YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Guide 1	Junos OS Basics Feature Guide for QFX10000 Switches
----------------	--

Part 1	Autoinstallation
Chapter 1	Understanding Autoinstallation 3
	Understanding Autoinstallation of Configuration Files 3
	Typical Uses for Autoinstallation 3
	Autoinstallation Configuration Files and IP Addresses 4
	Typical Autoinstallation Process on a New Switch 4
	Configuring Autoinstallation of Configuration Files (CLI Procedure) 5
	Upgrading Software by Using Automatic Software Download 7
	Verifying Autoinstallation Status 8
	Verifying That Automatic Software Download Is Working Correctly 9
Part 2	Basic System Management
Chapter 2	Understanding Basic System Management 13
	Compressing the Current Configuration File 14
	Configuring a DNS Name Server for Resolving a Hostname into Addresses 15
	Configuring Console and Auxiliary Port Properties 15
	Configuring the Hostname of a Router or Switch by Using a Configuration Group 16
	Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types 18
	Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch 18
	Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses 19
	Configuring Junos OS to Extend the Default Port Address Range 19

Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets	20
Configuring System Alarms to Appear Automatically Upon Login	20
Configuring Time-Based User Access	20
Configuring the Timeout Value for Idle Login Sessions	22
Including the Year or Millisecond in Timestamps	22
Mapping the Hostname of the Switch to IP Addresses	23
Modifying the Default Time Zone for a Router or Switch Running Junos OS	24
Rebooting and Halting a Device	25
Reaching a Domain Name System Server	26
Reverting to the Default Factory Configuration by Using the request system zeroize Command	28
Saving Core Files Generated by Junos OS Processes	29
Specifying the Physical Location of the Switch	29
Specifying Access Privileges for Junos OS Operational Mode Commands	30
Updating the IANA Time Zone Database on Junos OS Devices	32
Importing and Installing Time Zone Files	32
Configuring a Custom Time Zone	33
Viewing Core Files from Junos OS Processes	34
Example: Configuring the Name of the Switch, IP Address, and System ID	34

Part 3

Chapter 3

Command Line Interface (CLI)

Understanding the CLI	37
CLI User Interface Overview	37
CLI Overview	37
CLI Key Features	38
CLI Command Modes	38
Configuring Login Tips	40
Format for Specifying Filenames and URLs in Junos OS CLI Commands	40
Getting Started with Enhanced Layer 2 Software	41
Understanding Enhanced Layer 2 Software Support	42
Using the ELS Translator	42
Configuring a VLAN	43
Configuring the Native VLAN Identifier	44
Configuring Layer 2 Interfaces	44
Configuring Layer 3 Interfaces	45
Configuring an IRB Interface	45
Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface	46
Enhanced Layer 2 CLI Configuration Statement and Command Changes	47
Changes to the ethernet-switching-options Hierarchy Level	47
Changes to the Port Mirroring Hierarchy Level	49
Changes to the Layer 2 Control Protocol Hierarchy Level	49
Changes to the dot1q-tunneling Statement	50
Changes to the L2 Learning Protocol	50
Changes to Nonstop Bridging	50
Changes to Port Security and DHCP Snooping	51
Changes to Configuring VLANs	52

	Changes to Storm Control Profiles	55
	Changes to the Interfaces Hierarchy	56
	Changes to IGMP Snooping	57
	Junos OS Operational Mode Commands That Combine Other Commands	57
	Overview of Junos OS CLI Operational Mode Commands	58
	CLI Command Categories	58
	Commonly Used Operational Mode Commands	59
	Overview of Navigating the CLI	61
	CLI Command Hierarchy	61
	CLI Configuration Statements	62
	Moving Among Hierarchy Levels	62
	Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS	
	Operational Commands	62
	Understanding Junos OS CLI Configuration Mode	63
	Configuration Mode Commands	65
	Configuration Statements and Identifiers	66
	Configuration Statement Hierarchy	68
Part 4	Dynamic Host Control Protocol (DHCP)	
Chapter 4	Understanding DHCP	73
	Understanding DHCP Services for Switches	73
	DHCP Client/Server Model	73
	Using DHCP	74
	DHCP Relay Servers and DHCP Servers	74
	Legacy DHCP and Extended DHCP for Server Versions	75
	Configuring DHCP on a Switch	76
	How DHCP Works	76
	Configuring a DHCP Client (CLI Procedure)	77
	Configuring a DHCP Server on Switches (CLI Procedure)	78
	Configuring an Extended DHCP Server on a Switch	79
	Configuring a Legacy DHCP Server on a Switch (CLI Procedure)	79
Part 5	Internet Control Message Protocol (ICMP)	
Chapter 5	Understanding ICMP	85
	Configuring Junos OS to Disable the Reporting of IP Address and Timestamps	
	in Ping Responses	85
	Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping	
	Packets	86
	Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine	
	Messages	86
Part 6	Junos OS With Upgraded FreeBSD	
Chapter 6	Understanding Junos OS With Upgraded FreeBSD	89
	Understanding Junos OS with Upgraded FreeBSD	89
	Understanding Junos OS with Upgraded FreeBSD Package Names	92
	Understanding Junos OS with Upgraded FreeBSD Disk Volumes	94

	Understanding Junos OS with Upgraded FreeBSD Snapshots	95
	Upgrading Junos OS with Upgraded FreeBSD	96
	To Install Junos OS with Upgraded FreeBSD Over a Plain Junos OS	98
	To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of an Earlier Release	101
	To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of a Later Release	102
	Downgrading Junos OS from Upgraded FreeBSD	102
Part 7	Licenses	
Chapter 7	Using Licenses	107
	Junos OS Feature Licenses	107
	Software Features That Require Licenses on the QFX Series	108
	Junos OS Feature License Keys	112
	Release-Tied License Keys and Upgrade Licenses on MX Series Routers	112
	Licensable Ports on MX5, MX10, and MX40 Routers	113
	Port Activation on MX104 Routers	114
	Generating License Keys	115
	Adding New Licenses (CLI Procedure)	117
	Deleting a License (CLI Procedure)	118
	Saving License Keys	119
	Verifying Junos OS License Installation	120
	Displaying Installed Licenses	120
	Displaying License Usage	121
Part 8	Login Classes	
Chapter 8	Understanding Login Classes	125
	Configuring Junos OS User Accounts	125
	Configuring the Junos OS to Display a System Login Announcement	126
	Configuring Junos OS to Display a System Login Message	126
Part 9	Network Time Protocol (NTP)	
Chapter 9	Understanding NTP	131
	Understanding NTP Time Servers	131
	Configuring NTP Authentication Keys	132
	Configuring the NTP Time Server and Time Services	133
	Configuring the Switch to Operate in Client Mode	133
	Configuring the Router or Switch to Operate in Symmetric Active Mode	134
	Configuring the Router or Switch to Operate in Broadcast Mode	134
	Configuring the Router or Switch to Operate in Server Mode	135
	Configuring the Switch to Listen for Broadcast Messages Using NTP	135
	Configuring the Switch to Listen for Multicast Messages Using NTP	136
	Setting the Date and Time	136
	Synchronizing and Coordinating Time Distribution Using NTP	137
	Configuring NTP	137
	Configuring the NTP Boot Server	137

	Specifying a Source Address for an NTP Server	138
	Example: Configuring NTP	139
	Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization	142
Part 10	Passwords	
Chapter 10	Understanding Passwords	145
	Configuring the Root Password	145
	Recovering the Root Password	147
	Example: Changing the Requirements for Junos OS Plain-Text Passwords	148
Chapter 11	Precision Time Protocol (PTP)	151
	Understanding Transparent Clocks in Precision Time Protocol	152
	Configuring Transparent Clock Mode for Precision Time Protocol	152
Part 11	Recovery Installation	
Chapter 12	Understanding Recovery Installation	157
	Creating an Emergency Boot Device	157
	Performing a Recovery Installation Using an Emergency Boot Device	159
	Recovering from a Failed Software Installation	160
Part 12	Routine Monitoring	
Chapter 13	Understanding Routine Monitoring	165
	Monitoring System Process Information	165
	Monitoring System Properties	166
	Monitoring Interface Status and Traffic	167
	Other Tools to Configure and Monitor Devices Running Junos OS	168
	Fabric Management Overview	168
Part 13	Standard Software Installation and Upgrade	
Chapter 14	Understanding Standard Software Installation and Upgrade	173
	Junos OS Package Names	173
	Software Installation Overview	174
	Creating an Emergency Boot Device	175
	Installing and Recovering Software Using the Open Network Install Environment (ONIE)	176
	Understanding the Open Network Install Environment	178
	Downloading Software Files with a Browser	178
	Connecting to the Console Port	179
	Backing Up the Current Configuration Files	179
	Uninstalling the Existing Version of Junos OS	180
	Installing a Junos OS Software Package That Resides on a Webserver or DHCP Server with DHCP Options Configured	180
	Installing Junos OS Software Using Secure Copy Protocol (SCP)	181
	Installing Junos OS Software Using FTP or TFTP Without a Webserver	182

	Installing Junos OS Software Using DHCP Server with No DHCP Options Configured	182
	Installing Junos OS Software Using Webserver Without DHCP Configured	184
	Installing Junos OS Software Using USB Media	185
	Verifying Software Installation	185
	Troubleshooting Unsupported Network Operating System	187
	Troubleshooting ONIE ISO Files	187
	Creating an Emergency Boot Device for ONIE Software and Network Operating System	187
	Performing a Recovery Installation	188
	Upgrading Software	189
	Downloading Software Files with a Browser	190
	Accessing Software Downloaded to a Remote Location	191
	Connecting to the Console Port	191
	Backing Up the Current Configuration Files	191
	Installing a Standard Software Package	191
	Installing a Standard Software Package on a QFX10008 Switch	192
Part 14	Zero Touch Provisioning (ZTP)	
Chapter 15	Understanding ZTP	197
	Understanding Zero Touch Provisioning	197
	Understanding Zero Touch Provisioning	197
	Zero Touch Provisioning Process	199
	Zero Touch Provisioning Restart Process Triggers	202
	Configuring Zero Touch Provisioning	204
	Monitoring Zero Touch Provisioning	209
	Using the Console to Monitor Zero Touch Provisioning	209
	Using System Log Alerts to Monitor Zero Touch Provisioning	210
	Using Error Messages to Monitor Zero Touch Provisioning	210
	Using System Log Files to Monitor Zero Touch Provisioning	210
	Using the show dhcp client binding Command	211
	Using the show dhcp client statistics Command	211
Part 15	Configuration Statements and Operational Commands	
Chapter 16	Basic System Management Configuration Statements	215
	arp (System)	217
	auxiliary	218
	checksum	219
	compress-configuration-files (System)	220
	console (Physical Port)	221
	default-address-selection	222
	domain-name	223
	domain-search	223
	ethernet (Alarm)	224
	host-name	224
	icmpv4-rate-limit	225

	internet-options	226
	link-down	227
	location	228
	login-alarms	229
	management-ethernet (Alarm)	230
	max-configurations-on-flash	231
	name-server	231
	no-ping-record-route	232
	no-ping-time-stamp	232
	no-redirects (IPv4 Traffic)	233
	optional	234
	ports	234
	retry	235
	saved-core-context	236
	saved-core-files	236
	source-port (Port Addresses)	237
	static-host-mapping	238
	system	239
	time-format	244
	time-zone	245
	traceoptions (Layer 2 Learning)	247
	uid	249
	use-imported-time-zones	249
Chapter 17	DHCP Configuration Statements	251
	client-identifier (DHCP Client)	251
	lease-time	252
	retransmission-attempt	253
	retransmission-interval	254
	server-address	255
	update-server	256
	vendor-option	257
Chapter 18	ICMP Configuration Statement	259
	no-multicast-echo	259
Chapter 19	Junos OS With Upgraded FreeBSD Operational Commands	261
	request system reboot (Junos OS with Upgraded FreeBSD)	262
	request system snapshot (Junos OS with Upgraded FreeBSD)	265
	show system snapshot (Junos OS with Upgraded FreeBSD)	267
Chapter 20	Login Classes Configuration Statements	269
	access-end	270
	access-start	270
	allow-commands	271
	allow-configuration	272
	allowed-days	272
	announcement	273
	authentication (Login)	274
	class (Defining Login Classes)	275

	class (Assigning a Class to an Individual User)	276
	deny-commands	276
	deny-configuration	277
	idle-timeout	278
	load-key-file	279
	login	280
	login-tip	281
	message	281
	user (Access)	282
Chapter 21	NTP Configuration Statements	283
	authentication-key	284
	boot-server (NTP)	285
	broadcast	286
	broadcast-client	287
	multicast-client	287
	ntp	288
	peer	289
	server (NTP)	290
	source-address (NTP, RADIUS, System Logging, or TACACS+)	291
	trusted-key	292
Chapter 22	Password Configuration Statements	293
	authentication (Login)	294
	change-type	295
	format	296
	maximum-length	297
	minimum-changes	298
	minimum-length	299
	minimum-lower-cases	300
	minimum-numeric	301
	minimum-punctuations	302
	minimum-upper-cases	303
	password (Login)	304
	permissions	304
	retry-options	305
	root-authentication	307
	ssh-dsa	308
	ssh-rsa	308
	user (Access)	309
Chapter 23	PTP Configuration Statement	311
	e2e-transparent	311
Chapter 24	RADIUS and TACACS+ Accounting Configuration Statements	313
	accounting-port (RADIUS Server)	314
	destination (Accounting)	315
	events	316
	port (TACACS+ Server)	316
	radius (System)	317

	secret	318
	server (RADIUS Accounting)	319
	server (TACACS+ Accounting)	319
	single-connection	320
	tacplus	320
	timeout	321
Chapter 25	Autoinstallation Operational Commands	323
	show system autoinstallation status	324
Chapter 26	Basic System Management Operational Commands	327
	commit	329
	clear log	332
	clear chassis display message	333
	clear system commit	336
	clear system reboot	337
	file	341
	file archive	342
	file checksum md5	344
	file checksum sha1	345
	file checksum sha-256	346
	file compare	347
	file delete	351
	file list	352
	file rename	354
	file show	356
	load	358
	ping	360
	request chassis beacon	364
	request chassis fpc	366
	request chassis pic	371
	request chassis routing-engine master	376
	request message	381
	request system configuration rescue delete	382
	request system configuration rescue save	383
	request system halt	384
	request system logout	390
	request system power-off	391
	request system reboot	396
	request system storage cleanup	399
	request system zeroize	409
	restart	414
	save	425
Chapter 27	CLI Operational Commands	427
	show cli	428
	show cli authorization	430
	show cli directory	434
	show cli history	435

Chapter 28	Licensing Operational Commands	437
	request system license add	438
	request system license delete	439
	request system license save	440
	show system license	441
Chapter 29	NTP Operational Commands	449
	show ntp associations	450
	show ntp status	452
Chapter 30	PTP Operational Command	455
	show ptp global-information	456
Chapter 31	Routine Monitoring Operational Commands	457
	show chassis alarms	459
	show chassis beacon	474
	show chassis environment	476
	show chassis environment fpc	540
	show chassis environment pem	566
	show chassis environment routing-engine	575
	show chassis fabric errors	580
	show chassis fabric fpcs	585
	show chassis fabric plane-location	624
	show chassis fabric sibs	629
	show chassis fabric summary	641
	show chassis fabric topology	647
	show chassis fan	678
	show chassis firmware	692
	show chassis fpc	703
	show chassis hardware	743
	show chassis lcd	921
	show chassis led	935
	show chassis location	945
	show chassis mac-addresses	949
	show chassis pic	954
	show chassis routing-engine	970
	show chassis zones	996
	show host	1002
	show log	1003
	show subscribers	1007
	show system alarms	1027
	show system audit	1030
	show system boot-messages	1038
	show system buffers	1045
	show system certificate	1052
	show system commit	1054
	show system configuration archival	1057
	show system configuration rescue	1058
	show system connections	1060
	show system core-dumps	1079

	show system directory-usage	1093
	show system processes	1097
	show system reboot	1126
	show system resource-cleanup processes	1129
	show system services service-deployment	1131
	show system software	1132
	show system statistics	1140
	show system storage	1177
	show system uptime	1185
	show system users	1190
	show system virtual-memory	1195
	show version	1253
	start shell	1266
	test configuration	1268
	traceroute	1269
	traceroute monitor	1273
Chapter 32	Standard Software Installation and Upgrade Operational Commands . .	1275
	request system software add	1276
	request system software delete	1286
	request system software download	1290
	request system software rollback	1292
	request system software validate	1297
	rollback	1301
	show system rollback	1302
Guide 2	Configuration and File Management Feature Guide for QFX10000 Switches	
Part 16	Configuration and File Management Overview	
Chapter 33	Understanding Configuration Files and the configure Command	1309
	Configuration File Terms	1309
	Understanding Configuration Files	1310
	Forms of the configure Command	1310
Chapter 34	Understanding How Configuration Files are Committed and Stored	1313
	Junos OS Commit Model for Router or Switch Configuration	1313
	Understanding How the Junos OS Configuration Is Stored	1314
Part 17	Managing Configuration Files	
Chapter 35	Using the Default Configuration	1319
	QFX3500 Switch Default Configuration	1319
Chapter 36	Loading, Uploading, Transferring, and Saving Configuration Files	1325
	Loading a Configuration from a File	1325
	Examples: Loading a Configuration from a File	1328
	Loading a Previous Configuration File	1330
	Saving a Configuration to a File	1331

	Uploading a Configuration File	1332
	Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site	1333
	Configuring the Transfer of the Currently Active Configuration to an Archive Site	1333
	Configuring the Periodic Transfer of the Active Configuration to an Archive Site	1334
	Configuring the Transfer of the Currently Active Configuration When a Configuration Is Committed	1334
	Configuring Archive Sites for the Transfer of Active Configuration Files	1334
Chapter 37	Reverting a Configuration or Rolling Back to the Factory Default	1337
	Rolling Back Junos OS Configuration Changes	1337
	Returning to the Most Recently Committed Junos OS Configuration	1338
	Returning to a Previously Committed Junos OS Configuration	1339
	Returning to a Configuration Prior to the One Most Recently Committed	1339
	Displaying Previous Configurations	1339
	Comparing Configuration Changes with a Prior Version	1340
	Creating and Returning to a Rescue Configuration	1342
	Saving a Configuration to a File	1343
	Reverting to the Default Factory Configuration	1344
Chapter 38	Using Rescue Configurations	1345
	Setting or Deleting the Rescue Configuration	1345
	Creating and Returning to a Rescue Configuration	1345
	Reverting to the Rescue Configuration	1346
Chapter 39	Comparing or Compressing Configuration Files	1349
	Comparing Configuration Changes with a Prior Version	1349
	Compressing the Current Configuration File	1351
Chapter 40	Troubleshooting Procedures	1353
	Loading a Previous Configuration File	1353
	Reverting to the Default Factory Configuration	1354
	Reverting to the Rescue Configuration	1354
	Cleaning Up the System File Storage Space	1355
Part 18	Configuration Statements and Operational Commands	
Chapter 41	Configuration Statements	1359
	archival	1360
	archive-sites (Configuration File)	1361
	configuration	1363
	transfer-interval (Configuration)	1364
	transfer-on-commit	1365
Chapter 42	Operational Commands	1367
	clear log	1368
	clear system commit	1369
	file archive	1370
	file checksum md5	1372

file checksum sha1	1373
file checksum sha-256	1374
file compare	1375
file delete	1379
file list	1380
file rename	1382
file show	1384
request system configuration rescue delete	1386
request system configuration rescue save	1387
show system commit	1388
show system configuration archival	1391
show system configuration rescue	1392
show system rollback	1394
test configuration	1396

Guide 3 Network Management and Monitoring Feature Guide for QFX10000 Switches

Part 19	Overview	
Chapter 43	Understanding Network Management	1401
	Understanding Device and Network Management Features	1401
Chapter 44	Junos Space	1405
	Understanding Junos Space Support	1405
Part 20	Configuration	
Chapter 45	Configuring Network Management	1409
	Understanding Tracing and Logging Operations	1409
	Configuring Console and Auxiliary Port Properties	1411
	Configuring SSH Service for Remote Access to the Router or Switch	1412
	Configuring the Root Login Through SSH	1413
	Configuring the SSH Protocol Version	1413
	Configuring the Client Alive Mechanism	1413
	Configuring Telnet Service for Remote Access to a Switch	1414
	Pinging Hosts	1414
	Monitoring Traffic Through the Router or Switch	1415
	Displaying Real-Time Statistics About All Interfaces on the Router or Switch	1416
	Displaying Real-Time Statistics About an Interface on the Router or Switch	1416
Chapter 46	Configuring Automation	1419
	Overview of Junos Automation Enhancements	1419
	Features of the Junos Automation Enhancements	1419
	Overview of Python with Junos Automation Enhancements	1420
	Understanding Automation Scripts Support	1423

	How Commit Scripts Work	1424
	Commit Script Input	1425
	Commit Script Output	1425
	Commit Scripts and the Junos OS Commit Model	1426
	Standard Commit Model	1426
	Commit Model with Commit Scripts	1427
	Avoiding Potential Conflicts When Using Multiple Commit Scripts	1429
	Overview of Generating Persistent or Transient Configuration Changes	1430
	Differences Between Persistent and Transient Changes	1430
	Interaction of Configuration Changes and Configuration Groups	1433
	Tag Elements and Templates for Generating Changes	1434
	Required Boilerplate for Commit Scripts	1434
	How Op Scripts Work	1436
	Required Boilerplate for Op Scripts	1436
	Installing Junos OS Software with Junos Automation Enhancements	1438
	Invoking the Python Interpreter	1442
	Controlling the Execution of Commit Scripts	1443
	Enabling Commit Scripts to Execute	1443
	Removing Commit Scripts from the Configuration	1444
	Deactivating Commit Scripts	1445
	Activating Inactive Commit Scripts	1445
	Displaying Commit Script Output	1445
Chapter 47	Configuring sFlow Technology	1449
	Understanding How to Use sFlow Technology for Network Monitoring on a Switch	1449
	Sampling Mechanism and Architecture of sFlow Technology on Switches	1449
	Adaptive Sampling	1451
	sFlow Agent Address Assignment	1452
	sFlow Limitations on Switches	1452
	Example: Monitoring Network Traffic Using sFlow Technology	1453
	Configuring sFlow Technology	1457
Chapter 48	Configuring SNMP	1459
	Utility MIB	1460
	SNMPv3 Overview	1460
	Minimum SNMPv3 Configuration on a Device Running Junos OS	1461
	Understanding RMON	1463
	RMON Overview	1463
	Alarm Thresholds and Events	1464
	RMON MIB Event, Alarm, Log, and History Control Tables	1464
	Understanding Health Monitoring	1467
	SNMP MIBs Support	1468
	MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis	1468
	MIBs Supported on QFabric Systems	1478

SNMP Traps Support	1484
SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis	1484
SNMPv1 Traps	1484
SNMPv2 Traps	1489
SNMP Traps Supported on QFabric Systems	1493
MIB Objects for the QFX Series	1497
QFX Series Standalone Switches	1497
QFabric Systems	1497
QFabric System QFX3100 Director Device	1498
QFabric System QFX3008-I Interconnect Device	1498
QFabric System QFX3600-I Interconnect Device	1498
QFabric System Node Devices	1499
Configuring SNMP	1499
Configuring the SNMP Community String	1503
Configuring SNMP Trap Groups	1504
Adding a Group of Clients to an SNMP Community	1505
Configuring the Interfaces on Which SNMP Requests Can Be Accepted	1506
Configuring MIB Views	1506
Configuring RMON Alarms and Events	1507
Configuring SNMP	1508
Configuring an Event	1508
Configuring an Alarm	1509
Configuring Health Monitoring	1509
Creating SNMPv3 Users	1510
Configuring Access Privileges for a Group	1511
Assigning a Security Name to a Group	1513
Configuring SNMPv3 Traps on a Device Running Junos OS	1514
Configuring SNMP Informs	1515
Monitoring RMON MIB Tables	1516
Monitoring SNMP	1516
Tracing SNMP Activity on a Device Running Junos OS	1518
Configuring the Number and Size of SNMP Log Files	1519
Configuring Access to the Log File	1519
Configuring a Regular Expression for Lines to Be Logged	1520
Configuring the Trace Operations	1520
Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage	1521
Example: Configuring SNMP	1523
Chapter 49	
Configuring System Logging	1527
Overview of Junos OS System Log Messages	1528
Overview of Single-Chassis System Logging Configuration	1528
Junos OS Minimum System Logging Configuration	1530
Junos OS System Log Configuration Statements	1530
Adding a Text String to System Log Messages	1531
Directing System Log Messages to a Log File	1532
Directing System Log Messages to a Remote Machine	1533
Directing System Log Messages to a User Terminal	1533
Directing System Log Messages to the Console	1534

	Disabling the System Logging of a Facility	1534
	Displaying a Log File from a Single-Chassis System	1535
	Including Priority Information in System Log Messages	1536
	Including the Year or Millisecond in Timestamps	1537
	Logging Messages in Structured-Data Format	1538
	Interpreting Messages Generated in Structured-Data Format	1539
	Interpreting Messages Generated in Standard Format	1542
	Specifying Log File Size, Number, and Archiving Properties	1543
	Specifying the Facility and Severity of Messages to Include in the Log	1544
	Junos OS System Logging Facilities and Message Severity Levels	1546
	Default Facilities for System Log Messages Directed to a Remote Destination	1548
	Junos OS System Log Alternate Facilities for Remote Logging	1548
	Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination	1549
	Using Regular Expressions to Refine the Set of Logged Messages	1551
	Managing Host OS System Log and Core Files	1553
	Viewing Log Files On the Host OS System	1554
	Copying Log Files From the Host System To the Switch	1554
	Viewing Core Files On the Host OS System	1554
	Copying Core Files From the Host System To the Switch	1554
	Cleaning Up Temporary Files on the Host OS	1555
	Monitoring System Log Messages	1555
	Examples: Configuring System Logging	1556
	Examples: Assigning an Alternative Facility	1558
	Example: Configuring System Log Messages	1559

Guide 4	User and Access Management Feature Guide for QFX10000 Switches	

Part 23	User and Access Management Overview	
Chapter 59	Understanding the Software	1793
	Understanding Junos OS Infrastructure and Processes	1793
	Routing Engine and Packet Forwarding Engine	1793
	Junos OS Processes	1794
	Understanding LLDP	1795
	Monitoring SNMP	1796
Chapter 60	Understanding Access and Authentication Methods	1799
	Understanding Junos OS Access Privilege Levels	1799
	Junos OS Login Class Permission Flags	1799
	Allowing or Denying Individual Commands for Junos OS Login Classes	1802
	Junos OS User Authentication Methods	1804
	Understanding Login Authentication	1804
	MAC RADIUS Authentication	1805

Part 24	Configuring Access	
Chapter 61	Configuring and Managing Root Users	1809
	Configuring Management Access	1809
	Configuring Access Privilege Levels	1809
	Configuring Login Tips	1810
	Recovering the Root Password	1810
	Example: Configuring a Plain-Text Password for Root Logins	1812
	Example: Configuring SSH Authentication for Root Logins	1814
	Understanding Troubleshooting Resources	1814
	Troubleshooting Overview	1816
	Recovering the Root Password	1818
Chapter 62	Configuring and Managing User Accounts	1821
	Junos OS User Accounts Overview	1821
	Junos OS Login Classes Overview	1823
	Special Requirements for Junos OS Plain-Text Passwords	1824
	Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies	1826
	Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands	1827
	Examples of Defining Access Privileges Using allow/deny-configuration Statements	1829
	Example: Configuring User Accounts	1830
	Example: Configuring User Permissions with Access Privilege Levels	1831
	Example: Configuring User Permissions with Access Privileges for Operational Mode Commands	1832
	Example: Changing the Requirements for Junos OS Plain-Text Passwords	1834
	Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions to Prevent Unauthorized Access	1835
	Understanding Troubleshooting Resources	1836
	Troubleshooting Overview	1838
	Recovering the Root Password	1840
Part 25	Configuring Authentication	
Chapter 63	Configuring and Managing Local Password Authentication	1845
	Junos OS User Accounts Overview	1845
	Junos OS User Authentication Methods	1847
	Junos OS Login Classes Overview	1848
	Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies	1848
	Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands	1849
	Special Requirements for Junos OS Plain-Text Passwords	1850
	Configuring Junos OS User Accounts	1853
	Configuring a Local Administrator Account	1853
	Example: Creating Login Classes with Specific Privileges	1854

	Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication	1855
	Example: Changing the Requirements for Junos OS Plain-Text Passwords . . .	1857
Chapter 64	Configuring and Managing TACACS+ Authentication	1859
	Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication	1859
	Using RADIUS or TACACS+ Authentication	1859
	Using Local Password Authentication	1860
	Order of Authentication Attempts	1860
	Juniper Networks Vendor-Specific TACACS+ Attributes	1863
	Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication	1865
Chapter 65	Configuring and Managing RADIUS Authentication	1869
	Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication	1869
	Using RADIUS or TACACS+ Authentication	1869
	Using Local Password Authentication	1870
	Order of Authentication Attempts	1870
	Configuring RADIUS Authentication (QFX Series or OCX Series)	1873
	Configuring RADIUS Server Details	1874
	Configuring MS-CHAPv2 for Password-Change Support	1875
	Specifying a Source Address for the Junos OS to Access External RADIUS Servers	1876
	Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands	1876
	Example: Configuring RADIUS Authentication	1878
	Example: Configuring RADIUS Template Accounts	1879
	Configuring a Local Administrator Account	1879
	Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication	1880
Chapter 66	Configuring and Managing RADIUS Accounting	1883
	Understanding RADIUS Accounting	1883
	Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication	1884
	Using RADIUS or TACACS+ Authentication	1884
	Using Local Password Authentication	1885
	Order of Authentication Attempts	1885
	Juniper Networks Vendor-Specific RADIUS Attributes	1888
	Configuring RADIUS System Accounting	1891
	Configuring Auditing of User Events on a RADIUS Server	1891
	Specifying RADIUS Server Accounting and Auditing Events	1891
	Configuring RADIUS Server Accounting	1892
	Configuring RADIUS Authentication (QFX Series or OCX Series)	1893
	Configuring RADIUS Server Details	1894
	Configuring MS-CHAPv2 for Password-Change Support	1895
	Specifying a Source Address for the Junos OS to Access External RADIUS Servers	1896

	Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands	1896
	Example: Configuring RADIUS System Accounting	1898
Chapter 67	Configuring and Managing RADIUS Template Accounts	1899
	Overview of Template Accounts for RADIUS and TACACS+ Authentication . .	1899
	Example: Configuring RADIUS Template Accounts	1899
Chapter 68	Configuring and Managing VSAs for RADIUS and TACACS+	1901
	Understanding Vendor-Specific Attributes (VSAs)	1901
	Juniper-Switching-Filter VSA Match Conditions and Actions	1902
	Juniper Networks Vendor-Specific TACACS+ Attributes	1904

Guide 5 Ethernet Switching Feature Guide for QFX10000 Switches

Part 27	ELS CLI
Chapter 71	Enhanced Layer 2 Software (ELS) CLI 2035
	Getting Started with Enhanced Layer 2 Software 2035
	Understanding Enhanced Layer 2 Software Support 2035
	Using the ELS Translator 2036
	Configuring a VLAN 2037
	Configuring the Native VLAN Identifier 2037
	Configuring Layer 2 Interfaces 2038
	Configuring Layer 3 Interfaces 2038
	Configuring an IRB Interface 2039
	Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface 2039
	Enhanced Layer 2 CLI Configuration Statement and Command Changes . . 2040
	Changes to the ethernet-switching-options Hierarchy Level 2041
	Changes to the Port Mirroring Hierarchy Level 2042
	Changes to the Layer 2 Control Protocol Hierarchy Level 2043
	Changes to the dot1q-tunneling Statement 2043
	Changes to the L2 Learning Protocol 2044
	Changes to Nonstop Bridging 2044
	Changes to Port Security and DHCP Snooping 2044
	Changes to Configuring VLANs 2046
	Changes to Storm Control Profiles 2049
	Changes to the Interfaces Hierarchy 2050
	Changes to IGMP Snooping 2051
Part 28	Ethernet Ring Protection
Chapter 72	Understanding Ethernet Ring Protection 2055
	Ethernet Ring Protection Switching Overview 2055
	Understanding Ethernet Ring Protection Switching Functionality 2056
	Acronyms 2056
	Ring Nodes 2057
	Ring Node States 2057
	Default Logging of Basic State Transitions on EX Series Switches 2057
	Failure Detection 2058
	Logical Ring 2058
	FDB Flush 2058
	Traffic Blocking and Forwarding 2058
	RPL Neighbor Node 2059
	RAPS Message Blocking and Forwarding 2059
	Dedicated Signaling Control Channel 2060
	RAPS Message Termination 2060
	Revertive and Non-revertive Modes 2061
	Multiple Rings 2061
	Node ID 2061

Ring ID	2061
Bridge Domains with the Ring Port (MX Series Routers Only)	2061
Wait-to-Block Timer	2061
Adding and Removing a Node	2062
Configuring Ethernet Ring Protection Switching (CLI Procedure)	2063
Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS	2066

Part 29

Chapter 73

Bridging and VLANs

Using Bridging and VLANs	2085
Overview of Layer 2 Networking	2085
Understanding Layer 2 Broadcasting	2087
Layer 2 Learning and Forwarding for VLANs Overview	2088
Understanding Bridging and VLANs	2089
History of VLANs	2089
How Bridging of VLAN Traffic Works	2090
Packets Are Either Tagged or Untagged	2091
Switch Interface Modes—Access, Trunk, or Tagged Access	2091
Access Mode	2092
Trunk Mode	2092
Trunk Mode and Native VLAN	2092
Tagged-Access Mode	2093
Additional Advantages of Using VLANs	2093
Maximum VLANs and VLAN Members Per Switch	2094
A Default VLAN Is Configured on Most Switches	2095
Assigning Traffic to VLANs	2095
Assign VLAN Traffic According to the Interface Port Source	2095
Assign VLAN Traffic According to the Source MAC Address	2096
Forwarding VLAN Traffic	2096
VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces	2096
Example: Setting Up Basic Bridging and a VLAN on the QFX Series	2096
Example: Setting Up Bridging with Multiple VLANs	2114
Configuring VLANs	2120
Configuring the Native VLAN Identifier (CLI Procedure)	2121
Creating a Series of Tagged VLANs	2123
Understanding Integrated Routing and Bridging	2124
Example: Configuring Routing Between VLANs on One Switch	2126
Configuring IRB Interfaces	2131
Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)	2133
Configuring Static ARP Entries	2133
Troubleshooting Ethernet Switching	2134

Part 30	MAC Addresses	
Chapter 74	Using MAC Addresses	2137
	Introduction to the Media Access Control (MAC) Layer 2 Sublayer	2137
	Understanding MAC Learning	2138
	Disabling MAC Learning	2138
	Example: Disabling MAC Learning	2139
	Configuring MAC Notification (CLI Procedure)	2140
	Enabling MAC Notification	2140
	Disabling MAC Notification	2141
	Setting the MAC Notification Interval	2141
	Verifying That MAC Notification Is Working Properly	2141
	Configuring MAC Limiting (CLI Procedure)	2142
	Limiting the Number of MAC Addresses Learned by an Interface	2143
	Limiting the Number of MAC Addresses Learned by a VLAN	2143
	Configuring MAC Table Aging	2144
Part 31	Spanning Trees	
Chapter 75	Using Spanning Trees	2147
	Overview of Spanning-Tree Protocols	2148
	Understanding Spanning Tree Protocols on a QFabric System	2148
	Understanding MSTP	2149
	Example: Configuring Network Regions for VLANs with MSTP	2149
	Configuring MSTP	2170
	Understanding RSTP	2172
	Example: Configuring Faster Convergence and Improved Network Stability with RSTP	2173
	Configuring RSTP (CLI Procedure)	2190
	Understanding VSTP	2191
	Example: Configuring VSTP on QFX Series Switches and EX4600 Switches	2191
	Configuring VSTP (CLI Procedure)	2197
	Understanding BPDU Protection for STP, RSTP, and MSTP	2199
	Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations	2200
	Configuring BPDU Protection on Spanning Tree Interfaces	2205
	Understanding Loop Protection for STP, RSTP, VSTP, and MSTP	2206
	Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree	2207
	Understanding Root Protection for STP, RSTP, VSTP, and MSTP	2211
	Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees	2212
	Unblocking an Interface That Receives BPDUs in Error (CLI Procedure)	2217
Part 32	Q-in-Q Tunneling	
Chapter 76	Using Q-in-Q Tunneling	2221
	Understanding Q-in-Q Tunneling	2221
	How Q-in-Q Tunneling Works	2222
	How VLAN Translation Works	2222

	Sending and Receiving Untagged Packets	2222
	Disabling MAC Address Learning	2223
	Mapping C-VLANs to S-VLANs	2223
	All-in-One Bundling	2223
	Many-to-Many Bundling	2224
	Mapping a Specific Interface	2224
	Constraints for Q-in-Q Tunneling and VLAN Translation	2224
	Configuring Q-in-Q Tunneling	2226
	Using the Different Mapping Methods	2226
	Configuring All-in-One Bundling	2227
	Configuring Many-to-Many Bundling	2228
	Configuring a Specific Interface Mapping with VLAN ID Translation Option	2231
	Configuring All-in-One Bundling	2233
	Configuring Many-to-Many Bundling	2235
	Configuring a Specific Interface Mapping with VLAN ID Translation Option	2237
Part 33	Proxy ARP	
Chapter 77	Using Proxy ARP	2243
	Understanding Proxy ARP	2243
	What Is ARP?	2243
	Proxy ARP Overview	2243
	Best Practices for Proxy ARP	2244
	Configuring Proxy ARP (CLI Procedure)	2245
	Verifying That Proxy ARP Is Working Correctly	2245
Part 34	Reflective Relay	
Chapter 78	Using Reflective Relay	2249
	Understanding Reflective Relay for Use with VEPA Technology	2249
	VEPA	2249
	Reflective Relay	2249
	Configuring Reflective Relay	2250
	Example: Configuring Reflective Relay for Use with VEPA Technology	2251
Part 35	Configuration Statements and Operational Commands	
Chapter 79	Ethernet Ring Protection Configuration Statements	2259
	control-channel	2260
	control-vlan	2261
	data-channel	2262
	east-interface	2263
	ethernet-ring	2264
	guard-interval	2265
	hold-interval (Protection Group)	2266
	protection-group	2267
	restore-interval	2268
	ring-protection-link-end	2269
	ring-protection-link-owner	2269

	west-interface	2270
Chapter 80	VLAN Configuration Statements	2271
	[edit vlans] Configuration Statement Hierarchy on the QFX Series	2272
	Supported Statements in the [edit vlans] Hierarchy Level	2272
	Unsupported Statements in the [edit vlans] Hierarchy Level	2274
	description (VLAN)	2275
	dhcp-relay	2276
	filter (VLANs)	2281
	forwarding-options	2282
	interface (VLANs)	2287
	interface-mac-limit	2288
	interface-mode	2290
	irb (Interfaces)	2292
	l3-interface (VLAN)	2295
	mac (Static MAC-Based VLANs)	2296
	members	2297
	native-vlan-id	2298
	packet-action	2299
	port-mode	2302
	service-id	2303
	switch-options	2304
	static (Static MAC-Based VLANs)	2305
	static-mac	2305
	vlan-id (VLANs)	2306
	vlan-id-list	2307
	vlan-rewrite	2308
	vlan-tagging	2309
	vlan-tags	2310
	vlans	2311
Chapter 81	MAC Address Configuration Statements	2315
	global-mac-table-aging-time	2315
	mac-limit	2316
	mac-notification	2317
	mac-statistics	2318
	mac-table-size	2320
	notification-interval	2321
Chapter 82	STP Configuration Statements	2323
	bpdu-block	2324
	bpdu-block-on-edge	2325
	bpdu-timeout-action	2326
	bridge-priority (Spanning Trees)	2327
	configuration-name	2328
	cost	2329
	disable (Spanning Trees)	2330
	bpdu-block	2331
	bpdu-block-on-edge	2332
	bpdu-timeout-action	2333

	bridge-priority (Spanning Trees)	2334
	configuration-name	2335
	cost	2336
	disable (Spanning Trees)	2337
	disable-timeout (Spanning Trees)	2338
	edge	2339
	force-version (IEEE 802.1D STP)	2340
	forward-delay	2341
	hello-time	2342
	interface (BPDU)	2343
	interface (Spanning Tree)	2344
	max-age	2345
	max-hops	2346
	mode	2347
	msti	2348
	mstp	2349
	no-root-port	2351
	priority (Protocols STP)	2352
	protocol	2353
	protocols (STP Type)	2354
	revision-level	2355
	rstp	2356
	traceoptions (Spanning Tree)	2357
	vlan (MSTP)	2360
	vlan (VSTP)	2361
	vlan (VSTP)	2362
	vlan-group	2363
	vstp	2364
Chapter 83	Q-in-Q Configuration Statements	2367
	flexible-vlan-tagging	2368
	input-vlan-map	2369
	native-vlan-id	2370
	output-vlan-map (Gigabit Ethernet IQ and 10-Gigabit Ethernet with SFPP) . .	2371
	pop	2372
	push	2373
	swap	2374
	vlan-id-list	2375
Chapter 84	Reflective Relay Configuration Statement	2377
	reflective-relay	2377
Chapter 85	Bridging and VLANs Monitoring Commands	2379
	clear ethernet-switching table	2380
	show ethernet-switching interfaces	2382
	show ethernet-switching table	2386
	show system statistics arp	2394
	show vlans	2395

Chapter 86	MAC Address Operational Commands	2405
	show ethernet-switching mac-learning-log	2406
	show ethernet-switching mac-notification	2408
	show ethernet-switching statistics aging	2410
	show ethernet-switching statistics mac-learning	2412
Chapter 87	Spanning Tree Monitoring Commands	2417
	clear error bpdu interface	2418
	clear spanning-tree statistics	2419
	show spanning-tree bridge	2420
	show spanning-tree interface	2425
	show spanning-tree mstp configuration	2431
	show spanning-tree statistics	2433
Guide 6	OVSDB and VXLAN Feature Guide for QFX10000 Switches (VMware NSX)	
Part 36	Overview	
Chapter 88	OVSDB and VXLAN Overview	2439
	Understanding the Junos OS Implementation of OVSDB and VXLAN in a VMware NSX for Multi-Hypervisor Environment	2439
	Understanding VXLANs	2442
	VXLAN Benefits	2442
	How Does VXLAN Work?	2443
	VXLAN Implementation Methods	2443
	Using an MX Series Router or EX9200 Switch as a VTEP	2444
	Manual VXLANs Require PIM	2444
	Understanding the OVSDB Protocol Running on Juniper Networks Devices	2445
	OVSDDB Support on Juniper Networks Devices	2446
	OVSDDB Schema for Physical Devices	2447
	Understanding How Layer 2 BUM and Layer 3 Routed Multicast Traffic Are Handled with OVSDB	2450

Part 37**Configuring OVSDB and VXLAN****Chapter 89****Configuring OVSDB-Managed VXLANs with an SDN Controller 2455**

OVSDB and VXLAN Configuration Workflows for VMware NSX Environment . .	2455
OVSDB and VXLAN Configuration Workflow for QFX Series Switches . . .	2455
OVSDB and VXLAN Configuration Workflow for MX Series Routers and EX9200 Switches	2457
Understanding How to Set Up OVSDB Connections on a Juniper Networks Device	2458
Creating and Installing an SSL Key and Certificate on a Juniper Networks Device for Connection with SDN Controllers	2459
Setting Up OVSDB on Juniper Networks Devices That Support the Dynamic Configuration of VXLANs	2461
Understanding Dynamically Configured VXLANs in an OVSDB Environment . .	2462
Performing Tasks Before and After the Dynamic Configuration of OVSDB-Managed VXLANs	2462
What the Juniper Networks Switch Actually Creates Dynamically	2467
Dynamic Association of a Trunk Interface Supporting Untagged Packets to a Dynamically Created VXLAN	2467
Dynamic Association of a Trunk Interface Supporting Tagged Packets to a Dynamically Created VXLAN	2468
VMware NSX Configuration for Juniper Networks Devices Functioning as Virtual Tunnel Endpoints	2469
Creating a Gateway	2470
Creating a Gateway Service	2470
Creating a Logical Switch Port	2471
Example: Setting Up a VXLAN Layer 2 Gateway and OVSDB Connections in a VMware NSX Environment (Trunk Interfaces Supporting Untagged Packets)	2472
Example: Setting Up a VXLAN Layer 2 Gateway and OVSDB Connections in a VMware NSX Environment (Trunk Interfaces Supporting Tagged Packets)	2480
Verifying That a Logical Switch and Corresponding Junos OS OVSDB-Managed VXLAN Are Working Properly	2488

Chapter 90**Configuring VXLANs Without an SDN Controller 2491**

VXLAN Constraints on QFX Series Switches	2491
Manually Configuring VXLANs on a QFX5100 Switch	2492
Configuring a Source IP Address	2493
Configuring PIM for VXLANs	2493
Configuring VXLANs	2493
Examples: Manually Configuring VXLANs on QFX Series Switches	2494
Example: Configuring a VXLAN Transit Switch	2494
Example: Configuring a VXLAN Layer 2 Gateway	2496
Verifying That a Local VXLAN VTEP Is Configured Correctly	2502
Verifying MAC Learning from a Remote VTEP	2502

Part 38	Troubleshooting	
Chapter 91	Troubleshooting Tasks	2507
	Troubleshooting a Nonoperational Logical Switch and Corresponding Junos OS	
	OVSDB-Managed VXLAN	2507
	Verifying VXLAN Reachability	2509
	Monitoring a Remote VTEP Interface	2509
Part 39	Configuration Statements and Operational Commands	
Chapter 92	OVSDB Configuration Statements	2513
	controller (OVSDB)	2514
	inactivity-probe-duration	2515
	interfaces (OVSDB)	2516
	maximum-backoff-duration	2517
	ovsdb	2518
	ovsdb-managed	2519
	port (OVSDB)	2520
	protocol (OVSDB)	2521
	traceoptions (OVSDB)	2522
Chapter 93	VXLAN Configuration Statements	2525
	decapsulate-accept-inner-vlan	2525
	encapsulate-inner-vlan	2526
	multicast-group	2526
	ovsdb-managed	2527
	unreachable-vtep-aging-timer	2528
	vni	2528
	vtep-source-interface	2529
	vxlan	2529
Chapter 94	OVSDB Operational Commands	2531
	clear ovsdb commit failures	2532
	show ovsdb commit failures	2534
	show ovsdb controller	2536
	show ovsdb interface	2538
	show ovsdb logical-switch	2540
	show ovsdb mac	2543
	show ovsdb statistics interface	2547
	show ovsdb virtual-tunnel-end-point	2549
	show vpls mac-table	2551
Chapter 95	VXLAN Operational Commands	2557
	show bridge mac-table	2558
	show vpls mac-table	2563

Guide 7 High Availability Feature Guide for QFX10000 Switches

Part 40	Adaptive Load Balancing	
Chapter 96	Configuring Load Balancing	2573
	Understanding Aggregated Ethernet Load Balancing	2573
	Configuring Adaptive Load Balancing	2575
Part 41	Graceful Restart	
Chapter 97	Configuring Graceful Restart	2579
	Graceful Restart Concepts	2579
	Configuring Routing Protocols Graceful Restart	2580
	Enabling Graceful Restart	2580
	Configuring Graceful Restart Options for BGP	2581
	Configuring Graceful Restart Options for ES-IS	2582
	Configuring Graceful Restart Options for IS-IS	2582
	Configuring Graceful Restart Options for OSPF and OSPFv3	2583
	Configuring Graceful Restart Options for RIP and RIPng	2585
	Configuring Graceful Restart Options for PIM Sparse Mode	2585
	Tracking Graceful Restart Events	2586
Part 42	Nonstop Bridging	
Chapter 98	Configuring Nonstop Bridging	2589
	Nonstop Bridging Concepts	2589
	Nonstop Bridging System Requirements	2591
	Platform Support	2591
	Protocol Support	2592
	Configuring Nonstop Bridging on Switches (CLI Procedure)	2593
Part 43	Nonstop Active Routing	
Chapter 99	Configuring Nonstop Active Routing	2597
	Nonstop Active Routing Concepts	2597
	Nonstop Active Routing System Requirements	2600
	Nonstop Active Routing Platform and Switching Platform Support	2600
	Nonstop Active Routing Protocol and Feature Support	2601
	Nonstop Active Routing BFD Support	2604
	Nonstop Active Routing BGP Support	2605
	Nonstop Active Routing Layer 2 Circuit and VPLS Support	2606
	Nonstop Active Routing PIM Support	2606
	Nonstop Active Routing MSDP Support	2609
	Nonstop Active Routing Support for RSVP-TE LSPs	2609
	Example: Configuring Nonstop Active Routing on Switches	2611

Part 44	Graceful Routing Engine Switchover	
Chapter 100	Configuring Graceful Routing Engine Switchover	2617
	Understanding Graceful Routing Engine Switchover	2617
	Graceful Routing Engine Switchover Concepts	2617
	Effects of a Routing Engine Switchover	2622
	Graceful Routing Engine Switchover System Requirements	2623
	Graceful Routing Engine Switchover Platform Support	2623
	Graceful Routing Engine Switchover Feature Support	2624
	Graceful Routing Engine Switchover DPC Support	2626
	Graceful Routing Engine Switchover and Subscriber Access	2626
	Graceful Routing Engine Switchover PIC Support	2626
	Configuring Graceful Routing Engine Switchover	2627
	Enabling Graceful Routing Engine Switchover	2627
	Configuring Graceful Routing Engine Switchover with Graceful Restart	2627
	Synchronizing the Routing Engine Configuration	2627
	Verifying Graceful Routing Engine Switchover Operation	2629
	Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)	2629
	Resetting Local Statistics	2630
Part 45	Virtual Router Redundancy Protocol	
Chapter 101	Configuring Virtual Router Redundancy Protocol	2633
	Understanding VRRP	2633
	Overview of VRRP	2633
	Sample VRRP Topology	2634
	Example: Configuring VRRP for Load Sharing	2636
	Configuring Basic VRRP Support for QFX	2641
	Configuring VRRP Authentication (IPv4 Only)	2642
	Configuring the Startup Period for VRRP Operations	2643
	Configuring the Advertisement Interval for the VRRP Master	2643
	Modifying the Advertisement Interval in Seconds	2644
	Modifying the Advertisement Interval in Milliseconds	2644
	Configuring VRRP Preemption and Hold Time	2644
	Configuring VRRP Preemption	2645
	Configuring the Preemption Hold Time	2645
	Overriding the Hold Time	2645
	Configuring a Route to Be Tracked	2646
	Configuring a Logical Interface to Be Tracked	2646
	Configuring a Backup to Accept Packets Destined for the Virtual IP Address	2648
	Configuring Passive ARP Learning for VRRP Backups	2649
	Configuring the Silent Period	2649
	Configuring Inheritance for a VRRP Group	2650
	Troubleshooting VRRP	2651
Part 46	Configuration Statements and Operational Commands	
Chapter 102	Configuration Statements (Adaptive Load Balancing)	2655
	adaptive	2656

Chapter 103	Configuration Statements (Graceful Restart)	2657
	disable	2658
	disable (BGP Graceful Restart)	2659
	graceful-restart (Enabling Globally)	2660
	graceful-restart (Protocols BGP)	2662
	graceful-restart	2664
	helper-disable (OSPF)	2666
	no-strict-lsa-checking	2667
	notify-duration	2668
	redundancy (Graceful Switchover)	2669
	restart-duration	2670
	restart-time (BGP Graceful Restart)	2671
	stale-routes-time	2672
Chapter 104	Configuration Statements (Graceful Switchover)	2673
	graceful-switchover	2673
	redundancy (Graceful Switchover)	2674
Chapter 105	Configuration Statements (Nonstop Bridging and Routing)	2675
	nonstop-bridging	2675
	nonstop-routing	2676
	synchronize	2677
	traceoptions	2679
Chapter 106	Configuration Statements (VRRP)	2683
	accept-data	2684
	advertise-interval	2685
	asymmetric-hold-time	2686
	authentication-key	2687
	authentication-type	2688
	bandwidth-threshold	2689
	failover-delay	2690
	fast-interval	2691
	hold-time (VRRP)	2692
	interface	2693
	preempt (VRRP)	2694
	priority (Protocols VRRP)	2695
	priority-cost (VRRP)	2696
	priority-hold-time	2697
	route (Interfaces)	2698
	startup-silent-period	2699
	traceoptions	2700
	track (VRRP)	2702
	virtual-address	2703
	vrrp-group	2704
Chapter 107	Operational Mode Commands (Graceful Restart)	2707
	Verifying Graceful Restart Operation	2707
	Graceful Restart Operational Mode Commands	2707
	Verifying BGP Graceful Restart	2708

	Verifying IS-IS and OSPF Graceful Restart	2708
	Verifying CCC and TCC Graceful Restart	2709
	show bgp neighbor	2710
	show log	2727
	show (ospf ospf3) overview	2731
Chapter 108	Operational Mode Commands (Graceful Switchover)	2737
	show system switchover	2738
	show task replication	2744
Chapter 109	Operational Mode Command (Nonstop Routing)	2747
	show task replication	2748
Chapter 110	Operational Mode Commands (VRRP)	2751
	show vrrp	2752

Guide 8 Interfaces Feature Guide for QFX10000 Switches

Part 47	Ethernet OAM Link Fault Management	
Chapter 111	Understanding Ethernet OAM Link Fault Management	2767
	Understanding Ethernet OAM Link Fault Management for an EX Series	
	Switch	2767
	Configuring Ethernet OAM Link Fault Management (CLI Procedure)	2768
	Example: Configuring Ethernet OAM Link Fault Management on EX Series	
	Switches	2770
Part 48	Generic Routing Encapsulation (GRE)	
Chapter 112	Understanding GRE	2777
	Understanding Generic Routing Encapsulation	2777
	Overview of GRE	2777
	GRE Tunneling	2778
	Encapsulation and De-Encapsulation on the Switch	2778
	Number of Source and Destination Tunnels Allowed on a Switch	2778
	Class of Service on GRE Tunnels	2779
	Applying Firewall Filters to GRE Traffic	2779
	Using a Firewall Filter to De-encapsulate GRE Traffic on a QFX5100 and	
	OCX Series Switches	2779
	Configuration Limitations	2780
	Configuring Generic Routing Encapsulation Tunneling	2780
	Configuring a GRE Tunnel	2781
	Verifying That Generic Routing Encapsulation Tunneling Is Working Correctly	2781

Part 49	Interfaces	
Chapter 113	Understanding Interfaces	2785
	Interfaces Overview	2785
	Network Interfaces	2785
	Special Interfaces	2786
	Understanding Interface Naming Conventions	2787
	Physical Part of an Interface Name	2788
	Logical Part of an Interface Name on a Switch Running QFabric Software Package	2794
	Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software	2795
	Wildcard Characters in Interface Names	2795
	Understanding Interface Ranges	2795
	Understanding Management Interfaces	2796
	Understanding Port Ranges and System Modes	2798
	Port Ranges for Different Media Types	2798
	Supported System Modes	2822
	Configuring the Interface Address	2824
	Configuring Gigabit and 10-Gigabit Ethernet Interfaces	2826
	Configuring Port Mode on QFX5100-48S, QFX5100-48T, QFX5100-24Q, and EX4600 Switches	2827
	Configuring the Link Settings for Gigabit Ethernet Interfaces on QFX5100-48S, QFX5100-24Q Switches, and EX4600 Switches	2828
	Configuring Gigabit Ethernet Interfaces on QFX5100-48T Switches	2828
	Configuring the Link Settings for 10-Gigabit Ethernet Interfaces on QFX5100-48S, QFX5100-24Q Switches, and EX4600 Switches	2830
	Configuring the Link Settings for 10-Gigabit Ethernet Interfaces on QFX5100-48T Switches	2830
	Configuring the IP Options on QFX5100-48S, QFX5100-48T, QFX5100-24Q, and EX4600 Switches	2830
	Configuring Ethernet Loopback Capability	2831
	Configuring an LPM Table With Junos OS Release 13.2X51-D10	2832
	Channelizing Interfaces	2835
	Monitoring Interface Status and Traffic	2844
	Troubleshooting Network Interfaces	2845
	The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down	2845
Part 50	IP Directed Broadcast	
Chapter 114	Understanding IP Directed Broadcast	2849
	Understanding IP Directed Broadcast	2849
	IP Directed Broadcast Overview	2849
	IP Directed Broadcast Implementation	2850
	When to Enable IP Directed Broadcast	2850
	When Not to Enable IP Directed Broadcast	2850
	Configuring IP Directed Broadcast (CLI Procedure)	2851
	Example: Configuring IP Directed Broadcast	2852

Part 51	Layer 3 Logical Interfaces	
Chapter 115	Understanding Layer 3 Logical Interfaces	2859
	Understanding Layer 3 Logical Interfaces	2859
	Configuring a Layer 3 Logical Interface	2860
	Verifying That Layer 3 Logical Interfaces Are Working	2860
Part 52	Link Aggregation Groups (LAGs) and Link Aggregation Control Protocol (LACP)	
Chapter 116	Understanding LAGs and LACP	2865
	Understanding Aggregated Ethernet Interfaces and LACP	2865
	Link Aggregation Group	2866
	Link Aggregation Control Protocol (LACP)	2867
	Configuring Aggregated Ethernet LACP	2868
	Configuring Link Aggregation	2869
	Creating an Aggregated Ethernet Interface	2870
	Configuring the VLAN Name and VLAN ID Number	2870
	Configuring Aggregated Ethernet LACP	2871
	Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)	2872
	Configuring LACP Link Protection for a Single Link at the Global Level	2873
	Configuring LACP Link Protection for a Single Link at the Aggregated Interface Level	2873
	Configuring Subgroup Bundles to Provide LACP Link Protection to Multiple Links in an Aggregated Ethernet Interface	2874
	Configuring Periodic Rebalancing of Subscribers in an Aggregated Ethernet Interface	2875
	Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch	2876
	Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch	2880
	Verifying the Status of a LAG Interface	2885
	Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets	2885
	Verifying the LACP Setup	2885
	Verifying That LACP Packets Are Being Exchanged	2886
	Troubleshooting an Aggregated Ethernet Interface	2886
Part 53	Load Balancing	
Chapter 117	Understanding Load Balancing	2891
	Configuring Load Balancing Based on MAC Addresses	2891
Part 54	Local Link Bias	
Chapter 118	Understanding Local Link Bias	2895
	Understanding Local Link Bias	2895
	Configuring Local Link Bias (CLI Procedure)	2897

Part 55	Redundant Trunk Groups	
Chapter 119	Understanding Redundant Trunk Groups	2901
	Understanding Redundant Trunk Links	2901
	Example: Configuring Redundant Trunk Links for Faster Recovery	2903
Part 56	Resilient Hashing	
Chapter 120	Understanding Resilient Hashing	2911
	Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop	
	ECMP Traffic	2911
	Understanding the Hashing Algorithm	2911
	IP (IPv4 and IPv6)	2913
	MPLS	2914
	MAC-in-MAC Packet Hashing	2915
	Layer 2 Header Hashing	2916
	Understanding the Use of Resilient Hashing to Minimize Flow Remapping in	
	Trunk/ECMP Groups	2917
	Why You Might Want to Use Resilient Hashing and How It Works with Static Hashing	2917
	Limitations and Caveats for Resilient Hashing	2918
	Resilient Hashing on LAGs	2918
	Resilient Hashing on ECMP	2919
	Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop	
	ECMP Traffic (QFX 10002 and QFX 10008 Switches)	2919
	Understanding the Hashing Algorithm	2919
	IP (IPv4 and IPv6)	2920
	MPLS	2921
	Layer 2 Header Hashing on the QFX10002 and QFX 10008 Switches	2922
	Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP	
	Traffic (CLI Procedure)	2923
	Configuring the Hashing Algorithm to Use Fields in the Layer 2 Header for Hashing	2924
	Configuring the Hashing Algorithm to Use Fields in the IP Payload for Hashing	2924
	Configuring the Hashing Algorithm to Use Fields in the IPv6 Payload for Hashing	2924
	Configuring Resilient Hashing for Trunk/ECMP Groups	2925
	Configuring Resilient Hashing on LAGs	2925
	Configuring Resilient Hashing on ECMP Groups	2926
Part 57	Uplink Failure Detection	
Chapter 121	Understanding Uplink Failure Detection	2929
	Overview of Uplink Failure Detection	2929
	Uplink Failure Detection Configuration	2929
	Failure Detection Pair	2930
	Configuring Interfaces for Uplink Failure Detection	2931
	Example: Configuring Interfaces for Uplink Failure Detection	2932

Part 58	Configuration Statements and Operational Commands

	show uplink-failure-detection	3222

Guide 9 Routing Options Feature Guide for QFX10000 Switches

Part 59	Configuring Routing Options	
	Overview of Routing Options	3227
	Configuring Static Routing	3228
	Configuring Per-Packet Load Balancing	3228
	Examples: Configuring Per-Packet Load Balancing	3230
	Using a QFX10000 Switch with 6PE	3231
	Understanding Virtual Router Routing Instances	3232
	Configuring Virtual Router Routing Instances	3232
	Understanding Distributed Periodic Packet Management	3233
	Configuring Distributed Periodic Packet Management	3234
	Disabling or Enabling Distributed Periodic Packet Management Globally	3234
	Disabling or Enabling Distributed Periodic Packet Management for LACP Packets	3235
	Understanding Bidirectional Forwarding Detection (BFD)	3236
Chapter 138	Examples: Configuring BFD for Static Routes	3237
	Understanding BFD for Static Routes for Faster Network Failure Detection	3237
	Example: Configuring BFD for Static Routes for Faster Network Failure Detection	3241
	Example: Enabling BFD on Qualified Next Hops in Static Routes for Route Selection	3246
Chapter 139	Example: Configuring BFD Authentication for Static Routes	3253
	Understanding BFD Authentication for Static Route Security	3253
	BFD Authentication Algorithms	3254
	Security Authentication Keychains	3254
	Strict Versus Loose Authentication	3255
	Example: Configuring BFD Authentication for Securing Static Routes	3255
	Monitoring Routing Information	?
	Verifying That Virtual Router Routing Instances Are Working	?
Chapter 140	Troubleshooting Virtual Routing Instances	3263
	Direct Routes Not Leaked Between Routing Instances	3263

Part 60

Guide 10 BGP Feature Guide for QFX10000 Switches

Part 61	Overview	
Chapter 143	BGP Overview	3593
	Understanding BGP	3593
	Autonomous Systems	3594
	AS Paths and Attributes	3594
	External and Internal BGP	3594

	Multiple Instances of BGP	3595
	BGP Routes Overview	3596
	BGP Messages Overview	3597
	Open Messages	3597
	Update Messages	3597
	Keepalive Messages	3598
	Notification Messages	3598
	Route-Refresh Messages	3598
Part 62	Configuring BGP	
Chapter 144	Basic BGP Configuration	3601
	Examples: Configuring External BGP Peering	3601
	Understanding External BGP Peering Sessions	3601
	Example: Configuring External BGP Point-to-Point Peer Sessions	3602
	Example: Configuring External BGP on Logical Systems with IPv6 Interfaces	3609
	Examples: Configuring Internal BGP Peering	3624
	Understanding Internal BGP Peering Sessions	3624
	Example: Configuring Internal BGP Peer Sessions	3625
	Example: Configuring Internal BGP Peering Sessions on Logical Systems	3636
	Configuring BGP Monitoring Protocol Version 3	3647
Chapter 145	BGP Path Attribute Configuration	3651
	Understanding the Advertisement of Multiple Paths to a Single Destination in BGP	3651
	Example: Configuring BGP Local Preference	3652
	Understanding the Local Preference Metric for Internal BGP Routes	3652
	Example: Configuring the Local Preference Value for BGP Routes	3653
	Examples: Configuring BGP MED	3665
	Understanding the MED Attribute That Determines the Exit Point in an AS	3665
	Example: Configuring the MED Attribute That Determines the Exit Point in an AS	3668
	Example: Configuring the MED Using Route Filters	3680
	Example: Configuring the MED Using Communities	3693
	Example: Associating the MED Path Attribute with the IGP Metric and Delaying MED Updates	3694
	Examples: Configuring BGP Local AS	3704
	Understanding the BGP Local AS Attribute	3704
	Example: Configuring a Local AS for EBGp Sessions	3709
	Example: Configuring a Private Local AS for EBGp Sessions	3719
	Example: Configuring the Accumulated IGP Attribute for BGP	3724
	Understanding the Accumulated IGP Attribute for BGP	3725
	Example: Configuring the Accumulated IGP Attribute for BGP	3725

Chapter 146	BGP Policy Configuration	3765
	Example: Configuring BGP Interactions with IGPs	3765
	Understanding Routing Policies	3765
	Example: Injecting OSPF Routes into the BGP Routing Table	3766
	Example: Configuring BGP Route Advertisement	3769
	Configuring Routing Policies to Control BGP Route Advertisements	3769
	Applying Routing Policy	3769
	Setting BGP to Advertise Inactive Routes	3770
	Configuring BGP to Advertise the Best External Route to Internal Peers	3770
	Configuring How Often BGP Exchanges Routes with the Routing Table	3772
	Disabling Suppression of Route Advertisements	3773
	Example: Configuring BGP Prefix-Based Outbound Route Filtering	3773
	Example: Configuring EBGp Multihop	3777
	Understanding BGP Multihop for Peering	3777
	Example: Configuring EBGp Multihop Sessions	3777
	Example: Configuring BGP Route Preference (Administrative Distance)	3786
	Understanding Route Preference Values (Administrative Distance)	3786
	Example: Configuring the Preference Value for BGP Routes	3787
	Example: Configuring BGP Path Selection	3793
	Understanding BGP Path Selection	3793
	Routing Table Path Selection	3795
	Effects of Advertising Multiple Paths to a Destination	3796
	Example: Ignoring the AS Path Attribute When Selecting the Best Path	3796
	Example: Removing Private AS Numbers	3803
	Understanding Private AS Number Removal from AS Paths	3804
	Example: Removing Private AS Numbers from AS Paths	3805
Chapter 147	BGP BFD Configuration	3811
	Example: Configuring BFD for BGP	3811
	Understanding BFD for BGP	3811
	Example: Configuring BFD on Internal BGP Peer Sessions	3812
	Example: Configuring BFD Authentication for BGP	3820
	Understanding BFD Authentication for BGP	3820
	BFD Authentication Algorithms	3821
	Security Authentication Keychains	3822
	Strict Versus Loose Authentication	3822
	Example: Configuring BFD Authentication for BGP	3822
	Configuring BFD Authentication Parameters	3822
	Viewing Authentication Information for BFD Sessions	3824

Chapter 148	BGP Load Balancing Configuration	3827
	Examples: Configuring BGP Multipath	3827
	Understanding BGP Multipath	3827
	Example: Load Balancing BGP Traffic	3828
	Example: Configuring Single-Hop EBGP Peers to Accept Remote Next Hops	3833
	Example: Advertising Multiple Paths in BGP	3844
	Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing . . .	3870
Chapter 149	IBGP Scaling Configuration	3873
	Example: Configuring BGP Route Reflectors	3873
	Understanding BGP Route Reflectors	3873
	Example: Configuring a Route Reflector	3876
	Example: Configuring BGP Confederations	3890
	Understanding BGP Confederations	3890
	Example: Configuring BGP Confederations	3891
Chapter 150	BGP Security Configuration	3897
	Example: Configuring BGP Route Authentication	3897
	Understanding Route Authentication	3897
	Example: Configuring Route Authentication for BGP	3898
	Examples: Configuring TCP and BGP Security	3904
	Understanding Security Options for BGP with TCP	3904
	Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers	3904
	Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List	3909
	Example: Limiting TCP Segment Size for BGP	3912
Chapter 151	BGP Flap Configuration	3919
	Example: Preventing BGP Session Resets	3919
	Understanding BGP Session Resets	3919
	Example: Preventing BGP Session Flaps When VPN Families Are Configured	3919
	Examples: Configuring BGP Flap Damping	3926
	Understanding Damping Parameters	3926
	Example: Configuring BGP Route Flap Damping Parameters	3927
	Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family	3936
Part 63	Monitoring and Troubleshooting	
Chapter 152	BGP Monitoring Configuration	3949
	Example: Configuring BGP Trace Operations	3949
	Understanding Trace Operations for BGP Protocol Traffic	3949
	Example: Viewing BGP Trace Files on Logical Systems	3951
	Tracing BMP Operations	3956
Chapter 153	Routine Monitoring	3959
	Monitoring BGP Routing Information	3959

Part 64	Configuration Statement and Operational Commands	
Chapter 154	Configuration Statements	3963

Guide 11	IS-IS Feature Guide for QFX10000 Switches	
Chapter 156	Overview	4157
	IS-IS Overview	4157
	IS-IS Terminology	4158
	ISO Network Addresses	4158
	IS-IS Packets	4160
	Persistent Route Reachability	4161
	IS-IS Support for Multipoint Network Clouds	4161
	Installing a Default Route to the Nearest Routing Device That Operates at Both IS-IS Levels	4161
Part 65	Configuring IS-IS Features	
Chapter 157	Configuring IS-IS	4165
	Understanding Loop-Free Alternate Routes for IS-IS	4165
	Configuring Link Protection for IS-IS	4167
	Configuring Node-Link Protection for IS-IS	4168
	Excluding an IS-IS Interface as a Backup for Protected Interfaces	4168
	Configuring RSVP Label-Switched Paths as Backup Paths for IS-IS	4168
	Using Operational Mode Commands to Monitor Protected IS-IS Routes	4169
	Example: Configuring IS-IS	4169
	Example: Configuring a Multi-Level IS-IS Topology to Control Interarea Flooding	4175
	Configuring IS-IS Authentication	4183
	Configuring IS-IS Authentication Without Network-Wide Deployment	4184
	Example: Redistributing OSPF Routes into IS-IS	4185
	Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies	4193
	Understanding IS-IS IPv4 and IPv6 Unicast Topologies	4193
	Example: Configuring IS-IS IPv4 and IPv6 Unicast Topologies	4193
	Example: Configuring IS-IS Multicast Topology	4201
	IS-IS Multicast Topologies Overview	4202
	Example: Configuring IS-IS Multicast Topology	4203
	Example: Configuring Link and Node Protection for IS-IS Routes	4217
	Understanding Loop-Free Alternate Routes for IS-IS	4218
	Configuring Link Protection for IS-IS	4219
	Configuring Node-Link Protection for IS-IS	4220
	Excluding an IS-IS Interface as a Backup for Protected Interfaces	4220
	Configuring RSVP Label-Switched Paths as Backup Paths for IS-IS	4221
	Using Operational Mode Commands to Monitor Protected IS-IS Routes	4221
	Example: Configuring Node-Link Protection for IS-IS Routes in a Layer 3 VPN	4221
	Example: Configuring an IS-IS Default Route Policy on Logical Systems	4232
	Example: Configuring IS-IS for CLNS	4237
	Understanding IS-IS for CLNS	4237
	Example: Configuring IS-IS for CLNS	4237
	Example: Enabling Packet Checksums on IS-IS Interfaces for Error Checking	4239

Chapter 158	Configuring BFD Authentication for IS-IS	4243
	Understanding BFD Authentication for IS-IS	4243
	BFD Authentication Algorithms	4243
	Security Authentication Keychains	4244
	Strict Versus Loose Authentication	4244
	Example: Configuring BFD for IS-IS	4245
	Example: Configuring BFD Authentication for IS-IS	4250
Chapter 159	Configuring Hitless Authentication Key Rollover for IS-IS	4255
	Understanding Hitless Authentication Key Rollover for IS-IS	4255
	Example: Configuring Hitless Authentication Key Rollover for IS-IS	4256

Guide 12 OSPF Feature Guide for QFX10000 Switches

Part 66**Overview****Chapter 162****OSPF Overview 4385**

OSPF Overview	4386
OSPF Default Route Preference Values	4388
OSPF Routing Algorithm	4388
OSPF Three-Way Handshake	4389
OSPF Version 3	4390
OSPF Packets Overview	4391
OSPF Packet Header	4391
Hello Packets	4391
Database Description Packets	4392
Link-State Request Packets	4392
Link-State Update Packets	4392
Link-State Acknowledgment Packets	4392
Link-State Advertisement Packet Types	4393
Understanding OSPF External Metrics	4393

Part 67**Configuring OSPF****Chapter 163****Basic OSPF Area Configuration 4397**

Understanding OSPF Areas	4397
Areas	4397
Area Border Routers	4398
Backbone Areas	4398
AS Boundary Routers	4398
Backbone Router	4398
Internal Router	4398
Stub Areas	4398
Not-So-Stubby Areas	4399
Transit Areas	4399
Examples: Configuring OSPF Designated Routers	4399
OSPF Designated Router Overview	4400
Example: Configuring an OSPF Router Identifier	4400
Example: Controlling OSPF Designated Router Election	4402
Examples: Configuring OSPF Areas	4404
Understanding OSPF Areas and Backbone Areas	4404
Example: Configuring a Single-Area OSPF Network	4406
Example: Configuring a Multiarea OSPF Network	4408

Chapter 164	Advanced OSPF Area Configuration	4413
	Examples: Configuring OSPF Stub and Not-So-Stubby Areas	4413
	Understanding OSPF Stub Areas, Totally Stubby Areas, and Not-So-Stubby Areas	4413
	Example: Configuring OSPF Stub and Totally Stubby Areas	4414
	Example: Configuring OSPF Not-So-Stubby Areas	4418
	Example: Configuring OSPF Multiarea Adjacency	4423
	Multiarea Adjacency for OSPF	4423
	Example: Configuring Multiarea Adjacency for OSPF	4424
	Example: Disabling OSPFv2 Compatibility with RFC 1583	4428
	OSPFv2 Compatibility with RFC 1583 Overview	4428
	Example: Disabling OSPFv2 Compatibility with RFC 1583	4428
Chapter 165	OSPF Interface Configuration	4431
	Examples: Configuring OSPF Interfaces	4431
	About OSPF Interfaces	4431
	Example: Configuring an Interface on a Broadcast or Point-to-Point Network	4432
	Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network	4435
	Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network	4438
	Example: Configuring OSPF Demand Circuits	4439
	Example: Configuring a Passive OSPF Interface	4442
	Example: Configuring OSPFv2 Peer interfaces	4444
	Example: Configuring Multiple Address Families for OSPFv3	4446
	Understanding Multiple Address Families for OSPFv3	4446
	Example: Configuring Multiple Address Families for OSPFv3	4446
Chapter 166	OSPF Route Control Configuration	4451
	Examples: Configuring OSPF Route Summarization	4451
	Understanding OSPF Route Summarization	4451
	Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements	4452
	Example: Limiting the Number of Prefixes Exported to OSPF	4457
	Configuring OSPF Refresh and Flooding Reduction in Stable Topologies	4459
	Examples: Configuring OSPF Traffic Control	4460
	Understanding OSPF Traffic Control	4461
	Controlling the Cost of Individual OSPF Network Segments	4461
	Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth	4462
	Controlling OSPF Route Preferences	4462
	Example: Controlling the Cost of Individual OSPF Network Segments	4462
	Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth	4466
	Example: Controlling OSPF Route Preferences	4468
	Example: Configuring OSPF Overload Mode	4470
	OSPF Overload Function Overview	4471
	Example: Configuring OSPF to Make Routing Devices Appear Overloaded	4472

Chapter 167	OSPF Fault Detection Configuration	4475
	Example: Configuring OSPF Timers	4475
	OSPF Timers Overview	4475
	Example: Configuring OSPF Timers	4476
	Example: Configuring BFD for OSPF	4482
	Understanding BFD for OSPF	4482
	Example: Configuring BFD for OSPF	4484
	Example: Configuring BFD Authentication for OSPF	4488
	Understanding BFD Authentication for OSPF	4488
	BFD Authentication Algorithms	4489
	Security Authentication Keychains	4490
	Strict Versus Loose Authentication	4490
	Configuring BFD Authentication for OSPF	4490
	Configuring BFD Authentication Parameters	4490
	Viewing Authentication Information for BFD Sessions	4492
Chapter 168	OSPF Redundancy Features Configuration	4495
	Examples: Configuring Graceful Restart for OSPF	4495
	Graceful Restart for OSPF Overview	4495
	Helper Mode for Graceful Restart	4496
	Planned and Unplanned Graceful Restart	4496
	Example: Configuring Graceful Restart for OSPF	4497
	Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart	4501
	Example: Configuring the Helper Capability Mode for OSPFv3 Graceful Restart	4504
	Example: Disabling Strict LSA Checking for OSPF Graceful Restart	4507
Chapter 169	OSPF Traffic Engineering Configuration	4511
	Examples: Configuring OSPF Traffic Engineering	4511
	OSPF Support for Traffic Engineering	4511
	Example: Enabling OSPF Traffic Engineering Support	4513
	Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface	4518
	Example: Configuring OSPF Passive Traffic Engineering Mode	4519
	OSPF Passive Traffic Engineering Mode	4519
	Example: Configuring OSPF Passive Traffic Engineering Mode	4520
Chapter 170	OSPF Database Protection Configuration	4523
	Example: Configuring OSPF Database Protection	4523
	OSPF Database Protection Overview	4523
	Configuring OSPF Database Protection	4524
Chapter 171	OSPF Policy Configuration	4527
	Examples: Configuring OSPF Routing Policy	4527
	Understanding OSPF Routing Policy	4527
	Routing Policy Terms	4528
	Routing Policy Match Conditions	4528

	Routing Policy Actions	4529
	Example: Injecting OSPF Routes into the BGP Routing Table	4529
	Example: Redistributing Static Routes into OSPF	4532
	Example: Configuring an OSPF Import Policy	4535
	Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF	4539
	Examples: Configuring Routing Policy for Network Summaries	4543
	Import and Export Policies for Network Summaries Overview	4543
	Example: Configuring an OSPF Export Policy for Network Summaries	4544
	Example: Configuring an OSPF Import Policy for Network Summaries	4554
Part 68	Monitoring and Troubleshooting	
Chapter 172	Routine Monitoring	4567
	Monitoring OSPF Routing Information	4567
Chapter 173	OSPF Monitoring Configuration	4569
	Example: Configuring OSPF Trace Options	4569
	Tracing OSPF Protocol Traffic	4569
	Example: Tracing OSPF Protocol Traffic	4570
Part 69	Configuration Statements and Operational Commands	
Chapter 174	OSPF Configuration Statements	4579
	area	4580
	area-range	4582
	authentication	4584
	context-identifier (Protocols OSPF)	4585

Guide 13 RIP Feature Guide for QFX10000 Switches

Chapter 176	Overview	4677
	RIP Overview	4677
	Distance-Vector Routing Protocols	4677
	RIP Protocol Overview	4678
	RIP Packets	4679
	Maximizing Hop Count	4680
	Split Horizon and Poison Reverse Efficiency Techniques	4680
	Limitations of Unidirectional Connectivity	4681
Part 70	Configuring RIP	
Chapter 177	Example: Configuring RIP	4685
	Understanding Basic RIP Routing	4685
	Example: Configuring a Basic RIP Network	4685
Chapter 178	Example: Configuring Authentication for RIP Routes	4693
	Understanding RIP Authentication	4693
	Example: Configuring Route Authentication for RIP	4693
	Enabling Authentication with Plain-Text Passwords (CLI Procedure)	4698
	Enabling Authentication with MD5 Authentication (CLI Procedure)	4699
Chapter 179	Example: Configuring BFD for RIP	4701
	Understanding BFD for RIP	4701
	Example: Configuring BFD for RIP	4702
Chapter 180	Example: Configuring BFD Authentication for RIP	4709
	Understanding BFD Authentication for RIP	4709
	BFD Authentication Algorithms	4709
	Security Authentication Keychains	4710

	Strict Versus Loose Authentication	4710
	Example: Configuring BFD Authentication for RIP	4711
Chapter 181	Example: Applying Policies to RIP Routes Imported from Neighbors . . .	4719
	Understanding RIP Import Policy	4719
	Example: Applying Policies to RIP Routes Imported from Neighbors	4719
Chapter 182	Examples: Controlling Traffic with Metrics in a RIP Network	4725
	Understanding Traffic Control with Metrics in a RIP Network	4725
	Example: Controlling Traffic in a RIP Network with an Incoming Metric	4726
	Example: Controlling Traffic in a RIP Network with an Outgoing Metric	4728
	Example: Configuring the Metric Value Added to Imported RIP Routes	4729
Chapter 183	Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets	4735
	Understanding the Sending and Receiving of RIPv1 and RIPv2 Packets	4735
	Example: Configuring the Sending and Receiving of RIPv1 and RIPv2 Packets . .	4735
Chapter 184	Example: Redistributing Routes Among RIP Instances	4741
	Understanding Route Redistribution Among RIP instances	4741
	Example: Redistributing Routes Between Two RIP Instances	4742
Chapter 185	Example: Configuring RIP Timers	4749
	Understanding RIP Timers	4749
	Example: Configuring RIP Timers	4750
Chapter 186	Example: Tracing RIP Protocol Traffic	4757
	Understanding RIP Trace Operations	4757
	Example: Tracing RIP Protocol Traffic	4758
	Monitoring RIP Routing Information	?

Guide 14 MPLS Feature Guide for QFX10000 Switches

Part 71	LDP	
Chapter 189	Using LDP	4803
	LDP Introduction	4804
	Junos OS LDP Protocol Implementation	4804
	LDP Operation	4804
	Tunneling LDP LSPs in RSVP LSPs	4805
	Tunneling LDP LSPs in RSVP LSPs Overview	4805
	Label Operations	4806
	LDP Message Types	4807
	Discovery Messages	4807
	Session Messages	4808
	Advertisement Messages	4808
	Notification Messages	4808
	LDP Session Protection	4808
	LDP Graceful Restart	4809
	Minimum LDP Configuration	4810
	Enabling and Disabling LDP	4810
	Enabling Strict Targeted Hello Messages for LDP	4810
	Filtering Inbound LDP Label Bindings	4811
	Examples: Filtering Inbound LDP Label Bindings	4812
	Filtering Outbound LDP Label Bindings	4813
	Examples: Filtering Outbound LDP Label Bindings	4814
	Specifying the Transport Address Used by LDP	4815
	Collecting LDP Statistics	4815
	LDP Statistics Output	4816
	Disabling LDP Statistics on the Penultimate-Hop Router	4816
	LDP Statistics Limitations	4817
	Tracing LDP Protocol Traffic	4817
	Tracing LDP Protocol Traffic at the Protocol and Routing Instance Levels	4818
	Tracing LDP Protocol Traffic Within FECs	4819
	Examples: Tracing LDP Protocol Traffic	4819
	Example: Configuring LDP Downstream on Demand	4820
	Configuring the LDP Timer for Hello Messages	4825
	Configuring the LDP Timer for Link Hello Messages	4826
	Configuring the LDP Timer for Targeted Hello Messages	4826

Configuring the Delay Before LDP Neighbors Are Considered Down	4826
Configuring the LDP Hold Time for Link Hello Messages	4827
Configuring the LDP Hold Time for Targeted Hello Messages	4827
Configuring the Interval for LDP Keepalive Messages	4827
Configuring the LDP Keepalive Timeout	4828
Configuring LDP Route Preferences	4828
Configuring LDP Graceful Restart	4828
Enabling Graceful Restart	4829
Disabling LDP Graceful Restart or Helper Mode	4829
Configuring Reconnect Time	4830
Configuring Recovery Time and Maximum Recovery Time	4830
Configuring the Prefixes Advertised into LDP from the Routing Table	4831
Example: Configuring the Prefixes Advertised into LDP	4831
Configuring LDP LSP Traceroute	4832
Configuring Miscellaneous LDP Properties	4833
Configuring LDP to Use the IGP Route Metric	4833
Preventing Addition of Ingress Routes to the inet.0 Routing Table	4833
Multiple-Instance LDP and Carrier-of-Carriers VPNs	4834
Configuring MPLS and LDP to Pop the Label on the Ultimate-Hop Router	4834
Enabling LDP over RSVP-Established LSPs	4834
Enabling LDP over RSVP-Established LSPs in Heterogeneous Networks	4835
Configuring the TCP MD5 Signature for LDP Sessions	4835
Configuring LDP Session Protection	4836
Disabling SNMP Traps for LDP	4837
Configuring LDP Synchronization with the IGP on LDP Links	4837
Configuring LDP Synchronization with the IGP on the Router	4838
Configuring the Label Withdrawal Timer	4838

Chapter 191

MPLS

Using MPLS 4929

MPLS Overview For QFX Series and EX4600 Switches 4930

Why Use MPLS? 4931

Why Not Use MPLS? 4931

How Do I Configure MPLS?	4931
Configure the MPLS LER (Ingress) Switch and the Egress Switch . . .	4932
Configure LSRs for MPLS	4932
What Does the MPLS Protocol Do?	4932
How Does MPLS Interface to Other Protocols?	4933
If I Have Used Cisco MPLS, What Do I Need to Know?	4933
MPLS Feature Support on QFX Series and EX4600 Switches	4934
MPLS Commands Supported by QFX Series and EX4600 Switches . . .	4935
MPLS Features Supported by QFX Series and EX4600 Switches	4935
MPLS Limitations on QFX Series and EX4600 Switches	4943
MPLS Limitations on QFX3500 Switches	4943
MPLS Limitations on QFX5100 and EX4600 Switches	4944
MPLS Limitations on QFX5100 Virtual Chassis and Virtual Chassis Fabric	4945
MPLS Limitations on QFX10000 Switches	4946
Understanding MPLS Components for QFX Series and EX4600 Switches . .	4946
Provider Edge Switches	4946
MPLS Protocol and Label-Switched Paths	4947
IP Over MPLS for Customer Edge Interfaces	4947
BGP Layer 3 VPN Configuration	4947
Routing Instances for Layer 3 VPN	4947
Routing Instances for Layer 2 VPN and Layer 3 VPN	4948
Ethernet Encapsulation for Layer 2 VPN	4948
Provider Switch	4948
Components Required for All Switches in the MPLS Network	4948
Interior Gateway Protocol	4948
Traffic Engineering	4949
MPLS Protocol	4949
RSVP	4949
Family mpls	4950
Understanding MPLS Label Operations	4951
MPLS Label-Switched Paths and MPLS Labels	4951
Reserved Labels	4952
MPLS Label Operations	4952
Penultimate-Hop Popping and Ultimate-Hop Popping	4954
Understanding BGP	4955
Autonomous Systems	4955
AS Paths and Attributes	4955
External and Internal BGP	4956
Multiple Instances of BGP	4956
IPv6 Layer 3 VPNs	4957
Ethernet Pseudowire Overview	4958
Understanding CoS MPLS EXP Classifiers and Rewrite Rules	4959
EXP Classifiers	4960
EXP Rewrite Rules	4961
Schedulers	4962
Understanding Ethernet-over-MPLS (L2 Circuit)	4962
Ethernet-over-MPLS in Data Centers	4962

Understanding Using MPLS-Based Layer 3 VPNs on Switches	4963
MPLS-Based Layer 3 VPNs	4963
Carrier-of-Carriers VPNs	4965
Internet Service Provider as the Customer	4966
VPN Service Provider as the Customer	4966
Interprovider and Carrier-of-Carriers VPNs	4966
Fast Reroute Overview	4967
Graceful Restart and MPLS-Related Protocols	4969
LDP	4970
RSVP	4970
CCC and TCC	4970
Types of LSPs	4971
Configuring CoS Bits for an MPLS Network	4972
Configuring Ethernet over MPLS (L2 Circuit)	4972
Configuring the Local PE Switch for Port-Based Layer 2 Circuit (Pseudo-wire)	4973
Configuring the Remote PE Switch for Port-Based Layer 2 Circuit (Pseudo-wire)	4974
Configuring the Local PE Switch for VLAN-Based Layer 2 Circuit	4975
Configuring the Remote PE Switch for VLAN-Based Layer 2 Circuit	4975
Configuring a Global MPLS EXP Classifier	4977
Configuring MPLS Firewall Filters and Policers	4977
Configuring an MPLS Firewall Filter	4979
Applying an MPLS Firewall Filter to an MPLS Interface	4979
Configuring Policers for LSPs	4980
Configuring MPLS to Gather Statistics	4980
Configuring MPLS on Provider Edge Switches	4981
Configuring the Ingress PE Switch	4982
Configuring the Egress PE Switch	4983
Configuring MPLS on Provider Switches	4985
Configuring Reporting of Automatic Bandwidth Allocation Statistics for LSPs	4986
Configuring Static Label Switched Paths for MPLS	4989
Configuring the Ingress PE Switch	4990
Configuring the Provider and the Egress PE Switch	4991
Configuring Rewrite Rules for MPLS EXP Classifiers	4992
Example: Configuring MPLS-Based Layer 3 VPNs	4993
Example: Tunneling IPv6 Traffic over MPLS IPv4 Networks	5002
Verifying That MPLS Is Working Correctly	5010
Verifying the Physical Layer on the Switches	5011
Verifying the Routing Protocol	5011
Verifying the Core Interfaces Being Used for the MPLS Traffic	5011
Verifying RSVP	5012
MPLS Configuration Guidelines	5012
Supported MPLS Scaling Values	5013
MPLS Stitching For Virtual Machine Connection	5014
When Would I Use Stitching?	5015
How Does MPLS Stitching Work?	5015
How Do I Configure Stitching?	5016

	Which Switches Support Stitching?	5016
	Q&A	5016

Guide 15 Multicast Protocols Feature Guide for QFX10000 Switches

Chapter 195	Overview	5389
	Multicast Overview	5389
	Comparing Multicast to Unicast	5389
	IP Multicast Uses	5391
	IP Multicast Terminology	5392
	Reverse-Path Forwarding for Loop Prevention	5393
	Shortest-Path Tree for Loop Prevention	5393
	Administrative Scoping for Loop Prevention	5394
	Multicast Leaf and Branch Terminology	5394
	IP Multicast Addressing	5394
	Multicast Addresses	5395
	Layer 2 Frames and IPv4 Multicast Addresses	5395
	Multicast Interface Lists	5397
	Multicast Routing Protocols	5398
	T Series Router Multicast Performance	5401
Part 74	Managing Group Membership	
Chapter 196	Using IGMP	5405
	Understanding Group Membership Protocols	5405
	Understanding IGMP	5406
	Configuring IGMP	5408
	Enabling IGMP	5409
	Changing the IGMP Version	5410
	Modifying the IGMP Host-Query Message Interval	5411
	Modifying the IGMP Last-Member Query Interval	5412
	Specifying Immediate-Leave Host Removal for IGMP	5413
	Filtering Unwanted IGMP Reports at the IGMP Interface Level	5414
	Accepting IGMP Messages from Remote Subnetworks	5415
	Modifying the IGMP Query Response Interval	5416
	Modifying the IGMP Robustness Variable	5417
	Limiting the Maximum IGMP Message Rate	5418
	Enabling IGMP Static Group Membership	5418
	Recording IGMP Join and Leave Events	5425
	Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces	5426
	Tracing IGMP Protocol Traffic	5427
	Disabling IGMP	5429
Chapter 197	Using IGMP Snooping	5431
	IGMP Snooping Overview	5431
	How IGMP Snooping Works	5431
	How IGMP Snooping Works with Routed VLAN Interfaces	5432
	How Hosts Join and Leave Multicast Groups	5432
	IGMP Snooping and Forwarding Interfaces	5433

	General Forwarding Rules	5433
	Configuring IGMP Snooping	5434
	Configuring VLAN-Specific IGMP Snooping Parameters	5435
	Example: Configuring IGMP Snooping	5436
	Monitoring IGMP Snooping	5438
	Verifying the IGMP Snooping Group Timeout Value	5439
Chapter 198	Using MLD	5441
	Understanding MLD	5441
	Examples: Configuring MLD	5444
	Understanding MLD	5444
	Configuring MLD	5447
	Enabling MLD	5448
	Modifying the MLD Version	5449
	Modifying the MLD Host-Query Message Interval	5449
	Modifying the MLD Query Response Interval	5450
	Modifying the MLD Last-Member Query Interval	5450
	Specifying Immediate-Leave Host Removal for MLD	5451
	Filtering Unwanted MLD Reports at the MLD Interface Level	5452
	Example: Modifying the MLD Robustness Variable	5453
	Limiting the Maximum MLD Message Rate	5454
	Enabling MLD Static Group Membership	5454
	Create a MLD Static Group Member	5455
	Automatically create static groups	5456
	Automatically increment group addresses	5457
	Specify multicast source address (in SSM mode)	5458
	Automatically specify multicast sources	5459
	Automatically increment source addresses	5460
	Exclude multicast source addresses (in SSM mode)	5461
	Example: Recording MLD Join and Leave Events	5462
	Configuring the Number of MLD Multicast Group Joins on Logical Interfaces	5464
	Disabling MLD	5466
Chapter 199	Using MLD Snooping	5467
	Understanding MLD Snooping	5467
	How MLD Snooping Works	5468
	MLD Message Types	5469
	How Hosts Join and Leave Multicast Groups	5469
	Support for MLDv2 Multicast Sources	5470
	MLD Snooping and Forwarding Interfaces	5470
	General Forwarding Rules	5471
	Examples of MLD Snooping Multicast Forwarding	5471
	Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts	5471
	Scenario 2: Switch Forwarding Multicast Traffic to Another Switch	5472
	Scenario 3: Switch Connected to Hosts Only (No MLD Querier)	5473

	Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic	
	Between VLANs	5474
	Configuring MLD Snooping on a VLAN (CLI Procedure)	5475
	Enabling or Disabling MLD Snooping on VLANs	5476
	Configuring the MLD Version	5477
	Enabling Immediate Leave	5477
	Configuring an Interface as a Multicast-Router Interface	5478
	Configuring Static Group Membership on an Interface	5479
	Changing the Timer and Counter Values	5480
	Example: Configuring MLD Snooping	5481
	Verifying MLD Snooping	5484
	Verifying MLD Snooping Memberships	5485
	Verifying MLD Snooping Interfaces	5485
	Viewing MLD Snooping Statistics	5486
	Viewing MLD Snooping Routing Information	5487
Part 75	Configuring PIM	
Chapter 200	Using PIM Basic Features	5491
	PIM Overview	5491
	Basic PIM Network Components	5493
	PIM on Aggregated Interfaces	5494
	Changing the PIM Version	5494
	Modifying the PIM Hello Interval	5494
	Preserving Multicast Performance by Disabling Response to the ping Utility	5495
	Configuring PIM Trace Options	5496
	Configuring Interface Priority for PIM Designated Router Selection	5498
	Configuring PIM Designated Router Election on Point-to-Point Links	5499
	Configuring BFD for PIM	5500
	Configuring BFD Authentication for PIM	5502
	Configuring BFD Authentication Parameters	5502
	Viewing Authentication Information for BFD Sessions	5503
	Disabling PIM	5505
	Disabling the PIM Protocol	5505
	Disabling PIM on an Interface	5506
	Disabling PIM for a Family	5506
	Disabling PIM for a Rendezvous Point	5507
Chapter 201	Using PIM Sparse Mode	5509
	Understanding PIM Sparse Mode	5509
	Rendezvous Point	5511
	RP Mapping Options	5511
	Designated Router	5512
	Enabling PIM Sparse Mode	5512
	Configuring PIM Join Load Balancing	5513
	Modifying the Join State Timeout	5517
	Example: Enabling Join Suppression	5517

Chapter 202	Using PIM Dense Mode and PIM Sparse-Dense Mode	5523
	Understanding PIM Dense Mode	5523
	Understanding PIM Sparse-Dense Mode	5525
	Mixing PIM Sparse and Dense Modes	5525
	Configuring PIM Dense Mode Properties	5526
	Configuring PIM Sparse-Dense Mode Properties	5527
Chapter 203	Using Source-Specific Multicast	5529
	Source-Specific Multicast Groups Overview	5529
	Understanding PIM SSM	5530
	PIM SSM	5531
	Example: Configuring PIM SSM on a Network	5533
	Example: Configuring an SSM-Only Domain	5534
	Example: Configuring SSM Mapping	5535
	Example: Configuring Source-Specific Multicast Groups with Any-Source Override	5537
	Example: Configuring SSM Maps for Different Groups to Different Sources	5541
	Multiple SSM Maps and Groups for Interfaces	5541
	Example: Configuring Multiple SSM Maps Per Interface	5541
Chapter 204	Using Static RP	5545
	Understanding Static RP	5545
	Configuring Local PIM RPs	5545
	Configuring the Static PIM RP Address on the Non-RP Routing Device	5547
Chapter 205	Using Anycast RP	5551
	Understanding RP Mapping with Anycast RP	5551
	Example: Configuring PIM Anycast With or Without MSDP	5552
	Configuring a PIM Anycast RP Router with MSDP	5555
	Configuring a PIM Anycast RP Router Using Only PIM	5556
	Configuring All PIM Anycast Non-RP Routers	5557
	Example: Configuring Multiple RPs in a Domain with Anycast RP	5558
Chapter 206	Using Auto-RP	5561
	Understanding PIM Auto-RP	5561
	Configuring PIM Auto-RP	5561
Chapter 207	Using PIM Bootstrap Router	5567
	Understanding the PIM Bootstrap Router	5567
	Configuring PIM Bootstrap Properties for IPv4 or IPv6	5567
	Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain	5569
	Example: Configuring PIM BSR Filters	5569
Chapter 208	Using PIM Filtering	5571
	Understanding Multicast Message Filters	5571
	Filtering MAC Addresses	5572
	Filtering RP and DR Register Messages	5572
	Configuring Interface-Level PIM Neighbor Policies	5573
	Filtering Outgoing PIM Join Messages	5574
	Filtering Incoming PIM Join Messages	5575

	Configuring Register Message Filters on a PIM RP and DR	5577
Chapter 209	Using PIM RPT and SPT Cutover	5579
	Understanding Multicast Rendezvous Points, Shared Trees, and Rendezvous-Point Trees	5579
	Building an RPT Between the RP and Receivers	5580
	PIM Sparse Mode Source Registration	5581
	Multicast Shortest-Path Tree	5584
	SPT Cutover	5585
	SPT Cutover Control	5588
	Example: Configuring the PIM Assert Timeout	5588
	Example: Configuring the PIM SPT Threshold Policy	5590
Part 76	Configuring MSDP	
Chapter 210	Using MSDP	5597
	Understanding MSDP	5597
	Configuring MSDP	5598
	Filtering MSDP SA Messages	5600
	Tracing MSDP Protocol Traffic	5600
	Configuring the Interface to Accept Traffic from a Remote Source	5602
	Example: Configuring MSDP	5603
	Example: Configuring MSDP with Active Source Limits and Mesh Groups	5604
	Example: Configuring PIM Anycast With or Without MSDP	5610
	Configuring a PIM Anycast RP Router with MSDP	5613
Part 77	Configuration Statements and Operational Commands	
Chapter 211	Configuration Statements (IGMP)	5617
	accounting (Protocols IGMP)	5618
	accounting (Protocols IGMP Interface)	5618
	asm-override-ssm	5619
	disable (Protocols IGMP)	5619

Guide 16 Security Feature Guide for QFX10000 Switches

Part 78

Chapter 221

Firewall Filters

Configuring Firewall Filters	5951
Overview of Firewall Filters	5951
Firewall Filter Types	5952
Firewall Filter Components	5953
Firewall Filter Processing	5953
How Many Filters Are Supported?	5953
Understanding How Firewall Filters Are Evaluated	5954
Understanding How Firewall Filters Control Packet Flows	5956
Understanding Firewall Filter Match Conditions	5957
Filter Match Conditions	5957
Numeric Filter Match Conditions	5957
Interface Filter Match Conditions	5958
IP Address Filter Match Conditions	5958
MAC Address Filter Match Conditions	5959
Bit-Field Filter Match Conditions	5959
Firewall Filter Match Conditions and Actions for QFX10000 Switches	5960
Understanding How a Firewall Filter Tests a Protocol	5971
Understanding Firewall Filter Planning	5972
Planning the Number of Firewall Filters to Create	5973
Understanding How Many Firewall Filters Are Supported	5973
Egress Filters	5975
Avoid Configuring too Many Filters	5975
Configuring TCAM Error Messages	5976
Policers can Limit Egress Filters	5976
Planning for Filter-Specific Policers	5977

Planning for Filter-Based Forwarding	5977
Understanding Firewall Filter Processing Points for Bridged and Routed	
Packets	5978
Configuring Firewall Filters	5978
Configuring a Firewall Filter	5979
Applying a Firewall Filter to a Port	5980
Applying a Firewall Filter to a VLAN	5981
Applying a Firewall Filter to a Layer 3 (Routed) Interface	5981
Applying Firewall Filters to Interfaces	5982
Understanding Filter-Based Forwarding	5983
Example: Using Filter-Based Forwarding to Route Application Traffic to a Security	
Device	5983
Monitoring Firewall Filter Traffic	5987
Monitoring Traffic for All Firewall Filters and Policers That Are	
Configured	5987
Monitoring Traffic for a Specific Firewall Filter	5988
Monitoring Traffic for a Specific Policer	5988
Verifying That Firewall Filters Are Operational	5988
Troubleshooting Firewall Filters	5989
Troubleshooting QFX10000 Switches	5989
Do Not Combine Match Conditions for Different Layers	5989
Layer 2 Packets Cannot be Discarded with Firewall Filters	5989
Protect-RE (loopback) Firewall Filter Does Not Filter Packets Applied	
to EMO Interfaces	5990
Troubleshooting Other Switches	5990
Firewall Filter Configuration Returns a No Space Available in TCAM	
Message	5990
Filter Counts Previously Dropped Packet	5992
Matching Packets Not Counted	5993
Counter Reset When Editing Filter	5993
Cannot Include loss-priority and policer Actions in Same Term	5993
Cannot Egress Filter Certain Traffic Originating on QFX Switch	5994
Firewall Filter Match Condition Not Working with Q-in-Q Tunneling	5994
Egress Firewall Filters with Private VLANs	5994
Egress Filtering of L2PT Traffic Not Supported	5995
Cannot Drop BGP Packets in Certain Circumstances	5995
Invalid Statistics for Policer	5995
Policers can Limit Egress Filters	5995

Part 79

Chapter 222

Policers

Configuring Policers	5999
Overview of Policers	5999
Policer Overview	6000
Policer Types	6000
Policer Actions	6001
Policer Colors	6002
Filter-Specific Policers	6002
Suggested Naming Convention for Policers	6003

Policer Counters	6003
Policer Algorithms	6003
How Many Policers Are Supported?	6004
Policers Can Limit Egress Firewall Filters	6004
Understanding Policers with Link Aggregation Groups	6005
Understanding Color-Blind Mode for Single-Rate Tricolor Marking	6005
Understanding Color-Aware Mode for Single-Rate Tricolor Marking	6006
Summary of PLP Changes	6006
Effect on Green Packets (Low PLP)	6007
Effect on Yellow Packets (Medium PLP)	6007
Effect on Red Packets (High PLP)	6007
Understanding Color-Blind Mode for Two-Rate Tricolor Marking	6008
Understanding Color-Aware Mode for Two-Rate Tricolor Marking	6008
Summary of PLP Changes	6008
Effect on Green Packets (Low PLP)	6009
Effect on Yellow Packets (Medium PLP)	6009
Effect on Red Packets (High PLP)	6010
Example: Using Two-Color Policers and Prefix Lists	6010
Example: Using Policers to Manage Oversubscription	6013
Assigning Forwarding Classes and Loss Priority	6015
Configuring Color-Blind Egress Policers for Medium-Low PLP	6016
Configuring Two-Color and Three-Color Policers to Control Traffic Rates	6017
Configuring Two-Color Policers	6017
Configuring Three-Color Policers	6018
Specifying Policers in a Firewall Filter Configuration	6018
Applying a Firewall Filter That Includes a Policer	6019
Verifying That Two-Color Policers Are Operational	6019
Verifying That Three-Color Policers Are Operational	6020
Troubleshooting Policer Configuration	6020
Incomplete Count of Packet Drops	6020
Counter Reset When Editing Filter	6021
Invalid Statistics for Policer	6021
Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured	6021
Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured	6022
Policers Can Limit Egress Filters	6023

Part 80

Chapter 223

Configuring Port Security

Port Security	6027
Overview of Access Port Protection	6027
Mitigation of Ethernet Switching Table Overflow Attacks	6027
Mitigation of Rogue DHCP Server Attacks	6028
Protection Against DHCP Starvation Attacks	6028
Understanding MAC Limiting and MAC Move Limiting for Port Security	6029
MAC Limiting	6029
MAC Move Limiting	6030
Actions for MAC Limiting	6030

MAC Addresses That Exceed the MAC Limit or MAC Move Limit	6030
Verifying That MAC Limiting Is Working Correctly	6031
Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly	6031
Verifying That Allowed MAC Addresses Are Working Correctly	6032
Verifying That Interfaces Are Shut Down	6032
Customizing the Ethernet Switching Table Display to View Information for a Specific Interface	6033
Verifying That MAC Move Limiting Is Working Correctly	6034
Verifying That the Port Error Disable Setting Is Working Correctly	6034
Configuring Persistent MAC Learning (CLI Procedure)	6035
Understanding Trusted and Untrusted Ports	6037
Understanding Trusted DHCP Servers for Port Security	6037
Verifying That a Trusted DHCP Server Is Working Correctly	6037
Understanding DHCP Option 82 for Port Security	6039
DHCP Option 82 Processing	6039
Suboption Components of Option 82	6040
Configurations That Support Option 82	6040
Understanding Static ARP Entries	6041

Part 81

Chapter 224

Configuring Device Security

Device Security	6045
Understanding Storm Control	6045
Example: Configuring Storm Control to Prevent Network Outages	6046
Verifying That the Port Error Disable Setting Is Working Correctly	6049
Understanding Unicast RPF	6050
Unicast RPF for Switches Overview	6050
Unicast RPF Implementation	6051
Unicast RPF Packet Filtering	6051
Bootstrap Protocol (BOOTP) and DHCP Requests	6051
Default Route Handling	6051
When to Enable Unicast RPF	6051
When Not to Enable Unicast RPF	6052
Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches	6053
Configuring Unicast RPF (CLI Procedure)	6054
Disabling Unicast RPF (CLI Procedure)	6055
Verifying Unicast RPF Status	6056
Understanding Unknown Unicast Forwarding	6059
Configuring Unknown Unicast Forwarding (CLI Procedure)	6059
Configuring Unknown Unicast Forwarding on EX4300 Switches	6060
Configuring Unknown Unicast Forwarding on EX9200 Switches	6060

Part 82	DDoS Protection	
Chapter 225	Overview of DDoS Protection	6065
	Understanding Distributed Denial-of-Service Protection on QFX Series	
	Switches	6065
	Policer Types and Packet Priorities	6066
	Example of Policer Priority Behavior	6066
	Policer Enforcement Points on QFX Series Switches	6067
Chapter 226	Configuring DDoS Protection	6069
	Configuring Protection Against DDoS Attacks	6069
	Example: Configuring DDoS Protection on QFX Series Switches	6070
	Disabling DDoS Protection Policers and Logging Globally	6074
	Configuring DDoS Protection Policers on QFX Series Switches	6074
	Configuring the Aggregate Policer for a Protocol Group	6075
	Configuring Packet-Type Policers for a Protocol Group	6076
	Configuring Policers on Individual Line Cards	6077
	Disabling Policers and Policer Logging	6077
	Tracing DDoS Protection Operations	6078
	Configuring the DDoS Protection Trace Log Filename	6079
	Configuring the Number and Size of DDoS Protection Log Files	6079
	Configuring Access to the DDoS Protection Log File	6080
	Configuring a Regular Expression for DDoS Protection Messages to Be	
	Logged	6080
	Configuring the DDoS Protection Tracing Flags	6080
	Configuring the Severity Level to Filter Which DDoS Protection Messages	
	Are Logged	6081
Chapter 227	Monitoring DDoS Protection	6083
	Verifying and Managing DDoS Protection	6083
Part 83	Configuration Statements and Operational Commands	
Chapter 228	Configuration Statements (Firewall Filters)	6087
	family	6088
	filter	6089
	filter (Layer 2 and Layer 3 Interfaces)	6090
	filter (VLANs)	6091
	firewall	6092
	from	6093
	input (Forwarding Table)	6094
	interface-specific	6094
	output (Forwarding Table)	6095
	term	6096
	then (Filters)	6097
Chapter 229	Configuration Statements (Policers)	6099
	action	6100
	bandwidth-limit	6100
	burst-size-limit	6101
	color-aware	6102

	color-blind	6103
	committed-burst-size	6104
	committed-information-rate	6105
	excess-burst-size	6106
	filter-specific	6107
	firewall	6108
	if-exceeding	6109
	loss-priority high then discard (Three-Color Policer)	6110
	peak-burst-size	6111
	peak-information-rate	6112
	policer	6113
	single-rate	6114
	then (Policers)	6115
	three-color-policer	6116
	two-rate	6117
Chapter 230	Configuration Statements (Device Security)	6119
	action-shutdown	6120
	bandwidth-level	6121
	bandwidth-percentage	6122
	interface (Unknown Unicast Forwarding)	6123
	no-broadcast	6124
	no-multicast	6125
	no-unknown-unicast	6126
	rpf-check	6127
	storm-control	6128
	storm-control-profiles	6129
	unknown-unicast-forwarding	6130
Chapter 231	Configuration Statements (Port Security)	6131
	circuit-id	6132
	fc-map	6134
	fcoe-trusted	6136
	mac-move-limit	6137
	no-allowed-mac-log	6138
	no-gratuitous-arp-request	6139
	persistent-learning	6139
	port-error-disable	6140
	vendor-id	6142
	write-interval	6143
Chapter 232	Configuration Statements (DDoS Protection)	6145
	bandwidth (DDoS)	6146
	bandwidth-scale (DDoS)	6147
	burst (DDoS)	6148
	burst-scale (DDoS)	6149
	bypass-aggregate (DDoS)	6150
	ddos-protection (DDoS)	6151
	disable-fpc (DDoS)	6152
	disable-logging (DDoS)	6153

	fpc (DDoS)	6154
	global (DDoS)	6155
	priority (DDoS)	6156
	protocols (DDoS)	6157
	traceoptions (DDoS)	6162
Chapter 233	Operational Commands (Firewall Filters)	6165
	clear firewall	6166
	show firewall	6167
	show firewall policer	6171
	show interfaces filters	6173
	show pfe filter hw summary	6175
Chapter 234	Operational Commands (Port Security)	6177
	clear ethernet-switching port-error	6178
Chapter 235	Operational Commands (DDoS Protection)	6179
	clear ddos-protection protocols	6180
	show ddos-protection protocols	6182
	show ddos-protection protocols parameters	6201
	show ddos-protection protocols statistics	6208
	show ddos-protection statistics	6218
	show ddos-protection version	6220
	show ddos-protection protocols violations	6221

Guide 17 **System Services Feature Guide for QFX10000 Switches**

Part 84	Port Mirroring
Chapter 236	Configuring Port Mirroring
	6227
	Understanding Port Mirroring
	6227
	Port Mirroring Overview
	6227
	Port Mirroring Instance Types
	6228
	Port-Mirroring Terminology
	6228
	Port Mirroring and STP
	6230
	Port Mirroring Constraints and Limitations
	6230
	Local and Remote Port Mirroring
	6230
	Remote Port Mirroring Only
	6232
	Configuring Port Mirroring
	6232
	Configuring Port Mirroring for Local Analysis
	6233
	Configuring Port Mirroring for Remote Analysis
	6233
	Filtering the Traffic Entering an Analyzer
	6234
	Examples: Configuring Port Mirroring for Local Analysis
	6235
	Example: Mirroring Employee Web Traffic with a Firewall Filter
	6237
	Example: Configuring Port Mirroring for Remote Analysis
	6240

	Example: Mirroring Employee Web Traffic with a Firewall Filter	6245
	Troubleshooting Port Mirroring	6248
	Port Mirroring Constraints and Limitations	6248
	Local and Remote Port Mirroring	6248
	Remote Port Mirroring Only	6250
	Egress Port Mirroring with VLAN Translation	6250
	Egress Port Mirroring with Private VLANs	6250
Part 85	DHCP and DHCP Relay	
Chapter 237	Using DHCP and DHCP Relay	6255
	DHCP and BOOTP Relay Overview	6255
	Configuring DHCP and BOOTP	6255
	Verifying and Managing DHCP Local Server Configuration	6256
	Verifying and Managing DHCPv6 Local Server Configuration	6257
	Verifying and Managing DHCP Relay Configuration	6257
	Verifying and Managing DHCPv6 Relay Configuration	6257
	Understanding Layer 3 Logical Interfaces	6258
Part 86	Configuration Statements and Operational Commands	
Chapter 238	Configuration Statements (Port Mirroring)	6261
	analyzer	6262
	egress	6263
	ethernet-switching (Port Mirroring)	6264
	family (Port Mirroring)	6265
	inet (Port Mirroring)	6266
	ingress (Port Mirroring)	6267
	input	6268
	instance (Port Mirroring)	6269
	interface (Port Mirroring)	6270
	ip-address (Port Mirroring)	6271
	no-tag	6271
	output	6272
	port-mirroring	6273
	routing-instance (Port Mirroring)	6274
	vlan (Port Mirroring)	6275
Chapter 239	Configuration Statements (DHCP and DHCP Relay)	6277
	dhcp-local-server	6278
	dhcp-relay	6284
	dhcp-service	6289
	forwarding-options	6290
	forward-only (DHCP Relay Agent)	6295
Chapter 240	Configuration Statements (Encryption)	6297
	authentication-key-chains	6298
	cache-size	6299
	cache-timeout-negative	6300
	ca-name	6301

	certificates	6302
	certification-authority	6303
	crl (Encryption Interface)	6304
	encoding	6304
	enrollment-retry	6305
	enrollment-url	6305
	file	6306
	key (Authentication Keychain)	6307
	key-chain (Security)	6308
	ldap-url	6309
	local	6310
	maximum-certificates	6311
	path-length	6311
	secret	6312
	security	6313
	ssh-known-hosts	6314
	start-time (Authentication Key Transmission)	6315
	traceoptions	6317
Chapter 241	Operational Command (Port Mirroring)	6319
	show analyzer	6320
Chapter 242	Operational Commands (DHCP Local Server)	6323
	clear dhcp server binding	6324
	clear dhcp server statistics	6327
	clear dhcpv6 server binding	6329
	clear dhcpv6 server statistics	6331
	request dhcp server reconfigure	6332
	request dhcpv6 server reconfigure	6334
	request system reboot	6336
	show dhcp server binding	6341
	show dhcp server statistics	6347
	show dhcpv6 server binding	6350
	show dhcpv6 server statistics	6356
Chapter 243	Operational Commands (DHCP Relay Agent)	6359
	clear dhcp relay binding	6360
	clear dhcp relay statistics	6362
	clear dhcpv6 relay binding	6365
	clear dhcpv6 relay statistics	6368
	show dhcp relay binding	6370
	show dhcp relay statistics	6375
	show dhcpv6 relay binding	6378
	show dhcpv6 relay statistics	6384
	show route extensive	6387
	show route protocol	6404

Guide 18	Storage Feature Guide for QFX10000 Switches
Chapter 244	Storage Overview 6417
	Overview of FIP 6417
	Understanding Fibre Channel Terminology 6417
Part 87	Configuring FCoE on a Transit Switch
Chapter 245	Using FCoE on a Transit Switch 6431
	Understanding FCoE Transit Switch Functionality 6431
	Understanding FCoE 6436
	FCoE Devices 6437
	FCoE Frames 6438
	Virtual Links 6439
	FCoE VLANs 6439
	Configuring VLANs for FCoE Traffic on an FCoE Transit Switch 6442
	Troubleshooting Dropped FCoE Traffic 6447
	Understanding MC-LAGs on an FCoE Transit Switch 6451
	Supported Topology 6451
	Transit Switches (Server Access) 6453
	MC-LAG Switches (FCoE Aggregation) 6453
	FIP Snooping and FCoE Trusted Ports 6453
	CoS and Data Center Bridging (DCB) 6454
	Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG . . 6454
	Understanding FCoE and FIP Session High Availability 6480
	High Availability for Fibre Channel Process Termination (FCoE-FC Gateway Mode, QFX3500 Only) 6480
	High Availability for FIP Snooping 6480
	Nonstop Software Upgrade (QFabric Systems) 6481
	Troubleshooting Dropped FIP Traffic 6482
	Understanding OxID Hash Control for FCoE Traffic Load Balancing on Standalone Switches 6484
	Enabling and Disabling CoS OxID Hash Control on Standalone Switches . . . 6485
Part 88	Configuring DCBX and PFC
Chapter 246	Using DCBX and PFC 6489
	Understanding DCB Features and Requirements 6490
	Lossless Transport 6490
	PFC 6491
	Buffer Management 6491
	Physical Interfaces 6491
	ETS 6491
	DCBX 6492
	Understanding CoS Flow Control (Ethernet PAUSE and PFC) 6493
	General Information about Ethernet PAUSE and PFC and When to Use Them 6493
	Ethernet PAUSE 6494
	Symmetric Flow Control 6495
	Asymmetric Flow Control 6496

PFC	6499
Lossless Transport Support Summary	6502
Example: Configuring CoS PFC for FCoE Traffic	6504
Understanding DCBX	6514
DCBX Basics	6514
DCBX Modes and Support	6515
DCBX Modes (Versions)	6515
Autonegotiation	6517
CNA Support for DCBX Modes	6518
Interface Support for DCBX	6518
DCBX Attribute Types	6518
Asymmetric Attributes	6518
Symmetric Attributes	6519
DCBX Application Protocol TLV Exchange	6519
Application Protocol TLV Exchange	6519
FCoE Application Protocol TLV Exchange	6519
Disabling Application Protocol TLV Exchange	6520
DCBX and PFC	6520
DCBX and ETS	6521
Default DCBX ETS Advertisement	6521
ETS Advertisement and Peer Configuration	6521
ETS Recommendation TLV	6522
Configuring the DCBX Mode	6523
Configuring DCBX Autonegotiation	6524
Disabling the ETS Recommendation TLV	6527
Understanding DCBX Application Protocol TLV Exchange	6528
Applications	6528
Application Maps	6529
Classifying and Prioritizing Application Traffic	6530
Enabling Interfaces to Exchange Application Protocol Information	6531
Disabling DCBX Application Protocol Exchange	6531
Defining an Application for DCBX Application Protocol TLV Exchange	6532
Configuring an Application Map for DCBX Application Protocol TLV Exchange	6533
Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange	6534
Example: Configuring DCBX Application Protocol TLV Exchange	6535
Chapter 247 Learn About Technology	6547
Data Center Technology Overview Videos	6547
Learn About Video: Why Do We Need an IP Fabric?	6547
Learn About Video: What is the Best Control Plane Protocol to Use in a Data Center IP Fabric?	6547
Learn About Video: Why Use an Overlay Network in a Data Center?	6547

	show dcbx neighbors	6581

Guide 19 Traffic Management Feature Guide for QFX Switches

Part 90	CoS Overview	
Chapter 252	Basic Concepts	6607
	Overview of Junos OS CoS	6608
	CoS Standards	6608
	How Junos OS CoS Works	6609
	Default CoS Behavior	6610
	CoS Support on QFX Series Switches, EX4600 Switches, and QFabric Systems	6610
	Configuring CoS	6618
	Understanding Junos CoS Components	6621
	Code-Point Aliases	6622
	Policers	6622

Classifiers	6622
Forwarding Classes	6623
Forwarding Class Sets	6624
Flow Control (Ethernet PAUSE, PFC, and ECN)	6624
WRED Profiles and Tail Drop	6625
Schedulers	6626
Rewrite Rules	6626
Assigning CoS Components to Interfaces	6627
Understanding CoS Packet Flow	6628
Understanding Default CoS Settings	6630
Default Forwarding Classes and Queue Mapping	6631
Default Forwarding Class Sets (Priority Groups)	6631
Default Code-Point Aliases	6632
Default Classifiers	6633
Default Rewrite Rules	6636
Default Drop Profile	6636
Default Schedulers	6636
Default Scheduler Maps	6638
CoS Inputs and Outputs Overview	6639
Overview of Policers	6639
Policer Overview	6640
Policer Types	6640
Policer Actions	6641
Policer Colors	6642
Filter-Specific Policers	6642
Suggested Naming Convention for Policers	6642
Policer Counters	6643
Policer Algorithms	6643
How Many Policers Are Supported?	6643
Policers Can Limit Egress Firewall Filters	6644
Part 91	Classifying and Rewriting Traffic
Chapter 253	Using Classifiers, Forwarding Classes, and Rewrite Rules
Understanding CoS Classifiers	6650
Interfaces and Output Queues	6650
Classifier Support by Type	6651
Behavior Aggregate Classifiers	6651
Default Behavior Aggregate Classification	6652
Importing a Classifier	6652
PFC Priorities	6653
Fixed Classifiers on Ethernet Interfaces	6654
Multifield Classifiers	6654
MPLS EXP Classifiers	6655

Packet Classification for IRB Interfaces	6655
Defining CoS BA Classifiers (DSCP, DSCP IPv6, IEEE 802.1p)	6656
Example: Configuring Classifiers	6657
Understanding CoS MPLS EXP Classifiers and Rewrite Rules	6660
EXP Classifiers	6661
EXP Rewrite Rules	6662
Schedulers	6663
Configuring a Global MPLS EXP Classifier	6663
Configuring Rewrite Rules for MPLS EXP Classifiers	6664
Understanding Host Inbound Traffic Classification	6665
Understanding Default CoS Scheduling and Classification	6666
Default Classification	6666
Default Scheduling	6669
Default DCBX Advertisement	6671
Default Scheduling and Classification Summary	6671
Understanding Applying CoS Classifiers and Rewrite Rules to Interfaces	6672
Supported Classifier and Rewrite Rule Types	6672
Ethernet Interfaces Supported for Classifier and Rewrite Rule Configuration	6674
Interface Types That Support Classifier and Rewrite Rule Configuration	6674
Classifier and Rewrite Rule Physical and Logical Ethernet Interface Support	6675
Routed VLAN Interfaces (RVIs) and Integrated Routing and Bridging (IRB) Interfaces	6677
Default Classifiers	6677
Default Rewrite Rules	6678
Classifier Precedence	6678
Classifier Precedence on Physical Ethernet Interfaces (QFX5200, QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems)	6678
Classifier Precedence on Logical Ethernet Interfaces (All Switches)	6679
Classifier Behavior and Limitations	6680
Rewrite Rule Precedence and Behavior	6681
Classifier and Rewrite Rule Configuration Interaction with Ethernet Interface Configuration	6681
QFX5100, QFX5200, EX4600, QFX3500, and QFX3600 Switch Scenarios	6683
Understanding CoS Code-Point Aliases	6685
Defining CoS Code-Point Aliases	6687
Understanding CoS Forwarding Classes	6688
Default Forwarding Classes	6688
Forwarding Class Configuration Rules	6689
Queue Assignment Rules	6689
Scheduling Rules	6690
Rewrite Rules	6691
Lossless Transport Support	6691
Defining CoS Forwarding Classes	6691
Example: Configuring Forwarding Classes	6692

	Understanding CoS Forwarding Class Sets (Priority Groups)	6695
	Defining CoS Forwarding Class Sets	6696
	Example: Configuring Forwarding Class Sets	6697
	Understanding CoS Rewrite Rules	6701
	Defining CoS Rewrite Rules	6704
	Troubleshooting an Unexpected Rewrite Value	6705
Part 92	Scheduling Traffic	
Chapter 254	Using Schedulers	6711
	Understanding Default CoS Scheduling and Classification	6712
	Default Classification	6712
	Default Scheduling	6715
	Default DCBX Advertisement	6717
	Default Scheduling and Classification Summary	6717
	Understanding CoS Scheduling Behavior and Configuration Considerations . .	6718
	Understanding CoS Virtual Output Queues (VOQs) on QFX10000 Switches . .	6724
	VOQ Architecture	6724
	Round-Trip Time Buffering	6725
	Requesting and Granting Egress Port Bandwidth	6725
	VOQ Advantages	6726
	Eliminate Head-of-Line Blocking	6726
	Increase Fabric Efficiency and Utilization	6728
	Understanding CoS Port Schedulers on QFX Switches	6729
	Queue Scheduling Components	6730
	Default Schedulers	6732
	Scheduling Priority	6733
	Bandwidth Scheduling	6735
	Minimum Guaranteed Bandwidth	6735
	Maximum Bandwidth (Rate Shaping on Low Priority Queues and LAGs)	6736
	Limiting Bandwidth Consumed by Strict-High Priority Queues	6737
	Sharing Extra Bandwidth (Excess Rate on Low Priority Queues)	6738
	Scheduler Drop-Profile Maps	6739
	Buffer Size	6739
	Explicit Congestion Notification	6741
	Scheduler Maps	6741
	Defining CoS Queue Schedulers for Port Scheduling	6742
	Example: Configuring Queue Schedulers for Port Scheduling	6744
	Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth	6749
	Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth	6751
	Defining CoS Queue Scheduling Priority	6752
	Example: Configuring Queue Scheduling Priority	6753
	Understanding CoS Traffic Control Profiles	6757
	Understanding CoS Priority Group Scheduling	6758
	Priority Group Scheduling Components	6759
	Default Traffic Control Profile	6759

Guaranteed Rate (Minimum Guaranteed Bandwidth)	6759
Sharing Extra Bandwidth	6760
Shaping Rate (Maximum Bandwidth)	6760
Scheduler Maps	6760
Defining CoS Traffic Control Profiles (Priority Group Scheduling)	6761
Example: Configuring Traffic Control Profiles (Priority Group Scheduling)	6762
Understanding CoS Hierarchical Port Scheduling (ETS)	6765
Hierarchical Scheduling Tiers	6765
Hierarchical Scheduling and ETS	6766
ETS Advertisement in DCBX	6768
Hierarchical Scheduling Process	6768
Strict-High Priority Queues and Hierarchical Scheduling	6769
Default Hierarchical Scheduling	6770
Example: Configuring CoS Hierarchical Port Scheduling (ETS)	6771
Understanding CoS Priority Group and Queue Guaranteed Minimum	
Bandwidth	6795
Guaranteeing Bandwidth Using Hierarchical Scheduling	6796
Priority Group Guaranteed Rate (Guaranteed Minimum Bandwidth)	6797
Queue Transmit Rate (Guaranteed Minimum Bandwidth)	6797
Example: Configuring Minimum Guaranteed Output Bandwidth	6798
Understanding CoS Priority Group Shaping and Queue Shaping (Maximum	
Bandwidth)	6803
Priority Group Shaping	6803
Queue Shaping	6803
Shaping Maximum Bandwidth Using Hierarchical Scheduling	6804
Example: Configuring Maximum Output Bandwidth	6805
Understanding CoS WRED Drop Profiles	6809
Drop Profile Parameters	6809
Default Drop Profile	6810
Packet Drop Method	6811
Drop Profile Maps	6811
Congestion Prevention	6811
Configuring a WRED Drop Profile and Applying it to an Output Queue	6811
Drop Profiles on Explicit Congestion Notification Enabled Queues	6812
Configuring CoS WRED Drop Profiles	6813
Example: Configuring WRED Drop Profiles	6814
Configuring CoS Drop Profile Maps	6817
Example: Configuring Drop Profile Maps	6817
Understanding CoS Explicit Congestion Notification	6820
How ECN Works	6820
ECN Bits in the DiffServ Field	6821
End-to-End ECN Behavior	6822
ECN Compared to PFC and Ethernet PAUSE	6824
WRED Drop Profile Control of ECN Thresholds	6825
Support, Limitations, and Notes	6828
Example: Configuring ECN	6828

Part 93	Data Center Bridging (PFC, DCBX) and Flow Control	
Chapter 255	Using Data Center Bridging and Flow Control	6837
	Understanding DCB Features and Requirements	6838
	Lossless Transport	6839
	PFC	6839
	Buffer Management	6839
	Physical Interfaces	6839
	ETS	6840
	DCBX	6840
	Understanding CoS Hierarchical Port Scheduling (ETS)	6841
	Hierarchical Scheduling Tiers	6841
	Hierarchical Scheduling and ETS	6842
	ETS Advertisement in DCBX	6844
	Hierarchical Scheduling Process	6844
	Strict-High Priority Queues and Hierarchical Scheduling	6845
	Default Hierarchical Scheduling	6846
	Example: Configuring CoS Hierarchical Port Scheduling (ETS)	6847
	Disabling the ETS Recommendation TLV	6872
	Understanding CoS IEEE 802.1p Priorities for Lossless Traffic Flows	6873
	Default Lossless Priority Configuration	6873
	Configuring Lossless Priorities	6876
	Configuring Lossless Forwarding Classes (Packet Drop Attribute)	6876
	Congestion Notification Profiles (PFC Configuration)	6878
	Configuring DCBX (Application Protocol TLV Exchange)	6884
	Fate Sharing Among Traffic Classes	6885
	Transit Switch Configuration Versus FCoE-FC Gateway	
	Configuration	6886
	Configuration Results and Commit Checks	6887
	Configuration Rules and Recommendations	6889
	Lossless Transport Features Introduced in Junos OS Release 12.3 (Legacy	
	Non-ELS CLI)	6890
	Backward Compatibility with Junos OS Releases Earlier Than Release 12.3	
	(Legacy Non-ELS CLI)	6891
	Understanding CoS Flow Control (Ethernet PAUSE and PFC)	6893
	General Information about Ethernet PAUSE and PFC and When to Use	
	Them	6893
	Ethernet PAUSE	6894
	Symmetric Flow Control	6895
	Asymmetric Flow Control	6895
	PFC	6899
	Lossless Transport Support Summary	6902
	Configuring CoS PFC (Congestion Notification Profiles)	6905
	Example: Configuring CoS PFC for FCoE Traffic	6908
	Troubleshooting Dropped FCoE Traffic	6917
	Understanding PFC Functionality Across Layer 3 Interfaces	6921
	Example: Configuring PFC Across Layer 3 Interfaces	6923
	Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG	6943

Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)	6969
Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface	6977
Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces	6986
Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)	7000
Understanding DCBX	7016
DCBX Basics	7016
DCBX Modes and Support	7018
DCBX Modes (Versions)	7018
Autonegotiation	7020
CNA Support for DCBX Modes	7020
Interface Support for DCBX	7020
DCBX Attribute Types	7020
Asymmetric Attributes	7021
Symmetric Attributes	7021
DCBX Application Protocol TLV Exchange	7022
Application Protocol TLV Exchange	7022
FCoE Application Protocol TLV Exchange	7022
Disabling Application Protocol TLV Exchange	7023
DCBX and PFC	7023
DCBX and ETS	7023
Default DCBX ETS Advertisement	7023
ETS Advertisement and Peer Configuration	7024
ETS Recommendation TLV	7024
Configuring the DCBX Mode	7026
Configuring DCBX Autonegotiation	7027
Understanding DCBX Application Protocol TLV Exchange	7030
Applications	7030
Application Maps	7031
Classifying and Prioritizing Application Traffic	7032
Enabling Interfaces to Exchange Application Protocol Information	7033
Disabling DCBX Application Protocol Exchange	7033
Defining an Application for DCBX Application Protocol TLV Exchange	7034
Configuring an Application Map for DCBX Application Protocol TLV Exchange	7035
Applying an Application Map to an Interface for DCBX Application Protocol TLV Exchange	7036
Example: Configuring DCBX Application Protocol TLV Exchange	7037

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	<ul style="list-style-type: none">Introduces or emphasizes important new terms.Identifies guide names.Identifies RFC and Internet draft titles.	<ul style="list-style-type: none">A policy <i>term</i> is a named structure that defines match conditions and actions.<i>Junos OS CLI User Guide</i>RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none">To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level.The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none">In the Logical Interfaces box, select All Interfaces.To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page of the Juniper Networks TechLibrary site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <http://www.juniper.net/techpubs/feedback/>.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <http://kb.juniper.net/InfoCenter/>

- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

Junos OS Basics Feature Guide for QFX10000 Switches

PART 1

Autoinstallation

- [Understanding Autoinstallation on page 3](#)

CHAPTER 1

Understanding Autoinstallation

- [Understanding Autoinstallation of Configuration Files on page 3](#)
- [Configuring Autoinstallation of Configuration Files \(CLI Procedure\) on page 5](#)
- [Upgrading Software by Using Automatic Software Download on page 7](#)
- [Verifying Autoinstallation Status on page 8](#)
- [Verifying That Automatic Software Download Is Working Correctly on page 9](#)

Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

NOTE: The QFX5200 switches only work with HTTP for autoinstallation. TFTP and FTP protocols are not supported.

This topic describes:

- [Typical Uses for Autoinstallation on page 3](#)
- [Autoinstallation Configuration Files and IP Addresses on page 4](#)
- [Typical Autoinstallation Process on a New Switch on page 4](#)

Typical Uses for Autoinstallation

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

Autoinstallation Configuration Files and IP Addresses

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- **hostname.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, **hostname** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

Typical Autoinstallation Process on a New Switch

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.

2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
 - a. If the DHCP server specifies the host-specific configuration file **hostname.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
 - b. If the switch does not locate a **hostname.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
 - c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.
 - d. If the switch determines its hostname, it sends a TFTP request for the **hostname.conf** file.
 - e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.
3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically deploy multiple devices from a central location in the network.

To specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a switch to operate as a DHCP server. For more information, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 78](#).
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
 - A host-specific file with the name **hostname.conf** for each switch undergoing autoinstallation. Replace **hostname** with the name of a switch. The **hostname.conf** file typically contains all the configuration information necessary for the switch with this hostname.
 - A default configuration file named **switch.conf** with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.
- Physically attach the switch to the network using a Gigabit Ethernet port.
- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.
- If the switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the switch.
- If you are using **hostname.conf** files for autoinstallation, you must also complete the following tasks:
 - Configure the DHCP server to provide a **hostname.conf** filename to each switch. Each switch uses its **hostname.conf** filename to request a configuration file from the TFTP server. Copy the necessary **hostname.conf** configuration files to the TFTP server.
 - Create a default configuration file named **network.conf**, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a **hostname.conf** filename to a new switch, the switch uses **network.conf** to resolve its hostname based on its IP address.

Alternatively, you can add the IP-address-to-hostname mapping entry for the switch to a DNS database file.

The switch uses the hostname to request a **hostname.conf** file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@switch# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
```

NOTE: You can also use an FTP address, for example, `ftp://user:password@sftpconfig.sp.com`.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

```
[edit system]
user@switch# set autoinstallation interfaces ge-0/0/0 bootp
```

Upgrading Software by Using Automatic Software Download

The automatic software download feature uses the Dynamic Host Configuration Protocol (DHCP) message exchange process to download and install software packages. You configure the automatic software download feature on switches that act as DHCP clients. You must enable automatic software download on a switch before the software upgrade can occur.

You configure a path to a software package file on the DHCP server. The server communicates the path to the software package file through DHCP server messages.

If you enable automatic software download, the DHCP client switch compares the software package name in the DHCP server message with the name of the software package that booted the switch. If the software packages are different, the DHCP client switch downloads and installs the software package specified in the DHCP server message.

Before you upgrade software by using automatic software download, ensure that you have configured DHCP services for the switch, including configuring a path to a boot server and a boot file.

To configure a path to a boot server and a boot file:

1. Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete DHCP setup. This configuration is equivalent to DHCP Option 66:

```
[edit system services dhcp]
user@switch# set boot-server (address | hostname)
```

2. Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete the DHCP setup. This configuration is equivalent to DHCP Option 67:

```
[edit system services dhcp]
```

```
user@switch# set boot-file filename
```

To enable automatic software download on a switch that acts as a DHCP client:

```
[edit chassis]  
user@switch# set auto-image-upgrade
```

After automatic software download is enabled on your DHCP client switch and after DHCP services are enabled on your network, an automatic software download can occur at any time as part of the DHCP message exchange process.

If an automatic software download occurs, you see the following message on the switch:

```
Auto-image upgrade started  
On successful installation system will reboot automatically
```

The switch reboots automatically to complete the upgrade.

**Related
Documentation**

Verifying Autoinstallation Status

Purpose Display the status of the autoinstallation feature.

Action From the CLI, enter the **show system autoinstallation status** command.

Sample Output

```
user@switch> show system autoinstallation status  
Autoinstallation status:  
Master state: Active  
Last committed file: None  
Configuration server of last committed file: 10.25.100.1  
Interface:  
  Name: ge-0/0/0  
  State: Configuration Acquisition  
  Acquired:  
    Address: 192.168.124.75  
    Hostname: host-ge-000  
    Hostname source: DNS  
    Configuration filename: switch-ge-000.conf  
    Configuration filename server: 10.25.100.3  
  Address acquisition:  
    Protocol: DHCP Client  
    Acquired address: None  
    Protocol: RARP Client  
    Acquired address: None  
Interface:  
  Name: ge-0/0/1  
  State: None  
  Address acquisition:  
    Protocol: DHCP Client  
    Acquired address: None
```

Protocol: RARP Client
Acquired address: None

Meaning The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

Related Documentation • [Configuring Autoinstallation of Configuration Files \(CLI Procedure\) on page 5](#)

Verifying That Automatic Software Download Is Working Correctly

Purpose Verify that the automatic software download feature is working correctly.

Action Use the `show system services dhcp client interface-name` command to verify that the automatic software download feature has been used to install a software package.

```
user@switch> show system services dhcp client ge-0/0/1.0
Logical Interface Name      ge-0/0/1.0
Hardware address           00:0a:12:00:12:12
Client Status              bound
Vendor Identifier          ether
Server Address             10.1.1.1
Address obtained           10.1.1.89
Lease Obtained at          2009-08-20 18:13:04 PST
Lease Expires at           2009-08-22 18:13:04 PST

DHCP Options :
Name: name-server, Value: [ 10.209.194.131, 2.2.2.2, 3.3.3.3 ]
Name: server-identifier, Value: 10.1.1.1
Name: router, Value: [ 10.1.1.80 ]
Name: boot-image,
Value: jinstall-ex-4200-9.6R1.5-domestic-signed.tgz
Name: boot-image-location,
Value: 10.1.1.25:/bootfiles/
```

Meaning The output from this command shows the name and location of the software package under DHCP options when automatic software download was last used to install a software package. The sample output in DHCP options shows that the last DHCP server message to arrive on the DHCP client had a boot server address of 192.168.1.165 and a boot file named jinstall-ex-4200-9.6R1.5-domestic-signed.tgz. If automatic software download was enabled on this client switch during the last DHCP message exchange, these values were used by the switch to upgrade the software.

Compressing the Current Configuration File

By default, the current operational configuration file is compressed and is stored in the file **juniper.conf.gz** the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

NOTE: We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```
- Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
user@host# commit
commit complete
user@host# commit
commit complete
```
- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```
- Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

- Related Documentation**
- [Junos OS Commit Model for Router or Switch Configuration on page 1313](#)
 - [compress-configuration-files on page 220](#)

Configuring a DNS Name Server for Resolving a Hostname into Addresses

To have the router or switch resolve hostnames into addresses, you must configure one or more Domain Name System (DNS) name servers by including the **name-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
name-server {
    address;
}
```

The following example shows how to configure two DNS name servers:

```
[edit]
user@switch# set system name-server 192.168.1.253
[edit]
user@switch# set system name-server 192.168.1.254
[edit]
user@switch# show
system {
    name server {
        192.168.1.253;
        192.168.1.254;
    }
}
```

- Related Documentation**
- [name-server on page 231](#)

Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data terminal may be connected to the switch. The console port is enabled by default. The console port speed is 9600 baud, except on OCX Series devices, on which it is 115200 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

```
[edit system ports]
user@switch# set console log-out-on-disconnect
```

2. To specify the auxiliary port terminal type:

```
[edit system ports]
user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
```

For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

```
[edit system ports]
user@switch# set auxiliary type xterm
```

3. To check the configuration:

```
[edit system ports]
user@switch# show
console log-out-on-disconnect;
auxiliary type xterm;
```

- Related Documentation

 - [ports on page 234](#)

Configuring the Hostname of a Router or Switch by Using a Configuration Group

The hostname of a device is its identification. A router or switch must have its identity established to be accessible on the network to other devices. That is perhaps the most important reason to have a hostname, but a hostname has other purposes: Junos OS uses the configured hostname as part of the command prompt, to prepend log files and other accounting information, as well as in other places where knowing the device identity is useful. We recommend that the hostname be descriptive and memorable.

You can configure the hostname at the **[edit system]** hierarchy level, a procedure shown in *Example: Configuring the Unique Identity of a Router for Making it Accessible on the Network*. Optionally, instead of configuring the hostname at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the hostname, especially if the device has dual Routing Engines. This procedure uses groups called **re0** and **re1** as an example.

NOTE: If you configure hostnames that are longer than the CLI screen width, regardless of the terminal screen width setting, the commit operation occurs successfully, starting with Junos OS release 13.2R3. Even if the terminal screen width is less than the hostname length, commit is successful. In Junos OS releases earlier than Release 13.2R3, if you configured such hostnames by using the `host-name hostname` statement at the `[edit system]` hierarchy level and the terminal screen width was less than the length of the hostname by using the `set cli screen-width` statement, a foreign file propagation (ffp) failure error message is displayed when you attempt to commit the configuration. In such a case, because of the ffp failure, the commit operation does not complete and you cannot recover the router unless you make the modification in the backend in the `juniper.conf.gz` file and commit the change from the shell prompt.

To set the hostname using a configuration group:

1. Include the **host-name** statement in the configuration at the `[edit groups group-name system]` hierarchy level.

The name value must be less than 256 characters.

```
[edit groups group-name system]
host-name hostname;
```

For example:

```
[edit groups re0 system]
root@# set host-name san-jose-router

[edit groups re1 system]
root@# set host-name san-jose-router1
```

2. If you used one or more configuration groups, apply the configuration groups, substituting the appropriate group names.

For example:

```
[edit]
user@host# set apply-groups [re0 re1]
```

3. Commit the changes.

```
[edit]
root@# commit
```

The hostname subsequently appears in the device CLI prompt.

```
san-jose-router@#
```

Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

NOTE: By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

alarm-name is the name of an alarm.

- *Chassis Conditions That Trigger Alarms*
- *Silencing External Devices Connected to Alarm Relay Contacts*

Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch

By default, the router or switch sends protocol redirect messages. To disable the sending of redirect messages by the router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-redirects;
```

To reenable the sending of redirect messages on the router or switch, delete the **no-redirects** statement from the configuration.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces interface-name unit logical-unit-number family family]** hierarchy level.

Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record-route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

Related Documentation

- [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 86](#)

Configuring Junos OS to Extend the Default Port Address Range

By default, the upper range of a port address is 5000. You can increase the range from which the port number can be selected to decrease the probability that someone can determine your port number.

- To configure the Junos OS to extend the default port address range, include the **source-port** statement at the **[edit system internet-options]** hierarchy level:

```
[edit system internet-options]
source-port upper-limit upper-limit;
```

upper-limit *upper-limit* is the upper limit of a source port address and can be a value from 5000 through 65,355.

- [Configuring Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses](#)
- [source-port on page 237](#)

Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets

By default, the source address included in locally generated Transmission Control Protocol/IP (TCP/IP) packets, such as FTP traffic, and in User Datagram Protocol (UDP) and IP packets, such as Network Time Protocol (NTP) requests, is chosen as the local address for the interface on which the traffic is transmitted. This means that the local address chosen for packets to a particular destination might change from connection to connection based on the interface that the routing protocol has chosen to reach the destination when the connection is established. If multiple equal-cost next hops are present for a destination, locally generated packets use the **lo0** address as a source.

- To configure the software to select a fixed address to use as the source for locally generated IP packets, include the **default-address-selection** statement at the **[edit system]** hierarchy level:

```
[edit system]  
default-address-selection;
```

If you include the **default-address-selection** statement in the configuration, the Junos OS chooses the system default address as the source for most locally generated IP packets. The default address is usually an address configured on the **lo0** loopback interface. For example, if you specified that SSH and telnet use a particular address, but you also have **default-address selection** configured, the system default address is used.

Related Documentation

Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]  
login-alarms;
```

For more information on the **show system alarms** command, see the [CLI Explorer](#).

Related Documentation

- [show system alarms on page 1027](#)

Configuring Time-Based User Access

The Junos OS enables you to configure time-based restrictions for user access to log in to a device. This is useful for restricting the time and duration of user logins for all users

belonging to a login class. You can specify the days of the week when users can log in, the access start time, and the access end time.

- To configure user access on specific days of the week, without any restrictions on the duration of login, include the **allowed-days** statement only.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
  }
}
```

- To configure user access on all the days of the week for a specific duration, include the **access-start** and **access-end** statements only.

```
[edit system]
login {
  class class-name {
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

- To configure user access on specific days of the week for a specified duration, include the **allowed-days**, **access-start**, and **access-end** statements.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

Specify the start time and end time in **HH:MM** (24-hour) format, where **HH** represents the hours and **MM** represents the minutes.

NOTE: Access start time and end time that spans across 12:00 AM on a specified day results in the user having access until the next day, even if the access day is not explicitly configured. For instance, the following configuration results in the user having access until 6:00 AM on Tuesday and Thursday, although the **allowed-days** statement specifies access only on Monday and Wednesday:

```
[edit system]
login {
  class operator-night-shift {
    allowed-days [ monday wednesday ];
    access-start 2000;
    access-end 0600;
  }
}
```

Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.  
Warning: session will be closed in 1 minute if there is no activity  
Warning: session will be closed in 10 seconds if there is no activity  
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

 - *idle-timeout (System-Login)*

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

```
Aug 21 12:36:30.401 2006
```

NOTE: Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the **[edit system syslog file filename]** hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Reference for Security Devices*.

- Related Documentation**
- *Single-Chassis System Logging Configuration Overview*

Mapping the Hostname of the Switch to IP Addresses

To map a hostname of a switch to one or more IP addresses, include the **inet** statement at the **[edit system static-host-mapping hostname]** hierarchy level:

```
[edit system]
static-host-mapping {
  hostname {
    inet [ addresses ];
    alias [ aliases ];
  }
}
```

hostname is the name specified by the **host-name** statement at the **[edit system]** hierarchy level.

For each host, you can specify one or more aliases.

- Related Documentation**
- [Reaching a Domain Name System Server on page 26](#)
 - [Example: Configuring the Unique Identity of a Router for Making it Accessible on the Network](#)
 - [static-host-mapping on page 238](#)

Modifying the Default Time Zone for a Router or Switch Running Junos OS

The default local time zone on the router or switch is UTC (Coordinated Universal Time, formerly known as Greenwich Mean Time, or GMT).

- To modify the local time zone, include the **time-zone** statement at the **[edit system]** hierarchy level:

```
[edit system]
time-zone (GMT hour-offset | time-zone);
```

You can use the **GMT hour-offset** option to set the time zone relative to UTC (GMT) time. By default, **hour-offset** is 0. You can configure this to be a value from -14 to +12.

You can also specify the **time-zone** value as a string such as PDT (Pacific Daylight Time) or WET (Western European Time), or specify the continent and major city.

NOTE: Junos OS complies with the POSIX time-zone standard, which is counter-intuitive to the way time zones are generally indicated relative to UTC. A time zone ahead of UTC (east of the Greenwich meridian) is commonly indicated as GMT +*n*; for example, the Central European Time (CET) zone is indicated as GMT +1. However, this is not true for POSIX time zone designations. POSIX indicates CET as GMT-1. If you include the `set system time-zone GMT+1` statement for a router in the CET zone, your router time will be set to one hour behind GMT, or two hours behind the actual CET time. For this reason, you might find it easier to use the POSIX time-zone strings, which you can list by entering `set system time-zone ?`.

For the time zone change to take effect for all processes running on the router or switch, you must reboot the router or switch.

The following example shows how to change the current time zone to **America/New_York**:

```
[edit]
user@host# set system time-zone America/New_York
[edit]
user@host# show
system {
    time-zone America/New_York;
}
```

- Related Documentation**

Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>      Execute this command
all-members    Reboot all virtual chassis members
at             Time at which to perform the operation
both-routing-engines Reboot both the Routing Engines
fast-boot      Enable fast reboot
hypervisor     Reboot Junos OS, host OS, and Hypervisor
in            Number of minutes to delay before operation
local         Reboot local virtual chassis member
member        Reboot specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine Reboot the other Routing Engine
|            Pipe through a command
{master:0}
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

NOTE: Not all options shown in the preceding command output are available on all QFX Series, OCX Series, and EX4600 switches. See the documentation for the **request system reboot** command for details about options.

NOTE: When you issue the **request system reboot hypervisor** command on QFX10000 switches, the reboot takes longer than a standard Junos OS reboot.

Similarly, to halt the switch, issue the **request system halt** command.

CAUTION: Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
all-members    Halt all virtual chassis members
at             Time at which to perform the operation
backup-routing-engine Halt backup Routing Engine
both-routing-engines Halt both Routing Engines
in            Number of minutes to delay before operation
local         Halt local virtual chassis member
member        Halt specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine Halt other Routing Engine
|            Pipe through a command
```

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

Reaching a Domain Name System Server

Domain name system (DNS) servers are used for resolving hostnames to IP addresses.

For redundancy, it is a best practice to configure access to multiple DNS servers. You can configure a maximum of three DNS servers. The approach is similar to the way Web browsers resolve the names of a Web site to its network address. Additionally, Junos OS enables you configure one or more domain names, which it uses to resolve hostnames that are not fully qualified (in other words, the domain name is missing). This is convenient because you can use a hostname in configuring and operating Junos OS without the need to reference the full domain name. After adding DNS server addresses and domain names to your Junos OS configuration, you can use DNS resolvable hostnames in your configuration and commands instead of IP addresses.

Optionally, instead of configuring the name server at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the name server. This procedure uses a group called **global** as an example.

Before you begin, configure your DNS servers with the hostname and an IP address for your Junos OS device. It does not matter which IP address you assign as the address of your Junos OS device in the DNS server, as long it is an address that reaches your device. Normally, you would use the management interface IP address, but you can choose the loopback interface IP address, or a network interface IP address, or even configure multiple addresses on the DNS server.

To configure the router or switch to resolve hostnames into addresses:

1. Reference the IP addresses of your DNS servers.

```
[edit groups group-name system]
name-server {
```

```

    address;
}

```

The following example shows how to reference two DNS servers:

```

[edit groups global system]
user@host# set name-server 192.168.1.253
user@host# set name-server 192.168.1.254

```

```

user@host# show
name server {
    192.168.1.253;
    192.168.1.254;
}

```

2. (Optional) Configure the name of the domain in which the device itself is located.

This is a good practice. Junos OS then uses this configured domain name as the default domain name to append to hostnames that are not fully qualified.

```

[edit system]
domain-name domain-name;

```

The following example shows how to configure the domain name:

```

[edit groups global system]
user@host# set domain-name company.net

```

```

user@host# show
domain-name company.net;

```

3. (Optional) Configure a list of domains to be searched.

If your device can reach several different domains, you can configure these as a list of domains to be searched. Junos OS then uses this list to set an order in which it appends domain names when searching for the IP address of a host.

```

[edit groups global system]
domain-search [ domain-list ];

```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched. This example configures Junos OS to search the company.net domain and then the domainone.net domain and then the domainonealternate.com domain when attempting to resolve unqualified hosts.

```

[edit groups global system]
domain-search [ company.net domainone.net domainonealternate.com ]

```

4. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```

[edit]
user@host# set apply-groups global

```

5. Commit the configuration.

```
user@host# commit
```

6. Verify the configuration.

If you have configured your DNS server with the hostname and an IP address for your Junos OS device, you can issue the following commands to confirm that DNS is working and reachable. You can either use the configured hostname to confirm resolution to the IP address or use the IP address of your device to confirm resolution to the configured hostname.

```
user@host> show host host-name
user@host> show host host-ip-address
```

For example:

```
user@host> show host san-jose-router1
san-jose-router1.company.net
san-jose-router1.company.net has address 192.168.187.1

user@host> show host 192.168.187.1
1.187.168.192.in-addr.arpa domain name pointer san-jose-router1.company.net.
```

Related Documentation • [DNS Overview](#)

Reverting to the Default Factory Configuration by Using the `request system zeroize` Command

The **`request system zeroize`** command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the **`request system zeroize media`** command.

CAUTION: Before issuing **`request system zeroize`**, use the **`request system snapshot`** command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the **`request system zeroize`** command:

1.

```
user@switch> request system zeroize
```

```
warning: System will be rebooted and may not boot without configuration
```

```
Erase all data, including configuration and log files? [yes,no] (yes)
```
2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch.

Related Documentation • [request system zeroize on page 409](#)

Saving Core Files Generated by Junos OS Processes

By default, when an internal Junos OS process generates a core file, the file and associated context information are saved for debugging purposes in a compressed tar file named `/var/tmp/process-name.core.core-number.tgz`. The contextual information includes the configuration and system log message files.

- To disable the saving of core files and associated context information:

```
[edit system]
no-saved-core-context;
```

- To save the core files only:

```
[edit system]
saved-core-files number;
```

Where *number* is the number of core files to save and can be a value from 1 through 10.

- To save the core files along with the contextual information:

```
[edit system]
saved-core-context;
```

Related Documentation

- [Viewing Core Files from Junos OS Processes on page 34](#)

Specifying the Physical Location of the Switch

To specify the physical location of the switch, specify the following options for the **location** statement at the **[edit system]** hierarchy level:

- **altitude *feet***—Number of feet above sea level.
- **building *name***—Name of the building, 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code *code***—Two-letter country code.
- **floor *number***—Floor in the building.
- **hcoord *horizontal-coordinate***—Bellcore Horizontal Coordinate.
- **lata *service-area***—Long-distance service area.
- **latitude *degrees***—Latitude in degree format.
- **longitude *degrees***—Longitude in degree format.
- **npa-nxx *number***—First six digits of the phone number (area code and exchange).
- **postal-code *postal-code***—Postal code.
- **rack *number***—Rack number.
- **vcoord *vertical-coordinate***—Bellcore Vertical Coordinate.

The following example shows how to specify the physical location of the switch:

```
[edit system]
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

Related Documentation • [Example: Configuring the Name of the Switch, IP Address, and System ID on page 34](#)

Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-commands "regular-expression";
```

NOTE: The regular expression to allow/deny commands for any login class is supported at the commands level but not at the arg level. For example, you can completely block ping, but not ping *arg1*.

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

NOTE: Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the `deny command set protocols` does not match anything, whereas `protocols` matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

allow-commands = "(monitor.*)"|(ping.*)"|(show.*)"|(exit)". Instead, you must specify the expression using the following syntax: **allow-commands = "^(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^(monitor | ping | show | exit)"**

Updating the IANA Time Zone Database on Junos OS Devices

Junos OS devices use the tz database, also known as the IANA Time Zone Database to manage time zones. This database is periodically updated by IANA to reflect political and time changes. As such, you may need from time to time to update this file to ensure the Junos devices continue to accurately reflect worldwide time zones and daylight savings time intervals.

To update the IANA Time Zone Database, perform the following steps:

1. [Importing and Installing Time Zone Files on page 32](#)
2. [Configuring a Custom Time Zone on page 33](#)

Importing and Installing Time Zone Files

The IANA Time Zone Database is maintained by the Internet Assigned Numbers Authority (IANA), which is a department of the Internet Corporation for Assigned Names and Numbers (ICANN). You can download the latest IANA Time Zone Database file from the following URL: <http://www.iana.org/time-zones>.

The following steps will guide you through one method of installing the file to your device. However, depending on your network access and other preferences, you may need to modify these steps.

1. Log into the Junos device.
2. If you are in the CLI interface, open the shell interface.

```
device@user# start shell
```
3. Create a **tz** directory in the **/var/tmp** and navigate to that directory.

```
# mkdir /var/tmp/tz  
# cd /var/tmp/tz
```
4. Using FTP, download the time zone files archive.

NOTE: FTP must be enabled on your device before you can use FTP. FTP is enabled by adding the **ftp** statement into the **[edit system services]** hierarchy.

```
# ftp ftp.iana.org/tz  
# bin
```

```
# get tzdata-latest.tar.gz
```

NOTE: If needed, you can edit the above untarred files to create or modify the time zones.

5. Select the names of time zone files to compile and feed them to the following script. For example, to generate **northamerica** and **asia** tz files:

```
# /usr/libexec/ui/compile-tz northamerica asia
```

6. Enable the use of the generated tz files using the CLI:

```
[edit]
# set system use-imported-time-zones
[edit]
# set system time-zone ?
```

This should show the newly generated tz files in **/var/db/zoneinfo/**.

7. Set the time zone and commit the configuration:

```
[edit]
# set system time-zone <your-time-zone>
# commit
```

8. Verify that the time zone change has taken effect:

```
[edit]
# run show system uptime
```

Configuring a Custom Time Zone

To use a custom time zone, follow these steps:

1. Download a time zones archive (from a known or designated source) to the router or switch. Compile the time zone archive using the **zic** time zone compiler, which generates **tz** files.
2. Using the CLI, configure the router or switch to enable the use of the generated tz files as follows:

```
[edit]
user@host# set system use-imported-time-zones
```

3. Display the imported time zones (saved in the directory **/var/db/zoneinfo/**):

```
[edit]
user@host# set system time-zone ?
```

If you do not configure the router to use imported time zones, the Junos OS default time zones are shown (saved in the directory **/usr/share/zoneinfo/**).

Viewing Core Files from Junos OS Processes

When an internal Junos OS process generates a core file, the output found at `/var/crash/` and `/var/tmp/` can now be viewed. This provides a quick method of finding core issues across large networks.

Use the CLI command `show system core-dumps` to view core files.

```
root@host> show system core-dumps
-rw-----  1 root  wheel  268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw----  1 root  field   3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r--  1 root  wheel   27775914 Jun 18 17:59 /var/crash/kernel.0
```

Related Documentation • [Saving Core Files from Junos OS Processes](#)

Example: Configuring the Name of the Switch, IP Address, and System ID

The following example shows how to configure the switch name, map the name to an IP address and alias, and configure a system identifier:

```
[edit]
user@switch# set system host-names switch-sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 inet 192.168.1.77
[edit]
user@switch# set system static-host-mapping switch-sj1 alias sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 sysid 1921.6800.1077
[edit]
user@switch# show
system {
    host-name switch-sj1;
    static-host-mapping {
        switch-sj1 {
            inet 192.168.1.77;
            alias sj1;
            sysid 1921.6800.1077;
        }
    }
}
```

- [Understanding Junos OS CLI Configuration Mode on page 63](#)

CLI User Interface Overview

- [CLI Overview on page 37](#)
- [CLI Key Features on page 38](#)
- [CLI Command Modes on page 38](#)

CLI Overview

The command-line interface (CLI) is the software interface you use to access, monitor, configure, troubleshoot, and manage a device running Junos OS. You can access the CLI either from the console or through a network connection. The CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel.

The CLI provides a variety of UNIX utilities, such as Emacs-style keyboard sequences, which allows you to perform the following actions:

- Move around on a command line and scroll through recently executed commands.
- Match regular expressions to locate and replace values and identifiers in a configuration.
- Filter command output.
- Log file entries.
- Store and archive device files on a UNIX-based file system.

You can exit the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage processes, and perform other tasks.

CLI Key Features

The CLI commands and statements follow a hierarchical organization and have consistent syntax. The CLI provides the following features for ease of use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with the Junos OS, you can use many of the CLI commands without referring to the documentation.
- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press Tab or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

CLI Command Modes

The CLI has two modes, operational mode and configuration mode.

- Operational mode—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot Junos OS and devices and network connectivity. Operational mode is indicated by the > prompt—for example, **user@switch> clear**
- Configuration mode—A Junos OS device configuration is stored as a hierarchy of statements. In configuration mode, you can define all properties of the Juniper Networks Junos OS, including interfaces, VLANs, Virtual Chassis information, user access, and several system hardware properties. To enter configuration mode, enter the **configure** command. Configuration mode is indicated by the # prompt and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]  
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration,

the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you must issue another **commit** command within the defined period of time (10 minutes by default), or the system reverts to the previous configuration.

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (>) and the configuration mode prompt is a pound sign (#).

When you log in to the switch and type the **cli** command, you are automatically in operational mode. To switch to configuration mode, type the **configure** command or the **edit** command.

The CLI prompt changes from **user@switch>** to **user@switch#**, and a banner appears to indicate the hierarchy level.

To return to operational mode as well as commit your changes, enter **command and-quit**. To return to operational mode without committing any of your changes, enter **exit**.

To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command.

Related Documentation

- [Overview of Navigating the CLI on page 61](#)
- *CLI User Guide*
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 168](#)

Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

- *Defining Junos OS Login Classes*

Format for Specifying Filenames and URLs in Junos OS CLI Commands

In some command-line interface (CLI) commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication load-key-file**, and **request system software add**—you can include a filename. On a routing matrix, you can include chassis information (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**) as part of the filename.

A *routing matrix* is a multichassis architecture composed of either one TX Matrix router and from one to four T640 routers connected to the TX Matrix router, or one TX Matrix Plus router and from one to four T1600 routers connected to the TX Matrix Plus router. From the perspective of the user interface, the routing matrix appears as a single router. On a routing matrix composed of the TX Matrix router and T640 routers, the TX Matrix router controls all the T640 routers. On a routing matrix composed of a TX Matrix Plus router and T1600 routers, the TX Matrix Plus router controls all the T1600 routers.

You can specify a filename or URL in one of the following ways:

- **filename**—File in the user's current directory on the local CompactFlash card (not applicable on the QFX Series). You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in Hypertext Transfer Protocol (HTTP) or FTP.

NOTE: Wildcards are supported only by the **file (compare | copy | delete | list | rename | show)** commands. When you issue the **file show** command with a wildcard, it must resolve to one filename.

- **path/filename**—File on the local flash disk.
- **/var/filename** or **/var/path/filename**—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> file delete lcc0-re0:/var/tmp/junk
```

- **a:filename** or **a:path/filename**—File on the local removable media. The default path is / (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- **hostname:/path/filename**, **hostname:filename**, **hostname:path/filename**, or **"scp://hostname/path/filename"**—File on an scp/ssh client. This form is not available in the worldwide version of the Junos OS. The default path is the user's home directory on the remote system. You can also specify **hostname** as **username@hostname**.
- **ftp://hostname/path/filename**—File on an FTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. The default path is the user's home directory. To specify an absolute path, the path must start with %2F; for example, **ftp://hostname/%2Fpath/filename**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net/filename
file copy ftp.hostname.net: Not logged in.
```

```
user@host> file copy ftp://username:prompt@ftp.hostname.net/filename
Password for username@ftp.hostname.net:
```

- **re0:/path/filename** or **re1:/path/filename**—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> show log lcc0-re1:chassisd
```

NOTE: You cannot specify a URL for a file on a Hypertext Transfer Protocol (HTTP) server, because HTTP URLs are not writable.

Getting Started with Enhanced Layer 2 Software

- [Understanding Enhanced Layer 2 Software Support on page 42](#)
- [Using the ELS Translator on page 42](#)
- [Configuring a VLAN on page 43](#)
- [Configuring the Native VLAN Identifier on page 44](#)
- [Configuring Layer 2 Interfaces on page 44](#)
- [Configuring Layer 3 Interfaces on page 45](#)
- [Configuring an IRB Interface on page 45](#)

- [Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface on page 46](#)
- [Enhanced Layer 2 CLI Configuration Statement and Command Changes on page 47](#)

Understanding Enhanced Layer 2 Software Support

Enhanced Layer 2 Software (ELS) is automatically supported if your device is running a Junos OS release that supports it. You do not need to take any action to enable ELS, and you cannot disable ELS.

Table 1 lists the EX Series and QFX Series switches that support ELS and the initial ELS release they support..

Table 3: ELS Support

Device	Initial ELS Release
EX4300 switches	13.2X50-D10
EX4600 switches	13.2X51-D25
EX9200 switches	12.3R2
QFX3500 switches	13.2X50-D15
QFX3600 switches	13.2X50-D15
QFX5100 switches	13.2X51-D10
QFX10000 switches	15.1X53-D10

ELS is supported on the EX4300, EX4600, and EX9200 switches for all Junos OS releases, starting with the initial releases shown in [Table 3](#).

ELS support was introduced on QFX3500 and QFX3600 switches in Junos OS Release 13.2X50-D15. ELS is supported only on the software package that supports Virtual Chassis (the **jinstall-qfx-3-*** software package) for QFX3500 and QFX3600 switches.

For QFX5100 switches, ELS support was introduced in Junos OS Release 13.2X51-D10 and is supported on the **jinstall-qfx-5-*** software package.

NOTE: ELS is not supported on software packages that can be installed in a QFabric system.

Using the ELS Translator

ELS Translator is a Web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations. This conversion tool supports all Juniper Networks EX Series, MX Series, and QFX Series devices with ELS installed. ELS Translator is hosted on the Juniper Networks Customer Support website for EX Series switches, MX

Series routers, and QFX Series switches and is available to registered users, internal users, partners, and premium service contract customers. You need to log in using your Juniper Networks username and password to access the ELS Translator.

[Click here](#) to access the ELS translator.

If you are upgrading from a version of Junos OS that does not support ELS to a version of Junos OS that supports ELS, we recommend that you update your configuration with the ELS Translator using the following procedure:

1. Log in to your device by using the console port.

NOTE: Perform this procedure only from the console port. You will lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Copy the entire existing configuration to another file. Save the file in a remote location. See [“Saving a Configuration to a File” on page 1331](#).
3. Retain the portion of your existing configuration related to management network connectivity (such as **[edit system]** hierarchy level). Delete all other top-level configuration hierarchy levels (such as the **[edit interfaces]**, **[edit protocols]**, and **[edit vlans]**). Issue the **commit** command to remove the deleted configuration hierarchy levels.
4. Perform the software upgrade. Reboot your device to complete the upgrade. See [“Software Installation Overview” on page 174](#).

NOTE: Ensure that the console port connection is up during the reboot.

5. [Click here](#) to access the ELS Translator in a web browser. Follow the instructions on the page to update your configuration.
6. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator to your switch. See [“Uploading a Configuration File” on page 1332](#).
7. Commit the new configuration.

NOTE: It is possible that scripts do not translate correctly. Therefore, review translated scripts carefully before loading the converted configuration on your switch or other device.

Configuring a VLAN

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series and QFX Series switches can

function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting a unique VLAN name and configuring the VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id-number
```

2. Assign at least one interface to the VLAN:

```
[edit]
user@host# set interface interface-name family ethernet-switching vlan members vlan-name
```

Configuring the Native VLAN Identifier

EX Series and QFX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets, but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to **trunk**, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name native-vlan-id number
```

3. Assign the interface to the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching vlan
members native-vlan-id-number
```

Configuring Layer 2 Interfaces

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch's network interfaces.

To configure a Gigabit Ethernet interface or a 10-Gigabit Ethernet interface as a **trunk** interface:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

To configure a Gigabit Ethernet interface or a 10-Gigabit Ethernet interface as a **access** interface:

```
[edit]
```

```
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode access
```

Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when you configure the protocol family. For the **inet** or **inet6** family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To specify an IP4 address for the logical unit:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation by using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP6 address for the logical unit:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRB interfaces enable the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named **irb** functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```

3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces aex
```

3. Specify the minimum number of links for the aggregated Ethernet interface (*aex*)—that is, the defined bundle— to be labeled *up*:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp periodic interval
```

Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 CLI feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some of the Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following sections provide a list of existing commands that were moved to new hierarchy levels or changed on EX Series switches as part of this CLI enhancement effort. These sections are provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided or see the technical documentation.

- [Changes to the ethernet-switching-options Hierarchy Level on page 47](#)

Changes to the ethernet-switching-options Hierarchy Level

This section outlines the changes to the **ethernet-switching-options** hierarchy level.

NOTE: The **ethernet-switching-options** hierarchy level has been renamed as **switch-options**.

Table 4: Renaming the ethernet-switching-options hierarchy

Original Hierarchy	Changed Hierarchy
<pre>ethernet-switching-options { authentication-whitelist { ... } }</pre>	<pre>switch-options { ... authentication-whitelist { ... } }</pre>

Table 4: Renaming the ethernet-switching-options hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { interfaces <i>interface-name</i> { no-mac-learning; ... } } </pre>	<pre> switch-options { interfaces <i>interface-name</i> { no-mac-learning; ... } } </pre>
<pre> ethernet-switching-options { unknown-unicast-forwarding { (...) } } </pre>	<pre> switch-options { unknown-unicast-forwarding { (...) } } </pre>
<pre> ethernet-switching-options { voip { interface (all [<i>interface-name</i> access-ports]) { forwarding-class (assured-forwarding best-effort expedited-forwarding network-control); vlan <i>vlan-name</i>; ... } } } </pre>	<pre> switch-options { voip { interface (all [<i>interface-name</i> access-ports]) { forwarding-class (assured-forwarding best-effort expedited-forwarding network-control); vlan <i>vlan-name</i>; ... } } } </pre>

Table 5: RTG Statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { redundant-trunk-group { group <i>name</i> { description; interface <i>interface-name</i> { primary; } preempt-cutover-timer <i>seconds</i>; ... } } } </pre>	<pre> switch-options { redundant-trunk-group { group <i>name</i> { description; interface <i>interface-name</i> { primary; } preempt-cutover-timer <i>seconds</i>; ... } } } </pre>

Table 6: Deleted Statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { mac-notification { notification-interval <i>seconds</i>; ... } } </pre>	<p>The statements have been removed from the switch-options hierarchy.</p>

Table 6: Deleted Statements (*continued*)

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { traceoptions { file filename <files number> <no-stamp> <replace> <size size> <world-readable no-world-readable>; flag flag <disable>; ... } } </pre>	<p>The statements have been removed from the switch-options hierarchy.</p>
<pre> ethernet-switching-options { port-error-disable { disable-timeout timeout; ... } } </pre>	<p>NOTE: The port-error-disable statement has been replaced with a new statement.</p> <pre> interfaces interface-name family ethernet-switching { recovery-timeout seconds; } </pre>

Changes to the Port Mirroring Hierarchy Level

NOTE: Statements have moved from the **ethernet-switching-options** hierarchy level to the **forwarding-options** hierarchy level.

Table 7: Port Mirroring hierarchy

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { analyzer (Port Mirroring) { name { ... } } } </pre>	<pre> forwarding-options { analyzer (Port Mirroring) { name { ... } } } </pre>

Changes to the Layer 2 Control Protocol Hierarchy Level

The Layer 2 control protocol statements have moved from the **ethernet-switching-options** hierarchy to the **protocols** hierarchy.

Table 8: Layer 2 Control Protocol

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { bpdu-block { ... } } </pre>	<pre> protocols { layer2-control { bpdu-block { ... } } } </pre>

Changes to the dot1q-tunneling Statement

The **dot1q-tunneling** statement has been replaced with a new statement and moved to a different hierarchy level.

Table 9: dot1q-tunneling

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { dot1q-tunneling { ether-type (0x8100 0x88a8 0x9100); ... } }</pre>	<pre> interfaces interface-name { ether-options { ethernet-switch-profile { tag-protocol-id [tpids]; } } } interfaces interface-name { aggregated-ether-options { ethernet-switch-profile { tag-protocol-id [tpids]; } } }</pre>

Changes to the L2 Learning Protocol

The **mac-table-aging-time** statement has been replaced with a new statement and moved to a different hierarchy level.

Table 10: mac-table-aging-time statement

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { mac-table-aging-time seconds; ... }</pre>	<pre> protocols { l2-learning { global-mac-table-aging-time seconds; ... } }</pre>

Changes to Nonstop Bridging

The **nonstop-bridging** statement has moved to a different hierarchy level.

Table 11: Nonstop Bridging statement

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { nonstop-bridging; }</pre>	<pre> protocols { layer2-control { nonstop-bridging { } } }</pre>

Changes to Port Security and DHCP Snooping

Port security and DHCP snooping statements have moved to different hierarchy levels.

NOTE: The statement `examine-dhcp` does not exist in the changed hierarchy. DHCP snooping is now enabled automatically when other DHCP security features are enabled on a VLAN. See *Configuring Port Security Features* for additional information.

Table 12: Port Security statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { secure-access-port { interface (all interface-name) { (dhcp-trusted no-dhcp-trusted); static-ip ip-address { mac mac-address; vlan vlan-name; } } } vlan (all vlan-name) { (arp-inspection no-arp-inspection); dhcp-option82 { disable; circuit-id { prefix hostname; use-interface-description; use-vlan-id; } remote-id { prefix (hostname mac none); use-interface-description; use-string string; } vendor-id [string]; } (examine-dhcp no-examine-dhcp); } (ip-source-guard no-ip-source-guard); } </pre>	<pre> vlans vlan-name forwarding-options{ dhcp-security { arp-inspection; group group-name { interface interface-name { static-ip ip-address { mac mac-address; } } } overrides { no-option82; trusted; } } ip-source-guard; no-dhcp-snooping; option-82 { circuit-id { prefix { host-name; routing-instance-name; } use-interface-description (device logical); use-vlan-id; } } remote-id { host-name; use-interface-description (device logical); use-string string; } vendor-id { use-string string; } } </pre>

NOTE: DHCP snooping statements have moved to a different hierarchy level.

Table 13: DHCP Snooping Statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { secure-access-port { dhcp-snooping-file { location <i>local_pathname</i> <i>remote_URL</i>; timeout <i>seconds</i>; write-interval <i>seconds</i>; } } </pre>	<pre> system [processes [dhcp-service dhcp-snooping-file <i>local_pathname</i> <i>remote_URL</i>; write-interval <i>interval</i>; }] } </pre>

Changes to Configuring VLANs

The statements for configuring VLANs have moved to a different hierarchy level.

NOTE: When configuring xSTP on EX4300 and EX4600 switches, you must add all the interfaces in the applied VLANs in configurations. For MSTP, configure all interfaces in all VLANs at the [edit protocols mstp interface] hierarchy level.

Table 14: VLAN hierarchy

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { secure-access-port vlan (all <i>vlan-name</i>) { mac-move-limit } } </pre>	<pre> vlangs <i>vlan-name</i> switch-options { mac-move-limit } </pre>
<pre> ethernet-switching-options { static { vlan <i>vlan-id</i> { mac <i>mac-address</i> next-hop <i>interface-name</i>; ... } } } </pre>	<p>NOTE: Statement is replaced with a new statement and has moved to a different hierarchy level.</p> <pre> vlangs { <i>vlan-name</i> { switch-options { interface <i>interface-name</i> { static-mac <i>mac-address</i>; ... } } } } </pre>
<pre> vlangs { <i>vlan-name</i> { interface <i>interface-name</i> { egress; ingress; mapping (native (push swap) policy tag (push swap)); pvlan-trunk; ... } } } </pre>	<p>These statements have been removed. You can assign interfaces to a VLAN using the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching vlan members <i>vlan-name</i>] hierarchy.</p>

Table 14: VLAN hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre>vlan { vlan-name { isolation-id id-number; ... } }</pre>	Statements have been removed.
<pre>vlan { vlan-name { l3-interface vlan.logical-interface-number; ... } }</pre>	<p>NOTE: Syntax is changed.</p> <pre>vlan { vlan-name { l3-interface irb.logical-interface-number; ... } }</pre>
<pre>vlan { vlan-name { l3-interface-ingress-counting layer-3-interface-name; ... } }</pre>	Statement is removed. Ingress traffic is automatically tracked.
<pre>vlan { vlan-name { no-local-switching; ... } }</pre>	Statement is removed.
<pre>vlan { vlan-name { no-mac-learning; ... } }</pre>	<p>Statement has been moved to different hierarchy.</p> <pre>vlan { vlan-name { switch-options { no-mac-learning limit ... } } }</pre>
<pre>vlan { vlan-name { primary-vlan vlan-name; ... } }</pre>	Statement has been removed.
<pre>vlan { vlan-name { vlan-prune; ... } }</pre>	Statement is removed.

Table 14: VLAN hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre>vlan { vlan-name { vlan-range <i>vlan-id-low-vlan-id-high</i>; ... } }</pre>	<p>NOTE: Statement has been replaced with a new statement.</p> <pre>vlan { vlan-name { <i>vlan-id-list</i> [<i>vlan-id-numbers</i>]; ... } }</pre>
<pre>vlan { vlan-name { l3-interface <i>vlan.logical-interface-number</i>; ... } }</pre>	<p>NOTE: Syntax is changed.</p> <pre>vlan { vlan-name { l3-interface <i>irb.logical-interface-number</i>; ... } }</pre>

Table 15: Statements Moved to a Different Hierarchy

Original Hierarchy	Changed Hierarchy
<pre>vlan { vlan-name { dot1q-tunneling { customer-vlans (<i>id</i> <i>native</i> <i>range</i>); layer2-protocol-tunneling all <i>protocol-name</i> { drop-threshold <i>number</i>; shutdown-threshold <i>number</i>; ... } } } }</pre>	<pre>interface <i>interface-name</i> { encapsulation extended-vlan-bridge; <i>flexible-vlan-tagging</i>; <i>native-vlan-id number</i>; unit <i>logical-unit-number</i> { <i>input-vlan-map action</i>; <i>output-vlan-map action</i>; <i>vlan-id number</i>; <i>vlan-id-list</i> [<i>vlan-id vlan-id-vlan-id</i>]; } }</pre>
<pre>vlan { vlan-name { filter { input <i>filter-name</i> output <i>filter-name</i>; ... } } }</pre>	<pre>vlan { vlan-name { forwarding-options { filter { input <i>filter-name</i> output <i>filter-name</i>; ... } } } }</pre>

Table 15: Statements Moved to a Different Hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre> vlangs { vlan-name { mac-limit limit action action; ... } } </pre>	<pre> vlangs { vlan-name { switch-options { interface-mac-limit limit { packet-action action; ... } } } } vlangs { vlan-name { switch-options { interface interface-name { interface-mac-limit limit { packet-action action; ... } } } } } </pre>
<pre> vlangs { vlan-name { mac-table-aging-time seconds; ... } } </pre>	<pre> protocols { l2-learning { global-mac-table-aging-time seconds; ... } } </pre>

Changes to Storm Control Profiles

Storm control is configured in two steps. The first step is to create a storm control profile at the **[edit forwarding-options]** hierarchy level, and the second step is to bind the profile to a logical interface at the **[edit interfaces]** hierarchy level. See *Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches* for the changed procedure.

Table 16: Changes to the Storm Control Profile hierarchy level

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { storm-control { (...) } } </pre>	<pre> forwarding-options { storm-control-profiles profile-name { (...) } } interfaces interface-name unit number family ethernet-switching { storm-control storm-control-profile; } </pre>

Changes to the Interfaces Hierarchy

NOTE: Statements have been moved to a different hierarchy.

Table 17: Changes to the Interfaces hierarchy

Original Hierarchy	Changed Hierarchy
<pre> interfaces <i>interface-name</i> { ether-options { link-mode <i>mode</i>; speed (auto-negotiation <i>speed</i>) } } </pre>	<pre> interfaces <i>interface-name</i> { link-mode <i>mode</i>; speed <i>speed</i>) } </pre>
<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { native-vlan-id <i>vlan-id</i> } } } </pre>	<pre> interfaces <i>interface-name</i> { native-vlan-id <i>vlan-id</i> } </pre>
<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { port-mode <i>mode</i> } } } </pre>	<p>NOTE: Statement has been replaced with a new statement.</p> <pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { interface-mode <i>mode</i> } } } </pre>
<pre> interfaces vlan </pre>	<p>NOTE: Statement has been replaced with a new statement.</p> <pre> interfaces irb </pre>

Changes to IGMP Snooping

Table 18: IGMP Snooping hierarchy

Original Hierarchy	Changed Hierarchy
<pre> protocols { igmp-snooping { traceoptions { file filename <files number> <no-stamp> <replace> <size maximum-file-size> <world-readable no-world-readable>; flag flag <flag-modifier> <disable>; } vlan (all vlan-identifier) { disable; data-forwarding { receiver { install; source-vlans vlan-name; } source { groups ip-address; } } immediate-leave; interface (all interface-name) { multicast-router-interface; static { group multicast-ip-address; } } proxy { source-address ip-address; } robust-count number; } } } </pre>	<pre> protocols { igmp-snooping { vlan vlan-name { immediate-leave; interface interface-name { group-limit <1..65535> host-only-interface multicast-router-interface; immediate-leave; static { group multicast-ip-address { source <> } } } } l2-querier { source-address ip-address; } proxy { source-address ip-address; } query-interval number; query-last-member-interval number; query-response-interval number; robust-count number; traceoptions { file filename <files number> <no-stamp> <replace> <size maximum-file-size> <world-readable no-world-readable>; flag flag <flag-modifier>; } } } </pre>

Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in [Figure 1](#).

Figure 1: Commands That Combine Other Commands

The **request support information** command provides output from a combination of other operational commands.

```

user@host> request support information

root@host> show system uptime

Current time: 2007-02-16 13:10:08 PST
System booted: 2007-02-02 09:21:50 PST (2w0d 03:48 ago)
Protocols started: 2007-02-02 09:24:42 PST (2w0d 03:45 ago)
Last configured: 2007-02-16 03:04:58 PST (10:05:10 ago) by root
1:10PM up 14 days, 3:48, 2 users, load averages: 0.01, 0.02, 0.00

root@host> show version detail

Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 58](#)
- [Commonly Used Operational Mode Commands on page 59](#)

CLI Command Categories

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.

- **clear**—Clear statistics and protocol database information.
- **mtrace**—Trace mtrace packets from source to receiver.
- **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
- **ping**—Determine the reachability of a remote network host.
- **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
- **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
- **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the [CLI Explorer](#).
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the [CLI Explorer](#).
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the [CLI Explorer](#).
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the [CLI Explorer](#).
- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the [CLI Explorer](#).
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see “[Understanding Junos OS CLI Configuration Mode](#)” on page 63.
- A command—**quit**—to exit the CLI. For information about this command, see the [CLI Explorer](#).
- For more information about the CLI operational mode commands, see the [CLI Explorer](#).

Commonly Used Operational Mode Commands

[Table 19](#) lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

Table 19: Commonly Used Operational Mode Commands

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	show version
Log files	Contents of the log files	monitor
	Log files and their contents and recent user logins	show log
Remote systems	Host reachability and network connectivity	ping
	Route to a network system	traceroute
Configuration	Current system configuration	show configuration
Manipulate files	List of files and directories on the router or switch	file list
	Contents of a file	file show
Interface information	Detailed information about interfaces	show interfaces
Chassis	Chassis alarm status	show chassis alarms
	Information currently on craft display	show chassis craft-interface
	Router or switch environment information	show chassis environment
	Hardware inventory	show chassis hardware
Routing table information	Information about entries in the routing tables	show route
Forwarding table information	Information about data in the kernel's forwarding table	show route forwarding-table
IS-IS	Adjacent routers or switches	show isis adjacency
OSPF	Display standard information about OSPF neighbors	show ospf neighbor
BGP	Display information about BGP neighbors	show bgp neighbor

Table 19: Commonly Used Operational Mode Commands (*continued*)

Items to Check	Description	Command
MPLS	Status of interfaces on which MPLS is running	show mpls interface
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	show mpls lsp
	Routes that form a label-switched path	show route label-switched-path
RSVP	Status of interfaces on which RSVP is running	show rsvp interface
	Currently active RSVP sessions	show rsvp session
	RSVP packet and error counters	show rsvp statistics

Overview of Navigating the CLI

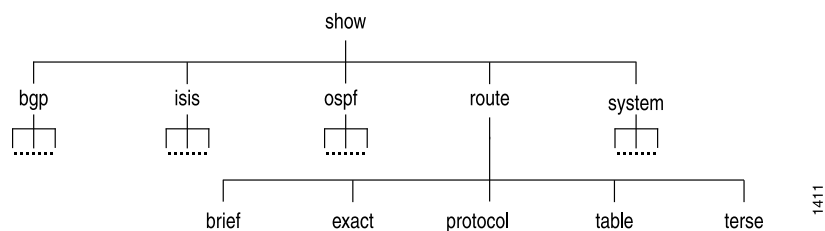

This topic describes how to navigate the CLI.

- [CLI Command Hierarchy on page 61](#)
- [CLI Configuration Statements on page 62](#)
- [Moving Among Hierarchy Levels on page 62](#)

CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command. [Figure 2](#) illustrates a portion of the **show** command hierarchy.

Figure 2: CLI Command Hierarchy

To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of your Ethernet switching options for your interfaces, use the command **show ethernet-switching-options interfaces**.

CLI Configuration Statements

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

Moving Among Hierarchy Levels

You can use the CLI commands to navigate the levels of the configuration statement hierarchy:

- **edit**— Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
- **exit**— Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the **edit** command. Alternatively, you can use the **quit** command. The **exit** and **quit** commands are interchangeable.
- **up**— Moves up the hierarchy one level at a time.
- **top**— Moves directly to the top level of the hierarchy.

Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

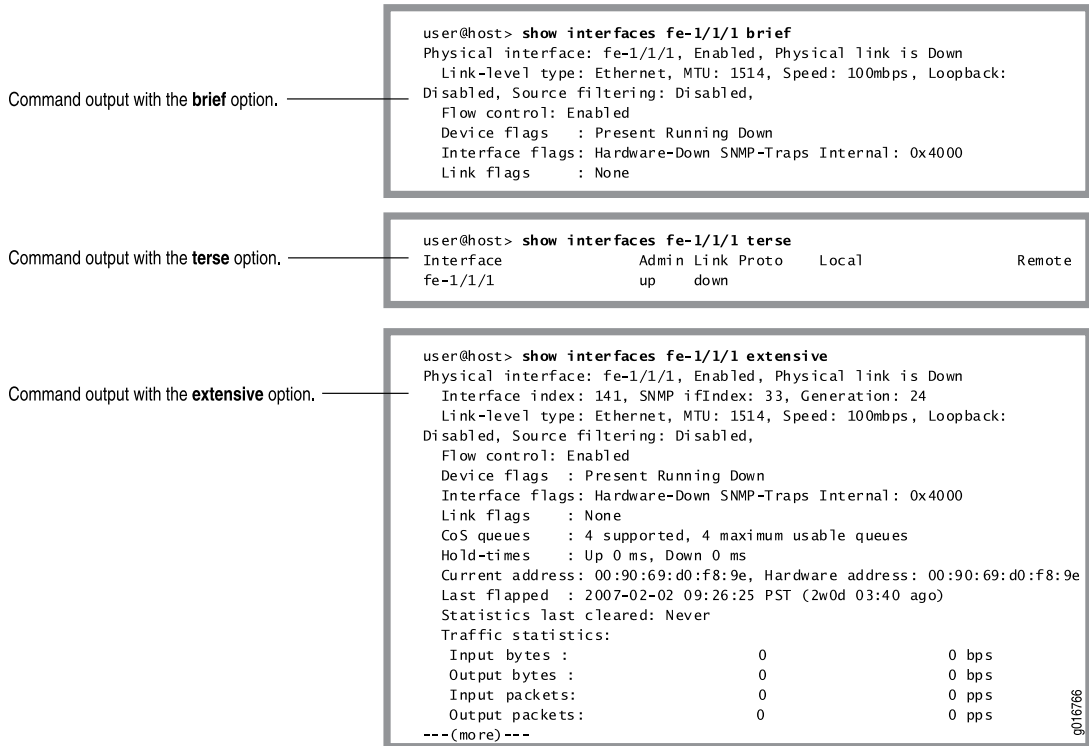

1. Use the **?** prompt to list options available for the command. For example:

```
user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>          Execute this command
brief              Display brief output
descriptions       Display interface description strings
detail             Display detailed output
extensive          Display extensive output
media              Display media information
snmp-index         SNMP index of interface
```

statistics	Display statistics and detailed output
terse	Display terse output
	Pipe through a command

2. Choose the option you wish to use with the command. (See [Figure 3.](#))

Figure 3: Command Output Options

Understanding Junos OS CLI Configuration Mode

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*, a router configuration is stored as a hierarchy of statements. In configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- [Configuration Mode Commands on page 65](#)
- [Configuration Statements and Identifiers on page 66](#)
- [Configuration Statement Hierarchy on page 68](#)

Configuration Mode Commands

Table 20 summarizes each CLI configuration mode command. The commands are organized alphabetically.

Table 20: Summary of Configuration Mode Commands

Command	Description
activate	Remove the inactive: tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the commit command.
annotate	Add comments to a configuration. You can add comments only at the current hierarchy level.
commit	Commit the set of changes to the database and cause the changes to take operational effect.
copy	Make a copy of an existing statement in the configuration.
deactivate	Add the inactive: tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the commit command.
delete	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
edit	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
exit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The quit and exit commands are synonyms.
extension	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
help	Display help about available configuration statements.
insert	Insert an identifier into an existing hierarchy.
load	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 20: Summary of Configuration Mode Commands (*continued*)

Command	Description
quit	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The quit and exit commands are synonyms.
rename	Rename an existing configuration statement or identifier.
replace	Replace identifiers or values in a configuration.
rollback	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the commit configuration command.
run	Run a top-level CLI command without exiting from configuration mode.
save	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
set	Create a statement hierarchy and set identifier values. This is similar to edit except that your current level in the hierarchy does not change.
show	Display the current configuration.
status	Display the users currently editing the configuration.
top	Return to the top level of configuration command mode, which is indicated by the [edit] banner.
up	Move up one level in the statement hierarchy.
update	Update a private database.
wildcard	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 21 describes top-level CLI configuration mode statements.

NOTE: The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

Table 21: Configuration Mode Top-Level Statements

Statement	Description
access	Configure the Challenge Handshake Authentication Protocol (CHAP). For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
accounting-options	Configure accounting statistics data collection for interfaces and firewall filters. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
chassis	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
class-of-service	Configure class-of-service parameters. For information about the statements in this hierarchy, see the <i>Class of Service Feature Guide for Routing Devices</i> .
firewall	Define filters that select packets based on their contents. For information about the statements in this hierarchy, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i> .
forwarding-options	Define forwarding options, including traffic sampling options. For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
groups	Configure configuration groups. For information about statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
interfaces	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
policy-options	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. For information about the statements in this hierarchy, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i> .
protocols	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the <i>Junos OS Routing Protocols Library for Routing Devices</i> and the <i>MPLS Applications Feature Guide for Routing Devices</i> .

Table 21: Configuration Mode Top-Level Statements (*continued*)

Statement	Description
routing-instances	Configure multiple routing instances. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
routing-options	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
security	Configure IP Security (IPsec) services. For information about the statements in this hierarchy see the <i>Junos OS Administration Library for Routing Devices</i> .
snmp	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
system	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .

For specific information on configuration statements, see the Junos OS configuration guides.

Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see [Figure 4](#)). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 4: Configuration Mode Hierarchy of Statements

Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. Figure 4 illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in Figure 4 as **[edit protocols ospf area *area-number* interface *interface-name*]** and displays the configuration as follows:

```
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
      interface so-0/0/1 {
        hello-interval 5;
      }
    }
  }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain “oneliners” at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric 10** is a oneliner because the **level** container statement with identifier **1**, its child statement **metric**, and its corresponding attribute **10** all appear on a single line in the hierarchy:

```
[edit protocols]
isis {
  interface ge-0/0/0.0 {
    level 1 metric 10;
  }
}
```

Likewise, in the following example, **dynamic-profile *dynamic-profile-name* aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier ***dynamic-profile-name***, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

PART 4

Dynamic Host Control Protocol (DHCP)

- [Understanding DHCP on page 73](#)

CHAPTER 4

Understanding DHCP

- [Understanding DHCP Services for Switches on page 73](#)
- [Configuring a DHCP Client \(CLI Procedure\) on page 77](#)
- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 78](#)

Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

This topic describes:

- [DHCP Client/Server Model on page 73](#)
- [Using DHCP on page 74](#)
- [DHCP Relay Servers and DHCP Servers on page 74](#)
- [Legacy DHCP and Extended DHCP for Server Versions on page 75](#)
- [Configuring DHCP on a Switch on page 76](#)
- [How DHCP Works on page 76](#)

DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See [Figure 5](#).

Figure 5: DHCP Client/Server Model

Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, the new software is downloaded and installed. See [“Upgrading Software by Using Automatic Software Download” on page 7](#).

DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server. For directions on configuring a DHCP relay server, see *DHCP/BOOTP Relay for Switches Overview*.

Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series, QFX Series, and OCX Series switches. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch. See *EX Series Switch Software Features Overview* for a list of switches that support the extended DHCP server.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients. For details, see *High Availability Features for EX Series Switches Overview*.
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see *Understanding Virtual Routing Instances on EX Series Switches*.

NOTE: Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See *EX Series Switch Software Features Overview* for a list of switches that support extended DHCP (VR-aware DHCP).

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in [Table 22](#):

Table 22: Legacy DHCP and Extended DHCP Server Hierarchy Levels

DHCP Service	Hierarchy
Extended DHCP server	<code>edit system services dhcp-local-server</code>
Extended DHCP address pool	<code>edit access address-assignment pool</code>
Legacy DHCP server	<code>edit system services dhcp</code>
Legacy DHCP relay	<code>edit forwarding-options helpers bootp</code>
Extended DHCP relay	<code>edit forwarding-options dhcp-relay</code>
Legacy DHCP address pool	<code>edit system services dhcp pool</code>

DHCP clients on a switch are always configured at the hierarchy level `[edit interfaces interface-name family dhcp]`.

Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

For directions for configuring either a legacy DHCP server or an extended DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 78](#).

To configure a DHCP client, set the client's DHCP interface address in the **[edit interfaces interface-name unit 0 family inet dhcp]** hierarchy. For directions for configuring a DHCP client on a switch, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 77](#).

How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See [Figure 6](#).

Figure 6: DHCP Four-Step Transfer

NOTE: Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

Related Documentation

- [Configuring an Extended DHCP Relay Server on EX Series Switches \(CLI Procedure\)](#)
- [Configuring a DHCP SIP Server \(CLI Procedure\)](#)
- [Upgrading Software by Using Automatic Software Download on page 7](#)
- [Monitoring DHCP Services](#)

Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 78](#) or [Configuring a DHCP Server on Switches \(CLI Procedure\)](#).

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in [Table 23](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

Table 23: DHCP Client Settings

Configuration Statement	Description
client-identifier	Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.
lease-time	Time in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.
retransmission-attempt	Number of times the client attempts to retransmit a DHCP packet.
retransmission-interval	Time between transmission attempts.
server-address	IP address of the server that the client queries for an IP address.

Table 23: DHCP Client Settings (*continued*)

Configuration Statement	Description
update-server	TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.
vendor-option	Vendor class ID (CPU's manufacturer ID string) for the DHCP client.

**Related
Documentation**

- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 78](#)
- [Understanding DHCP Services for Switches on page 73](#)

Configuring a DHCP Server on Switches (CLI Procedure)

NOTE: This task uses Junos OS for EX Series switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring a DHCP Server on Switches (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 41.

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

A DHCP configuration consists of two components—an optional reconfiguration of default settings on DHCP clients and the configuration of a DHCP server. This topic covers configuration of the DHCP server. For information about reconfiguring a DHCP client, see “[Configuring a DHCP Client \(CLI Procedure\)](#)” on page 77.

You can configure either of two versions of a DHCP server on a switch— the extended server version or the legacy server version. We recommend that you configure the extended server unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 79](#)
2. [Configuring a Legacy DHCP Server on a Switch \(CLI Procedure\) on page 79](#)

Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before it assigns them to clients.

1. Create an address pool for DHCP IP addresses:

```
[edit]
user@switch# set access address-pool address-pool
```

2. Configure an address-assignment pool that can be used by different client applications for DHCP dynamic assignment:

```
[edit access address-assignment]
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface name for DHCP:

```
[edit system services dhcp-local-server]
user@switch# set group group-name interface interface-name
```

4. (Optional) Process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]
user@switch# set overrides process-inform
```

5. (Optional) Redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first
```

6. (Optional) Enable dynamic reconfiguration triggered by the DHCP extended server for all DHCP clients or only for the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]
user@switch# set reconfigure

[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure
```

Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

```
[edit system services dhcp]
user@switch# set pool network-range
```

NOTE: Step 2 through Step 15 are for assigning global values at the `[edit system services dhcp]` hierarchy level. You can also assign the same values to a specific pool by using those same commands at the `[edit system services dhcp pool network-range]` hierarchy level.

2. (Optional) Change the domain search list used to resolve hostnames:

```
[edit system services dhcp]
user@switch# set domain-search [ domain-list ]
```

3. (Optional) Change the domain name server (DNS) name that the DHCP server advertises to clients:

```
[edit system services dhcp]
user@switch# set name-server address
```

4. (Optional) Change the DHCP options:

```
[edit system services dhcp]
user@switch# set option id-number
```

5. (Optional) Change the devices advertised to clients:

```
[edit system services dhcp]
user@switch# set router address
```

6. (Optional) Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete the DHCP setup. This configuration step is equivalent to DHCP Option 66:

```
[edit system services dhcp]
user@switch# set boot-server (address | hostname)
```

7. (Optional) Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. This configuration step is equivalent to DHCP Option 67:

```
[edit system services dhcp]
user@switch# set boot-file filename
```

8. (Optional) Change the SIP server:

```
[edit system services dhcp]
user@switch# set sip-server addresses-or-names
```

For more information, see *Configuring a DHCP SIP Server (CLI Procedure)*.

9. (Optional) Change the DHCP client's hardware address:

```
[edit system services dhcp]
user@switch# set static-binding mac-address
```

10. (Optional) Change the NetBIOS name server:

```
[edit system services dhcp]
user@switch# set wins-server address
```

PART 5

Internet Control Message Protocol (ICMP)

- [Understanding ICMP on page 85](#)

CHAPTER 5

Understanding ICMP

- [Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 85](#)
- [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 86](#)
- [Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages on page 86](#)

Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]  
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]  
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

Related Documentation

- [Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 86](#)

Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets

By default, the Routing Engine responds to Internet Control Message Protocol (ICMP) echo requests sent to multicast group addresses. To disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses, include the **no-multicast-echo** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-multicast-echo;
```

By configuring the Routing Engine to ignore multicast ping packets, you can prevent unauthorized persons from discovering the list of provider edge (PE) routers or switches in the network.

- Related Documentation**
- [Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 19](#)

Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

To limit the rate at which ICMPv4 messages can be generated and received by the Routing Engine, include the **icmpv4-rate-limit** statement at the **[edit system internet-options]** hierarchy level:

```
icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
```

The bucket size is the number of seconds in the rate-limiting bucket. The packet rate is the rate-limiting packets earned per second. Specify a **bucket-size** from 0 through 4294967295 seconds. The default value is 5 seconds. Specify a **packet-rate** from 0 through 4,294,967,295. The default value is 1000.

- [Downgrading Junos OS from Upgraded FreeBSD on page 102](#)

Understanding Junos OS with Upgraded FreeBSD

Starting with Junos OS Release 15.1, certain hardware platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD. Basing Junos OS on the newer kernel provides Junos OS with sophisticated processing, efficiency, and security features which do not then have to be reproduced in Junos OS.

NOTE: Upgrading to Junos OS Release 15.1 reformats the file system. Only specific files and directories are preserved unless precautions are taken. For details, see [“Upgrading Junos OS with Upgraded FreeBSD” on page 96](#).

Junos OS with an upgraded FreeBSD kernel provides a clean-slate implementation of Junos OS on top of a pristine (minimally modified) and current version of the FreeBSD OS.

NOTE: In Junos OS releases earlier than 15.1, the partition swap pages were counted as part of the memory file system partition. Using this method leaves 4 GB of memory as the maximum that is theoretically accessible when you are using a 32-bit image. However, when Junos OS with upgraded FreeBSD is run, the system only counts the actual partition size, which leaves around 3.4 GB of available physical address space, or only 3 GB of usable RAM. Therefore, we recommend you use a 64-bit image with Junos OS with upgraded FreeBSD.

The platforms currently running Junos OS with upgraded FreeBSD are listed in [Table 24](#).

Table 24: Upgraded FreeBSD Kernel Support by Hardware Platform

Platforms	CPU Type	Release Introduced
MX240, MX460, MX960, MX2010, MX2020	Intel	15.1
EX9200	Intel	15.1

The major processing changes are as follows:

- Interactions between Junos OS and the upgraded FreeBSD kernel use well-established interfaces because Junos OS is now layered on a minimally modified and current version of FreeBSD.
- Symmetric multiprocessing (SMP) is enabled by default.
- FreeBSD provides a consistent runtime environment for all Junos OS platforms.

There are also major changes in file structures and software packages. These changes are as follows:

- New packages use XML description files instead of scripts.
- Hybrid packages are used to install legacy or replacement build images in the general form **junos-upgrade-x.tgz** where x is a variable such as **mx-x86-64-15.1-20150114** (the whole package name is **junos-upgrade-mx-x86-64-15.1-20150114.tgz**).
- Multiple package sets (a collection of installed packages) are stored on the router at the same time. Sets can be either active (the currently used set), pending (the set that should be used at the next reboot), or previous (a formerly active set). Non-recovery snapshots (but not recoverable image snapshots) are available for the package sets to preserve package content lists.

There is now a separate Operations, Administration, and Maintenance (OAM) volume (**oam**) distinct from the Junos OS volume (**junos**). This provides support for downgrades from replacement build images (that is, those using the upgraded FreeBSD kernel) to the legacy Junos OS with a different kernel. The OAM volume allows you to recover the Junos OS volume using recovery snapshots.

One major change is the distinction between recovery snapshots and non-recovery snapshots.

The major characteristics of the recovery snapshots are as follows:

- Recovery snapshots are full copies of the packages and configuration taken at the time the snapshot command is issued.
- Recovery snapshots reside on the OAM volume or USB medium.

The major characteristics of the non-recovery snapshots are as follows:

- Non-recovery snapshots are snapshots residing on the Junos OS volume that refer to the current running set of packages and a copy of the configuration at the time the snapshot command is issued.
- Non-recovery snapshots do not need to copy the whole Junos OS installation and so are very fast.
- Non-recovery snapshots can be requested as the boot image for the next reboot.

The upgraded FreeBSD kernel requires changes to several commands and statements and their related parameters. The new and changed actions are summarized in [Table 25](#). For details on the changes, see the topics covering the specific command or statement.

Table 25: New and Changed Commands and Statements for Junos OS with Upgraded FreeBSD

Command or Statement	Release Introduced	Change
<code>request system snapshot delete <i>snapshot</i></code>	15.1	New action
<code>request system snapshot recovery</code>	15.1	New action
<code>request system snapshot load <i>snapshot</i></code>	15.1	New action
<code>request system recover <i>volume</i></code>	15.1	New action: <i>volume</i> is either <code>/junos-volume</code> or <code>/oam-volume</code>
<code>request system snapshot</code>	15.1	Changed action
<code>show system snapshot</code>	15.1	Changed action
<code>request system reboot <i>media</i></code>	15.1	Changed action with new media options

The new FreeBSD kernel also requires that several commands and statements are now deprecated. In some cases, these commands and statements generate an error, and, in other cases, the result is appropriate for the new kernel. The deprecated commands and statements are summarized in [Table 26](#). For details, see the topics covering the specific command or statement.

Table 26: Deprecated Commands and Statements for Junos OS with Upgraded FreeBSD

Deprecated Command or Configuration Statement	Release Deprecated
Deprecated Command	
<code>request system partition abort</code>	15.1
<code>request system partition compact-flash</code>	15.1
<code>request system partition hard-disk</code>	15.1

Table 26: Deprecated Commands and Statements for Junos OS with Upgraded FreeBSD (*continued*)

Deprecated Command or Configuration Statement	Release Deprecated
<code>request system snapshot <config-partition></code>	15.1
<code>request system snapshot <root-partition></code>	15.1
<code>request system snapshot <slice></code>	15.1
<code>request system software delete-backup</code>	15.1
<code>request system software rollback <force></code>	15.1
<code>show system processes providers</code>	15.1
<code>show system snapshot <slice></code>	15.1
Deprecated Configuration Statement	
<code>set system mirror-flash-on-disk</code>	15.1

Understanding Junos OS with Upgraded FreeBSD Package Names

Starting with Junos OS Release 15.1, certain hardware platforms run a Junos OS based on an upgraded FreeBSD kernel (hereafter called Junos OS with upgraded FreeBSD). In releases earlier than Junos OS Release 15.1, software packages came in several major software package categories, such as domestic, world-wide, or Federal Information Processing Standard (FIPS). However, Junos OS with upgraded FreeBSD has a new naming convention: There is only one category, and FIPS, instead of being a separate category, is an option you select on installation. This topic describes the simplified naming convention for Junos OS with upgraded FreeBSD.

If your hardware platform is listed in the table in [“Understanding Junos OS with Upgraded FreeBSD” on page 89](#), then you must use the new package names for download and installation.

The components of the new package naming conventions are as follows:

- **Prefix**—This is normally **junos-install**. This prefix takes the place of what was called a bundle name, but we do use the term *bundle* in the new package naming convention.
- **Media keyword**—Added to the prefix, a media keyword is only used when the image is not for use with the **request system software add** command. Values for the **media** keyword include **usb** for images installed from a USB drive or **net** for images installed over a network, for example, the entire prefix of your package might be **junos-install-usb-**.
- **Platform**—This field indicates the major product group, such as **mx** or **qfx**.
- **Architecture**—This field indicates the CPU architecture of the platforms. Values include **x86** for Intel and **arm** for Advanced RISC Machines CPUs.
- **Application Binary Interface (ABI)**—This field indicates the “word length” of the CPU architecture. Values include **32** for 32-bit architectures and **64** for 64-bit architectures.
- **Release**—This field indicates the release number, such as **15.1R1.9**.
- **Edition**—The edition field is null (empty) for the standard (domestic) images. For the Russian Trade Zone (RTZ) images, this field is set to **limited**.

As before, all images are in tarred and gzipped (**.tgz**) format.

NOTE: There are no longer “export” World-Wide images or separate FIPS images. The keyword “signed” no longer appears because all Junos OS images are signed for validation.

Examples of valid Junos OS software package names include the following:

- **junos-install-mx-x86-32-15.1R1.9.tgz**—an image for a supported MX platform outside the RTZ.
- **junos-install-mx-x86-32-15.1R1.9-limited.tgz**—an image for a supported MX platform used in the RTZ.
- **junos-install-usb-mx-x86-32-15.1R1.9.tgz**—an image stored on and installed from a USB drive for a supported MX platform outside the RTZ.

Because an upgrade to Junos OS with upgraded FreeBSD from a release earlier than Junos OS 15.1 restructures the disk file system, you can lose many configuration and log files that you might want to keep. Items that are essential can be preserved by moving or copying them to the **/var/preserve** directory.

Understanding Junos OS with Upgraded FreeBSD Disk Volumes

Starting with Junos OS Release 15.1, certain hardware platforms have a new disk naming convention. These platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD.

The hardware platforms listed in the table in [“Understanding Junos OS with Upgraded FreeBSD” on page 89](#) have two volumes. The main device is the **/junos** volume and contains all of the software and files needed for the day-to-day running of the device. The compact flash drive is the **/oam** volume and stores recovery snapshot backup information. In case of failure of the main drive (that is, the **/junos** volume), the **/oam** volume can be used to boot the system.

Because the **/junos** and **/oam** volumes have very different purposes, their content is different. Technically, these volumes are **dev/gpt/oam** and **dev/gpt/junos**, but the short forms (**/junos** and **/oam**) are used in this topic. Essentially, the **/junos** volume is used for the running device software and holds configuration information and logs, whereas the **/oam** volume is used for backup copies of everything needed in the event that the **/junos** volume fails.

The **/junos** volume contains a directory named **/packages/db** that has all the components present on the device, such as **os-kernel-123**, **os-kernel-456**, and so on. A sibling directory named **/package-sets** is also present. Package sets are an important concept in Junos OS with upgraded FreeBSD.

The **/package-sets** directory contains a package listing that gathers all the components of the running Junos OS into an XML format in the **/active** subdirectory. So **os-kernel-123** could be a component in the **/package-sets/active** subdirectory, but then **os-kernel-456** could not be in the same XML package. Package sets do not contain the kernel software itself (for example), but tell the device where to find the kernel component needed for the software package. The same kernel can be present in several package listings, but only one package can be active and running on the device at any given time.

There are several directories on the **/junos** volume where a particular software package listing can be found:

- **/previous**—The package set in this directory contains the list of all the components that ran on the device before the last upgrade.
- **/active**—The package set in this directory contains the list of all the software components currently running on the device.
- **/pending**—The package set in this directory contains the list of all the software components on the device that will run after the next reboot.

NOTE: After a successful reboot, the package set in the **/pending** directory becomes the active package set, and the package set in the **/active** directory becomes the previous set.

The **/junos** volume also contains non-recovery snapshots taken with the **request system snapshot** command. These types of snapshots are new to Junos OS with upgraded FreeBSD and cannot be used for recovery of a failed system. Non-recovery snapshots are a special type of package set that includes a copy of the configuration. There can be many non-recovery snapshots on the device, and the files can be renamed. Multiple non-recovery snapshots, essentially lists of software components and configuration files, can be helpful when major software or configuration changes are occurring and establishment of a known stable system baseline is required.

On the other hand, a recovery snapshot, created with the **request system snapshot recovery** command, is stored on the **/oam** volume and is always replaced when a new recovery snapshot is taken.

The **/oam** volume should contain all the information needed to reboot the system if there is a failure of the **/junos** volume and restore the system to the state running at the time of the failure. In order to perform this reboot, the **/oam** volume needs to have all of the information required to provide the system with a running configuration. This information is provided by the recovery snapshot, created with the **request system snapshot recovery** command. Although it can take a while to perform, the recovery snapshot establishes an **.izo** or **.iso** image of the running Junos OS.

In the case of a total failure of the **/junos** volume, the system can be booted from the **/oam** volume. The recovery snapshot can then restore the repaired system.

Understanding Junos OS with Upgraded FreeBSD Snapshots

Starting with Junos OS Release 15.1, certain hardware platforms have two types of snapshots. These platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD. The two types of snapshots have different content, locations, and purposes, so it is important that they are created and maintained properly. One major change is the distinction between recovery snapshots and non-recovery snapshots. The hardware platforms listed in the table in “[Understanding Junos OS with Upgraded FreeBSD](#)” on page 89 have these two different types of snapshots.

Recovery snapshots are full copies of the packages and configuration taken at the time the snapshot command is issued. Recovery snapshots reside on the OAM volume or USB medium. Recovery snapshots take some time to complete because of the level of detail captured. Recovery snapshots can be used to recover the Junos OS volume. There is only ever one recovery snapshot on the system.

On the other hand, non-recovery snapshots are snapshots residing on the Junos OS volume that refer to the current running set of packages and a copy of the configuration at the time the snapshot command is issued. Non-recovery snapshots do not need to copy the whole Junos OS installation and so are very fast. They also consume little space, except for the **config.tgz** file. Non-recovery snapshots can be requested as the boot image for the next reboot. You can rename non-recovery snapshots and retain more than one.

You rename the non-recovery snapshots with the same procedure used to rename any other file on the system.

NOTE: We recommend that you generate both a non-recovery and a recovery snapshot after you successfully upgrade to Junos OS with upgraded FreeBSD. These snapshots should be refreshed periodically.

Package sets relate to non-recovery and recovery snapshots. The **/active**, **/pending**, and **/previous** sets are all package sets. A non-recovery snapshot is also a package set in a sense, with the addition of a copy of the configuration at the time that the non-recovery snapshot is taken.

Packages that are no longer referenced by any package set or non-recovery snapshot are automatically deleted. We recommend deleting any old non-recovery snapshots after an upgrade so that old packages can be deleted and space recovered.

Some helpful commands for non-recovery snapshots are:

- **request system snapshot**—Use this command to create a non-recovery snapshot.
- **show system snapshot**—Use this command to list all the available non-recovery snapshots.
- **request system snapshot delete**—Use this command to delete a non-recovery snapshot.
- **request system snapshot recovery**—Use this command to create a recovery snapshot. You can use other parameters to determine the details of the recovery snapshot created. There is only ever one recovery snapshot on the system.

Upgrading Junos OS with Upgraded FreeBSD

Starting with Junos OS Release 15.1, certain hardware platforms run an upgraded FreeBSD kernel instead of older versions of FreeBSD.

Before you begin:

1. Verify that the upgrade applies to your router or switch model, as listed in [“Understanding Junos OS with Upgraded FreeBSD” on page 89](#).
2. Download the Junos OS package.

The current Junos OS release determines the upgrade path to Junos OS with upgraded FreeBSD, as shown in [Table 27](#). Other upgrade paths might work, but they are not supported.

Table 27: Upgrade Path to Junos OS with the Upgraded FreeBSD

Current Router's Junos OS Release	Upgrade Path
12.3 or earlier	Upgrade to 13.3. or 14.2 first, then upgrade to 15.1 or later (multiple steps).
13.3 or later	Use upgrade package to upgrade from the current Junos OS release to Junos OS with upgraded FreeBSD (single step).
15.1 or later	Use upgrade package to upgrade from the current Junos OS release to Junos OS with upgraded FreeBSD (single step).

NOTE: You can also downgrade from Junos OS Release 15.1 to an earlier release of Junos OS, as long as the path complies with the Junos OS policy of skipping at most two releases earlier.

The upgrade process only preserves the following directories:

- `/config`
- `/etc/localtime`
- `/var/db`
- `/var/etc/master.passwd`
- `/var/etc/inetd.conf`
- `/var/etc/pam.conf`
- `/var/etc/resolv.conf`
- `/var/etc/syslog.conf`
- `/var/etc/localtime`
- `/var/etc/exports`
- `/var/etc/extensions.allow`
- `/var/preserve`
- `/var/tmp/baseline-config.conf`
- `/var/tmp/preinstall_boot_loader.conf`

For specific installation procedures, see the following:

- [To Install Junos OS with Upgraded FreeBSD Over a Plain Junos OS on page 98](#)
- [To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of an Earlier Release on page 101](#)
- [To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of a Later Release on page 102](#)

To Install Junos OS with Upgraded FreeBSD Over a Plain Junos OS

NOTE: If you have important files in other directories, copy them from the router or switch to a secure location before upgrading the router or switch.

NOTE: The following procedure refers to routers, but it also applies to switches.

To install Junos OS with upgraded FreeBSD over a plain Junos OS:

1. Enter the **request system software add *package-name* no-validate** command from the operational mode in the CLI:

NOTE: The **no-copy** option is enabled by default.

Use the **no-validate** option with the **request system software add** command. If you leave out the **no-validate** option, the command uses the **validate** option by default, and direct validation of running configuration does not work for upgrading to Junos OS with upgraded FreeBSD from Junos OS based on older versions of the FreeBSD kernel.

NOTE: You can also use **reboot** option along with **request system software add** command, but it is not recommended to do this in a single step while upgrading from a FreeBSD 6.1 based Junos OS to FreeBSD 10 based Junos OS.

NOTE: To validate current configuration on an upgrade to Junos OS with upgraded FreeBSD from Junos OS, use the **request system software validate on** command.

```
user@host>request system software add
/var/tmp/junos-install-mx-x86-32-15.1R1.9.tgz no-validate
Installing package '/var/tmp/junos-install-mx-x86-32-15.1R1.9.tgz' ...
Verified manifest signed by PackageProductionEc_2015
Verified manifest signed by PackageProductionRSA_2015
```

```

Verified contents.iso
Verified issu-indb.tgz
Verified junos-x86-32.tgz
Verified kernel
Verified metatags
Verified package.xml
Verified pkgtools.tgz
camcontrol: not found
camcontrol: not found
Verified manifest signed by PackageProductionEc_2015
Saving the config files ...
NOTICE: uncommitted changes have been saved in
/var/db/config/juniper.conf.pre-install
Saving package file in
/var/sw/pkg/junos-install-x86-32-domestic-20150618.043753_builder_junos_151_r1.tgz
...
Saving state for rollback ...

```

The new Junos OS image is installed on the router.

2. Reboot the device to start the new software using the **request system reboot** command:

```

user@host> request system reboot
Reboot the system? [yes, no] (no) yes

```

NOTE: You must reboot the device to load the newly installed version of Junos OS on the device.

To abort the installation, do not reboot the device. Instead, finish the installation and then issue the **request system software delete *package-name*** command where package is, for example, **junos-install-mx-x86-32-15.1R1.9.tgz**. This is your last chance to stop the installation.

The software is loaded when you reboot the system. Installation can take between 5 and 10 minutes. The device then reboots from the boot device on which the software was just installed. When the reboot is complete, the device displays the login prompt.

While the software is being upgraded, the Routing Engine on which you are performing the installation does not route traffic.

3. Log in and issue the **show version** command to verify the version of the software installed.

```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of an Earlier Release

NOTE: If you have important files in other directories, copy them from the router or switch to a secure location before upgrading the router or switch.

NOTE: The following procedure refers to routers, but it also applies to switches.

To install Junos OS with upgraded FreeBSD over Junos OS with upgraded FreeBSD of an earlier release:

1. Enter the **request system software add *package-name* validate reboot** command from the operational mode in the CLI:

NOTE: The **no-copy** option is enabled by default.

Use the **validate** and **reboot** options with the **request system software add** command. The command uses the **validate** option by default. We encourage users to validate using the **validate** option when upgrading from Junos OS to Junos OS or from Junos OS with upgraded FreeBSD to Junos OS with upgraded FreeBSD.

If you leave out the **reboot** option, you can take care of that in a separate reboot step.

The new Junos OS image is installed on the router.

2. Verify the installation of Junos OS with upgraded FreeBSD.

```
user@host> show version
```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

To Install Junos OS with Upgraded FreeBSD Over Junos OS with Upgraded FreeBSD of a Later Release

NOTE: If you have important files in other directories, copy them from the router or switch to a secure location before upgrading the router or switch.

NOTE: The following procedure refers to routers, but it also applies to switches.

To install Junos OS with upgraded FreeBSD over Junos OS with upgraded FreeBSD of a later release:

1. Enter the **request system software add *package-name* validate reboot** command from the operational mode in the CLI:

NOTE: The **no-copy** option is enabled by default.

Use the **validate** and **reboot** options with the **request system software add** command. The command uses the **validate** option by default. We encourage users to validate using the **validate** option when upgrading from Junos OS to Junos OS or from Junos OS with upgraded FreeBSD to Junos OS with upgraded FreeBSD.

If you leave out the **reboot** option, you can take care of that in a separate reboot step.

The new Junos OS image is installed on the router.

2. Verify the installation of Junos OS with upgraded FreeBSD.

```
user@host> show version
```

NOTE: The output shows the OS kernel, OS runtime, and other packages installed on the router.

Downgrading Junos OS from Upgraded FreeBSD

Starting with Junos OS Release 15.1, certain hardware platforms run a Junos OS based on an upgraded FreeBSD kernel instead of older versions of FreeBSD. If you have previously upgraded to Junos OS with upgraded FreeBSD, you can downgrade to earlier versions

versions of Junos OS, as long as the downgrade conforms to the Junos OS policy of skipping at most two earlier releases.

Before you begin:

1. Verify that you have previously upgraded to Junos OS with the upgraded FreeBSD kernel, as described in [“Upgrading Junos OS with Upgraded FreeBSD” on page 96](#).
2. Download the Junos OS package.

This example uses the package `/var/tmp/jinstall-13.3R2.7-domestic-signed.tgz` to install Junos OS with a pre-upgraded FreeBSD kernel on the master Routing Engine (**re0**).

NOTE: The following procedure refers to routers, but it also applies to switches.

To downgrade from Junos OS with upgraded FreeBSD to Junos OS:

1. Enter the **request system software add package-name no-validate reboot** command from the operational mode in the CLI:

Use the **no-validate** and **reboot** options with the **request system software add** command. If you leave out the **no-validate** option, the command uses the **validate** option by default, and direct validation of running configuration does not work for downgrading to Junos OS from Junos OS with upgraded FreeBSD.

NOTE: To validate current configuration on a downgrade to Junos OS from Junos OS with upgraded FreeBSD, use the **request system software validate on** command.

If you leave out the **reboot** option, you can take care of that in a separate reboot step.

The following example uses the **re0** option.

```
user@host>request system software add
/var/tmp/jinstall-13.3R2.7-domestic-signed.tgz re0 no-validate reboot

Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

Software Features That Require Licenses on the QFX Series

NOTE: If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

NOTE: Virtual Extensible Local Area Network (VXLAN) is not supported on QFX3500 and QFX3600 devices. When you issue the `show licenses` command, you will see VXLAN in the CLI output, but the feature is not enabled.

NOTE: There is no separate license for Virtual Chassis like there is for Virtual Chassis Fabric.

We provide licenses for both standard Junos OS features and disaggregated Junos OS features.

Disaggregated Junos OS is offered starting with the QFX5200 switch. The QFX5200 hardware model number is hardware only and does not include the right to use the basic Junos OS functions. You can purchase feature licenses from three different tiers for disaggregated Junos OS. The disaggregated Junos OS feature licenses are available on a perpetual basis.

The following disaggregated Junos OS feature licenses are available:

- Junos Base Services (JBS)

The JBS license includes basic layer 2 switching, basic layer 3 routing, multicast, automation, programmability, Zero Touch Provisioning (ZTP) and basic monitoring.

- Junos Advanced Services (JAS)

The JAS license includes features supported in the JBS license and Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Virtual Extensible Local Area Network (VXLAN).

- Junos Premium Service (JPS)

The JPS license includes features supported in the JAS license and the Multi-protocol Label Switching (MPLS) feature set.

[Table 28](#) lists the disaggregated Junos OS feature licenses and supported QFX Series devices, and [Table 29](#) lists the standard Junos OS features licenses and supported QFX Series devices.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

Table 28: Disaggregated Junos OS Feature Licenses and Model Numbers for QFX Series Devices

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
Junos base services (JBS) license includes basic layer 2 switching, basic layer 3 routing, multicast, automation, programmability, Zero Touch Provisioning (ZTP) and basic monitoring.	QFX5200-32C switch	One per switch.	QFX5000-35-JBS
Junos advanced services (JAS) license includes features supported in JBS license and Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Virtual Extensible Local Area Network (VXLAN)	QFX5200-32C switch	One per switch.	QFX5000-35-JAS
Junos premium services (JPS) license includes features supported in JAS license and Multi-protocol Label Switching (MPLS) feature set.	QFX5200-32C switch	One per switch.	QFX5000-35-JPS

Table 29: Standard Junos OS Feature Licenses and Model Numbers for QFX Series Devices

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series premium feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Virtual Extensible Local Area Network (VXLAN), and Open vSwitch Database (OVSDB)	QFX10002-36Q switch	One per switch	QFX10002-36Q-PFL
	QFX10002-72Q switch		QFX10002-72Q-PFL
	QFX10008 switch		QFX10008-PFL

Table 29: Standard Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Multi-protocol Label Switching (MPLS), and Virtual Extensible Local Area Network (VXLAN), and Open vSwitch Database (OVSDB)	QFX10002-36Q switch	One per switch	QFX10002-36Q-AFL
	QFX10002-72Q switch		QFX10002-72Q-AFL
	QFX10008 switch		QFX10008-AFL
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Multi-protocol Label Switching (MPLS), and Virtual Extensible Local Area Network (VXLAN), and Open vSwitch Database (OVSDB)	QFX3500, QFX3600, QFX5100-48S, and QFX5100-48T switches	One per switch, two per Virtual Chassis, and two per Virtual Chassis Fabric	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Multi-protocol Label Switching (MPLS), and Virtual Extensible Local Area Network (VXLAN) and Open vSwitch Database (OVSDB)	QFX5100-24Q and QFX5100-96S switches	One per switch, two per Virtual Chassis, and two per Virtual Chassis Fabric	QFX5100-HDNSE-LIC
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC

Table 29: Standard Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB
QFX and EX Series feature license for enabling Media Access Control security (MACsec)	QFX switches that support MACsec. See <i>Understanding Media Access Control Security (MACsec)</i> .	One per switch, two per Virtual Chassis,	EX-QFX-MACSEC-AGG
Virtual Chassis Fabric (VCF)	All member devices in a Virtual Chassis Fabric (VCF)	Two per Virtual Chassis Fabric (VCF)	QFX-VCF-LIC

Junos OS Feature License Keys

Some Junos OS software features require a license to be activated. To enable each licensed feature, you must purchase, install, manage, and verify a license key that corresponds to the licensed feature.

Release-Tied License Keys and Upgrade Licenses on MX Series Routers

The Junos OS licensing infrastructure currently associates a license feature with attributes such as date, platform, and validity. In addition to these attributes, for MX Series routers running Junos OS Release 12.2 and later, a licensed feature can be associated with a release number at the time of generating the license key. This type of release-tied license key is used to validate a particular licensed feature while attempting a software upgrade. The upgrade process aborts if the release number in the license key is earlier than the Junos OS release number to which the system is being upgraded.

Additionally, an upgrade license key can be generated for a release-tied licensed feature. An upgrade license key is used for carrying forward a capacity license to the upgrade release. Although an upgrade license might be an acceptable license on the current release, it does not add to the existing capacity limit. The capacity added in the upgrade license key is valid for the upgrade software release only.

The release number embedded in the license key indicates the maximum release number up to which Junos OS can be upgraded.

As an example, assume that your system is running Junos OS Release 12.2 and is using the **scale-subscriber** licensed feature with a later release-tied upgrade license key installed. If you request a software upgrade to the later release of Junos OS, the software upgrade operation fails and the following error message is displayed:

```
mgd: error: No valid upgrade license found for feature 'scale-subscriber'.  
Aborting Software upgrade.  
Validation failed
```

In this example, to successfully upgrade to the later release of Junos OS, the release number included in the upgrade license key should be greater than or equal to the later release number. Also, you can perform software upgrades up to the previous release without any additional license keys to retain the existing scale limit.

**NOTE:**

When you install a release-tied license, the following apply:

- You can purchase an upgrade capacity license only if a base capacity license for the same scale-tier has already been generated or purchased.
- You cannot install an upgrade license if the capacity does not match any of the existing base capacity licenses on the system.
- The license installation fails when you install a lower release number license key on a higher software release number.
- A release-tied license can be installed on a Junos OS release number that is lower than or equal to the release number included in the license key. For example, a 12.2 license key is valid on Junos OS Release 12.1.
- An upgrade license is valid only on the target release number specified in the license key, but can be installed on an earlier Junos OS release. For example, a 4 K scale-tier upgrade license for Junos OS Release 12.2 can be installed on an earlier release, and the installed count of licenses remains unaltered.
- Release-tied licenses of the previous release are not deleted on upgrading Junos OS to a newer release version.

Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity. [Table 30](#) displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

Table 30: Upgrade Licenses for Enhancing Port Capacity

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 • 1/MIC0	f1—MX5 to MX10 upgrade	Slot 1 and 2 • 1/MIC0 • 1/MIC1
MX10	40G	0x555	Slot 1 and 2 • 1/MIC0 • 1/MIC1	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 • 1/MIC1 • First 2 ports on 0/MIC0
MX40	60G	0x554	Slot 1, Slot 2 and first 2 ports on Slot 0 • 1/MIC0 • 1/MIC1 • First 2 ports on 0/MIC0	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 • 1/MIC1 • All 4 ports on 0/MIC0

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
 - An f1 feature ID on an MX10 upgrade license key rejects the license.
 - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

Port Activation on MX104 Routers

Starting with Junos OS Release 13.3, license keys are available to activate the ports on the MX104 router. MX104 routers have four built-in ports. By default, in the absence of valid licenses, all four built-in ports are deactivated. By installing licenses, you can activate any two of the four or all of the four built-in ports. For instance, you can install a license to activate the first two built-in ports (xe-2/0/0 and xe-2/0/1) or you can install a license to activate the next two built-in ports (xe-2/0/2 and xe-2/0/3). You can also install a license to activate all four built-in ports (xe-2/0/0, xe-2/0/1, xe-2/0/2, and xe-2/0/3). If you have already activated two of the built-in ports, you can install an additional license to activate the other two built-in ports on the MX104 router.

A feature ID is assigned to every license for activating the built-in ports on the MX104 router. The port license model with the feature ID is described in [Table 31](#).

Table 31: Port Activation License Model for MX104 Routers

Feature ID	Feature Name	Functionality
F1	MX104 2X10G Port Activate (0 and 1)	Ability to activate first two built-in ports (xe-2/0/0 and xe-2/0/1)
F2	MX104 2X10G Port Activate (2 and 3)	Ability to activate next two built-in ports (xe-2/0/2 and xe-2/0/3)

Both the features are also provided in a single license key for ease of use. To activate all four ports, you must either install the licenses for both the features listed in [Table 31](#) or the single license key for both features. If you install the single license key when feature IDs F1 and F2 are already installed, the license does not get rejected. Also, MX104 routers do not support the graceful license expiry policy. A graceful license expiry policy allows the use of a feature for a certain period of time (usually a grace period of 30 days), and reverts if the license for that feature is not installed after the grace period.

Generating License Keys

When you purchase a Junos OS software feature license for a device, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the device's serial number) for the device, and then add the license key on the device.

Before generating the license keys for a device:

- Purchase the required licenses for the device. See [“Software Features That Require Licenses on the QFX Series” on page 108](#).
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Determine the serial number of the device. For instructions, see *Locating the Serial Number on a QFX3500 Device or Component*.

To generate the license keys for a device:

NOTE: This procedure shows you how to generate license keys on a QFX Series device, but you can follow the same procedure for any device.

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

NOTE: To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Device** option button, and click **Continue**.

The Generate Licenses - QFX Series Product Devices page appears.

4. In the **Device Serial Number** field, enter the serial number for the device.
5. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
6. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
7. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

8. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Devices page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

9. Select the file format in which you want to obtain your new license keys.
10. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

Related Documentation

- [Software Features That Require Licenses on the QFX Series on page 108](#)
- [Adding New Licenses \(CLI Procedure\) on page 117](#)
- [Locating the Serial Number on a QFX3500 Device or Component](#)

Adding New Licenses (CLI Procedure)

Before adding new licenses, complete the following tasks:

- Purchase the required licenses.
- Establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your device.

NOTE: On QFabric systems, install your licenses in the default partition of the QFabric system and not on the individual components (Node devices and Interconnect devices).

To add a new license key to the device using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To add a license key from a file or URL, enter the following command, specifying the filename or the URL where the key is located:

```
user@host> request system license add filename | url
```

- To add a license key from the terminal, enter the following command:

```
user@host> request system license add terminal
```

2. When prompted, enter the license key, separating multiple license keys with a blank line.

If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit license entry mode.

3. Go on to [“Verifying Junos OS License Installation” on page 120](#).

On routers that have graceful Routing Engine switchover (GRES) enabled, after successfully adding the new license on the master Routing Engine, the license keys are automatically synchronized on the backup Routing Engine as well. However, in case GRES is not enabled, the new license is added on each Routing Engine separately. This ensures

that the license key is enabled on the backup Routing Engine during changeover of mastership between the Routing Engines.

To add a new license key to a router with dual Routing Engines without GRES:

1. After adding the new license key on the master Routing Engine, use the **request chassis routing-engine master switch** command to have the backup Routing Engine become the master Routing Engine.
2. Log in to the active Routing Engine and add the new license key, repeat the same step.

NOTE: Adding a license key to the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-adding operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

Deleting a License (CLI Procedure)

Before deleting a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

You have the options to delete a single license, delete all licenses, or delete a list of licenses enclosed in brackets.

1. Display the licenses available to be deleted.

```
user@host> request system license delete license-identifier-list ?
```

```
Possible completions:
```

E00468XXX4	License key identifier
JUNOS10XXX1	License key identifier
JUNOS10XXX2	License key identifier
JUNOS10XXX3	License key identifier
JUNOS10XXX4	License key identifier
[Open a set of values

2. To delete a license key or keys from a device using the CLI operational mode, select one of the following methods:

- Delete a single license by specifying the license ID. Using this option, you can delete only one license at a time.

```
user@host> request system license delete license-identifier
```

- Delete all license keys from the current device.

```
user@host> request system license delete all
```

- Delete multiple license keys from the current device. Specify the license identifier for each key and enclose the list of identifiers in brackets.

```
user@host> request system license delete license-identifier-list [JUNOS10XXX1
JUNOS10XXX3 JUNOS10XXX4 ...]
```

```
Delete license(s) ?
[yes,no] (no) yes
```

3. Go on to [“Verifying Junos OS License Installation” on page 120](#).

NOTE: Deleting a license key from the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-deleting operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

Saving License Keys

Before saving a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To save the licenses installed on a device to a file using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To save the installed license keys to a file or URL, enter the following command:

```
user@host> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named `license.config`:

- To save a license key from the terminal, enter the following command:

```
user@host> request system license save ftp://user@host/license.config
```

2. Go on to [“Verifying Junos OS License Installation” on page 120](#).

- Related Documentation**
- [Adding New Licenses \(CLI Procedure\) on page 117](#)
 - [Deleting a License \(CLI Procedure\) on page 118](#)
 - [Junos OS Feature Licenses on page 107](#)
 - [Verifying Junos OS License Installation on page 120](#)

Verifying Junos OS License Installation

To verify Junos OS license management, perform the following tasks:

- [Displaying Installed Licenses on page 120](#)
- [Displaying License Usage on page 121](#)

Displaying Installed Licenses

Purpose Verify that the expected licenses are installed and active on the router or switch.

Action From the CLI, enter the **show system license** command.

Sample Output

```
user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-acct	0	1	0	permanent
subscriber-auth	0	1	0	permanent
subscriber-addr	0	1	0	permanent
subscriber-vlan	0	1	0	permanent
subscriber-ip	0	1	0	permanent
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

```

Licenses installed:
License identifier: E000185416
License version: 2
Features:
subscriber-acct - Per Subscriber Radius Accounting
permanent
subscriber-auth - Per Subscriber Radius Authentication
permanent
subscriber-addr - Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
permanent
subscriber-ip - Dynamic and Static IP
permanent
```

Meaning The output shows a list of the license usage and a list of the licenses installed on the router or switch. Verify the following information:

- Each license is present. Licenses are listed in ascending alphanumeric order by license ID.
- The state of each license is **permanent**.

NOTE: A state of invalid indicates that the license key is not a valid license key. Either it was entered incorrectly or it is not valid for the specific device.

- The feature for each license is the expected feature. The features enabled are listed by license. An all-inclusive license has all features listed.
- All configured features have the required licenses installed. The Licenses needed column must show that no licenses are required.

Displaying License Usage

Purpose Verify that the licenses fully cover the feature configuration on the router or switch.

Action From the CLI, enter the **show system license usage** command.

Sample Output

```
user@host> show system license usage
```

	Licenses used	Licenses installed	Licenses needed	Expiry
Feature name				
subscriber-addr	1	0	1	29 days
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

Meaning The output shows any licenses installed on the router or switch and how they are used. Verify the following information:

- Any configured licenses appear in the output. The output lists features in ascending alphabetical order by license name. The number of licenses appears in the third column. Verify that you have installed the appropriate number of licenses.
- The number of licenses used matches the number of configured features. If a licensed feature is configured, the feature is considered used. The sample output shows that the subscriber address pooling feature is configured.
- A license is installed on the router or switch for each configured feature. For every feature configured that does not have a license, one license is needed.

For example, the sample output shows that the subscriber address feature is configured but that the license for the feature has not yet been installed. The license must be installed within the remaining grace period to be in compliance.

PART 8

Login Classes

- [Understanding Login Classes on page 125](#)

CHAPTER 8

Understanding Login Classes

- [Configuring the Junos OS to Display a System Login Announcement on page 126](#)
- [Configuring Junos OS to Display a System Login Message on page 126](#)

Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
  class class-name;
  class {
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
  full-name complete-name;
  uid uid-value;
  class class-name;
}
```

Related Documentation

- [Configuring a Local Administrator Account on page 1853](#)
- [Junos OS User Accounts Overview on page 1821](#)
- [*Limiting the Number of User Login Attempts for SSH and Telnet Sessions*](#)

Configuring the Junos OS to Display a System Login Announcement

By default, no login announcement is displayed. To configure a system login announcement, include the **announcement** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
announcement text;
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

TIP: You can use the same special characters described to format your system login announcement.

Related Documentation

- *Defining Junos OS Login Classes*
- *Configuring the Junos OS to Display a System Login Message*

Configuring Junos OS to Display a System Login Message

By default, no login message is displayed on the router or switch. To configure a system login message, include the **message** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
message text;
```

If the message text contains any spaces, enclose it in quotation marks.

You can format the message using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

The following is a sample login message configuration:

```
[edit]
system {
  login {
    message "\n\n\n\tUNAUTHORIZED USE OF THIS SYSTEM\n\tIS STRICTLY PROHIBITED!\n\n\tPlease contact\n\t'company-noc@company.com\t' to gain\n\taccess to this equipment if you need authorization.\n\n\n";
  }
}
```

```
    }  
}
```

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet router1  
Trying 1.1.1.1...  
Connected to router1.  
Escape character is '^['.
```

```
UNAUTHORIZED USE OF THIS SYSTEM  
IS STRICTLY PROHIBITED!
```

```
Please contact 'company-noc@company.com' to gain  
access to this equipment if you need authorization.
```

```
router1 (ttyp0)
```

```
login:
```

A system login message appears before the user logs in. A system login announcement appears after the user logs in.

- [Synchronizing and Coordinating Time Distribution Using NTP on page 137](#)
- [Example: Configuring NTP on page 139](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 142](#)

Understanding NTP Time Servers

The IETF defined the Network Time Protocol (NTP) to synchronize the clocks of computer systems connected to each other over a network. Most large networks have an NTP server that ensures that time on all devices is synchronized, regardless of the device location. If you use one or more NTP servers on your network, ensure you include the NTS server addresses in your Junos OS configuration.

When configuring the NTP, you can specify which system on the network is the authoritative time source, or time server, and how time is synchronized between systems on the network. To do this, you configure the router, switch, or security device to operate in one of the following modes:

- **Client mode**—In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.
- **Symmetric active mode**—In this mode, the local router or switch and the remote system can synchronize with each other. You use this mode in a network in which either the local router or switch or the remote system might be a better source of time.

NOTE: Symmetric active mode can be initiated by either the local or the remote system. Only one system needs to be configured to do so. This means that the local system can synchronize with any system that offers symmetric active mode without any configuration whatsoever. However, we strongly encourage you to configure authentication to ensure that the local system synchronizes only with known time servers.

- Broadcast mode—In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the local router or switch is operating as a transmitter.
- Server mode—In this mode, the local router or switch operates as an NTP server.

NOTE: In NTP server mode, the Junos OS supports authentication as follows:

- If the NTP request from the client comes with an authentication key (such as a key ID and message digest sent with the packet), the request is processed and answered based on the authentication key match.
- If the NTP request from the client comes without any authentication key, the request is processed and answered without authentication.

- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 142](#)

Configuring NTP Authentication Keys

Time synchronization can be authenticated to ensure that the switch obtains its time services only from known sources. By default, network time synchronization is unauthenticated. The switch will synchronize to whatever system appears to have the most accurate time. We strongly encourage you to configure authentication of network time services.

To authenticate other time servers, include the **trusted-key** statement at the **[edit system ntp]** hierarchy level. Only time servers that transmit network time packets containing one of the specified key numbers are eligible to be synchronized. Additionally, the key needs to match the value configured for that key number. Other systems can synchronize to the local switch without being authenticated.

```
[edit system ntp]  
trusted-key [ key-numbers ];
```

Each key can be any 32-bit unsigned integer except 0. Include the **key** option in the **peer**, **server**, or **broadcast** statements to transmit the specified authentication key when

transmitting packets. The key is necessary if the remote system has authentication enabled so that it can synchronize to the local system.

To define the authentication keys, include the **authentication-key** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
```

number is the key number, **type** is the authentication type (only Message Digest 5 [MD5] is supported), and **password** is the password for this key. The key number, type, and password must match on all systems using that particular key for authentication.

- [trusted-key on page 292](#)
- *authentication-key*

Configuring the NTP Time Server and Time Services

When you use NTP, configure the switch to operate in one of the following modes:

- Client mode
- Symmetric active mode
- Broadcast mode
- Server mode

The following topics describe how to configure these modes of operation:

1. [Configuring the Switch to Operate in Client Mode on page 133](#)
2. [Configuring the Router or Switch to Operate in Symmetric Active Mode on page 134](#)
3. [Configuring the Router or Switch to Operate in Broadcast Mode on page 134](#)
4. [Configuring the Router or Switch to Operate in Server Mode on page 135](#)

Configuring the Switch to Operate in Client Mode

To configure the local router or switch to operate in client mode, include the **server** statement and other optional statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
server address <key key-number> <version value> <prefer>;
authentication-key key-number type type value password;
boot-server address;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement, as described in .

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in client mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$EgfcvX7VY4ZEcwgoHjkP5Q3CuREyv87";
boot-server 10.1.1.1;
server 10.1.1.1 key 1 prefer;
trusted-key 1;
```

Configuring the Router or Switch to Operate in Symmetric Active Mode

To configure the local router or switch to operate in symmetric active mode, include the **peer** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
peer address <key key-number> <version value> <prefer>;
```

Specify the address of the remote system. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2 or 3, include the **version** option.

If you configure more than one remote system, you can mark one system preferred by including the **prefer** option:

```
peer address <key key-number> <version value> prefer;
```

Configuring the Router or Switch to Operate in Broadcast Mode

To configure the local router or switch to operate in broadcast mode, include the **broadcast** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast address <key key-number> <version value> <ttl value>;
```

Specify the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be **224.0.1.1**.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2, or 3, include the **version** option.

Configuring the Router or Switch to Operate in Server Mode

In server mode, the router or switch acts as an NTP server for clients when the clients are configured appropriately. The only prerequisite for “server mode” is that the router or switch must be receiving time from another NTP peer or server. No other configuration is necessary on the router or switch.

To configure the local router or switch to operate as an NTP server, include the following statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
server address <key key-number> <version value> <prefer>;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, or 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in server mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$txEruBEreWx-wtuLNdboaUjH.T3AtOESe";
server 172.17.27.46 prefer;
trusted-key 1;
```

Related Documentation

- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 142](#)

Configuring the Switch to Listen for Broadcast Messages Using NTP

When you are using NTP, you can configure the local switch to listen for broadcast messages on the local network to discover other servers on the same subnet by including the **broadcast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
broadcast-client;
```

When the switch detects a broadcast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *broadcast client* mode, in which it listens for, and synchronizes to, succeeding broadcast messages.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related
Documentation**

- [Configuring the Switch to Listen for Multicast Messages Using NTP on page 136](#)
- [Configuring the NTP Time Server and Time Services on page 133](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 142](#)

Configuring the Switch to Listen for Multicast Messages Using NTP

When you are using NTP, you can configure the local switch to listen for multicast messages on the local network to discover other servers on the same subnet by including the **multicast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]  
multicast-client <address>;
```

When the switch receives a multicast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *multicast client* mode, in which it listens for, and synchronizes to, succeeding multicast messages.

You can specify one or more IP addresses. (You must specify an address, not a hostname.) If you do, the router or switch joins those multicast groups. If you do not specify any addresses, the software uses **224.0.0.1**.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related
Documentation**

- [Configuring the Switch to Listen for Broadcast Messages Using NTP on page 135](#)

Setting the Date and Time

1. Enter operational mode in the CLI.
2. Enter the following command:

```
user@switch> set date YYYYMMDDHHMM.ss source-address
```

For example, the following command sets the date and time.

```
user@switch# set date 201102151010.55
```

3. To set the date and time from an NTP server, enter the following command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from an NTP server:

```
user@switch# set date ntp 200.40.40.1
```

4. To set the date and time from more than one NTP server, enter the same command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from more than one NTP server:

```
user@switch# set date ntp 200.40.40.1 200.40.40.2
```

Related Documentation

- [set date](#)

Synchronizing and Coordinating Time Distribution Using NTP

Using NTP to synchronize and coordinate time distribution in a large network involves these tasks:

1. [Configuring NTP on page 137](#)
2. [Configuring the NTP Boot Server on page 137](#)
3. [Specifying a Source Address for an NTP Server on page 138](#)

Configuring NTP

- To configure NTP on the switch, include the **ntp** statement at the **[edit system]** hierarchy level:

```
[edit system]
ntp {
  authentication-key number type type value password;
  boot-server (address | hostname);
  broadcast <address> <key key-number> <version value> <ttl value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

Configuring the NTP Boot Server

When you boot the switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the switch uses to determine the time when the switch boots. Otherwise, NTP will not be able to

synchronize to a time server if the server's time appears to be very far off of the local switch's time.

- To configure the NTP boot server, include the **boot-server** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
boot-server (address | hostname);
```

Specify either the IP address or the hostname of the network server.

Specifying a Source Address for an NTP Server

For IP version 4 (IPv4), you can specify that if the NTP server configured at the **[edit system ntp]** hierarchy level is contacted on one of the loopback interface addresses, the reply always uses a specific source address. This is useful for controlling which source address NTP uses to access your network when it is either responding to or sending an NTP client request from your network.

To configure the specific source address that the reply will always use, and the source address that requests initiated by NTP server will use, include the **source-address** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
source-address source-address;
```

source-address is a valid IP address configured on one of the switch interfaces.

NOTE: If a firewall filter is applied on the loopback interface, ensure that the source address specified for the NTP server at the **[edit system ntp]** hierarchy level is explicitly included as one of the match criteria in the firewall filter. This enables the Junos OS to accept traffic on the loopback interface from the specified source address.

The following example shows a firewall filter with the source address 10.0.10.100 specified in the **from** statement included at the **[edit firewall filter firewall-filter-name]** hierarchy:

```
[edit firewall filter Loopback-Interface-Firewall-Filter]
term Allow-NTP {
  from {
    source-address {
      172.17.27.46/32; // IP address of the NTP server
      10.0.10.100/32; // Source address specified for the NTP server
    }
  }
  then accept;
}
```

If no source address is configured for the NTP server, include the primary address of the loopback interface in the firewall filter.

 - [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 142](#)

Example: Configuring NTP

The Network Time Protocol (NTP) provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network. NTP uses a returnable-time design in which a distributed subnet of time servers operating in a self-organizing, hierarchical primary-secondary configuration synchronizes local clocks within the subnet and to national time standards by means of wire or radio. The servers also can redistribute reference time using local routing algorithms and time daemons.

This example shows how to configure NTP:

- [Requirements on page 139](#)
- [Overview on page 139](#)
- [Configuration on page 139](#)
- [Verification on page 140](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later
- A switch connected to a network on which an NTP boot server and NTP server reside

Overview

Debugging and troubleshooting are much easier when the timestamps in the log files of all switches are synchronized, because events that span a network can be correlated with synchronous entries in multiple logs. We recommend using the Network Time Protocol (NTP) to synchronize the system clocks of your switch and other network equipment.

In this example, an administrator wants to synchronize the time in a switch to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date are obtained when the switch boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme is used to hash the key value for authentication, which prevents the switch from synchronizing with an attacker's host that is posing as the time server.

Configuration

To configure NTP:

CLI Quick Configuration	<p>To quickly configure NTP, copy the following commands and paste them into the switch's terminal window:</p> <pre>[edit system] set ntp boot-server 10.1.4.1 set ntp server 10.1.4.2 set ntp authentication-key 2 type md5 value "\$9\$aHlj8"</pre>
Step-by-Step Procedure	<p>To configure NTP :</p> <ol style="list-style-type: none">1. Specify the boot server: <pre>[edit system] user@switch# set ntp boot-server 10.1.4.1</pre>2. Specify the NTP server: <pre>[edit system] user@switch# set ntp server 10.1.4.2</pre>3. Specify the key number, authentication type (MD5), and key for authentication: <pre>[edit system] user@switch# set ntp authentication-key 2 type md5 value "\$9\$aHlj8"</pre>
Results	<p>Check the results:</p> <pre>[edit system] user@switch# show ntp { boot-server 10.1.4.1; authentication-key 2 type md5 value "\$9\$aHlj8"; ## SECRET-DATA server 10.1.4.2; }</pre>

Verification

To confirm that the configuration is correct, perform these tasks:

- [Checking the Time on page 140](#)
- [Displaying the NTP Peers on page 141](#)
- [Displaying the NTP Status on page 141](#)

Checking the Time

Purpose	Check the time that has been set on the switch.
Action	<p>Enter the show system uptime operational mode command to display the time.</p> <pre>user@switch> show system uptime fpc0: ----- Current time: 2009-06-12 12:49:03 PDT System booted: 2009-05-15 06:24:43 PDT (4w0d 06:24 ago) Protocols started: 2009-05-15 06:27:08 PDT (4w0d 06:21 ago) Last configured: 2009-05-27 14:57:03 PDT (2w1d 21:52 ago) by admin1 12:49PM up 28 days, 6:24, 1 user, load averages: 0.05, 0.06, 0.01</pre>

Meaning The output shows that the current date and time are June 12, 2009 and 12:49:03 PDT. The switch booted 4 weeks, 6 hours, and 24 minutes ago, and its protocols were started approximately 3 minutes before it booted. The switch was last configured by user **admin1** on May 27, 2009, and there is currently one user logged in to the switch.

The output also shows that the load average is 0.05 seconds for the last minute, 0.06 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

Displaying the NTP Peers

Purpose Verify that the time has been obtained from an NTP server.

Action Enter the **show ntp associations** operational mode command to display the NTP server from switch obtained its time.

```
user@switch> show ntp associations
      remote      refid      st t when poll reach  delay  offset  jitter
=====
*ntp5.domain1.ne .GPS.          1 u  414 1024  377   3.435   4.002   0.765
```

Meaning The asterisk (*) in front of the NTP server name, or peer, indicates that the time is synchronized and obtained from this server. The delay, offset, and jitter are displayed in milliseconds.

Displaying the NTP Status

Purpose View the configuration of the NTP server and the status of the system.

Action Enter the **show ntp status** operational mode command to view the status of the NTP.

```
user@switch> show ntp status
status=0644 leap_none, sync_ntp, 4 events, event_peer/strat_chg,
version="ntpd 4.2.0-a Mon Apr 13 19:09:05 UTC 2009 (1)",
processor="powerpc", system="JUNOS9.5R1.8", leap=00, stratum=2,
precision=-18, rootdelay=2.805, rootdispersion=42.018, peer=48172,
refid=172.17.28.5,
reftime=cddd397a.60e6d7bf Fri, Jun 12 2009 13:30:50.378, poll=10,
clock=cddd3b1b.ec5a2bb4 Fri, Jun 12 2009 13:37:47.923, state=4,
offset=3.706, frequency=-23.018, jitter=1.818, stability=0.303
```

Meaning The output shows status information about the switch and the NTP.

Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization

Debugging and troubleshooting are much easier when the timestamps in the log files of all the routers or switches are synchronized, because events that span the network can be correlated with synchronous entries in multiple logs. We strongly recommend using the Network Time Protocol (NTP) to synchronize the system clocks of routers, switches, and other network equipment.

By default, NTP operates in an entirely unauthenticated manner. If a malicious attempt to influence the accuracy of a router or switch's clock succeeds, it could have negative effects on system logging, make troubleshooting and intrusion detection more difficult, and impede other management functions.

The following sample configuration synchronizes all the routers or switches in the network to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date is obtained when the router boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme should be used to hash the key value for authentication, which prevents the router or switch from synchronizing with an attacker's host posing as the time server.

```
[edit]
system {
  ntp {
    authentication-key 2 type md5 value "$9$aHlj8gqQ1gJyJghgJgiiii"; # SECRET-DATA
    boot-server 10.1.4.1;
    server 10.1.4.2;
  }
}
```

PART 10

Passwords

- [Understanding Passwords on page 145](#)

CHAPTER 10

Understanding Passwords

- [Configuring the Root Password on page 145](#)
- [Recovering the Root Password on page 147](#)
- [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 148](#)

Configuring the Root Password

The Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user **root** with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as the *root user*. The root user (also referred to as *superuser*) has unrestricted access and full permissions within the system. The expression “log in as root” is commonly used when an action requires the user to log into the device as the root user.

NOTE: If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration but you *cannot* log in as the root user and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level and configuring one of the password options:

```
[edit system]
root-authentication {
  (encrypted-password "password"| plain-text-password);
  load-key-file URL filename;
  ssh-dsa "public-key" <from hostname>;
  ssh-ecdsa "public-key" <from hostname>;
  ssh-rsa "public-key" <from hostname>;
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
```

```
user@host# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
 - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
 - Valid passwords must contain at least one change of case or character class.

You can use the **load-key-file** *URL filename* statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file** *URL* statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Optionally, you can use the **ssh-dsa**, **ssh-ecdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@host# set root-authentication load-key-file my-host::ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
  SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

Related Documentation

- *Protecting Network Security by Configuring the Root Password*
- [Example: Configuring a Plain-Text Password for Root Logins on page 1812](#)
- [Example: Configuring SSH Authentication for Root Logins on page 1814](#)
- [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 148](#)
- *Recovering the Root Password*

Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
 - Bits per second: 9600
 - Data bits: 8
 - Parity: None
 - Stop bits: 1
 - Flow control: None

9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1  
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit  
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

Related Documentation

- *Configuring the Root Password*

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 149](#)
- [Overview on page 149](#)
- [Configuration on page 149](#)

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**s, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
set system login password maximum-length 22
set system login password minimum-numeric 1
set system login password minimum-upper-cases 1
set system login password minimum-lower-cases 1
set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the **[system login password]** hierarchy level.

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

```
[edit system login password]
```

```
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```

4. Require users to set a password that has at least one punctuation-class character and at least one number.

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

CHAPTER 11

Precision Time Protocol (PTP)

- [Understanding Transparent Clocks in Precision Time Protocol on page 152](#)
- [Configuring Transparent Clock Mode for Precision Time Protocol on page 152](#)

Understanding Transparent Clocks in Precision Time Protocol

The Precision Time Protocol (PTP) standardized by IEEE 1588 improves the current methods of synchronization used within a distributed network. You can use PTP across packet-based networks including, but not limited to, Ethernet networks. Queuing and buffering delays in the switch can cause variable delay to packets, which affect path delay measurements. Queuing delays vary based on the network load and also depend on the architecture of the switch.

Transparent clocks measure and adjust for packet delay. The transparent clock computes the variable delay as the PTP packets pass through the switch. The switches act as transparent clocks only and operate between the master and slave clocks in a distributed network. Transparent clocks improve synchronization between the master and slave clocks and ensure that the master and slave clocks are not impacted by the affects of packet delay variation.

The transparent clock measures the residence time (the time that the packet spends passing through the switch), adds the residence time into the correction field of the PTP packet. The slave clock accounts for the packet delay by using both the origin timestamp and the information in the correction field.

End-to-end transparent clocks are supported. With an end-to-end transparent clock, only the residence time is included in the correction field of the PTP packets. The residence time can be sent in a one-step process, which means that the timestamps are sent in one packet. In a two-step process, estimated timestamps are sent in one packet, and additional packets contain updated timestamps.

You can enable or disable a transparent clock globally for the switch. With a global configuration, the same configuration is applied to each interface. If the transparent clock is disabled, PTP packet correction fields are not updated. If the transparent clock is enabled, the PTP packet correct fields are updated.

PTP over Ethernet, UDP over IPv4 and IPv6, and unicast and multicast transparent clocks are also supported.

Related Documentation

- [Configuring Transparent Clock Mode for Precision Time Protocol on page 152](#)
- [e2e-transparent on page 311](#)

Configuring Transparent Clock Mode for Precision Time Protocol

In a distributed network, you can configure Precision Time Protocol (PTP) transparent clocks to help synchronize the timing across the network.

To configure the transparent clock mode for Precision Time Protocol (PTP):

1. In configuration mode, go to the **[edit protocols ptp]** hierarchy level.

```
[edit]  
user@host# edit protocols ptp
```

2. Specify transparent clock mode:

```
[edit protocols ptp]  
user@host# set e2e-transparent
```

Recovery Installation

- [Understanding Recovery Installation on page 157](#)

Understanding Recovery Installation

- [Creating an Emergency Boot Device on page 157](#)
- [Performing a Recovery Installation Using an Emergency Boot Device on page 159](#)
- [Recovering from a Failed Software Installation on page 160](#)

Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

NOTE: You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

NOTE: The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the device:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=install-media-qfx-5e-15.1X53-D30.5-domestic.img of=/dev/da0
bs=1m
1399+0 records in
1399+0 records out
1466957824 bytes transferred in 394.081902 secs (3722469 bytes/sec)
```

6. Enter the following command:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

NOTE: The device automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Performing a Recovery Installation Using an Emergency Boot Device

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 157](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

You can use the system snapshot feature to complete this step. The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into a memory source. See *Creating a Snapshot and Using It to Boot a Device*.

NOTE: System snapshot is not supported on the QFX10000 and QFX5200 switches.

WARNING: The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the device.
2. Power cycle the device.

The emergency boot device is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following option if you have a snapshot saved on the emergency boot device:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
Install Junos Snapshot [14.1X53-D11_vjunos.61]
Boot to host shell [debug]
```

Select **Install Junos Snapshot** install the snapshot.

The software prompts you with the following option if you have Junos OS software from the factory installed on the emergency boot device.

```
Juniper Linux Installer - (c) Juniper Networks 2014
Reboot
Install Juniper Linux Platform
Boot to host shell [debug]
```

Select **Install Juniper Linux Platform** to install the Junos OS software from the emergency boot device.

4. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the software is finished being copied from the emergency device to the device, the device reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the Junos OS login prompt:

```
root@switch#
```

5. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.
6. Remove the emergency boot device.

**Related
Documentation**

- [Creating an Emergency Boot Device on page 157](#)

Recovering from a Failed Software Installation

Problem	Description: If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.
Solution	If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

NOTE: QFX5100, EX4600, and OCX Series switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See *Creating a Snapshot and Using It to Boot a QFX3500 and QFX3600 Switch* or *Creating a Snapshot and Using It to Boot a Device*.

System snapshot is not supported on QFX10002 switches.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

Hit [Enter] to boot immediately, or space bar for command prompt.

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

NOTE: The loader prompt does not appear on QFX5100, QFX5200, EX4600, and OCX Series switches.

On QFX5100, QFX5200, EX4600, and OCX Series switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100, QFX5200, EX4600, or OCX Series switch.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
 - Network address of the server and the path on the server; for example,
tftp://192.17.1.28/junos/jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz
 - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example,
file:///jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz.

The installation now proceeds normally and ends with a login prompt.

Monitoring System Properties

Purpose View system properties such as the name, IP address, and resource usage.

Action To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

Meaning [Table 33](#) summarizes key output fields in the system properties display.

Table 33: Summary of Key System Properties Output Fields

Field	Values	Additional Information
General Information		
Serial Number	Serial number of device.	
Junos OS Version	Version of Junos OS active on the switch, including whether the software is for domestic or export use.	Export software is for use outside the USA and Canada.
Hostname	Name of the device.	
IP Address	IP address of the device.	
Loopback Address	Loopback address.	
Domain Name Server	Address of the domain name server.	
Time Zone	Time zone on the device.	
Time		
Current Time	Current system time, in Coordinated Universal Time (UTC).	
System Booted Time	Date and time when the device was last booted and how long it has been running.	
Protocol Started Time	Date and time when the protocols were last started and how long they have been running.	

Table 33: Summary of Key System Properties Output Fields (*continued*)

Field	Values	Additional Information
Last Configured Time	Date and time when a configuration was last committed. This field also shows the name of the user who issued the last commit command.	
Load Average	CPU load average for 1, 5, and 15 minutes.	
Storage Media		
Internal Flash Memory	Usage details of internal flash memory.	
External Flash Memory	Usage details of external USB flash memory.	
Logged in Users Details		
User	Username of any user logged in to the switch.	
Terminal	Terminal through which the user is logged in.	
From	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.	
Login Time	Time when the user logged in.	This is the user@switch field in show system users command output.
Idle Time	How long the user has been idle.	

- Related Documentation**

Monitoring Interface Status and Traffic

Purpose View interface status to monitor interface bandwidth utilization and traffic statistics.

- Action**
- To view interface status for all the interfaces, enter **show interfaces xe**.
 - To view status and statistics for a specific interface, enter **show interfaces xe interface-name**.
 - To view status and traffic statistics for all interfaces, enter either **show interfaces xe detail** or **show interfaces xe extensive**.

Meaning For details about output from the CLI commands, see [show interfaces xe](#).

Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- Junos XML Management Protocol Application Programming Interface (API)—Application programmers can use the Junos XML Management Protocol API to monitor and configure Juniper Networks devices. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring the devices.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF API to monitor and configure Juniper Networks devices.
- Junos OS commit scripts—You can define scripts to enforce custom configuration tasks, enforce consistency, prevent common mistakes, and more. Every time you commit a new candidate configuration, the active commit scripts are called to inspect the new candidate configuration. If a configuration violates your custom rules, the script can instruct the Junos OS to perform various actions, including making changes to the configuration and generating custom, warning, and system log messages.
- Junos OS Op scripts—You can add your own commands to the operation-mode CLI. You can use these scripts to automate troubleshooting of known network problems and correct them.
- Junos OS event scripts—You can use event scripts to diagnose and fix issues, monitor the overall status of the system, and examine errors periodically. Event scripts are similar to op scripts except that certain events on the switch will trigger these scripts.
- CHEF—You can use CHEF automate the provisioning and management of compute, networking, and storage resources. Chef for Junos OS provides support for Chef on selected Junos OS devices, allowing you to automate common switching network configurations.
- Puppet—You can use PUPPET for configuration management. Puppet provides an efficient and scalable solution for managing the configurations of large numbers of devices. System administrators take advantage of Puppet to manage compute resources such as physical and virtual servers.

Fabric Management Overview

Fabric management is responsible for setting up and managing the connections between Packet Forwarding Engines (PFEs) in a switching fabric. The switching fabric consists of Switch Interface Boards (SIBs) which provide the interconnection between the PFEs across Flexible PIC Concentrators (FPCs).

Fabric management is event-driven. When the system is in a steady state, fabric management only collects fabric statistics periodically, monitors the health of the hardware, and responds to CLI queries. Other fabric management activity is triggered as a response to managed events and faults to minimize packet loss.

Fabric management handles the following managed events:

- Online and planned offline of field replaceable units (FRUs)—FPCs and SIBs are two classes of FRUs.
- Software upgrade
- Firmware upgrade

Fabric management handles the following faults:

- Hardware faults—Includes hardware errors at the link level, board level, or chassis level. These faults occur during initialization or during runtime. Temperature and voltage triggered faults, card level power brick failure, and control board failure are some examples of hardware faults.
- Operator faults—These faults can occur during run-time or install time. Accidental removal of a functional FRU, bent pins at the mid-plane due to improper insertion of a line card, and power loss of a chassis or a FRU are some examples of operator faults.
- Software faults—The most likely software faults that affect fabric management are process crash and restart, kernel crash and reboot, and process starvation, causing loss of control plane keep-alives.

The following commands are used to monitor fabric management:

- **show chassis fabric fpcs**—Indicates whether any fabric links are in error on the FPCs' side.
- **show chassis fabric plane location**—Displays the fabric plane location of each SIB.
- **show chassis fabric sibs**—Indicates whether any fabric links are in error on the SIBs' side.
- **show chassis fabric summary**—Displays the state of all fabric planes.
- **show chassis fabric topology**—Displays the input-output link topology.

CHAPTER 14

Understanding Standard Software Installation and Upgrade

- [Junos OS Package Names on page 173](#)
- [Software Installation Overview on page 174](#)
- [Creating an Emergency Boot Device on page 175](#)
- [Installing and Recovering Software Using the Open Network Install Environment \(ONIE\) on page 176](#)
- [Upgrading Software on page 189](#)

Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the switch by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

NOTE: A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

package-name-m.nZx.y-domestic-signed.tgz

where:

- ***package-name*** is the name of the package—for example, ***jinstall-qfx***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***15.1***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, ***1.5***.

A sample switch software package name is:

```
jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz
```

NOTE: The image in the .tgz file is not automatically cleaned up after the image is successfully installed. If necessary, you can free up the storage space by using the `request system storage cleanup` command.

Software Installation Overview

A device is delivered with the Junos OS preinstalled. As new features and software fixes become available, you can upgrade your software to use them.

When you power on the switch, it starts (boots) using the installed software.

You upgrade the Junos OS on a switch by copying a software package to a switch or other system on your local network and then using the CLI to install the new software on the switch. You then reboot the switch, which boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the installation package removes all files from the `/var/tmp` directory of the switch and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

If you encounter any difficulties during software installation or an upgrade, you can use the recovery installation procedure to install the Junos OS on the switch.

Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

NOTE: You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the `/var/tmp` directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the `su` command:

```
% su
Password: password
```

NOTE: The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the device:

```
root@device% dd if=/var/tmp/filename of=/dev/dal bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=install-media-qfx-5e-15.1X53-D30.5-domestic.img of=/dev/da0
bs=1m
1399+0 records in
1399+0 records out
1466957824 bytes transferred in 394.081902 secs (3722469 bytes/sec)
```

6. Enter the following command:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

NOTE: The device automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

Installing and Recovering Software Using the Open Network Install Environment (ONIE)

NOTE: ONIE is not supported on QFX10002 and QFX10008 switches in Junos OS Release 15.1X53-D30.

ONIE, the open network install environment from Cumulus Networks, is a network OS installer that installs Junos OS and third party applications on a switch. Juniper Network switches come preinstalled with ONIE. When you turn on a switch, the ONIE discovery and execution (ODE) application locates the management Ethernet interface and the Junos OS software package, which can be found either locally on the switch or on the network using HTTP, FTP, or TFTP. After the switch discovers and downloads the Junos OS software package, the switch installs the Junos OS software, reboots, and then boots from Junos OS. Junos OS then becomes the default software image .

NOTE: If you want to use the Junos OS CLI to install software, see [“Upgrading Software” on page 189](#).

Upgrading involves these tasks:

- [Understanding the Open Network Install Environment on page 178](#)
- [Downloading Software Files with a Browser on page 178](#)
- [Connecting to the Console Port on page 179](#)
- [Backing Up the Current Configuration Files on page 179](#)
- [Uninstalling the Existing Version of Junos OS on page 180](#)

- [Installing a Junos OS Software Package That Resides on a Webserver or DHCP Server with DHCP Options Configured on page 180](#)

Understanding the Open Network Install Environment

Juniper Network switches come preinstalled with Junos OS, which is designed to be used with the Junos OS CLI. The Junos OS CLI uses .tgz files; an example filename is `jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz`. However, if you want to use ONIE to install Junos OS, you need to uninstall the existing Junos OS and reinstall the Junos OS image that has a .bin extension—for example, `jnr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin` file. When you uninstall the existing Junos OS image (.tgz file) and reinstall with the image that ONIE requires (.bin file), any existing configuration information is destroyed. ONIE only supports the ability to install a fresh version of Junos OS or reinstall the Junos OS software. ONIE does not support upgrading to a different version of Junos OS.

When you log into the switch with ONIE, you see the install boot menu:

- Juniper Linux (This is a default menu option.)
- Juniper Linux Debug
- Juniper Linux Recovery
- Go to ONIE Loader
 - ONIE: Install OS (This is a default menu option.)
 - ONIE: Rescue
 - ONIE: Uninstall OS
 - ONIE: Update ONIE
 - ONIE: Embed ONIE

You can use the following commands to install and uninstall Junos OS and start and stop the ONIE ODE application:

- **onie-nos-install**

Installs Junos OS from any URL, such as `http://`, `ftp://`, and `file://`.

- **onie-uninstaller**

Uninstalls Junos OS.

- **onie-discovery-start**

The discovery process starts automatically. However, if you stop the discovery process by issuing the **onie-discovery-stop** command, you can restart the discovery process by issuing the **onie-discovery-start** command.

- **onie-discovery-stop**

Stops the discovery process. To restart the discovery process, issue the **onie-discovery-start** command.

Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website at <http://www.juniper.net/support/>.

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

This procedure shows you how to upgrade software on a QFX Series device, but you can follow the same procedure for any device unless otherwise specified.

To download a software package:

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the By Technology box, click **Switching > QFXSeries > QFX5200**.
4. In the QFXSeries section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the install package from the Install Package box.
A login screen appears.
6. Enter your name and password and press Enter.
7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Save the `jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin` file to your computer.
9. Open or save the installation package either to the local system in the `var/tmp` directory or to a remote location. If you are copying the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or SCP.

Connecting to the Console Port

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that might occur.

Backing Up the Current Configuration Files

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

```
user@switch# save filename
```

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

Uninstalling the Existing Version of Junos OS

The switch comes preinstalled with a version of Junos OS that is to be used with the Junos OS CLI. However, if you want to use ONIE to install Junos OS, you need to uninstall the existing Junos OS and reinstall the Junos OS image that has a .bin extension—for example, `jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin` file.

To uninstall your existing Junos OS version:

1. Select **Go to ONIE Loader** from the GNU GRUB menu.
2. Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured DHCP or webserver and the management IP address of the switch and the IP address of the default gateway. If you want to manually configure static addressing for the management IP address of the switch, issue **onie-discovery-stop** command at the ONIE prompt, and then manually configure the management IP address and IP address of the default gateway.

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

To restart the ONIE discovery and execution (ODE) application, issue the **onie-discovery-start** command.

For example:

```
ONIE:/ # onie-discovery-start
```

Installing a Junos OS Software Package That Resides on a Webserver or DHCP Server with DHCP Options Configured

To install a Junos OS software package residing on a webserver or DHCP server:

1. Copy the software image with the filename **onie-installer** to the `var/www/html` directory of the webserver or DHCP server.
2. Configure the DHCP option 114 in the DHCP server to redirect to the webserver to fetch the Junos OS software image.
3. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

4. Configure DHCP option 114 and other DHCP options as necessary.

Here is a sample Windows Open DHCP server configuration with DHCP option 114 configured.

```
#Following are range-specific DHCP options.
#You can copy more option names from [GLOBAL_OPTIONS]
IP=10.204.42.250
SubnetMask=255.255.240.0
Router=10.204.47.254
114="http://10.207.66.147/onie-installer"
```

Here is a sample boot initialization log, showing the options you just configured:

```
Info: Trying DHCPv4 on interface: eth0
ONIE: Using DHCPv4 addr: eth0: 10.204.42.250 / 255.255.240.0
ONIE: Starting ONIE Service Discovery
Info: Fetching http://10.207.66.147/onie-installer ...
ONIE: Executing installer: http://10.207.66.147/onie-installer  <-----
automatically redirects to web sever to fetch Junos OS image.
Verifying image checksum ... OK.
Preparing image archive ... OK.
Installing Juniper NOS...
```

The log shows that the installation process has fetched the Junos OS software image from the DHCP server and is installing the Junos OS software.

The switch reboots and the GNU GRUB menu is displayed.

Installing Junos OS Software Using Secure Copy Protocol (SCP)

To install Junos OS software using SCP:

1. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured webserver. If you do not have DHCP configured, you will need to stop the ONIE discovery and execution (ODE) application and manually configure static addressing for the management IP address of the switch,

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

2. Use SCP to copy the Junos OS image from a server or other location to the `/var/tmp` directory on the switch.

For example:

```
user@server scp jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
root@10.204.32.196:/var/tmp/
```

3. Issue the `onie-nos-install` command in the `/var/tmp` directory to install Junos OS software.

```
ONIE:/var/tmp # onie-nos-install file:///var/tmp/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

The switch reboots and displays the GNU GRUB menu.

Installing Junos OS Software Using FTP or TFTP Without a Webserver

To install Junos OS software using FTP or TFTP:

1. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured webserver. If you do not have DHCP configured, you will need to stop the ONIE discovery and execution (ODE) application and manually configure static addressing for the management IP address of the switch,

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

2. Copy the Junos OS image to an FTP or TFTP directory.
3. Issue the **onie-nos-install** command at the ONIE prompt to install the Junos OS software.

If you are using FTP:

```
ONIE:/ # onie-nos-install ftp://<username>:<password>@10.209.152.22/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

If you are using TFTP:

NOTE: The software image should be located in the `/tftp/boot` directory.

```
ONIE:/ # onie-nos-install tftp://10.207.66.147/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

The switch reboots and displays the GNU GRUB menu.

Installing Junos OS Software Using DHCP Server with No DHCP Options Configured

Use this installation method if you cannot modify or set the DHCP options on your DHCP server.

To install the Junos OS software using a DHCP server with no DHCP options configured:

1. Copy the software image with the filename **jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin** to the **var/www/html** directory of the webserver or DHCP server.
2. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.

- Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

3. Issue the **onie-nos-install** command at the ONIE prompt to install the Junos OS software.

For example:

```
ONIE:/ # onie-nos-install http://10.207.66.147/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

Here is sample log with the options you just configured:

```
ONIE:/ # ifconfig
eth0      Link encap:Ethernet  HWaddr 94:DE:80:AA:F2:E1
          inet addr:10.204.42.250  Bcast:10.204.47.255  Mask:255.255.240.0
<<<---- --> Received IP address from DHCP server, but auto redirected to web
server. Installation will not happen because DHCP option (114) is not
configured.
```

```
inet6 addr: fe80::96de:80ff:feaa:f2e1/64 Scope:Link

```

The switch reboots and the GNU GRUB menu is displayed.

Installing Junos OS Software Using Webserver Without DHCP Configured

Use this installation method if you do not have a DHCP server.

To install the Junos OS software using a webserver without DHCP configured:

1. Because the switch comes preinstalled with the Junos OS to be used with the Junos OS CLI, you need to uninstall this version of software before you can install the Junos OS image to be used with ONIE.

- Select **Go to ONIE Loader** from the GNU GRUB menu.
- Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

2. Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, and the switch reboots.

By default, the ONIE discovery and execution (ODE) application attempts to discover and fetch an image from a configured webserver. Because you do not have DHCP configured, you will need to stop the ONIE discovery and execution (ODE) application and manually configure static addressing for the management IP address of the switch.

For example:

```
ONIE:/ # onie-discovery-stop
ONIE:/ # ifconfig eth0 10.204.32.96 netmask 255.255.254.0
ONIE:/ # route add default gw 10.204.47.254
```

3. Copy the software image to the **var/www/html** directory of the webserver.
4. Issue the **onie-nos-install** command at the ONIE prompt to install the Junos OS software.

For example:

```
ONIE:/ # onie-nos-install http://10.204.35.100/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
```

Here is sample log:

```
Stopping: discover... done.
Info: Fetching http://10.204.35.100/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin ...

installer          100% | ***** | 464M 0:00:00
ETA
ONIE: Executing installer: http://10.204.35.100/
jnpr-qfx-5e-flex-nos-updater-15.1X53-D30.5.bin
Verifying image checksum ... OK.
Preparing image archive ... OK.
Installing Juniper NOS...
```

The log shows that the installation process has fetched the Junos OS software image from the webserver and is installing the Junos OS software.

The switch reboots and the GNU GRUB menu is displayed.

Installing Junos OS Software Using USB Media

NOTE: This installation method is not supported on the QFX5200 switches.

To install the Junos OS software using USB media:

1. Make sure the USB stick is formatted as VFAT or ext2.
2. Copy the software image with the filename **onie-installer** to the USB stick and insert the USB stick into the front USB port of the switch.
3. Uninstall the preinstalled Junos OS version.
 - Select **Go to ONIE Loader** from the GNU GRUB menu.
 - Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The Junos OS is uninstalled, the switch reboots, and the software is installed from the USB stick.

Here is a sample log showing the USB installation process:

```

Version      : master-201412161452.0.1

```

In this example, the CLI output shows that Junos OS Release Software 15.1X53-D30.5 was installed on the switch.

Troubleshooting Unsupported Network Operating System

Problem **Description:** ONIE has detected an unsupported network operating system.

Solution You can only run the Junos OS network operating system with the .bin file extension on the switch. If you receive a message that says, “**NOS Updater has detected incompatible NOS. Please uninstall it manually before proceeding. Exiting...**,” you must uninstall the unsupported network operating system from the switch. The following procedure explains how to uninstall the unsupported network operating system.

1. Select **Go to ONIE Loader** from the GNU GRUB menu.
2. Select **ONIE: Uninstall OS** from the GNU GRUB menu.

The network operating system is uninstalled, and the switch reboots.

Troubleshooting ONIE ISO Files

Problem **Description:** In the event that you cannot get ONIE ISO file sources from Alpha Networks, you can perform this procedure to get ISO files sources from an open source.

Solution 1. Download the ONIE ISO files by issuing the **git clone** <https://github.com/opencomputeproject/onie> command.

For example:

```
$ git clone https://github.com/opencomputeproject/onie
```

2. To compile ONIE, make sure you are in the **build-config** directory and then issue the **make -j4 MACHINEROOT=../machine/alpha_networks MACHINE=alpha_networks_snx60a0_486f all** command.

For example:

```
$ cd build-config
$ make -j4 MACHINEROOT=../machine/alpha_networks
MACHINE=alpha_networks_snx60a0_486f all
```

3. Download the built image located in the **build/images/onie-recovery-x86_64-alpha_networks_snx60a0_486f-r0.iso** directory.

Creating an Emergency Boot Device for ONIE Software and Network Operating System

If the Open Network Install Environment (ONIE) software is damaged or corrupted in some way, or the switch went into rescue mode, you can use an emergency boot device to repartition the primary disk and load a fresh installation of ONIE. Use the following procedure to create an emergency boot device.

Before you begin, you need to have the 201502181747 version of ONIE software.

NOTE: In the following procedure, we assume that you are creating the emergency boot device on a switch. You can create the emergency boot device on any PC or laptop that supports Linux. The emergency boot device will contain both ONIE software and the Network Operating Software (NOS).

To create an emergency boot device:

1. Insert the USB stick into the front USB port of the switch.
2. Issue the following command from the directory on the switch in which the ISO file is located:

```
ONIE:/ # dd if=onie-recovery-x86_64-alpha_networks_snx60a0_486f-r0.iso  
of=<usb-detected-drive> bs=1M count=20
```

You can also issue the **dd** command using the full path to where the ISO file is located.

For example, if the ISO file is located in the **/var/tmp/** directory:

```
root@device%dd if=jnpr-qfx-5e-flex-onie-usb-15.1X53-D30.5.iso of=<usb-detected-drive>  
/dev/da0 bs=1m
```

The switch writes the installation media image to the USB device:

3. Remove the USB stick from the USB port of the switch.

Performing a Recovery Installation

In the event that the Open Network Install Environment (ONIE) is corrupted, the switch goes into rescue mode, or you need to reinstall ONIE software for any reason, you need to perform a recovery installation.

NOTE: All Junos OS partitions are destroyed during a recovery installation.

NOTE: Before you can perform a recovery installation, make sure you have an emergency boot device loaded with ONIE software.

1. Insert the emergency boot device into the device.
2. Power cycle the device.
3. Press the **ESC** button to go into the Boot Manager menu.
4. Select **Boot Manager**, and then press **Enter**.
5. Select **Unigen PQS1000** under **Legacy USB**, and then press **Enter**.
6. Select **ONIE: Embed ONIE** from the **ONIE Installer** menu, and then press **Enter**.

The recovery installation proceeds using the emergency boot device.

7. Remove the emergency boot device.
8. Verify that the ONIE software was installed by looking at the installation log file.

For example:

```
Info: Found static url: file:///lib/onie/onie-updater
ONIE: Executing installer: file:///lib/onie/onie-updater
Verifying image checksum ... OK.
Preparing image archive ... OK.
ONIE: Version          : master-201502181747
```

Installation log files are displayed automatically during the installation process, but if you want to verify installation log files at a different time, you can find them in the `/var/log/` directory. To view an installation log file, issue the **tail -f /var/log/onie.log** command.

9. Issue the **var/tmp # parted /dev/sda print** command to verify that the ONIE partitions have been created.

For example:

```
ONIE:/ var/tmp # parted /dev/sda print
Model: ATA TS32GMTS400 (scsi)
Disk /dev/sda: 32.0GB
Sector size (logical/physical): 512B/512B
Partition Table: gpt
Disk Flags:
```

Number	Start	End	Size	File system	Name	Flags
1	1049kB	3146kB	2097kB		GRUB-B00T	hidden, bios_grub
2	3146kB	137MB	134MB	ext4	ONIE-B00T	hidden

Upgrading Software

To upgrade Junos OS, you need to install the appropriate upgrade package on the device. Upgrading involves these tasks:

NOTE: If you want to use the Open Network Install Environment (ONIE) to install software, see “Installing and Recovering Software Using the Open Network Install Environment (ONIE)” on page 176.

1. [Downloading Software Files with a Browser on page 190](#)
2. [Accessing Software Downloaded to a Remote Location on page 191](#)
3. [Connecting to the Console Port on page 191](#)
4. [Backing Up the Current Configuration Files on page 191](#)

5. [Installing a Standard Software Package on page 191](#)
6. [Installing a Standard Software Package on a QFX10008 Switch on page 192](#)

Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website, go to <http://www.juniper.net/support/>.

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

This procedure shows you how to upgrade software on a QFX Series device, but you can follow the same procedure for any device unless otherwise specified.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. In the **Install Package** section of the **Software** tab, select the **Install Package** for the release.
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Save the **jinstall-qfx-<version>-domestic-signed.tgz** file on your computer.
10. Open or save the installation package either to the local system in the **var/tmp** directory or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

Accessing Software Downloaded to a Remote Location

To access the installation package if you downloaded it to a remote location (for example, any system other than the switch):

1. From the command line, make sure you are in the **/var/tmp** directory of the switch.
2. Start the shell interface:
`user@switch> start shell`
3. Initiate an FTP, TFTP, or scp session.

In this example, FTP is used.

`>ftp`

4. Use FTP to access the remote location where the installation package resides.

`ftp ftp://<hostname>/<pathname>/<package-name-m.mZx-distribution>.tgz.`

where `<package-name-m.mZx-distribution>.tgz` is

`jinstall-qfx-5e-flex-15.1X53-D30.5-domestic-signed.tgz`

5. When prompted, enter your username and password.
6. Use the **get** command to transfer the installation package from the remote location to your **/var/tmp** directory on your switch.

`get <package-name-m.mZx-distribution>.tgz`

7. Close the FTP session:

`bye`

Connecting to the Console Port

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that may occur.

Backing Up the Current Configuration Files

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

`user@switch# save filename`

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

Installing a Standard Software Package

NOTE: Before you install the software, back up any critical files in **/var/home**. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

Install the software in one of two ways:

NOTE: On the switch, use the **force-host** option to force installing the latest version of the Host OS. However, by default, if the Host OS version is different from the one that is already installed on the switch, the latest version is installed without using the **force-host** option.

If the installation package resides locally on the switch, execute the **request system software add <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add  
/var/tmp/jinstall-qfx-5e-flex-15.1X53-D30-domestic.tgz reboot
```

If the Install Package resides remotely, execute the **request system software add <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add  
ftp://ftpsrvr/directory/jinstall-qfx-5e-flex-15.1X53-D30-domestic.tgz reboot
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

Installing a Standard Software Package on a QFX10008 Switch

NOTE: Before you install the software, back up any critical files in `/var/home`. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

NOTE: On the switch, use the `force-host` option to force-install the latest version of the Host OS. However, by default, if the Host OS version is different from the one that is already installed on the switch, the latest version is installed without using the `force-host` option.

The switch contains two routing engines, so you will need to install the software on each routing engine (re0 and re1).

If the installation package resides locally on the switch, execute the **request system software add <pathname><source> (re0 | re1)** command.

To install the software on re0:

```
user@switch> request system software add
/var/tmp/jinstall-qfx-10-m-flex-15.1X53-D30-secure-domestic-signed.tgz re0
```

If the Install Package resides remotely from the switch, execute the **request system software add <pathname><source> re0** command.

For example:

```
user@switch> request system software add
ftp://ftpsrvr/directory/jinstall-qfx-10-m-flex-15.1X53-D30-secure-domestic-signed.tgz re0
```

To install the software on re1:

```
user@switch> request system software add
/var/tmp/jinstall-qfx-10-m-flex-15.1X53-D30-secure-domestic-signed.tgz re1
```

If the Install Package resides remotely from the switch, execute the **request system software add <pathname><source> re1** command.

For example:

```
user@switch> request system software add
ftp://ftpsrvr/directory/jinstall-qfx-10-m-flex-15.1X53-D30-secure-domestic-signed.tgz re1
```

Reboot both routing engines.

For example:

```
user@switch> request system reboot both-routing-engines
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

Understanding Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning (ZTP) in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, ZTP was called EZ Touchless Provisioning.

NOTE: QFX5200 switches only work with HTTP in 15.1X53-D30. FTP and TFTP protocols are not supported.

ZTP allows you to provision new Juniper Networks switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default factory configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If the DHCP server does not respond or provide the software image and configuration files, the switch boots with the preinstalled software and default factory configuration. On switches running Enhanced Layer 2 Software, Junos Extended Dynamic Host Configuration Protocol (JDHCP) is used instead of legacy DHCP. JDHCP supports

the same functionality as DHCP, and all configuration options remain the same. JDHCP is an enhanced version of legacy DHCP software.

NOTE: For detailed information regarding the DHCP and DHCP options, refer to RFC2131 (<http://www.ietf.org/rfc/rfc2131.txt>) and RFC2132 (www.ietf.org/rfc/rfc2132.txt). Also, this document refers to Internet Systems Consortium (ISC) DHCP version 4.2. For more information regarding this version, refer to <http://www.isc.org/software/dhcp/documentation>.

The Zero Touch Provisioning process will either upgrade or downgrade the Junos OS version. During a downgrade:

- On an EX Series switch, If you downgrade to a software version earlier than Junos OS Release 12.2, in which ZTP is not supported, the configuration file autoinstall phase of the Zero Touch Provisioning process does not happen.
- On an EX Series switch, to downgrade to a software version that does not support resilient dual-root partitions (Junos OS Release 10.4R2 or earlier), you must perform some manual work on the switch. For more information, see *Understanding Resilient Dual-Root Partitions on Switches*.

NOTE: On QFX3500 and QFX3600 switches running the original CLI, you cannot use ZTP to upgrade from Junos OS Release 12.2 or later to Junos OS Release 13.2X51-D15 or later.

Zero Touch Provisioning Process

When you boot a switch with the default factory configuration, the following process happens:

NOTE: If you are performing Zero Touch Provisioning (ZTP) with a Junos OS image that contains enhanced automation for the QFX5100 switch, configure root authentication, and the provider name, license type, and deployment scope for Chef and Puppet at the [edit system] hierarchy in the configuration file that is fetched from the server:

```
{master:0}
root# set root-authentication (encrypted-password password | plain-text-password
password | ssh-dsa public-key | ssh-rsa public-key)
root# set extensions providers juniper license-type customer deployment-scope
commercial
root# set extensions providers chef license-type customer deployment-scope
commercial
```

1. If DHCP option 43, suboption 00 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

2. If DHCP option 43, suboption 02 (a symbolic link to the software image file on the FTP, HTTP, or TFTP server), the switch compares the version of the provided software image to the version of the software installed on the switch.
 - If the Junos OS versions are different, the switch downloads the software image from the FTP, HTTP, or TFTP server, installs the Junos OS, and reboots using the default factory configuration.
 - If the software versions are the same, the switch does not upgrade the software.
3. If DHCP option 43, suboption 01 (the name of the configuration file on the FTP, TFTP, or HTTP server) is configured:

If DHCP option 43 suboption 01 is not specified, the switch uses the default factory configuration.

If both DHCP option 43 suboption 01 and suboption 2 are specified, suboption 01 is processed before suboption 02. The Junos OS is upgraded, and then the configuration file is applied.

NOTE: On EX4300 and QFX5100 switches running Enhanced Layer 2 Software, and QFX5100 switches running a Junos OS image that contains enhanced automation, you can specify the name of a script file or a configuration file in suboption 01. ZTP determines if the file is a script file based on the first line that is included in the file. If the first line contains

#! characters followed by an interpreter path—for example, `#!/usr/libexec/ui/cscript`—ZTP determines that the file is a script file, and executes the script file with the specified interpreter path. If the script returns an error, ZTP will fetch the script file and execute the script file until the script executes successfully. If the file does not contain special characters or an interpreter path, ZTP determines that the file is a configuration file.

4. If DHCP option 43, suboption 03 (the transfer mode setting) is configured, the switch accesses the FTP, HTTP, or TFTP server using the specified transfer mode setting—for example, FTP.

If DHCP option 43, suboption 03, is not configured, TFTP becomes the transfer mode automatically.

5. If DHCP option 43, suboption 04 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

NOTE: DHCP option 43 suboptions 05 through 255 are reserved.

6. If DHCP option 150 or option 66 is specified, the IP address of the FTP, HTTP, or TFTP server is configured.

NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

7. (Optional) If DHCP option 7 is specified, you can configure one or more system log (syslog) servers.

8. (Optional) If DHCP option 42 is specified, you can configure one or more NTP servers.
9. (Optional) If DHCP option 12 is specified, you can configure the hostname of the switch.

Zero Touch Provisioning Restart Process Triggers

ZTP restarts when any of the following events occur:

- Request for configuration file, script file, or image file fails.
- Configuration file is incorrect, and commit fails.
- No configuration file and no image file is available.
- Image file is corrupted, and installation fails.
- No file server information is available.
- DHCP client does not have valid ZTP parameters configured.
- When none of the DHCP client interfaces goes to a bound state.
- ZTP transaction fails after six attempts to fetch configuration file or image file.

When any of these events occur, ZTP resets the DHCP client state machine on all of the DHCP client-configured interfaces (management and network) and then restarts the state machine. Restarting the state machine enables the DHCP client to get the latest DHCP server-configured parameters.

Before ZTP restarts, approximately 15 to 30 seconds must elapse to allow enough time to build a list of bound and unbound DHCP client interfaces.

The list of bound and unbound DHCP client interfaces can contain:

- No entries.
- Multiple DHCP client interfaces.

Priority is given to the DHCP client interfaces that have received all ZTP parameters (software image file, configuration file, and file server information) from the DHCP server.

After the lists of bound and unbound client interfaces are created, and a DHCP client gets selected for ZTP activity, then any existing default route is deleted, and the DHCP client interface that was selected adds a new default route. In order to add a new default route, only one ZTP instance can be active.

After ZTP restarts, the DHCP client attempts fetching files from the DHCP server for up to six times, with ten to fifteen seconds elapsing between attempts. Every attempt, whether successful or not, is logged and can be seen on the console.

If there is a failure, or the number of attempts exceeds the limit, ZTP stops. ZTP then clears the DHCP client bindings and restarts state machine on the DHCP-configured interfaces.

The ZTP restart process continues until there is either a successful software upgrade, or an operator manually commits a user configuration and deletes the ZTP configuration.

- [Monitoring Zero Touch Provisioning on page 209](#)

Configuring Zero Touch Provisioning

NOTE: To see which platforms support Zero Touch Provisioning (ZTP), in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning.

Zero Touch Provisioning allows you to provision new devices in your network automatically, without manual intervention. When you physically connect a device to the network and boot it with a default configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The device uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If the DHCP server does not respond or provide the software image and configuration files, the device continues using the preinstalled Junos OS software and default factory configuration. On switches running Enhanced Layer 2 Software, Junos Extended Dynamic Host Configuration Protocol (JDHCP) is used instead of legacy DHCP. JDHCP supports the same functionality as DHCP, and all configuration options remain the same. JDHCP is an enhanced version of legacy DHCP software. If you are performing Zero Touch Provisioning with a Junos OS image that contains enhanced automation for the QFX5100 switch, you can use DHCP option 43 suboption 01 to run script files, not just load configuration files. Using scripts, you can create device-specific configuration files, and perform HTTP request operations to web servers to download specific configuration files or Junos OS software.

NOTE: If the ZTP configuration is enabled, the switch broadcasts DHCP DISCOVER packets on its interfaces. If the DHCP server on the network responds with DHCP vendor options set with the necessary values to initiate ZTP, then ZTP proceeds. To disable broadcasting the DHCP DISCOVER packets without performing the ZTP process, manually delete the `auto-image-upgrade` statement located at the `[edit chassis]` hierarchy. If ZTP completes without errors, the `auto-image-upgrade` statement is automatically deleted.

Before you begin, ensure that the switch has access to the following network resources:

- A DHCP server to lease IP addresses and information on software images and configuration files on the network.

Refer to your DHCP server documentation for configuration instructions.

- The File Transfer Protocol (anonymous FTP), Hypertext Transfer Protocol (HTTP), Trivial File Transfer Protocol (TFTP) server on which the software image and configuration files are stored

NOTE: Although TFTP is supported, we recommend that you use FTP or HTTP instead, because these transport protocols are more reliable.

- A Domain Name System (DNS) server to perform reverse DNS lookup
- (Optional) An NTP server to perform time synchronization on the network
- (Optional) A system log (syslog) server to manage system log messages and alerts

CAUTION: We recommend that you do not commit a user configuration while the device is performing ZTP activity—for example, updating the software image or applying a configuration file.

Perform the following steps to configure ZTP:

1. Boot the device.

The device continues to use the preinstalled Junos OS software and default factory configuration.

2. Issue the **request system zeroize** command on the device.
3. Download the software image file and the configuration file to the FTP, HTTP, TFTP server that the device will download these files from.

You can download either one or both of these files.

NOTE: If you are performing Zero Touch Provisioning with a Junos OS image that contains enhanced automation for the QFX5100 device, configure root authentication, and the provider name, license type, and deployment scope for Chef and Puppet at the [edit system] hierarchy in the configuration file that is fetched from the server:

```
{master:0}
root# set root-authentication (encrypted-password password |
plain-text-password password | ssh-dsa public-key | ssh-rsa public-key)
root# set extensions providers juniper license-type customer deployment-scope
commercial
root# set extensions providers chef license-type customer deployment-scope
commercial
```

4. Configure the DHCP server to provide the necessary information to the device.

Configure IP address assignment.

You can configure dynamic or static IP address assignment for the device's management address. To determine the device's management MAC address for static IP address mapping, add 1 to the last byte of the device's MAC address, which you noted before you began this procedure.

5. Define the format of the vendor-specific information for DHCP option 43 in the dhcpd.conf file.

Here is an example of an ISC DHCP 4.2 server `dhcpd.conf` file:

```
option space NEW_OP; option;
option NEW_OP.image-file-name code 0 = text;
option NEW_OP.config-file-name code 1 = text;
option NEW_OP.image-file-type code 2 = text;
option NEW_OP.transfer-mode code 3 = text;
option NEW_OP.alt-image-file-name code 4 = text;
option NEW_OP-encapsulation code 43 = encapsulate NEW_OP;
```

6. Configure the following DHCP option 43 suboptions:

- Suboption 00: The name of the software image file to install

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

```
option NEW_OP.image-file-name
"/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
```

- Suboption 01: The name of the configuration file to install

NOTE: On EX4300 and QFX5100 devices running Enhanced Layer 2 Software, and QFX5100 devices running a Junos OS image that contains enhanced automation, you can specify the name of a script file or a configuration file. ZTP determines if the file is a script file based on the first line that is included in the file. If the first line contains `#!` characters followed by an interpreter path, ZTP determines that the file is a script file, and executes the script file with the specified interpreter path. In order for a script to execute, the script file must provide the ability to fetch and load a valid configuration file on the device during the ZTP process.

The following list provides the types of scripts and their associated interpreter paths:

- Shell script interpreter path: `#!/bin/sh`
- SLAX script interpreter path: `#!/usr/libexec/ui/cscript`
- Python script interpreter path: `#!/usr/bin/python`

Unsigned Python scripts are only supported on limited platforms, such as the QFX5100 device. If you try to execute unsigned Python scripts on devices that do not provide support, error messages will be issued.

If the file does not contain special characters (`#!`), ZTP determines that the file is a configuration file and loads the configuration file.

```
option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
```

- Suboption 02: The symbolic link to the software image file to install

```
option NEW_OP.image-file-type "symlink";
```

NOTE: If you do not specify suboption 2, the Zero Touch Provisioning process handles the software image as a filename, not a symbolic link.

- Suboption 03: The transfer mode that the device uses to access the TFTP/FTP/HTTP server

```
option NEW_OP.transfer-mode "ftp";
```

NOTE: If suboption 03 is not configured, TFTP becomes the transfer mode by default.

- Suboption 04: The name of the software image file to install

NOTE: When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

NOTE: DHCP option 43 suboptions 05 through 255 are reserved.

```
option NEW_OP.alt-image-file-name
"/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
```

7.

NOTE: You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

Configure DHCP option 150 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option option-150 code 150 "10.100.31.71";
```

8. Configure DHCP option 66 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option tftp-server-name "10.100.31.71";
```

9. (Optional) Configure DHCP option 7 to specify one or more system log (syslog) servers.

```
option log-servers 10.100.31.72;
```

10. (Optional) Configure DHCP option 42 to specify one or more NTP servers.

```
option ntp-servers 10.100.31.73;
```

11. (Optional) Configure DHCP option 12 to specify the hostname of the device.

```
option hostname "jn-switch35";
```

The following sample configuration shows the DHCP options you just configured:

```
host jn-switch35 {
  hardware ethernet ac:4b:c8:29:5d:02;
  fixed-address 10.100.31.36;
  option tftp-server-name "10.100.31.71";
  option host-name "jn-switch35";
  option log-servers 10.100.31.72;
  option ntp-servers 10.100.31.73;
  option NEW_OP.image-file-name
    "/dist/images/jinstall-ex-4300-13.2R1.1-domestic-signed.tgz";
  option NEW_OP.transfer-mode "ftp";
  option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
}
```

Based on the DHCP options you just configured, the following statements are appended to the Junos OS configuration file (for example, `jn-switch35.config`):

```
system {
  host-name jn-switch35;
  syslog {
    host 10.100.31.72 {
      any any;
    }
  }
  ntp {
    server 10.100.31.73;
  }
}
```

12. Connect the device to the network that includes the DHCP server and the FTP, HTTP, or TFTP server.
13. Boot the device with the default configuration.
14. Monitor the ZTP process by looking at the following log files.

NOTE: When SLAX (live operating system based on Linux) scripts are issued, the `op-script.log` and `event-script.log` files are produced.

- `/var/log/dhcp_logfile`
- `/var/log/event-script.log`
- `/var/log/image_load_log`
- `/var/log/messages`
- `/var/log/op-script.log`
- `/var/log/script_output`

You can also monitor the ZTP process by looking at error messages and issuing operational commands. See [“Monitoring Zero Touch Provisioning” on page 209](#) for more information.

- Related Documentation**

 - [Reverting to the Default Factory Configuration by Using the request system zeroize Command on page 28](#)

Monitoring Zero Touch Provisioning

You can use the console and operational commands to monitor Zero Touch Provisioning.

1. [Using the Console to Monitor Zero Touch Provisioning on page 209](#)
2. [Using System Log Alerts to Monitor Zero Touch Provisioning on page 210](#)
3. [Using Error Messages to Monitor Zero Touch Provisioning on page 210](#)
4. [Using System Log Files to Monitor Zero Touch Provisioning on page 210](#)
5. [Using the show dhcp client binding Command on page 211](#)
6. [Using the show dhcp client statistics Command on page 211](#)

Using the Console to Monitor Zero Touch Provisioning

The following Zero Touch Provisioning (ZTP) activities are displayed on the console during the ZTP process:

- Starting and ending times of ZTP process.
- Lists of bound and unbound DHCP client interfaces.
- DHCP options that DHCP servers send to DHCP clients.
- Logs indicating which interfaces are used for ZTP.
- ZTP parameters that DHCP clients obtain from DHCP servers.
- File names of configuration and image files, names of file servers, protocols used to fetch files, and times when DHCP servers fetch configuration and image files.
- Failure states caused by files not being on servers, or unreachable servers, and time outs.
- Number of attempts made, and number of attempts remaining, for retry in current ZTP cycle.
- Completion of file transfers.
- Installation, reboot, and state of ZTP process.
- Internal state errors and termination of ZTP process.
- Logs for when default routes were added or deleted.

Using System Log Alerts to Monitor Zero Touch Provisioning

Purpose In this example, the system log alert alerts you that the auto-image upgrade will start.

Action Use the following system log alert to monitor the auto-image upgrade process.

```
"ALERT:Auto-image upgrade will start. This can terminate config CLI session(s).  
Modified configuration will be lost. To stop Auto-image, in CLI do the  
following: 'edit; delete chassis auto-image-upgrade; commit'."
```

```
"Checking whether image upgrade is already invoked"
```

Meaning This system log alert indicates that the auto-image upgrade will start, and provides information on how to stop the auto-image upgrade process.

Using Error Messages to Monitor Zero Touch Provisioning

Purpose Error messages provide information on which DHCP options are not configured.

Action Use the information in the following error message to find out which DHCP options are not configured.

```
"DHCP Log Server Option"  
"DHCP Host Name Option"  
"DHCP NTP Server Option"
```

Meaning The error message indicates that the DHCP log server, hostname, and NTP server options are not configured.

Using System Log Files to Monitor Zero Touch Provisioning

Purpose System log files provide information on the state of the auto-upgrade process, lists of bound and unbound DHCP client interfaces, IP addresses of file servers, names and locations of image and configuration files, and successful and failed attempts at fetching configuration and image files.

Action Use the information in the following system log files to monitor the auto-upgrade process.

```
Auto Image Upgrade: Start fetching config-file file from server 1.1.1.1 through  
irb using ftp
```

```
Auto Image Upgrade: Tried [2] attempts to fetch config-file file from server  
1.1.1.1 through irb. Summary: "Retrieving /config-file  
:: Failed to open file.". To retry [4] times.
```

```
Auto Image Upgrade: Tried [4] attempts to fetch config-file file from server  
1.1.1.1 through irb. Summary: "Retrieving /config-fileconfig-file  
:: Failed to open file.". To retry [2] times.
```

```
Auto Image Upgrade: Tried [6] attempts to fetch config-file file from server  
1.1.1.1 through irb. Summary: "Retrieving /config-file  
:: Failed to open file.". To retry [0] times.
```

Auto Image Upgrade: All [6] attempts to fetch config-file file from server 1.1.1.1 through irb FAILED. Start retry again in few minutes.

Meaning These system log files indicate that there were six failed attempts to fetch the configuration file from the file server, the IP address of the file server, the DHCP client interface name, and the number of times the retry process occurred.

Using the show dhcp client binding Command

Purpose Issue the **show dhcp client binding** command to display DHCP client binding information

Action Issue the **show dhcp client binding** command to display the IP address of the DHCP client, the hardware address of the DHCP client, number of seconds in which the DHCP client's IP address lease expires, state of the DHCP client IP address in the binding table, and the name of the interface that has active client bindings.

show dhcp client binding

```
user@switch# show dhcp client binding
IP address      Hardware address Expires   State      Interface
0.0.0.0         00:22:83:2a:db:dc 0         SELECTING  irb.0
6.6.6.13        00:22:83:2a:db:dd 49201     BOUND      vme.0
0.0.0.0         00:22:83:2a:db:df 0         SELECTING  xe-0/0/0.0
0.0.0.0         00:22:83:2a:db:e0 0         SELECTING  xe-0/0/1.0
```

Meaning The output of this command shows that there is one client interface that is bound, and that there are three interfaces that are receiving DHCP offers from the DHCP server.

Using the show dhcp client statistics Command

Purpose Issue the **show dhcp client statistics** command to display DHCP client statistics.

Action Issue the **show dhcp client statistics** command to display DHCP client statistics, such as the number of packets dropped, and the number DHCP and BOOTP messages sent and received.

show dhcp client statistics

```
user@switch# show dhcp client statistics
Packets dropped:
  Total          14
  Send error     14
Messages received:
  BOOTREPLY      5
  DHCPOFFER      1
  DHCPACK        4
  DHCPNAK        0
  DHCPFORCERENEW 0
Messages sent:
  BOOTREQUEST    6751
  DHCPDECLINE    0
  DHCPDISCOVER   6747
  DHCPREQUEST    4
  DHCPINFORM     0
  DHCPRELEASE    0
```

DHCPRENEW	0
DHCPREBIND	0

Meaning The output of this command displays how many packets were dropped with errors, the number of BOOTREPLY and DHCPOFFER messages that were received, and the number of BOOTREQUEST and DHCPREQUEST messages that were sent.

arp (System)

Syntax	<pre>arp { aging-timer <i>minutes</i>; gratuitous-arp-delay <i>seconds</i>; gratuitous-arp-on-ifup; interfaces { <i>interface-name</i> { aging-timer <i>minutes</i>; } } passive-learning; purging; }</pre> <p>For EX-Series switches:</p> <pre>arp { aging-timer <i>minutes</i>; }</pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.</p> <p>For EX-Series switches, set only the time interval between ARP updates.</p>
Options	<p>aging-timer—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.</p> <p>passive-learning (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.</p> <p>Default: 20 minutes</p> <p>Range: 1 to 240 minutes</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

auxiliary

Syntax	<pre>auxiliary { disable; insecure; type <i>terminal-type</i>; }</pre>
Hierarchy Level	[edit system ports]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the characteristics of the auxiliary port.
Default	The auxiliary port is disabled.
Options	<p>disable—Disable the port.</p> <p>insecure—Disable superuser access or root logins to establish a terminal connection.</p> <p>type <i>terminal-type</i>—Type of terminal that is connected to the port.</p> <p>Range: <code>ansi</code>, <code>vt100</code>, <code>small-xterm</code>, <code>xterm</code></p> <p>Default: The terminal type is unknown, and the user is prompted for the terminal type.</p>
Required Privilege Level	<p><code>system</code>—To view this statement in the configuration.</p> <p><code>system-control</code>—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Configuring Console and Auxiliary Port Properties on page 15

checksum

Syntax	<code>checksum (md5 sha-256 sha1) <i>hash</i>;</code>
Hierarchy Level	[edit event-options event-script file <i>filename</i>], [edit system scripts commit file <i>filename</i>],
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For Junos commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event or commit script, the Junos OS verifies the authenticity of the script by using the configured checksum hash.
Options	<p>md5 <i>hash</i>—MD5 checksum of this script.</p> <p>sha-256 <i>hash</i>—SHA-256 checksum of this script.</p> <p>sha1 <i>hash</i>—SHA-1 checksum of this script.</p>
Required Privilege Level	<p>maintenance—To view this statement in the configuration.</p> <p>maintenance-control—To add this statement to the configuration.</p>

compress-configuration-files (System)

Syntax	(compress-configuration-files no-compress-configuration-files);
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Compress the current operational configuration file. The file is stored in the file juniper.conf , in the /config file system, along with the last three committed versions of the configuration. However, with large networks, the current configuration file might exceed the available space in the /config file system. Compressing the current configuration file allows the file to fit in the file system, typically reducing the size of the file by 90 percent. The current configuration file is compressed on the second commit of the configuration after the first commit is made to include the compress-configuration-files statement.
<div> NOTE: We recommend that you enable compression of the configuration files to minimize the amount of disk space that they require.</div>	
Default	The current operational configuration file is uncompressed.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Compressing the Current Configuration File on page 14

console (Physical Port)

Syntax	<pre>console { disable; insecure; log-out-on-disconnect; type <i>terminal-type</i>; }</pre>
Hierarchy Level	[edit system ports]
Release Information	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Configure the characteristics of the console port.
Default	The console port is enabled and its speed is 9600 baud.
Options	<p>disable—Disable console login connections.</p> <p>insecure—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.</p> <p>log-out-on-disconnect—Log out the session when the data carrier on the console port is lost.</p> <p>type <i>terminal-type</i>—Type of terminal that is connected to the port: ansi, vt100, small-xterm, or xterm.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring Console and Auxiliary Port Properties on page 15

default-address-selection

Syntax	default-address-selection;
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Use the loopback interface, lo0 , as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as fxp0 . The lo0 interface is the interface to the switch's Routing Engine.
Default	<p>The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:</p> <ul style="list-style-type: none">• The primary address on the loopback interface lo0 that is <i>not</i> 127.0.0.1 is used.• The primary address for the primary interface or the preferred address (if configured) for the primary interface is used. <p>By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.</p> <p>An interface's <i>primary address</i> is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's <i>preferred address</i> is the default local address used for packets sourced by the local switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.</p> <p>To configure a different primary address or preferred address, include the primary or preferred statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] or [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] hierarchy levels.</p>
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets on page 20• <i>Junos OS Network Interfaces Library for Routing Devices</i>

domain-name

Syntax	<code>domain-name <i>domain-name</i>;</code>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the name of the domain in which the switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.
Options	<i>domain-name</i> —Name of the domain.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Reaching a Domain Name System Server on page 26

domain-search

Syntax	<code>domain-search <i>domain-list</i>;</code>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure a list of domains to be searched.
Options	<i>domain-list</i> —List of domain names to search. The list can contain up to 6 domain names, with a total of up to 256 characters.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Reaching a Domain Name System Server on page 26

ethernet (Alarm)

Syntax	ethernet { link-down (red yellow ignore); }
Hierarchy Level	[edit chassis alarm], [edit chassis interconnect-device <i>name</i> alarm], [edit chassis node-group <i>name</i> alarm]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure alarms for an Ethernet interface.
Options	The remaining statement is explained separately.—

max-configurations-on-flash

Syntax	<code>max-configurations-on-flash <i>number</i>;</code>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the number of configurations stored on the internal fixed media storage (for example, USB device).
Options	<i>number</i> —The number of configurations stored on the CompactFlash card. Range: 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Saving a Configuration to a File on page 1331• Setting or Deleting the Rescue Configuration on page 1345• Uploading a Configuration File on page 1332• Uploading a Configuration File

name-server

Syntax	<code>name-server { <i>address</i>; }</code>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure one or more Domain Name System (DNS) name servers.
Options	<i>address</i> —Address of the name server. To configure multiple name servers, include multiple <i>address</i> options.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a DNS Name Server for Resolving a Hostname into Addresses on page 15

no-ping-record-route

Syntax	no-ping-record-route;
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the Junos OS to disable the reporting of the IP address in ping responses.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 19

no-ping-time-stamp

Syntax	no-ping-time-stamp;
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the Junos OS to disable the recording of timestamps in ping responses.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses on page 19

no-redirects (IPv4 Traffic)

Syntax	no-redirects;
Hierarchy Level	[edit system], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Stop protocol redirect messages for IPv4 traffic from being sent on the entire switch or on an interface on the router or switch.</p> <p>To disable the sending of protocol redirect messages for the entire router or switch, include the no-redirects statement at the [edit system] hierarchy level.</p> <p>To disable the sending of protocol redirect messages on a specific interface, include the no-redirects statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>] hierarchy level.</p>
Default	The router or switch sends redirect messages.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch on page 18 • <i>Understanding the Protocol Redirect Mechanism on EX Series Switches</i> • <i>Configuring Junos OS to Disable Sending Protocol Redirect Messages on EX Series Switches (CLI Procedure)</i> • <i>Junos OS Network Interfaces Library for Routing Devices</i>

optional

Syntax	optional;
Hierarchy Level	[edit system scripts commit file <i>filename</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the file statement is missing from the /var/db/scripts/commit directory on the router.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Controlling Execution of Commit Scripts During Commit Operations</i>

ports

Syntax	<pre>ports { auxiliary { disable; insecure; type <i>terminal-type</i>; } console { disable; insecure; log-out-on-disconnect; type <i>terminal-type</i>; } }</pre>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the properties of the console and auxiliary ports. The ports are located on the craft interface. See the switch hardware documentation for port locations. The remaining statements are explained separately.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Console and Auxiliary Port Properties on page 15

retry

Syntax	<code>retry number;</code>
Hierarchy Level	[edit system radius server <i>server-address</i>], [edit system accounting destination radius server <i>server-address</i>]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.
Options	<i>number</i> —Number of retries allowed for contacting a RADIUS server. Range: 1 through 10 Default: 3

NOTE: The [edit system accounting] hierarchy is not available on QFabric systems.

Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring RADIUS Authentication (QFX Series or OCX Series) on page 1873 • Configuring RADIUS Accounting • timeout on page 321

saved-core-context

Syntax	(saved-core-context no-saved-core-context);
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure whether the switch saves core files generated by internal Junos OS processes, along with contextual information (system log files and a copy of the current configuration): <ul style="list-style-type: none">• saved-core-context—The switch saves each core file and its associated context in a compressed tar file named <code>/var/tmp/process-name.core.core-number.tgz</code>.• no-saved-core-context—The switch does not save core files and their associated context.
Default	The switch saves core files.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Saving Core Files from Junos OS Processes</i>• saved-core-files on page 236

saved-core-files

Syntax	saved-core-files <i>number</i> ;
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Save core files generated by internal Junos OS processes, but not the associated contextual information (configuration and system log files).
Options	<i>number</i> —Maximum number of core files to save. Range: 1 through 10
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Saving Core Files from Junos OS Processes</i>• saved-core-context on page 236

source-port (Port Addresses)

Syntax	source-port upper-limit <upper-limit>;
Hierarchy Level	[edit system internet-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the range of port addresses.
Options	upper-limit <i>upper-limit</i> —(Optional) The range of port addresses and can be a value from 5000 through 65,355.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Junos OS to Extend the Default Port Address Range on page 19

static-host-mapping

Syntax	<pre>static-host-mapping { hostname { alias [<i>alias</i>]; inet [<i>address</i>]; sysid <i>system-identifier</i>; } }</pre>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).
Options	<p>alias <i>alias</i>—Alias for the hostname.</p> <p>hostname—Fully qualified hostname.</p> <p>inet <i>address</i>—IP address. You can specify one or more IP addresses for the host.</p> <p>sysid <i>system-identifier</i>—ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address 208.197.169.18 is 2081.9716.9018 in BCD.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Configuring the Hostname of a Router or Switch by Using a Configuration Group on page 16

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure system management properties.

NOTE: The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

time-format

Syntax `time-format (year | millisecond | year millisecond);`

Hierarchy Level [edit system syslog]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a `file`, `console`, or `user` statement at the [edit system syslog] hierarchy level, but not to destinations configured by a `host` statement.

Default The timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, **Aug 21 12:36:30**.

NOTE: When the `structured-data` statement is included at the [edit system syslog file *filename*] hierarchy level, this statement is ignored for the file.

Options `millisecond`—Include the millisecond in the timestamp.

`year`—Include the year in the timestamp.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

traceoptions (Layer 2 Learning)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> (detail disable receive send); in-memory-debug; level; no-remote-trace; } </pre>
Hierarchy Level	[edit protocols l2-learning]
Release Information	Statement introduced in Junos OS Release 13.2 for the QFX Series.
Description	Define tracing operations for Layer 2 learning.
Default	The traceoptions feature is disabled by default.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p>You can specify the following options:</p> <ul style="list-style-type: none"> • no-world-readable—(Optional) Restrict file access to the user who created the file. • size <i>size</i> —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the files option. Use xk to specify KB, xm to specify MB, or xg to specify gigabytes. • world-readable—(Optional) Enable unrestricted file access. <p>flag <i>flag</i> —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> • all—All tracing operations. • bmac-next-hop—Trace backbone MAC next hop operations. • bridge-bmac-next-hop—Trace backbone MAC next hop bridge operations. • bridging-interface—Trace interface bridge operations. • bridging-domain—Trace bridging domain operations. • configuration—Trace configuration operations. • flood-next-hop—Trace flood next hop operations. • initialization—Trace initialization operations. • interface-device—Trace interface device operations. • interface-family—Trace interface family operations.

- **interface-logical**—Trace logical interface operations.
- **ipc**—Trace inter-process communications operations.
- **irb**—Trace integrated routing and bridging operations.
- **isid**—Trace i-tagged service ID operations.
- **kack**—Trace kernel-acknowledgment.
- **learning-domain**—Trace learning domain operations.
- **logical-system**—Trace logical system operations.
- **mac-learning**—Trace MAC address learning.
- **mc-ae**—Trace multichassis aggregated Ethernet interface operations.
- **redundant-trunk-group**—Trace redundant trunk group operations.
- **routing-instance**—Trace routing instance operations.
- **routing-socket**—Trace routing socket operations.
- **storm-control**—Trace storm control operations.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vpls-ping**—Trace Virtual Private VLAN Service (VPLS) ping operations.

in-memory-debug—Enable trace parameters in the memory.

level—Specify level of debugging output.

no-remote-trace—Disable remote tracing.

Required Privilege Level	routing —To view this statement in the configuration.
	routing-control —To add this statement to the configuration.

uid

Syntax	<code>uid <i>uid-value</i>;</code>
Hierarchy Level	[edit system login user]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure a user identifier for a login account.
Options	<i>uid-value</i> —Number associated with the login account. This value must be unique on the router or switch. Range: 100 through 64000
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Junos OS User Accounts on page 125

use-imported-time-zones

Syntax	<code>use-imported-time-zones;</code>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure a custom time zone from a locally generated time zone database.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

CHAPTER 17

DHCP Configuration Statements

- [client-identifier \(DHCP Client\) on page 251](#)
- [lease-time on page 252](#)
- [retransmission-attempt on page 253](#)
- [retransmission-interval on page 254](#)
- [server-address on page 255](#)
- [update-server on page 256](#)
- [vendor-option on page 257](#)

client-identifier (DHCP Client)

Syntax	client-identifier (ascii <i>ascii</i> hexadecimal <i>hexadecimal</i>);
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify an ASCII or hexadecimal identifier for the Dynamic Host Configuration Protocol (DHCP) client. The DHCP server identifies a client by a client-identifier value, which must be unique for each client.
Default	If you do not include client-identifier in the configuration, the DHCP server uses the client hardware type and MAC address to identify the client.
Options	ascii <i>ascii</i> —Identifier consisting of ASCII characters, such as a fully qualified domain name. hexadecimal <i>hexadecimal</i> —Identifier consisting of hexadecimal numbers (0-9, a-f, A-F). Do not use colons.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	• Configuring a DHCP Client (CLI Procedure) on page 77

lease-time

Syntax	lease-time (<i>length</i> infinite);
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Request a specific lease time for the IP address.
Default	If no lease time is requested by client, then the server sends the lease time. The default lease time on a Junos OS DHCP server is one day.
Options	seconds —Request a lease time of a specific duration. Range: 60 through 2147483647 seconds infinite —Request that the lease never expire.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Understanding Interfaces</i>• <i>unit</i>• <i>family</i>

retransmission-attempt

Syntax	<code>retransmission-attempt <i>number</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the number of times the device retransmits a Dynamic Host Control Protocol (DHCP) packet if a DHCP server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.
Options	<i>number</i> —Number of retransmit attempts.. Range: 0 through 6 Default: 4
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring a DHCP Client (CLI Procedure) on page 77 • <i>Example: Configuring the Device as a DHCP Client</i> • <i>interfaces</i> • <i>unit</i> • <i>family</i>

retransmission-interval

Syntax	retransmission-interval <i>seconds</i> ;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the time between successive retransmissions of the client DHCP request if a DHCP server fails to respond.
Options	<i>seconds</i> —Number of seconds between successive retransmissions. Range: 4 through 64 seconds Default: 4 seconds
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a DHCP Client (CLI Procedure) on page 77

server-address

Syntax	<code>server-address <i>ip-address</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
Release Information	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the address of the DHCP server that the client should accept DHCP offers from. If this option is included in the DHCP configuration, the client accepts offers only from this server and ignores all other offers.
Default	The client accepts the first offer it receives from any DHCP server.
Options	<i>ip-address</i> —DHCP server address.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring a DHCP Client (CLI Procedure) on page 77 • <i>Example: Configuring the Device as a DHCP Client</i> • <i>interfaces</i> • <i>unit</i> • <i>family</i>

update-server

Syntax	update-server;
Hierarchy Level	[edit Interfaces <i>interface-name</i> unit <i>logical-unit-number</i> inet dhcp]
Release Information	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Propagate TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch, router, or device.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a DHCP Client (CLI Procedure) on page 77• <i>Example: Configuring the Device as a DHCP Client</i>• <i>interfaces</i>• <i>unit</i>• <i>family</i>

vendor-option

Syntax	<pre> vendor-option { default-local-server-group <i>local-server-group-name</i> default-relay-server-group <i>server-group-name</i> drop; equals starts-with } </pre>
Hierarchy Level	[edit forwarding-options dhcp-relay relay-option-60]
Release Information	Statement introduced before Junos OS Release 12.1 for EX Series switches. Statement deprecated in Junos OS Release 12.3 for EX Series switches.
Description	Configure the match criteria when you use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers. The extended DHCP relay agent compares the option 60 vendor-specific strings received in DHCP client packets against the match criteria that you specify. If there is a match, you can define certain actions for the associated DHCP client packets.
<div style="display: flex; align-items: center;">  <div> <p>NOTE: The <code>vendor-option</code> statement has been deprecated and might be removed from future product releases. We recommend that you phase out its use. See <i>option-number</i>.</p> </div> </div>	
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure)</i> • <i>Understanding the Extended DHCP Relay Agent for EX Series Switches</i>

CHAPTER 18

ICMP Configuration Statement

- [no-multicast-echo on page 259](#)

no-multicast-echo

Syntax	no-multicast-echo
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 8.1.
Description	Disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses.
Default	The Routing Engine responds to ICMP echo requests sent to multicast group addresses.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Junos OS to Disable the Routing Engine Response to Multicast Ping Packets on page 86

CHAPTER 19

Junos OS With Upgraded FreeBSD Operational Commands

- request system reboot (Junos OS with Upgraded FreeBSD)
- request system snapshot (Junos OS with Upgraded FreeBSD)
- show system snapshot (Junos OS with Upgraded FreeBSD)

request system reboot (Junos OS with Upgraded FreeBSD)

Syntax	<pre>request system reboot <all-members> <at <i>time</i>> <both-routing-engines> <in <i>minutes</i>> <local> <media (oam junos network usb)> <member <i>member-id</i>> <message "<i>text</i>"> <other-routing-engine></pre>
Release Information	<p>Command introduced in Junos OS Release 15.1 for MX240, MX480, MX960, MX2010, and MX2020 routers and EX9200 switches.</p> <p>Command introduced in Junos OS Release 15.1X53-D30 for QFX5200 switches.</p>
Description	Reboot the software.
Options	<p>none—Reboot the software immediately.</p> <p>all-members—(Optional) Reboot the software on all members of the Virtual Chassis configuration.</p> <p>at <i>time</i>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none">• now—Stop or reboot the software immediately. This is the default.• +<i>minutes</i>—Number of minutes from now to reboot the software.• <i>yymmddhhmm</i>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute. Omitting a value will default to the current date for that value.• <i>hh:mm</i>—Absolute time on the current day at which to stop the software, specified in 24-hour time. <p>both-routing-engines—(Optional) Reboot both Routing Engines at the same time.</p> <p>in <i>minutes</i>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the at +<i>minutes</i> option.</p> <p>local—(Optional) Reboot the software on the local Virtual Chassis member.</p> <p>media (oam junos network usb)—(Optional) Reboot the boot media:</p> <ul style="list-style-type: none">• oam—Reboot from the oam volume.• junos—Reboot from the junos volume.• network—Reboot from the network.• usb—Reboot from the USB device.

member *member-id*—(Optional) Reboot the software on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

Additional Information Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

NOTE: To reboot a router or switch that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

Required Privilege Level maintenance

Related Documentation

- [clear system reboot on page 337](#)
- [request system halt on page 384](#)
- [Understanding Junos OS with Upgraded FreeBSD on page 89](#)

List of Sample Output

[request system reboot on page 263](#)
[request system reboot \(at 2300\) on page 263](#)
[request system reboot \(in 2 Hours\) on page 264](#)
[request system reboot \(Immediately\) on page 264](#)
[request system reboot \(at 1:20 AM\) on page 264](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

request system reboot (at 2300)

```
user@host> request system reboot at 2300 message "Maintenance time!"
```

```
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
```

```
*** System shutdown message from root@berry.network.net ***
```

```
System going down at 23:00
```

request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
```

```
user@host> request system reboot in 120
```

```
user@host> request system reboot at 19:00
```

request system reboot (Immediately)

```
user@host> request system reboot at now
```

request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
```

```
request system reboot at 120
```

```
Reboot the system at 120? [yes,no] (no) yes
```

request system snapshot (Junos OS with Upgraded FreeBSD)

Syntax	request system snapshot <delete <i>snapshot-name</i> > <load <i>snapshot-name</i> > <media <i>type</i> > <recovery>
Release Information	Command introduced in Junos OS Release 15.1 for MX240, MX480, MX960, MX2010, and MX2020 routers and EX9200 switches. Command introduced in Junos OS Release 15.1X53-D30 for QFX5200 switches.
Description	On the router or switch, back up the currently running and active file system partitions to standby partitions that are not running. Non-recovery snapshots are named snap.date.time and stored in the /packages/sets directory.
<div>  <p>CAUTION: After you run the request system snapshot command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.</p> </div>	
Options	<p>none—On the router or switch, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, this creates a non-recovery snapshot named snap.<date>.<time> which is stored in /packages/sets.</p> <p>delete <i>snapshot-name</i>—(Optional) Delete a specific non-recovery snapshot from /packages/sets. Wildcards are supported, so request system snapshot delete snap* deletes all snapshots.</p> <p>load <i>snapshot-name</i>—(Optional) Load a specific snapshot from /packages/sets.</p> <p>media <i>type</i>—(Optional) Specify the boot device the software is copied to:</p> <ul style="list-style-type: none"> usb—(MX960 routers only) Copy software to the device connected to the USB port. <p>recovery—Create a recovery snapshot and store it in the /oam volume.</p>
Additional Information	Before upgrading the software on the router or switch, when you have a known stable system, issue the request system snapshot command to back up the software, including the configuration, to the /packages/sets file systems. After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the request system snapshot command again to back up the new software to the /packages/sets file systems.
Required Privilege Level	maintenance

authentication (Login)

Syntax	<pre>authentication { encrypted-password <i>password</i>; load-key-file <i>URL</i>; plain-text-password <i>password</i>; remote-debug-permission (qfabric-admin qfabric-operator qfabric-user); ssh-dsa "<i>public-key</i>"; ssh-rsa "<i>public-key</i>"; }</pre>
Hierarchy Level	[edit system login user <i>username</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.
Options	<p>encrypted-password "<i>password</i>"—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for encrypted-password using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p>load-key-file—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.</p> <p>plain-text-password—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p>remote-debug-permission (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.</p> <p>ssh-dsa "<i>public-key</i>"—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> <p>ssh-rsa "<i>public-key</i>"—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p>
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

class (Assigning a Class to an Individual User)

Syntax	<pre>class <i>class-name</i> { operator; read-only; super-user; unauthorized; }</pre>
Hierarchy Level	[edit system login user <i>username</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure a user's login class. You must configure one class for each user.
Options	<i>class-name</i> —One of the classes defined at the [edit system login class] hierarchy level.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Junos OS User Accounts on page 125

deny-commands

Syntax	<pre>deny-commands "<i>regular-expression</i>";</pre>
Hierarchy Level	[edit system login class]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the permissions statement would allow their use.
Default	If you omit this statement and the allow-commands statement, users can issue only those commands for which they have access privileges through the permissions statement.
Options	<i>regular-expression</i> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Specifying Access Privileges for Junos OS Operational Mode Commands on page 30• allow-commands on page 271• user on page 282

deny-configuration

Syntax	<code>deny-configuration "regular-expression";</code>
Hierarchy Level	[edit system login class]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Explicitly deny configuration access to the specified levels in the hierarchy even if the permissions set with the permissions statement grant such access by default.
Default	If you omit this statement and the allow-configuration statement, users can edit those levels in the configuration hierarchy for which they have access privileges through the permissions statement.
Options	regular-expression —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Specifying Access Privileges Using allow/deny-configuration Statements</i> • allow-configuration on page 272 • user on page 282

idle-timeout

Syntax	<code>idle-timeout <i>minutes</i>;</code>
Hierarchy Level	<code>[edit system login class <i>class-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For a login class, configure the maximum time that a session can be idle before the user is logged off the switch. The session times out after remaining at the CLI operational mode prompt for the specified time.
Default	If you omit this statement, a user is never forced off the system after extended idle times.
Options	<i>minutes</i> —Maximum idle time. Range: 0 through 4294967295 minutes
Required Privilege Level	admin —To view this statement in the configuration. admin-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Timeout Value for Idle Login Sessions on page 22

load-key-file

Syntax	<code>load-key-file URL filename;</code>
Hierarchy Level	[edit system root-authentication], [edit system login user <i>username</i> authentication]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	 NOTE: ECDSA is not supported on the QFabric system. Load RSA (SSH version 1 and SSH version 2) and DSA or ECDSA (SSH version 2) public keys from a previously-generated named file at a specified URL location or local path. The file contains one or more SSH keys that are copied into the configuration when the command is issued.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

authentication-key

Syntax	<code>authentication-key <i>key-number</i> type <i>type</i> value <i>password</i>;</code>
Hierarchy Level	[edit system ntp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure Network Time Protocol (NTP) authentication keys so that the router or switch can send authenticated packets. If you configure the router or switch to operate in authenticated mode, you must configure a key.</p> <p>Both the keys and the authentication scheme (MD5) must be identical between a set of peers sharing the same key number.</p>
Options	<p><i>key-number</i>—An integer in the range of 1 to 65533.</p> <p><i>type type</i>—Authentication type. It can only be md5.</p> <p><i>value password</i>—Key itself, consisting of 1 through 8 ASCII characters. If the key contains spaces, enclose it in quotation marks.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Understanding NTP Time Servers on page 131• Configuring NTP Authentication Keys on page 132

boot-server (NTP)

Syntax	<code>boot-server (address hostname);</code>
Hierarchy Level	[edit system ntp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure the server that NTP queries when the router or switch boots to determine the local date and time.</p> <p>When you boot the router or switch, it issues an ntpdate request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local router's or switch's time. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the ntpdate request resolves the hostname to an IP address when the router or switch boots up.</p>
Options	<ul style="list-style-type: none"> • address—IP address of an NTP boot server. • hostname—Hostname of an NTP boot server.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding NTP Time Servers on page 131 • Configuring NTP Authentication Keys on page 132 • Synchronizing and Coordinating Time Distribution Using NTP on page 137

broadcast

Syntax	<code>broadcast address <key key-number> <version value> <tll value>;</code>
Hierarchy Level	[edit system ntp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the local router or switch to operate in broadcast mode with the remote system at the specified address to send periodic broadcast messages to a client population. Normally, you include this statement only when the local router or switch is operating as a transmitter.
Options	<p>address—Broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be 224.0.1.1.</p> <p>key key-number—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number (any unsigned 32-bit integer).</p> <p>tll value—(Optional) Time-to-live (TTL) value to use. Range: 1 through 255 Default: 1</p> <p>version value—(Optional) Specify the version number to be used in outgoing NTP packets. Range: 1 through 4 Default: 4</p>
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding NTP Time Servers on page 131• Configuring NTP Authentication Keys on page 132• Configuring the NTP Time Server and Time Services on page 133

broadcast-client

Syntax	<code>broadcast-client;</code>
Hierarchy Level	<code>[edit system ntp]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the local switch to listen for broadcast messages on the local network to discover other servers on the same subnet.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding NTP Time Servers on page 131 • Configuring NTP Authentication Keys on page 132 • Configuring the Switch to Listen for Broadcast Messages Using NTP on page 135

multicast-client

Syntax	<code>multicast-client <address>;</code>
Hierarchy Level	<code>[edit system ntp]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For Network Time Protocol (NTP), configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet.
Options	address —(Optional) One or more IP addresses. If you specify addresses, the router or switch joins those multicast groups. Default: 224.0.1.1.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding NTP Time Servers on page 131 • Configuring NTP Authentication Keys on page 132 • Configuring the Switch to Listen for Multicast Messages Using NTP on page 136

ntp

Syntax	<pre>ntp { authentication-key <i>number</i> type <i>type</i> value <i>password</i>; boot-server <i>address</i>; broadcast <<i>address</i>> <<i>key key-number</i>> <<i>version value</i>> <<i>ttl value</i>>; broadcast-client; multicast-client <<i>address</i>>; peer <i>address</i> <<i>key key-number</i>> <<i>version value</i>> <<i>prefer</i>>; server <i>address</i> <<i>key key-number</i>> <<i>version value</i>> <<i>prefer</i>>; source-address <i>source-address</i>; trusted-key [<i>key-numbers</i>]; }</pre>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure Network Time Protocol (NTP) on the switch. The remaining statements are explained separately.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding NTP Time Servers on page 131• Configuring NTP Authentication Keys on page 132• Synchronizing and Coordinating Time Distribution Using NTP on page 137

peer

Syntax	<code>peer address <key key-number> <version value> <prefer>;</code>
Hierarchy Level	[edit system ntp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.
Options	<p>address—Address of the remote system. You must specify an address, not a hostname.</p> <p>key key-number—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p>Range: Any unsigned 32-bit integer</p> <p>prefer—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p>version value—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p>Range: 1 through 4</p> <p>Default: 4</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding NTP Time Servers on page 131 • Configuring NTP Authentication Keys on page 132 • Configuring the NTP Time Server and Time Services on page 133

server (NTP)

Syntax	<code>server address <key key-number> <version value> <prefer>;</code>
Hierarchy Level	[edit system ntp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For NTP, configure the switch to operate in client mode with the remote system at the specified server address. In this mode, the local switch can be synchronized with the remote system, but the remote system can never be synchronized with the local switch.
Options	<p>address—Address of the remote system. You must specify an address, not a hostname.</p> <p>key key-number—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p>Range: Any unsigned 32-bit integer</p> <p>prefer—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p>version value—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p>Range: 1 through 4</p> <p>Default: 4</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

source-address (NTP, RADIUS, System Logging, or TACACS+)

Syntax	<code>source-address <i>source-address</i>;</code>
Hierarchy Level	[edit system accounting destination radius server <i>server-address</i>], [edit system accounting destination tacplus server <i>server-address</i>], [edit system ntp], [edit system radius-server <i>server-address</i>], [edit system syslog], [edit system tacplus-server <i>server-address</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify a source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine.
Options	<i>source-address</i> —Valid IP address configured on one of the switch interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all host <i>hostname</i> statements at the [edit system syslog] hierarchy level.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring RADIUS Authentication (QFX Series or OCX Series) on page 1873 • Synchronizing and Coordinating Time Distribution Using NTP on page 137 • Specifying an Alternative Source Address for System Log Messages Directed to a Remote Destination

trusted-key

Syntax	<code>trusted-key [<i>key-numbers</i>];</code>
Hierarchy Level	[edit system ntp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For NTP, configure the keys to use when you configure the switch to synchronize its time with other systems on the network.
Options	<i>key-numbers</i> —One or more key numbers. Each key can be any 32-bit unsigned integer except 0.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

Related Documentation	<ul style="list-style-type: none">• Configuring Junos OS User Accounts on page 125• root-authentication on page 307

change-type

Syntax	change-type (character-sets set-transitions);
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set requirements for using character sets in plain-text passwords. When you combine this statement with the minimum-changes statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.
Options	Specify one of the following: <ul style="list-style-type: none">• character-sets—Number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.• set-transitions—Number of transitions between character sets.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Special Requirements for Junos OS Plain-Text Passwords on page 1824• minimum-changes on page 298

format

Syntax	format (des md5 sha1);
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the authentication algorithm for plain-text passwords.
Default	For Junos OS, the default encryption format is md5 . For Junos OS-FIPS software, the default encryption format is sha1 .
Options	The hash algorithm that authenticates the password can be one of three algorithms: <ul style="list-style-type: none">• des—Has a block size of 8 bytes; its key size is 48 bits long.• md5—Produces a 128-bit digest.• sha1—Produces a 160-bit digest.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

Syntax	maximum-length <i>length</i> ;
Hierarchy Level	[edit system login passwords]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the maximum number of characters allowed in plain-text passwords. Newly created passwords must meet this requirement.
Default	For Junos OS-FIPS software, the maximum number of characters for plain-text passwords is 20 . For Junos OS, no maximum is set.
Options	length —Maximum number of characters the password can include. Range: 1 to 64 characters
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Special Requirements for Junos OS Plain-Text Passwords on page 1824• minimum-length on page 299

minimum-changes

Syntax	<code>minimum-changes <i>number</i>;</code>
Hierarchy Level	[edit system login passwords]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement is used in combination with the change-type statement. If the change type is character-sets, then the number of character sets included in the password is checked against the specified minimum. If the change type is set-transitions, then the number of character set changes in the password is checked against the specified minimum.</p>
Default	For Junos OS, the minimum number of changes is 1. For Junos-FIPS software, the minimum number of changes is 3.
Options	<i>number</i> —Minimum number of character sets (or character set changes) required for the password.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Special Requirements for Junos OS Plain-Text Passwords on page 1824• change-type on page 295

minimum-length

Syntax	minimum-length <i>length</i> ;
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.
Default	For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.
Options	length —Minimum number of characters the password must include. Range: 6 to 20 characters
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Special Requirements for Junos OS Plain-Text Passwords on page 1824 • maximum-length on page 297

minimum-lower-cases

Syntax	<code>minimum-lower-cases <i>number</i>;</code>
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify the minimum number of lower-case letters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as minimum-length, minimum-punctuations, minimum-upper-cases, and so on.</p> <p>Using several password minimum requirement options will cause the minimum-length to be reset if the total sum of the required minimums exceeds the minimum-length setting.</p>
Options	<i>number</i> —The minimum number of lower-case letters required for the password.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Special Requirements for Junos OS Plain-Text Passwords on page 1824• Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 148• <i>password (Login)</i>

minimum-numeric

Syntax	<code>minimum-numeric <i>number</i>;</code>
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify the minimum number of numeric class characters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as minimum-length, minimum-punctuations, minimum-lower-cases, and so on.</p> <p>Using several password minimum requirement options will cause the minimum-length to be reset if the total sum of the required minimums exceeds the minimum-length setting.</p>
Options	<i>number</i> —The minimum number of numeric class characters required for the password.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Special Requirements for Junos OS Plain-Text Passwords on page 1824 • Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 148 • <i>password (Login)</i>

minimum-punctuations

Syntax	<code>minimum-punctuations <i>number</i>;</code>
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify the minimum number of punctuation class characters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as minimum-length, minimum-upper-cases, minimum-lower-cases, and so on.</p> <p>Using several password minimum requirement options will cause the minimum-length to be reset if the total sum of the required minimums exceeds the minimum-length setting.</p>
Options	<i>number</i> —The minimum number of punctuation class characters required for the password.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Special Requirements for Junos OS Plain-Text Passwords on page 1824• Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 148• <i>password (Login)</i>

minimum-upper-cases

Syntax	<code>minimum-upper-cases <i>number</i>;</code>
Hierarchy Level	[edit system login password]
Release Information	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify the minimum number of upper-case letters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as minimum-length, minimum-punctuations, minimum-lower-cases, and so on.</p> <p>Using several password minimum requirement options will cause the minimum-length to be reset if the total sum of the required minimums exceeds the minimum-length setting.</p>
Options	<i>number</i> —The minimum number of upper-case letters required for the password.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Special Requirements for Junos OS Plain-Text Passwords on page 1824 • Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 148 • <i>password (Login)</i>

password (Login)

Syntax	<pre>password { change-type (set-transitions character-set); format (md5 sha1 des); maximum-length length; minimum-changes number; minimum-length length; }</pre>
Hierarchy Level	[edit system login]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements. The remaining statements are explained separately.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Special Requirements for Junos OS Plain-Text Passwords on page 1824

permissions

Syntax	<pre>permissions { storage; storage-control; }</pre>
Hierarchy Level	[edit system login class]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the login access privileges to be provided on the switch.
Options	<i>permissions</i> —Privilege type.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Access Privilege Levels on page 1809• Table 137• user on page 282

retry-options

Syntax	<pre> retry-options { backoff-threshold <i>number</i>; backoff-factor <i>seconds</i>; maximum-time <i>seconds</i>; minimum-time <i>seconds</i>; tries-before-disconnect <i>number</i>; } </pre>
Hierarchy Level	[edit system login]
Release Information	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.
Options	<p>backoff-threshold <i>number</i>—Threshold for the number of failed login attempts before the user experiences a delay when attempting to reenter a password. Use the backoff-factor option to specify the length of delay, in seconds.</p> <p>Range: 1 through 3</p> <p>Default: 2</p> <p>backoff-factor <i>seconds</i>—Length of delay after each failed login attempt. The length of delay increases by this value for each subsequent login attempt after the value specified in the backoff-threshold option.</p> <p>Range: 5 through 10</p> <p>Default: 5</p> <p>maximum-time <i>seconds</i>—Maximum length of time that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured maximum-time, the connection is closed.</p> <p>Range: 20 through 300</p> <p>Default: 120</p> <p>minimum-time <i>seconds</i>—Minimum length of time that the connection remains open while the user is attempting to enter a password to log in.</p> <p>Range: 20 through 60</p> <p>Default: 20</p> <p>tries-before-disconnect <i>number</i>—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.</p> <p>Range: 1 through 10</p> <p>Default: 10</p>

Required Privilege	admin—To view this statement in the configuration.
Level	admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Limiting the Number of User Login Attempts for SSH and Telnet Sessions</i>

root-authentication

Syntax	<pre>root-authentication { (encrypted-password "password" load-key-password URL plain-text-password); ssh-dsa "public-key"; ssh-rsa "public-key"; }</pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Configure the authentication methods for the root-level user, whose username is root .
Options	<p>encrypted-password "password"— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for the encrypted-password option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p>
	<div>  <p>CAUTION: Do not use the encrypted-password option unless the password is <i>already</i> encrypted, and you are entering the encrypted version of the password. If you commit the encrypted-password option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as root, and you will need to use the password recovery process.</p> </div>
	<p>plain-text-password—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p>
	<p>ssh-dsa "public-key"—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.</p>
	<p>ssh-rsa "public-key"—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

CHAPTER 23

PTP Configuration Statement

- [e2e-transparent on page 311](#)

e2e-transparent

Syntax	e2e-transparent;
Hierarchy Level	[edit protocols ptp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D25 for the QFX Series.
Description	Configure the transparent clock for Precision Time Protocol (PTP). The end to end (E2E) transparent clock mode is supported. With an end-to-end transparent clock, only the residence time is included in the timestamp in the packet. Transparent clock functionality is supported on both PTP over IP and PTP over Ethernet. With PTP over Ethernet, one or two VLANs are supported. Transparent clock functionality is enabled globally and might be required in scenarios in which the interface on which packets are received and transmitted is unknown.
Options	There are no options.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• [edit protocols ptp] Hierarchy Level• Configuring Transparent Clock Mode for Precision Time Protocol on page 152

commit

Syntax `commit <<at <"string">> <and-quit> <check> <comment <"comment-string">>
<confirmed> <display detail> <minutes> <synchronize><force>>`

Release Information Command introduced before Junos OS Release 7.4.

Description Commit the set of changes to the database and cause the changes to take operational effect.

Options `at <"string">`—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.

string is **reboot** or the future time to activate the configuration changes. Enclose the **string** value (including **reboot**) in quotation marks (" "). You can specify time in two formats:

- A time value in the form **hh:mm[:ss]** (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the **commit at** configuration command is issued. Use 24-hour time for the **hh** value; for example, **04:30:00** is 4:30:00 AM, and **20:00** is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.
- A date and time value in the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the **commit at** command is issued. Use 24-hour time for the **hh** value. For example, **2003-08-21 12:30:00** is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.

For example, **commit at "18:00:00"**. For date and time, include both values in the same set of quotation marks. For example, **commit at "2005-03-10 14:00:00"**.

A *commit check* is performed when you issue the **commit at** configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.

NOTE: If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at** configuration command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see [CLI Explorer](#).

and-quit—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

check—(Optional) Verify the syntax of the configuration, but do not activate it.

comment <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab"**.

confirmed <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is 1 through 65,535 minutes, and the default is 10 minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

display detail—(Optional) Monitors the commit process.

NOTE: In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the **more** pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

synchronize <*force*>—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the **commit synchronize** command. The Routing Engine on which you execute this command (request Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine is terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

NOTE: When you issue the `commit synchronize` command, you must use the `apply-groups re0` and `re1` commands. For information about how to use groups, see *Disabling Inheritance of a Junos OS Configuration Group*.

The responding Routing Engine must use Junos OS Release 5.0 or later.

Required Privilege Level

`configure`—To enter configuration mode.

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the [Secure Configuration Guide for Common Criteria and Junos-FIPS](#).

NOTE: Do not use the `load override` or `load replace` command instead of `set` command in the management software Junos Space or NSM documentation.

clear log

Syntax	<code>clear log <i>filename</i></code> <code><all></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Remove contents of a log file.
Options	<i>filename</i> —Name of the specific log file to delete. all —(Optional) Delete the specified log file and all archived versions of it.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show log on page 1003
List of Sample Output	clear log on page 332
Output Fields	See file list for an explanation of output fields.

Sample Output

clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel           57 Sep 15 03:44 /var/log/sampled
total 1
```

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.
Options	<p>none—Clear all pending system software reboots or halts.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.</p>

all-members—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

infrastructure *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

node-group *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

scc—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace *number* with 0.

file

Syntax	file <archive checksum compare copy delete list rename show source address>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Archive files from the device, copy files to and from the router or switch, calculate the file checksum, compare files, delete a file from the device, list files on the device, rename a file, show file contents, or show the local address to initiate a connection.
Options	<p>archive (Optional)—Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.</p> <p>checksum (Optional)—Calculate the Message Digest 5 (MD5) checksum of a file.</p> <p>compare (Optional)—Compare two local files and describe the differences between them in default, context, or unified output styles.</p> <p>copy (Optional)—Copy files from one place to another on the local switch or between the local switch and a remote system.</p> <p>delete (Optional)—Delete a file on the local switch.</p> <p>list (Optional)—Display a list of files on the local switch.</p> <p>rename (Optional)—Rename a file on the local switch.</p> <p>show (Optional)—Display the contents of a file.</p> <p>source address (Optional)—Specify the source address of the local file.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • <i>Viewing Files and Directories on a Device Running Junos OS</i>

file archive

Syntax	<code>file archive destination <i>destination</i> source <i>source</i> <compress></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
Options	<p>destination <i>destination</i>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none">• For archived files—The suffix .tar• For archived and compressed files—The suffix .tgz <p>source <i>source</i>—Source of the original file or files. Specify the source as a URL or filename.</p> <p>compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix .tgz.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 40
List of Sample Output	file archive (Multiple Files) on page 342 file archive (Single File) on page 342 file archive (with Compression) on page 343
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

file checksum md5

Syntax	<code>file checksum md5 <pathname> filename</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Calculate the Message Digest 5 (MD5) checksum of a file.
Options	pathname —(Optional) Path to a filename. filename —Name of a local file for which to calculate the MD5 checksum.
Required Privilege Level	maintenance

file compare

Syntax	<pre>file compare (files <i>filename filename</i>) <context unified> <ignore-white-space></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
Description	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> • Default—In the first line of output, c means lines were changed between the two files, d means lines were deleted between the two files, and a means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (<) in front of output lines refers to the first file. A right angle bracket (>) in front of output lines refers to the second file. • Context—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-). • Unified—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.
Options	<p>files <i>filename</i>—Names of two local files to compare.</p> <p>context—(Optional) Display output in context format.</p> <p>ignore-white-space—(Optional) Ignore changes in the amount of white space.</p> <p>unified—(Optional) Display output in unified format.</p>

file delete

Syntax	<code>file delete <i>filename</i></code> <code><purge></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Delete a file on the local router or switch.
Options	<i>filename</i> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued. <i>purge</i> —(Optional) Overwrite regular files before deleting them.
Required Privilege Level	maintenance
List of Sample Output	file delete on page 351 file delete (Routing Matrix) on page 351
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax	<code>file list</code> <code><detail recursive></code> <code><filename></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display a list of files on the local router or switch.
Options	none —Display a list of all files for the current directory. detail recursive —(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively. filename —(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.
Additional Information	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the file list command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the file list command.
Required Privilege Level	maintenance
List of Sample Output	file list on page 352 file list (Routing Matrix) on page 352
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp

file rename

Syntax	<code>file rename <i>source destination</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Rename a file on the local router or switch.
Options	<i>destination</i> —New name for the file. <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
Required Privilege Level	maintenance
List of Sample Output	file rename on page 354 file rename (Routing Matrix) on page 354
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
```

```
-----

/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

file show

Syntax	<code>file show <i>filename</i></code> <code><encoding (base64 raw)></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the contents of a file.
Options	<i>filename</i> —Name of a file. For a routing matrix, the filename must include the chassis information. <code>encoding (base64 raw)</code> —(Optional) Encode file contents with base64 encoding or show raw text.
Required Privilege Level	maintenance
List of Sample Output	file show on page 356 file show (Routing Matrix) on page 356
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file show

```

  p $arg0, $arg1
  set $ch = $arg0
  set $j = 0
  set $n = $arg1
  while ($j < $n)
    #printf "%x %x ",&$ch[$j],$ch[$j]
    printf "%x ",$ch[$j]
    set $j = $j + 1
    if (!($j % 16))
      printf "\n"
    end
  end
end
end
```

load

Syntax	<code>load (factory-default merge override patch replace set update) load (<i>filename</i> terminal) <relative></code>
QFX Series	<code>load (dhcp-snooping <i>filename</i>)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs.

NOTE: `load` can be run from configuration mode only.

Options **dhcp-snooping**—(QFX Series switches) Loads DHCP snooping entries.

factory-default—Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on.

NOTE: To load the factory default configuration, you must first *unprotect* any protected hierarchies in the configuration.

filename—Name of the file to load. For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

merge—Combine the configuration that is currently shown in the CLI with the configuration.

override—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.

patch—Change part of the configuration and mark only those parts as changed.

replace—Look for a **replace** tag in *filename*, delete the existing statement of the same name, and replace it with the configuration.

set—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**.

relative—(Optional) Execute set of commands until the current edit point.

terminal—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.

update—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

Required Privilege Level configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Check host reachability and network connectivity. The ping command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.</p>
Options	<p>host—IP address or hostname of the remote system to ping.</p> <p>bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p>count requests—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.</p> <p>detail—(Optional) Include in the output the interface on which the ping reply was received.</p> <p>do-not-fragment—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> NOTE: In Junos OS Release 11.1 and later, when issuing the ping command for an IPv6 route with the do-not-fragment option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.</p> </div> <p>inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.</p> <p>inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.</p> <p>interface source-interface—(Optional) Interface to use to send the ping requests.</p> <p>interval seconds—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.</p> <p>logical-system logical-system-name—(Optional) Name of logical system from which to send the ping requests.</p> <p>Alternatively, enter the set cli logical-system logical-system-name command and then run the ping command. To return to the main router or switch, enter the clear cli logical-system command.</p>

loose-source value—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address mac-address—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern string—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance routing-instance-name—(Optional) Name of the routing instance for the ping attempt.

size bytes—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

strict—(Optional) Use the strict source route option (IPv4).

strict-source value—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos type-of-service—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point value** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

ttl value—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

verbose—(Optional) Display detailed output.

vpls instance-name—(Optional) Ping the instance to which this VPLS belongs.

wait seconds—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

Required Privilege Level	network

Syntax (PTX Series Packet Transport Routers)	<code>request chassis fpc (offline online restart) slot <i>slot-number</i></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i> .

NOTE: Beginning in Junos OS Release 12.3, it is possible that FPCs brought offline using the `request chassis fpc slot fpc-slot offline` operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the `set fpc fpc-slot power off` configuration-mode command at the `[edit chassis]` hierarchy level to ensure that the FPCs remain offline.

NOTE: If a CLI-based firmware upgrade is in progress, it prevents the specified FPC from restarting. Starting in Junos OS Release 15.1, the following message is displayed:

```
user@host> request chassis fpc slot 0 restart
FPC 0 Firmware update in progress. Wait!!!
```

NOTE: The command `request chassis fpc (offline | online | restart) slot slot-number` is not supported on PTX1000 router.

Options **offline**—Take the FPC offline.

online—Bring the FPC online.

interconnect-device *name*—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

restart—Restart the FPC.

slot *slot-number*—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.

- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace **slot-number** with a value from 0 through 2.
- EX Series switches:
 - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9.
 - EX6210 switches—Replace **slot-number** with a value from 0 through 9.

NOTE: These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace **slot-number** with a value from 0 through 7.
- EX8216 switches—Replace **slot-number** with a value from 0 through 15.
- PTX5000 Packet Transport Router—Replace **slot-number** with a value from 0 through 7.

all-members—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis fpc

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

request chassis fpc (MX Series Routers with Media Services Blade [MSB])

```
user@host> request chassis fpc slot 0
Possible completions:
  offline           Take FPC offline
  online            Bring FPC online
```

restart Restart FPC

request chassis fpc (MX2020 Router)

```
user@host >request chassis fpc online slot 2
FPC 2 already online
```

request chassis fpc (MX2010 Router)

```
user@host >request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
```

request chassis pic

List of Syntax	Syntax on page 371 Syntax (ACX4000 Series Routers) on page 371 Syntax (MX Series Routers) on page 371 Syntax (TX Matrix and TX Matrix Plus Routers) on page 371
Syntax	<code>request chassis pic (offline online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>

Syntax (MX Series Routers)	<code>request chassis pic (offline online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> <member <i>member-id</i>></code>
Syntax (TX Matrix and TX Matrix Plus Routers)	<code>request chassis pic (offline online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> <lcc <i>number</i>></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.3 for ACX4000 Routers. Command introduced in Junos OS Release 13.2 for the QFX Series. Option member introduced in Junos OS Release 14.2 for MX Series routers.
Description	Control the operation of the PIC.

NOTE: The `request chassis pic (offline | online) fpc-slot slot number pic-slot slot-number` command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the `show chassis hardware` command.

NOTE: This command is not supported on MX960 and MX2020 routers with MPC5EQ.

NOTE: T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only online and offline command options to PIC slot 0 are allowed. Use of the online and offline command options for PIC slot 1 with the described router and PIC combination is not allowed.

NOTE: In T Series routers, when the PIC state is set from offline to online or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC offline or online:

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify
```

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
```

NOTE: If a CLI-based firmware upgrade is in progress, it prevents the specified PIC from restarting. Starting in Junos OS Release 15.1, the following message is displayed:

```
user@host> request chassis pic fpc-slot 0 pic-slot 1 offline
PIC's Firmware update in progress. Wait!!!
```

NOTE: The command `request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number` is not supported on PTX1000 routers.

Options **offline**—Take the PIC offline.

online—Bring the PIC online.

fpc-slot *slot-number*—Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—0.
 - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
 - EX8208 switches—0 through 7 (line card).
 - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.

- M40 and M40e routers—0 through 7.
- M120 routers—0 through 5.
- M160 routers—0 through 7.
- M320 routers—0 through 7.
- MX 5, MX10, and MX40 routers—0 or 1.
- MX80 routers—0 or 1.
- MX240 routers—0 through 2
- MX480 routers—0 through 5
- MX2020 routers—0 through 19.
- MX2010 routers—0 through 9.
- MX960 routers—0 through 11.
- PTX5000 routers—0 or 1.
- T Series routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the **number** of the T1600 or T4000 router by using the lcc number option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, for the FPC slot number, replace **slot-number** with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline
```

- QFX5100 standalone switches—0.

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member *member-id*—(MX Series routers only) (Optional) Change the PIC status on the specified member of the Virtual Chassis configuration. Replace *member-id* with the value that is assigned to the specified member.

offline—Take the PIC offline.

online—Bring the PIC online.

pic-slot *slot-number*—PIC slot number.

- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—***slot-number*** corresponds to the slot number of the Packet Forwarding Engine.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- T1600 router —0, 1, 2, or 3.
- T4000 router—0, 1, 2, or 3.
- QFX5100 standalone switches—0, 1, or 2. PIC 0 is used for all interfaces that are not configured on expansion modules, and PIC 1 and PIC 2 are used for interfaces configured on expansion modules.

Release Information	Command introduced before Junos OS Release 7.4. all-chassis option added in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.3 for QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

CAUTION: (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the *Junos OS High Availability Library for Routing Devices*.

NOTE: Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

NOTE: On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

Options **acquire**—Attempt to become the master Routing Engine.

release—Request that the other Routing Engine become the master.

switch—Toggle mastership between Routing Engines.

NOTE: The **acquire** option should be used with caution because acquiring a Routing Engine may result in a corrupted database. If possible, use the **switch** option instead.

The **acquire**, **release**, and **switch** options have the following suboptions:

all-chassis—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

all-lcc—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

all-members—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

check—(QFabric systems, MX104, MX480, MX960, MX2010, and MX2020 routers, and PTX5000 routers only) (Optional) Available with the **switch**, **release**, and **acquire** options. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

no-confirm—(Optional) Do not request confirmation for the switch.

node-group *name*—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

scc—(TX Matrix routers only) TX Matrix (switch-card chassis).

sfc—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

Additional Information Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (**RE0**) is the master and the Routing Engine in slot 1 (**RE1**) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the *Junos OS Administration Library for Routing Devices*.

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

NOTE: Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

Required Privilege Level maintenance

- [request chassis routing-engine master switch check on page 380](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

[request chassis routing-engine master acquire](#)

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

[request chassis routing-engine master switch](#)

```
user@host> request chassis routing-engine master switch
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes
```

```
Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes
```

```
Resolving mastership...
Complete. The local routing engine becomes the master.
```

request chassis routing-engine master switch check

Usage shown for M Series, MX Series, and T Series routers.

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
```

```
warning: Standby Routing Engine is not ready for graceful switchover.
```

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
Switchover Ready
```

You can similarly check the backup Routing Engine.

request message

Syntax	<code>request message all message "text"</code> <code>request message message "text" (terminal <i>terminal-name</i> user <i>user-name</i>)</code>

Description	Stop the router or switch software.

NOTE: When you issue this command on an individual component—for example, a Node device—in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, issue this command with the **member** option on the Node device CLI, because you cannot issue this command from the QFabric CLI. Also, issuing this command might cause traffic loss on an individual component.

When you issue this command on a QFX5100 switch, you are not prompted to reboot. You must power cycle the switch to reboot.

Options **none**—Stop the router or switch software immediately.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Halt all chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

at time —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- **+minutes**—Number of minutes from now to stop the software.
- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

backup-routing-engine—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

both-routing-engines—(Optional) Halt both Routing Engines at the same time.

director-device *director-device-id*—(QFabric systems only) Halt a specific Director device.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

in *minutes*—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

media (compact-flash | disk)—(Optional) Boot medium for the next boot.

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping the software.

other-routing-engine—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

slice *slice*—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

NOTE: If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

Required Privilege Level maintenance

List of Sample Output

- [request system halt on page 389](#)
- [request system halt \(In 2 Hours\) on page 389](#)
- [request system halt \(Immediately\) on page 389](#)
- [request system halt \(At 1:20 AM\) on page 389](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

request system halt (Immediately)

```
user@host> request system halt at now
```

request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

request system logout

Syntax	<code>request system logout (pid <i>pid</i> terminal <i>terminal</i> user <i>username</i>) <all></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Log out users from the router or switch and the configuration database. If a user held the configure exclusive lock, this command clears the exclusive lock.
Options	all —(Optional) Log out all sessions owned by a particular PID, terminal session, or user. (On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.) pid <i>pid</i> —Log out the user session using the specified management process identifier (PID). The PID type must be management process. terminal <i>terminal</i> —Log out the user for the specified terminal session. user <i>username</i> —Log out the specified user.
Required Privilege Level	configure
Related Documentation	<ul style="list-style-type: none">• <i>Log a User Out of the Router</i>

Release Information Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Power off the software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

NOTE: For a standalone chassis (such as MX Series, PTX Series, and T Series routers), the request to power off the system is applicable only to the Routing Engines. When you request to power off both Routing Engines, all the FPCs in the chassis shut down after approximately 10 minutes and the chassis fans run at full speed. The FPCs shut down because they no longer have communication with the Routing Engines and an Inter-Integrated Circuit (I2C) timeout occurred.

Options `none`—Power off the router or switch software immediately.

all-chassis—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.

all-lcc—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.

at *time*—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- **+*minutes***—Number of minutes from now to power off the software.
- ***yymmddhhmm***—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- ***hh:mm***—Absolute time on the current day at which to power off the software.

both-routing-engines—(Optional) Power off both Routing Engines at the same time.

in *minutes*—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +*minutes*** option.

lcc *number*—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

media (compact-flash | disk)—(Optional) Boot medium for the next boot.

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before powering off the software.

other-routing-engine—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

sfc number—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

slice slice—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

Please save your data and log out immediately."  
warning: This command will not halt the other routing-engine.  
If planning to switch off power, use the both-routing-engines option.  
Power Off the system ? [yes,no] (no) yes
```

```
*** FINAL System shutdown message from remote@nutmeg ***  
System going down IMMEDIATELY
```

```
This router will be powered off in 30 minutes. Please save your data and log out  
immediately.
```

```
Shutdown NOW!  
[pid 5177]
```

request system reboot

Syntax (QFX Series) request system reboot
 <all <graceful>>
 <at time>
 <director-device *name*>
 <director-group <graceful>>
 <fabric <graceful>>
 <fast-boot>
 <in minutes>
 <hypervisor>
 <media >
 <message "text">
 <node-group *name*>
 <slice (1 | 2 | alternate)>

Release Information Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Reboot the Junos OS.

NOTE: On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

Options **none**—Reboots the software immediately.

all—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

at time—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **+minutes**—Number of minutes from now to reboot the software.
- **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

director-device *name*—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

director-group—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

fabric—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

fast-boot—(QFX5100 switches only) (Optional) Enable fast reboot.

graceful—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

in minutes—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

hypervisor—(Optional) Reboot Junos OS, host OS, and any installed guest VMs.

media (external | internal)—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

message "text"—(Optional) Message to display to all system users before rebooting the software.

node-group name—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

routing-engine—(Optional) Reboot the Routing Engine.

slice (1 | 2 | alternate)—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

NOTE: The slice option is not supported on the QFX5100 switch, because there is no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to previous version of Junos OS, issue the **request system software rollback** command.

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

Required Privilege Level maintenance

Syntax (SRX Series)	request system storage cleanup <dry-run>
Release Information	Command introduced in Junos OS Release 7.4. dry-run option introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 9.2 for SRX Series. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series. satellite option introduced in Junos OS Release 14.2R3.
Description	Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.

Options **all-members**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the Virtual Chassis master Routing Engine only.

NOTE: To delete files on the other members of the Virtual Chassis configuration, log in to each backup Routing Engine and delete the files using the **request system storage cleanup local** command.

component (*UUID | serial number | all*)—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

director-group *name*—(QFabric systems only) (Optional) Delete files on the Director group.

dry-run—(Optional) List files proposed for deletion (without deleting them).

infrastructure *name*—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Delete files on the Interconnect device.

local—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

name-tag *name-tag*—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

node-group *name*—(QFabric systems only) (Optional) Delete files on the Node group.

prune—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

qfabric component *name*—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

repository (*core | log*)—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

satellite [*slot-id slot-id | device-alias alias-name*]—(Junos Fusion only) (Optional) Specify the satellite device in the Junos Fusion by FPC ID or device alias name for which you want to delete debug files.

Additional Information If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

Output Fields [Table 35](#) describes the output fields for the **request system storage cleanup** command. Output fields are listed in the approximate order in which they appear.

Table 35: request system storage cleanup Output Fields

Field Name	Field Description
List of files to delete:	Shows list of files available for deletion.
Size	Size of the core-dump file.
Date	Last core-dump file modification date and time.
Name	Name of the core-dump file.
Directory to delete:	Shows list of directories available for deletion.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the core repository, and the log files are located in the log repository. The default Repository scope is shared since both the core and log repositories are shared by all of the QFabric system devices.
Repository head:	Name of the top-level repository location.
Repository name:	Name of the repository: core or log .
Creating list of debug artifacts to be removed under:	Shows location of files available for deletion.
List of debug artifacts to be removed under:	Shows list of files available for deletion.

Sample Output

request system storage cleanup dry-run

```
user@host> request system storage cleanup dry-run
Currently rotating log files, please wait.
This operation can take up to a minute.
```

List of files to delete:

request system zeroize

Syntax request system zeroize
 <media>
 <local>

Release Information Command introduced before Junos OS Release 9.0.
 Command introduced in Junos OS Release 11.2 for EX Series switches.
 Option **media** added in Junos OS Release 11.4 for EX Series switches.
 Command introduced in Junos OS Release 12.2 for MX Series routers.
 Command introduced in Junos OS Release 12.3 for the QFX Series.
 Option **local** added in Junos OS Release 14.1.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description

NOTE: The **media** option is not available on the QFX Series.

Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as **root** and start the Junos OS CLI by typing **cli** at the prompt.

NOTE: If you configure the **commit synchronize** statement at the **[edit system]** hierarchy level and issue a **commit** in the master Routing Engine, the master configuration is automatically synchronized with the backup. However, if the backup Routing Engine is down when you issue the **commit**, the Junos OS displays a warning and commits the candidate configuration in the master Routing Engine. When the backup Routing Engine comes up, its configuration will automatically be synchronized with the master. A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

To completely erase user-created data so that it is unrecoverable, use the **media** option.

Options **media**—(Optional) In addition to removing all configuration and log files, causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and so on. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the **request system zeroize media**

operation can take considerably more time than the **request system zeroize** operation. However, the critical security parameters are all removed at the beginning of the process.

local—(Optional) Remove all the configuration information and restore all the key values on the active Routing Engine.

Required Privilege Level

maintenance

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series routers.</p>

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dls** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

Description Restart a Junos OS process.

CAUTION: Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

Options **none**—Same as **gracefully**.

adaptive-services—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

all-sfc—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

ancpd-service—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

auto-configuration—(Optional) Restart the Interface Auto-Configuration process.

autoinstallation—(EX Series switches only) (Optional) Restart the autoinstallation process.

captive-portal-content-delivery—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

ce-l2tp-service—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

chassis-control—(Optional) Restart the chassis management process.

class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

database-replication—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

datapath-trace-service—(Optional) Restart the packet path tracing process.

dhcp—(EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

dhcp-service—(Optional) Restart the Dynamic Host Configuration Protocol process.

dialer-services—(EX Series switches only) (Optional) Restart the ISDN dial-out process.

diameter-service—(Optional) Restart the diameter process.

disk-monitoring—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

dls—(QFX Series only) (Optional) Restart the data link switching (DLSw) service.

dot1x-protocol—(EX Series switches only) (Optional) Restart the port-based network access control process.

dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only)
(Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

ethernet-switching—(EX Series switches only) (Optional) Restart the Ethernet switching process.

event-processing—(Optional) Restart the event process (eventd).

fibre-channel—(QFX Series only) (Optional) Restart the Fibre Channel process.

firewall—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only)
(Optional) Restart the general authentication process.

gracefully—(Optional) Restart the software process.

iccp-service—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

immediately—(Optional) Immediately restart the software process.

interface-control—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

ipsec-key-management—(Optional) Restart the IPsec key management process.

isdn-signaling—(QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

kernel-replication—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Restart the Layer 2 address flooding and learning process.

l2cpd-service—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

l2tp-service— (M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

l2tp-universal-edge— (MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

lACP— (Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc *number*— (TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

license-service— (EX Series switches only) (Optional) Restart the feature license management process.

link-management— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

lldpd-service— (EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

local— (MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

local-policy-decision-function— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

mac-validation— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member *member-id*— (MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

mib-process— (Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

mobile-ip— (Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

moundd-service— (EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

mpls-traceroute— (Optional) Restart the MPLS Periodic Traceroute process.

mspd— (Optional) Restart the Multiservice process.

multicast-snooping— (EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service— (Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

network-access-service— (QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

nfsd-service— (Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

packet-triggered-subscribers— (Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service— (Optional) Restart the Peer Selection Service process.

pgcp-service— (Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

pgm— (Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

pic-services-logging— (Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

pki-service—(Optional) Restart the PKI Service process.

ppp—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—(Optional) Restart the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

pppoe—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

protected-system-domain-service—(Optional) Restart the Protected System Domain (PSD) process.

redundancy-interface-process—(Optional) Restart the ASP redundancy process.

remote-operations—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

root-system-domain-service—(Optional) Restart the Root System Domain (RSD) service.

routing—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

routing <logical-system *logical-system-name*>—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

sampling—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

sdk-service—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

sfc *number*—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

service-deployment—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

services—(Optional) Restart a service.

services pgcp gateway gateway-name—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

sflow-service—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

snmp—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

soft—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

static-subscribers—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

statistics-service—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

subscriber-management—(Optional) Restart the Subscriber Management process.

subscriber-management-helper—(Optional) Restart the Subscriber Management Helper process.

tunnel-oamd—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

usb-control—(MX Series routers) (Optional) Restart the USB control process.

vrrp—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

web-management—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

Required Privilege Level reset

Documentation**

- [Overview of Junos OS CLI Operational Mode Commands on page 58](#)

List of Sample Output [restart interfaces on page 424](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

save

Syntax	<code>save <i>filename</i></code>
QFX Series	<code>save (dhcp-snooping <i>filename</i>)</code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.</p> <p>When saving a file to a remote system, the software uses the scp/ssh protocol.</p>
Options	<p><i>filename</i>—Name of the saved file. You can specify a filename in one of the following ways:</p> <ul style="list-style-type: none"> • <i>filename</i>—File in the user's home directory (the current directory) on the local flash drive. • <i>path/filename</i>—File on the local flash drive. • <i>/var/filename</i> or <i>/var/path/filename</i>—File on the local hard disk. • <i>a:filename</i> or <i>a:path/filename</i>—File on the local drive. The default path is / (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format. • <i>hostname:/path/filename</i>, <i>hostname:filename</i>, <i>hostname:path/filename</i>, or <i>scp://hostname/path/filename</i>—File on an scp/ssh client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify <i>hostname</i> as <i>username@hostname</i>. • <i>ftp://hostname/path/filename</i>—File on an FTP server. You can also specify <i>hostname</i> as <i>username @hostname</i> or <i>username:password @hostname</i>. The default path is the user's home directory. To specify an absolute path, the path must start with the string %2F; for example, <i>ftp://hostname/%2Fpath/filename</i>. To have the system prompt you for the password, specify <i>prompt</i> in place of the password. If a password is required, and you do not specify the password or <i>prompt</i>, an error message is displayed: <pre> user@host> file copy ftp://username@ftp.hostname.net//filename file copy ftp.hostname.net: Not logged in. user@host> file copy ftp://username:prompt@ftphostname.net//filename </pre> <p>Password for <i>username@ftp.hostname.net</i>:</p> • <i>http://hostname/path/filename</i>—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify <i>hostname</i> as <i>username@hostname</i> or <i>username:password@hostname</i>. If a password is required and you omit it, you are prompted for it. • <i>re0:/path/filename</i> or <i>re1:/path/filename</i>—File on a local Routing Engine.

Required Privilege Level configure—To enter configuration mode.

CHAPTER 27

CLI Operational Commands

- `show cli`
- `show cli authorization`
- `show cli directory`
- `show cli history`

show cli

Syntax	show cli
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display configured CLI settings.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli on page 428
Output Fields	Table 36 lists the output fields for the show cli command. Output fields are listed in the approximate order in which they appear.

Table 36: show cli Output Fields

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: on or off .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is disabled .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: on or off .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: enhanced .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is disabled .
CLI working directory	Pathname of the working directory.

Sample Output

show cli

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
```

```
CLI terminal is 'vt100'  
CLI is operating in enhanced mode  
CLI timestamp disabled  
CLI working directory is '/var/home/regress'
```

show cli authorization

Syntax	show cli authorization
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display the permissions for the current user.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli authorization on page 432
Output Fields	Table 37 lists the output fields for the show cli authorization command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

Table 37: show cli authorization Output Fields

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 37: show cli authorization Output Fields (*continued*)

Field Name	Field Description
flow-tap-control	Can configure flow-tap configuration information.
idp-profiler-operation	Can configure Profiler data.
interface	Can view interface configuration information.
interface-control	Can modify interface configuration information.
maintenance	Can perform system maintenance.
network	Can access the network by entering the ping , ssh , telnet , and traceroute commands.
pgcp-session-mirroring	Can view Packet Gateway Control Protocol session mirroring configuration.
pgcp-session-mirroring-control	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
reset	Can reset or restart interfaces and system processes.
rollback	Can roll back to previous configurations.
routing	Can view routing configuration information.
routing-control	Can modify routing configuration information.
secret	Can view passwords and authentication keys in the configuration.
secret-control	Can modify passwords and authentication keys in the configuration.
security	Can view security configuration information.
security-control	Can modify security configuration information.
shell	Can start a local shell.
snmp	Can view SNMP configuration information.
snmp-control	Can modify SNMP configuration information.
system	Can view system configuration information.
system-control	Can modify system configuration information.
trace	Can view trace file settings information.

Table 37: show cli authorization Output Fields (*continued*)

Field Name	Field Description
trace-control	Can modify trace file settings information.
view	Can view current values and statistics.
view-configuration	Can view all configuration information (not including secrets).

Sample Output

show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network information
  configure  -- Can enter configuration mode
  control    -- Can modify any configuration
  edit       -- Can edit full files
  field      -- Special for field (debug) support
  floppy     -- Can read and write from the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret configuration
  secret-control-- Can modify secret configuration
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration
  access     -- Can view access configuration
  access-control-- Can modify access configuration
  view-configuration-- Can view all configuration (not including secrets)
  flow-tap   -- Can view flow-tap configuration
  flow-tap-control-- Can configure flow-tap service
Individual command authorization:
  Allow regular expression: none
  Deny regular expression: none
  Allow configuration regular expression: none
  Deny configuration regular expression: none

```

show cli directory

Syntax show cli directory

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the current working directory.

Options This command has no options.

Required Privilege Level view

List of Sample Output [show cli directory on page 434](#)

Output Fields [Table 38](#) lists the output fields for the **show cli directory** command. Output fields are listed in the approximate order in which they appear.

Table 38: show cli directory Output Fields

Field Name	Field Description
Current directory	Pathname of the current working directory.

Sample Output

show cli directory

```
user@host> show cli directory
Current directory: /var/home/regress
```

show cli history

Syntax	<code>show cli history</code> <code><count></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display a list of previous CLI commands.
Options	none —Display all previous CLI commands. count —(Optional) Maximum number of commands to display.
Required Privilege Level	view
List of Sample Output	show cli history on page 435
Output Fields	Table 39 lists the output fields for the show cli history command. Output fields are listed in the approximate order in which they appear.

Table 39: show cli history Output Fields

Field Name	Field Description
<i>timestamp</i>	Time at which the command was entered.
<i>command-syntax</i>	Command that was entered.

Sample Output

show cli history

```
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history
```

CHAPTER 28

Licensing Operational Commands

- request system license add
- request system license delete
- request system license save
- show system license

request system license add

Syntax	<code>request system license add (<i>filename</i> terminal)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 9.5 for SRX Series devices. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Add a license key.
Options	<i>filename</i> —License key from a file or URL. Specify the filename or the URL where the key is located. <i>terminal</i> —License key from the terminal.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Adding New Licenses (CLI Procedure) on page 117
List of Sample Output	request system license add on page 438
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license add

```
user@host> request system license add terminal
E408408918 aeaqib qcsbj a okbuq rcmxnq vjocwf uxfsta
          z5ufjb kdrmt6 57bimv 2f3ddp qttcdn 627q4a
          jx4s5x hiri
E408408918: successfully added
add license complete (no errors)
```

request system license delete

Syntax	<code>request system license delete (<i>license-identifier</i> license-identifier-list [<i>licenseid001</i> <i>licenseid002</i> <i>licenseid003</i>] all)</code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option license-identifier-list introduced in Junos OS Release 13.1.</p>
Description	Delete a license key. You can choose to delete one license at a time, all licenses at once, or a list of license identifiers enclosed in brackets.
Options	<p>license-identifier—Text string that uniquely identifies a license key.</p> <p>license-identifier-list [<i>licenseid001</i> <i>licenseid002</i> <i>licenseid003</i>....]—Delete multiple license identifiers as a list enclosed in brackets.</p> <p>all—Delete all licenses on the device.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • Deleting a License (CLI Procedure) on page 118

request system license save

Syntax	<code>request system license save (<i>filename</i> terminal)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 9.5 for SRX Series devices.
Description	Save installed license keys to a file or URL.
Options	<i>filename</i> —License key from a file or URL. Specify the filename or the URL where the key is located. <i>terminal</i> —License key from the terminal.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Saving License Keys on page 119
List of Sample Output	request system license save on page 440
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system license save

```
user@host> request system license save ftp://user@host/license.conf
```

show system license

Syntax	show system license <installed keys usage>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 13.3 for the MX104 3D Universal Edge Routers.
Description	Display licenses and information about how they are used.
Options	<p>none—Display all license information.</p> <p>installed—(Optional) Display installed licenses only.</p> <p>keys—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p>usage—(Optional) Display the state of licensed features.</p>
Required Privilege Level	maintenance
List of Sample Output	show system license on page 442 show system license installed on page 443 show system license keys on page 443 show system license usage on page 443 show system license (MX104 Routers) on page 443 show system license installed (MX104 Routers) on page 444 show system license keys (MX104 Routers) on page 444 show system license usage (MX104 Routers) on page 444 show system license (MX104 Routers) on page 444 show system license installed (MX104 Routers) on page 445 show system license keys (MX104 Routers) on page 445 show system license usage (MX104 Routers) on page 445 show system license (MX104 Routers) on page 446 show system license installed (MX104 Routers) on page 446 show system license keys (MX104 Routers) on page 446 show system license usage (MX104 Routers) on page 447 show system license (QFX Series) on page 447
Output Fields	Table 40 lists the output fields for the show system license command. Output fields are listed in the approximate order in which they appear.

Table 40: show system license Output Fields

Field Name	Field Description
Feature name	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.

Table 40: show system license Output Fields (*continued*)

Field Name	Field Description
Licenses used	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p>NOTE: In Junos OS Release 10.1 and later, the Licenses used column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (scale-subscriber), L2TP (scale-l2tp), Mobile IP (scale-mobile-ip), and so on.</p>
Licenses installed	<p>Information about the installed license key:</p> <ul style="list-style-type: none"> • License identifier—Identifier associated with a license key. • State—State of the license key: valid or invalid. An invalid state indicates that the key was entered incorrectly or is not valid for the specific device. • License version—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key. • Valid for device—Device that can use a license key. • Group defined—Group membership of a device. • Features—Feature associated with a license, such as data link switching (DLSw).
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

Sample Output

show system license

```
user@host> show system license
```

```
License usage:
```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

```
Licenses installed:
```

```
License identifier: XXXXXXXXXX
```

```
License version: 2
```

```
Features:
```

```
subscriber-accounting - Per Subscriber Radius Accounting
permanent
subscriber-authentication - Per Subscriber Radius Authentication
permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
```

```

    permanent
subscriber-ip    - Dynamic and Static IP
    permanent

```

show system license installed

```

user@host> show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
  subscriber-accounting - Per Subscriber Radius Accounting
    permanent
  subscriber-authentication - Per Subscriber Radius Authentication
    permanent
  subscriber-address-assignment - Radius/SRC Address Pool Assignment
    permanent
  subscriber-vlan - Dynamic Auto-sensed Vlan
    permanent
  subscriber-ip - Dynamic and Static IP
    permanent

```

show system license keys

```

user@host> show system license keys
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx

```

show system license usage

```

user@host> show system license usage
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

show system license (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent

```

Licenses installed:
License identifier: XXXXXXXXXX
License version: 2
Features:

```

```

MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

show system license installed (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

show system license keys (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

```

show system license usage (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license usage

```

Feature name	Licenses used	Licenses installed	Expiry needed	
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent

show system license (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

MX104-2x10Gig-port-2-3	0	1	0	permanent

```

Licenses installed:
License identifier: XXXXXXXXXX
License version: 2

```

```

Features:
MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
  permanent

License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-2-3 - MX104 2X10Gig Builtin Port(xe-2/0/2 & xe-2/0/3)
upgrade
  permanent

```

show system license installed (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
  permanent

License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-2-3 - MX104 2X10Gig Builtin Port(xe-2/0/2 & xe-2/0/3)
upgrade
  permanent

```

show system license keys (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

```

show system license usage (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license usage

```

Feature name	Licenses used	Licenses installed	Expiry needed	
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent

 permanent

CHAPTER 29

NTP Operational Commands

- `show ntp associations`
- `show ntp status`

show ntp associations

Syntax	<code>show ntp associations</code> <code><no-resolve></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display Network Time Protocol (NTP) peers and their state.
Options	none —Display NTP peers and their state. no-resolve —(Optional) Suppress symbolic addressing.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show ntp status on page 452
List of Sample Output	show ntp associations on page 451
Output Fields	Table 41 describes the output fields for the show ntp associations command. Output fields are listed in the approximate order in which they appear.

Table 41: show ntp associations Output Fields

Field Name	Field Description
remote	Address or name of the remote NTP peer.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0 .
st	Stratum of the remote peer.
t	Type of peer: b (broadcast), l (local), m (multicast), or u (unicast).
when	When the last packet from the peer was received.
poll	Polling interval, in seconds.
reach	Reachability register, in octal.
delay	Current estimated delay of the peer, in milliseconds.
offset	Current estimated offset of the peer, in milliseconds.
disp	Current estimated dispersion of the peer, in milliseconds.

Table 41: show ntp associations Output Fields (*continued*)

Field Name	Field Description
<i>peer-name</i>	<p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> • space—Discarded because of a high stratum value or failed sanity checks. • x—Designated "falseticker" by the intersection algorithm. • .—Culled from the end of the candidate list. • — —Discarded by the clustering algorithm. • +—Included in the final selection set. • #—Selected for synchronization, but the distance exceeds the maximum. • *—Selected for synchronization. • o—Selected for synchronization, but the packets-per-second (pps) signal is in use.

Sample Output

show ntp associations

```

user@host> show ntp associations
      remote          refid      st t when poll reach  delay  offset  disp
=====
*wolfe-gw.junipe tick.ucla.edu    2 u  43   64  377    1.86    0.319    0.08

```

show ntp status

Syntax	<code>show ntp status</code> <code><no-resolve></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the values of internal variables returned by Network Time Protocol (NTP) peers.
Options	none —Display the values of internal variables returned by NTP peers. no-resolve —(Optional) Suppress symbolic addressing.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show ntp associations on page 450
List of Sample Output	show ntp status on page 453
Output Fields	Table 42 describes the output fields for the show ntp status command. Output fields are listed in the approximate order in which they appear.

Table 42: show ntp status Output Fields

Field Name	Field Description
status	System status word, a code representing the status items listed.
leap_none	Indicates a normal synchronized state with no leap seconds imminent. Other options could be leap_add_sec , leap_del_sec , or leap_alarm , indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
sync_ntp	Indicates the current synchronization source, in this case, an NTP server. Other options include sync_alarm and sync_unspec , both indicating that the router has not been synched.
x events	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
event_peer/strat_chg	Describes the most recent event, in this case, the stratum of the peer server changed.
version	A detailed description of the version of NTP being used.
processor	Indicates the current hardware platform and version of the processor.
system	Detailed description of the name and version of the operating system in use.
leap	The number of leap seconds in use.

Table 42: show ntp status Output Fields (*continued*)

Field Name	Field Description
stratum	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
precision	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
rootdelay	The total roundtrip delay to the primary reference source, in seconds.
rootdispersion	The maximum error relative to the primary reference source, in seconds.
peer	An identification number of the peer in use.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.
reftime	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
poll	The NTP broadcast message polling interval, in seconds.
clock	The current time on the local router clock.
state	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
offset	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
frequency	The frequency of the clock.
jitter	Indicates the magnitude of jitter, in milliseconds, between several time queries.
stability	A measure of how well this clock can maintain a constant frequency.

Sample Output

show ntp status

```

user@host> show ntp status
assID=0 status=0544 leap_none, sync_local_proto, 4 events, event_peer/strat_chg,
version="ntpd 4.2.2p1@1.1570-o Tue May 19 13:57:55 UTC 2009 (1)",
processor="x86_64", system="Linux/2.6.18-164.el5", leap=00, stratum=4,
precision=-10, rootdelay=0.000, rootdispersion=11.974, peer=59475,
refid=LOCAL(0),
reftime=d495c32c.0e71eaf2 Mon, Jan 7 2013 13:57:00.056, poll=10,

stability=0.000, tai=0

```

CHAPTER 30

PTP Operational Command

- `show ptp global-information`

show ptp global-information

Syntax	show ptp global-information
Release Information	Command introduced in Junos OS Release 14.1X53-D25 for the QFX Series.
Description	Show Precision Time Protocol (PTP)—related global information.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Understanding Transparent Clocks in Precision Time Protocol on page 152 • Configuring Transparent Clock Mode for Precision Time Protocol on page 152
List of Sample Output	show ptp global-information on page 456
Output Fields	Table 43 lists the output fields for the show ptp global-information command. Output fields are listed in the approximate order in which they appear.

Table 43: show ptp global-information Output Fields

Field Name	Field Description
PTP Global Configuration	Displays if PTP is configured globally.
Transparent-clock-config	Displays if transparent clock mode is enabled or disabled.
Transparent-clock-status	Displays if transparent clock mode is active or inactive. If the mode is active, the switch is ready to update the correction field in the PTP packets. If the mode is inactive, the switch is not ready to update the correction field in the PTP packets.

Sample Output

show ptp global-information

```

user@switch> show ptp global-information
PTP Global Configuration:
Transparent-clock-config : ENABLED
Transparent-clock-status  : ACTIVE

```

CHAPTER 31

Routine Monitoring Operational Commands

- `show chassis alarms`
- `show chassis beacon`
- `show chassis environment`
- `show chassis environment fpc`
- `show chassis environment pem`
- `show chassis environment routing-engine`
- `show chassis fabric errors`
- `show chassis fabric fpcs`
- `show chassis fabric plane-location`

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.

Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

satellite option introduced in Junos OS Release 14.2R3 for Junos Fusion.

Description Display information about the conditions that have been configured to trigger alarms.

Options **none**—Display information about the conditions that have been configured to trigger alarms.

all-members—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

satellite [*slot-id slot-id*]—(Junos Fusion only) (Optional) Display information about alarm conditions for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

sfc number—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with 0.

Additional Information You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559
```

To understand what CM_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code: 559
```

First, you have to convert 559 to binary; that is **1000101111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **100010111**,

which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3

CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR	275
CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR	276
CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279
<hr/>	
Chip Type: R Chip	Code
CMALARM_RCHIP_SRAM_PARITY_ERR	512
<hr/>	
Chip Type: R Chip	Code
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602

CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608
CMALARM_ICHIP_WO_IP_INTER_ERR	609
CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630
CMALARM_ICHIP_SDRAM_BIST_ERR	631
CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM_NCHIP_DBUF_CRC_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code = $(257-1)/2 = 128$. Similarly, for minor alarms, Actual Error Code = $(\text{Error Code})/2$

```

show chassis alarms (MX960, MX480, and MX240 Routers showing Major CB Failure)

A major CB 0 failure alarm occurs in the event of a bad CB (unknown or mismatched CBs do not trigger this alarm in Junos Release OS 12.3R9 and later). Following GRES or recovery, if the hardware issue persists, the traffic moves to the good CB and continues. If the alarm was triggered by something transient like a power zone budget on GRES, bringing the CB back online can clear the alarm. Otherwise, replace the bad CB. Note that fabric link speed is not impacted by an offline SCB. The alarm might be raised on CB0, CB1, and CB2.

show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

show chassis alarms (PDU Converter Failed Alarm on a PTX5000 Packet Transport Router with FPC2-PTX-P1A)

The **PDU Converter Failed** alarm is raised when one or more 36 V booster converter of a DC PDU fails. If two or more 36 V booster converter fails, fan trays fail and the router might get over heated. Therefore, when this alarm is raised, check the PDU and replace it, if required.

show chassis beacon

show chassis beacon (QFX Series)	<pre>show chassis beacon <cb slot-number> <fpc slot-number> <interconnect-device name (cb slot-number fpc slot-number)> <node-device name></pre>
Release Information	<p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display the beacon LED status on a QFX3500, QFX3600, QFX5100, EX4600, OCX Series standalone switch, Node device, and an Interconnect device. You can also display the beacon LED status of the Control Boards and Flexible PIC Concentrators on the Interconnect device.
Options	<p>cb slot-number— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Control Board on the Interconnect device.</p> <p>fpc slot-number— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator (FPC) on the Interconnect device. (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator on the standalone switch.</p> <p>interconnect-device name— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Interconnect device.</p> <p>node-device name— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Node device.</p>
Required Privilege Level	view

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
monitored option added in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
pem option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
all-members, **local**, and **member *member-id*** options introduced in Junos OS Release 15.1 for MX2020 and MX2010 routers.
satellite option introduced in Junos OS Release 14.2R3.

Description Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition, on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

Starting with Junos OS Release 14.1, the **show chassis environment *cb cb-slot-number* | *ccg ccg-slot-number* | *fpc fpc-slot-number* | *fpm* | *monitored* | *pdu pdu-slot-number* | *routing-engine re-slot-number* | *sib sib-slot-number*** operational mode command output displays environmental information for the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-PIA) and other components in a PTX5000 Packet Transport Router.

Options **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

adc *adc-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace ***adc-slot-number*** with a value from 0 through 19. For MX2010 routers, replace ***adc-slot-number*** with a value from 0 through 9.

cb *cb-slot-number*—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace ***cb-slot*** with **0** or **1**. For the EX Series switches, see *EX Series Switches Hardware and CLI Terminology Mapping* for information on CB slot numbering.

cip *cip-slot-number*—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the ***cip-slot-number*** variable with a value of **0** or **1**.

cb *interconnect-device name*—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

ccg *ccg-slot-number*—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace ***cb-slot*** with a value of **0** or **1**.

fan *fantray-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the fan trays. Replace ***fantray-slot-number*** with a value from **0** through **3**.

fpc *fpc-slot*—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace ***fpc-slot*** with a value from **0** through **9**. For MX2020 routers, replace ***fpc-slot*** with a value from **0** through **19**. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see *EX Series Switches Hardware and CLI Terminology Mapping* for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace ***fpc-slot*** with a value from **0** through **63**.

fpm—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the local Virtual Chassis member.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* with a value of 0 or 1. For EX Series switches, see *member* for member ID values.

monitored—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

pdu *pdu-slot-number*—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

pem—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

pem *pem-slot-number*—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

psm *psm-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace *psm-slot-number* with a value from 0 through 17. For MX2010 routers, replace *psm-slot-number* with a value from 0 through 8.

psu *psu-slot-number*—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See *EX Series Switches Hardware and CLI Terminology Mapping* for detailed information.

routing-engine—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

routing-engine *re-slot-number*—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

satellite [**slot-id** *slot-id* | **device-alias** *alias-name*]**—**(Junos Fusion only) (Optional) Display chassis environmental information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scg**—**(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

scc**—**(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

sfb **sfb-slot-number****—**(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace **sfb-slot-number** with a value from 0 through 7.

sfc **number****—**(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router (switch-fabric chassis). Replace **number** variable with 0.

sib **sib-slot-number****—**(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

Output Fields [Table 46](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 46: show chassis environment Output Fields

Field Name	Field Description
Class	<p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> • Power: Power information: <ul style="list-style-type: none"> • (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: OK, Testing, (during initial power-on), Failed, or Absent. • (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: OK, Testing, (during initial power-on), Check, Failed, or Absent. • (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: OK, Testing, (during initial power-on), Check, Failed, or Absent. • Temp: Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). <ul style="list-style-type: none"> • On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones. • EX2200 switches have a side-to-rear cooling system. The Local Intake temperature is measured by the sensor on the right side of the chassis, and the Remote Intake temperature is measured by the sensor on the left side of the chassis. • Pic: On ACX4000 Routers, multiple temperature channels on a MIC. The status is: OK and the Measurement is in degrees Celsius (C) and Fahrenheit (F). • Fan: Fan status: OK, Testing (during initial power-on), Failed, or Absent. On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. Measurement indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only). • Misc: Information about other components of the chassis. <ul style="list-style-type: none"> • On some routers, this field indicates the status of one or more additional components. • On the M40e, M160, and M320 router, Misc includes CIP (Connector Interface Panel). OK indicates that the CIP is present. Absent indicates that the CIP is not present. • On T Series routers, Misc includes CIP and SPMB (Switch Processor Mezzanine Board). OK indicates that the CIP or SPMB is present. Absent indicates that the CIP or SPMB is not present. • On PTX Series Packet Transport Routers, Misc includes the SPMB (Switch Processor Mezzanine Board). The SPMB is located on the control boards. OK indicates that the control board is present. Absent indicates that the control board is not present.
Item	<p>(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</p> <p>(MX104 Routers) Information about the chassis components: Routing Engines, Control Board (CB), Power Entry Module (PEM), and Compact Forwarding Engine Board (AFEB).</p> <p>(QFabric Systems) Information about the chassis component: Control Boards, Routing Engines, Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs), Node Devices, and Interconnect Devices.</p> <p>(QFX Series) Information about the chassis component: Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs).</p>

Table 46: show chassis environment Output Fields (*continued*)

Field Name	Field Description
Status	<p>(MX104, MX2010, and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> • OK: The fans are operational. • Testing: The fans are being tested during initial power-on. • Failed: The fans have failed or the fans are not spinning. • Absent: The fan tray is not installed. <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> • OK: The power component is operational. • Testing: The power component is being tested during initial power-on. • Check: There is insufficient power---that is, fewer than the minimum required feeds are connected. • Failed: The inputs leads have failed. • Absent: The power component is not installed.
Measurement	<p>(MX104, MX2010, and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>

show chassis environment (ACX4000 Universal Access Router)

On the ACX4000 router, the MIC output of the **show chassis environment** command varies depending on the number of temperature channels present in the installed MIC.

```
user@host> show chassis environment
```

Class	Item	Status	Measurement

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series. satellite option introduced in Junos OS Release 14.2R3.
Description	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).

Options **none**—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

satellite [*slot-id slot-id* | *device-alias alias-name*]—(Junos Fusion only) (Optional) Display environmental information for the FPCs in the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

slot* or *fpc-slot—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc *number*** option (the recommended method), replace ***slot*** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc *number*** option (the recommended method), replace ***slot*** with a value from 0 through 7. Otherwise, replace ***slot*** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
user@host> show chassis environment fpc 9
```

- M120 router—Replace ***slot*** with a value from 0 through 5.

- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
 - EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotuing Engine (SRE) module), or 6 through 9 (line card only).
 - EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
 - EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Router—Replace **fpc-slot** with 0 through 7.

Output Fields Table 47 lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

Table 47: show chassis environment fpc Output Fields

Field Name	Field Description
State	<p>Status of the FPC:</p> <ul style="list-style-type: none"> • Unknown—FPC is not detected by the router. • Empty—No FPC is present. • Present—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online. • Ready—FPC is in intermediate or transition state. • Announce online—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative. • Online—FPC is online and running. • Offline—FPC is powered down. • Diagnostics—FPC is set to operate in diagnostics mode.
Temperature	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
PMB Temperature	<p>(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).</p> <p>The PTX5000 Packet Transport Router with FPC2-PTX-P1A include multiple temperatures for PMB (TEMPO and TEMP1).</p>
PMB CPU Temperature	(PTX5000 Packet Transport Router with FPC2-PTX-P1A only) Temperature of the air flowing past the PMB CPU.
Temperature Intake	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
Temperature Top	(T Series routers only) Temperature of the air flowing past the top of the FPC.
Temperature Exhaust	<p>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.</p> <p>The PTX Series Packet Transport Routers, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</p>

Table 47: show chassis environment fpc Output Fields (*continued*)

Field Name	Field Description
Temperature Bottom	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
TL <i>n</i> Temperature	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
TQ <i>n</i> Temperature	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
Temperature MMBO	(T640 router only) Temperature of the air flowing past the type 3 FPC.
Temperature MMB1	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
Power	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
CMB Revision or BUS revision	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS 11.3 for the QFX Series. Command introduced in Junos OS 12.3R2 for EX Series. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display Power Entry Module (PEM) environmental status information.

NOTE: The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

- Options** **none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached T1600 routers.
- all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.
- interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.
- lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display environmental information about the PEM in a specified T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display environmental information about the PEM in a specified T1600 router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace ***number*** with a value from **0** through **3**.
- local**—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.
- member *member-id***—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of **0** or **1**.
- node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.
- scc**—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (or switch-card chassis).
- sfc**—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).
- slot**—(Optional) Display environmental information about an individual PEM. Replace ***slot*** with **0** or **1**.

Output Fields Table 48 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

Table 48: show chassis environment pem Output Fields

Field Name	Field Description
PEM <i>slot</i> status	Number of the PEM slot.
State	Status of the PEM.
Temperature	Temperature of the air flowing past the PEM.
AC Input	Status of the AC input for the specified component
AC Output	Status of the AC output for the specified component.
DC input	Status of the DC input for the specified component.
DC output	Status of the DC output for the specified component.
Load	(Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.
Voltage	(M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM. (MX104 routers only) Information about voltage supplied by the PEM to the system.

Table 48: show chassis environment pem Output Fields (*continued*)

Field Name	Field Description
Current	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.
Power	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.
SCG/CB/SIB	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board.
FAN	(T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.

Description	Display Routing Engine environmental status information.

Options **none**—Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

satellite [*slot-id slot-id* | *device-alias alias-name*]—(Junos Fusion only) (Optional) Display environmental information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX104 routers, MX2010 routers, MX2020 routers, and T Series routers, replace *slot* with 0 or 1. On M5, M7i, M10, and M40 routers, replace *slot* with 0. On EX3200 and EX4200 standalone switches, replace *slot* with 0. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with 0 or 1. On the QFX3500 switch, there

is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Routers, replace **slot** with **0** or **1**

Output Fields Table 49 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 49: show chassis environment routing-engine Output Fields

Field Name	Field Description
Routing engine <i>slot</i> status	Number of the Routing Engine slot: 0 or 1.
State	Status of the Routing Engine: <ul style="list-style-type: none"> • Online Master—Routing Engine is online, operating as Master. • Online Standby—Routing Engine is online, operating as Standby. • Offline—Routing Engine is offline.
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	(PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.

Sample Output

show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature     27 degrees C / 80 degrees
```

show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
  State:                Online Master
  Temperature:          26 degrees C / 78 degrees F
Route Engine 1 status:
  State:                Online Standby
  Temperature:          26 degrees C / 78 degrees F
```

show chassis environment routing-engine (MX104 Router)

```
user@ host >show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          34 degrees C / 93 degrees F
  CPU Temperature      43 degrees C / 109 degrees F
Routing Engine 1 status:
  State                Online Standby
  Temperature          33 degrees C / 91 degrees F
  CPU Temperature      39 degrees C / 102 degrees F
```

show chassis environment routing-engine (MX2010 Router)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          37 degrees C / 98 degrees F
  CPU Temperature      37 degrees C / 98 degrees F
Routing Engine 1 status:
  State                Online Standby
  Temperature          35 degrees C / 95 degrees F
  CPU Temperature      34 degrees C / 93 degrees F
```

show chassis environment routing-engine (MX2020 Router)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          35 degrees C / 95 degrees F
  CPU Temperature      34 degrees C / 93 degrees F
Routing Engine 1 status:
  State                Online Standby
  Temperature          44 degrees C / 111 degrees F
  CPU Temperature      43 degrees C / 109 degrees F
```

show chassis environment routing-engine (TX Matrix Plus Router)

```
user@host> show chassis environment routing-engine
sfc0-re0:
-----
Routing Engine 0 status:
  State                Online Master
  Temperature          26 degrees C / 78 degrees F
Routing Engine 1 status:
  State                Online Standby
  Temperature          28 degrees C / 82 degrees F

lcc0-re0:

show chassis fabric errors

List of Syntax	Syntax on page 580 Syntax (PTX Series Packet Transport Routers) on page 580
Syntax	<pre>show chassis fabric errors <autoheal> <fpc slot-number lcc number> <sib (slot f13 sib-slot f2s sib-slot/sib-f2s-slot-number lcc number)></pre>
Syntax (PTX Series Packet Transport Routers)	<pre>show chassis fabric errors (autoheal fpc slot-number sib sib-slot)</pre>
Release Information	<p>Command introduced in Junos OS Release 10.0.</p> <p>Command introduced in Junos OS Release 12.1X48 for the PTX Series Packet Transport Routers.</p>
Description	Display the first ten and last ten fabric errors for the FPC or Switch Interface Boards (SIBs).

NOTE: This command can only be issued on a master Routing Engine.

- Options**
- autoheal**—(TX Matrix Plus routers and PTX Series Packet Transport Routers only) Show an error log of the first 100 autoheal actions taken on the system.
- fpc slot-number**—Show error log of the first ten and last ten errors for the specified FPC. (PTX5000 Packet Transport Routers only)—Replace **slot-number** with a value from 0 through 7.
- (TX Matrix Plus routers only)—Replace **fpc slot-number** with the following values depending on the LCC configuration:
- On a TX Matrix Plus router with the TXP-T1600 configuration, if you specify the number of a T1600 LCC by using the **lcc number** option (the recommended method), replace **fpc slot-number** with a value from 0 through 7. Otherwise, use a value from 0 through 31.
 - On a TX Matrix Plus router with the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 LCC by using the **lcc number** option (the recommended method), replace **fpc slot-number** with a value from 0 through 7. Otherwise, use a value from 0 through 63.
 - lcc number**—Show error log of the first ten and last ten errors for the specified FPC on a specific network device (line-card chassis) that is part of the routing matrix.

Replace **lcc number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

If you specify the number of the network device by using only the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fabric errors fpc 1 lcc 1
user@host> show chassis fabric errors fpc 9
```

sib—Show error log of the first ten and last ten errors for the specified SIB. This option has the following suboptions:

- (TX Matrix Plus routers only) **sib-slot**—Specify a value ranging from 0 through 4.
- (PTX Series Packet Transport Routers) **sib-slot**—Specify a value ranging from 0 through 8.
- **f13 sib-slot**—(Optional) Show SIB F13 errors. Specify a valid SIB value number: 0, 1, 3, 4, 6, 7, 8, 9, 11, or 12.
- **f2s sib-slot/sib-f2s-slot-number**—(Optional) Show SIB F2S errors. Replace **sib-slot** with a value from 0 through 4, followed by a **sib-f2s-slot-number** value 0, 2, 4 or 6.
- **lcc number**—(Optional) Show error log of the first ten and last ten SIB errors for the specified network device (line-card chassis).

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

NOTE: The `lcc number` suboption is mandatory when using the following format for the command: `show chassis fabric errors sib lcc number sib slot-number`. For instance, issuing `show chassis fabric errors sib lcc 2 3` displays errors detected on LCC 2, SIB 3.

This suboption is not required when the `f13` or `f2s` suboptions are used with the `sib slot-number` option.

Output Fields [Table 50](#) lists the output fields for the `show chassis fabric errors` command. Output fields are listed in the approximate order in which they appear.

Table 50: show chassis fabric errors Output Fields

Field Name	Field Description
Time	Time the error was logged. (TX Matrix Plus routers and PTX Series Packet Transport Routers only) For the <code>autoheal</code> option, shows the timestamp when autoheal was attempted on a SIB that was in fault state.
Error log of first 10 errors	List of the first ten errors.
Error log of last 10 errors	List of the last ten errors.

Table 50: show chassis fabric errors Output Fields (*continued*)

Field Name	Field Description
Error log of first 100 errors	<p>Indicates the autoheal action taken on the SIB. The following actions can occur:</p> <ul style="list-style-type: none"> • Req—A SIB autoheal request was made on a faulty SIB. • Action—Autohealing (taking the SIB offline and then online) is initiated. • Denied—Autohealing (taking the SIB offline and then online) is denied because the SIB went to a fault state before the autoheal configuration period completed. • Set info—Setting information to force skipping autoheal on the SIB so that no further attempts to autoheal the faulty SIB are made. • Clear info—If a user takes a SIB offline and then online, then the autoheal information of the SIB is cleared. If the SIB goes to a fault state, autoheal is attempted on the SIB.
fpc slot number	(PTX5000 Packet Transport Router only)—Range is 0 through 7.
sib slot number	(PTX Series Packet Transport Routers only)—Range is 0 through 8.
lcc number	Not supported on PTX Series Packet Transport Routers.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.</p>
Description	Display the state of the electrical switch fabric links between the Flexible PIC Concentrators (FPCs) and the Switch Interface Boards (SIBs).
Options	<p>none—Display the switch fabric link state. On a TX Matrix router, display the switching fabric link states for the FPCs in all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display the switching fabric link states for the FPCs in all routers connected to the TX Matrix Plus router.</p>

all-members—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the switch fabric link state for the FPCs in the specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the switch fabric link state for the FPCs in the specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace *number* with a following value depending on the LCC configurations:

- From **0** through **3** on a T640 router on the routing matrix with TX Matrix routers.
- From **0** through **3** on a T1600 router on the routing matrix with TX Matrix Plus routers.
- From **0** through **7** on a T1600 router in a routing matrix with TX Matrix Plus router with 3D SIBs.
- **0, 2, 4, 6** on a T4000 router in a routing matrix with TX Matrix Plus router with 3D SIBs.

local—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

slot *fpc-slot*—(PTX Series Packet Transport Routers and QFX Series switches only) (Optional) Display the fabric state of the specified FPC slot. If no value is provided, display the status of all FPCs.

Output Fields [Table 51](#) lists the output fields for the **show chassis fabric fpcs** command. Output fields are listed in the approximate order in which they appear.

Table 51: show chassis fabric fpcs Output Fields

Field Name	Field Description
Fabric management FPC state	<p>Switching fabric link (link from SIB to FPC) state for each FPC:</p> <ul style="list-style-type: none"> • Unused—FPC is not present. (On MX240 and MX480 routers with AS- MLC modular carrier card or MPC4E only) the fabric plane from the pair that share physical links (1 and 5, and 3 and 7) is inactive. • Destination error on PFEs <i>list of PFE numbers</i>—Destination errors to the listed Packet Forwarding Engines. Indicates that the link is not carrying traffic to the listed Packet Forwarding Engines. NOTE: In Junos OS Release 9.6 and later, the list of Packet Forwarding Engines with destination errors is displayed in the output. In Junos OS Releases before 9.6, the output only indicates that there are destination errors. However, the list of Packet Forwarding Engines with destination errors is not displayed. • Links ok—Link between the spare SIB and FPC is eligible to carry traffic. • Link error—Link between the SIB and FPC has CRC errors. However, the link is still eligible to carry traffic. • Plane disabled—Fabric plane has been disabled for the following reasons: <ul style="list-style-type: none"> • Destination errors have exceeded the thresholds. • Run-time link errors have exceeded the thresholds. • Initialization time link errors detected, and link training was unsuccessful. • Plane Disabled, Links Error (PTX Series Packet Transport Routers and QFX Series switches only)—The plane is disabled because of link errors detected at the FPC RX. • Plane Disabled, Links Down (PTX Series Packet Transport Routers and QFX Series switches only)—The plane is disabled because of link errors detected at the SIB RX. • Plane enabled—Link between the active SIB and FPC is eligible to carry traffic. NOTE: On the Enhanced MX SCB with MPC, a maximum of 4 planes are operational and running. On all the other SCBs with MPC, all the planes are operational and running. • Plane Enabled, Links OK (PTX Series Packet Transport Routers and QFX Series switches only)—The FPC CCL RX link is eligible to carry traffic. • Plane Enabled, Links OK (TX Matrix and TX Matrix Plus routers only)—The FPC HSL RX link is eligible to carry traffic.

Sample Output

Syntax (TX Matrix Plus Router)	show chassis fabric plane-location
Syntax (QFX Switches)	show chassis fabric plane-location
Release Information	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.4 for EX Series switches. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.
Description	(M120, MX Series routers, and EX8200 switches only) Display the Control Board (CB) location of each plane. This command can be used on the master Routing Engine or the backup Routing Engine. For information about the meaning of “CBs” and “fabric plane” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i> . (TX Matrix Plus routers only) Display the SIB location of each fabric plane. (PTX Series Packet Transport Routers and QFX Series switches only) Display the fabric plane location of each SIB. (MX2010 and MX2020 Routers only) Display the fabric plane location of each Switch Fabric Board (SFB).

Options **all-members**—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in all member routers in the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the specified member in the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

Required Privilege Level view

Output Fields [Table 52](#) lists the output fields for the **show chassis fabric plane-location** command. Output fields are listed in the approximate order in which they appear.

Table 52: show chassis fabric plane-location Output Fields

Field Name	Field Description
Plane <i>n</i>	Plane number. (PTX Series Packet Transport Routers and QFX Series switches) Plane numbers associated with the SIB. (MX2010 and MX2020 Routers only) Plane numbers associated with the SFB.
Control Board <i>n</i>	Control board number.
SFC ABS-SIB-F13	(TX Matrix Plus routers only) Switch Interface Board (SIB) slot number on the F13 SIB.
SFC ABS-SIB-F2S	(TX Matrix Plus routers only) SIB slot number on the F2S SIB.
LCC ST-SIB-L	(TX Matrix Plus routers only) Line-card chassis (LCC) SIB slot number.
SFC SIB F13	(TX Matrix Plus routers with 3D SIBs only) Switch Interface Board (SIB) slot number on the F13 SIB.

Table 52: show chassis fabric plane-location Output Fields (*continued*)

Field Name	Field Description
SFC SIB F2S	(TX Matrix Plus routers with 3D SIBs only) SIB slot number on the F2S SIB.
LCC SIB	(TX Matrix Plus routers with 3D SIBs only) Line-card chassis (LCC) SIB slot number.
SIB	(PTX Series Packet Transport Routers and QFX Series switches) SIB number.
Switch Fabric Board <i>n</i>	(MX2010 and MX2020 Routers only) SFB number.

Sample Output

show chassis fabric plane-location (M120 Router)

```

user@host> show chassis fabric plane-location
-----Fabric Plane Locations-----
Plane 0                      Control Board 0
Plane 1                      Control Board 0
Plane 2                      Control Board 1
Plane 3                      Control Board 1

```

show chassis fabric plane-location (MX240 and MX480 Routers)

```

user@host> show chassis fabric plane-location
-----Fabric Plane Locations-----
Plane 0                      Control Board 0
Plane 1                      Control Board 0
Plane 2                      Control Board 0
Plane 3                      Control Board 0
Plane 4                      Control Board 1
Plane 5                      Control Board 1

Output Fields Table 53 lists the output fields for the **show chassis fabric sibs** command. Output fields are listed in the approximate order in which they appear.

Table 53: show chassis fabric sibs Output Fields

Field Name	Field Description
Fabric management SIB state	Switching fabric link (link from FPC to SIB) state for each SIB: <ul style="list-style-type: none">• Unused—SIB is not present.• Links ok—Link between the SIB and the FPC is active.• Link error—Link between the SIB and the FPC is not operational.

Table 53: show chassis fabric sibs Output Fields (*continued*)

Field Name	Field Description
Plane state	<p>Possible plane state of the M320 SIB, TX-SIB or T640 SIB:</p> <ul style="list-style-type: none"> • S_ACTIVE—Links on the SIB are operational, and the fabric plane (SIB) is operational and running. • S_SPARE—Links on the SIB are operational and the fabric plane (SIB) is redundant and can be operational if any of the fabric planes in the S_ACTIVE state encounters an error. <p>NOTE: If the plane is unusable by any of the Packet Forwarding Engines, the command output displays an additional string, plane has link errors on # pfes, where, # indicates the total number of links (both from SIB to FPC, and from FPC to SIB) having link errors (detected either during initialization time or runtime) in this particular plane. This does not count links having destination errors.</p> <ul style="list-style-type: none"> • S_EMPTY—No links are present on the SIB, and the fabric plane (SIB) is powered down. • S_ACTIVATING—Links on the SIB are coming online; this is a transitional state. • S_DEACTIVATING—Links on the SIB are going offline; this is a transitional state. • S_FAULTING—Links on the SIB are being marked faulty, and the fabric plane (SIB) is not operational. • S_FAULT—Links on the SIB are in an alarmed state, and the fabric plane (SIB) is not operational for the following reasons: <ul style="list-style-type: none"> • On-board F-chip is not operational. • Fiber optic connector faults. • FPC connector faults. <p>Possible plane state of the QFX Series SIB:</p> <ul style="list-style-type: none"> • Active—Links on the SIB are operational, and the fabric plane (SIB) is operational and running. • Spare—Links on the SIB are operational and the fabric plane (SIB) is redundant and can be operational if any of the fabric planes in the S_ACTIVE state encounters an error. • Empty—No links are present on the SIB, and the fabric plane (SIB) is powered down. • Activating—Links on the SIB are coming online; this is a transitional state. • Deactivating—Links on the SIB are going offline; this is a transitional state. • Faulting—Links on the SIB are being marked faulty, and the fabric plane (SIB) is not operational. • Fault—Links on the SIB are in an alarmed state, and the fabric plane (SIB) is not operational for the following reasons: <ul style="list-style-type: none"> • On-board F-chip is not operational. • Fiber optic connector faults. • FPC connector faults.

show chassis fabric summary

Syntax	<code>show chassis fabric summary <extended></code>
Release Information	<p>Command introduced in Junos OS Release 8.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.</p> <p>extended option added in Junos OS Release 14.1R2.</p>
Description	<p>(MX Series routers and EX8200 switches only) Display the state of all fabric planes and the elapsed uptime.</p> <p>(QFX Series switches) Display the state of all fabric planes.</p>
Options	extended —(Optional) Display the extended summary of fabric planes.
Required Privilege Level	view
List of Sample Output	<p>show chassis fabric summary (MX240 Router) on page 643</p> <p>show chassis fabric summary (MX480 Router) on page 643</p> <p>show chassis fabric summary (MX480 Router with MPC4E) on page 643</p> <p>show chassis fabric summary (MX960 Router) on page 644</p> <p>show chassis fabric summary (MX2010 Router) on page 644</p> <p>show chassis fabric summary (MX2020 Router) on page 644</p> <p>show chassis fabric summary (MX2020 Router with MPC4E) on page 644</p> <p>show chassis fabric summary (EX8200 Switch) on page 645</p> <p>show chassis fabric summary (PTX Series Packet Transport Router) on page 645</p> <p>show chassis fabric summary (QFX 10008 Switch) on page 645</p> <p>show chassis fabric summary extended (MX960 Router) on page 646</p>
Output Fields	Table 54 lists the output fields for the show chassis fabric summary command. Output fields are listed in the approximate order in which they appear.

Table 54: show chassis fabric summary Output Fields

Field Name	Field Description
Plane	(MX Series, MX2020 and MX2010 Routers only) Plane number.

Table 54: show chassis fabric summary Output Fields (*continued*)

Field Name	Field Description
State	<p>(MX Series and QFX Series) State of the SIB or FPC:</p> <ul style="list-style-type: none"> • Online—Switch Interface Board (SIB) is operational and running. <p>NOTE: On the Enhanced MX SCB with Trio MPC, a maximum of 4 planes are operational and running. On all the other SCBs with Trio MPC, all the planes are operational and running.</p> <ul style="list-style-type: none"> • Empty—SIB is powered down. • Check—SIB is in the Check state because of the following reasons: <ul style="list-style-type: none"> • SIB is not inserted properly. • Some destination errors are detected on the SIB. In this case, the Packet Forwarding Engine stops using the SIB to send traffic to the affected destination Packet Forwarding Engine. • Some link errors are detected on the channel between the SIB and a Packet Forwarding Engine. Link errors can be detected at initialization time or runtime: <ul style="list-style-type: none"> • Link errors caused by a link training failure at initialization time—The Packet Forwarding Engine does not use the SIB to send traffic. The show chassis fabric fpcs command shows Plane disabled as status for this link. • Link errors caused by CRC errors detected at runtime—The Packet Forwarding Engine continues to use the SIB to send traffic. The show chassis fabric fpcs command shows Link error as the status for this link. <p>NOTE: The Check state does not apply to PTX Series Packet Transport Routers because there are no SIBs in the Check state.</p> <p>For information about link and destination errors, issue the show chassis fabric fpcs commands.</p> <ul style="list-style-type: none"> • Spare—SIB is redundant and will move to active state if one of the working SIBs fails. <p>NOTE: Spare does not apply to PTX Series Packet Transport Routers because there are no spare SIBs in the device.</p> <p>(MX2010 and MX2020 Routers) State of the SFB.</p> <ul style="list-style-type: none"> • Online—Switch Fabric Board (SFB) is operational and running. • Offline—Switch Fabric Board (SFB) is powered down. • Check—Switch Fabric Board (SFB) is in the check state.
Errors	<p>(PTX Series and QFX Series) Indicates whether there is any error on the SIB.</p> <ul style="list-style-type: none"> • None—No errors • Link Errors—Fabric link errors were found on the SIB RX link. • Cell drops—Fabric cell drops were found on the SIB ASIC. • Link, Cell drops—Both Link errors and cell drops were detected on at least one of the FPC's fabric links.

Table 54: show chassis fabric summary Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none"> Asic Errors—A fault affecting one of the ASICs on the SIB is detected. It can be an IO error or an internal error signaled by the ASIC. <p>NOTE: The Errors column is empty only when the FPC or SIB is offline.</p>
Uptime	(MX Series, MX2010 and MX2020 Routers) Elapsed time the plane has been online.
Link Error	Fabric link errors were found on the SIB RX link.
Link TF	Fabric link training failure has occurred.
Destination errors	<ul style="list-style-type: none"> Local—Destination error detected on the FPC or PFE's own self-stream. Remote—Destination error detected on the FPC or PFE's non-self-streams.

Note:

For FPC slots with MPC Type 4 or MCC:

Fabric planes 1 and 5, 3 and 7 use shared physical links.

Those slots may run in a reduced bandwidth in case both plane 1 and 5, or both 3 and 7 are active.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 15.1X53-D30 for QFX Series switches.</p>
Description	<p>(TX Matrix routers only) Display the state of the switching fabric topology for the Switch Interface Board (SIB) connection between the TX Matrix router and the T640 routers.</p> <p>(TX Matrix Plus routers only) Display the state of the switching fabric topology for the SIB connection between the TX Matrix Plus router and the connected routers.</p> <p>(T320, T640, T1600, and T4000 routers only) Display the state of the switching fabric topology for the connection between the Switch Interface Board (SIB) and the FPCs.</p> <p>(PTX Series Packet Transport Routers and QFX Series switches) Display the input-output link topology.</p>
Options	<p>none—(TX Matrix routers only) Display the state of the switching fabric topology for the Switch Interface Board (SIB) connection between the TX Matrix router and the T640 routers.</p>

(TX Matrix Plus routers only) Display the state of the switching fabric topology for the SIB connection between the TX Matrix Plus router and the connected routers.

(T320, T640, T1600, and T4000 routers only) Display the state of the switching fabric topology for the connection between the Switch Interface Board (SIB) and the FPCs.

(QFX Series switches) Display the input-output link topology.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the fabric topology state for a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the fabric topology state for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

scc—(TX Matrix routers only) (Optional) Display the fabric topology state for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display the fabric topology for the switch-fabric chassis. Replace *number* with 0.

sib-slot—(Optional) Display the fabric topology state for a specified SIB slot. Replace *sib-slot* with a value from 0 through 4. On a TX Matrix Plus router, replace *sib-slot* with a value from 0 through 15.

Output Fields Table 55 lists the output fields for the **show chassis fabric topology** command. Output fields are listed in the approximate order in which they appear.

Table 55: show chassis fabric topology Output Fields

Field Name	Field Description
in-links	Fabric topology for receive side links.
out-links	Fabric topology for transmit side links.
state	<p>State of the fabric link:</p> <ul style="list-style-type: none"> • RESET—Link between the SIB and the FPC/DPC is powered down on purpose. This is done in all non-dual Packet Forwarding Engine–based boards. • UP—Link between the SIB and the FPC/DCP is up and running. • DOWN—Link between the SIB and the FPC/DCP is powered down. • FAULT—The SIB is in the alarmed state, in which the SIB's plane is not operational for one or more of the following reasons: <ul style="list-style-type: none"> • On-board F-chip is not operational. • Fiber-optic connector faults. • FPC connector faults. • SIB midplane connector faults. <p>NOTE: The following state descriptions are applicable only to PTX Series Packet Transport Routers.</p> <ul style="list-style-type: none"> • OK—The link between the SIB and the FPC is operational. • Down—The link between the SIB and the FPC is powered down. • Error—The CCL link between the SIB and FPC is not operational for one or more of the following reasons: <ul style="list-style-type: none"> • FPC midplane connector failure. • SIB midplane connector failure. • CCL link CRC error.

Table 55: show chassis fabric topology Output Fields (*continued*)

Out-Links: and In-Links (TX Matrix Plus router only)	State of the links from the F13 SIB to the LCC or vice-versa. Out-Links indicate Tx links. In-Links indicate an Rx link. The following additional fields are displayed for each SIB:
	<ul style="list-style-type: none"> • VCSEL Status—Optical (VCSEL channel) link status for the corresponding electrical (HSL2) link. The states include: <ul style="list-style-type: none"> • OK—Optical signal power is good. • Error—Internal error. • LOS—Loss of Signal detected. • High Cur—The Tx Bias-current is higher than threshold on this channel. This is applicable only to Tx Channels. • Low Cur—The Tx Bias-current is lower than threshold on this channel. This is applicable only to Tx Channels. • HSL2 Channel—HSL2 is the electrical link used to connect ASICs to the in-link and out-link. The channel number corresponds to the link and varies based on the ASIC or configuration.

- **HSL2 Status** —The status of the HSL2 Channel. Includes the following states:
 - **Up**—Channel is up.
 - **Down**—Channel is down.
 - **Reset**—Channel has been reset.
 - **Fault**—Channel has faults.

The following is a representation of display output for links originating from the SIBs (LCC or SFC)

SF_[1|3]_port#_FB_[A-D] (VCSEL#, fiber)

- **SF_[1|3]**—Name of the ASIC, with Fabric F1 or F3 mode.
- **port#**—HSL2 port number on the SF ASIC in the LCC.
- **FB_[A-D]**—via fiber bundle A, B, C or D.
- **VCSEL#**—VCSEL module number on SIB.
- **fiber**—Fiber channel number.

The following is a representation of display output for links originating from the SIBs (LCC or SFC)

SF_[1|3]_port#_FB_[A-D] (VCSEL#, fiber)

- **SF_[1|3]**—Name of the ASIC, with Fabric F1 or F3 mode.
- **port#**—HSL2 port number on the SF ASIC in the LCC.
- **FB_[A-D]**—via fiber bundle A, B, C or D.
- **VCSEL#**—VCSEL module number on SIB.
- **fiber**—Fiber channel number.

The following is a sample output with description of the fields displayed in the output for Out-Links:

Out-Links:

=====

SF_30_13_FB_A(21,09) -> FPC7_B_SG(3,3,6)_FB_A(18,09)	OK	203	Up
--	----	-----	----

Table 55: show chassis fabric topology Output Fields (*continued*)

- **SF_30_13**—Name of the ASIC, with Fabric F1 or F3 mode. In this case, 3 is the F3 direction and is used in the Tx path and 0 identifies the serial link on the SF chip (in this case, link goes to sf-3 chip number 0). You can also have F1 mode and Rx path instead.
- **FB_A (21, 09)**—Fiber bundle A, with VCSEL unit number 21 within the SIB, and channel number 9 within the unit number.
- **FPC7_B_SG(3,3,6)**—FPC 7.with bottom Packet Forwarding Engine (T for top PFE and B for bottom PFE), SG ASIC, with number 3 and port number 3, with HSL2 link number with the SIB as 6.
- **FB_A(18, 09)**—Fiber Bundle, with VCSEL unit number 18 within the SIB, and VCSEL channel number 9 within the unit number.

The following is a representation of display output for links originating from the FPCs (In-Links)

FPC#[T|B]_SG(ASIC#, port#, HSL2_bit)_FB_[A-D] (VCSEL#, fiber)

- **FPC#**—FPC number with PFE (0 or 1).
- **T**—Top Packet Forwarding Engine.
- **B**—Bottom Packet Forwarding Engine.
- **SG(ASIC#, port#, HSL2_bit)**—SG ASIC information (ASIC 0-3, port 0-3, HSL2_bit 0-7).
- **FB_[A-D]**—via fiber bundle A, B, C or D.
- **VCSEL#**—VCSEL module number on SIB.
- **fiber**—Fiber channel number.

The following is a representation of display output for links originating from the FPCs (In-Links)

FPC#[T|B]_SG(ASIC#, port#, HSL2_bit)_FB_[A-D] (VCSEL#, fiber)

- **FPC#**—FPC number with PFE (0 or 1).
- **T**—Top Packet Forwarding Engine.
- **B**—Bottom Packet Forwarding Engine.
- **SG(ASIC#, port#, HSL2_bit)**—SG ASIC information (ASIC 0-3, port 0-3, HSL2_bit 0-7).
- **FB_[A-D]**—via fiber bundle A, B, C or D.
- **VCSEL#**—VCSEL module number on SIB.
- **fiber**—Fiber channel number.

The following is a sample output with description of the fields displayed in the output for In-Links:

In-Links :

=====

FPC0_T_SG(0,0,0)_FB_D(04,11) -> SF_10_00_FB_D(01,11) OK 0 Up

- **FPC0**—FPC 0.
- **T**—Top Packet Forwarding Engine.
- **SG (0, 0, 0)**—SG ASIC with port number 0 and link 0.
- **FB_D (04,11)**—Fiber Bundle D with VCSEL 4, channel 11.
- **SF_10**—Indicates F1 mode chip number 0 and Rx path.
- **SF_10_00_FB_D(01,11)** —Indicates F1 mode chip number 0 and Rx path with port 0, fiber bundle D, with VCSEL 1, channel 11.

Table 55: show chassis fabric topology Output Fields (*continued*)

Out-links and In-links (TX Matrix Plus router with 3D SIBs only)	State of the links from the F13 SIB to the SFC/LCC or vice-versa. Out-Links indicate Tx links. In-Links indicate an Rx link. The following additional fields are displayed for each SIB:			
	<ul style="list-style-type: none"> Description of the fields displayed in the output for In-links and Out-links for SFC: 			
	In-links	State	Out-links	State
	CXP0_Evn->F13_SIB0_XF2,04_0	Up	F13_SIB0_XF2,04_0->CXP0_Evn	Up

- CXP0_Evn**—CXP optics with type of port bits such as even or odd. In this case, it indicates CXP optics with even port bit number 0.
- F13_SIB0**—Name of the SFC data plane SIB with the SIB number. In this case, it indicates F13 SIB with number 0.
- XF2,04_0**—Name of the ASIC with port and subchannel number. In this case, it Indicates XF2 chip with port number 4 and subchannel number 0.

- Description of the fields displayed in the output for In-links and Out-links for LCC:

	In-links	State	Out-links	
State				
CXP0_Evn->LCC_SIB0_XF3,10_0	Up	LCC_SIB0_XF3,10_0->CXP0_Evn	Up	

- CXP0_Evn**—CXP optics with the type of port bits such as even or odd. In this case, it indicates CXP optics with even port bit number 0.
- LCC_SIB0**—LCC SIB number. In this case, it indicates LCC SIB with number 0.
- XF3,10_0**—Name of the ASIC with port and subchannel number. In this case, it Indicates XF3 with port number 10 and subchannel number 0.

Release Information	Command introduced in Junos OS Release 10.0 on MX Series 3D Universal Edge Routers, M120 routers, and M320 routers, T320 routers, T640 routers, T1600 routers, TX Matrix Routers, and TX Matrix Plus routers. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 11.4 for EX Series switches. Command introduced in Junos OS Release 12.3 for PTX5000 Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for ACX Series Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
satellite option introduced in Junos OS Release 14.2R3.

Description (T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX104 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers, QFX3008-I Interconnect devices, QFX Series, OCX Series, EX Series switches, and PTX Series Packet Transport Routers only) Show information about the fan tray and fans.

Options **all-members**—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* variable with a value 0 or 1.

interconnect-device *name*—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

satellite [*slot-id slot-id* | *device-alias alias-name*]—(Junos Fusion only) (Optional) Display information about the fan tray and fans for the specified satellite device or devices in a Junos Fusion, or for all satellite devices if no satellite devices are specified.

scc—(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

Output Fields Table 56 lists the output fields for the **show chassis fan** command. Output fields are listed in the approximate order in which they appear.

Table 56: show chassis fan Output Fields

Field Name	Field Description
Item	Fan item identifier.
Status	Status of the fan: <ul style="list-style-type: none"> • OK—Fan is running properly and within the normal range. • Check—Fan is in Check state because of some fault or alarm condition.
RPM	(T Series routers, TX Matrix routers, TX Matrix Plus routers, MX Series 3D Universal Edge Routers, QFX3108 Interconnect devices, and EX Series switches only) Fan speed in revolutions per minute (RPM).
% RPM	(MX2010 routers, MX2020 routers, and PTX Series Packet Transport Routers only) Percentage of the fan speed being used.

Table 56: show chassis fan Output Fields (*continued*)

Field Name	Field Description
Measurement	<p>(T Series routers, TX Matrix routers, TX Matrix Plus routers, MX Series 3D Universal Edge Routers, QFX3108 Interconnect devices, and EX Series switches only) Fan speed status based on different chassis cooling requirements:</p> <ul style="list-style-type: none"> • Spinning at high speed • Spinning at intermediate speed • Spinning at normal speed • Spinning at low speed (except EX Series switches) <p>(MX2010 routers, MX2020 routers, and PTX Series Packet Transport Routers only) Fan speed in revolutions per minute (RPM) for each fan in the fan tray.</p>

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.4 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced for EX8200 switches in Junos OS Release 10.2 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
 Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
 Command introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.
 Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
satellite option introduced in Junos OS Release 14.2R3.

Description On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On EX2200, EX3200, EX4200, QFX Series, and OCX Series switches, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

Options **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

node-device—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

satellite [*slot-id slot-id* | *device-alias alias-name*]—(Junos Fusion only) (Optional) Display version levels of the firmware running for the specified satellite device or devices in a Junos Fusion, or for all satellite devices if no satellite devices are specified.

scc—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

detail—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

Output Fields Table 57 lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

Table 57: show chassis firmware Output Fields

Field Name	Field Description
Part	(MX Series, MX2010, and MX2020 routers) Chassis part name.
Type	(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: ROM or O/S . On switches: uboot or loader .
Version	(MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.
FPC	(<i>detail</i> option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.
AFEB	(MX104 routers) Version of the compact Forwarding Engine Board.
Boot	(<i>detail</i> option only) Version of the SYSPLD.
PoE	(<i>detail</i> option only) Version of the PoE firmware.
PFE-<number>	(<i>detail</i> option only) Version of the PFE used in the switch.
PHY-	(<i>detail</i> option only) Version of the physical layer device (PHY) used in the switch.
microcode	(<i>detail</i> option only) Microcode of the physical layer devices (PHY) used in the switch.
uboot	(<i>detail</i> option only) Version of the u-boot used in the switch.
loader	(<i>detail</i> option only) Version of the loader used in the switch.

Syntax (PTX Series Packet Transport Routers)	<pre>show chassis fpc <detail <fpc-slot>> <pic-status <fpc-slot>> <fpc-slot></pre>

Syntax (PTX Series Packet Transport Switches) `show chassis fpc`
`<detail <fpc-slot>> | <pic-status <fpc-slot>>`
`<fpc-slot>`

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for QFX Series.
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Command introduced in Junos OS Release 15.1 for MX104-40G 3D Universal Edge Routers.

Description Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

Options **none**—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached T1600 routers in the routing matrix.

NOTE: In EX8200 switches, line cards initialize Packet Forwarding Engine during start up. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (`/var/log/messages`), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
```

Utilization (%)	Temp	CPU	Utilization (%)	Memory
Slot State	(C)	Total	Interrupt	DRAM (MB) Heap
Buffer				
0 Empty				
1 Empty				
2 Empty				
3 Empty				
4 Empty				
5 Offline	---	Hard	FPC error---	
6 Empty				
7 Online	26	4	0	1024 0
32				

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
```

```
4 alarms currently active
Alarm time      Class  Description
2011-03-24 00:52:51 UTC Major  FPC 5 Hard errors
2011-03-24 00:52:31 UTC Major  Fan Tray Failure
2011-03-24 00:52:31 UTC Major  Fan Tray Failure
2011-03-24 00:51:26 UTC Minor  Loss of communication with Backup
RE
```

NOTE: On T4000 routers, when you include the enhanced-mode statement at the [edit chassis network-services] hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The show chassis alarm command output displays FPC misconfiguration (FPC *fpc-slot* misconfig) as the reason for the generation the alarms.

The following sample output shows the FPC status after the enhanced-mode statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
```

Utilization (%)	Temp	CPU Utilization (%)		Memory	
Slot State	(C)	Total	Interrupt	DRAM (MB)	Heap
Buffer					
0 offline	---	FPC misconfiguration---			
1 offline	---	FPC misconfiguration---			
2 offline	---	FPC misconfiguration---			
3 Empty					
4 Empty					
5 Online	66	50	0	2816	29
27					

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
```

```
3 alarms currently active
Alarm time      Class Description
2011-03-24 00:52:51 PST Major FPC 1 misconfig
2011-03-24 00:52:31 PST Major FPC 2 misconfig
2011-03-24 00:52:31 PST Major FPC 3 misconfig
```

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see *fpc-slot* or *slot*).

all-members—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric switches only) (Optional) Display status information for all FPCs on the Interconnect device.

fpc-slot—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only)—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the *lcc number* option (the recommended method), replace *fpc-slot* with a value from 0 through 7. Otherwise, replace *fpc-slot* with a value from 0 through 31. Likewise, on a TX Matrix

Plus router, if you specify the number of the specified router (line-card chassis) by using the **lcc number** option (the recommended method), replace **fpc-slot** with a value from 0 through 7. Otherwise, replace **fpc-slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace **fpc-slot** with a value from 0 through 5.
- MX80 router—Replace **fpc-slot** with a value from 0 through 1.
- MX104 and MX104-40G routers—Replace **fpc-slot** with a value from 0 through 2.
- MX240 router—Replace **fpc-slot** with a value from 0 through 2.
- MX480 router—Replace **fpc-slot** with a value from 0 through 5.
- MX-960 router—Replace **fpc-slot** with a value from 0 through 11.
- MX2010 router—Replace **fpc-slot-number** with a value from 0 through 9.
- MX2020 router—Replace **fpc-slot-number** with a value from 0 through 19.
- Other routers—Replace **fpc-slot** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace **fpc-slot** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace **fpc-slot** with a value from 0 through 9.
 - EX6210 switches—Replace **fpc-slot** with a value from 0 through 9.
 - EX8208 switches—Replace **fpc-slot** with a value from 0 through 7.
 - EX8216 switches—Replace **fpc-slot** with a value from 0 through 15.
- QFX Series:
 - QFX Series and OCX Series switches—Replace **fpc-slot** with 0.
 - QFabric systems—Replace **fpc-slot** with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Switches:
 - PTX5000 Packet Transport Router—Replace **fpc-slot** with a value from 0 through 7.
- ACX Series Universal Access Routers:
 - ACX1000 and ACX2000 Universal Access Routers—Replace **fpc-slot** with 0.

local—(MX Series routers only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

member member-id—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

node-device *name*—(QFabric switches only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

pic-status—(Optional) Display status information for all PICs or for the PIC in the specified slot (see *fpc-slot*).

NOTE: On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the `show chassis fpc` command with the `pic-status` option, the CLI displays the string “Not Supported” for 10x10GE (LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
```

```
Slot 0  Online      E2-FPC Type 1
  PIC 0  Online      1x G/E SFP, 1000 BASE
  PIC 1  Online      Adaptive Services-II
  PIC 2  Online      1x G/E IQ, 1000 BASE
  PIC 3  Online      1x G/E IQ, 1000 BASE
Slot 1  Online      FPC Type 3-ES
  PIC 0  Present     UNUSED- Not Supported
Slot 2  Online      FPC Type 4-ES
  PIC 0  Offline     4x OC-192 SONET XFP
  PIC 1  Present     10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4  Offline     FPC Type 1-ES
Slot 5  Offline     FPC Type 2-ES
Slot 6  Online      E2-FPC Type 3
  PIC 0  Online      1x OC-192 SONET XFP
  PIC 1  Online      4x OC-48 SONET
  PIC 2  Online      4x OC-48 SONET
  PIC 3  Online      MultiServices 500
Slot 7  Online      FPC Type 4-ES
  PIC 0  Online      4x 10GE (LAN/WAN) XFP
  PIC 1  Online      4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (`/var/log/messages`) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr  5 08:47:36  router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see [PSN-2010-03-696](https://www.juniper.net/psn/2010-03-696).

NOTE: When there is a double-bit ECC error in a network processor's memory, the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP or Channelized E1/T1 Circuit Emulation MIC is switched to the offline state.

```
user@host> show chassis fpc pic-status
```

```
Slot 1   Online      MPC Type 2 3D Q
PIC 0   Offline      1xC0C12/4xC0C3 CH-CE- ECC error detected
```

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Output Fields Table 58 lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

Table 58: show chassis fpc Output Fields

Field Name	Field Description	Level of Output
Slot or Slot State	<p>Slot number and state. The state can be one of the following conditions:</p> <ul style="list-style-type: none"> • Dead—Held in reset because of errors. • Diag—Slot is being ignored while the FPC is running diagnostics. • Dormant—Held in reset. • Empty—No FPC is present. • Offline—(PTX Series Packet Transport Routers only) One of the following two states is displayed: <ul style="list-style-type: none"> • FPC offlined due to unreachable destinations • FPC Offlined due to degraded FPC action • Online—FPC is online and running. • Present—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either Hardware Not Supported or Hardware Not In Right Slot. The FPC is coming up but not yet online. • Probed—Probe is complete; awaiting restart of the Packet Forwarding Engine. • Probe-wait—Waiting to be probed. 	all levels
Logical slot	Slot number.	all levels

Table 58: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
Temp (C) or Temperature	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels all levels
Temperature (PTX Series)	On PTX Series Packet Transport Routers, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: <ul style="list-style-type: none"> • Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC. • Temperature (Intake)—Temperature of the air flowing into the chassis. • Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B). • Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC. • Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC. 	detail
Total CPU Utilization (%)	Total percentage of CPU being used by the FPC's processor.	all levels
Interrupt CPU Utilization (%)	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
1 min CPU utilization (%)	Information about the Routing Engine's CPU utilization in the past 1 minute.	none specified
NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.		
5 min CPU utilization (%)	Information about the Routing Engine's CPU utilization in the past 5 minutes.	none specified
NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.		
15 min CPU utilization (%)	Information about the Routing Engine's CPU utilization in the past 5 minutes.	none specified
NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.		
Memory DRAM (MB)	Total DRAM, in megabytes, available to the FPC's processor.	none specified

Table 58: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
Heap Utilization (%)	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak). NOTE: On MX Series routers and EX Series switches in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.	none specified
Buffer Utilization (%)	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
Total CPU DRAM	Amount of DRAM available to the FPC's CPU.	detail
Total RLDRAM	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	detail
Total DDR DRAM	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	detail
Total SRAM	Amount of static RAM (SRAM) used by the FPC's CPU.	detail
Total SDRAM	Total amount of memory used for storing packets and notifications.	detail
I/O Manager ASICs information	I/O Manager version number, manufacturer, and part number.	detail
Start time	Time when the Routing Engine detected that the FPC was running.	detail
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	detail
PIC type	(pic-status output only) Type of PIC.	none specified

Release Information	Command introduced before Junos OS Release 7.4. models option introduced in Junos OS Release 8.2. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series. satellite option introduced in Junos OS Release 14.2R3.
Description	Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number. In the EX Series switch command output, FPC refers to the following: <ul style="list-style-type: none">• On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <i>number</i> is always 0.• On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <i>number</i> equals the member ID, from 0 through 9.• On EX8208 and EX8216 switches—Refers to a line card; FPC <i>number</i> equals the slot number for the line card.

On QFX3500, QFX5100, OCX Series standalone switches, and PTX1000 routers, both the FPC and FPC *number* are always 0.

On T4000 Type 5 FPCs, there are no **top temperature sensor** or **bottom temperature sensor** parameters. Instead, **fan intake temperature sensor** and **fan exhaust temperature sensors** parameters are displayed.

Starting from Junos OS Release 11.4, the output of the **show chassis hardware models** operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

Options **none**—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

detail—(Optional) Include RAM and disk information in output.

extensive—(Optional) Display ID EEPROM information.

all-members—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

interconnect-device name—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

lcc number—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

member *member-id*—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

node-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

satellite [*slot-id slot-id* | device-alias *alias-name*]—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

Additional Information The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

Table 59: Routing Engines Displaying DIMM Information

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

Output Fields [Table 60](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 60: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	<p>Chassis component:</p> <ul style="list-style-type: none"> (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See <i>EX Series Switches Hardware and CLI Terminology Mapping</i>. (MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2). (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller. (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB. (QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal). (MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays. 	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels

Table 60: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
Assb ID or Assembly ID	(extensive keyword only) Identification number that describes the FRU hardware.	extensive
Assembly Version	(extensive keyword only) Version number of the FRU hardware.	extensive
Assembly Flags	(extensive keyword only) Flags.	extensive
FRU model number	(clei-models , extensive , and models keyword only) Model number of the FRU hardware component.	none specified
CLEI code	(clei-models and extensive keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: 0x00 (version 0), 0x01 (version 1), or 0x02 (version 2).	extensive
Description	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> Type of power supply. Type of PIC. If the PIC type is not supported on the current software release, the output states Hardware Not Supported. Type of FPC: FPC Type 1, FPC Type 2, FPC Type 3, FPC Type 4, or FPC TypeOC192. <p>On EX Series switches, a brief description of the FPC.</p> <p>The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> 2x FE—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM 4x FE—4-port Fast Ethernet ePIM 1x GE Copper—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port) 1x GE SFP—SFP Gigabit Ethernet ePIM (one fiber port) 2x Serial—Dual-port serial PIM 2x T1—Dual-port T1 PIM 2x E1—Dual-port E1 PIM 2x CT1E1—Dual-port channelized T1/E1 PIM 1x T3—T3 PIM (one port) 1x E3—E3 PIM (one port) 4x BRI S/T—4-port ISDN BRI S/T PIM 4x BRI U—4-port ISDN BRI U PIM 1x ADSL Annex A—ADSL 2/2+ Annex A PIM (one port, for POTS) 1x ADSL Annex B—ADSL 2/2+ Annex B PIM (one port, for ISDN) 2x SHDSL (ATM)—G SHDSL PIM (2-port two-wire module or 1-port four-wire module) 	All levels

Table 60: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> • 1x TGM550—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog LINE ports, and two analog TRUNK ports) • 1x DS1 TIM510—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup) • 4x FXS, 4x FXO, TIM514—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog LINE ports and four analog TRUNK ports) • 4x BRI TIM521—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports) • Crypto Accelerator Module—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services • MPC M16x10GE—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: LX, SX, LH, or T. • LCD description for EX Series switches (except EX2200 switches). • MPC2—1-port MPC2 that supports two separate slots for MICs. • MPC3E—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs. • 100GBASE-LR4, pluggable CFP optics • Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy. • Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs). • MPC4E—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE on MX2020, MX960, MX480, and MX240 routers. • LCD description for MX Series routers

Hardware inventory:

Item	Version	Part number	Serial number	Description
Chassis			JN11E2227AFJ	MX2020
Midplane	REV 27	750-040240	ABAB9384	Lower Power Midplane
Midplane 1	REV 04	711-032386	ABAB9386	Upper Backplane
PMP 1	REV 05	711-032428	ACA11579	Upper Power Midplane
PMP 0	REV 04	711-032426	ACA11524	Lower Power Midplane
FPM Board	REV 06	760-040242	ABBT8837	Front Panel Display
PSM 0	REV 01	740-045050	1E022240056	DC 52V Power Supply
Module				
PSM 1	REV 01	740-045050	1E022240054	DC 52V Power Supply
Module				
PSM 2	REV 01	740-045050	1E02224005H	DC 52V Power Supply
Module				
PSM 3	REV 01	740-045050	1E022240053	DC 52V Power Supply
Module				
PSM 4	REV 01	740-045050	1E02224004K	DC 52V Power Supply
Module				
PSM 7	REV 01	740-045050	1E02224006W	DC 52V Power Supply
Module				
PSM 8	REV 01	740-045050	1E022240062	DC 52V Power Supply
Module				
PSM 9	REV 01	740-045050	1E02224005B	DC 52V Power Supply
Module				
PSM 10	REV 01	740-045050	1E02224005A	DC 52V Power Supply
Module				
PSM 11	REV 01	740-045050	1E022240052	DC 52V Power Supply
Module				
PSM 12	REV 01	740-045050	1E022240051	DC 52V Power Supply
Module				
PSM 13	REV 01	740-045050	1E022240058	DC 52V Power Supply
Module				
PSM 14	REV 01	740-045050	1E02224004L	DC 52V Power Supply
Module				
PSM 15	REV 01	740-045050	1E02224005M	DC 52V Power Supply
Module				
PSM 16	REV 01	740-045050	1E02224006S	DC 52V Power Supply
Module				
PSM 17	REV 01	740-045050	1E02224005Z	DC 52V Power Supply
Module				
PDM 0	REV 01	740-045234	1E012150033	DC Power Dist Module
