I/O request.</li> <li>• <b>%irq</b>—Percentage of time spent by the CPU or CPUs to service interrupts.</li> <li>• <b>%soft</b>—Percentage of time spent by the CPU or CPUs to service softirqs. A softirq (software interrupt) is one of up to 32 enumerated software interrupts which can run on multiple CPUs at once.</li> <li>• <b>%steal</b>—Percentage of time spent in involuntary wait by the virtual CPU or CPUs while the hypervisor was servicing another virtual processor.</li> <li>• <b>%idle</b>—Percentage of time that the CPU or CPUs were idle and the system did not have an outstanding disk I/O request.</li> <li>• <b>intr/s</b>—Total number of interrupts received per second by the CPU or CPUs.</li> </ul> |
| Memory Usage    | <p>This section shows the current memory usage in megabytes. Below are the fields in each row.</p> <ul style="list-style-type: none"> <li>• <b>total</b>—Total memory.</li> <li>• <b>used</b>—Used memory.</li> <li>• <b>free</b>—Free memory.</li> <li>• <b>shared</b>—Ignore this field.</li> <li>• <b>buffers</b>—Amount of physical RAM used for file buffers.</li> <li>• <b>cached</b>—Amount of physical RAM used as cache memory.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Mem             | RAM usage.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>            | Show the status of a compute node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                | <p><b>compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i></b>—(Optional)<br/>Name of computer cluster and compute node.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Additional Information</b> | <p>In the operational mode of the CLI when you type ? for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, , if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional <b>compute-cluster <i>compute-cluster-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional <b>compute-node <i>compute-node-name</i></b> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p> <p>When the compute node configuration has been updated or the jvae package is upgraded, this command shows the following note that the compute node configuration or the jvae package has been updated and the compute node needs to be rebooted for the configuration to take effect.</p> <p>NOTE: Configuration and/or jvae package updated. Please reboot to take effect.</p> <p>The note also displays the details of what exactly has been updated on the Routing Engine. Once the compute node is rebooted, the note automatically goes off.</p> <p>If the operational compute node name (hostname) is different than the administrative compute node name, then the following error message is displayed.</p> <pre>ERROR: The compute node has the following errors: - Operational node name: cn   Administrative node name: newname   Either reboot the node OR change the   administrative node name to 'cn' to   continue VMM operations.</pre> <p>Where <b>cn</b> is the previous compute node name.</p> <p>A mismatch between the operational node name and the administrative node name could happen if you rename the compute node name in the CLI. For example:</p> <pre>[edit] user@router# rename services app-engine compute-cluster cc compute-node cn to compute-node newname</pre> |

```

[edit]
user@router# set services app-engine virtual-machines instance vmx1 compute-cluster cc
compute-node newname
[edit]
user@router# commit
commit complete

[edit]
user@router# run show app-engine status
Compute cluster: cc
Compute node Status
newname Online ERROR: The compute node has the following errors:
 - Operational node name: cn
 Administrative node name: newname
 Either reboot the node OR change the administrative
 node name to 'cn' to continue VMM operations.

[edit]
user@router#

```

If the compute node has any error messages displayed, the VM operations will not work until the error is fixed.

```

user@router# run show app-engine virtual-machine instance
VM name Compute cluster VM status
vmx1 cc --- VMM service is not available ---

```

To fix the error, either reboot the node or change the administrative node name (in both the physical and VM configurations) back to the operational (previous) compute node name.

[show app-engine status compute-cluster compute-node on page 524](#)

**Output Fields**

For a description of the output fields, see [Table 41 on page 523](#). Output fields are listed in the approximate order in which they appear.

**Table 41: show app-engine status Output Fields**

| Field Name      | Field Description        |
|-----------------|--------------------------|
| Compute cluster | Name of compute cluster. |
| Compute node    | Name of compute node.    |

Table 41: show app-engine status Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status     | Online or offline.<br><br>If the status is Offline, a note is displayed. The XX:XX:XX:XX:XX:XX variable in the note will contain the <b>mac-address</b> attribute of the compute node.<br><br><b>NOTE:</b> If you see the node as <b>Offline</b> , please check if the compute node is booted and is properly connected to the router. |

## Sample Output

### show app-engine status

```
user@host> show app-engine status
Compute cluster: cc1
 Compute node Status
 cn0 Online
Compute cluster: new-cluster
 Compute node Status
 new-node Offline
```

**NOTE:** Please check if the compute node with network boot interface MAC address XX:XX:XX:XX:XX:XX is UP and is properly connected to the router

### show app-engine status compute-cluster compute-node

The output for the **show app-engine status compute-cluster compute-node** command is identical to that for the **show app-engine status** command except that usage information displayed is for only the compute node specified whereas the **show app-engine status** command displays all the compute nodes.

## show app-engine virtual-machine instance

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                      |

**Table 42: show app-engine virtual-machine instance Output Fields**

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VM name</b>           | Name of the VM instance.                                                                                                                                                                                                                                                                                                  |
| <b>Compute cluster</b>   | Name of the compute cluster.                                                                                                                                                                                                                                                                                              |
| <b>VM status</b>         | <p>Status of VM instance: active (the VM is up) or inactive (the VM is down).</p> <p>When the status is listed as <b>ACTIVE</b>, it does not mean that the operating system on the VM has come up. You need to telnet to the VM console to verify if the OS has come up or not and if everything is running properly.</p> |
| <b>Compute node name</b> | Name of the compute node.                                                                                                                                                                                                                                                                                                 |

Table 42: show app-engine virtual-machine instance Output Fields (*continued*)

| Field Name                          | Field Description                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------------|
| VM UUID                             | Unique identifier of the VM instance.                                                                   |
| Number of CPUs                      | Number of CPU in the VM instance.                                                                       |
| VM disk image                       | Name of VM disk image including package, version, and image ( <i>package-name/version/image-name</i> ). |
| Memory (GB)                         | Memory in gigabytes.                                                                                    |
| Console                             | Identifier of console.                                                                                  |
| VM PID                              | Process ID of VM instance.                                                                              |
| Name of the VM interface            | IP address of the VM.                                                                                   |
| Name of the secondary disk or disks | Size of secondary disk.                                                                                 |

## Sample Output

### show app-engine virtual-machine instance

```

user@host> show app-engine virtual-machine instance
VM name Compute cluster VM status
attacker cc1 ACTIVE
host cc1 ACTIVE
snort cc1 ACTIVE

```

### show app-engine virtual-machine instance for a Single VM Instance

```

user@host> show app-engine virtual-machine instance attacker
VM name Compute cluster VM status
attacker cc1 ACTIVE

```

### show app-engine virtual-machine instance detail

```

user@host> show app-engine virtual-machine instance attacker detail
VM name: attacker
VM status: ACTIVE
Compute cluster name: cc1
Compute node name: cn1
VM UUID: 34938d5c-6c45-11e1-8b1f-00e081ca5959
VM disk image: centos_vm/12.3B2/centos.img
Number of CPUs: 1
Memory (GB): 1
Console: 10.5.5.9 15144
VM PID: 9792
eth0: 10.5.5.29
hda: 10 GB

```

## Sample Output

### show app-engine virtual-machine instance (QFX5100 Switches)

```
root> show app-engine virtual-machine instance
VM name Compute cluster VM status
vm default-cluster ACTIVE
```

## show app-engine packages system

|                                 |                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show app-engine packages system<br><package-name>                                                                                                                                |
| <b>Release Information</b>      | Command introduced Junos OS Release 14.1.                                                                                                                                        |
| <b>Description</b>              | Show the local status of virtual machine (VM) packages.                                                                                                                          |
| <b>Options</b>                  | <i>package-name</i> —Name of the VM package.                                                                                                                                     |
| <b>Additional Information</b>   | If no additional option is added after <b>system</b> , the output shows all VM packages. See the sample output for <a href="#">show app-engine packages system on page 529</a> . |
| <b>Required Privilege Level</b> | view                                                                                                                                                                             |

**Table 43: show app-engine packages system Info Output Fields**

| Field           | Description                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Package         | Name of the package                                                                                                                                                                                                                                                                                                        |
| Disk Image      | Filename of the disk image.                                                                                                                                                                                                                                                                                                |
| Compute cluster | Name of the compute cluster.                                                                                                                                                                                                                                                                                               |
| Status          | Status of the compute cluster, which is one of the following: <ul style="list-style-type: none"> <li>• Not installed (not required)</li> <li>• Checking</li> <li>• Installing</li> <li>• Installation failed</li> <li>• Installation failed (attempts left)</li> <li>• Installed</li> <li>• Installed (invalid)</li> </ul> |

## Sample Output

### show app-engine packages system

```

user@host> show app-engine packages system
Package: verref
 Disk Image: verref/12.3I20121001_1737_jdoe/centos64a-1.4g-veref.img.gz
 Compute cluster Status
 pac-cc Installed

Package: verref-13.2X2
 Disk Image: verref-13.2X2/13.2X2/mini-qcow2.img.gz
 Compute cluster Status
 cc2 Installed
 pac-cc Not installed (not required by
configuration)

```

The **show app-engine packages system** command shows each package and gives the compute clusters the package is on.

### show app-engine packages system (package-name)

```

user@host> show app-engine packages system verref-13.2X2
Package: verref-13.2X2
 Disk Image: verref-13.2X2/13.2X2/mini-qcow2.img.gz
 Compute cluster Status
 cc2 Installed
 pac-cc Not installed (not required by
configuration)

```

If you use the package-name option, the output shows only the status of the named VM package.

## CHAPTER 30

# ISSU Operational Commands

- request system software in-service-upgrade
- show chassis in-service-upgrade

## request system software in-service-upgrade

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>               | Perform a unified in-service software upgrade (ISSU). A unified ISSU enables you to upgrade from one Junos OS Release to another with no disruption on the control plane and with minimal disruption of traffic. In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled. On QFX5100 switches, nonstop bridging (NSB) must be enabled if you are using the Layer 2 Control Protocol process (l2cpd) to transmit Layer 2 spanning tree protocols in a Layer 2 bridge environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                   | <p><b><i>package-name</i></b>—Location from which the software package or bundle is to be installed. For example:</p> <ul style="list-style-type: none"> <li>• <b><i>/var/tmp/package-name</i></b>— For a software package or bundle that is being installed from a local directory on the router.</li> <li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following: <ul style="list-style-type: none"> <li>• <b>ftp</b>—File Transfer Protocol</li> <li>• <b>http</b>—Hypertext Transfer Protocol</li> <li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version)</li> </ul> </li> </ul> <p><b>no-old-master-upgrade</b>—(Optional) When the <b>no-old-master-upgrade</b> option is included, after the backup Routing Engine is rebooted with the new software package and a switchover occurs to make it the new master Routing Engine, the former master (new backup) Routing Engine will not be upgraded to the new software. In this case, you must manually upgrade the former master (new backup) Routing Engine. If you do not include the <b>no-old-master-upgrade</b> option, the system will automatically upgrade the former master Routing Engine.</p> <p><b>reboot</b>—(Optional) When the <b>reboot</b> option is included, the former master (new backup) Routing Engine is automatically rebooted after being upgraded to the new software. When the <b>reboot</b> option is not included, you must manually reboot the former master (new backup) Routing Engine using the <b>request system reboot</b> command.</p> |

**NOTE:** The reboot option is not available on the QFX5100 switch.

**Additional Information** The following conditions apply to unified ISSUs:

- Unified ISSU is not supported on every platform. For a list of supported platforms, see *Unified ISSU System Requirements*.
- Unsupported PICs are restarted during a unified ISSU on certain routing devices. For information about supported PICs, see the *Junos OS High Availability Library for Routing Devices*.
- Unsupported protocols will experience packet loss during a unified ISSU. For information about supported protocols, see the *Junos OS High Availability Library for Routing Devices*.
- During a unified ISSU, you cannot bring any PICs online or offline on certain routing devices.

For more information, see the *Junos OS High Availability Library for Routing Devices*.

## show chassis in-service-upgrade

**Syntax** `show chassis in-service-upgrade`

**Release Information** Command introduced in Junos OS Release 9.0.  
 Command introduced in Junos OS Release 12.3R2, 13.1R2, and 13.2R1 for TX Matrix Plus routers.  
 Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.  
 Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.  
 Command introduced in Junos OS Release 13.2 for PTX5000 routers.  
 Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.

**Description** Display the status of Flexible PIC Concentrators (FPCs) and their corresponding PICs after the most recent unified in-service software upgrade (ISSU). This command must be issued on the master Routing Engine.

**NOTE:** Only Intelligent Queuing (IQ) PICs are displayed by this command output. Unified ISSU status for other PIC types is controlled internally by the FPC.

**Options** This command has no options.

**Required Privilege Level** view

- *Example: Performing a Unified ISSU*

**List of Sample Output** [show chassis in-service-upgrade on page 546](#)  
[show chassis in-service-upgrade \(MX2010 Router\) on page 546](#)  
[show chassis in-service-upgrade \(MX2020 Router\) on page 546](#)  
[show chassis in-service-upgrade \(TX Matrix Plus Router\) on page 547](#)  
[show chassis in-service-upgrade \(QFX5100 Switch\) on page 548](#)

**Output Fields** Table 44 on page 545 lists the output fields for the `show chassis in-service-upgrade` command. Output fields are listed in the approximate order in which they appear.

**Table 44: show chassis in-service-upgrade Output Fields**

| Field Name | Field Description                            |
|------------|----------------------------------------------|
| Item       | Flexible PIC Concentrator (FPC) slot number. |

Table 44: show chassis in-service-upgrade Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b> | FPC and corresponding PIC state. State can be either of the following: <ul style="list-style-type: none"> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Offline</b>—FPC is powered down.</li> </ul> |
| <b>Reason</b> | Reason for the state (if offline).                                                                                                                                                                                 |

| <b>Release Information</b> | Command introduced in Junos OS Release 10.4 for EX Series switches.<br>Option <b>set [<i>package-name</i> <i>package-name</i>]</b> added in Junos OS Release 12.1 for EX Series switches.<br>Command introduced in Junos OS Release 13.2X50-D20 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | <p>Perform a nonstop software upgrade (NSSU) on a switch with redundant Routing Engines or on a Virtual Chassis. The behavior of this command depends on which switch or Virtual Chassis it is executed on:</p> <ul style="list-style-type: none"><li>When you execute this command on an EX3300, EX4200, EX4300, EX4500, or EX4550 Virtual Chassis or QFX3500 and QFX3600 Virtual Chassis, a fixed configuration of switches in a Virtual Chassis Fabric (QFX3500/QFX3600 and QFX5100 switches) or for a mixed Virtual Chassis Fabric composed of any combination of QFX3500/QFX3600, QFX5100, and EX4300 switches, or a mixed Virtual Chassis composed of any combination of EX4200, EX4500, and EX4550 switches, all members are upgraded. The original Virtual Chassis backup becomes the master. The original master is automatically upgraded and rebooted and rejoins the Virtual Chassis as the backup after the upgrade completes.</li><li>When you execute this command on an EX6200 or EX8200 switch, both the backup and master Routing Engines are upgraded, with the original backup Routing Engine becoming the new master at the end of the upgrade.<br/><br/>The original master Routing Engine is automatically rebooted on an EX6200 switch.<br/><br/>The original master Routing Engine is not automatically rebooted on an EX8200 switch unless you specify the <b>reboot</b> option.</li><li>When you execute this command on an EX8200 Virtual Chassis, all master and backup Routing Engines are upgraded in the Virtual Chassis, including the external Routing Engines. The original backup Routing Engines become the new master Routing Engines. The original master Routing Engines are not automatically rebooted, unless you specify the <b>reboot</b> option.</li></ul> <p>This command has the following requirements:</p> <ul style="list-style-type: none"><li>All Virtual Chassis members and all Routing Engines must be running the same Junos OS release.</li><li>Graceful Routing Engine switchover (GRES) must be enabled.</li><li>Nonstop active routing (NSR) must be enabled.</li></ul> |

**NOTE:** Although nonstop bridging (NSB) does not have to be enabled for you to use this command, we recommend that you enable NSB. Enabling NSB ensures that all NSB-supported Layer 2 protocols operate seamlessly during the Routing Engine switchover that is part of the NSSU. See *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*.

- The command must be executed from the master Routing Engine on a standalone switch or from the master on a Virtual Chassis.
- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis members (for EX3300, EX4200, EX4300, EX4500, EX4550, QFX3500 and QFX3600 Virtual Chassis, and mixed Virtual Chassis, and Virtual Chassis Fabric) or on different line cards (for EX6200 and EX8200 switches, and for EX8200 Virtual Chassis).
- For EX3300, EX4200, EX4300, EX4500, EX4550, QFX3500 and QFX3600 Virtual Chassis, and mixed Virtual Chassis:
  - The Virtual Chassis members must be connected in a ring topology. A ring topology prevents the Virtual Chassis from splitting during an NSSU.
  - The Virtual Chassis master and backup must be adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
  - The Virtual Chassis must be preprovisioned so that the linecard role has been explicitly assigned to member switches acting in a linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their Routing Engine roles (although mastership will change), and the remaining switches must maintain their linecard roles.
  - A two-member Virtual Chassis must have **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.
- For Virtual Chassis Fabric:
  - Only two pre-provisioned members in the routing engine role are supported. If more than two routing engines are configured, a warning will be issued, and NSSU will stop.
  - The Virtual Chassis Fabric members are connected in a spine and leaf topology. A spine and leaf topology prevents the Virtual Chassis Fabric from splitting during an NSSU. Each leaf device must be connected to both spine devices.
  - The Virtual Chassis Fabric must be preprovisioned so that the line card role has been explicitly assigned to member switches acting in a line card role, and that the routing engine role has been explicitly assigned to member switches acting in a routing engine role. During an NSSU, the Virtual Chassis Fabric members must maintain their roles—the master and backup must maintain their master and backup roles (although

mastership will change), the member switches must remain their routing engine roles, and the remaining switches must maintain their linecard roles.

- A two-member Virtual Chassis Fabric must have **no-split-detection** configured so that the Virtual Chassis Fabric does not split when an NSSU upgrades a member.

**Options** *package-name*—Location from which the software package or bundle is to be installed. For example:

- */var/tmp/package-name*—For a software package or bundle that is being installed from a local directory on the switch.
- *protocol://hostname/pathname/package-name*—For a software package or bundle that is to be downloaded and installed from a remote location. Replace *protocol* with one of the following:
  - **ftp**—File Transfer Protocol.  
Use *ftp://hostname/pathname/package-name*. To specify authentication credentials, use *ftp://<username>:<password>@hostname/pathname/package-name*. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.  
Use *http://hostname/pathname/package-name*. To specify authentication credentials, use *http://<username>:<password>@hostname/pathname/package-name*. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).  
Use *scp://hostname/pathname/package-name*. To specify authentication credentials, use *scp://<username>:<password>@hostname/pathname/package-name*.

**NOTE:** The *pathname* in the protocol is the relative path to the user home directory on the remote system and not the root directory.

---

**set [package-name package-name]**—(Mixed Virtual Chassis only) Locations of the EX4200 and the EX4500 installation packages. These packages must be for the same Junos OS release. See the description of the *package-name* option for information about how to specify the location of the installation packages.

**force-host**—(Optional) Force the addition of host software package or bundle (ignore warnings) on the QFX5100 device.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of package or bundle files.

**no-old-master-upgrade**—(Optional) (EX8200 switches only) Upgrade the backup Routing Engine only. After the upgrade completes, the original master Routing Engine becomes the backup Routing Engine and continues running the previous software version.

**reboot**—(Optional) (EX8200 switches and EX8200 Virtual Chassis only) When the **reboot** option is included, the original master (new backup) Routing Engines are automatically rebooted after being upgraded to the new software. When the **reboot** option is not included, you must manually reboot the original master (new backup) Routing Engines using the **request system reboot** command.

**NOTE:** If you do not use the **reboot** option on an EX8200 Virtual Chassis, you must establish a connection to the console port on the Switch Fabric and Routing Engine (SRE) module or Routing Engine (RE) module to perform the manual reboot of the backup Routing Engines.

**unlink**—(Optional) Remove the software package after a successful upgrade is completed.

**Required Privilege Level** maintenance

| <b>Output Fields</b>            | Table 46 on page 568 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 46: show system license Output Fields

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Feature name</b>       | Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Licenses used</b>      | <p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p><b>NOTE:</b> In Junos OS Release 10.1 and later, the <b>Licenses used</b> column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (<b>scale-subscriber</b>), L2TP (<b>scale-l2tp</b>), Mobile IP (<b>scale-mobile-ip</b>), and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Licenses installed</b> | <p>Information about the installed license key:</p> <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>State</b>—State of the license key: <b>valid</b> or <b>invalid</b>. An <b>invalid</b> state indicates that the key was entered incorrectly or is not valid for the specific device.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Software Serial Number</b>—Serial number of the disaggregated software feature license. License Management System (LMS) uses the software serial number, not the chassis ID, to generate a disaggregated feature license.</li> <li>• <b>Customer ID</b>—what is this exactly?</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Group defined</b>—Group membership of a device.</li> <li>• <b>Features</b>—Feature associated with a license, such as data link switching (DLSw).</li> </ul> |
| <b>Licenses needed</b>    | Number of licenses required for features being used but not yet properly licensed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Expiry</b>             | Amount of time left within the grace period before a license is required for a feature being used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:
```

| Feature name                  | Licenses used | Licenses installed | Licenses needed | Expiry    |
|-------------------------------|---------------|--------------------|-----------------|-----------|
| subscriber-accounting         | 2             | 2                  | 0               | permanent |
| subscriber-authentication     | 1             | 2                  | 0               | permanent |
| subscriber-address-assignment | 2             | 2                  | 0               | permanent |
| subscriber-vlan               | 2             | 2                  | 0               | permanent |
| subscriber-ip                 | 0             | 2                  | 0               | permanent |
| scale-subscriber              | 2             | 3                  | 0               | permanent |
| scale-l2tp                    | 4             | 5                  | 0               | permanent |
| scale-mobile-ip               | 1             | 2                  | 0               | permanent |

```
Licenses installed:
```

```
License identifier: XXXXXXXXXX
```

```
License version: 2
```

**Features:**

```

subscriber-accounting - Per Subscriber Radius Accounting
 permanent
subscriber-authentication - Per Subscriber Radius Authentication
 permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
 permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
 permanent
subscriber-ip - Dynamic and Static IP
 permanent

```

**show system license installed**

```

user@host> show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
subscriber-accounting - Per Subscriber Radius Accounting
 permanent
subscriber-authentication - Per Subscriber Radius Authentication
 permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
 permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
 permanent
subscriber-ip - Dynamic and Static IP
 permanent

```

**show system license keys**

```

user@host> show system license keys
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
 xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
 xxxxxx xxxxxx xxx

```

**show system license usage**

```

user@host> show system license usage
License usage:

```

| Feature name                  | Licenses<br>used | Licenses<br>installed | Licenses<br>needed | Expiry    |
|-------------------------------|------------------|-----------------------|--------------------|-----------|
| subscriber-accounting         | 2                | 2                     | 0                  | permanent |
| subscriber-authentication     | 1                | 2                     | 0                  | permanent |
| subscriber-address-assignment | 2                | 2                     | 0                  | permanent |
| subscriber-vlan               | 2                | 2                     | 0                  | permanent |
| subscriber-ip                 | 0                | 2                     | 0                  | permanent |
| scale-subscriber              | 2                | 3                     | 0                  | permanent |
| scale-l2tp                    | 4                | 5                     | 0                  | permanent |
| scale-mobile-ip               | 1                | 2                     | 0                  | permanent |

**show system license (MX104 Routers)**

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host> show system license
License usage:

```

| Feature name     | Licenses<br>used | Licenses<br>installed | Licenses<br>needed | Expiry    |
|------------------|------------------|-----------------------|--------------------|-----------|
| scale-subscriber | 0                | 1000                  | 0                  | permanent |

|                        |   |      |   |           |
|------------------------|---|------|---|-----------|
| scale-l2tp             | 0 | 1000 | 0 | permanent |
| scale-mobile-ip        | 0 | 1000 | 0 | permanent |
| MX104-2x10Gig-port-0-1 | 0 | 1    | 0 | permanent |

```
Licenses installed:

upgrade
 permanent
```

### show system license installed (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```
user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
 MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
 permanent
```

### show system license keys (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```
user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
 xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
 xxxxxx xxxx
```

### show system license usage (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```
user@host > show system license usage
 Licenses Licenses Licenses Expiry
Feature name used installed needed
scale-subscriber 0 1000 0 permanent
scale-l2tp 0 1000 0 permanent
scale-mobile-ip 0 1000 0 permanent
MX104-2x10Gig-port-0-1 0 1 0 permanent
```

### show system license (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```
user@host > show system license
License usage:

 Licenses Licenses Licenses Expiry
Feature name used installed needed
scale-subscriber 0 1000 0 permanent
```

## CHAPTER 33

# NTP Operational Commands

- `show ntp associations`
- `show ntp status`

## show ntp associations

|                                 |                                                                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>show ntp associations</code><br><code>&lt;no-resolve&gt;</code>                                                                                                                                                                                              |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series. |
| <b>Description</b>              | Display Network Time Protocol (NTP) peers and their state.                                                                                                                                                                                                         |
| <b>Options</b>                  | <b>none</b> —Display NTP peers and their state.<br><br><b>no-resolve</b> —(Optional) Suppress symbolic addressing.                                                                                                                                                 |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                               |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li><a href="#">show ntp status on page 578</a></li> </ul>                                                                                                                                                                      |
| <b>List of Sample Output</b>    | <a href="#">show ntp associations on page 577</a>                                                                                                                                                                                                                  |
| <b>Output Fields</b>            | <a href="#">Table 47 on page 576</a> describes the output fields for the <b>show ntp associations</b> command. Output fields are listed in the approximate order in which they appear.                                                                             |

**Table 47: show ntp associations Output Fields**

| Field Name    | Field Description                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>remote</b> | Address or name of the remote NTP peer.                                                                                         |
| <b>refid</b>  | Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of <b>0.0.0.0</b> . |
| <b>st</b>     | Stratum of the remote peer.                                                                                                     |
| <b>t</b>      | Type of peer: <b>b</b> (broadcast), <b>l</b> (local), <b>m</b> (multicast), or <b>u</b> (unicast).                              |
| <b>when</b>   | When the last packet from the peer was received.                                                                                |
| <b>poll</b>   | Polling interval, in seconds.                                                                                                   |
| <b>reach</b>  | Reachability register, in octal.                                                                                                |
| <b>delay</b>  | Current estimated delay of the peer, in milliseconds.                                                                           |
| <b>offset</b> | Current estimated offset of the peer, in milliseconds.                                                                          |
| <b>disp</b>   | Current estimated dispersion of the peer, in milliseconds.                                                                      |

| <b>Output Fields</b>            | <a href="#">Table 48 on page 578</a> describes the output fields for the <b>show ntp status</b> command. Output fields are listed in the approximate order in which they appear.                                                                                   |

**Table 48: show ntp status Output Fields**

| Field Name                  | Field Description                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>status</b>               | System status word, a code representing the status items listed.                                                                                                                                                                                          |
| <b>leap_none</b>            | Indicates a normal synchronized state with no leap seconds imminent. Other options could be <b>leap_add_sec</b> , <b>leap_del_sec</b> , or <b>leap_alarm</b> , indicating a leap second will be added, deleted, or a leap second requirement is upcoming. |
| <b>sync_ntp</b>             | Indicates the current synchronization source, in this case, an NTP server. Other options include <b>sync_alarm</b> and <b>sync_unspec</b> , both indicating that the router has not been synched.                                                         |
| <b>x events</b>             | Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.                                                                                                                   |
| <b>event_peer/strat_chg</b> | Describes the most recent event, in this case, the stratum of the peer server changed.                                                                                                                                                                    |
| <b>version</b>              | A detailed description of the version of NTP being used.                                                                                                                                                                                                  |
| <b>processor</b>            | Indicates the current hardware platform and version of the processor.                                                                                                                                                                                     |
| <b>system</b>               | Detailed description of the name and version of the operating system in use.                                                                                                                                                                              |
| <b>leap</b>                 | The number of leap seconds in use.                                                                                                                                                                                                                        |

Table 48: show ntp status Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stratum</b>        | The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock. |
| <b>precision</b>      | The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.                                                                                                          |
| <b>rootdelay</b>      | The total roundtrip delay to the primary reference source, in seconds.                                                                                                                                                                    |
| <b>rootdispersion</b> | The maximum error relative to the primary reference source, in seconds.                                                                                                                                                                   |
| <b>peer</b>           | An identification number of the peer in use.                                                                                                                                                                                              |
| <b>refid</b>          | Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.                                                                                                                   |
| <b>reftime</b>        | The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.                                                                                            |
| <b>poll</b>           | The NTP broadcast message polling interval, in seconds.                                                                                                                                                                                   |
| <b>clock</b>          | The current time on the local router clock.                                                                                                                                                                                               |
| <b>state</b>          | The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.                                                                                                     |
| <b>offset</b>         | Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.                                                                                                     |
| <b>frequency</b>      | The frequency of the clock.                                                                                                                                                                                                               |
| <b>jitter</b>         | Indicates the magnitude of jitter, in milliseconds, between several time queries.                                                                                                                                                         |
| <b>stability</b>      | A measure of how well this clock can maintain a constant frequency.                                                                                                                                                                       |

## Sample Output

### show ntp status

```

user@host> show ntp status
assID=0 status=0544 leap_none, sync_local_proto, 4 events, event_peer/strat_chg,

| <b>Release Information</b>                                          | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.                                                                                                                                                                                                            |

Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**satellite** option introduced in Junos OS Release 14.2R3 for Junos Fusion.

**Description** Display information about the conditions that have been configured to trigger alarms.

**Options** **none**—Display information about the conditions that have been configured to trigger alarms.

**all-members**—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

**satellite [*slot-id slot-id*]**—(Junos Fusion only) (Optional) Display information about alarm conditions for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scc**—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with 0.

**Additional Information** You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors
- Error code: 257
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors
- Error code: 559
```

To understand what CM\_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM\_ALARM code has the following structure:

| Bits: | Error type: |
|-------|-------------|
| 1-31  | Major (1)   |
| 0     | Minor (0)   |

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors
- Error code: 559
```

First, you have to convert 559 to binary; that is **100010111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **10001011**,

which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

| Chip Type: L Chip                          | Code |
|--------------------------------------------|------|
| CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR        | 1    |
| CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR        | 2    |
| CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR   | 3    |
| CMALARM_LCHIP_LOUT_DESRD_ILLEGALSIZE_ERR   | 4    |

| CMALARM_ICHIP_RLDRAM_PARITY_ERR   | 632 |
| CMALARM_ICHIP_SDRAM_UNCORRECT_ERR | 633 |
| CMALARM_ICHIP_SDRAM_CORRECT_ERR   | 634 |
| CMALARM_ICHIP_FUSE_DONE_ERR       | 635 |

According to the table above, the **279** error code corresponds to **CMALARM\_NCHIP\_DBUF\_CRC\_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major
Errors - Error code: 257
```

Actual Error Code =  $(257-1)/2 = 128$ . Similarly, for minor alarms, Actual Error Code =  $(\text{Error Code})/2$

| Description | Information about the alarm.                                  |

## Sample Output

### show chassis alarms (Alarms Active)

```

user@host> show chassis alarms
3 alarms are currently active
Alarm time Class Description
2000-02-07 10:12:22 UTC Major fxp0: ethernet link down
2000-02-07 10:11:54 UTC Minor YELLOW ALARM - PEM 1 Removed
2000-02-07 10:11:03 UTC Minor YELLOW ALARM - Lower Fan Tray Removed

```

### show chassis alarms (No Alarms Active)

```

user@host> show chassis alarms
No alarms are currently active

```

### show chassis alarms (Fan Tray)

```

user@host> show chassis alarms
4 alarms currently active
Alarm time Class Description
2010-11-11 20:27:38 UTC Major Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC Minor Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC Major Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC Major Side Fan Tray 0 Failure

```

### show chassis alarms (MX104 Router)

```

user@host >show chassis alarms
1 alarms currently active
Alarm time Class Description
2013-06-05 14:43:31 IST Minor Backup RE Active

```

### show chassis alarms (MX2010 Router)

```

user@host> show chassis alarms
7 alarms currently active
Alarm time Class Description
2012-08-07 00:46:06 PDT Major Fan Tray 2 Failure
2012-08-06 18:24:36 PDT Minor Redundant feed missing for PSM 6
2012-08-06 07:41:04 PDT Minor Redundant feed missing for PSM 8
2012-08-04 02:42:06 PDT Minor Redundant feed missing for PSM 5
2012-08-03 21:14:24 PDT Minor Loss of communication with Backup RE
2012-08-03 12:26:03 PDT Minor Redundant feed missing for PSM 4
2012-08-03 10:40:18 PDT Minor Redundant feed missing for PSM 7

```

### show chassis alarms (MX2020 Router)

```

user@host> show chassis alarms

```

```

1 alarms currently active
Alarm time Class Description
2012-10-03 12:14:59 PDT Minor Plane 0 not online

```

#### show chassis alarms (MX960, MX480, and MX240 Routers showing Major CB Failure)

A major CB 0 failure alarm occurs in the event of a bad CB (unknown or mismatched CBs do not trigger this alarm in Junos Release OS 12.3R9 and later). Following GRES or recovery, if the hardware issue persists, the traffic moves to the good CB and continues. If the alarm was triggered by something transient like a power zone budget on GRES, bringing the CB back online can clear the alarm. Otherwise, replace the bad CB. Note that fabric link speed is not impacted by an offline SCB. The alarm might be raised on CB0, CB1, and CB2.

```

user@host> show chassis alarms
6 alarms currently active
Alarm time Class Description
2014-10-31 16:49:41 EDT Major PEM 3 Not OK
2014-10-31 16:49:41 EDT Major PEM 2 Not OK

### show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

```

2013-03-19 23:03:46 PDT Major No CG Online
```

### show chassis alarms (PDU Converter Failed Alarm on a PTX5000 Packet Transport Router with FPC2-PTX-P1A)

The **PDU Converter Failed** alarm is raised when one or more 36 V booster converter of a DC PDU fails. If two or more 36 V booster converter fails, fan trays fail and the router might get over heated. Therefore, when this alarm is raised, check the PDU and replace it, if required.

```
user@host> show chassis alarms

| <b>Description</b>                      | Display the beacon LED status on a QFX3500, QFX3600, QFX5100, EX4600, OCX Series standalone switch, Node device, and an Interconnect device. You can also display the beacon LED status of the Control Boards and Flexible PIC Concentrators on the Interconnect device.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                          | <p><b>cb slot-number</b>— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Control Board on the Interconnect device.</p> <p><b>fpc slot-number</b>— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator (FPC) on the Interconnect device. (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator on the standalone switch.</p> <p><b>interconnect-device name</b>— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Interconnect device.</p> <p><b>node-device name</b>— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Node device.</p> |
| <b>Required Privilege Level</b>         | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Output Fields</b>                    | Table 50 on page 598 lists the output fields for the <b>show chassis beacon</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 50: show chassis led Output Fields

| Field Name | Field Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------|
| Slot       | FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0. |

Table 50: show chassis led Output Fields (*continued*)

| Field Name   | Field Description                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Beacon State | Status of the beacon state: <ul style="list-style-type: none"> <li>• Off—The beacon is <b>OFF</b>.</li> <li>• On—The beacon is <b>ON</b>.</li> </ul> |

## Sample Output

### show chassis beacon (QFX Series and OCX Series)

```

user@switch> show chassis beacon
Slot Beacon State
FPC 0 OFF

```

### show chassis beacon interconnect-device (QFabric System)

```

user@switch> show chassis beacon interconnect-device interconnect1
Chassis OFF
CB 0 OFF
CB 1 OFF
FC 0 FPC 0 OFF
FC 1 FPC 1 OFF
RC 0 FPC 8 OFF
RC 1 FPC 9 OFF

```

### show chassis beacon interconnect-device fpc (QFabric System)

```

user@switch> show chassis beacon interconnect-device interconnect1 fpc 0
FPC 0 ON

```

### show chassis beacon node-device (QFabric System)

```

user@switch> show chassis beacon node-device node1
node1 ON

```

### show chassis beacon node-device fpc (QFabric System)

```

user@switch> show chassis beacon node-device node1 fpc 0
FPC 0 ON

```

## show chassis environment

| <b>Description</b>                                  | <p>Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.</p> <p>In addition, on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.</p> <p>Starting with Junos OS Release 14.1, the <b>show chassis environment <i>cb cb-slot-number</i>   <i>ccg ccg-slot-number</i>   <i>fpc fpc-slot-number</i>   <i>fpm</i>   <i>monitored</i>   <i>pdu pdu-slot-number</i>   <i>routing-engine re-slot-number</i>   <i>sib sib-slot-number</i></b> operational mode command output displays environmental information for the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-PIA) and other components in a PTX5000 Packet Transport Router.</p>                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                      | <p><b>none</b>—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.</p> <p><b>all-members</b>—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.</p> <p><b>adc <i>adc-slot-number</i></b>—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace <b><i>adc-slot-number</i></b> with a value from 0 through 19. For MX2010 routers, replace <b><i>adc-slot-number</i></b> with a value from 0 through 9.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

**cb *cb-slot-number***—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace **cb-slot** with **0** or **1**. For the EX Series switches, see *EX Series Switches Hardware and CLI Terminology Mapping* for information on CB slot numbering.

**cip *cip-slot-number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the **cip-slot-number** variable with a value of **0** or **1**.

**cb *interconnect-device name***—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

**cgc *cgc-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace **cb-slot** with a value of **0** or **1**.

**fan *fantray-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the fan trays. Replace **fantray-slot-number** with a value from **0** through **3**.

**fpc *fpc-slot***—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace **fpc-slot** with a value from **0** through **9**. For MX2020 routers, replace **fpc-slot** with a value from **0** through **19**. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see *EX Series Switches Hardware and CLI Terminology Mapping* for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace **fpc-slot** with a value from **0** through **63**.

**fpm**—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* with a value of 0 or 1. For EX Series switches, see *member* for member ID values.

**monitored**—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

**pdu *pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

**pem**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

**pem *pem-slot-number***—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

**psm *psm-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace *psm-slot-number* with a value from 0 through 17. For MX2010 routers, replace *psm-slot-number* with a value from 0 through 8.

**psu *psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See *EX Series Switches Hardware and CLI Terminology Mapping* for detailed information.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine *re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

**satellite** [**slot-id** *slot-id* | **device-alias** *alias-name*]**—**(Junos Fusion only) (Optional) Display chassis environmental information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scg****—**(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc****—**(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

**sfb** **sfb-slot-number****—**(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace **sfb-slot-number** with a value from 0 through 7.

**sfc** **number****—**(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router ( switch-fabric chassis). Replace **number** variable with 0.

**sib** **sib-slot-number****—**(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

**Output Fields** [Table 51 on page 607](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 51: show chassis environment Output Fields

| Field Name   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class</b> | <p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> <li>• <b>Power:</b> Power information: <ul style="list-style-type: none"> <li>• (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Failed</b>, or <b>Absent</b>.</li> <li>• (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> <li>• (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> </ul> </li> <li>• <b>Temp:</b> Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). <ul style="list-style-type: none"> <li>• On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.</li> <li>• EX2200 switches have a side-to-rear cooling system. The <b>Local Intake</b> temperature is measured by the sensor on the right side of the chassis, and the <b>Remote Intake</b> temperature is measured by the sensor on the left side of the chassis.</li> </ul> </li> <li>• <b>Pic:</b> On ACX4000 Routers, multiple temperature channels on a MIC. The status is: <b>OK</b> and the <b>Measurement</b> is in degrees Celsius (C) and Fahrenheit (F).</li> <li>• <b>Fan:</b> Fan status: <b>OK</b>, <b>Testing</b> (during initial power-on), <b>Failed</b>, or <b>Absent</b>.<br/>On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. <b>Measurement</b> indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only).</li> <li>• <b>Misc:</b> Information about other components of the chassis. <ul style="list-style-type: none"> <li>• On some routers, this field indicates the status of one or more additional components.</li> <li>• On the M40e, M160, and M320 router, <b>Misc</b> includes <b>CIP</b> (Connector Interface Panel). <b>OK</b> indicates that the CIP is present. <b>Absent</b> indicates that the CIP is not present.</li> <li>• On T Series routers, <b>Misc</b> includes <b>CIP</b> and <b>SPMB</b> (Switch Processor Mezzanine Board). <b>OK</b> indicates that the <b>CIP</b> or <b>SPMB</b> is present. <b>Absent</b> indicates that the <b>CIP</b> or <b>SPMB</b> is not present.</li> <li>• On PTX Series Packet Transport Routers, <b>Misc</b> includes the <b>SPMB</b> (Switch Processor Mezzanine Board). The SPMB is located on the control boards. <b>OK</b> indicates that the control board is present. <b>Absent</b> indicates that the control board is not present.</li> </ul> </li> </ul> |
| <b>Item</b>  | <p>(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</p> <p>(MX104 Routers) Information about the chassis components: Routing Engines, Control Board (CB), Power Entry Module (PEM), and Compact Forwarding Engine Board (AFEB).</p> <p>(QFabric Systems) Information about the chassis component: Control Boards, Routing Engines, Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs), Node Devices, and Interconnect Devices.</p> <p>(QFX Series) Information about the chassis component: Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 51: show chassis environment Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>      | <p>(MX104, MX2010, and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The fans are operational.</li> <li>• <b>Testing:</b> The fans are being tested during initial power-on.</li> <li>• <b>Failed:</b> The fans have failed or the fans are not spinning.</li> <li>• <b>Absent:</b> The fan tray is not installed.</li> </ul> <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The power component is operational.</li> <li>• <b>Testing:</b> The power component is being tested during initial power-on.</li> <li>• <b>Check:</b> There is insufficient power---that is, fewer than the minimum required feeds are connected.</li> <li>• <b>Failed:</b> The inputs leads have failed.</li> <li>• <b>Absent:</b> The power component is not installed.</li> </ul> |
| <b>Measurement</b> | <p>(MX104, MX2010, and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### show chassis environment (M5 Router)

```

user@host> show chassis environment
Class Item Status Measurement
Power Power Supply A OK
 Power Supply B Absent
Temp FPC 0 OK 30 degrees C / 86 degrees F
 FEB OK 33 degrees C / 91 degrees F
 PS Intake OK 27 degrees C / 80 degrees F
 PS Exhaust OK 27 degrees C / 80 degrees F
 Routing Engine OK 34 degrees C / 93 degrees F
Fans Left Fan 1 OK Spinning at normal speed
 Left Fan 2 OK Spinning at normal speed
 Left Fan 3 OK Spinning at normal speed
 Left Fan 4 OK Spinning at normal speed
Misc Craft Interface OK

```

### show chassis environment (M7i Router)

```

user@host> show chassis environment
Class Item Status Measurement
Power Power Supply 0 OK
 Power Supply 1 Absent
Temp Intake OK 22 degrees C / 71 degrees F
 FPC 0 OK 23 degrees C / 73 degrees F
 Power Supplies OK 23 degrees C / 73 degrees F
 CFEB Intake OK 24 degrees C / 75 degrees F
 CFEB Exhaust OK 29 degrees C / 84 degrees F
 Routing Engine OK 26 degrees C / 78 degrees F
Fans Fan 1 OK Spinning at normal speed
 Fan 2 OK Spinning at normal speed

```

|       |    |                          |
|-------|----|--------------------------|
| Fan 3 | OK | Spinning at normal speed |
| Fan 4 | OK | Spinning at normal speed |

### show chassis environment (M10 Router)

```
user@host> show chassis environment
```

| Class | Item            | Status | Measurement                 |
|-------|-----------------|--------|-----------------------------|

#### show chassis environment (ACX4000 Universal Access Router)

On the ACX4000 router, the MIC output of the **show chassis environment** command varies depending on the number of temperature channels present in the installed MIC.

```
user@host> show chassis environment
```

| Class | Item              | Status | Measurement                  |
|-------|-------------------|--------|------------------------------|
| Temp  | PEM 0             | OK     | 33 degrees C / 91 degrees F  |
|       | PEM 1             | Absent |                              |
|       | PCB Bottom        | OK     | 30 degrees C / 86 degrees F  |

**satellite** option introduced in Junos OS Release 14.2R3.

**Description** (M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).

**Options** **none**—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**satellite [*slot-id slot-id* | *device-alias alias-name*]**—(Junos Fusion only) (Optional) Display environmental information for the FPCs in the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**slot or *fpc-slot***—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc *number*** option (the recommended method), replace **slot** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc *number*** option (the recommended method), replace **slot** with a value from 0

through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
user@host> show chassis environment fpc 9
```

- M120 router—Replace **slot** with a value from 0 through 5.
- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
  - EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotuing Engine (SRE) module), or 6 through 9 (line card only).
  - EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Router—Replace **fpc-slot** with 0 through 7.
- PTX3000 Packet Transport Router—Replace **fpc-slot** with 0 through 15.

| <b>Temperature</b>         | (M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>PMB Temperature</b>     | <p>(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).</p> <p>The PTX5000 Packet Transport Router with FPC2-PTX-P1A include multiple temperatures for PMB (<b>TEMPO</b> and <b>TEMP1</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>PMB CPU Temperature</b> | (PTX5000 Packet Transport Router with FPC2-PTX-P1A only) Temperature of the air flowing past the PMB CPU.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 52: show chassis environment fpc Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Temperature Intake</b>           | (M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.                                                                                                                                                                                         |
| <b>Temperature Top</b>              | (T Series routers only) Temperature of the air flowing past the top of the FPC.                                                                                                                                                                                                                              |
| <b>Temperature Exhaust</b>          | (M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.<br><br>The PTX Series Packet Transport Routers, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones ( <b>Exhaust A</b> and <b>Exhaust B</b> ). |
| <b>Temperature Bottom</b>           | (T Series routers only) Temperature of the air flowing past the bottom of the FPC.                                                                                                                                                                                                                           |
| <b>TL <i>n</i> Temperature</b>      | (PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.                                                                                                                                                                                |
| <b>TQ <i>n</i> Temperature</b>      | (PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.                                                                                                                                                                                |
| <b>Temperature MMBO</b>             | (T640 router only) Temperature of the air flowing past the type 3 FPC.                                                                                                                                                                                                                                       |
| <b>Temperature MMB1</b>             | (M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.                                                                                                                                                                                                     |
| <b>Power</b>                        | Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.                                                                                                                                       |
| <b>CMB Revision or BUS revision</b> | Revision level of the chassis management bus device (M Series router) or bus (T Series routers).                                                                                                                                                                                                             |

## Sample Output

### show chassis environment fpc (M120 Router)

```

user@host> show chassis environment fpc
FPC 2 status:
 State Online
 Temperature Exhaust A 32 degrees C / 89 degrees F
 Temperature Exhaust B 31 degrees C / 87 degrees F

| <b>Description</b>                              | Display Power Entry Module (PEM) environmental status information.                                                                                                                                                                                                                                                                                                                                                                                        |

**NOTE:** The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

- Options** **none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached T1600 routers.
- all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.
- interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.
- lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display environmental information about the PEM in a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display environmental information about the PEM in a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.
- local**—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.
- member *member-id***—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of **0** or **1**.
- node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.
- scc**—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (or switch-card chassis).
- sfc**—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).
- slot** —(Optional) Display environmental information about an individual PEM. Replace ***slot*** with **0** or **1**.

| Output Fields         | <a href="#">Table 53 on page 693</a> lists the output fields for the <b>show chassis environment pem</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 53: show chassis environment pem Output Fields

| Field Name             | Field Description                                                                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PEM <i>slot</i> status | Number of the PEM slot.                                                                                                                                                                                             |
| State                  | Status of the PEM.                                                                                                                                                                                                  |
| Temperature            | Temperature of the air flowing past the PEM.                                                                                                                                                                        |
| AC Input               | Status of the AC input for the specified component                                                                                                                                                                  |
| AC Output              | Status of the AC output for the specified component.                                                                                                                                                                |
| DC input               | Status of the DC input for the specified component.                                                                                                                                                                 |
| DC output              | Status of the DC output for the specified component.                                                                                                                                                                |
| Load                   | (Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.                                                                                            |
| Voltage                | (M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.<br><br>(MX104 routers only) Information about voltage supplied by the PEM to the system. |

Table 53: show chassis environment pem Output Fields (*continued*)

| Field Name        | Field Description                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Current</b>    | (T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.                          |
| <b>Power</b>      | (T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.                            |
| <b>SCG/CB/SIB</b> | (T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board. |
| <b>FAN</b>        | (T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.      |

## Sample Output

### show chassis environment pem (M40e Router)

```
user@host> show chassis environment pem
PEM 0 status:
 State Online
 Temperature OK
 AC input OK
 DC output OK
```

### show chassis environment pem (M120 Router)

```
user@host> show chassis environment pem
PEM 0 status:
 State Online
 Temperature OK
 DC Input: OK
 DC Output: OK
 Load Less than 20 percent
 Voltage:
 48.0 V input 52864 mV
 48.0 V fan supply 41655 mV
 3.3 V 3399 mV
PEM 1 status:
 State Online
 Temperature OK
 DC Input: OK
 DC Output: OK
 Load Less than 20 percent
 Voltage:
 48.0 V input 54537 mV
 48.0 V fan supply 42910 mV
 3.3 V 3506 mV
```

### show chassis environment pem (M160 Router)

```
user@host> show chassis environment pem
PEM 0 status:
 State Online
 Temperature OK
 DC input OK
 DC output OK
 Load Less than 20 percent
```

```

Voltage:
 48.0 V input 54833 mV
 48.0 V fan supply 50549 mV
 8.0 V bias 8239 mV
 5.0 V bias 5006 mV

```

#### show chassis environment pem (M320 Router)

```

user@host> show chassis environment pem
PEM 2 status:
 State Online
 Temperature OK
 DC input OK
 Load Less than 40 percent
 48.0 V input 51853 mV
 48.0 V fan supply 48877 mV
 8.0 V bias 8449 mV
 5.0 V bias 4998 mV
PEM 3 status:
 State Online
 Temperature OK
 DC input OK
 Load Less than 40 percent
 48.0 V input 51717 mV
 48.0 V fan supply 49076 mV
 8.0 V bias 8442 mV
 5.0 V bias 4998 mV

```

#### show chassis environment pem (MX104 Router)

```

user@host> show chassis environment pem
PEM 0 status:
 State Online
 Temperature OK
 DC Output: OK
 Voltage:
 12.0 V output 12281 mV
 3.3 V output 3353 mV

| <b>Description</b>                                                  | Display Routing Engine environmental status information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Options** **none**—Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

**satellite [*slot-id slot-id* | *device-alias alias-name*]**—(Junos Fusion only) (Optional) Display environmental information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX104 routers, MX2010 routers, MX2020 routers, and T Series routers, replace *slot* with 0 or 1. On M5, M7i, M10, and M40 routers, replace *slot* with 0. On EX3200 and EX4200 standalone switches, replace *slot* with 0. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with 0 or 1. On the QFX3500 switch, there

is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Routers, replace **slot** with **0** or **1**

| Routing engine <i>slot</i> status | Number of the Routing Engine slot: 0 or 1.                                                                                                                                                                                                                                                  |
| State                             | Status of the Routing Engine: <ul style="list-style-type: none"> <li>• <b>Online Master</b>—Routing Engine is online, operating as Master.</li> <li>• <b>Online Standby</b>—Routing Engine is online, operating as Standby.</li> <li>• <b>Offline</b>—Routing Engine is offline.</li> </ul> |
| Temperature                       | Temperature of the air flowing past the Routing Engine.                                                                                                                                                                                                                                     |
| CPU Temperature                   | (PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.                                                                                                                                                                                        |

## Sample Output

**show chassis environment routing-engine (Nonredundant)**

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 27 degrees C / 80 degrees
```

**show chassis environment routing-engine (Redundant)**

```

user@host> show chassis environment routing-engine
Route Engine 0 status:
 State: Online Master
 Temperature: 26 degrees C / 78 degrees F
Route Engine 1 status:
 State: Online Standby
 Temperature: 26 degrees C / 78 degrees F

```

**show chassis environment routing-engine (MX104 Router)**

```

user@ host >show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 34 degrees C / 93 degrees F
 CPU Temperature 43 degrees C / 109 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 33 degrees C / 91 degrees F
 CPU Temperature 39 degrees C / 102 degrees F

```

**show chassis environment routing-engine (MX2010 Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 37 degrees C / 98 degrees F
 CPU Temperature 37 degrees C / 98 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 35 degrees C / 95 degrees F
 CPU Temperature 34 degrees C / 93 degrees F

```

**show chassis environment routing-engine (MX2020 Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
 State Online Master
 Temperature 35 degrees C / 95 degrees F
 CPU Temperature 34 degrees C / 93 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 44 degrees C / 111 degrees F
 CPU Temperature 43 degrees C / 109 degrees F

```

**show chassis environment routing-engine (TX Matrix Plus Router)**

```

user@host> show chassis environment routing-engine
sfc0-re0:

Routing Engine 0 status:
 State Online Master
 Temperature 26 degrees C / 78 degrees F
Routing Engine 1 status:
 State Online Standby
 Temperature 28 degrees C / 82 degrees F

lcc0-re0:

Routing Engine 0 status:

```

```
State Online Master
Temperature 30 degrees C / 86 degrees F
Routing Engine 1 status:
State Online Standby
Temperature 29 degrees C / 84 degrees F
```

#### show chassis environment routing-engine (T4000 Core Router)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
State Online Master
Temperature 33 degrees C / 91 degrees F
CPU Temperature 50 degrees C / 122 degrees F
Routing Engine 1 status:
State Online Standby
Temperature 33 degrees C / 91 degrees F
CPU Temperature 46 degrees C / 114 degrees F
```

#### show chassis environment routing-engine (QFX Series and OCX Series)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
State Online Master
Temperature 42 degrees C / 107 degrees F
```

#### show chassis environment routing-engine interconnect-device (QFabric System)

```
user@switch> show chassis environment routing-engine interconnect-device interconnect1
routing-engine interconnect-device interconnect1
Routing Engine 0 status:
State Online Standby
Temperature 52 degrees C / 125 degrees F
Routing Engine 1 status:
State Online Master
Temperature 57 degrees C / 134 degrees F
```

#### show chassis environment routing-engine (PTX5000 Packet Transport Router)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
State Online Master
Temperature 55 degrees C / 131 degrees F
CPU Temperature 66 degrees C / 150 degrees F
Routing Engine 1 status:
State Online Standby
Temperature 52 degrees C / 125 degrees F
CPU Temperature 64 degrees C / 147 degrees F
```

## show chassis fan

|                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.  
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
**satellite** option introduced in Junos OS Release 14.2R3.

**Description** (T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX104 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers, QFX3008-I Interconnect devices, QFX Series, OCX Series, EX Series switches, and PTX Series Packet Transport Routers only) Show information about the fan tray and fans.

**Options** **all-members**—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* variable with a value 0 or 1.

**interconnect-device *name***—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**satellite [*slot-id slot-id* | *device-alias alias-name*]**—(Junos Fusion only) (Optional) Display information about the fan tray and fans for the specified satellite device or devices in a Junos Fusion, or for all satellite devices if no satellite devices are specified.

**scc**—(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Required Privilege Level** view

### show chassis fan (EX Series Switches)

```
user@host> show chassis fan
```

| Item   | Status | RPM  | Measurement              |
|--------|--------|------|--------------------------|
| Fan 1  | OK     | 3477 | Spinning at normal speed |
| Fan 2  | OK     | 3477 | Spinning at normal speed |
| Fan 3  | OK     | 3479 | Spinning at normal speed |
| Fan 4  | OK     | 3508 | Spinning at normal speed |
| Fan 5  | OK     | 3517 | Spinning at normal speed |
| Fan 6  | OK     | 3531 | Spinning at normal speed |
| Fan 7  | OK     | 3439 | Spinning at normal speed |
| Fan 8  | OK     | 3424 | Spinning at normal speed |
| Fan 9  | OK     | 3413 | Spinning at normal speed |
| Fan 10 | OK     | 3439 | Spinning at normal speed |
| Fan 11 | OK     | 3446 | Spinning at normal speed |
| Fan 12 | OK     | 3432 | Spinning at normal speed |

### show chassis fan (T320 Router)

```
user@host> show chassis fan
```

| Item                    | Status | RPM  | Measurement              |
|-------------------------|--------|------|--------------------------|
