show chassis lcd

List of Syntax	show chassis lcd (EX Series) on page 921 show chassis lcd (QFX Series) on page 921 show chassis lcd (OCX Series) on page 921
show chassis lcd (EX Series)	<pre>show chassis lcd <fpc-slot <i>fpc-slot-number</i>> <menu <(all-members local member <i>member-id</i>)>></pre>
show chassis lcd (QFX Series)	<pre>show chassis lcd <fpc-slot <i>fpc-slot-number</i>> <interconnect-device <i>device-id</i>> <node-device <i>device-id</i>></pre>
show chassis lcd (OCX Series)	<pre>show chassis lcd <fpc-slot <i>fpc-slot-number</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>menu option introduced in Junos OS Release 10.2 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.1 for QFabric systems.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, OCX Series switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.</p>
Options	<p>none—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.</p> <p>fpc-slot <<i>fpc-slot-number</i>>—(Optional) Display the information as follows:</p> <ul style="list-style-type: none"> (EX3200, EX3300, EX4200, and EX4500 switches, QFX Series, or OCX Series) Display the information that appears on the LCD panel for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by fpc-slot 0. fpc-slot refers to the switch itself and 0 is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the none option. <p>Also display the status of the currently selected port parameter of the Status LED for each network port.</p> <ul style="list-style-type: none"> (EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <i>fpc-slot-number</i> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the none option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the information for the specified member.

Also display the status of the currently selected port parameter of the Status LED for each network port.

- (EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the *fpc-slot-number* value.

Also display the status of the currently selected port parameter of the Status LED for each network port.

interconnect-device *device-id*—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

menu—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

menu all-members—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

menu local—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

menu member *member-id*—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

node-device *device-id*—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

Output Fields Table 61 lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

Table 61: show chassis lcd Output Fields

Field Name	Field Description
membernumber (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
Front panel contents for slot Front panel contents (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	<p>FPC slot number of the switch whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.</p> <p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the member number field for each member device in the EX8200 Virtual Chassis.</p>
LCD screen	<p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays RE and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> • ADM—Administrative • SPD—Speed • DPX—Duplex • POE—Power over Ethernet (EX3200 and EX4200 switches only)
LEDs status	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
Interface	Names of the interfaces on the switch.
LED (ADM/SPD/DPX/POE)	<p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p>NOTE: The XRE200 External Routing Engine always displays the NA parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> • ADM—Administrative • SPD—Speed • DPX—Duplex • NA—Not applicable. • POE—Power over Ethernet
fpcx	On standalone EX Series and QFX Series switches, always 0 . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

show chassis led

List of Syntax	show chassis led (EX Series) on page 935 show chassis led (QFX Series) on page 935 Syntax (OCX Series) on page 935
show chassis led (EX Series)	<pre>show chassis led <fpc-slot <fpc-slot-number>></pre>
show chassis led (QFX Series)	<pre>show chassis led <fpc-slot <fpc-slot-number>> interconnect-device name node-device name</pre>
Syntax (OCX Series)	<pre>show chassis led <fpc-slot <fpc-slot-number>></pre>
Release Information	<p>Command introduced in Junos OS Release 10.1 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.</p>
Options	<p>none—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).</p> <p>fpc-slot <fpc-slot-number>—(Optional) (Not on EX2200 switches) Display the information as follows:</p> <ul style="list-style-type: none"> (EX3200, standalone EX4200, standalone QFX3500, EX4500, and OCX Series switches) Display the status of the chassis status LEDs for either an FPC slot with no fpc-slot-number value specified or for the FPC slot specified by fpc-slot 0. fpc-slot refers to the switch itself and 0 is the only valid value for fpc-slot-number. Output for these options is the same as for the none option. (EX4200 switches in a Virtual Chassis with two or more members) If no fpc-slot-number value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the none option. If the fpc-slot-number value is specified (it equals the member-id value), display the status of the chassis status LEDs for the specified member. (EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the fpc-slot-number value. <p>interconnect-device name—</p> <p>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.</p>

node-device name— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.

Output Fields [Table 45](#) lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

Table 62: show chassis led Output Fields

Field Name	Field Description
Front panel contents for slot	FPC slot number of the device whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
Front panel contents (EX8200 Switches)	
Front Panel Module Information (QFabric system QFX3008-I Interconnect device)	On EX8200 switches, no slot number is displayed.
Front panel contents for (QFabric system Node devices and QFX3600-I Interconnect devices)	On QFabric system Node devices, the name of the Node device whose content is being displayed.

Table 62: show chassis led Output Fields (*continued*)

Field Name	Field Description
Alarms LED	<p>(EX Series switches only) Displays status of the ALM LED:</p> <ul style="list-style-type: none"> • Off—No alarm has been configured. • Green—No alarm has been triggered. • Red—Major alarm. • Yellow—Minor alarm
System LED	<p>(EX Series switches only) Displays status of the SYS LED:</p> <ul style="list-style-type: none"> • Off—Switch is powered off. • Green—Switch is operating normally. • Yellow—Switch is booting.
Master LED:	<p>Displays status of the MST LED (on EX3200, EX4200, and EX8200 switches):</p> <ul style="list-style-type: none"> • Green—On an EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational. • Off <ul style="list-style-type: none"> • On an EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration. • On EX3200, standalone EX4200, and EX8200 switches, indicates that the Routing Engine is not operational.
Mode LED:	<p>(EX Series switches only) On an EX2200 switch only, displays the currently selected port parameter of the Status LED:</p> <ul style="list-style-type: none"> • ADM—Administrative • SPD—Speed • DPX—Duplex • POE—Power over Ethernet
Status/Beacon LED	<p>(QFX Series and OCX Series) Displays the system status as indicated by the Status LED on the chassis. For more information, see:</p> <ul style="list-style-type: none"> • <i>Chassis Status LEDs on a QFX3500 Device</i> • <i>Chassis Status LEDs in the QFX3600 and QFX3600-I Device</i>
LINK/SPEED LED	<p>(QFX Series and OCX Series) Displays the link status and speed of a management port. For more information, see:</p> <ul style="list-style-type: none"> • <i>Management Port LEDs on a QFX3500 Device</i> • <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i>
ACTIVITY LED	<p>(QFX Series and OCX Series) Displays the activity status of a management port. For more information, see:</p> <ul style="list-style-type: none"> • <i>Management Port LEDs on a QFX3500 Device</i> • <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i>

Table 62: show chassis led Output Fields (*continued*)

Field Name	Field Description
STATUS LED	<p>(QFX Series and OCX Series) Displays the link status of an interface as indicated by the ST LED. For more information, see:</p> <ul style="list-style-type: none"> Control Board LEDs on a QFX3008-I Interconnect Device Access Port and Uplink Port LEDs on a QFX3500 Device Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device
LINK/ACTIVITY LED	<p>(QFX Series and OCX Series) Displays link activity or faults on an interface as indicated by the LA LED. For more information, see:</p> <ul style="list-style-type: none"> Access Port and Uplink Port LEDs on a QFX3500 Device Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device
Status LED	<p>(QFX3008-I Interconnect device only)</p> <ul style="list-style-type: none"> Displays the system status as indicated by the STATUS LED on the front panel of the chassis. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>. Displays the status of a Control Board as indicated by the STATUS LED on the Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i>.
Power LED	<p>(QFX3008-I Interconnect device only) Displays the status of system power on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Major Alarm LED	<p>(QFX3008-I Interconnect device only) Displays whether a critical error condition that requires immediate action exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Minor Alarm LED	<p>(QFX3008-I Interconnect device only) Displays whether a noncritical condition that requires monitoring or maintenance exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
Fan 0 LED	<p>(QFX3008-I Interconnect device only) Displays the status of fan trays on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>

Syntax	show chassis location
Syntax (TX Matrix Router)	show chassis location <fpc interface (by-name <i>name</i> by-slot fpc number lcc number) lcc number scc>
Syntax (TX Matrix Plus Router)	show chassis location <fpc interface (by-name <i>name</i> by-slot fpc number lcc number) lcc number sfc number>
Syntax (MX Series Router)	show chassis location <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
Syntax (OCX Series)	show chassis location
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
Options	<p>none—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.</p> <p>all-members—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.</p> <p>fpc—(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.</p>

interface by-name *name*—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.

interface by-slot *fpc number lcc number*—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace *number* with a value from **0** through **7**.
- For **lcc**, replace *number* with a value from **0** through **7**.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display the physical location of the Node device.

scc—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

Output Fields Table 63 lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

Table 63: show chassis location Output Fields

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31. On TX Matrix Plus router with 3D SIBs the value is 0 through 63.
LATA	Local access transport area information.
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.

Description	Display the media access control (MAC) addresses for the router, switch chassis, or switch.

Options **none**—(TX Matrix, TX Matrix Plus routers, QFX Series, and OCX Series Switches) Display the MAC addresses for the router chassis or switch. On a TX Matrix router, display MAC addresses on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display MAC addresses on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display the MAC addresses for all the member routers of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display the MAC addresses for the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display MAC addresses for a specified T640 router (line-card chassis) that is connected to the TX Matrix Plus router. On a TX Matrix Plus router, display MAC addresses for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the MAC addresses for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the MAC addresses for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display the MAC addresses for the specified Node group.

scc—(TX Matrix routers only) (Optional) Display MAC addresses for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display MAC addresses for the TX Matrix Plus router (or switch-fabric chassis).

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.

Options **fpc-slot *slot-number***—Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc *number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc *number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1
```

- M120 routers only—Replace ***slot-number*** with a value from 0 through 5.
- MX80 routers only—Replace ***slot-number*** with a value from 0 through 1.
- MX104 routers only—Replace ***slot-number*** with a value from 0 through 2.
- MX240 routers only—Replace ***slot-number*** with a value from 0 through 2.
- MX480 routers only—Replace ***slot-number*** with a value from 0 through 5.
- MX960 routers only—Replace ***slot-number*** with a value from 0 through 11.
- MX2010 routers only—Replace ***slot-number*** with a value from 0 through 9.
- MX2020 routers only—Replace ***slot-number*** with a value from 0 through 19.
- Other routers—Replace ***slot-number*** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace ***slot-number*** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace ***slot-number*** with a value from 0 through 9 (switch's member ID).
 - EX8208 switches—Replace ***slot-number*** with a value from 0 through 7 (line card).
 - EX8216 switches—Replace ***slot-number*** with a value from 0 through 15 (line card).
- QFX Series:
 - QFX3500, QFX3600, QFX5100, and OCX Series standalone switches—Replace ***slot-number*** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
 - QFabric systems—Replace ***slot-number*** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

all-members—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot *slot-number*—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

transport—Display PIC information for optical transport network.

Output Fields Table 65 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 65: show chassis pic Output Fields

Field Name	Field Description
Type	<p>PIC type.</p> <p>NOTE: On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as MIC-3D-1STM64-XFP and with the SONET framing mode, the type is displayed as MIC-3D-1OC192-XFP. By default, the 1-port OC192/STM64 MICs displays the type as MIC-3D-1OC192-XFP.</p>
Account Layer2 Overhead	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
ASIC type	Type of ASIC on the PIC.
State	<p>Status of the PIC. State is displayed only when a PIC is in the slot.</p> <ul style="list-style-type: none"> • Online— PIC is online and running. • Offline—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: Layer-2 or Layer-3 .
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: LH , LX , or SX .
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction • Xcvr Firmware—Transceiver firmware version.

Table 65: show chassis pic Output Fields (*continued*)

Field Name	Field Description
PIC Port Information (MX960 Router Bidirectional Optics)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> • BX10-10-km bidirectional optics. • BX40-40-km bidirectional optics. • SFP-LX-40-km SFP optics. • Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.
PIC Port Information (Next-Generation SONET/SDH SFP)	<p>Port-level information for the next-generation SONET/SDH SFP PIC.</p> <ul style="list-style-type: none"> • Port—Port number. • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. • Fiber type—Type of fiber: SM (single-mode) or MM (multimode). • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.
PIC port information (MX104 router)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. • Xcvr Firmware—Firmware version of the transceiver.
Multirate Mode	Rate-selectability status for the MIC: Enabled or Disabled .
Channelization	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 3D Univesral Edge Routers.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> <p>satellite option introduced in Junos OS Release 14.2R3.</p>
Description	Display the status of the Routing Engine.
Options	<p>none—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.</p> <p>all-members—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.</p> <p>bios—(Optional) Display the (BIOS) firmware version.</p> <p>interconnect-device <i>number</i>—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-device *number*—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

satellite [*slot-id slot-id* [*device-alias alias-name*]]—(Junos Fusion only) (Optional) Display Routing Engine information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

slot—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace *slot* with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

Output Fields Table 66 lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 66: show chassis routing-engine Output Fields

Field Name	Field Description
Slot	(Systems with single and multiple Routing Engines) Slot number.
Current state	(Systems with multiple Routing Engines) Current state of the Routing Engine: Master , Backup , or Disabled .
Election priority	(Systems with multiple Routing Engines) Election priority for the Routing Engine: Master or Backup .
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	Temperature of the CPU.
DRAM	<p>Total DRAM available to the Routing Engine's processor.</p> <p>Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.</p> <p>NOTE: For platforms running Junos OS with upgraded FreeBSD, the way memory utilization is calculated has changed. Starting in Junos OS Release 15.1R1, inactive memory is no longer included in the calculation for memory utilization. For platforms that run Junos OS with upgraded FreeBSD, see "Understanding Junos OS with Upgraded FreeBSD" on page 89.</p>
Memory utilization	Percentage of Routing Engine memory being used.

Table 66: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
CPU utilization	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"> • User—Percentage of CPU time being used by user processes. • Background—Percentage of CPU time being used by background processes. • Kernel—Percentage of CPU time being used by kernel processes. • Interrupt—Percentage of CPU time being used by interrupts. • Idle—Percentage of CPU time that is idle.
5 sec CPU Utilization NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.	Information about the Routing Engine's CPU utilization in the past 5 seconds: <ul style="list-style-type: none"> • User—Percentage of CPU time being used by user processes. • Background—Percentage of CPU time being used by background processes. • Kernel—Percentage of CPU time being used by kernel processes. • Interrupt—Percentage of CPU time being used by interrupts. • Idle—Percentage of CPU time that is idle.
1 min CPU Utilization NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.	Information about the Routing Engine's CPU utilization in the past 1 minute: <ul style="list-style-type: none"> • User—Percentage of CPU time being used by user processes. • Background—Percentage of CPU time being used by background processes. • Kernel—Percentage of CPU time being used by kernel processes. • Interrupt—Percentage of CPU time being used by interrupts. • Idle—Percentage of CPU time that is idle.
5 min CPU Utilization NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.	Information about the Routing Engine's CPU utilization in the past 5 minutes: <ul style="list-style-type: none"> • User—Percentage of CPU time being used by user processes. • Background—Percentage of CPU time being used by background processes. • Kernel—Percentage of CPU time being used by kernel processes. • Interrupt—Percentage of CPU time being used by interrupts. • Idle—Percentage of CPU time that is idle.
15 min CPU Utilization NOTE: Supported only on MX240, MX480, MX960, MX2010, and MX2020.	Information about the Routing Engine's CPU utilization in the past 15 minutes: <ul style="list-style-type: none"> • User—Percentage of CPU time being used by user processes. • Background—Percentage of CPU time being used by background processes. • Kernel—Percentage of CPU time being used by kernel processes. • Interrupt—Percentage of CPU time being used by interrupts. • Idle—Percentage of CPU time that is idle.
Model	Routing Engine model number.
Serial ID	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
Start time	Time at which the Routing Engine started running.
Uptime	How long the Routing Engine has been running.

Table 66: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Routing Engine BIOS Version	BIOS version being run by the Routing Engine.
Last reboot reason	Reason for last reboot, including: <ul style="list-style-type: none"> • power cycle/failure—Halt of the Routing Engine using the halt command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the request system halt command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard. • watchdog—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered. • reset-button reset—(Not available on the EX Series switch) Reboot due to pressing of the reset button on the Routing Engine. • power-button hard power off—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the request system power-off command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software. • misc hardware reason—Reboot due to miscellaneous hardware reasons. • thermal shutdown—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations. • hard disk failure—Reboot due to a hard disk or solid-state drive (SSD) failure. • reset from debugger—Reboot due to reset from the debugger. • chassis control reset—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the restart chassis-control command. • bios auto recovery reset—Reboot due to a BIOS auto-recovery reset. • could not be determined—Reboot due to an undetermined reason. • Router rebooted after a normal shutdown—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the request system reboot command. You can enter this command to reboot the chassis or specific Routing Engines.
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

Sample Output

show chassis routing-engine (M5 Router)

```

show chassis zones

List of Syntax	Syntax on page 996 Syntax (MX Series Routers) on page 996 Syntax (QFX Series) on page 996
Syntax	show chassis zones <detail>
Syntax (MX Series Routers)	show chassis zones <detail> <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show chassis zones <detail> <interconnect-device <i>name</i> >
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. all-members , local , and member <i>member-id</i> options introduced in Junos OS Release 15.1 for MX2020 and MX2010 routers.
Description	<p>(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays.</p> <p>(MX2010 and MX2020 routers only) Display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.</p>
Options	<p>all-members—(MX2010 and MX2020 routers only) (Optional) Display the status of the cooling system zones in all members of the Virtual Chassis configuration.</p> <p>detail—(MX2010 and MX2020 routers only) (Optional) Display detailed status of the cooling system zones.</p> <p>detail <i>device-name</i>— (QFabric systems only) (Optional) Display detailed status of the two cooling systems on the Interconnect device.</p> <p>interconnect-device <i>name</i>— (QFabric systems only) (Optional) Display the status of the cooling zones on the Interconnect device.</p> <p>local—(MX2010 and MX2020 routers only) (Optional) Display the status of the cooling system zones in the local member of the Virtual Chassis.</p>

member *member-id*—(MX2010 and MX2020 routers only) (Optional) Display the status of the cooling system zones in the specified member of the Virtual Chassis. Replace *member-id* with the value 0 or 1.

Output Fields Table 45 lists the output fields for the **show chassis zones** command. Output fields are listed in the approximate order in which they appear.

Table 67: show chassis zones Output Fields

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0.
Beacon State	Status of the beacon state: <ul style="list-style-type: none"> • Off—The beacon is OFF. • On—The beacon is ON.
show chassis zones command output fields for MX2020 and MX2010 routers:	
Driving FRU	Field replacable unit (FRU).
Temperature	Temperature of the specified FRU in degrees Celsius and degrees Fahrenheit.
Condition	Condition of the specified FRU. Condition can be HIGH TEMP , WARM TEMP , OK , and Offline .
Num Fans Missing	Number of fans or fan trays missing.
Num Fans Failed	Number of fans or fan trays that have failed.
Fan Duty Cycle	Fan duty cycle value.
show chassis zones detail command output fields for MX2020 and MX2010 routers:	

Table 67: show chassis zones Output Fields (*continued*)

Field Name	Field Description
Item	Chassis component: <ul style="list-style-type: none"> Information about the chassis, Routing Engines, Control Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).
Measurement	Fan tray speed utilization in percentage.
Status	Status of the specified item. Status can be OK , Absent , or Offline .

show host

Syntax	<code>show host <i>hostname</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display Domain Name System (DNS) hostname information.
Options	<i>hostname</i> —Hostname or address.
Additional Information	The <code>show host</code> command displays the raw data received from the DNS server.
Required Privilege Level	view
List of Sample Output	show host on page 1002

Sample Output

show host

```
user@host> show host snark
snark.boojum.net has address 192.168.1.254

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <i>device-type (device-id device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.

NOTE: On MX Series routers, modifying a configuration to replace a service interface with another service interface is treated as a catastrophic event. When you modify a configuration, the entire configuration associated with the service interface—including NAT pools, rules, and service sets—is deleted and then re-created for the newly specified service interface. If there are active sessions associated with the service interface that is being replaced, these sessions are deleted and the NAT pools are then released, which leads to the generation of the NAT_POOL_RELEASE system log messages. However, because NAT pools are already deleted as a result of the catastrophic configuration change and no longer exist, the NAT_POOL_RELEASE system log messages are not generated for the changed configuration.

Options none—List all log files.

<all-lcc | lcc *number* | scc>—(Routing matrix only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace *number* with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(device-id | device-alias)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include **username**, display logging information about the specified user.

 <subscriber-state *subscriber-state*>
 <user-name *user-name*>
 <vci *vci-identifier*>
 <vpi *vpi-identifier*>
 <vlan-id *vlan-id*>

Release Information Command introduced in Junos OS Release 9.3.
 Command introduced in Junos OS Release 9.3 for EX Series switches.
client-type, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.
count option usage with other options introduced in Junos OS Release 10.2.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.
 The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.
 Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.
 Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

Description Display information for active subscribers.

Options **detail | extensive | terse**—(Optional) Display the specified level of output.

aci-interface-set-name—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

address—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example,

192.168.17.1). If you specify the IP address as a prefix with a netmask (for example, 192.168.17.1/32), the router displays a message that the IP address is invalid, and rejects the command.

agent-circuit-identifier-substring—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

client-type—(Optional) Display subscribers whose client type matches one of the following client types:

- ***dhcp***—DHCP clients only.
- ***dot1x***—Dot1x clients only.
- ***essm***—ESSM clients only.
- ***fwauth***—FwAuth (authenticated across a firewall) clients only.
- ***l2tp***—L2TP clients only.
- ***mlppp***—MLPPP clients only.
- ***ppp***—PPP clients only.
- ***pppoe***—PPPoE clients only.
- ***static***—Static clients only.
- ***vlan***—VLAN clients only.
- ***vlan-oob***—VLAN out-of-band (ANCP-triggered) clients only.
- ***vpls-pw***—VPLS pseudowire clients only.
- ***xauth***—Xauth clients only.

count—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the ***count*** option alone or with the ***address***, ***client-type***, ***interface***, ***logical-system***, ***mac-address***, ***profile-name***, ***routing-instance***, ***stacked-vlan-id***, ***subscriber-state***, or ***vlan-id*** options.

id—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the ***show subscribers extensive*** or the ***show subscribers interface extensive*** commands.

interface—(Optional) Display subscribers whose interface matches the specified interface.

logical-system—(Optional) Display subscribers whose logical system matches the specified logical system.

mac-address—(Optional) Display subscribers whose MAC address matches the specified MAC address.

physical-interface-name—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

profile-name—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

routing-instance—(Optional) Display subscribers whose routing instance matches the specified routing instance.

stacked-vlan-id—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

subscriber-state—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

user-name—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

vci-identifier—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is 0 through 255.

vpi-identifier—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is 0 through 65535.

vlan-id—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID, regardless of whether the subscriber uses a single-tagged or double-tagged VLAN. For subscribers using a double-tagged VLAN, this option displays subscribers where the inner VLAN tag matches the specified VLAN ID. To display only subscribers where the specified value matches only double-tagged VLANs, use the **stacked-vlan-id** option to match the outer VLAN tag.

NOTE: Due to display limitations, logical system and routing instance output values are truncated when necessary.

Output Fields Table 68 lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

Table 68: show subscribers Output Fields

Field Name	Field Description
Interface	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface. The * character indicates a continuation of addresses for the same session.
IP Address/VLAN ID	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is Tunnel-switched .
User Name	Name of subscriber.

Table 68: show subscribers Output Fields (*continued*)

Field Name	Field Description
LS:RI	Logical system and routing instance associated with the subscriber.
Type	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
IP Address	Subscriber IPv4 address.
IP Netmask	Subscriber IP netmask.
Primary DNS Address	IP address of primary DNS server.
Secondary DNS Address	IP address of secondary DNS server.
Primary WINS Address	IP address of primary WINS server.
Secondary WINS Address	IP address of secondary WINS server.
IPv6 Address	Subscriber IPv6 address, or multiple addresses.
IPv6 Prefix	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
IPv6 User Prefix	IPv6 prefix obtained through ND/RA.
IPv6 Address Pool	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
IPv6 Network Prefix Length	Length of the network portion of the IPv6 address.
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.
Interface	(Enhanced subscriber management for MX Series routers) Name of the enhanced subscriber management logical interface, in the form demux0.nnnn (for example, demux0.3221225472), to which access-internal and framed subscriber routes are mapped.
Interface Type	Whether the subscriber interface is Static or Dynamic .
Interface Set	Internally generated name of the dynamic ACI interface set used by the subscriber session.
Interface Set Type	Interface type of the ACI interface set: Dynamic . This is the only ACI interface set type currently supported.
Interface Set Session ID	Identifier of the dynamic ACI interface set entry in the session database.

Table 68: show subscribers Output Fields (*continued*)

Field Name	Field Description
Underlying Interface	Name of the underlying interface for the subscriber session.
Dynamic Profile Name	Dynamic profile used for the subscriber.
Dynamic Profile Version	Version number of the dynamic profile used for the subscriber.
MAC Address	MAC address associated with the subscriber.
State	Current state of the subscriber session (Init , Configured , Active , Terminating , Tunneled).
L2TP State	Current state of the L2TP session, Tunneled or Tunnel-switched . When the value is Tunnel-switched , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
Tunnel switch Profile Name	Name of the L2TP tunnel switch profile that initiates tunnel switching.
Local IP Address	IP address of the local gateway (LAC).
Remote IP Address	IP address of the remote peer (LNS).
VLAN Id	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	<p>For the dhcp client type, option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the vlan-oob client type, the agent circuit ID or access-loop circuit identifier that identifies the subscriber line based on the subscriber-facing DSLAM interface on which the subscriber request originates.</p>
Agent Remote ID	<p>For the dhcp client type, option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the vlan-oob client type, the agent remote ID or access-loop remote identifier that identifies the subscriber line based on the NAS-facing DSLAM interface on which the subscriber request originates.</p>
DHCP Relay IP Address	IP address used by the DHCP relay agent.
ATM VPI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
ATM VCI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.

Table 68: show subscribers Output Fields (*continued*)

Field Name	Field Description
Login Time	Date and time at which the subscriber logged in.
Effective shaping-rate	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.
IPv6 Interface Address	Address assigned by the Framed-Ipv6-Prefix AAA attribute.
IPv6 Framed Interface Id	Interface ID assigned by the Framed-Interface-Id AAA attribute.
ADF IPv4 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv4 Output Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv6 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.

Table 68: show subscribers Output Fields (*continued*)

Field Name	Field Description
ADF IPv6 Output Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
IPv4 Input Filter Name	Name assigned to the IPv4 input filter (client or service session).
IPv4 Output Filter Name	Name assigned to the IPv4 output filter (client or service session).
IPv6 Input Filter Name	Name assigned to the IPv6 input filter (client or service session).
IPv6 Output Filter Name	Name assigned to the IPv6 output filter (client or service session).
IFL Input Filter Name	Name assigned to the logical interface input filter (client or service session).
IFL Output Filter Name	Name assigned to the logical interface output filter (client or service session).

show system alarms

Syntax	show system alarms
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display active system alarms.
Options	This command has no options.
Additional Information	<p>System alarms are preset. They include a <i>configuration</i> alarm that appears when no rescue configuration alarm is set and a <i>license</i> alarm that appears when a software feature is configured and no valid license is configured for the feature. On EX6200 switches, an alarm can be triggered by an internal link error. For more information about system alarms, see the <i>Junos OS Administration Library for Routing Devices</i>.</p> <p>In Junos OS release 11.1 and later, alarms for fans also show the slot number of the malfunctioning fans in the CLI output.</p> <p>Starting with Junos OS Release 13.2, you can view degraded fabric alarms on a routing matrix based on TX Matrix Plus router with 3D SIBs. The alarm indicates that the source FPC is running with a degraded fabric condition. This alarm is an early warning of a possible fabric black-hole condition. When the degraded fabric alarm is raised on the source FPC, you can take remedial action to avoid a fabric black-hole condition. The degraded fabric alarm is raised on the source FPC if both the following conditions are met:</p> <ul style="list-style-type: none"> • The active Packet Forwarding Engine destinations are reachable on one or no active switching planes. • At least one of the inactive switching planes has a fault that causes the destination Packet Forwarding Engine to become unreachable.
Required Privilege Level	view

Syntax (TX Matrix Router)	show system audit <all-lcc lcc <i>number</i> scc> <root-only>
Syntax (TX Matrix Plus Router)	show system audit <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <root-only>
Syntax (QFX Series)	show system audit <infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i> root-only>
Syntax (OCX Series)	show system audit <root-only>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the state and checksum values for file systems.
Options	none —Display the state and checksum values for all file systems. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.

all-members—(EX4200 switch, QFX Series, and MX Series routers only) (Optional)

Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

infrastructure name—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

interconnect-device name—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

local—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

member member-id—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group name—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

root-only—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

scc—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information To redirect the output to a file, issue the following command:

```
ssh device-name 'show system audit root-only' > output-file
```

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Syntax (MX Series Router)	show system boot-messages <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system boot-messages infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
Options	none —Display all boot time messages. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs. all-members —(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.

infrastructure *name*—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.

interconnect-device *name*—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display boot time messages on the Node group.

scc—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Syntax	show system buffers
Syntax (EX Series)	show system buffers <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system buffers <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system buffers <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system buffers <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system buffers <infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i> root-only (infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i>)>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
Options	none —Show all buffer statistics. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.

all-members—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.

infrastructure *name*—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Show buffer statistics for the Node group

sfc—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

Output Fields	Table 70 describes the output fields for the show system buffers command. Output fields are listed in the approximate order in which they appear.

Table 70: show system buffers Output Fields

Field Name	Field Description
mbufs in use	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
mbufs allocated to packet headers	Number of memory buffers currently holding packet headers
mbufs allocated to control blocks	Number of memory buffers currently holding the state for sockets.
mbufs allocated to send data	Number of memory buffers currently holding socket send data.
mbufs allocated to pfe refill data	Number of memory buffers currently holding Packet Forwarding Engine refill data.
mbufs allocated to fxp data	Number of memory buffers currently holding fxp data.
mbufs allocated to socket names and addresses	Number of memory buffers currently holding addresses for sockets.
mbuf clusters in use	Allocation statistics for memory buffer clusters.
allocated to network	Total amount of memory in use by the networking and interprocess communication (IPC) code.
requests for memory denied	Number of times a memory allocation request within the IPC and networking code failed.
requests for memory delayed	Number of times a memory allocation request within the IPC and networking code was postponed.
calls to protocol drain routines	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

Sample Output

show system buffers

```

user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)
395/331/726/30000 mbuf clusters in use (current/cache/total/max)
384/256 mbuf+clusters out of packet secondary zone in use (current/cache)
0/0/0/0 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/0 9k jumbo clusters in use (current/cache/total/max)

show system certificate

Syntax	<code>show system certificate</code> <code><certificate-id></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	(Encryption interface on M Series, T Series routers, QFX Series, and OCX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority.
Options	none —Display all installed certificates signed by the Juniper Networks certificate authority. certificate-id —(Optional) Display the details of a particular certificate.
Required Privilege Level	maintenance
List of Sample Output	show system certificate on page 1053 show system certificate (QFX Series) on page 1053
Output Fields	Table 71 lists the output fields for the show system certificate command. Output fields are listed in the approximate order in which they appear.

Table 71: show system certificate Output Fields

Field Name	Field Description
Certificate identifier	Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.
Issuer Subject	Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> • Organization—Name of the owner's organization. • Organizational unit—Name of the owner's department. • Country—Two-character country code in which the owner's system is located. • State—State in the USA in which the owner is using the certificate. • Locality—City in which the owner's system is located. • Common name—Name of the owner of the certificate. • E-mail address—E-mail address of the owner of the certificate.
Validity	When a certificate is valid.
Signature algorithm	Encryption algorithm applied to the installed certificate.
Public key algorithm	Encryption algorithm applied to the public key.

Sample Output

show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
Issuer:
Organization: Juniper Networks, Organizational unit: Juniper CA,
Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,

```

show system configuration archival

Syntax show system configuration archival

Release Information Introduced in Junos OS Release 7.6.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display directory and number of files queued for archival transfer.

NOTE: The [edit system configuration] hierarchy is not available on QFabric systems.

Options This command has no options.

Required Privilege Level maintenance

List of Sample Output [show system configuration archival on page 1057](#)

Sample Output

show system configuration archival

```
user@host> show system configuration archival
```

```
/var/transfer/config/:
total 8
```

show system configuration rescue

Syntax show system configuration rescue

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

Description Display a rescue configuration, if one exists.

NOTE: The [edit system configuration] hierarchy is not available on QFabric systems.

Options This command has no options.

Required Privilege Level maintenance

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.</p>
Options	<p>none—Display information about all active IP sockets on the Routing Engine.</p> <p>extensive—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs</p> <p>all-members—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.</p> <p>inet inet6—(Optional) Display IPv4 connections or IPv6 connections, respectively.</p> <p>infrastructure <i>name</i>—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display system connection activity for the Node group.

scc—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

show-routing-instances—(Optional) Display routing instances.

Additional Information By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 73](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

Table 73: show system connections Output Fields

Field Name	Field Description
Proto	Protocol of the socket: IP , TCP , or UDP for IPv4 or IPv6.
Recv-Q	Number of input packets received by the protocol and waiting to be processed by the application.
Send-Q	Number of output packets sent by the application and waiting to be processed by the protocol.
Local Address	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
Foreign Address	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.
Routing Instance	(Displayed only when the show-routing-instance option is used.) Routing instances associated with active IP sockets on the Routing Engine.
(state)	For TCP, the protocol state of the socket.

Sample Output

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
satellite option introduced in Junos OS Release 14.2R3.

Description Show core files on all routers or switches running Junos OS. You can use the **show system core-dumps** command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. If dual Routing Engines are present, you can view core-dump files for either routing engine or both routing engines together. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.

You can use the option **core-filename** and its options **core-file-info**, **brief**, and **detail** to display more information about the specified core-dump files.

Options **none**—Display a list of all existing core-dump files.

NOTE: If dual Routing Engines are present, then only the core-dump files for the active Routing Engine are listed.

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

<all-lcc | lcc number>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc number** option, replace **number** with a value from 0 through 3.

NOTE: The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

all-members—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

brief—(Optional) View details of a binary file.

component (*UUID* | *serial number* | *all*)—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

core-file-info—(Optional) Display the stack trace of a core file.

core-filename—(Optional) Name of a specific core file to display.

detail—(Optional) View stack trace with details of the binary file.

display-order (*timestamp-sort* | *alphanumeric-sort*)—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—according to their filename.

display-period (*hours* | *minutes* | *seconds*)—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

kernel-crashinfo component (*UUID* | *serial number*)—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

local—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

re0—(Dual Routing Engines only) Display the core-dump files on re0.

re1—(Dual Routing Engines only) Display the coredump files on re1.

repository (*core* | *log*)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

routing-engine (*backup* | *both* | *local* | *master* | *other*)—(Dual routing engines only) Display a list of core-dump files for either the backup, local, master, or other routing engine or both routing engines.

satellite [*fpc-slot-id* | *device-alias* *alias-name*]—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

Required Privilege Level view

Output Fields Table 74 describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

Table 74: show system core-dumps Output Fields

Field Name	Field Description
<i>Permissions</i>	Read/write permissions for the file named.
<i>Links</i>	Number of links to the file.
<i>Owner</i>	Name of the file owner.
<i>Group</i>	Name of the group with file access.
<i>File size</i>	File size in bytes.
<i>Modified</i>	Last file modification date and time.
<i>Path/filename</i>	File path where the file resides and the filename. (MX Series routers only) When you display the core files for an MX Series Virtual Chassis, the show system core-dumps command does not display information about files pertaining to the relayd process.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the core repository, and the log files are located in the log repository. The default Repository scope is shared since both the core and log repositories are shared by all of the QFabric system devices.
Repository head:	Path to the top-level repository location.

Table 74: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
Repository name:	Name of the repository: core or log .
List of nodes for core repository:	List of core-dump files associated with a particular QFabric system device located in the core repository.
Node Group	Name of the QFabric system device.
Node Identifier	UUID or serial number of the QFabric system device.
Num	Number of core-dump and log files.
Model	Model number of the QFabric system device.
Usage	Usage of the repository in megabytes.
Total usage of core repository:	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
Total usage of log repository:	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
List of nodes for core repository:	List of core-dump files associated with a particular QFabric system device located in the core repository.
List of nodes for log repository:	List of log files associated with a particular QFabric system device located in the log repository.
Filename	Name of the core-dump file.
Date	Last core-dump file modification date and time.
Size	Size of the core-dump file.
Core filename	Filename of the core-dump file.
Process name	Name of the process that is generating a core-dump file or log file.
Release	Junos OS release.
Build server	Junos OS build server.
Build date	Junos OS build date.
Stack trace	Stack trace of the core-dump file.

Sample Output

show system core-dumps

This example shows the command output if core files exist.

```
user@switch> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

show system core-dumps routing-engine both

This example shows the command output if dual Routing Engines are present.

```
user@host> show system core-dumps routing-engine both

Description	Display directory usage information.

Options **none**—Display all directory usage information.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

depth *number*—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

infrastructure *name*— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

interconnect-device *name*— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

node-group *name*— (QFabric systems only) (Optional) Display directory information for the Node group.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

path—(Optional) Path or root directory to traverse.

scc—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with 0.

- Output Fields
- Table 75 describes the output fields for the **show system directory-usage** command. Output fields are listed in the approximate order in which they appear.

Table 75: show system directory-usage Output Fields

Field Name	Field Description
<i>bytes</i>	Number of bytes used by files in a directory.
<i>directory-name</i>	Name of the directory.

Sample Output

show system directory-usage scc (TX Matrix Router)

```
user@host> show system directory-usage /var/tmp scc
/var/tmp
1.0K    /var/tmp/vi.recover
2.0K    /var/tmp/instmp.tPMk8u

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display information about software processes that are running on the router or switch and that have controlling terminals.
Options	none —Display standard information about system processes. brief detail extensive summary —(Optional) Display the specified level of detail. adaptive-services —(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC. alarm-control —(Optional) Display the process to configure the system alarm. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis. all-lcc —(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs. all-members —(EX4200 switches, QFX Series Virtual Chassis, and MX Series routers) (Optional) Display standard system process information for all members of the Virtual Chassis configuration. ancpd-service —Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

application-identification—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

audit-process—(Optional) Display the RADIUS accounting process.

auto-configuration—Display the Interface Auto-Configuration process.

bootp—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.

captive-portal-content-delivery—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

ce-l2tp-service—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

cfm—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

chassis-control—(Optional) Display the chassis management process.

class-of-service—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

craft-control—Display the process for the I/O of the craft interface.

database-replication—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

datapath-trace-service—Display the packet path tracing process.

dhcp-service—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

diameter-service—(Optional) Display the diameter process.

disk-monitoring—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

dynamic-flow-capture—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

- ecc-error-logging**—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.
- ethernet-connectivity-fault-management**—Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.
- ethernet-link-fault-management**—(EX Series switches and MX Series routers only)
(Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.
- event-processing**—(Optional) Display the event process (eventd).
- firewall**—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.
- general-authentication-service**—(EX Series switches and MX Series routers only)
(Optional) Display the general authentication process.
- health (pid *process-identifier* | process-name *process-name*)**—(Optional) Display process health information, either by process id (PID) or by process name.
- host-processes**—Display process information of processes running on the host system.
(On OCX Series only) The following options are available:
- **brief | detail**—(Optional) Display the specified level of detail.
- iccp-service**—Display the Inter-Chassis Communication Protocol (ICCP) process.
- idp-policy**—Display the intrusion detection and prevention (IDP) protocol process.
- ilmi**—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
- inet-process**—Display the IP multicast family process.
- init**—Display the process that initializes the USB modem.
- interface-control**—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.
- kernel-replication**—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.
- l2-learning**—(Optional) Display the Layer 2 address flooding and learning process.
- l2cpd-service**—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

lACP—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches, QFX Series Virtual Chassis, and MX Series routers) (Optional) Display standard system process information for the local Virtual Chassis member.

local-policy-decision-function—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

logical-system-mux—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

mac-validation—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member member-id—(EX4200 switches, QFX Series Virtual Chassis, and MX Series routers) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

mib-process—(Optional) Display the MIB II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

mountd-service—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

mpls-traceroute—(Optional) Display the MPLS Periodic Traceroute process.

mspd—(Optional) Display the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

neighbor-liveness—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

nfsd-service—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

ntp—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

packet-triggered-subscribers—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Display the Peer Selection Service process.

periodic-packet-services—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

pfe—Display the Packet Forwarding Engine management process.

pgcp-service—(Optional) Display the pgcpd service process running on the Routing Engine.

pgm—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

pic-services-logging—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

ppp—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

pppoe—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

process-monitor—Display the process health monitor process (pmond).

providers—(Optional) Display provider processes.

redundancy-interface-process—(Optional) Display the ASP redundancy process.

remote-operations—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

resource-cleanup—Display the resource cleanup process.

resource-limits (brief | detail) process-name—(Optional) Display process resource limits.

routing—(Optional) Display the routing protocol process.

sampling—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—Display the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

sdk-service—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

send—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

service-deployment—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

sfc number—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace *number* with 0.

snmp—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

sonet-aps—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

static-subscribers—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

tunnel-oamd—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

vrp—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

watchdog—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

wide—(Optional) Display process information that might be wider than 80 columns.

Additional Information By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields

Table 76 describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

Table 76: show system processes Output Fields

Field Name	Field Description	Level of Output
last pid	Last process identifier assigned to the process.	brief extensive summary
load averages	Three load averages followed by the current time.	brief extensive summary
processes	Number of existing processes and the number of processes in each state (sleeping , running , starting , zombies , and stopped).	brief extensive summary
Mem	Information about physical and virtual memory allocation.	brief extensive summary
Active	<p>Memory allocated and actively used by the program.</p> <p>When the system is under memory pressure, the pageout process reuses memory from the free, cache, inact and, if necessary, active pages. When the pageout process runs, it scans memory to see which pages are good candidates to be unmapped and freed up. Thus, the distinction between Active and Inact memory is only used by the pageout process to determine which pool of pages to free first at the time of a memory shortage.</p> <p>The pageout process first scans the Inact list, and checks whether the pages on this list have been accessed since the time they have been listed here. The pages that have been accessed are moved from the Inact list to the Active list. On the other hand, pages that have not been accessed become prime candidates to be freed by the pageout process. If the pageout process cannot produce enough free pages from the Inact list, pages from the Active list get freed up.</p> <p>Because the pageout process runs only when the system is under memory pressure, the pages on the Inact list remain untouched – even if they have not been accessed recently – when the amount of Free memory is adequate.</p>	brief extensive summary
Inact	<p>Memory allocated but not recently used or memory freed by the programs. Inactive memory remains mapped in the address space of one or more processes and, therefore, counts toward the RSS value of those processes.</p> <p>Any amount of memory freed by the routing protocol process might still be considered part of the RES value. Generally, the kernel delays the migrating of memory out of the Inact queue into the Cache or Free list unless there is a memory shortage.</p>	brief extensive summary
Wired	Memory that is not eligible to be swapped, usually used for in-kernel memory structures and/or memory physically locked by a process.	brief extensive summary
Cache	Memory that is not associated with any program and does not need to be swapped before being reused.	brief extensive summary
Buf	Size of memory buffer used to hold data recently called from the disk.	brief extensive summary
Free	Memory that is not associated with any programs. Memory freed by a process can become Inactive , Cache , or Free , depending on the method used by the process to free the memory.	brief extensive summary

Table 76: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
Swap	Information about physical and virtual memory allocation. NOTE: Memory can remain swapped out indefinitely if it is not accessed again. Therefore, the show system process extensive command shows that memory is swapped to disk even though there is plenty of free memory, and such a situation is not unusual.	brief extensive summary
PID	Process identifier.	detail extensive summary
TT	Control terminal name.	none detail
STAT	Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process: <ul style="list-style-type: none"> • D—In disk or other short-term, uninterruptible wait • I—Idle (sleeping longer than about 20 seconds) • R—Runnable • S—Sleeping for less than 20 seconds • T—Stopped • Z—Dead (zombie) • + —The process is in the foreground process group of its control terminal. • <—The process has raised CPU scheduling priority. • >—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped. • A—The process requested random page replacement. • E—The process is trying to exit. • L—The process has pages locked in core. • N—The process has reduced CPU scheduling priority. • S—The process requested first-in, first-out (FIFO) page replacement. • s—The process is a session leader. • V—The process is temporarily suspended. • W—The process is swapped out. • X—The process is being traced or debugged. 	none detail
UID	User identifier.	detail
USERNAME	Process owner.	extensive summary
PPID	Parent process identifier.	detail
CPU	(D)—Short-term CPU usage. (E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.	detail extensive summary
RSS	Resident set size.	detail

Table 76: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
WCHAN	Symbolic name of the wait channel.	detail
STARTED	Local time when the process started running.	detail
PRI	Current priority of the process. A lower number indicates a higher priority.	detail extensive summary
NI or NICE	UNIX "niceness" value. A lower number indicates a higher priority.	detail extensive summary
SIZE	Total size of the process (text, data, and stack), in kilobytes.	extensive summary
RES	Current amount of program resident memory, in kilobytes. This is also known as RSS or Resident Set Size. The RES value includes shared library pages used by the process. Any amount of memory freed by the process might still be considered part of the RES value. Generally, the kernel delays the migrating of memory out of the Inact queue into the Cache or Free list unless there is a memory shortage. This can lead to large discrepancies between the values reported by the routing protocol process and the kernel, even after the routing protocol process has freed a large amount of memory.	extensive summary
STATE	Current state of the process (for example, sleep , wait , run , idle , zombie , or stop).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running. (MX Series routers only) When you display the software processes for an MX Series Virtual Chassis, the show system processes command does not display information about the relayd process.	detail extensive summary
THR	Number of threads in the process	extensive

show system reboot

List of Syntax	Syntax on page 1126 Syntax (EX Series Switches) on page 1126 Syntax (TX Matrix Router) on page 1126 Syntax (TX Matrix Plus Router) on page 1126 Syntax (MX Series Router) on page 1126 Syntax (QFX Series and OCX Series) on page 1126
Syntax	show system reboot <both-routing-engines>
Syntax (EX Series Switches)	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system reboot <all-chassis all-lcc lcc <i>number</i> scc> <both-routing-engines>
Syntax (TX Matrix Plus Router)	show system reboot <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <both-routing-engines>
Syntax (MX Series Router)	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
Syntax (QFX Series and OCX Series)	show system reboot <both-routing-engines> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-device <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display pending system reboots or halts.
Options	none —Display pending reboots or halts on the active Routing Engine. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix router, display

halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

all-lcc—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

infrastructure *name*—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display reboot request information on the Node group.

scc—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

Additional Information By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

```

```
-----
No shutdown/reboot scheduled.
```

show system reboot sfc (TX Matrix Plus Router)

```
user@host> show system sfc 0
No shutdown/reboot scheduled.
```

show system reboot (QFX3500 Switch)

```
user@switch> show system reboot
No shutdown/reboot scheduled.
```

show system resource-cleanup processes

Syntax	show system resource-cleanup processes <detail> <pid <i>number</i> > <process-name <i>name</i> >
Release Information	Command introduced in Junos OS Release 9.3. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the list of processes that have been registered for resource cleanup services.
Options	<p>detail—(Optional) Display the list of processes that have been registered for resource cleanup services, along with the resources that have been requested for cleanup.</p> <p>pid <i>number</i>—(Optional) Display a process that has been registered for resource cleanup services by specifying the Process Identifier number.</p> <p>process-name <i>name</i>—(Optional) Display a process that has been registered for resource cleanup services by name of the process.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>resource-cleanup</i> <i>traceoptions (Resource Cleanup)</i>
List of Sample Output	show system resource-cleanup processes on page 1129 show system resource-cleanup processes detail on page 1130
Output Fields	For a description of the output fields, see Table 77 . Output fields are listed in the approximate order in which they appear.

Table 77: show system resource-cleanup processes Output Fields

Field Name	Field Description
PID	Process ID, a number that identifies a process.
Process name	String that identifies the process.
Resources to clean	Resources that have been registered to be cleaned up.

Sample Output

show system resource-cleanup processes

```
user@host> show system resource-cleanup processes
PID      Process name      Resources to clean
420      jnx-exampld      GENCFG, SYSV shared memory
```

show system resource-cleanup processes detail

```
user@host> show system resource-cleanup processes detail
PID      Process name      Resources to clean
420      jnx-exampld        GENCFG blob major ID 0x8000, minor ID 0x0000
          SYSV shared memory ID 65536, key 1108955839
          SYSV shared memory ID 65537, key 1108955837
```

show system services service-deployment

Syntax	show system services service-deployment
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display information about a Session and Resource Control (SRC) client.
Options	This command has no options.
Required Privilege Level	system view
List of Sample Output	show system services service-deployment on page 1131
Output Fields	Table 78 lists the output fields for the show system services service-deployment command. Output fields are listed in the approximate order in which they appear.

Table 78: show system services service-deployment Output Fields

Field Name	Field Description
PDT Keepalive settings	Configured PDT keepalive interval, in seconds.
Keepalives sent	Number of keepalives sent.
Notifications sent	Number of notifications sent.
Last update from peer	Time at which the last update from a peer was received.

Sample Output

show system services service-deployment

```
user@host> show system services service-deployment
Connected to 192.4.4.4 port 10288 since 2004-05-03 11:04:34 PDT Keepalive settings:
Interval 15 seconds Keepalives sent: 750 Notifications sent: 0 Last update from
peer: 00:00:06 ago
```

Syntax (QFX Series)	show system statistics
Release Information	Command introduced before JUNOS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display system-wide protocol-related statistics.
Options	none —Display system statistics for all the following protocols: <ul style="list-style-type: none">• arp—Address Resolution Protocol• bridge—IEEE 802.1 Bridging• clns—Connectionless Network Service• esis—End System-to-Intermediate System• ethoamcfm—Ethernet OAM protocol for connectivity fault management• ethoamlfm—Ethernet OAM protocol for link fault management• icmp—Internet Control Message Protocol• icmp6—Internet Control Message Protocol version 6

- **igmp**—Internet Group Management Protocol
- **ip**—Internet Protocol version 4
- **ip6**—Internet Protocol version 6
- **jsr**—Juniper Socket Replication
- **mpls**—Multiprotocol Label Switching
- **rdp**—Reliable Datagram Protocol
- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all routers (line-card chassis) connected to the TX Matrix Plus router

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

Required Privilege Level view

show system statistics

```
user@host> show system statistics
ip:
    3682087 total packets received
    0 bad header checksums
    0 with size smaller than minimum
    0 with data size < data length
    0 with header length < data size
    0 with data length < header length
    0 with incorrect version number
    0 packets destined to dead next hop
    0 fragments received
    0 fragments dropped (dup or out of space)
    0 fragments dropped (queue overflow)
    0 fragments dropped after timeout
    0 fragments dropped due to over limit
    0 packets reassembled ok
    3664774 packets for this host
    17316 packets for unknown/unsupported protocol
    0 packets forwarded
    0 packets not forwardable
    0 redirects sent
    6528 packets sent from this host
```

```

0 packets sent with fabricated ip header
0 output packets dropped due to no bufs
0 output packets discarded due to no route
0 output datagrams fragmented
0 fragments created
0 datagrams that can't be fragmented
0 packets with bad options
1123 packets with options handled without error
0 strict source and record route options
0 loose source and record route options
0 record route options
0 timestamp options
0 timestamp and address options
0 timestamp and prespecified address options
0 option packets dropped due to rate limit
1123 router alert options
0 multicast packets dropped (no iflist)
0 packets dropped (src and int don't match)
icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
    echo reply: 75
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
0 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
    echo: 75
    router advertisement: 130
75 message responses generated
tcp:
3844 packets sent
    3618 data packets (1055596 bytes)
    0 data packets (0 bytes) retransmitted
    0 resends initiated by MTU discovery
    205 ack-only packets (148 packets delayed)
    0 URG only packets
    0 window probe packets
    0 window update packets
    1079 control packets
5815 packets received
    3377 acks (for 1055657 bytes)
    24 duplicate acks
    0 acks for unsent data
    2655 packets (15004 bytes) received in-sequence
    1 completely duplicate packet (0 bytes)
    0 old duplicate packets
    0 packets with some dup. data (0 bytes duped)
    0 out-of-order packets (0 bytes)
    0 packets (0 bytes) of data after window
    0 window probes
    7 window update packets
    0 packets received after close
    0 discarded for bad checksums
    0 discarded for bad header offset fields
    0 discarded because packet too short

```

```
1 connection request
32 connection accepts
0 bad connection attempts
0 listen queue overflows
33 connections established (including accepts)
30 connections closed (including 0 drops)
    27 connections updated cached RTT on close
    27 connections updated cached RTT variance on close
    0 connections updated cached ssthresh on close
0 embryonic connections dropped
3374 segments updated rtt (of 3220 attempts)
0 retransmit timeouts
    0 connections dropped by rexmit timeout
0 persist timeouts
    0 connections dropped by persist timeout
344 keepalive timeouts
    0 keepalive probes sent
    0 connections dropped by keepalive
1096 correct ACK header predictions
1314 correct data packet header predictions
32 syncache entries added
    0 retransmitted
    0 dupsyn
    0 dropped

    0 zone failures
0 cookies sent
0 cookies received
0 ACKs sent in response to in-window but not exact RSTs
0 ACKs sent in response to in-window SYNs on established connections
0 rcv packets dropped by TCP due to bad address
0 out-of-sequence segment drops due to insufficient memory
1058 RST packets
0 ICMP packets ignored by TCP
0 send packets dropped by TCP due to auth errors
0 rcv packets dropped by TCP due to auth errors

udp:
3658884 datagrams received
0 with incomplete header
0 with bad data length field
0 with bad checksum
3657342 dropped due to no socket
3657342 broadcast/multicast datagrams dropped due to no socket
0 dropped due to full socket buffers
0 not for hashed pcb
4291311496 delivered
1551 datagrams output

ipsec:
0 inbound packets processed successfully
0 inbound packets violated process security policy
0 inbound packets with no SA available
0 invalid inbound packets
0 inbound packets failed due to insufficient memory
0 inbound packets failed getting SPI
```

```

0 inbound packets failed on AH replay check
0 inbound packets failed on ESP replay check
0 inbound AH packets considered authentic
0 inbound AH packets failed on authentication
0 inbound ESP packets considered authentic
0 inbound ESP packets failed on authentication
0 outbound packets processed successfully
0 outbound packets violated process security policy
0 outbound packets with no SA available
0 invalid outbound packets
0 outbound packets failed due to insufficient memory
0 outbound packets with no route

igmp:
17186 messages received
0 messages received with too few bytes
0 messages received with bad checksum
0 membership queries received
0 membership queries received with invalid field(s)
0 membership reports received
0 membership reports received with invalid field(s)
0 membership reports received for groups to which we belong
0 membership reports sent

arp:
44181302 datagrams received
2 ARP requests received
2028 ARP replies received
3156 resolution requests received
0 unrestricted proxy requests
0 received proxy requests
0 proxy requests not proxied
0 with bogus interface
787 with incorrect length
712 for non-IP protocol
0 with unsupported op code
0 with bad protocol address length
0 with bad hardware address length
0 with multicast source address
7611 with multicast target address
0 with my own hardware address
14241699 for an address not on the interface
0 with a broadcast source address
0 with source address duplicate to mine
29929250 which were not for me
0 packets discarded waiting for resolution
6 packets sent after waiting for resolution
17812 ARP requests sent
2 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry

ip6:
0 total packets received
0 with size smaller than minimum
0 with data size < data length
0 with bad options
0 with incorrect version number
0 fragments received
0 fragments dropped (dup or out of space)
0 fragments dropped after timeout
0 fragments that exceeded limit
0 packets reassembled ok

```

```
0 packets for this host
0 packets forwarded
0 packets not forwardable
0 redirects sent
0 packets sent from this host
0 packets sent with fabricated ip header
0 output packets dropped due to no bufs, etc.
0 output packets discarded due to no route
0 output datagrams fragmented
0 fragments created
0 datagrams that can't be fragmented
0 packets that violated scope rules
0 multicast packets which we don't join
Mbuf statistics:
0 packets whose headers are not continuous
0 tunneling packets that can't find gif
0 packets discarded due to too many headers
0 failures of source address selection
0 forward cache hit
0 forward cache miss
0 packets destined to dead next hop
0 option packets dropped due to rate limit
0 packets dropped (src and int don't match)
0 packets dropped due to bad protocol

icmp6:
0 calls to icmp_error
0 errors not generated because old message was icmp error or so
0 errors not generated because rate limitation
0 messages with bad code fields
0 messages < minimum length
0 bad checksums
0 messages with bad length
Histogram of error messages to be generated:
    0 no route
    0 administratively prohibited
    0 beyond scope
    0 address unreachable
    0 port unreachable
    0 packet too big
    0 time exceed transit
    0 time exceed reassembly
    0 erroneous header field
    0 unrecognized next header
    0 unrecognized option
    0 redirect
    0 unknown
0 message responses generated
0 messages with too many ND options

ipsec6:
0 inbound packets processed successfully
0 inbound packets violated process security policy
0 inbound packets with no SA available
0 invalid inbound packets
0 inbound packets failed due to insufficient memory
0 inbound packets failed getting SPI
0 inbound packets failed on AH replay check
0 inbound packets failed on ESP replay check
0 inbound AH packets considered authentic
0 inbound AH packets failed on authentication
0 inbound ESP packets considered authentic
0 inbound ESP packets failed on authentication
```

```

0 outbound packets processed successfully
0 outbound packets violated process security policy
0 outbound packets with no SA available
0 invalid outbound packets
0 outbound packets failed due to insufficient memory
0 outbound packets with no route
c1nl:
0 total packets received
0 packets delivered
0 too small
0 bad header length
0 bad checksum
0 bad version
0 unknown or unsupported protocol
0 bogus sdl size
0 no free memory in socket buffer
0 send packets discarded
0 sbappend failure
0 mcopy failure
0 address fields were not reasonable
0 segment information forgotten
0 forwarded packets
0 total packets sent
0 output packets discarded
0 non-forwarded packets
0 packets fragmented
0 fragments sent
0 fragments discarded
0 fragments timed out
0 fragmentation prohibited
0 packets reconstructed
0 packets destined to dead nexthop
0 packets discarded due to no route
0 Error pdu rate drops
0 ER pdu generation failure
esis:
0 total pkts received
0 total packets consumed by protocol
0 pdus received with bad checksum
0 pdus received with bad version number
0 pdus received with bad type field
0 short pdus received
0 bogus sdl size
0 bad header length
0 unknown or unsupported protocol
0 no free memory in socket buffer
0 send packets discarded
0 sbappend failure
0 mcopy failure
0 ISO family not configured
tnp:

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>

sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6.
Command introduced in Junos OS Release 11.1 for the QFX Series.
Option **invoke-on (all-routing-engines | other-routing-engine)** introduced in Junos OS Release 14.1
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

- Description** Display statistics about the amount of free disk space in the router's or switch's file systems.
- Options**
- none**—Display standard information about the amount of free disk space in the router's or switch's file systems.
 - detail**—(Optional) Display detailed output.
 - invoke-on all-routing-engines**—(Optional) Display the system storage information on all master and backup Routing Engines on a routing matrix based on the TX Matrix or TX Matrix Plus router or on a router that has dual Routing Engines.
 - invoke-on other-routing-engines**—(Optional) Display the system storage information on the other Routing Engine. For example, if you issue this command on the master Routing Engine on an M320 router, the JUNOS Software displays the system storage information on the backup Routing Engine. On a routing matrix based on the TX Matrix or TX Matrix Plus router, if you issue this command on the TX Matrix or TX Matrix Plus router's master Routing Engine, the JUNOS Software displays all the system storage information on all the backup Routing Engines.
 - all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.
 - all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.
 - all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.
 - infrastructure *name***—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.
 - interconnect-device *name***—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.
 - lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

scc—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields Table 79 describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

Table 79: show system storage Output Fields

Field Name	Field Description
Filesystem	Name of the filesystem.
Size	Size of the filesystem.
Used	Amount of space used in the filesystem.
Avail	Amount of space available in the filesystem.
Capacity	Percentage of the filesystem space that is being used.
Mounted on	Directory in which the filesystem is mounted.

Sample Output

show system storage

```

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
Options	none —Show time since the system rebooted and processes started. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus

router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

director-group *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

infrastructure *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

invoke-on—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

scc—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields Table 80 describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

Table 80: show system uptime Output Fields

Field Name	Field Description
Current time	Current system time in UTC.
Time Source	Reference time source that the system is locked to.
System booted	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
Protocols started	Date and time when the routing protocols were last started and how long they have been running.
Last configured	Date and time when a configuration was last committed. Also shows the name of the user who issued the last commit command.
time and up	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

Syntax (TX Matrix Plus Router)	show system users <detail> <all-chassis all-lcc lcc number sfc number> <no-resolve>
Syntax (MX Series Router)	show system users <all-members> <local> <member member-id> <no-resolve>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	List information about the users who are currently logged in to the router or switch.

NOTE: The **show system users** command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

- Options**
- none**—List information about the users who are currently logged in to the router or switch.
 - all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.
 - all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.

all-members—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

no-resolve—(Optional) Do not attempt to resolve IP addresses to hostnames.

scc—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields Table 81 describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

Table 81: show system users Output Fields

Field Name	Field Description
<i>time and up</i>	Current time, in the local time zone, and how long the router or switch has been operational.
<i>users</i>	Number of users logged in to the router or switch.
<i>load averages</i>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
<i>USER</i>	Username.
<i>TTY</i>	Terminal through which the user is logged in.
<i>FROM</i>	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
<i>LOGIN@</i>	Time when the user logged in.
<i>IDLE</i>	How long the user has been idle.
<i>WHAT</i>	Processes that the user is running.

Syntax (QFX Series)	show system virtual-memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the show system virtual-memory command for troubleshooting with Juniper Networks Customer Support.
Options	none —Display kernel dynamic memory usage information. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

infrastructure *name*—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

scc—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix

or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

NOTE: The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

Output Fields	Table 82 lists the output fields for the <code>show system virtual-memory</code> command. Output fields are listed in the approximate order in which they appear.

Table 82: show system virtual-memory Output Fields

Field Name	Field Description
Memory statistics by bucket size	
Size	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
In Use	Number of memory blocks of this size that are in use (bytes).
Free	Number of memory blocks of this size that are free (bytes).
Requests	Number of memory allocation requests made.
HighWater	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
Couldfree	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
Memory usage type by bucket size	
Size	Memory block size (bytes).
Type(s)	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
Memory statistics by type	
Type	Kernel module that is using dynamic memory.
InUse	Number of memory blocks used by this type. The number is rounded up.
MemUse	Amount of memory in use, in kilobytes (KB).
HighUse	Maximum memory ever used by this type.
Limit	Maximum memory that can be allocated to this type.
Requests	Total number of dynamic memory allocation requests this type has made.
Type Limit	Number of times requests were blocked for reaching the maximum limit.
Kern Limit	Number of times requests were blocked for the kernel map.
Size(s)	Memory block sizes this type is using.
Memory Totals	
In Use	Total kernel dynamic memory in use (bytes, rounded up).
Free	Total kernel dynamic memory free (bytes, rounded up).

Table 82: show system virtual-memory Output Fields (*continued*)

Field Name	Field Description
Requests	Total number of memory allocation requests.
ITEM	Kernel module that is using memory.
Size	Memory block size (bytes).
Limit	Maximum memory that can be allocated to this type.
Used	Number of memory blocks used by this type. The number is rounded up.
Free	Number of memory blocks available to this type.
Requests	Total number of memory allocation requests this type has made.
interrupt	Timer events and scheduling interruptions.
total	Total number of interruptions for each type.
rate	Interruption rate.
Total	Total for all interruptions.

Sample Output

show system virtual-memory

Syntax (QFX Series)	<pre>show version <brief detail> <component component-name all></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Display the hostname and version information about the software running on the router or switch.</p> <p>Beginning in Junos OS Release 13.3, the show version command output includes the Junos field that displays the Junos OS version running on the device. This field provides a consistent means of identifying the Junos OS version, rather than extracting that information from the list of installed sub-packages.</p>

- Options** **none**—Display standard information about the hostname and version of the software running on the router or switch.
- brief | detail**—(Optional) Display the specified level of output.
- all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.
- component all**—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.
- component *component-name***—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace *component-name* with the name of the QFabric system component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.
- local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.
- member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.
- scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).
- lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.
- Replace *number* with the following values depending on the LCC configuration:
- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
 - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
 - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
 - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

Sample Output

show version (Devices Running Junos OS Release 13.3 and Later)

The following output is from the MX240 Router and shows the **Junos** field introduced in Junos OS 13.3. Depending on the platform running Junos OS 13.3, you might see different installed sub-packages, but the **Junos** field is common across all platforms that run Junos OS 13.3 and later.

start shell

Syntax	<code>start shell (csh sh)</code> <code><user username></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type exit from the shell.
<div> NOTE:<ul style="list-style-type: none">To issue this command, the user must have the required login access privileges configured by including the <code>permissions</code> statement at the <code>[edit system login class class-name]</code> hierarchy level.UNIX wheel group membership or permissions are no longer required to issue this command.</div>	
Options	<code>csh</code> —Create a UNIX C shell. <code>sh</code> —Create a UNIX Bourne shell. <code>user username</code> —(Optional) Start the shell as another user.
Additional Information	When you are in the shell, the shell prompt has the following format: <code>username@hostname%</code> An example of the prompt is: <code>root@host%</code>
Required Privilege Level	shell and maintenance
List of Sample Output	start shell csh on page 1266
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

start shell csh

```
user@host> start shell csh
%
exit
%
```

```
username@hostname% start shell sh
%

exit
user@host>
```

test configuration

Syntax	<code>test configuration <i>filename</i></code> <code>syntax-only</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. syntax-only option introduced in Junos OS Release 12.1. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found. This command only accepts text files.
Options	<i>filename</i> —Name of the configuration file. syntax-only —(Optional) Check the syntax of a partial configuration file, without checking for commit errors.
Required Privilege Level	view
List of Sample Output	test configuration on page 1268
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

test configuration

```
user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
[edit system]
  'paris-23;'
    syntax error
terminal:4:(11) statement must contain additional statements: ;
[edit system login]
  'login ;'
    statement must contain additional statements
configuration syntax failed
```

Syntax (QFX Series and OCX Series) `traceroute host`
 `<as-number-lookup>`
 `<bypass-routing>`
 `<gateway address>`
 `<inet>`
 `<inet6>`
 `<interface interface-name>`
 `<monitor host>`
 `<no-resolve>`
 `<routing-instance routing-instance-name>`
 `<source source-address>`
 `<tos value>`
 `<ttl value>`
 `<wait seconds>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 mpls option introduced in Junos OS Release 9.2.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 propagate-ttl option introduced in Junos OS Release 12.1.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

Options **host**—IP address or name of remote host.

as-number-lookup—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

bypass-routing—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

clns—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

gateway address—(Optional) Address of a router or switch through which the route transits.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interface *interface-name*—(Optional) Name of the interface over which to send packets.

logical-system *logical-system-name*—(Optional) Perform this operation on all logical systems or on a particular logical system.

monitor *host*—(Optional) Display real-time monitoring information for the specified host.

mpls (*ldp FEC address* | *rsvp label-switched-path name*)—(Optional) See [traceroute mpls ldp](#) and [traceroute mpls rsvp](#).

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

propagate-ttl—(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

NOTE: Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the traceroute attempt.

source *source-address*—(Optional) Source address of the outgoing traceroute packets.

tos *value*—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

ttl *value*—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

wait *seconds*—(Optional) Maximum time to wait for a response to the traceroute request.

Output Fields

Table 83 describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

Table 83: traceroute Output Fields

Field Name	Field Description
traceroute to	IP address of the receiver.
hops max	Maximum number of hops allowed.
byte packets	Size of packets being sent.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
Round trip time	Average round-trip time, in milliseconds (ms).

Sample Output

traceroute

```

user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254)  2.370 ms  2.853 ms  0.367 ms
 2 red14 (10.168.255.250) 0.778 ms  2.937 ms  0.446 ms
 3 yellow (10.156.169.254) 7.737 ms  89.905 ms  0.834 ms

```

traceroute as-number-lookup host

```

user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1 10.39.1.1 (10.39.1.1) 0.779 ms 0.728 ms 0.562 ms
 2 10.39.1.6 (10.39.1.6) [AS 32] 0.657 ms 0.611 ms 0.617 ms
 3 10.100.1.1 (10.100.1.1) [AS 10, 40, 50] 0.880 ms 0.808 ms 0.774 ms

```

traceroute no-resolve

```

user@host> traceroute santacruz no-resolve

```

```
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1  10.168.1.254  0.458 ms  0.370 ms  0.365 ms
 2  10.168.255.250  0.474 ms  0.450 ms  0.444 ms
 3  10.156.169.254  0.931 ms  0.876 ms  0.862 ms
```

traceroute propagate-ttl

```
user@host> traceroute propagate-ttl 100.200.2.2 routing-instance VPN-A
traceroute to 100.200.2.2 (100.200.2.2) from 1.1.0.2, 30 hops max, 40 byte packets

 1  1.2.0.2 (1.2.0.2)  2.456 ms  1.753 ms  1.672 ms
    MPLS Label=299776 CoS=0 TTL=1 S=0
    MPLS Label=299792 CoS=0 TTL=1 S=1
 2  1.3.0.2 (1.3.0.2)  1.213 ms  1.225 ms  1.166 ms
    MPLS Label=299792 CoS=0 TTL=1 S=1

```

traceroute (Between CE Routers, Layer 3 VPN)

```
user@host> traceroute vpn09
traceroute to vpn09.skybank.net (10.255.14.179), 30 hops max, 40
byte packets
 1  10.39.10.21 (10.39.10.21)  0.598 ms  0.500 ms  0.461 ms
 2  10.39.1.13 (10.39.1.13)  0.796 ms  0.775 ms  0.806 ms
    MPLS Label=100006 CoS=0 TTL=1 S=1
 3  vpn09.skybank.net (10.255.14.179)  0.783 ms  0.716 ms  0.686
```

traceroute (Through an MPLS LSP)

```
user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1  mpls1-sr0.company.net (10.168.200.101)  0.555 ms  0.393 ms  0.367 ms
    MPLS Label=1024 CoS=0 TTL=1
 2  mpls5-lo0.company.net (10.168.1.224)  0.420 ms  0.394 ms  0.401 ms
```

traceroute monitor

List of Syntax	Syntax on page 1273 Syntax (QFX Series) on page 1273
Syntax	<pre>traceroute monitor <i>host</i> <count <i>value</i>> <inet inet6> <interval <i>seconds</i>> <no resolve> <size <i>value</i>> <source <i>source-address</i>> <summary></pre>
Syntax (QFX Series)	<pre>traceroute monitor <i>host</i> <count <i>value</i>> <inet> <inet6> <interval <i>seconds</i>> <no resolve> <size <i>value</i>> <source <i>source-address</i>> <summary></pre>
Release Information	<p>Command introduced in Junos OS Release 8.0</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.
Options	<p><i>host</i>—IP address or name of remote host.</p> <p><i>count value</i>—Number of ping requests, in packets, to send in summary mode. The default value is 10.</p> <p><i>inet inet6</i>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><i>interval seconds</i>—(Optional) Number of seconds to wait before sending ping requests. The default value is 1.</p> <p><i>no resolve</i>—(Optional) Do not attempt to display addresses symbolically.</p> <p><i>size value</i>—(Optional) Receive the specified number of bytes for each packet. The range is 0 through 65468 bytes. The default value is 64.</p> <p><i>source source-address</i>—(Optional) Source address of the outgoing ping packets.</p> <p><i>summary</i>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p>

Required Privilege Level network

List of Sample Output [traceroute monitor on page 1274](#)

Output Fields Table 84 describes the output fields for the **traceroute monitor** command. Output fields are listed in the approximate order in which they appear.

Table 84: traceroute monitor Output Fields

Field Name	Field Description
Host	Hostname or IP address of the router at each hop.
Loss%	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
Snt	Number of ping requests sent to the router at this hop.
Last	Most recent round-trip time, in milliseconds, to the router at this hop.
Avg	Average round-trip time, in milliseconds, to the router at this hop.
Best	Shortest round-trip time, in milliseconds, to the router at this hop.
Wrst	Longest round-trip time, in milliseconds, to the router at this hop.
StDev	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

Sample Output

traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

	Loss%	Snt	Last	Avg	Best	Wrst	StDev
Host							
1. 10.17.41.254	0.0%	17	0.7	1.0	0.6	5.4	1.2
2. secret.net	0.0%	17	0.6	1.0	0.6	6.6	1.4
3. top-secret.net	0.0%	17	0.6	0.6	0.6	0.6	0.0

Release Information

Command introduced before Junos OS Release 7.4.

best-effort-load and **unlink** options added in Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.

sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.1 for the QFX Series.

set [package-name package-name] option added in Junos OS Release 11.1 for EX Series switches.

set [package-name package-name] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

NOTE: On EX Series switches, the **set [package-name package-name]** option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the **set [package-name package-name]** option allows you to install multiple software packages and software add-on packages at the same time.

upgrade-with-config and **upgrade-with-config-format *format*** options added in Junos OS Release 12.3 for M Series routers, MX Series routers, T Series routers, EX Series Ethernet switches, and QFX Series devices.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

device-alias, **satellite**, **upgrade-group**, and **version** options introduced in Junos OS Release 14.2R3 for Junos Fusion.

Description

NOTE: We recommend that you always download the software image to **/var/tmp** only. On EX Series and QFX Series switches, you must use the **/var/tmp** directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

WARNING: Any configuration changes performed after inputting the **request system software add** command will be lost when the system reboots with an upgraded version of Junos OS.

NOTE: When graceful Routing Engine switchover (GRES) is enabled on a device, you must perform a unified ISSU operation to update the software running on the device. With GRES enabled, if you attempt to perform a software upgrade by entering the request system software add *package-name* command, an error message is displayed stating that only in-service-software-upgrades are supported when GRES is configured. In such a case, you must either remove the GRES configuration before you attempt the upgrade or perform a unified ISSU.

Options *package-name*—Location from which the software package or bundle is to be installed.
For example:

- */var/tmp/package-name*—For a software package or bundle that is being installed from a local directory on the router or switch.
- *protocol://hostname/pathname/package-name*—For a software package or bundle that is to be downloaded and installed from a remote location. Replace *protocol* with one of the following:
 - **ftp**—File Transfer Protocol.
Use *ftp://hostname/pathname/package-name*. To specify authentication credentials, use *ftp://<username>:<password>@hostname/pathname/package-name*. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
 - **http**—Hypertext Transfer Protocol.
Use *http://hostname/pathname/package-name*. To specify authentication credentials, use *http://<username>:<password>@hostname/pathname/package-name*. If a password is required and you omit it, you are prompted for it.
 - **scp**—Secure copy (available only for Canada and U.S. version).
Use *scp://hostname/pathname/package-name*. To specify authentication credentials, use *scp://<username>:<password>@hostname/pathname/package-name*.

NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the `scp` protocol in the `request system software add` command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support `scp`.

Use the `file copy` command to copy the software package or bundle from the remote location to the `/var/tmp` directory on the hard disk:

`file copy scp://source/package-name /var/tmp`

Then install the software package or bundle using the `request system software add` command:

`request system software add /var/tmp/package-name`

best-effort-load—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

component all—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

delay-restart—(Optional) Install a software package or bundle, but do not restart software processes.

device-alias *alias-name*—(Junos Fusion only) (Optional) Install the satellite software package onto the specified satellite device using the satellite device's alias name.

force—(Optional) Force the addition of the software package or bundle (ignore warnings).

force-host—(Optional) Force the addition of host software package or bundle (ignore warnings) on the QFX5100 device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member *member-id*—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace *member-id* with a value of 0 or 1.

partition—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

satellite *slot-id*—(Junos Fusion only) (Optional) Install the satellite software package onto the specified satellite device using the satellite devices FPC slot identifier.

scc—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router. Replace *number* with 0.

no-copy—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

no-validate—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

re0 | re1—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

reboot—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

set [*package-name package-name*]—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

unlink—(Optional) On M Series, T Series, and MX Series routers, use the unlink option to remove the software package from this directory after a successful upgrade is completed.

upgrade-group [all |*upgrade-group-name*]—(Junos Fusion only) (Required to configure a Junos Fusion using autoconversion or manual conversion) Associate a satellite software image with a satellite software upgrade group. The satellite software package is associated with the specified satellite software upgrade group using the

upgrade-group-name, or for all satellite software upgrade groups in a Junos Fusion when the *all* keyword is specified.

A satellite software upgrade group is a group of satellite devices in a Junos Fusion that are designated to upgrade to the same satellite software version using the same satellite software package. See *Understanding Software in a Junos Fusion* and *Managing Satellite Software Upgrade Groups in a Junos Fusion*.

upgrade-with-config—(Optional) Install one or more configuration files.

upgrade-with-config-format *format*—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

NOTE: The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

validate—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

NOTE: The **validate** option only works on systems that do not have graceful-switchover (GRES) enabled. To use the **validate** option on a system with GRES, either disable GRES for the duration of the installation, or install using the command **request system software in-service-upgrade**, which requires nonstop active routing (NSR) to be enabled when using GRES.

version *version-string*—(Junos Fusion only) (Optional) Associate a satellite software package with a satellite software upgrade group by selecting the satellite software package's version. This option can only be used if the specified version of the satellite software has previously been installed on the aggregation device.

Additional Information Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is

successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

NOTE: The **request system snapshot** command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, **jkernl**, last. Add the operating system package, **jkernl**, first and the routing software package, **jroute**, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernl
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add *package-name*** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add *package-name*** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

request system software delete

List of Syntax	Syntax on page 1286 Syntax (TX Matrix Router) on page 1286 Syntax (TX Matrix Plus Router) on page 1286
Syntax	<pre>request system software delete <i>software-package</i> <force> <reboot> <set [<i>package-name package-name</i>]> <upgrade-group [<i>all upgrade-group-name</i>]> <version <i>version-string</i>></pre>
Syntax (TX Matrix Router)	<pre>request system software delete <i>software-package</i> <force> <lcc <i>number</i> scc> <reboot> <set [<i>package-name package-name</i>]></pre>
Syntax (TX Matrix Plus Router)	<pre>request system software delete <i>software-package</i> <force> <lcc <i>number</i> sfc <i>number</i>> <reboot> <set [<i>package-name package-name</i>]></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option set [<i>package-name package-name</i>] added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways.</p> <p>Option reboot introduced in Junos OS Release 12.3.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> <p>Options upgrade-group, and version introduced in Junos OS Release 14.2R3 for Junos Fusion.</p>
Description	Remove a software package or bundle from the router or switch.

CAUTION: Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

- Options** *software-package*—Software package or bundle name. You can delete any or all of the following software bundles or packages:
- **jbase**—(Optional) Junos base software suite
 - **crypto**—(Optional, in domestic version only) Junos security software
 - **docs**—(Optional) Junos online documentation file

- **jkernel**—(Optional) Junos kernel software suite
- **jpfe**—(Optional) Junos Packet Forwarding Engine support
- **jroute**—(Optional) Junos routing software suite
- **junos**—(Optional) Junos base software

NOTE: On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

force—(Optional) Ignore warnings and force removal of the software.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix, delete a software package or bundle on a T640 router indicated by **lcc number** that is connected to the TX Matrix router. In a routing matrix, delete a software package or bundle on a router indicated by **lcc number** that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

re0 | re1—(Optional) On routers or switches that support dual or redundant Routing Engines, delete a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

scc—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

set [package-name package-name]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc number—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace *number* with 0.

upgrade-group [all [*upgrade-group-name*]—(Junos Fusion only) Delete the satellite software image association with the specified satellite software upgrade group.

A satellite software upgrade group is a group of satellite devices in the same Junos Fusion that are designated to upgrade to the same satellite software version using the same satellite software package.

version *version-string*—(Junos Fusion only) (Optional) Delete a satellite software package association with a satellite software upgrade group by selecting the satellite software package's version.

Additional Information Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

request system software download

Syntax (QFabric System)	request system software download <i>path package-name</i>
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Download a software package from a location on the Director device, mounted external USB flash drive, remote FTP or SCP location, or other location.
Options	<p>path—Location where the software package is located. For example:</p> <ul style="list-style-type: none">• /pbdata/packages/package-name—For a software package that is being installed from a local directory on the switch.• protocol://hostname/pathname/package-name—For a software package or bundle that is to be downloaded and installed from a remote location. Replace protocol with one of the following:<ul style="list-style-type: none">• ftp—File Transfer Protocol. Use ftp://hostname/pathname/package-name. To specify authentication credentials, use ftp://<username>:<password>@hostname/pathname/package-name. To have the system prompt you for the password, specify prompt in place of the password. If a password is required, and you do not specify the password or prompt, an error message is displayed.• scp—Secure copy (available only for Canada and U.S. version). Use scp://hostname/pathname/package-name. To specify authentication credentials, use scp://<username>:<password>@hostname/pathname/package-name.
Required Privilege Level	maintenance

request system software rollback

List of Syntax	Syntax on page 1292 Syntax (EX Series Switches) on page 1292 Syntax (TX Matrix Router) on page 1292 Syntax (TX Matrix Plus Router) on page 1292 Syntax (MX Series Router) on page 1292
Syntax	request system software rollback
Syntax (EX Series Switches)	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
Syntax (TX Matrix Router)	request system software rollback <lcc <i>number</i> scc> <reboot>
Syntax (TX Matrix Plus Router)	request system software rollback <lcc <i>number</i> sfc <i>number</i> > <reboot>
Syntax (MX Series Router)	request system software rollback <all-members> <device-alias <i>alias-name</i> > <local> <member <i>member-id</i> > <reboot> <satellite <i>slot-id</i> > <upgrade-group [all <i>upgrade-group-name</i>]>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command behavior changed in Junos OS Release 12.1. Option reboot introduced in Junos OS Release 12.3. Options device-alias , satellite , and upgrade-group introduced in Junos OS Release 14.2R3 for Junos Fusion. Option force deprecated for Junos OS with Upgraded FreeBSD in Junos OS Release 15.1.

NOTE: To determine which platforms run Junos OS with Upgraded FreeBSD, see the table listing the platforms currently running Junos OS with upgraded FreeBSD in “[Understanding Junos OS with Upgraded FreeBSD](#)” on page 89.

Description For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful **request system software add** command.

As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command. For example, using **rollback** in Junos OS 12.1 after using **request system software add** restores the system to a known good state prior to using the **add** command. Similarly, using **rollback** in Junos OS 12.1 after using **request system software delete** restores the system to a known good state prior to using the **delete** command.

A software rollback fails if any required package (or a **bundle** package containing the required package) cannot be found in `/var/sw/pkg`.

Additional Information

- On a Junos Fusion, the **request system software rollback** command can be used to roll back the version of satellite software associated with a satellite software upgrade group. Rolling back the version of satellite software associated with a satellite software upgrade group triggers a satellite software upgrade.
- On M Series and T Series routers, if **request system software add <jinstall> reboot** was used for the previous installation, then **request system software rollback** has no effect. In this case, use **jinstall** to reinstall the required package.
- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Roll back takes each root back to the previously installed image.
- On QFX3500 and QFX3600 devices in a mixed Virtual Chassis, when the **request system software rollback** command is issued, the system does not rollback to the image stored in the alternate partition.
- On QFX5100 switches, the **reboot** option has been removed. To reboot the switch after a software rollback, issue the **request system reboot** command as a separate, secondary command.

Options **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

device-alias *alias-name*—(Junos Fusion only) (Optional) Rollback the satellite software package onto the specified satellite device using the satellite devices FPC slot identifier.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

none—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

satellite *slot-id*—(Junos Fusion only) (Optional) Roll back the satellite software package onto the specified satellite device using the satellite devices FPC slot identifier.

scc—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

upgrade-group [all | *upgrade-group-name*]—(Junos Fusion only) Roll back the satellite software image associated with the specified satellite software upgrade group, or for all satellite software upgrade groups in the Junos Fusion when **all** is entered.

request system software validate

List of Syntax	Syntax on page 1297 Syntax (TX Matrix Router) on page 1297 Syntax (TX Matrix Plus Router) on page 1297 Syntax (MX Series Router) on page 1297
Syntax	<pre>request system software validate <i>package-name</i> <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i>></pre>
Syntax (TX Matrix Router)	<pre>request system software validate <i>package-name</i> <lcc <i>number</i> scc> <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i>></pre>
Syntax (TX Matrix Plus Router)	<pre>request system software validate <i>package-name</i> <lcc <i>number</i> sfc <i>number</i>> <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i>></pre>
Syntax (MX Series Router)	<pre>request system software validate <i>package-name</i> <member <i>member-id</i>> <set [<i>package-name package-name</i>]> <upgrade-with-config> <upgrade-with-config-format <i>format</i>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>set [<i>package-name package-name</i>] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.</p> <p>upgrade-with-config and upgrade-with-config-format <i>format</i> options added in Junos OS Release 12.3 for M Series routers, MX Series routers, and T Series routers.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Validate candidate software against the current configuration of the router.
Options	<p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member *member-id*—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

package-name—Name of the software bundle or package to test.

scc—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc *number*—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

upgrade-with-config—(Optional) Install one or more configuration files.

upgrade-with-config-format *format*—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

NOTE: The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

Additional Information By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all

the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

rollback

Syntax	<code>rollback <number rescue></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	<p>Return to a previously committed configuration. The software saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the commit configuration command.</p> <p>The currently operational Junos OS configuration is stored in the file juniper.conf, and the last three committed configurations are stored in the files juniper.conf.1, juniper.conf.2, and juniper.conf.3. These four files are located in the directory /config, which is on the router's flash drive. The remaining 46 previous committed configurations, the files juniper.conf.4 through juniper.conf.49, are stored in the directory /var/db/config, which is on the router's hard disk.</p> <p>During rollback, the configuration you specify is loaded from the associated file. Only objects in the rollback configuration that differ from the previously loaded configuration are marked as changed (equivalent to load update).</p>
Options	<p>none (Optional)—Return to the most recently saved configuration.</p> <p>number—(Optional) Configuration to return to. The range of values is from 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. The default is 0.</p> <p>rescue—(Optional) Return to the rescue configuration.</p>
Required Privilege Level	rollback—To roll back to configurations other than the one most recently committed.
Related Documentation	<ul style="list-style-type: none"> • Returning to a Previously Committed Junos OS Configuration on page 1339 • Creating and Returning to a Rescue Configuration on page 1342

show system rollback

Syntax	<code>show system rollback <i>number</i></code> <code><compare <i>number</i>></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the contents of a previously committed configuration, or the differences between two previously committed configurations.
<div>  NOTE: The <code>show system rollback</code> command is a purely operational mode command and cannot be issued with <code>run</code> from the configuration mode. </div>	
Options	<p><i>number</i>—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.</p> <p><code>compare <i>number</i></code>—(Optional) Number of another previously committed (rollback) configuration to compare to rollback <i>number</i>. The output displays the differences between the two configurations. The range of values is 0 through 49.</p>
Required Privilege Level	view
List of Sample Output	show system rollback compare on page 1302

CHAPTER 33

Understanding Configuration Files and the configure Command

- [Configuration File Terms on page 1309](#)
- [Understanding Configuration Files on page 1310](#)
- [Forms of the configure Command on page 1310](#)

Configuration File Terms

Table 85 lists the various configuration file terms and their definitions.

Table 85: Configuration File Terms

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

Understanding Configuration Files

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration.

Juniper Networks Junos OS saves the 50 most recently committed configuration files on a switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.
- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

To make changes to the configuration file, you have to work in configuration mode in the CLI. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

 - [Loading a Previous Configuration File on page 1330](#)
 - [Reverting to the Rescue Configuration on page 1346](#)
 - [Configuration File Terms on page 1309](#)

Forms of the configure Command

The Junos OS supports three forms of the **configure** command: **configure**, **configure private**, and **configure exclusive**. These forms control how users edit and commit configurations and can be useful when multiple users configure the software. See [Table 86](#).

Table 86: Forms of the configure Command

Command	Edit Access	Commit Access
configure	<ul style="list-style-type: none"> No one can lock the configuration. All users can make configuration changes. <p>When you enter configuration mode, the CLI displays the following information:</p> <ul style="list-style-type: none"> A list of other users editing the configuration. Hierarchy levels the users are viewing or editing. Whether the configuration has been changed, but not committed. When multiple users enter conflicting configurations, the most recent change to be entered takes precedence. 	<ul style="list-style-type: none"> No one can lock the configuration. All users can commit all changes to the configuration. If you and another user make changes and the other user commits changes, your changes are committed as well.
configure exclusive	<ul style="list-style-type: none"> One user locks the configuration and makes changes without interference from other users. Other users can enter and exit configuration mode, but they cannot commit the configuration. If you enter configuration mode while another user has locked the configuration (with the configure exclusive command), the CLI displays the user and the hierarchy level the user is viewing or editing. If you enter configuration mode while another user has locked the configuration, you can forcibly log out that user with the request system logout operational mode command. For details, see the CLI Explorer. 	
configure private	<ul style="list-style-type: none"> Multiple users can edit the configuration at the same time. Each user has a private candidate configuration to edit independently of other users. When multiple users enter conflicting configurations, the first commit operation takes precedence over subsequent commit operations. 	<ul style="list-style-type: none"> When you commit the configuration, the router verifies that the operational (running) configuration has not been modified by another user before accepting your private candidate configuration as the new operational configuration. If the configuration has been modified by another user, you can merge the modifications into your private candidate configuration and attempt to commit again.

Understanding How Configuration Files are Committed and Stored

- [Junos OS Commit Model for Router or Switch Configuration on page 1313](#)
- [Understanding How the Junos OS Configuration Is Stored on page 1314](#)

Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model—a candidate configuration is modified as desired and then committed to the system. When a configuration is committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The formerly active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and any other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (numbered 1 through 49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

NOTE: The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available

to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

NOTE: When you use the `commit synchronize force` CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the `synchronize` command.

 - [commit on page 329](#)

Understanding How the Junos OS Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

By default, Junos OS saves the current configuration and three previous versions of the committed configuration on the CompactFlash card. The currently operational Junos OS configuration is stored in the file `juniper.conf.gz`, and the last three committed configurations are stored in the files `juniper.conf.1.gz`, `juniper.conf.2.gz`, and `conf.3.gz`. These four files are located in the router or switch's CompactFlash card in the directory `/config`.

The remaining 46 previous versions of committed configurations, the files `juniper.conf.4` through `juniper.conf.49`, are stored in the directory `/var/db/config` on the hard disk.

Using the Default Configuration

- QFX3500 Switch Default Configuration on page 1319

QFX3500 Switch Default Configuration

Each QFX Series product is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**, configures storm control and Ethernet switching on all interfaces, and enables IGMP snooping, RSTP, and LLDP protocols.

When you commit changes to the configuration, a new configuration file is created, which becomes the active configuration. You can always revert to the factory default configuration if you need to.

The following factory default configuration file is for a QFX3500 switch with 48 ports:

NOTE: In this example, xe-0/0/0 through xe-0/0/47 are the network interface ports.

```
protocols {
  igmp-snooping {
    vlan all;
  }
  rstp;
  lldp {
    interface all;
  }
}
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching;
    }
  }

Loading, Uploading, Transferring, and Saving Configuration Files

- Loading a Configuration from a File on page 1325
- Examples: Loading a Configuration from a File on page 1328
- Loading a Previous Configuration File on page 1330
- Saving a Configuration to a File on page 1331
- Uploading a Configuration File on page 1332
- Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site on page 1333

Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
          filename <relative>
```

For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Press Ctrl-d to end the input.

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
terminal <relative>
```

To replace an entire configuration, specify the **override** option at any level of the hierarchy. A **load override** operation completely replaces the current candidate configuration with the file you are loading. Thus, if you saved a complete configuration, use this option.

An **override** operation discards the current candidate configuration and loads the configuration in *filename* or the configuration that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. For an example, see [Figure 7](#).

To replace portions of a configuration, specify the **replace** option. The **load replace** operation looks for **replace:** tags that you added to the loaded file, and replaces the parts of the candidate configuration with whatever is specified after the tag. This is useful when you want more control over exactly what is being changed. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see [Figure 8](#).

If, in an **override** or **merge** operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

The **load merge** operation adds the saved file to the existing candidate configuration. This is useful if you are adding new configuration sections. For example, suppose that you are adding a BGP configuration to the **[edit protocols]** hierarchy level, where there was no BGP configuration before, you can use the **load merge** operation to combine the saved file configuration to the existing candidate configuration. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration.

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. The **load update** operation compares the candidate configuration and the file you are loading, and only changes the parts of the candidate configuration that are different from the new configuration. You would use this, for example, if there is an existing BGP configuration and the file you are loading changes it in some way.

To change part of the configuration with a patch file, specify the **patch** option. The **load patch** operation loads a file or terminal input that contains configuration changes. First, on a device that already has the configuration changes, you type the **show | compare** command to output the differences between two configurations. Then you can load the differences on another router. The advantage of the **load patch** command is that it saves you from having to copy snippets from different hierarchy levels into a text file prior to loading them into the target device. This might be a useful time saver if you are configuring several devices with the same options. For example, suppose that you configure a routing

policy on router1 and you want to replicate the policy configuration on router2, router3, and router4. You can use the **load patch** operation.

First, run the **show | compare** command.

```
user@router1# show | compare rollback 3
[edit protocols ospf]
+ export default-static;
- export static-default
[edit policy-options]
+ policy-statement default-static {
+   from protocol static;
+   then accept;
+ }
```

Copy the output of the **show | compare** command to the clipboard, making sure to include the hierarchy levels. On router2, router3, and router4, type **load patch terminal** and paste the output. Press Enter and then press Ctrl-d to end the operation. If the patch input specifies different values for an existing statement, the patch input overrides the existing statement.

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
  bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see [Figure 11](#).

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities, as described in the [CLI Explorer](#).

NOTE: If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

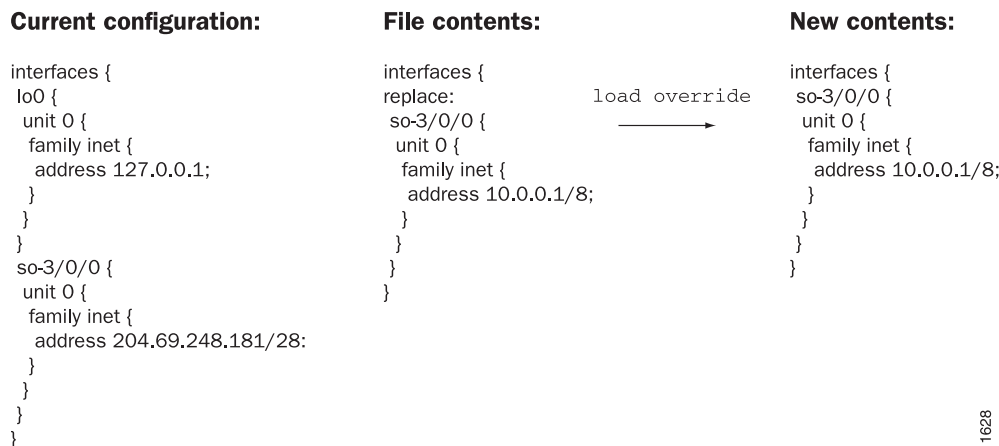

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

- [Loading a Configuration from a File on page 1325](#)

Loading a Previous Configuration File

You can use the **rollback <number>** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

```
rollback <number>
```

Options

- **none**—Return to the most recently saved configuration.
- **number**—Return to the specified configuration.
 - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
 - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration 0):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

Related Documentation • [Configuration File Terms on page 1309](#)

Saving a Configuration to a File

Save Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:

    }
}

```

Uploading a Configuration File

You can create a configuration file on your local system, copy the file to the switch, and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file, see the *Junos OS System Basics and Services Command Reference* at <http://www.juniper.net/techpubs/software/junos/index.html>.
2. In the configuration text file, use an option to perform the required action when the file is loaded. [Table 87](#) lists and describes some options for the **load** command.

Table 87: Options for the load Command

Options	Description
merge	Combines the current active configuration and the configuration in the filename you specify or the one that you type at the terminal. A merge operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
override	Discards the current candidate configuration and loads the configuration in the filename you specify or the one that you type at the terminal. When you use the override option and commit the configuration, all system processes reparse the configuration. You can use the override option at any level of the hierarchy.
replace	Searches for the replace tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the replace operation adds the statements marked with the replace tag to the active configuration. NOTE: For this operation to work, you must include replace tags in the text file or in the configuration you type at the terminal.

3. Press Ctrl+a to select all the text in the configuration file.
4. Press Ctrl+c to copy the contents of the configuration text file to the Clipboard.
5. Log in to the switch using your username and password.

6. Enter configuration mode:
user@switch> **configure**

[edit]
user@switch#
7. Load the configuration file:
[edit]
user@switch# **load merge terminal**
8. At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:
[edit]
user@switch# **load merge terminal**
[Type ^D at a new line to end input]
>Cursor is here. Paste the contents of the clipboard here<
9. Press Enter.
10. Press Ctrl+d to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

You can configure a router or switch to transfer its configuration to an archive file periodically. The following tasks describe how to transfer the configuration to an archive site:

1. [Configuring the Transfer of the Currently Active Configuration to an Archive Site on page 1333](#)
2. [Configuring the Periodic Transfer of the Active Configuration to an Archive Site on page 1334](#)
3. [Configuring the Transfer of the Currently Active Configuration When a Configuration Is Committed on page 1334](#)
4. [Configuring Archive Sites for the Transfer of Active Configuration Files on page 1334](#)

Configuring the Transfer of the Currently Active Configuration to an Archive Site

If you want to back up your device's current configuration to an archive site, you can configure the router or switch to transfer its currently active configuration by FTP or secure copy (SCP) periodically or after each commit.

To configure the router or switch to transfer its currently active configuration to an archive site, include statements at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username<:password>@host-address<:port>/url-path;
  scp://username<:password>@host-address<:port>/url-path;
}
transfer-interval interval;
transfer-on-commit;
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ("") and enclose the IPv6 host address in brackets ([]). For example,
"ftp://username<:password>@[ipv6-host-address]<:port>/url-path"

Configuring the Periodic Transfer of the Active Configuration to an Archive Site

To configure the router or switch to periodically transfer its currently active configuration to an archive site, include the **transfer-interval** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-interval interval;
```

The **interval** is a period of time ranging from 15 through 2880 minutes.

Configuring the Transfer of the Currently Active Configuration When a Configuration Is Committed

To configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration, include the **transfer-on-commit** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-on-commit;
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ("") and enclose the IPv6 host address in brackets ([]). For example,
"scp://username<:password>@[ipv6-host-address]<:port>/url-path"

Configuring Archive Sites for the Transfer of Active Configuration Files

When you configure the router or switch to transfer its configuration files, you specify an archive site to which the files are transferred. If you specify more than one archive site, the router or switch attempts to transfer files to the first archive site in the list, moving to the next site only if the transfer fails.

When you use the **archive-sites** statement, you can specify a destination as an FTP URL, or SCP-style remote file specification. The URL type **file://** is also supported.

To configure the archive site, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username@host:<port>url-path password password;
  scp://username@host:<port>url-path password password;
  file://<path>/<filename>;
}
```

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([]). For example,
 "scp://username<:password>@[ipv6-host-address]<:port>/url-path"

When you specify the archive site, do not add a forward slash (/) to the end of the URL.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

```
<router-name>_YYYYMMDD_HHMMSS_juniper.conf.n.gz
```

NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

Reverting a Configuration or Rolling Back to the Factory Default

- [Rolling Back Junos OS Configuration Changes on page 1337](#)
- [Returning to the Most Recently Committed Junos OS Configuration on page 1338](#)
- [Returning to a Previously Committed Junos OS Configuration on page 1339](#)
- [Reverting to the Default Factory Configuration on page 1344](#)

Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

2. Show the current configuration (if any) for SNMP:

```
[edit]
user@host# show snmp
```

No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

```
[edit]
user@host# set snmp health-monitor
```

4. Show the new configuration:

```
[edit]
user@host# show snmp
```

```
health-monitor;
```

The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

```
[edit]
user@host# rollback
load complete
```

6. Show the configuration again to make sure your change is no longer present:

```
[edit]
user@host# show snmp
```

No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

```
[edit]
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

**Related
Documentation**

- [Returning to the Most Recently Committed Junos OS Configuration on page 1338](#)

Returning to the Most Recently Committed Junos OS Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback

load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

**Related
Documentation**

- [Rolling Back Junos OS Configuration Changes on page 1337](#)
- [Returning to a Previously Committed Junos OS Configuration on page 1339](#)
- [Understanding How the Junos OS Configuration Is Stored on page 1314](#)

Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- [Returning to a Configuration Prior to the One Most Recently Committed on page 1339](#)
- [Displaying Previous Configurations on page 1339](#)
- [Comparing Configuration Changes with a Prior Version on page 1340](#)
- [Creating and Returning to a Rescue Configuration on page 1342](#)
- [Saving a Configuration to a File on page 1343](#)

Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

| Pipe through a command
[edit]
```

Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```
[edit]
user@host# show | compare (filename| rollback n)
```

filename is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

n is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (**/config/juniper.conf**).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ().

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
    -type external;
    -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 90;
```

```
    allow 1.1.1.1/32;
  }
  group fred {
    type external;
    advertise-inactive;
    peer-as 3333;
    allow 2.2.2.2/32;
  }
```

Creating and Returning to a Rescue Configuration

A rescue configuration allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

NOTE: If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, then the **rollback** command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

Saving a Configuration to a File

Save Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
  ospf {
    traffic-engineering;
    reference-bandwidth 4g;
    ...
  }
}
```

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- [Reverting to the Rescue Configuration on page 1346](#)

Setting or Deleting the Rescue Configuration

A *rescue configuration* is a user-defined configuration that restores connectivity to the device. You set a current committed configuration to be the rescue configuration through the CLI. If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

Compressing the Current Configuration File

By default, the current operational configuration file is compressed and is stored in the file **juniper.conf.gz** in the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

NOTE: We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```
- Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
user@host# commit
commit complete
user@host# commit
commit complete
```
- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```
- Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

- [Reverting to the Default Factory Configuration on page 1354](#)
- [Reverting to the Rescue Configuration on page 1354](#)
- [Cleaning Up the System File Storage Space on page 1355](#)

Loading a Previous Configuration File

You can use the **rollback** *<number>* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

Syntax

rollback *<number>*

Options

- **none**—Return to the most recently saved configuration.
- **number**—Return to the specified configuration.
 - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
 - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration 0):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

- Related Documentation**
- [Configuration File Terms on page 1309](#)

Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1310](#)
 - [Loading a Previous Configuration File on page 1330](#)
 - [Reverting to the Rescue Configuration on page 1346](#)

Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

- Related Documentation**
- [Reverting to the Default Factory Configuration on page 1344](#)

Cleaning Up the System File Storage Space

Problem **Description:** The system file storage space on the switch is full. Rebooting the switch does not solve the problem.

The following error message is displayed during a typical operation on the switch after the file storage space is full.

```
user@switch% cli
user@switch> configure
/var: write failed, filesystem is full
```

Solution Clean up the file storage on the switch by deleting system files.

1. Request to delete system files on the switch.

```
user@switch> request system storage cleanup
```

The list of files to be deleted is displayed.

List of files to delete:

Size	Date	Name
11B	Jul 26 20:55	/var/jail/tmp/alarmd.ts
124B	Aug 4 18:05	/var/log/default-log-messages.0.gz

0B	Apr 14 16:20	/var/tmp/gres-tp/lock
0B	Apr 14 17:37	/var/tmp/if-rtssdb/env.lock
12.0K	Jul 26 20:55	/var/tmp/if-rtssdb/env.mem
2688.0K	Jul 26 20:55	/var/tmp/if-rtssdb/shm_usr1.mem
132.0K	Jul 26 20:55	/var/tmp/if-rtssdb/shm_usr2.mem
2048.0K	Jul 26 20:55	/var/tmp/if-rtssdb/trace.mem
155B	Jul 26 20:55	/var/tmp/krt_gencfg_filter.txt
0B	Jul 26 20:55	/var/tmp/rtssdb/if-rtssdb
1400.6K	Aug 3 10:13	/var/tmp/sfid.core.0.gz
1398.9K	Aug 3 17:01	/var/tmp/sfid.core.1.gz

Delete these files ? [yes,no] (no)

2. Enter **yes** to delete the files.

3. Reboot the switch.

BEST PRACTICE: We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch.

file compare

Syntax	<pre>file compare (files <i>filename filename</i>) <context unified> <ignore-white-space></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
Description	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> • Default—In the first line of output, c means lines were changed between the two files, d means lines were deleted between the two files, and a means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (<) in front of output lines refers to the first file. A right angle bracket (>) in front of output lines refers to the second file. • Context—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-). • Unified—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.
Options	<p>files <i>filename</i>—Names of two local files to compare.</p> <p>context—(Optional) Display output in context format.</p> <p>ignore-white-space—(Optional) Ignore changes in the amount of white space.</p> <p>unified—(Optional) Display output in unified format.</p>
Required Privilege Level	none

file delete

Syntax	<code>file delete <i>filename</i></code> <code><purge></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Delete a file on the local router or switch.
Options	<i>filename</i> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued. <i>purge</i> —(Optional) Overwrite regular files before deleting them.
Required Privilege Level	maintenance
List of Sample Output	file delete on page 1379 file delete (Routing Matrix) on page 1379
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax	<code>file list</code> <code><detail recursive></code> <code><filename></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display a list of files on the local router or switch.
Options	none —Display a list of all files for the current directory. detail recursive —(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively. filename —(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.
Additional Information	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the file list command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the file list command.
Required Privilege Level	maintenance
List of Sample Output	file list on page 1380 file list (Routing Matrix) on page 1380
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp

file rename

Syntax	<code>file rename <i>source destination</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Rename a file on the local router or switch.
Options	<i>destination</i> —New name for the file. <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
Required Privilege Level	maintenance
List of Sample Output	file rename on page 1382 file rename (Routing Matrix) on page 1382
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
```

```
-----
/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

file show

Syntax	<code>file show <i>filename</i></code> <code><encoding (base64 raw)></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the contents of a file.
Options	<i>filename</i> —Name of a file. For a routing matrix, the filename must include the chassis information. <code>encoding (base64 raw)</code> —(Optional) Encode file contents with base64 encoding or show raw text.
Required Privilege Level	maintenance
List of Sample Output	file show on page 1384 file show (Routing Matrix) on page 1384

show system rollback

Syntax `show system rollback number`
`<compare number>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

NOTE: The `show system rollback` command is a purely operational mode command and cannot be issued with `run` from the configuration mode.

Options *number*—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

compare number —(Optional) Number of another previously committed (rollback) configuration to compare to rollback *number*. The output displays the differences between the two configurations. The range of values is 0 through 49.

Network Management and Monitoring Feature Guide for QFX10000 Switches

PART 19

Overview

- [Understanding Network Management on page 1401](#)
- [Junos Space on page 1405](#)

Understanding Network Management

- [Understanding Device and Network Management Features on page 1401](#)

Understanding Device and Network Management Features

After you install a QFX Series product, OCX Series device, or EX4600 switch in your network, you need to manage the device. The products support features that you use to manage the device within the network, including the management of configuration, system performance, fault monitoring, and remote access.

[Table 89](#) lists the device and network management features on the QFX Series, OCX Series, and EX4600.

Table 89: Device and Network Management Features on the QFX Series, OCX Series, and EX4600

Feature	Typical Uses	Documentation
AI-Scripts and Advanced Insight Manager (AIM)—Automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems, and submit problem reports to Juniper Support Systems.	Fault management	Advanced Insight Scripts (AI-Scripts) Release Notes
Alarms and LEDs on the switch—Show status of hardware components and indicate warning or error conditions.	Fault management	Chassis Alarm Messages on a QFX3500 Device
Firewall filters—Control the packets that are sent to and from the network, balance network traffic, and optimize performance.	Performance management	<ul style="list-style-type: none">• Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices• Overview of Firewall Filters on page 5951

Table 89: Device and Network Management Features on the QFX Series, OCX Series, and EX4600 (continued)

Feature	Typical Uses	Documentation
In-band management—Enables connection to the switch using the same interfaces through which customer traffic flows. Communication between the switch and a remote console is typically enabled using SSH and Telnet services. SSH provides secure encrypted communications, whereas Telnet provides unencrypted, and therefore less secure, access to the switch.	Remote access management	<ul style="list-style-type: none"> • Configuring SSH Service for Remote Access to the Router or Switch on page 1412 • Configuring Telnet Service for Remote Access to a Router or Switch
Juniper Networks Junos OS automation scripts—Configuration and operations automation tools provided by Junos OS. These tools include commit scripts, operation scripts, event scripts, and event policies. Commit scripts enforce custom configuration rules, whereas operation scripts, event policies, and event scripts automate network troubleshooting and management.	<ul style="list-style-type: none"> • Configuration management • Performance management • Fault management 	<i>Automation Scripting Feature Guide</i>
Junos OS command-line interface (CLI)—CLI configuration statements that enable you to configure the switch based on your networking requirements, such as security, service, and performance.	<ul style="list-style-type: none"> • Configuration management • Performance management • User access management • Remote access management 	<i>CLI User Guide</i>
Junos Space software—Multipurpose GUI-based network management system that includes a base platform, the Network Application Platform, and other optional applications such as Ethernet Design, Service Now, Service Insight, and Virtual Control. NOTE: Junos Space does not support the OCX Series.	<ul style="list-style-type: none"> • Configuration management • Performance management • Fault management 	<ul style="list-style-type: none"> • Understanding Junos Space Support on page 1405 • Junos Space Network Application Platform User Guide
Junos XML API—XML representation of Junos OS configuration statements and operational mode commands. Junos XML configuration tag elements are the content to which the Junos XML protocol operations apply. Junos XML operational tag elements are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device. The Junos XML API also includes tag elements that are the counterpart to Junos CLI configuration statements.	<ul style="list-style-type: none"> • Configuration management • Performance management • Fault management 	<ul style="list-style-type: none"> • Junos XML API Configuration Developer Reference • Junos XML API Operational Developer Reference

Table 89: Device and Network Management Features on the QFX Series, OCX Series, and EX4600 (*continued*)

Feature	Typical Uses	Documentation
NETCONF XML management protocol—XML-based management protocol that client applications use to request and change configuration information on routing, switching, and security platforms running Junos OS. The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as show , set , and commit to perform those operations.	<ul style="list-style-type: none"> • Configuration management • Performance management • Fault management 	<i>NETCONF XML Management Protocol Developer Guide</i>
Operational mode commands—May be used to do the following: <ul style="list-style-type: none"> • Monitor switch performance. For example, the show chassis routing-engine command shows the CPU utilization of the Routing Engine. High CPU utilization of the Routing Engine can affect performance of the switch. • View current activity and status of the device or network. For example, you can use the ping command to monitor and diagnose connectivity problems, and the traceroute command to locate points of failure on the network. 	<ul style="list-style-type: none"> • Performance management • Fault management 	CLI Explorer
Out-of-band management—Enables connection to the switch through a management interface. Out-of-band management is supported on two dedicated management Ethernet interfaces as well as on the console and auxiliary ports. The management Ethernet interfaces connect directly to the Routing Engine. No transit traffic is allowed through the interfaces, separating customer and management traffic and ensuring that congestion or failures in the transit network do not affect the management of the switch.	Remote access management	<ul style="list-style-type: none"> • Connecting a QFX3500 Device to a Network for Out-of-Band Management • Connecting a QFX Series Device to a Management Console • Configuring Console and Auxiliary Port Properties on page 15

Table 89: Device and Network Management Features on the QFX Series, OCX Series, and EX4600 (*continued*)

Feature	Typical Uses	Documentation
SNMP Configuration Management MIB—Provides notification for configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in <code>jnxCmChgEventTable</code> .	Configuration management	<i>SNMP MIBs and Traps Reference</i>
SNMP MIBs and traps—Enable the monitoring of network devices from a central location. Use SNMP requests such as get and walk to monitor and view system activity. The QFX3500 switch supports SNMP Version 1 (v1), v2, and v3, and both standard and Juniper Networks enterprise-specific MIBs and traps. System log messages—Log details of system and user events, including errors. You can specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> • Fault management • User access management 	<ul style="list-style-type: none"> • <i>Junos OS System Log Messages Reference</i> • Overview of Junos OS System Log Messages on page 1528 • Overview of Single-Chassis System Logging Configuration on page 1528

Junos Space

- [Understanding Junos Space Support on page 1405](#)

Understanding Junos Space Support

The Juniper Networks Junos Space application, running on a JA1500 appliance or a Junos Space Virtual Appliance, is a comprehensive platform for building and deploying applications for collaboration, productivity, and network infrastructure and operations management. Junos Space provides a runtime environment implemented as a fabric of virtual and physical appliances.

The Junos Space Network Management Platform software comprises various applications for network management and configuration, including:

- Junos Space Administration—Provides management of Junos Space fabric, databases, licenses, applications, authentication servers, tags, permission labels, DMI schemas, and troubleshooting.
- Network Director—Provides unified management of supported Juniper Networks devices in your network. By providing full network life cycle management, Network Director simplifies the discovery, configuration, visualization, monitoring, and administration of large networks.
- Service Automation—Provides an end-to-end solution designed to streamline operations and enable proactive network management for Junos OS devices. The solution consists of Advanced Insight Scripts (AI-Scripts), Junos Space Service Now and Service Insight applications, and Juniper Support Systems (JSS).

NOTE: Do not install Junos Space and AI-Scripts on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

Before you can use Junos Space Network Director to manage the QFX Series device, you must ensure that the configuration on the device meets the requirements for all managed devices. For example:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

For more information about Network Director requirements, see the *Network Director Quick Start Guide* at:

http://www.juniper.net/techpubs/en_US/network-director1.5/information-products/pathway-pages/index.html

For more information about Junos Space, go to:

http://www.juniper.net/techpubs/en_US/release-independent/junos-space/index.html

Understanding Tracing and Logging Operations

Tracing and logging operations enable you to track events that occur in the switch—both normal operations and error conditions—and to track the packets that are generated by or passed through the switch. The results of tracing and logging operations are placed in files in the `/var/log` directory on the switch.

The Junos OS supports remote tracing for the following processes:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

You configure remote tracing by using the **tracing** statement at the **[edit system]** hierarchy level.

NOTE: The **tracing** statement is not supported on the QFX3000 QFabric system.

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy level. This feature does not alter local tracing functionality in any way, and logging files are stored on the switch.

Logging operations use a system logging mechanism similar to the UNIX **syslogd** utility to record systemwide, high-level operations, such as interfaces going up or down and users logging in to or out of the switch. You configure these operations by using the **syslog**

statement at the **[edit system]** hierarchy level and by using the **options** statement at the **[edit ethernet-switching-options]** hierarchy level.

Tracing operations record more detailed information about the operations of the switch, including packet forwarding and routing information. To configure tracing operations, use the **traceoptions** statement.

NOTE: The **traceoptions** statement is not supported on the QFX3000 QFabric system.

You can define tracing operations in different portions of the switch configuration:

- **SNMP agent activity tracing operations**—Define tracing of the activities of SNMP agents on the switch. You configure SNMP agent activity tracing operations at the **[edit snmp]** hierarchy level.
- **Global switching tracing operations**—Define tracing for all switching operations. You configure global switching tracing operations at the **[edit ethernet-switching-options]** hierarchy level of the configuration.
- **Protocol-specific tracing operations**—Define tracing for a specific routing protocol. You configure protocol-specific tracing operations in the **[edit protocols]** hierarchy when configuring the individual routing protocol. Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.
- **Tracing operations within individual routing protocol entities**—Some protocols allow you to define more granular tracing operations. For example, in Border Gateway Protocol (BGP), you can configure peer-specific tracing operations. These operations override any equivalent BGP-wide operations or, if there are no equivalents, supplement them. If you do not specify any peer-specific tracing operations, the peers inherit, first, all the BGP-wide tracing operations and, second, the global tracing operations.
- **Interface tracing operations**—Define tracing for individual interfaces and for the interface process itself. You define interface tracing operations at the **[edit interfaces]** hierarchy level of the configuration.
- **Remote tracing**—To enable system-wide remote tracing, configure the **destination-override syslog host** statement at the **[edit system tracing]** hierarchy level. This specifies the remote host running the system log process (syslogd), which collects the traces. Traces are written to files on the remote host in accordance with the syslogd configuration in **/etc/syslog.conf**. By default, remote tracing is not configured.

To override the system-wide remote tracing configuration for a particular process, include the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy. When **no-remote-trace** is enabled, the process does local tracing.

To collect traces, use the **local0** facility as the selector in the **/etc/syslog.conf** file on the remote host. To separate traces from various processes into different files, include the process name or trace-file name (if it is specified at the **[edit process-name**

traceoptions file] hierarchy level) in the Program field in the `/etc/syslog.conf` file. If your system log server supports parsing hostname and program name, then you can separate traces from the various processes.

NOTE: During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data terminal may be connected to the switch. The console port is enabled by default. The console port speed is 9600 baud, except on OCX Series devices, on which it is 115200 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

```
[edit system ports]
user@switch# set console log-out-on-disconnect
```

2. To specify the auxiliary port terminal type:

```
[edit system ports]
user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
```

For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

```
[edit system ports]
user@switch# set auxiliary type xterm
```

3. To check the configuration:

```
[edit system ports]
user@switch# show
console log-out-on-disconnect;
auxiliary type xterm;
```

 - [console \(Physical Port\) on page 221](#)
 - [ports on page 234](#)

Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ... ]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-passwords;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

By default, a user can create an SSH tunnel over a CLI session to a router running Junos OS via SSH. This type of tunnel could be used to forward TCP traffic, bypassing any firewall filters or ACLs, allowing access to resources beyond the router. Use the **no-tcp-forwarding** option to prevent a user from creating an SSH tunnel to a router via SSH.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 1413](#)
- [Configuring the SSH Protocol Version on page 1413](#)
- [Configuring the Client Alive Mechanism on page 1413](#)

Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]  
root-login (allow | deny | deny-password);
```

allow—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

deny—Disables users from logging in to the router or switch as root through SSH.

deny-password—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

Configuring the SSH Protocol Version

By default, only version 2 of the SSH protocol is enabled. To enable version 1, you must explicitly configure it.

To configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]  
protocol-version [ v1 v2 ];
```

To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]  
protocol-version [ v1 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

Configuring Telnet Service for Remote Access to a Switch

Telnet provides unencrypted access to network devices. Configuring Telnet service for a switch enables in-band remote access to the switch.

By default, the switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute. Optionally, you can change the default Telnet settings by configuring the connection limit and rate limit at the **[edit system services telnet]** hierarchy level.

The connection limit is the maximum number of simultaneous connections per protocol (IPv4). The range is from 1 through 250. The default is 75.

The rate limit is the maximum number of connection attempts accepted per minute per protocol. The range is from 1 through 250. The default is 150.

To configure Telnet service:

1. To specify the connection limit:

```
[edit system services]
user@switch# set telnet connection-limit connection-limit
```

2. To specify the rate limit:

```
[edit system services]
user@switch# set telnet rate-limit rate-limit
```

3. Check that the Telnet connection limit and rate limit show the values you specified:

```
[edit system services]
user@switch# show
telnet {
  connection-limit 50;
  rate-limit 100;
}
```

Related Documentation

Pinging Hosts

Purpose Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

Action To use the **ping** command to send four requests (ping count) to host3:
ping *host* *count* *number*

Sample Output

```
ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

- Meaning**
- The **ping** results show the following information:
 - Size of the ping response packet (in bytes).
 - IP address of the host from which the response was sent.
 - Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
 - Time-to-live (ttl) hop-count value of the ping response packet.
 - Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
 - Number of ping requests (probes) sent to the host.
 - Number of ping responses received from the host.
 - Packet loss percentage.
 - Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 1416](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 1416](#)

Displaying Real-Time Statistics About All Interfaces on the Router or Switch

Purpose Display real-time statistics about traffic passing through all interfaces on the router or switch.

Action To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

Sample Output

```
user@host> monitor interface traffic
host name          Seconds: 15          Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0    Down      0          (0)      0          (0)
so-1/1/0    Down      0          (0)      0          (0)
so-1/1/1    Down      0          (0)      0          (0)
so-1/1/2    Down      0          (0)      0          (0)
so-1/1/3    Down      0          (0)      0          (0)

t3-1/2/1    Down      0          (0)      0          (0)
t3-1/2/2    Down      0          (0)      0          (0)
t3-1/2/3    Down      0          (0)      0          (0)
so-2/0/0     Up    211035      (1)    36778      (0)
so-2/0/1     Up    192753      (1)    36782      (0)
so-2/0/2     Up    211020      (1)    36779      (0)
so-2/0/3     Up    211029      (1)    36776      (0)
so-2/1/0     Up    189378      (1)    36349      (0)
so-2/1/1    Down      0          (0)    18747      (0)
so-2/1/2    Down      0          (0)    16078      (0)
so-2/1/3     Up      0          (0)    80338      (0)
at-2/3/0     Up      0          (0)      0          (0)
at-2/3/1    Down      0          (0)      0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D
```

Meaning The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

Displaying Real-Time Statistics About an Interface on the Router or Switch

Purpose Display real-time statistics about traffic passing through an interface on the router or switch.

Action To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

Sample Output

```
user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
```

```

Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: OC3 Traffic statistics:
  Input bytes:          5856541 (88 bps)
  Output bytes:         6271468 (96 bps)

Overview of Junos Automation Enhancements

The Junos Automation Enhancements are designed to support the increasing needs of large data centers for more automation and programmability.

- [Features of the Junos Automation Enhancements on page 1419](#)

Features of the Junos Automation Enhancements

To use the Junos Automation Enhancements, you must install the **jinstall-qfx-5-flex-x.tgz** software bundle. This software bundle is identical to the other software bundle except that Veriexec is disabled, which enables you to run unsigned programs, such as programs that you develop with Python, Chef, and Puppet. The Junos Automation Enhancements include the following features:

- The factory default configuration is a Layer 3 configuration. (The standard default factory configuration on some devices series is Layer 2.)
- Safeguards ensure that you cannot overwrite essential Junos OS files, including system log notifications.

- Zero Touch Provisioning (ZTP) allows you to provision new switches in your network automatically, without manual intervention. See [“Understanding Zero Touch Provisioning” on page 197](#).
- The installation automatically sets up and reserves a 1-gigabit user partition on your system. You can use this partition to store your binaries and additional packages.
- The user partition is not overwritten when you upgrade or downgrade the software to a OS image that does not contain the automation enhancements.

NOTE: If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

- The Python interpreter is included by default.
 - You can invoke Python directly from the shell. See [“Invoking the Python Interpreter” on page 1442](#).
 - Starting with Junos OS Release 14.1X53-D10, three Open Source Python modules are pre-installed in the `jinstall-qfx-5-flex-x.tgz` software bundle. See [“Overview of Python with Junos Automation Enhancements” on page 1420](#) for details.
- Chef for Junos OS and Puppet for Junos OS automation tools for provisioning and managing computer networking and storage resources are included.
 - For further information on Chef, see [Chef for Junos Getting Started Guide](#).
 - For further information on Puppet, see [Puppet for Junos OS Documentation](#).

NOTE: For full compatibility, you must use only Chef for Junos OS and Puppet for Junos OS rather than the standard FreeBSD versions of Chef and Puppet software.

CAUTION: Download additional third party packages at your own risk.

Overview of Python with Junos Automation Enhancements

Python is a programming language that lets you work more quickly and integrate your systems more effectively. The Python interpreter is included within the Junos operating system (Junos OS) `jinstall-qfx-5-flex-x.tgz` software bundle.

Python is also suitable as an extension language for customizable applications.

Starting with Junos OS Release 14.1X53-D10, these Open Source Python modules are pre-installed in the `jinstall-qfx-5-flex-x.tgz` software bundle:

- **ncclient**—Facilitates client scripting and application development through the NETCONF protocol. See <http://ncclient.grnet.gr/0.3.2/> for documentation of some of the external APIs of the ncclient Python module. At the bottom of this list, see examples of usage of some of these APIs with sample scripts.
- **lxml**—Combines the speed and XML feature completeness of the C libraries libxml2 and libxslt with the simplicity of a native Python API. See <http://lxml.de/tutorial.html/> for documentation of some of the external APIs of the lxml Python module.
- **jinja2**—Serves as a fast, secure, designer-friendly templating language. See <http://jinja.pocoo.org/docs/api/> for documentation of some of the external APIs of the jinja2 Python module.

Example usage of some of the APIs of the ncclient Python module follows:

*** Example of "connect" and "command" API:**

```
from ncclient import manager

def connect(host, port, user, password):
    conn = manager.connect(host=host,
                           port=port,
                           username=user,
                           password=password,
                           timeout=10,
                           device_params = {'name': 'junos'},
                           hostkey_verify=False)

    print 'show version'
    print '*' * 30
    result = conn.command('show version', format='text')
    print result.xpath('output')[0].text

if __name__ == '__main__':
    connect('router', '22', 'netconf', 'juniper!')
```

*** Example of "compare_configuration" API:**

```
from ncclient import manager
from ncclient.xml_ import *

import time

def connect(host, port, user, password, source):
    conn = manager.connect(host=host,
                           port=port,
                           username=user,
                           password=password,
                           timeout=10,
                           device_params = {'name': 'junos'},
                           hostkey_verify=False)

    compare_config = conn.compare_configuration(rollback=3)
    print compare_config.tostring

if __name__ == '__main__':
    connect('router', 830, 'netconf', 'juniper!', 'candidate')
```

* Example of "lock", "load_configuration", "validate", "commit", "discard_changes", "unlock" APIs:

```
from ncclient import manager
from ncclient.xml_ import *

import time

def connect(host, port, user, password, source):
    conn = manager.connect(host=host,
                           port=port,
                           username=user,
                           password=password,
                           timeout=10,
                           device_params = {'name': 'junos'},
                           hostkey_verify=False)

    print 'locking configuration'
    lock = conn.lock()

    # build configuration element
    config = new_ele('system')
    sub_ele(config, 'host-name').text = 'foo'
    sub_ele(config, 'domain-name').text = 'bar'

    send_config = conn.load_configuration(config=config)
    print send_config.tostring

    check_config = conn.validate()
    print check_config.tostring

    compare_config = conn.compare_configuration()
    print compare_config.tostring

    print 'commit confirmed 300'
    #commit_config = conn.commit(confirmed=True, timeout='300')
    commit_config = conn.commit()
    print commit_config.tostring

    print 'sleeping for 5 sec...'
    time.sleep(5)

    discard_changes = conn.discard_changes()
    print discard_changes.tostring

    print 'unlocking configuration'
    unlock = conn.unlock()
    print unlock.tostring

if __name__ == '__main__':
    connect('router', 830, 'netconf', 'juniper!', 'candidate')
```

NOTE: For information on using Python, refer to your Python documentation.

Understanding Automation Scripts Support

This document describes the support for the Junos OS automation scripts on the QFabric system Director devices.

Junos OS automation consists of a suite of tools used to automate operational and configuration tasks on network devices running Junos OS. The automation tools, which leverage the native XML capabilities of the Junos OS, include commit scripts, operation (op) scripts, event policies and event scripts, and macros.

NOTE: Event policies and event scripts are not supported on the QFabric system at this time.

The QFabric system supports Junos OS automation scripts that are written in Stylesheet Language Alternative Syntax (SLAX) version 1.0.

Commit scripts automate the commit process and enforce custom configuration rules. You can use commit scripts to generate specific errors and warnings, and customize configurations and configuration templates. When a candidate configuration is committed, it is inspected by each active commit script. If a configuration violates your custom rules and the scripts generate an error, the commit fails. If the commit is successful, any configuration changes (both transient and permanent) are incorporated into the active configuration before it is passed to the Director software, which distributes the configuration to all applicable QFabric system components, including Node devices and Node servers.

Op scripts automate operational and troubleshooting tasks. Op scripts can be executed manually from the Junos OS CLI or NETCONF XML management protocol, or they can be called from another script.

The QFabric system supports the following automation script features:

- Commit scripts and op scripts are supported.
- Scripts written in SLAX version 1 are supported.
- Scripts are configured and deployed from the Director group. Since there is more than one Director device in a Director group, scripts must be deployed by each Director device or deployed in the shared media space.
- Scripts are stored in the shared media at this location:
`/pbdata/mgd_shared/partition-ip/var/db/scripts`. Under this directory, commit scripts are stored in the **commit** subdirectory, and op scripts are stored in the **op** subdirectory.
- Scripts are not stored in flash memory.

How Commit Scripts Work

You enable commit scripts by listing the names of one or more commit script files at the **[edit system scripts commit]** hierarchy level. These scripts contain instructions that enforce custom configuration rules. Commit scripts are invoked during the commit process before the standard Junos OS validity checks are performed.

When you perform a commit operation, Junos OS executes each script in turn, passing the information in the candidate configuration to the scripts. The script inspects the configuration, performs the necessary tests and validations, and generates a set of instructions for performing certain actions. These actions include generating error, warning, and system log messages. If errors are generated, the commit operation fails and the candidate configuration remains unchanged. This is the same behavior that occurs with standard commit errors.

Commit scripts can also generate changes to the system configuration. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 12 shows the flow of commit script input and output.

Figure 12: Commit Script Input and Output

Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

The following sections discuss several important concepts related to the commit script input and output:

- [Commit Script Input on page 1425](#)
- [Commit Script Output on page 1425](#)
- [Commit Scripts and the Junos OS Commit Model on page 1426](#)

Commit Script Input

The input for a commit script is the postinheritance candidate configuration in Junos XML API format. The term *postinheritance* means that all configuration group values have been inherited by their targets in the candidate configuration and the inactive portions of the configuration have been removed. For more information about configuration groups, see the *CLI User Guide*.

When you issue the **commit** command, Junos OS automatically generates the candidate configuration in XML format and reads it into the management (mgd) process, at which time the input is evaluated by any commit scripts.

To display the XML format of the postinheritance configuration, issue the **show | display commit-scripts view** command:

```
[edit]
user@host# show | display commit-scripts view
```

To display all configuration groups data, including script-generated changes to the groups, issue the **show groups | display commit-scripts** command:

```
[edit]
user@host# show groups | display commit-scripts
```

To save the commit script input to a file, add the **save** command to the command line:

```
[edit]
user@host# show | display commit-scripts view | save filename.xml
```

By default, the file is placed in your home directory on the switch, router, or security device.

Commit Script Output

To specify the desired commit script output—including warning, error, and system log messages, persistent changes, and transient changes—the script can contain tags that appear in any order, in any number. The tags for specifying output are as follows:

- **<xnm:warning>**—Generates a warning message
- **<xnm:error>**—Generates an error message.
- **<syslog><message>**—Generates a system log message.
- **<change>**—Generates a persistent change to the configuration.
- **<transient-change>**—Generates a transient change to the configuration.
- **<xsl:call-template name="jcs:emit-change">**
 <xsl:with-param name="content">—Generates a persistent change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**
 <xsl:with-param name="tag" select="'transient-change'"/>
 <xsl:with-param name="content">—Generates a transient change relative to the current context node as defined by an XPath expression.
- **<xsl:call-template name="jcs:emit-change">**

```
<xsl:with-param name="message">
```

```
<xsl:text>
```

—Generates a warning message in conjunction with a configuration change. You can use this set of tags to generate a notification that the configuration has been changed.

Junos OS processes this output and performs the appropriate actions. Errors and warnings are passed back to the Junos OS CLI or to a Junos XML protocol client application. The presence of an error automatically causes the commit operation to fail. Persistent and transient changes are loaded into the appropriate configuration database.

To test the output of error, warning, and system log messages from commit scripts, issue the **commit check | display xml** command:

```
[edit]
user@host# commit check | display xml
```

To display a detailed trace of commit script processing, issue the **commit check | display detail** command:

```
[edit]
user@host# commit check | display detail
```

NOTE: System log messages do not appear in the trace output, so you cannot use the commit check operation to test script-generated system log messages. Furthermore, system log messages are written to the system log during a commit operation, but not during a commit check operation.

Commit Scripts and the Junos OS Commit Model

Junos OS uses a commit model to update the device's configuration. This model allows you to make a series of changes to a candidate configuration without affecting the operation of the device. When the changes are complete, you can commit the configuration. The commit operation saves the candidate configuration changes into the current configuration.

When you commit a set of changes in the candidate configuration, two methods are used to forward these changes to the current configuration:

- Standard commit model—Used when no commit scripts are active on the device.
- Commit script model—Incorporates commit scripts into the commit model.

Standard Commit Model

In the standard commit model, the management (mgd) process validates the candidate configuration based on standard Junos validation rules. If the configuration file is valid, it becomes the current active configuration. [Figure 13](#) and the accompanying discussion explain how the standard commit model works:

Figure 13: Standard Commit Model

In the standard commit model, the software performs the following steps:

1. When the candidate configuration is committed, it is copied to become the checkout configuration.
2. The mgd process validates the checkout configuration.
3. If no error occurs, the checkout configuration is copied as the current active configuration.

Commit Model with Commit Scripts

When commit scripts are added to the standard commit model, the process becomes more complex. The mgd process first passes an XML-formatted checkout configuration to a script driver, which handles the verification of the checkout configuration by the commit scripts. When verification is complete, the script driver returns an XML *action file* to the mgd process. The mgd process follows the instructions in the action file to update the candidate and checkout configurations, issue messages to the CLI, and write information to the system log as required. After processing the action file, the mgd process performs the standard Junos OS validation. Figure 14 and the accompanying discussion explain this process.

Figure 14: Commit Model with Commit Scripts Added

In the commit script model, Junos OS performs the following steps:

1. When the candidate configuration is committed, the mgd process sends the XML-formatted candidate configuration to the script driver.
2. Each enabled commit script is invoked against the candidate configuration, and each script can generate a set of actions for the mgd process to perform. The actions are collected in an XML action file.
3. The mgd process performs the following actions in response to **<error>**, **<warning>**, and **<syslog>** tag elements in the action file:
 - **<error>**—The mgd process halts the commit process (that is, the commit operation fails), returns an error message to the CLI or Junos XML protocol client, and takes no further action.
 - **<warning>**—The mgd process forwards the message to the CLI or the Junos XML protocol client.
 - **<syslog>**—The mgd process forwards the message to the system log process.
4. If the action file includes any **<change>** tag elements, the mgd process loads the requested changes into the candidate configuration.
5. The candidate configuration is copied to become the checkout configuration.
6. If the action file includes any **<transient-change>** tag elements, the mgd process loads the requested changes into the checkout configuration.
7. The mgd process validates the checkout configuration.
8. If there are no validation errors, the checkout configuration is copied to become the current active configuration.

NOTE: Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

Changes that are made to the candidate configuration during the commit operation are not evaluated by the custom rules during that commit operation. However, persistent changes are maintained in the candidate configuration and are evaluated by the custom rules during subsequent commit operations. For more information about how commit scripts change the candidate configuration, see [“Avoiding Potential Conflicts When Using Multiple Commit Scripts” on page 1429](#).

Transient changes are never evaluated by the custom rules in commit scripts, because they are made to the checkout configuration only after the commit scripts have evaluated the candidate configuration and the candidate is copied to become the checkout configuration. To remove a transient change from the configuration, remove, disable, or deactivate the commit script (as discussed in *Controlling Execution of Commit Scripts During Commit Operations*), or comment out the code that generates the transient change.

For more information about differences between persistent and transient changes, see [“Overview of Generating Persistent or Transient Configuration Changes Using Commit Scripts”](#) on page 1430.

Related Documentation

- [Avoiding Potential Conflicts When Using Multiple Commit Scripts](#) on page 1429

Avoiding Potential Conflicts When Using Multiple Commit Scripts

When you use multiple commit scripts, each script evaluates the original candidate configuration file. Changes made by one script are not evaluated by the other scripts. This means that conflicts between scripts might not be resolved when the scripts are first applied to the configuration. The commit scripts are executed in the order they are listed at the `[edit system scripts commit]` hierarchy level, as illustrated in [Figure 15](#).

Figure 15: Configuration Evaluation by Multiple Commit Scripts

As an example of a conflict between commit scripts, suppose that commit script **A.xsl** is created to ensure that the device uses the domain name server with IP address **192.168.0.255**. Later, the DNS server's address is changed to **192.168.255.255** and a second script, **B.xsl**, is added to check that the device uses the DNS server with that address. However, script **A.xsl** is not removed or disabled.

Because each commit script evaluates the original candidate configuration, the final result of executing both scripts **A.xsl** and **B.xsl** depends on which DNS server address is configured in the original candidate configuration. If the now outdated address of **192.168.0.255** is configured, script **B.xsl** changes it to **192.168.255.255**. However, if the correct address of **192.168.255.255** is configured, script **A.xsl** changes it to the incorrect value **192.168.0.255**.

As another example of a potential conflict between commit scripts, suppose that a commit script protects a hierarchy using the **protect** attribute. If a second commit script attempts to modify or delete the hierarchy or the statements within the hierarchy, Junos OS issues a warning during the commit process and prevents the configuration change.

Exercise care to ensure that you do not introduce conflicts between scripts like those described in the examples. As a method of checking for conflicts with persistent changes, you can issue two separate **commit** commands.

Related Documentation

- [How Commit Scripts Work on page 1424](#)

Overview of Generating Persistent or Transient Configuration Changes

Junos OS commit scripts enforce custom configuration rules. When a candidate configuration includes statements that you have decided must not be included in your configuration, or when the candidate configuration omits statements that you have decided are required, commit scripts can automatically change the configuration and thereby correct the problem.

- [Differences Between Persistent and Transient Changes on page 1430](#)
- [Interaction of Configuration Changes and Configuration Groups on page 1433](#)
- [Tag Elements and Templates for Generating Changes on page 1434](#)

Differences Between Persistent and Transient Changes

Configuration changes made by commit scripts can be *persistent* or *transient*.

A persistent change remains in the candidate configuration and affects routing operations until you explicitly delete it, even if you subsequently remove or disable the commit script that generated the change and reissue the **commit** command. In other words, removing the commit script does not cause a persistent change to be removed from the configuration.

A transient change, in contrast, is made in the *checkout configuration* but not in the candidate configuration. The checkout configuration is the configuration database that is inspected for standard Junos OS syntax just before it is copied to become the active configuration on the device. If you subsequently remove or disable the commit script that made the change and reissue the **commit** command, the change is no longer made to the checkout configuration and so does not affect the active configuration. In other words, removing the commit script effectively removes a transient change from the configuration.

A common use for transient changes is to eliminate the need to repeatedly configure and display well-known policies, thus allowing these policies to be enforced implicitly. For example, if MPLS must be enabled on every interface with an International Organization for Standardization (ISO) protocol enabled, the change can be transient, so that the repetitive or redundant configuration data need not be carried or displayed in the candidate configuration. Furthermore, transient changes allow you to write script instructions that apply the change only if a set of conditions is met.

Persistent and transient changes are loaded into the configuration in the same manner that the **load replace** configuration mode command loads an incoming configuration. When generating a persistent or transient change, adding the **replace="replace"** attribute

to a configuration element produces the same behavior as a **replace** tag in a **load replace** operation.

By default, Junos OS merges the incoming configuration and the candidate configuration. New statements and hierarchies are added, and conflicting statements are overridden. When generating a persistent or transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing configuration element with the incoming configuration element. If the **replace="replace"** attribute is added to a configuration element, but there is no existing element of the same name in the current configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.

Persistent and transient changes are loaded before the standard Junos validation checks are performed. This means any configuration changes introduced by a commit script are validated for correct syntax. If the syntax is correct, the new configuration becomes the active, operational device configuration.

Protected elements in the configuration hierarchy cannot be modified or deleted by either a persistent or a transient change. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made, and proceeds with the commit.

Persistent and transient changes have several important differences, as described in [Table 91](#).

Table 91: Differences Between Persistent and Transient Changes

Persistent Changes	Transient Changes
<p>A persistent change is represented in a commit script by the <change> tag.</p> <p>Another way to represent a persistent change is with the content parameter inside a call to the jcs:emit-change template.</p> <p>The jcs:emit-change template is a helper template contained in the junos.xsl import file.</p>	<p>A transient change is represented in a commit script by the <transient-change> tag.</p> <p>Another way to represent a transient change is to use the content parameter and the tag transient parameter inside a call to the jcs:emit-change template.</p>
<p>You can use persistent changes to perform any Junos XML protocol operation, such as activate, deactivate, delete, insert (reorder), comment (annotate), and replace sections of the configuration.</p>	<p>Like persistent changes, you can use transient changes to perform any Junos XML protocol operation. However, some Junos XML protocol operations do not make sense to use with transient changes, such as generating comments and inactive settings.</p>

Table 91: Differences Between Persistent and Transient Changes (*continued*)

Persistent Changes	Transient Changes
Persistent changes are always loaded during the commit process if no errors are generated by any commit scripts or by the standard Junos OS validity check.	<p>For transient changes to be loaded, you must include the allow-transients statement at the [edit system scripts commit] hierarchy level. If you enable a commit script that generates transient changes and you do not include the allow-transients statement in the configuration, the CLI generates an error message and the commit operation fails.</p> <p>Like persistent changes, transient changes must pass the standard Junos OS validity check.</p> <p>You cannot use a commit script to generate the allow-transients statement at the [edit system scripts commit] hierarchy level. Rather, you must include this statement directly by using the CLI.</p>
<p>Persistent changes work like the load replace configuration mode command, and the change is added to the candidate configuration.</p> <p>When generating a persistent change, if you add the replace="replace" attribute to a configuration element, Junos OS replaces the existing element in the candidate configuration with the incoming configuration element. If there is no existing element of the same name in the candidate configuration, the incoming configuration element is added into the configuration. Elements that do not have the replace attribute are merged into the configuration.</p>	<p>Transient changes work like the load replace configuration mode command, and the change is added to the checkout configuration.</p> <p>When generating a transient change, if you add the replace="replace" attribute to a configuration element, Junos OS replaces the existing element in the checkout configuration with the incoming configuration element. If there is no existing element of the same name in the checkout configuration, the incoming configuration element is added into the configuration. Elements that do not have the replace attribute are merged into the configuration.</p> <p>Transient changes are not copied to the candidate configuration. For this reason, transient changes are not saved in the configuration if the associated commit script is deleted or deactivated.</p>
<p>After a persistent change is committed, the software treats it like a change you make by directly editing and committing the candidate configuration.</p> <p>After the persistent changes are copied to the candidate configuration, they are copied to the checkout configuration. If the changes pass the standard Junos OS validity checks, the changes are propagated to the switch, router, or security device components.</p>	<p>Each time a transient change is committed, the software updates the checkout configuration database. After the transient changes pass the standard Junos OS validity checks, the changes are propagated to the device components.</p>
<p>After committing a script that causes a persistent change to be generated, you can view the persistent change by issuing the show configuration mode command:</p> <pre>user@host# show</pre> <p>This command displays persistent changes only, not transient changes.</p>	<p>After committing a script that causes a transient change to be generated, you can view the transient change by issuing the show display commit-scripts configuration mode command:</p> <pre>user@host# show display commit-scripts</pre> <p>This command displays both persistent and transient changes.</p>

Table 91: Differences Between Persistent and Transient Changes (*continued*)

Persistent Changes	Transient Changes
<p>Persistent changes must conform to your custom configuration design rules as dictated by commit scripts.</p> <p>This does not become apparent until after a second commit operation because persistent changes are not evaluated by commit script rules on the current commit operation. The subsequent commit operation fails if the persistent changes do not conform to the rules imposed by the commit scripts configured during the first commit operation.</p>	<p>Transient changes are never tested by and do not need to conform to your custom rules. This is caused by the order of operations in the Junos OS commit model, which is explained in detail in “Commit Scripts and the Junos OS Commit Model” on page 1426.</p>
<p>A persistent change remains in the configuration even if you delete, disable, or deactivate the commit script instructions that generated the change.</p>	<p>If you delete, disable, or deactivate the commit script instructions that generate a transient change, the change is removed from the configuration after the next commit operation. In short, if the associated instructions or the entire commit script is removed, the transient change is also removed.</p>
<p>As with direct CLI configuration, you can remove a persistent change by rolling back to a previous configuration that did not include the change and issuing the commit command. However, if you do not disable or deactivate the associated commit script, and the problem that originally caused the change to be generated still exists, the change is automatically regenerated when you issue another commit command.</p>	<p>You cannot remove a transient change by rolling back to a previous configuration.</p>
<p>You can alter persistent changes directly by editing the configuration using the CLI.</p>	<p>You cannot directly alter or delete a transient change by using the Junos OS CLI, because the change is not in the candidate configuration.</p> <p>To alter the contents of a transient change, you must alter the statements in the commit script that generates the transient change.</p>

Interaction of Configuration Changes and Configuration Groups

Any configuration change you can make by directly editing the configuration using the Junos OS command-line interface (CLI) can also be generated by a commit script as a persistent or transient change. This includes values specified at a specific hierarchy level or in configuration groups. As with direct CLI configuration, values specified in the *target* override values inherited from a configuration group. The target is the statement to which you apply a configuration group by including the **apply-groups** statement.

If you define persistent or transient changes as belonging to a configuration group, the configuration groups are applied in the order you specify in the **apply-groups** statements, which you can include at any hierarchy level except the top level. You can also disable inheritance of a configuration group by including the **apply-groups-except** statement at any hierarchy level except the top level.

CAUTION: Each commit script inspects the postinheritance view of the configuration. If a candidate configuration contains a configuration group,

be careful when using a commit script to change the related target configuration, because doing so might alter the intended inheritance from the configuration group.

Also be careful when using a commit script to change a configuration group, because the configuration group might be generated by an application that performs a load replace operation on the group during each commit operation.

For more information about configuration groups, see the *CLI User Guide*.

Tag Elements and Templates for Generating Changes

To generate changes, you can use the `jcs:emit-change` template, which implicitly includes `<change>` and `<transient-change>` XML elements; or you can explicitly include `<change>` and `<transient-change>` XML elements. Using the `jcs:emit-change` template allows you to set the hierarchical context of the change once rather than multiple times.

The `<change>` and `<transient-change>` elements are similar to the `<load-configuration>` operation defined by the Junos XML management protocol. The possible contents of the `<change>` and `<transient-change>` elements are the same as the contents of the `<configuration>` tag element used in the Junos XML protocol operation `<load-configuration>`. For complete details about the `<load-configuration>` element, see the *Junos XML Management Protocol Developer Guide*.

Required Boilerplate for Commit Scripts

When you write commit scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all commit scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make commit scripts easier to read and write, which you import from a file called `junos.xsl`. For more information about the extension functions and templates, see *Understanding Extension Functions in the jcs and slax Namespaces* and *Named Templates in the jcs Namespace Overview*.

Commit scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all commit scripts that you create. The XSLT boilerplate follows:

XSLT Boilerplate for Commit Scripts

```
1 <?xml version="1.0" standalone="yes"?>
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
```

```

6  xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7  <xsl:import href="../../import/junos.xsl"/>

8  <xsl:template match="configuration">
    <!-- ... Insert your code here ... -->
9  </xsl:template>
10 </xsl:stylesheet>

```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI). This PI specifies that the code is written in XML using version 1.0. The XML PI, if present, must be the first noncomment token in the script file.

```
1 <?xml version="1.0"?>
```

Lines 2 through 6 set the style sheet element and the associated namespaces. Line 2 sets the style sheet version as 1.0. Lines 3 through 6 list all the namespace mappings commonly used in commit scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```

2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">

```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of Junos OS. The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Named Templates in the jcs Namespace Overview* and *Named Templates in the jcs Namespace Summary*.

```
7 <xsl:import href="../../import/junos.xsl"/>
```

Line 8 defines a template that matches the `<configuration>` element, which is the node selected by the `<xsl:template match="/">` template, contained in the `junos.xsl` import file. The `<xsl:template match="configuration">` element allows you to exclude the `/configuration/` root element from all XML Path Language (XPath) expressions in the script and begin XPath expressions with the top Junos OS hierarchy level. For more information, see *XPath Overview*.

```
8 <xsl:template match="configuration">
```

Add your code between Lines 8 and 9.

Line 9 closes the template.

```
9 </xsl:template>
```

Line 10 closes the style sheet and the commit script.

```
10 </xsl:stylesheet>
```

SLAX Boilerplate for Commit Scripts

The corresponding SLAX boilerplate is as follows:

```

version 1.0;
ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";

```

```
import "../import/junos.xml";

match configuration {
  /*
   * Insert your code here
   */
}
```

How Op Scripts Work

Op scripts execute Junos OS operational commands and inspect the resulting output. After inspection, op scripts can automatically correct errors within the device running Junos OS based on this output.

You add op scripts to device operations by listing the filenames of one or more op script files within the **[edit system scripts op]** hierarchy level. These files must be added to the appropriate op script file directory. For more information about op script file directories, see *Storing Scripts in Flash Memory*. Once added to the device, op scripts are invoked from the command line, using the **op filename** command.

You can use op scripts to generate changes to the device configuration by including the **<load-configuration>** tag element. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 16 shows a high-level view of the flow of op script input and output.

Figure 16: Op Script Input and Output

Required Boilerplate for Op Scripts

When you write operation (op) scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all op scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make scripts easier to read and write, which you import from a file called **junos.xml**. For more information about the extension functions and templates, see *Understanding Extension Functions in the jcs and slax Namespaces* and *Named Templates in the jcs Namespace Overview*.

Op scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are

a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all op scripts that you create. The XSLT boilerplate follows:

XSLT Boilerplate for Op Scripts

```

1  <?xml version="1.0" standalone="yes"?>
2  <xsl:stylesheet version="1.0"
3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7    <xsl:import href="../../import/junos.xml"/>

8    <xsl:template match="/">
9      <op-script-results>
10       <!-- ... insert your code here ... -->
11     </op-script-results>
12   </xsl:template>
13   <!-- ... insert additional template definitions here ... -->
14 </xsl:stylesheet>

```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI), which marks this file as XML and specifies the version of XML as 1.0. The XML PI, if present, must be the first non-comment token in the script file.

```
1  <?xml version="1.0"?>
```

Line 2 opens the style sheet and specifies the XSLT version as 1.0.

```
2  <xsl:stylesheet version="1.0"
```

Lines 3 through 6 list all the namespace mappings commonly used in operation scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```

3    xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4    xmlns:junos="http://xml.juniper.net/junos/*/junos"
5    xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6    xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">

```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xml`, which ships as part of Junos OS (in the file `/usr/libdata/cscript/import/junos.xml`). The `junos.xml` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Named Templates in the jcs Namespace Overview* and *Named Templates in the jcs Namespace Summary*.

```
7    <xsl:import href="../../import/junos.xml"/>
```

Line 8 defines a template that matches the `</>` element. The `<xsl:template match="/">` element is the root element and represents the top level of the XML hierarchy. All XML Path Language (XPath) expressions in the script must start at the top level. This allows the script to access all possible Junos XML and Junos XML protocol remote procedure calls (RPCs). For more information, see *XPath Overview*.

```
8    <xsl:template match="/">
```

After the `<xsl:template match="/">` tag element, the `<op-script-results>` and `</op-script-results>` container tags must be the top-level child tags, as shown in Lines 9 and 10.

```
9      <op-script-results>
      <!-- ... insert your code here ... -->
10     </op-script-results>
```

Line 11 closes the template.

```
11    </xsl:template>
```

Between Line 11 and Line 12, you can define additional XSLT templates that are called from within the `<xsl:template match="/">` template.

Line 12 closes the style sheet and the op script.

```
12 </xsl:stylesheet>
```

SLAX Boilerplate for Op Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xml";

match / {
  <op-script-results> {
    /*
     * Insert your code here
    */
  }
}
```

Installing Junos OS Software with Junos Automation Enhancements

Junos operating system (Junos OS) with Junos Automation Enhancements is a full-featured version of Junos OS with Veriexec disabled, which can only be installed on supported devices.

NOTE: You must install the `jinstall-qfx-5-flex-x.tgz` software bundle in order to use the automation enhancements.

Before you install software, download the Junos OS `jinstall-qfx-5-flex-x.tgz` software bundle. For information on downloading and accessing the files, see [“Upgrading Software” on page 189](#).

BEST PRACTICE: Before you install the software, back up any critical files in `/var/home`. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

Install the software:

1. Execute the **request system software add** command with the **validate** option:

- If the installation package resides locally on the switch, execute the **request system software add validate *pathname* source reboot** command, using the following format:

```
user@switch> request system software add validate /var/tmp/jinstall-qfx-5-flex-x.tgz
reboot
```

- If the installation package resides remotely, execute the **request system software add validate *pathname* source reboot** command, using the following format:

```
user@switch> request system software add validate
ftp://ftpserver/directory/jinstall-qfx-5-flex-x.tgz reboot
```

2. After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
root@qfx5100-24q-et013> show version
fpc0:
-----
Hostname: qfx5100-24q-et013
Model: qfx5100-24q-2p
JUNOS Base OS Software Suite [13.2X51-D20]
JUNOS Base OS boot [13.2X51-D20]
JUNOS Crypto Software Suite [13.2X51-D20]
JUNOS Online Documentation [13.2X51-D20]
JUNOS Kernel Software Suite [13.2X51-D20]
JUNOS Packet Forwarding Engine Support (qfx-x86-32) [13.2X51-D20]
JUNOS Routing Software Suite [13.2X51-D20]
JUNOS Enterprise Software Suite [13.2X51-D20]
JUNOS py-base-i386 [13.2X51-D20]
Puppet on Junos [2.7.19_1.junos.i386]
Ruby Interpreter [11.10.4_1.junos.i386]
Chef [11.10.4_1.junos.i386]
junos-ez-stdlib [11.10.4_1.junos.i386]
JUNOS Host Software [13.2X51-D20]
JUNOS for Automation Enhancement
```

NOTE: If you are upgrading a device from standard Junos OS to use Junos Automation Enhancements and you are *not* loading the new factory default configuration, you need to use the following procedure.

To upgrade an existing device from standard Junos to use Junos Automation Enhancements:

1. Edit your existing Junos OS configuration to include the following configuration statements:

```
[edit]
user@switch# set system extensions providers juniper license-type juniper
deployment-scope commercial
user@switch# set system extensions providers chef license-type juniper
deployment-scope commercial
```

NOTE: The factory default configuration of the QFX5100 switch `jinstall-qfx-5-flex-x.tgz` software bundle is a Layer 3 configuration, whereas the factory default configuration for QFX5100 switch software bundles is a Layer 2 configuration. Therefore, if you are running the `jinstall-qfx-5-flex-x.tgz` software bundle on a QFX5100 switch and you use the `load factory-default` command, the resulting factory default configuration is set up for Layer 3 interfaces.

This is the factory default configuration for QFX5100 switch `jinstall-qfx-5-flex-x.tgz` software bundle:

```
user@switch> show configuration
```

```
system syslog user * any emergency
system syslog file messages any notice
system syslog file messages authorization info
system syslog file interactive-commands interactive-commands any

Invoking the Python Interpreter

The Python interpreter is available by default with the Junos Automation Enhancements. You can invoke Python by entering the **python** command at the shell script.

To invoke the Python interpreter:

1. Start the shell interface:

```
user@switch> start shell
```
2. Enter the **python** command without any parameters:

```
% python
```

NOTE: The Python interpreter is designated with the prompt `>>>` at the beginning of a line or `...` to indicate the continuation of a line.

Controlling the Execution of Commit Scripts

This document describes the tasks that affect the way commit scripts are executed. In the QFabric system, commit scripts are stored in the in the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory that is shared among Director devices in a Director group.

To determine which commit scripts are currently enabled on the QFabric system, use the **show** command to display the files included at the **[edit system scripts commit]** hierarchy level. To ensure that the enabled files are on the device, list the contents of the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory using the **file list** operational mode command.

See the following tasks:

- [Enabling Commit Scripts to Execute on page 1443](#)
- [Removing Commit Scripts from the Configuration on page 1444](#)
- [Deactivating Commit Scripts on page 1445](#)
- [Activating Inactive Commit Scripts on page 1445](#)

Enabling Commit Scripts to Execute

The commit operation requires that all scripts be included in configuration at the **[edit system scripts commit file]** hierarchy level for all QFabric Director devices.

If you need to temporarily remove a script from a commit operation but do not want to remove it from the configuration permanently, you may configure the **optional** statement at the **[edit system scripts commit file filename]** hierarchy level to enable the commit operation to succeed even if a script is missing from the commit script directory.

CAUTION: When you include the **optional** statement at the **[edit system scripts commit file filename]** hierarchy level, no error message is generated during the commit operation if the file does not exist. As a result, you might not be aware that a script has not been executed as expected.

The filename of a commit script written in SLAX must include the **.slax** extension for the script to be executed.

To enable a commit script to execute during a commit operation:

1. Ensure that the commit script is located in the correct directory:
/pbdata/mgd_shared/partition-ip/var/db/scripts/commit directory on the Director device.

2. Configure the commit script.

```
[edit system scripts commit]
user@switch# set file filename <optional>
```

3. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

Removing Commit Scripts from the Configuration

You can prevent commit scripts from executing during a commit operation by removing the scripts from the commit directory in the configuration.

NOTE: You can also deactivate a script using the **deactivate** statement instead of removing it from the configuration. Deactivated scripts may be reactivated later.

To prevent a commit script from executing during a commit operation:

1. Delete the commit script file from the commit directory in the configuration.

```
[edit system scripts commit]
user@switch# delete file filename
```

2. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

3. Remove the commit script from the **/pbdata/mgd_shared/** directory on the Director device.

BEST PRACTICE: Although removing the commit script is not necessary, we recommend deleting unused files from the system.

Deactivating Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration. The script is not executed during the commit operation, but you can reactivate the script by using the **activate** statement.

To deactivate the commit script:

1. Deactivate the script.

```
[edit]
user@switch deactivate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

3. Verify that the commit script is deactivated.

```
[edit]
user@switch# show system scripts commit
inactive: file mycommit.slax
```

Activating Inactive Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration and is therefore not executed during the commit operation.

To activate an inactive commit script:

1. Activate the script.

```
[edit]
user@switch# activate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

Displaying Commit Script Output

Table 92 summarizes the Junos OS command-line interface (CLI) commands you can use to monitor and troubleshoot commit scripts. For more information about the **cscript.log** file, see *Tracing Commit Script Processing*.

Table 92: Commit Script Configuration and Operational Mode Commands

Task	Command
Configuration Mode Commands	
Display errors and warnings generated by commit scripts.	commit or commit check

Table 92: Commit Script Configuration and Operational Mode Commands (*continued*)

Task	Command
Display detailed information.	commit display detail
Display the underlying Extensible Markup Language (XML) data.	commit display xml
Display the postinheritance contents of the configuration database. This view includes transient changes, but does not include changes made in configuration groups.	show display commit-scripts
Display the postinheritance contents of the configuration database. This view excludes transient changes.	show display commit-scripts no-transients
Display the postinheritance configuration in XML format. Viewing the configuration in XML format can be helpful when you are writing XML Path Language (XPath) expressions and configuration element tags.	show display commit-scripts view
Display the postinheritance configuration in XML format, but exclude transient changes.	show display commit-scripts view display commit-scripts no-transients
Display all configuration groups data, including script-generated changes to the groups.	show groups display commit-scripts
Display a particular configuration group, including script-generated changes to the group.	show groups <i>group-name</i> display commit-scripts
Operational Mode Commands	
Display logging data associated with all commit script processing.	show log cscript.log
Display processing for only the most recent commit operation.	show log cscript.log last

Configuring sFlow Technology

- [Understanding How to Use sFlow Technology for Network Monitoring on a Switch on page 1449](#)
- [Example: Monitoring Network Traffic Using sFlow Technology on page 1453](#)
- [Configuring sFlow Technology on page 1457](#)

Understanding How to Use sFlow Technology for Network Monitoring on a Switch

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology randomly samples network packets and sends the samples to a monitoring station called a *collector*. You can configure sFlow technology on a Juniper Networks switch to continuously monitor traffic at wire speed on all interfaces simultaneously.

This topic describes:

- [Sampling Mechanism and Architecture of sFlow Technology on Switches on page 1449](#)
- [Adaptive Sampling on page 1451](#)
- [sFlow Agent Address Assignment on page 1452](#)
- [sFlow Limitations on Switches on page 1452](#)

Sampling Mechanism and Architecture of sFlow Technology on Switches

sFlow technology uses the following two sampling mechanisms:

- **Packet-based sampling**—Samples one packet out of a specified number of packets from an interface enabled for sFlow technology. Only the first 128 bytes of each packet are sent to the collector. Data collected include the Ethernet, IP, and TCP headers, along with other application-level headers (if present). Although this type of sampling might not capture infrequent packet flows, the majority of flows are reported over time, allowing the collector to generate a reasonably accurate representation of network activity. To configure packet-based sampling, you must specify a sample rate.
- **Time-based sampling**—Samples interface statistics at a specified interval from an interface enabled for sFlow technology. Statistics such as Ethernet interface errors are captured. To configure time-based sampling, you must specify a polling interval.

The sampling information is used to create a network traffic visibility picture. The Juniper Networks Junos operating system (Junos OS) fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks* (see <http://faqs.org/rfcs/rfc3176.html>).

NOTE: sFlow technology on the switches samples only raw packet headers. A raw Ethernet packet is the complete Layer 2 network frame.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent's two main activities are random sampling and statistics gathering. It combines interface counters and flow samples and sends them across the network to the sFlow collector as UDP datagrams, directing those datagrams to the IP address and UDP destination port of the collector. Each datagram contains the following information:

- The IP address of the sFlow agent
- The number of samples
- The interface through which the packets entered the agent
- The interface through which the packets exited the agent
- The source and destination interface for the packets
- The source and destination VLAN for the packets

EX Series switches, QFX Series switches, and the QFabric systems adopt the distributed sFlow architecture. The sFlow agent has two separate sampling entities that are associated with each Packet Forwarding Engine in case of switches and nodes in case of a QFabric system. These sampling entities are known as subagents. Each subagent has a unique ID that is used by the collector to identify the data source. A subagent has its own independent state and forwards its own sample messages to the sFlow agent. The sFlow agent is responsible for packaging the samples into datagrams and sending them to the sFlow collector. Because sampling is distributed across subagents, the protocol overhead associated with sFlow technology is significantly reduced at the collector.

NOTE: On the QFabric system, an sFlow collector must be reachable through the data network. Because each Node device has all routes stored in the default routing instance, the collector IP address should be included in the default routing instance to ensure the collector's reachability from the Node device.

NOTE: You cannot configure sFlow monitoring on a link aggregation group (LAG), but you can configure it individually on a LAG member interface.

Infrequent sampling flows might not be reported in the sFlow information, but over time the majority of flows are reported. Based on a configured sampling rate N , 1 out of N packets is captured and sent to the collector. This type of sampling does not provide a 100 percent accurate result in the analysis, but it does provide a result with quantifiable accuracy. A user-configured polling interval defines how often the sFlow data for a specific interface are sent to the collector, but an sFlow agent can also schedule polling.

NOTE: We recommend that you configure the same sample rate for all the ports in a line card. If you configure different sample rates, the lowest value is used for all ports on the line card..

NOTE: If the mastership assignment changes in a Virtual Chassis setup, sFlow technology continues to function.

Adaptive Sampling

To ensure sampling accuracy and efficiency, EX Series switches and QFX Series devices use adaptive sFlow sampling. Adaptive sampling monitors the overall incoming traffic rate on the device and provides feedback to the interfaces to dynamically adapt their sampling rate to traffic conditions. The sFlow agent reads the statistics on the interfaces every few seconds (12 seconds for EX Series switches and 5 seconds for QFX Series devices) and identifies five interfaces with the highest number of samples.

On a Flexible PIC Concentrator (FPC), when the CPU processing limit is reached because of sflow sample processing, a binary backoff algorithm is initiated. This reduces the sampling load, arriving through the top five sample-producing interfaces on that FPC by half. The backoff algorithm achieves this by doubling the sampling rate on these five earmarked interfaces. This process is repeated until the CPU-load due to sflow on the given FPC comes down to an acceptable level.

On a QFabric system, sFlow technology monitors the interfaces on each node device as a group, and implements the binary backoff algorithm based on the traffic on that group of interfaces.

NOTE: On the QFX Series standalone switches, if you configure sFlow technology monitoring on multiple interfaces and with a high sampling rate, we recommend that you specify a collector that is on the data network instead of on the management network. Having a high volume of sFlow technology monitoring traffic on the management network might interfere with other management interface traffic.

Using adaptive sampling prevents overloading of the CPU and keeps the device operating at its optimum level even when there is a change in traffic patterns on the interfaces. The reduced sampling rate is used until the device is rebooted or when a new sampling rate is configured.

NOTE: sFlow technology on EX Series switches does not support graceful restart. When a graceful restart occurs, the adaptive sampling rate is set to the user-configured sampling rate.

sFlow Agent Address Assignment

The sFlow collector uses the sFlow agent's IP address to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID of the sFlow agent remains constant. If you do not specify the IP address to be assigned to the agent, an IP address is automatically assigned to the agent based on the following order of priority of interfaces configured on the device:

EX Series Devices	QFX Series Devices
<ol style="list-style-type: none"> 1. Virtual Management Ethernet (VME) interface 2. Management Ethernet interface 	<ol style="list-style-type: none"> 1. Management Ethernet interface me0 IP address 2. Any Layer 3 interface if the me0 IP address is not available

If a particular interface is not configured, the IP address of the next interface in the priority list is used as the IP address for the agent. Once an IP address is assigned to the agent, the agent ID is not modified until the sFlow service is restarted. At least one interface has to be configured for an IP address to be assigned to the agent. When the agent's IP address is assigned automatically, the IP address is dynamic and changes when the switch reboots.

On the QFabric system, the following default values are used if the optional parameters are not configured:

- Agent ID is the management IP address of the default partition.
- Source IP is the management IP address of the default partition.

In addition, the QFabric system subagent ID (which is included in the sFlow datagrams) is the ID of the node group from which the datagram is sent to the collector.

sFlow data can be used to provide network traffic visibility information. You can explicitly configure the source IP address to be assigned to the sFlow datagrams. If you do not explicitly configure the IP address, the IP address of any of the configured Layer 3 network interfaces is used as the source IP address. If a Layer 3 IP address is not configured, then the agent IP address is used as the source IP address.

sFlow Limitations on Switches

On the QFX Series, limitations of sFlow traffic sampling include the following:

- sFlow sampling on ingress interfaces does not capture CPU-bound traffic.
- sFlow sampling on egress interfaces does not support broadcast and multicast packets.
- Egress samples do not contain modifications made to the packet in the egress pipeline.

- If a packet is discarded because of a firewall filter, the reason code for discarding the packet is not sent to the collector.
- The out-priority field for a VLAN is always set to 0 (zero) on ingress and egress samples.
- On QFX5100 standalone switches and the QFX Series Virtual Chassis (including mixed QFX Series Virtual Chassis), egress firewall filters are not applied to sFlow sampling packets. On these platforms, the software architecture is different from that on other QFX Series devices—sFlow packets are sent by the Routing Engine (not the line card on the host) and do not transit the switch. Egress firewall filters affect data packets that are transiting a switch, but do not affect packets sent by the Routing Engine. As a result, sFlow sampling packets are always sent to the sFlow collector.

EX9200 switches support configuration of only one sampling rate (inclusive of ingress and egress rates) on an FPC. To support compatibility with the sflow configuration of other Juniper Networks products, EX9200 switches still accept multiple rate configuration on different interfaces of the same FPC. However, the switch programs the lowest rate as the sampling rate for all the interfaces of that FPC. The sFlow show command (**show sflow interfaces**) displays the configured rate and the actual (effective) rate. However, different rates on different FPCs is still supported on EX9200 switches.

Example: Monitoring Network Traffic Using sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow monitoring on a QFX3500 switch in standalone mode.

- [Requirements on page 1454](#)
- [Overview on page 1454](#)
- [Configuration on page 1455](#)
- [Verification on page 1456](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.3 or later
- One QFX3500 switch

Overview

An sFlow monitoring system consists of an sFlow agent embedded in the device and a centralized collector on the network. The two main activities of the sFlow agent are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them to the IP address and UDP destination port of the sFlow collector in UDP datagrams.

Figure 17 depicts the basic elements of an sFlow system.

Figure 17: sFlow Technology Monitoring System

Configuration

CLI Quick Configuration To quickly configure sFlow technology, copy the following commands and paste them into the terminal window of the switch:

```
[edit protocols sflow]
set collector 10.204.32.46 udp-port 5600
set interfaces xe-0/0/1.0
set polling-interval 20
set sample-rate 1000
```

Step-by-Step Procedure To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@switch# set collector 10.204.32.46 udp-port 5600
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@switch# set interfaces xe-0/0/1.0
```

NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example, ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled at the global level. The following example sets a sample rate of 1 in 1000 packets:

```
[edit protocols sflow]
user@switch# set sample-rate 1000
```

Results Check the results of the configuration:

```
[edit]
user@switch# show protocols
sflow {
  collector 10.204.32.46 {
    udp-port 5600;
```

```

    }
    interfaces xe-0/0/1.0 {
        polling-interval 20;
        sample-rate 1000;
    }
}

```

Verification

To confirm that the configuration is correct, perform these tasks:

- [Verifying That sFlow Technology Has Been Configured Properly on page 1456](#)
- [Verifying That sFlow Technology Is Enabled on an Interface on page 1456](#)
- [Verifying the sFlow Collector Configuration on page 1457](#)

Verifying That sFlow Technology Has Been Configured Properly

Purpose Verify that sFlow technology has been configured properly.

Action Enter the **show sflow** operational mode command:

```

user@switch> show sflow
sFlow           : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate     : 1:1000
Agent ID        : 10.1.1.2

```

NOTE: The sample limit cannot be configured and is set to 300 packets per second.

Meaning The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and sampling rate.

Verifying That sFlow Technology Is Enabled on an Interface

Purpose Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

Action Enter the **show sflow interface** operational mode command:

```

user@switch> show sflow interface
Interface      Status      Sample    Polling
                rate      interval
xe-0/0/1.0    Enabled      1000       20

```

Meaning The output indicates that sFlow technology is enabled on the **Node1:xe-0/0/1.0** interface on the Node device with a sampling rate of 1000 and a polling interval of 20 seconds.

Verifying the sFlow Collector Configuration

Purpose	Verify the sFlow collector configuration.						
Action	<p>Enter the show sflow collector operational mode command:</p> <pre>user@switch> show sflow collector</pre> <table><tr><th>Collector address</th><th>Udp-port</th><th>No. of samples</th></tr><tr><td>10.204.32.46</td><td>5600</td><td>7516</td></tr></table>	Collector address	Udp-port	No. of samples	10.204.32.46	5600	7516
Collector address	Udp-port	No. of samples					
10.204.32.46	5600	7516					
Meaning	The output displays the IP address of the collector, the UDP port, and the number of samples collected.						
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• <i>Overview of sFlow Technology</i>						

Configuring sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

On the QFabric system, the sFlow monitoring global configuration that is defined on the Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@host# set collector ip-address udp-port port-number
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@host# set interfaces interface-name
```

NOTE: You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@host# set polling-interval seconds
```

NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets are sampled at the global level. For example, configuring a *number* of 1000 sets a sample rate of 1 in 1000 packets.

```
[edit protocols sflow]
user@host# set sample-rate number
```

5. (Optional) You can also configure the polling interval and sample rate at the interface level:

```
[edit protocols sflow]
user@host# set interfaces interface-name polling-interval seconds sample-rate number
```

NOTE: The interface-level configuration overrides the global configuration for the specified interface.

Utility MIB

The Juniper Networks enterprise-specific Utility MIB, whose object ID is `{jnxUtilMibRoot 1}`, defines objects for counters, integers, and strings. The Utility MIB contains one table for each of the following five data types:

- 32-bit counters
- 64-bit counters
- Signed integers
- Unsigned integers
- Octet strings

Each data type has an arbitrary ASCII name, which is defined when the data is populated, and a timestamp that shows the last time when the data instance was modified.

For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos15.1x49/topics/reference/mibs/mib-jnx-util.txt.

For information about the enterprise-specific Utility MIB objects, see the following topics:

- *jnxUtilCounter32Table*
- *jnxUtilCounter64Table*

SNMPv3 Overview

The QFX3500 switch supports SNMP version 3 (SNMPv3). SNMPv3 enhances the functionality of SNMPv1 and SNMPv2c by supporting user authentication and data encryption. SNMPv3 uses the user-based security model (USM) to provide security for SNMP messages, and the view-based access control model (VACM) for user access control.

SNMPv3 features include:

- With USM, the SNMP messages between the SNMP manager and the agent can have the message source authenticated and the data integrity checked. USM reduces messaging delays and message replays by enforcing timeout limits and by checking for duplicate message request IDs.
- VACM complements USM by providing user access control for SNMP queries to the agent. You define access privileges that you wish to extend to a group of one or more users. Access privileges are determined by the security model parameters (**usm**, **v1**, or **v2**) and security level parameters (**authentication**, **privacy**, or **none**). For each security level, you must associate one MIB view for the group. Associating a MIB view with a group grants the read, write, or notify permission to a set of MIB objects for the group.
- You configure security parameters for each user, including the username, authentication type and authentication password, and privacy type and privacy password. The username given to each user is in a format that is dependent on the security model configured for that user.
- To ensure messaging security, another type of username, called the security name, is included in the messaging data that is sent between the local SNMP server and the destination SNMP server. Each user name is mapped to a security name, but the security name is in a format that is independent of the security model.
- Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag that defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines the address of an SNMP management application and other attributes used in sending notifications. Target parameters define the message processing and security parameters used in sending notifications to a particular target.

Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the **[edit snmp v3]** and **[edit snmp]** hierarchy levels:

NOTE: You must configure at least one view (notify, read, or write) at the **[edit snmp view-name]** hierarchy level.

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
```

```
notify name {
    tag tag-name;
}
notify-filter profile-name {
    oid object-identifier (include | exclude);
}
snmp-community community-index {
    security-name security-name;
}
target-address target-address-name {
    address address;
    target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
        message-processing-model (v1 | v2c | v3);
        security-level (authentication | none | privacy);
        security-model (usm | v1 | v2c);
        security-name security-name;
    }
}
usm {
    local-engine {
        user username {
        }
    }
}
vacm {
    access {
        group group-name {
            (default-context-prefix | context-prefix context-prefix){
                security-model (any | usm | v1 | v2c) {
                    security-level (authentication | none | privacy) {
                        notify-view view-name;
                        read-view view-name;
                        write-view view-name;
                    }
                }
            }
        }
    }
    security-to-group {
        security-model (usm | v1 | v2c) {

Understanding RMON

- [RMON Overview on page 1463](#)
- [Alarm Thresholds and Events on page 1464](#)

RMON Overview

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

An operational support system (OSS) or a fault-monitoring system can be used to automatically monitor events that track many different metrics, including performance, availability, faults, and environmental data. For example, an administrator might want to know when the internal temperature of a chassis has risen above a configured threshold, which might indicate that a chassis fan tray is faulty, the chassis air flow is impeded, or the facility cooling system in the vicinity of the chassis is not operating normally.

The RMON MIB also defines tables that store various statistics for Ethernet interfaces, including the **etherStatsTable** and the **etherHistoryTable**. The **etherStatsTable** contains cumulative real-time statistics for Ethernet interfaces, such as the number of unicast, multicast, and broadcast packets received on an interface. The **etherHistoryTable** maintains a historical sample of statistics for Ethernet interfaces. The control of the **etherHistoryTable**, including the interfaces to track and the sampling interval, is defined by the RMON **historyControlTable**.

To enable RMON alarms, you perform the following steps:

1. Configure SNMP, including trap groups. You configure SNMP at the **[edit snmp]** hierarchy level.
2. Configure rising and falling events in the **eventTable**, including the event types and trap groups. You can also configure events using the CLI at the **[edit snmp rmon event]** hierarchy level.
3. Configure alarms in the **alarmTable**, including the variables to monitor, rising and falling thresholds, the sampling types and intervals, and the corresponding events to generate when alarms occur. You can also configure alarms using the CLI at the **[edit snmp rmon alarm]** hierarchy level.

Extensions to the **alarmTable** are defined in the Juniper Networks enterprise-specific MIB **jnxRmon** (mib-jnx-rmon.txt).

Alarm Thresholds and Events

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range (see [Figure 18](#)).

Figure 18: Setting Thresholds

Events are only generated when the alarm threshold is first crossed in any one direction rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs. This considerably reduces the quantity of events that are produced by the system, making it easier for operations staff to react when events do occur.

Before you configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least 3 months is not unusual when you first identify the operational ranges and define thresholds, but baseline monitoring should continue over the life span of each monitored variable.

RMON MIB Event, Alarm, Log, and History Control Tables

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and

its corresponding event are generated. The event can be logged and can generate an SNMP trap.

Table 93 provides each field in the RMON eventTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the `[edit snmp rmon]` hierarchy level.

Table 93: RMON Event Table

Field	Description	Statement [edit snmp rmon]
eventDescription	Text description of this event.	description
eventType	Type of event (for example, log, trap, or log and trap).	type
eventCommunity	Trap group to which to send this event, as defined in the Junos OS configuration. (This is not the same as the SNMP community.)	community
eventOwner	Entity (for example, manager) that created this event.	—
eventStatus	Status of this row (for example, valid, invalid, or createRequest).	—

Table 94 provides each field in the RMON alarmTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the `[edit snmp rmon]` hierarchy level.

Table 94: RMON Alarm Table

Field	Description	Statement [edit snmp rmon]
alarmStatus	Status of this row (for example, valid, invalid, or createRequest)	—
alarmInterval	Sampling period (in seconds) of the monitored variable	interval
alarmVariable	Object identifier (OID) and instance of the variable to be monitored	—
alarmValue	Actual value of the sampled variable	—
alarmSampleType	Sample type (absolute or delta changes)	sample-type
alarmStartupAlarm	Initial alarm (rising, falling, or either)	startup-alarm
alarmRisingThreshold	Rising threshold against which to compare the value	rising-threshold
alarmFallingThreshold	Falling threshold against which to compare the value	falling-threshold
alarmRisingEventIndex	Index (row) of the rising event in the event table	rising-event-index
alarmFallingEventIndex	Index (row) of the falling event in the event table	falling-event-index

[Table 95](#) provides each field in the jnxRmon jnxRmonAlarmTable, which is an extension to the RMON alarmTable. You can troubleshoot the RMON agent, rmopd, that runs on a switch by inspecting the contents of the jnxRmonAlarmTable object.

Table 95: jnxRmon Alarm Table

Field	Description
jnxRmonAlarmGetFailCnt	Number of times the internal Get request for the variable failed
jnxRmonAlarmGetFailTime	Value of the sysUpTime object when the last failure occurred
jnxRmonAlarmGetFailReason	Reason why the Get request failed
jnxRmonAlarmGetOkTime	Value of the sysUpTime object when the variable moved out of failure state
jnxRmonAlarmState	Status of this alarm entry

[Table 96](#) provides each field in the RMON historyControlTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the **[edit snmp rmon history]** hierarchy level. The historyControlTable controls the RMON etherHistoryTable.

Table 96: RMON History Control Table

Field	Description	Statement [edit snmp rmon history]
historyControlDataSource	Identifies the source of the data for which historical data was collected.	interface
historyControlBucketsRequested	Requested number of discrete time intervals over which data is to be saved.	bucket-size
historyControlBucketsGranted	Number of discrete sampling intervals over which data is to be saved.	—
historyControlInterval	Interval, in seconds, over which the data is sampled for each bucket.	interval
historyControlOwner	Entity that configured this entry.	owner
historyControlStatus	Status of this entry.	—

Understanding Health Monitoring

Health monitoring is an SNMP feature that extends the RMON alarm infrastructure to provide monitoring for a predefined set of objects (such as file system usage, CPU usage, and memory usage), and for Junos OS processes.

You enable the health monitor feature using the **health-monitor** statement at the **[edit snmp]** hierarchy level. You can also configure health monitor parameters such as a falling threshold, rising threshold, and interval. If the value of a monitored object exceeds the rising or falling threshold, an alarm is triggered and an event may be logged.

The falling threshold is the lower threshold for the monitored object instance. The rising threshold is the upper threshold for the monitored object instance. Each threshold is expressed as a percentage of the maximum possible value. The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

Events are only generated when a threshold is first crossed in any one direction, rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs.

System log entries for health monitor events have a corresponding HEALTHMONITOR tag and not a generic SNMPD_RMON_EVENTLOG tag. However, the health monitor sends generic RMON risingThreshold and fallingThreshold traps. You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 97](#).

Table 97: Monitored Object Instances

Object	Description
jnxHrStoragePercentUsed.1	Monitors the /dev/ad0s1a: file system on the switch. This is the root file system mounted on / .
jnxHrStoragePercentUsed.2	Monitors the /dev/ad0s1e: file system on the switch. This is the configuration file system mounted on /config .
jnxOperatingCPU (RE0)	Monitors CPU usage by the Routing Engine (RE0).
jnxOperatingBuffer (RE0)	Monitors the amount of memory available on the Routing Engine (RE0).
sysAppElmtRunCPU	Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately.
sysAppElmtRunMemory	Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.

MIB	Description
Alarm MIB (mib-jnx-chassis-alarm)	<p>Provides support for alarms from the switch.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis-alarm.txt.</p> <p>For more information, see <i>Alarm MIB</i>.</p>
Analyzer MIB (mib-jnx-analyzer)	<p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt.</p> <p>For more information, see <i>Analyzer MIB</i>.</p> <p>Not supported on OCX Series devices.</p>
Chassis MIB (mib-jnx-chassis)	<p>Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs.</p> <p>NOTE: The jnxLEDTable table has been deprecated.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis.txt.</p> <p>For more information, see <i>Chassis MIBs</i>.</p>
Chassis Definitions for Router Model MIB (mib-jnx-chas-defines)	<p>Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify routing and switching platforms and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chas-defines.txt.</p> <p>For more information, see <i>Chassis MIBs</i>.</p>
Class-of-Service MIB (mib-jnx-cos)	<p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt.</p> <p>For more information, see <i>Class-of-Service MIB</i>.</p>

Table 99: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)

MIB	Description
Configuration Management MIB (mib-jnx-cfgmgmt)	<p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt.</p> <p>For more information, see <i>Configuration Management MIB</i>.</p>
Ethernet MAC MIB (mib-jnx-mac)	<p>Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, inoctets, inframes, outoctets, and outframes on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mac.txt.</p> <p>For more information, see <i>Ethernet MAC MIB</i>.</p> <p>Not supported on OCX Series devices.</p>
Event MIB (mib-jnx-event)	<p>Defines a generic trap that can be generated using an operations script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found.</p> <p>In Junos OS release 13.2X51-D10 or later, if you configured an event policy to raise a trap when a new SNMP trap target is added, the SNMPD_TRAP_TARGET_ADD_NOTICE trap is generated with information about the new target.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-event.txt.</p> <p>For more information, see <i>Event MIB</i>.</p>
Firewall MIB (mib-jnx-firewall)	<p>Provides support for monitoring firewall filter counters.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-firewall.txt.</p> <p>For more information, see <i>Firewall MIB</i>.</p>

Table 99: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)

MIB	Description
Host Resources MIB (mib-jnx-hostresources)	<p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt.</p> <p>For more information, see <i>Host Resources MIB</i>.</p>
Interface MIB (Extensions) (mib-jnx-if-extensions)	<p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt.</p> <p>For more information, see <i>Interface MIB</i>.</p>
MPLS MIB (mib-jnx-mpls)	<p>Provides MPLS information and defines MPLS notifications.</p> <p>NOTE: This MIB is not supported on the QFX5100 switch.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls.txt.</p> <p>For more information, see <i>MPLS MIB</i>.</p>
MPLS LDP MIB (mib-jnx-mpls-ldp)	<p>Contains object definitions as described in RFC 3815, <i>Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)</i>.</p> <p>NOTE: This MIB is not supported on the QFX5100 switch.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls-ldp.txt.</p> <p>For more information, see <i>MPLS LDP MIB</i>.</p>
Ping MIB (mib-jnx-ping)	<p>Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-ping.txt.</p> <p>For more information, see <i>PING MIB</i>.</p>

Table 99: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)

MIB	Description
RMON Events and Alarms MIB (mib-jnx-rmon)	<p>Supports Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments the alarmTable object with additional information about each alarm. Two additional traps are also defined to indicate when problems are encountered with an alarm.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-rmon.txt.</p> <p>For more information, see <i>RMON Events and Alarms MIB</i>.</p>
Structure of Management Information MIB (mib-jnx-smi)	<p>Explains how the Juniper Networks enterprise-specific MIBs are structured.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-smi.txt.</p> <p>For more information, see <i>Structure of Management Information MIB</i>.</p>
System Log MIB (mib-jnx-syslog)	<p>Enables notification of an SNMP trap-based application when an important system log message occurs.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-syslog.txt.</p> <p>For more information, see <i>System Log MIB</i>.</p>
Utility MIB (mib-jnx-util)	<p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt.</p> <p>For more information, see “Utility MIB” on page 1460 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 1521.</p>
VLAN MIB (mib-jnx-vlan)	<p>Contains information about prestandard IEEE 802.10 VLANs and their association with LAN emulation clients.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-vlan.txt.</p> <p>For more information, see <i>VLAN MIB</i>.</p> <p>Not supported on OCX Series devices.</p>

MIBs Supported on QFabric Systems

The QFabric systems support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- [Table 100](#) for standard MIBs.
- [Table 101](#) for Juniper Networks enterprise-specific MIBs.

Table 100: Standard MIBs Supported on QFabric Systems

RFC	Additional Information
RFC 1155, <i>Structure and Identification of Management Information for TCP/IP-based Internets</i>	—
RFC 1157, <i>A Simple Network Management Protocol (SNMP)</i>	—
RFC 1212, <i>Concise MIB Definitions</i>	—
RFC 1213, <i>Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II</i>	<p>The following areas are supported:</p> <ul style="list-style-type: none"> • MIB II and its SNMP version 2 derivatives, including: <ul style="list-style-type: none"> • Statistics counters • IP, except for ipRouteTable, which has been replaced by ipCidrRouteTable (RFC 2096, <i>IP Forwarding Table MIB</i>) • ipAddrTable • SNMP management • Interface management • SNMPv1 Get, GetNext requests, and version 2 GetBulk request • Junos OS-specific secured access list • Master configuration keywords • Reconfigurations upon SIGHUP
RFC 1215, <i>A Convention for Defining Traps for use with the SNMP</i>	Support is limited to MIB II SNMP version 1 traps and version 2 notifications.
RFC 1286, <i>Definitions of Managed Objects for Bridges</i>	—
RFC 1901, <i>Introduction to Community-based SNMPv2</i>	—
RFC 1905, <i>Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)</i>	—
RFC 1907, <i>Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)</i>	—

Table 100: Standard MIBs Supported on QFabric Systems (*continued*)

RFC	Additional Information
RFC 2011, <i>SNMPv2 Management Information Base for the Internet Protocol Using SMIv2</i>	NOTE: On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.
RFC 2012, <i>SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2</i>	—
RFC 2013, <i>SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2</i>	—
RFC 2233, <i>The Interfaces Group MIB Using SMIv2</i>	<p>NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.</p> <p>NOTE: The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.</p>
RFC 2571, <i>An Architecture for Describing SNMP Management Frameworks</i> (read-only access)	NOTE: RFC 2571 has been replaced by RFC 3411. However, Junos OS supports both RFC 2571 and RFC 3411.
RFC 2572, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i> (read-only access)	NOTE: RFC 2572 has been replaced by RFC 3412. However, Junos OS supports both RFC 2572 and RFC 3412.
RFC 2576, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i>	NOTE: RFC 2576 has been replaced by RFC 3584. However, Junos OS supports both RFC 2576 and RFC 3584.
RFC 2578, <i>Structure of Management Information Version 2 (SMIv2)</i>	—
RFC 2579, <i>Textual Conventions for SMIv2</i>	—
RFC 2580, <i>Conformance Statements for SMIv2</i>	—

Table 100: Standard MIBs Supported on QFabric Systems (*continued*)

RFC	Additional Information
RFC 2665, <i>Definitions of Managed Objects for the Ethernet-like Interface Types</i>	<p>The QFabric system supports the following tables only:</p> <ul style="list-style-type: none"> dot3StatsTable—There is one row with statistics for each Ethernet-like interface in the QFabric system. The dot3StatsIndex is an interface index that is unique across the system. dot3ControlTable—There is one row in this table for each Ethernet-like interface in the QFabric system that implements the MAC control sublayer. OIDs supported are dot3ControlFunctionsSupported and dot3ControlInUnknownOpcode. dot3PauseTable—There is one row in this table for each Ethernet-like interface in the QFabric system that supports the MAC control PAUSE function. OIDs supported are dot3PauseAdminMode, dot3PauseOperMode, dot3InPauseFrames, and dot3OutPauseFrames. <p>NOTE: Scalar variables are not supported on the QFabric system.</p>
RFC 2863, <i>The Interfaces Group MIB</i>	<p>NOTE: RFC 2233 has been replaced by RFC 2863. However, Junos OS supports both RFC 2233 and RFC 2863.</p> <p>NOTE: The QFabric system supports the following objects only: ifNumber, ifTable, and ifxTable.</p>
RFC 2933, <i>Internet Group Management Protocol (IGMP) MIB</i>	—
RFC 3410, <i>Introduction and Applicability Statements for Internet Standard Management Framework</i>	—
RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i>	NOTE: RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.
RFC 3412, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i>	NOTE: RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.
RFC 3416, <i>Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)</i>	NOTE: RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.
RFC 3417, <i>Transport Mappings for the Simple Network Management Protocol (SNMP)</i>	—
RFC 3418, <i>Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)</i>	NOTE: RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.
RFC 3584, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i>	—

Table 100: Standard MIBs Supported on QFabric Systems (*continued*)

RFC	Additional Information
RFC 4188, <i>Definitions of Managed Objects for Bridges</i>	<p>The QFabric system support is limited to the following objects:</p> <ul style="list-style-type: none"> Under the dot1dBase OID, the dot1dBasePortTable table supports only the first two columns in the table: dot1dBasePort and dot1dBasePortIfIndex. The system does not implement the optional traps supporting dot1dNotifications (dot1dBridge 0). Under the dot1dStp OID, supports only the dot1dStpPortTable table. Does not support the scalar variables under dot1dStp. The system does not support scalar variables under dot1dTp, but under that, the dot1dTpFdbTable table is supported (dot1dBridge 4). For OIDs with tables support only, scalar values that are returned by the SNMP agent may not be meaningful and are therefore not recommended for use. <p>Not supported on OCX Series devices.</p>
RFC 4293, <i>Management Information Base for the Internet Protocol (IP)</i>	<p>Supports the ipAddrTable table only.</p> <p>On the QFabric system, supported objects in the ipAddrTable table include: ipAdEntAddr, ipAdEntIfIndex, ipAdEntNetMask, ipAdEntBcastAddr, and ipAdEntReasmMaxSize.</p> <p>NOTE: On the QFabric system, for the SNMP mibwalk request to work, you must configure the IP address of at least one interface besides the management Ethernet interfaces (me0 and me1) in the Director group.</p>
RFC 4363b, <i>Q-Bridge VLAN MIB</i>	<p>The QFabric system supports the following tables only:</p> <ul style="list-style-type: none"> dot1qTpFdbTable dot1qVlanStaticTable dot1qPortVlanTable dot1qFdbTable <p>Not supported on OCX Series devices.</p>

NOTE: QFabric-specific MIBs are not supported on OCX Series devices.

Table 101: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems

MIB	Description
Analyzer MIB (mib-jnx-analyzer)	<p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>The QFabric system supports:</p> <ul style="list-style-type: none"> Analyzer table—jnxAnalyzerName, jnxMirroringRatio, jnxLossPriority. Analyzer input table—jnxAnalyzerInputValue, jnxAnalyzerInputOption, jnxAnalyzerInputType. Analyzer output table—jnxAnalyzerOutputValue, jnxAnalyzerOutputType. <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt.</p> <p>For more information, see <i>Analyzer MIB</i>.</p>
Chassis MIB (mib-jnx-chassis)	<p>NOTE: The Chassis MIB has been deprecated for the QFabric system. We recommend that you use the Fabric Chassis MIB (mib-jnx-fabric-chassis) for information about the QFabric system.</p>
Class-of-Service MIB (mib-jnx-cos)	<p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>The QFabric system supports the following tables and objects:</p> <ul style="list-style-type: none"> Jnxcosifstatflagtable—jnxCosIfstatFlags and jnxCosIfIndex. Jnxcosqstattable—jnxCosQstatTxedPkts, jnxCosQstatTxedPktRate, jnxCosQstatTxedBytes, and jnxCosQstatTxedByteRate. Jnxcosfcidtable—jnxCosFcIdToFcName. Jnxcosfctable—jnxCosFcQueueNr. <p>The QFabric system does not support any traps for this MIB.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt.</p> <p>For more information, see <i>Class-of-Service MIB</i>.</p>

Table 101: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems (*continued*)

MIB	Description
Configuration Management MIB (mib-jnx-cfgmgmt)	<p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p>NOTE: On the QFabric system, these conditions apply:</p> <ul style="list-style-type: none"> • All scalar variables under the jnxCmCfgChg table are supported. • Supported scalar OIDs are jnxCmCfgChgLatestIndex, jnxCmCfgChgLatestTime, jnxCmCfgChgLatestDate, jnxCmCfgChgLatestSource, jnxCmCfgChgLatestUser, and jnxCmCfgChgMaxEventEntries. • Scalar variables under the jnxCmRescueChg table are not supported. <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt.</p> <p>For more information, see <i>Configuration Management MIB</i>.</p>
Fabric Chassis MIB (mib-jnx-fabric-chassis)	<p>Provides hardware information about the QFabric system and its component devices. This MIB is based on the Juniper Networks enterprise-specific Chassis MIB but adds another level of indexing that provides information for QFabric system component devices.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt.</p> <p>For more information, see <i>Fabric Chassis MIB</i>.</p>
Interface MIB (Extensions) (mib-jnx-if-extensions)	<p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p>NOTE: On the QFabric system, scalar variables are not supported.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt.</p> <p>For more information, see <i>Interface MIB</i>.</p>
Power Supply Unit MIB (mib-jnx-power-supply-unit)	<p>Provides support for environmental monitoring of the power supply unit for the Interconnect device of the QFabric system.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-power-supply-unit.txt.</p> <p>For more information, see <i>Power Supply Unit MIB</i>.</p> <p>NOTE: On the QFabric system, scalar variables for the jnxPsuObjects 1 object ID in the jnxPsuScalars table are not supported.</p>

Table 101: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems (*continued*)

MIB	Description
QFabric MIB (jnx-qf-smi)	<p>Explains how the Juniper Networks enterprise-specific QFabric MIBs are structured. Defines the MIB objects that are reported by the QFabric system and the contents of the traps that can be issued by the QFabric system.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-qf-smi.txt.</p>
Utility MIB (mib-jnx-util)	<p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt.</p> <p>For more information, see “Utility MIB” on page 1460 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 1521.</p>

SNMP Traps Support

The QFX Series standalone switches, QFX Series Virtual Chassis, and QFabric systems support standard SNMP traps and Juniper Networks enterprise-specific traps.

For more information, see:

- *SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis on page 1484*
- *SNMP Traps Supported on QFabric Systems on page 1493*

SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

QFX Series standalone switches and QFX Series Virtual Chassis support SNMPv1 and v2 traps. For more information, see:

- *SNMPv1 Traps on page 1484*
- *SNMPv2 Traps on page 1489*

SNMPv1 Traps

QFX Series standalone switches and QFX Series Virtual Chassis support both standard SNMPv1 traps and Juniper Networks enterprise-specific SNMPv1 traps. See:

- [Table 102](#) for standard SNMPv1 traps.
- [Table 103](#) for enterprise-specific SNMPv1 traps.

The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

SNMP Traps Supported on QFabric Systems

QFabric systems support standard SNMPv2 traps and Juniper Networks enterprise-specific SNMPv2 traps.

NOTE: QFabric systems do not support SNMPv1 traps.

For more information, see:

- [Table 106](#) for standard SNMPv2 traps

- [Table 107](#) for Juniper Networks enterprise-specific SNMPv2 traps

Table 106: Standard SNMPv2 Traps Supported on QFabric Systems

Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series and OCX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
  }
}
```

```
logical-system logical-system-name {  
    routing-instance routing-instance-name {  
        clients {  
            addresses;  
        }  
    }  
}  
routing-instance routing-instance-name {  
    clients {  
        addresses;  
    }  
}  
view view-name;  
}

Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```

[edit snmp]
community name {
    authorization authorization;
    clients {
        default restrict;
        address restrict;
    }
    view view-name;
}

```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see [“Configuring MIB Views” on page 1506](#).

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local switch.

NOTE: Community names must be unique within each SNMP system.

Related Documentation

- [Configuring SNMP on page 1499](#)

Configuring SNMP Trap Groups

Before any SNMP traps can be sent, you must configure a trap group, the categories of traps the group can receive, and the targets (systems) that will receive the traps. To create and name an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 address of each recipient and not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement.

A trap group can receive the following categories of traps:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications such as up-down transitions
- **remote-operations**—Remote operation notifications
- **startup**—System warm and cold starts

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name** *name* statement at the **[edit snmp community community-name]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  client-list client-list-name {
    ip-addresses;
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list** statement, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community community-name]** hierarchy level:

```
[edit snmp community community-name]
  client-list-name client-list-name;
```

NOTE: The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
  client-list clentlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
```

The following example shows how to add a client list to an SNMP community:

```
[edit]
snmp {
  community community1 {
    authorization read-only;
    client-list-name clientlist1;
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
  prefix-list prefixlist {
```

```
10.3.3.3/32;  
10.5.5.5/32;  
}  
}  
snmp {  
  community community2 {  
    client-list-name prefixlist;  
  }  
}
```

- Related Documentation**
- [client-list on page 1613](#)
 - [client-list-name on page 1614](#)

Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]  
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

 - *Example: Configuring Secured Access List Checking*

Configuring MIB Views

SNMPv3 defines the concept of MIB views in RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*. MIB views provide an agent better control over who can access specific branches and objects within its MIB tree. A view consists of a name and a collection of SNMP object identifiers, which are either explicitly included or excluded. Once defined, a view is then assigned to an SNMPv3 group or SNMPv1/v2c community (or multiple communities), automatically masking which parts of the agent's MIB tree members of the group or community can (or cannot) access.

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To configure MIB views, include the **view** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]  
view view-name {
```

```
oid object-identifier (include | exclude);
}
```

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as **1.3.6.1.2.1.2**) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

NOTE: To remove an OID completely, use the **delete view all oid *oid-number*** command but omit the **include** parameter.

To associate MIB views with a community, include the **view** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]
view view-name;
```

For more information about the Ping MIB, see RFC 2925 and the *PING MIB* topic.

Configuring RMON Alarms and Events

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

To configure RMON alarms and events using the CLI, perform these tasks:

1. [Configuring SNMP on page 1508](#)
2. [Configuring an Event on page 1508](#)
3. [Configuring an Alarm on page 1509](#)

Configuring SNMP

To configure SNMP:

1. Grant read-only access to all SNMP clients:

```
[edit snmp]
user@switch# set community community-name authorization authorization
```

For example:

```
[edit snmp]
user@switch# set community public authorization read-only
```

2. Grant read-write access to the RMON and jnx-rmon MIBs:

```
[edit snmp]
user@switch# set view view-name oid object-identifier include
user@switch# set view view-name oid object-identifier include
user@switch# set community community-name authorization authorization view view-name
```

For example:

```
[edit snmp]
user@switch# set view rmon-mib-view oid .1.3.6.1.2.1.16 include
user@switch# set view rmon-mib-view oid .1.3.6.1.4.1.2636.13 include
user@switch# set community private authorization read-write view rmon-mib-view
```

OIDs 1.3.6.1.2.1.16 and 1.3.6.1.4.1.2636.13 correspond to the RMON and jnxRmon MIBs.

3. Configure an SNMP trap group:

```
[edit snmp]
user@switch# set trap-group group-name categories category
user@switch# set trap-group group-name targets address
```

For example:

```
[edit snmp]
user@switch# set trap-group rmon-trap-group categories rmon-alarm
user@switch# set trap-group rmon-trap-group targets 192.168.5.5
```

The trap group **rmon-trap-group** is configured to send RMON traps to 192.168.5.5.

Configuring an Event

To configure an event:

1. Configure an event index, community name, and type:

```
[edit snmp rmon]
user@switch# set event index community community-name type type
```

For example:

```
[edit snmp rmon]
user@switch# set event 1 community rmon-trap-group type log-and-trap
```

The event community corresponds to the SNMP trap group and is not the same as an SNMP community. This event generates an SNMP trap and adds an entry to the **logTable** in the RMON MIB.

2. Configure a description for the event:

```
[edit snmp rmon]
user@switch# set event index description description
```

For example:

```
[edit snmp rmon]
user@switch# set event 1 description "rmon event"
```

Configuring an Alarm

To configure an alarm:

1. Configure an alarm index, the variable to monitor, the rising and falling thresholds, and the corresponding rising and falling events:

```
[edit snmp rmon]
user@switch# set alarm index variable oid-variable falling-threshold integer rising-threshold
integer rising-event-index index falling-event-index index
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 falling-threshold 75
rising-threshold 90 rising-event-index 1 falling-event-index 1
```

The variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 corresponds to the `jnxRmon` MIB object `jnxOperatingCPU`, which represents the CPU utilization of the Routing Engine. The falling and rising threshold integers are 75 and 90. The rising and falling events both generate the same event (event index 1).

2. Configure the sample interval and type and the alarm type:

```
[edit snmp rmon]
user@switch# set alarm index interval seconds sample-type (absolute-value | delta-value)
startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm)
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 interval 30 sample-type absolute-value
startup-alarm rising-or-falling-alarm
```

The absolute value of the monitored variable is sampled every 30 seconds. The initial alarm can occur because of rising above the rising threshold or falling below the falling threshold.

Configuring Health Monitoring

This topic describes how to configure the health monitor feature for QFX Series and OCX Series devices.

The health monitor feature extends the SNMP RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (such as file system usage,

CPU usage, and memory usage) and dynamic object instances (such as Junos OS processes).

To configure health monitoring:

1. Configure the health monitor:

```
[edit snmp]
user@switch# set health-monitor
```

2. Configure the falling threshold:

```
[edit snmp]
user@switch# set health-monitor falling-threshold percentage
```

For example:

```
user@switch# set health-monitor falling-threshold 85
```

3. Configure the rising threshold:

```
[edit snmp]
user@switch# set health-monitor rising-threshold percentage
```

For example:

```
user@switch# set health-monitor rising-threshold 75
```

4. Configure the interval:

```
[edit snmp]
user@switch# set health-monitor interval seconds
```

For example:

```
user@switch# set health-monitor interval 600
```

Related Documentation

- [rising-threshold \(Health Monitor\) on page 1653](#)

Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

NOTE: You can configure only one encryption type for each SNMPv3 user.

To create users, include the `user` statement at the `[edit snmp v3 usm local-engine]` hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

`username` is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the `[edit snmp v3 usm local-engine user username]` hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
  privacy-password privacy-password;
}
privacy-3des {
  privacy-password privacy-password;
}
privacy-none;
```

Related Documentation

- [Example: SNMPv3 Configuration](#)

Configuring Access Privileges for a Group

In SNMPv3, you can configure a group that sets the same access privileges for one or more users. Configuring a group includes defining the security model and security level, and associating one or more MIB view permissions for the group.

NOTE: You must associate at least one MIB view with the group. You can associate multiple MIB views (read, notify, write) to authorize different permissions based on the view. The view name cannot exceed 32 characters.

To configure access privileges for a group:

1. To configure the group:

```
[edit snmp v3 vacm access]
user@switch# edit group group-name
```

2. To configure the context prefix of the SNMP instance for the group:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit (default-context-prefix | context-prefix context-prefix)
```

For example, to configure the default context prefix:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit default-context-prefix
```

3. To configure the security model:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
user@switch# edit security-model (any | usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix)]
user@switch# edit security-model usm
```

4. To configure the security level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level (authentication | none | privacy)
```

For example, to configure a security level requiring user authentication and encryption:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level privacy
```

NOTE: Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or v2c security model, use *none* as your security level. If you are configuring the SNMPv3 security model (USM), use the *authentication*, *none*, or *privacy* security level.

5. (Optional) To associate a read-only MIB view with an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit read-view view-name
```

6. (Optional) To associate a MIB view with an SNMP notification permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit notify-view view-name
```

7. (Optional) To associate a MIB view with write permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit write-view view-name
```

 - [Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1461](#)

Assigning a Security Name to a Group

In SNMPv3, each username is associated with a security name. The security name, together with the SNMP engine ID, is included in SNMP messages to ensure messaging security.

Before you assign a security name to a group, first create the security name. For an SNMPv3 client, the security name is the username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 or v2c clients, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Assigning a security name to a group includes configuring a security model for the group, assigning the security name to the group, and configuring the group.

To assign an SNMP security name to a group:

1. To configure a security model for the group:

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model (usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model usm
```

2. To associate the security name with a group:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
user@switch# edit security-name security-name
```

3. To configure a group of SNMPv3 security names with the same security policy:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
security-name]
user@switch# edit group group-name
```

Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 1515](#).

The target address defines a management application’s address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

NOTE: When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the `[edit snmp v3 vacm access]` and `[edit snmp v3 vacm security-to-group]` hierarchy levels.

To configure SNMP traps, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
  notify name {
    tag tag-name;
    type trap;
  }
  notify-filter name {
    oid object-identifier (include | exclude);
  }
  target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system (SNMP) logical-system;
    port port-number;
    routing-instance instance;
    tag-list tag-list;
    target-parameters target-parameters-name;
  }
  target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
      message-processing-model (v1 | v2c | v3);
      security-level (authentication | none | privacy);
      security-model (usm | v1 | v2c);
      security-name security-name;
    }
  }
}
```

Configuring SNMP Informs

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 19](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

Figure 19: Inform Request and Response

For information about configuring SNMP traps, see [“Configuring SNMPv3 Traps on a Device Running Junos OS” on page 1514](#).

Monitoring RMON MIB Tables

Purpose Monitor remote monitoring (RMON) alarm, event, and log tables.

Action To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State

      5 monitor
      jnxOperatingCPU.9.1.0.0                        5 falling threshold

Event
Index  Type                               Last Event
      1 log and trap                     2010-07-10 11:34:17 PDT
Event Index: 1
  Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
  Time: 2010-07-10 11:34:07 PDT
  Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
  Time: 2010-07-10 11:34:17 PDT
```

Meaning The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.

- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                               Value State

32768 Health Monitor: root file system utilization
      jnxHrStoragePercentUsed.1                      58 active

32769 Health Monitor: /config file system utilization
      jnxHrStoragePercentUsed.2                      0 active

32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                        0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0                    35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                                   0 active
      Chassis daemon                               50 active
      Firewall daemon                              0 active
      Interface daemon                             5 active
      SNMP daemon                                  11 active
      MIB2 daemon                                  42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system

sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx

Build date: 2010-09-26 06:00:10 U

Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
 - chassisd
 - craftd
 - ilmid
 - mib2d
 - rmopd
 - serviced
 - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]  
traceoptions {
```

```

file <files number> <match regular-expression> <size size> <world-readable |
no-world-readable>;
flag flag;
memory-trace;
no-remote-trace;
no-default-memory-trace;
}

```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 1519](#)
- [Configuring Access to the Log File on page 1519](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 1520](#)
- [Configuring the Trace Operations on page 1520](#)

Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```

[edit snmp traceoptions]
file files number size size;

```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```

[edit snmp traceoptions]
file world-readable;

```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```

[edit snmp traceoptions]
file no-world-readable;

```

Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

Table 108 describes the meaning of the SNMP tracing flags.

Table 108: SNMP Tracing Flags

Flag	Description	Default Setting
all	Log all operations.	Off
configuration	Log reading of the configuration at the [edit snmp] hierarchy level.	Off
database	Log events involving storage and retrieval in the events database.	Off
events	Log important events.	Off
general	Log general events.	Off
interface-stats	Log physical and logical interface statistics.	Off

Table 108: SNMP Tracing Flags (*continued*)

Flag	Description	Default Setting
nonvolatile-set	Log nonvolatile SNMP set request handling.	Off
pdu	Log SNMP request and response packets.	Off
policy	Log policy processing.	Off
protocol-timeouts	Log SNMP response timeouts.	Off
routing-socket	Log routing socket calls.	Off
server	Log communication with processes that are generating events.	Off
subagent	Log subagent restarts.	Off
timer	Log internal timer events.	Off
varbind-error	Log variable binding errors.	Off

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though the Junos OS has built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, the Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**. You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using

CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- **request snmp utility-mib set** instance *name* object-type <counter | counter 64 | integer | string | unsigned integer> object-value *value*
- **request snmp utility-mib clear** instance *name* object-type <counter | counter 64 | integer | string | unsigned integer>

The **instance *name*** option of the **request snmp utility-mib <set | clear>** command specifies the name of the data instance and is the main identifier of the data. The **object-type <counter | counter 64 | integer | string | unsigned integer>** option enables you specify the object type, and the **object-value *value*** option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

Event Policy Configuration

To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the **[edit]** hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 3600;
  }
  policy Mbufs {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

check-mbufs.slax Script

The following example shows the **check-mbufs.slax** script that is stored under **/var/db/scripts/event/**:

```
----- script START -----
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
  <op-script-results>{
    var $cmd = <command> "show system buffers";
    var $out = jcs:invoke($cmd);
```

```

var $lines = jcs:break_lines($out);
for-each ($lines) {
    if (contains(., "current/peak/max")) {
        var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
        var $split = jcs:regex($pattern, .);
        var $result = $split[2];

        var $rpc = <request-snmp-utility-mib-set> {
            <object-type> "integer";
            <instance> "current-mbufs";
            <object-value> $result;
        }
        var $res = jcs:invoke($rpc);
    }
}
}
----- script END -----

```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```

user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
regress@caramels>

```

NOTE: The `show snmp mib walk` command is not available on the QFabric system, but you can use external SNMP client applications to perform this operation.

- [Configuring Options on Managed Devices for Better SNMP Response Time](#)
- [Managing Traps and Informs](#)
- [Understanding the Implementation of SNMP on the QFabric System](#)

Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- [Requirements on page 1524](#)
- [Overview on page 1524](#)
- [Configuration on page 1524](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name "snmp qfabric" description "qfabric0 switch"
set snmp location "Lab 4 Row 11" contact "qfabric-admin@qfabric0"
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

NOTE: If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

```
[edit snmp]
user@switch# set name "snmp qfabric"
```

2. Specify a description.

```
[edit snmp]
user@switch# set description "qfabric0 system"
```

This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

```
[edit snmp]
user@switch# set location "Lab 4 Row 11"
```

This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

```
[edit snmp]
user@switch# set contact "qfabric-admin@qfabric0"
```

This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

NOTE: The read-write option is not supported on the QFabric system.

```
[edit snmp]
user@switch# set community public authorization read-only
```

6. Create a client list with a set of IP addresses that can use the SNMP community.

```
[edit snmp]
user@switch# set client-list list0 192.168.0.0/24
user@switch# set community public client-list-name list0
```

7. Specify IP addresses of clients that are restricted from using the community.

```
[edit snmp]
user@switch# set community public clients 192.170.0.0/24 restrict
```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

NOTE: You do not need to include the destination-port statement if you use the default port 162.

The trap group qf-traps is configured to send traps to 192.168.0.100.

Results From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
```

```
user@switch# show
snmp {
  name "snmp qfabric";
  description "qfabric0 system";
  location "Lab 4 Row 11";
  contact "qfabric-admin@qfabric0";
  client-list list0 {
    192.168.0.0/24;
  }
  community public {
    authorization read-only;
    clients {
      197.170.0.0/24 restrict;
    }
  }
  trap-group qf-traps {
    destination-port 155;
    targets {
      192.168.0.100;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

Overview of Junos OS System Log Messages

The Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Messages Reference*.

NOTE: OCX Series switches comprise both the Junos OS and the host operating system (OS). For information about system logging on the host OS, see [“Managing Host OS System Log and Core Files” on page 1553](#).

Related Documentation

- [Junos OS System Log Configuration Statements on page 1530](#)
- [Junos OS Minimum System Logging Configuration on page 1530](#)

Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1544](#).

You direct messages to one or more destinations by including the appropriate statement at the **[edit system syslog]** hierarchy level:

- To a named file in a local file system, by including the **file** statement. See [“Directing System Log Messages to a Log File” on page 1532](#).
- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the **user** statement. See [“Directing System Log Messages to a User Terminal” on page 1533](#).

- To the switch console, by including the **console** statement. See [“Directing System Log Messages to the Console” on page 1534](#).
- To a remote machine that is running the **syslogd** utility, by including the **host** statement. See [“Directing System Log Messages to a Remote Machine” on page 1533](#).

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see [“Logging Messages in Structured-Data Format” on page 1538](#).
- A message’s facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 1536](#).
- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see [“Including the Year or Millisecond in Timestamps” on page 1537](#).
- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see [“Directing System Log Messages to a Remote Machine” on page 1533](#).
- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 1551](#).

NOTE: During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in [Table 109](#). For more information about the configuration statements, see *Single-Chassis System Logging Configuration Overview*.

Table 109: Minimum Configuration Statements for System Logging

Destination	Minimum Configuration Statements
File	<pre>[edit system syslog] file filename { facility severity; }</pre>
Terminal session of one, several, or all users	<pre>[edit system syslog] user (username *) { facility severity; }</pre>
Router or switch console	<pre>[edit system syslog] console { facility severity; }</pre>
Remote machine or the other Routing Engine on the router or switch	<pre>[edit system syslog] host (hostname other-routing-engine) { facility severity; }</pre>

Related Documentation

- [Junos OS System Log Overview](#)

Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the **syslog** statement at the **[edit system]** hierarchy level:

```
[edit system]
syslog {
    archive <files number> <size size> <world-readable | no-world-readable>;
    console {
        facility severity;
    }
    file filename {
```

```

    facility severity;
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
        <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
        no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
        brief;
    }
}
host hostname {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string
    match "regular-expression";
}
source-address source-address;
time-format (year | millisecond | year millisecond);
user (username | *) {
    facility severity;
    match "regular-expression";
}
}

```

Related Documentation • [Overview of Junos OS System Log Messages on page 1528](#)

Adding a Text String to System Log Messages

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```

[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;

```

The string can contain any alphanumeric or special character except the equal sign (=) and the colon (:). It also cannot include the space character; do not enclose the string in quotation marks (" ") in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```

[edit system syslog]
host hardware-logger.mycompany.com {
    any info;
    log-prefix M120;
}

```

When these configuration statements are included on an M120 router called origin1, a message in the system log on hardware-logger.mycompany.com looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run show version'
```

- [Single-Chassis System Logging Configuration Overview](#)
 - [Specifying Log File Size, Number, and Archiving Properties on page 1543](#)

Directing System Log Messages to a Log File

To direct system log messages to a file in the `/var/log` directory of the local Routing Engine, include the `file` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
file filename {
  facility severity;
  archive <archive-sites (ftp-url <password password>) > <files number> <size size>
    <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
    no-world-readable>;
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

For the list of facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1544](#).

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the `archive` statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see [“Specifying Log File Size, Number, and Archiving Properties” on page 1543](#).

For information about the following statements, see the indicated sections:

- **explicit-priority**—See [“Including Priority Information in System Log Messages” on page 1536](#)
- **match**—See [“Using Regular Expressions to Refine the Set of Logged Messages” on page 1551](#)
- **structured-data**—See [Logging Messages in Structured-Data Format](#)

- Related Documentation**
- [Single-Chassis System Logging Configuration Overview](#)
 - [Examples: Configuring System Logging](#)

Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the **host** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
  facility severity;
  explicit-priority;
  facility-override facility;
  log-prefix string;
  match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the **host hostname** statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard **syslogd** utility. We do not recommend directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the **host** statement, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1544](#).

To record facility and severity level information in each message, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 1536](#).

For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 1551](#).

When directing messages to remote machines, you can include the **source-address** statement to specify the IP address of the switch that is reported in the messages as their source. In each **host** statement, you can also include the **facility-override** statement to assign an alternative facility and the **log-prefix** statement to add a string to each message.

Related Documentation

- [Overview of Single-Chassis System Logging Configuration on page 1528](#)

Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
  facility severity;
  match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1544](#). For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 1551](#).

- Related Documentation**
- *Single-Chassis System Logging Configuration Overview*
 - *Examples: Configuring System Logging*

Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
  console {
    facility severity;
  }
```

For the list of logging facilities and severity levels, see [“Specifying the Facility and Severity of Messages to Include in the Log” on page 1544](#).

- Related Documentation**
- *Single-Chassis System Logging Configuration Overview*
 - *Examples: Configuring System Logging*

Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the **facility none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include the **any severity** statement and then a **facility none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
  console {
    any error;
    daemon none;
    kernel none;
  }
  file internals {
    daemon info;
    kernel info;
  }
```

- Related Documentation**

Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

- [Interpreting Messages Generated in Structured-Data Format on page 1539](#)

Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]  
facility severity;  
explicit-priority;
```

NOTE: Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Reference for Security Devices*.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the **[edit system syslog host (*hostname* | other-routing-engine)]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]  
facility severity;  
explicit-priority;
```

NOTE: The **other-routing-engine** option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see [“Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination” on page 1549](#).

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

```
FACILITY-severity[-TAG]
```

(The tag is a unique identifier assigned to some Junos OS system log messages.)

In the following example, the **CHASSISD_PARSE_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info** (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
configuration
```

For more information about message formatting, see the *Junos OS System Log Reference for Security Devices*.

Documentation**

- *Single-Chassis System Logging Configuration Overview*
- *Examples: Configuring System Logging*

Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 15:36:30
```

To include the year, the millisecond, or both, in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Aug 21 15:36:30.401 2010
```

NOTE: By default, messages logged in structured-data format include the year and millisecond. If you include the structured-data statement at the [edit system syslog file *filename*] hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see “[Logging Messages in Structured-Data Format](#)” on page 1538. For information about interpreting messages in a structured-data format, see “[Interpreting Messages Generated in Structured-Data Format](#)” on page 1539.

Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft **draft-ietf-syslog-protocol-21.txt**. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the [edit system syslog file *filename*] hierarchy level:

```
[edit system syslog file filename]  
  facility severity;  
  structured-data {  
    brief;  
  }
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data-format message, see “[Interpreting Messages Generated in Structured-Data Format](#)” on page 1539.

The structured format is used for all messages logged to the file that are generated by a Junos OS process or software library.

NOTE: If you include either or both of the explicit-priority and time-format statements along with the structured-data statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

Interpreting Messages Generated in Structured-Data Format

By default, Junos OS processes and software libraries write messages to the system log file in structured-data format. For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*.

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

```
<priority code>version timestamp hostname process processID TAG [junos@2636.platform
variable-value-pairs] message-text
```

Table 110 describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen (-) appears instead.

Table 110: Fields in Structured-Data Messages

Field	Description	Examples
<i><priority code></i>	Number that indicates the facility and severity of a message. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see “Specifying the Facility and Severity of Messages to Include in the Log” on page 1544 .	<165> for a message from the pfe facility (facility=20) with severity notice (severity=5).
<i>version</i>	Version of the Internet Engineering Task Force (IETF) system logging protocol specification.	1 for the initial version
<i>timestamp</i>	Time when the message was generated, in one of two representations: <ul style="list-style-type: none"> YYYY-MM-DDTHH:MM:SS.MSZ is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC) YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC 	2007-02-15T09:17:15.719Z is 9:17 AM UTC on 15 February 2007. 2007-02-15T01:17:15.719-08:00 is the same timestamp expressed as Pacific Standard Time in the United States.
<i>hostname</i>	Name of the host that originally generated the message.	switch1

Table 110: Fields in Structured-Data Messages (*continued*)

Field	Description	Examples
<i>process</i>	Name of the Junos OS process that generated the message.	mgd
<i>processID</i>	UNIX process ID (PID) of the Junos process that generated the message.	3046
<i>TAG</i>	Junos OS system log message tag, which uniquely identifies the message.	UI_DBASE_LOGOUT_EVENT
<i>junos@2636.platform</i>	An identifier for the type of hardware platform that generated the message. The junos@2636 prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type.	junos@2636.1.1.1.2.18
<i>variable-value-pairs</i>	A variable-value pair for each element in the <i>message-text</i> string that varies depending on the circumstances that triggered the message. Each pair appears in the format <i>variable</i> = " <i>value</i> ".	username="regress"
<i>message-text</i>	English-language description of the event or error (omitted if the brief statement is included at the [edit system syslog file <i>filename</i> structured-data] hierarchy level).	User 'regress' exiting configuration mode

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"] User 'regress' exiting configuration mode
```

When the brief statement is included at the [edit system syslog file *filename* structured-data] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"]
```

Table 111 maps the codes that appear in the *priority-code* field to facility and severity level.

NOTE: Not all of the facilities and severities listed in Table 111 can be included in statements at the [edit system syslog] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see “Specifying the Facility and Severity of Messages to Include in the Log” on page 1544.

Table 111: Facility and Severity Codes in the priority-code Field

Facility (number)	Severity emergency	alert	critical	error	warning	notice	info	debug
kernel (0)	1	1	2	3	4	5	6	7
user (1)	8	9	10	11	12	13	14	15

Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the **explicit-priority** statement is included at the `[edit system syslog file filename]` or `[edit system syslog host hostname]` hierarchy level, a system log message has the following syntax:

```
timestamp message-source: %facility-severity-TAG: message-text
```

- When directed to the console or to users, or when the **explicit-priority** statement is not included for files or remote hosts, a system log message has the following syntax:

```
timestamp message-source: TAG: message-text
```

Table 112 describes the message fields.

Table 112: Fields in Standard-Format Messages

Field	Description
<i>timestamp</i>	Time at which the message was logged.
<i>message-source</i>	Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format: <i>hostname process[process-ID]</i>
<i>facility</i>	Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: Facility Codes Reported in Priority Information in “Including Priority Information in System Log Messages” on page 1536.
<i>severity</i>	Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: Numerical Codes for Severity Levels Reported in Priority Information in “Including Priority Information in System Log Messages” on page 1536.
<i>TAG</i>	Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix. Not all processes on a routing platform use tags, so this field does not always appear.
<i>message-text</i>	Text of the message.

Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos OS system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called **logfile** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file **logfile.0.gz**. The logging utility then opens and writes to a new active file called **logfile**. This process is also known as file rotation. When the new **logfile** reaches the configured maximum size, **logfile.0.gz** is renamed **logfile.1.gz**, and the new **logfile** is closed, compressed, and renamed **logfile.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the **root** user and users who have Junos OS **maintenance** permission.

Junos OS provides a configuration statement **log-rotate-frequency** that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the **log-rotate-frequency** statement at the **[edit system syslog]** hierarchy level.

You can include the **archive** statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the **archive** statement at the **[edit system syslog]** hierarchy level:

```
archive <files number> <size size> <world-readable | no-world-readable>;
```

To configure values that apply to a specific log file, include the **archive** statement at the **[edit system syslog file filename]** hierarchy level:

```
archive <archive-sites (ftp-url <password password>)> <files number> <size size>
  <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
  no-world-readable>;
```

archive-sites site-name specifies a list of archive sites that you want to use for storing files. The **site-name** value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list,

moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see [Format for Specifying Filenames and URLs in Junos OS CLI Commands](#).

binary-data Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the **no-binary-data** statement.

files number specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

size size specifies the maximum size of each file. The value can be from 64 KB (64k) through 1 gigabyte (1g); to represent megabytes, use the letter **m** after the integer. There is no space between the digits and the **k**, **m**, or **g** units letter.

start-time "YYYY-MM-DD.hh:mm" defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval interval defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

world-readable enables all users to read log files. To restore the default permissions, include the **no-world-readable** statement.

Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a facility, which groups together messages that either are generated by the same source (such as a software process) or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects routing platform functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level and higher are logged to the following destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  facility severity ;
}
```

For more information about the destinations, see [“Directing System Log Messages to a User Terminal” on page 1533](#), and, [“Directing System Log Messages to the Console” on page 1534](#).

To log messages belonging to more than one facility to a particular destination, specify each facility and associated severity as a separate statement within the set of statements for the destination.

[Table 113](#) lists the Junos OS system logging facilities that you can specify in configuration statements at the `[edit system syslog]` hierarchy level.

Table 113: Junos OS System Logging Facilities

Facility	Type of Event or Error
any	All (messages from all facilities)
authorization	Authentication and authorization attempts
change-log	Changes to the Junos OS configuration
conflict-log	Specified configuration is invalid on the router type
daemon	Actions performed or errors encountered by system processes
dfc	Events related to dynamic flow capture
firewall	Packet filtering actions performed by a firewall filter
ftp	Actions performed or errors encountered by the FTP process
interactive-commands	Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client
kernel	Actions performed or errors encountered by the Junos OS kernel
pfe	Actions performed or errors encountered by the Packet Forwarding Engine
user	Actions performed or errors encountered by user-space processes

[Table 114](#) lists the severity levels that you can specify in configuration statements at the `[edit system syslog]` hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see [“Disabling the System Logging of a Facility” on page 1534](#).

Table 114: System Log Message Severity Levels

Severity Level	Description
any	Includes all severity levels
none	Disables logging of the associated facility to a destination
emergency	System panic or other condition that causes the router to stop functioning
alert	Conditions that require immediate correction, such as a corrupted system database
critical	Critical conditions, such as hard errors
error	Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels
warning	Conditions that warrant monitoring
notice	Conditions that are not errors but might warrant special handling
info	Events or nonerror conditions of interest

Default Facilities for System Log Messages Directed to a Remote Destination

Table 117 lists the default alternative facility name next to the Junos OS-specific facility name for which it is used. For facilities that are not listed, the default alternative name is the same as the local facility name.

Table 117: Default Facilities for Messages Directed to a Remote Destination

Junos OS–Specific Local Facility	Default Facility When Directed to Remote Destination
change-log	local6
conflict-log	local5
dfc	local1
firewall	local3
interactive-commands	local7
pfe	local4

- Related Documentation**
- *Single-Chassis System Logging Configuration Overview*

Junos OS System Log Alternate Facilities for Remote Logging

Table 118 lists the facilities that you can specify in the **facility-override** statement.

Table 118: Facilities for the facility-override Statement

Facility	Description
authorization	Authentication and authorization attempts
daemon	Actions performed or errors encountered by system processes
ftp	Actions performed or errors encountered by the FTP process
kernel	Actions performed or errors encountered by the Junos OS kernel
local0	Local facility number 0
local1	Local facility number 1

Table 118: Facilities for the facility-override Statement (*continued*)

Facility	Description
local2	Local facility number 2
local3	Local facility number 3
local4	Local facility number 4
local5	Local facility number 5
local6	Local facility number 6
local7	Local facility number 7
user	Actions performed or errors encountered by user-space processes

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

**Related
Documentation**

- *Examples: Assigning an Alternative Facility to System Log Messages Directed to a Remote Destination*
- *Single-Chassis System Logging Configuration Overview*

Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see “[Junos OS System Logging Facilities and Message Severity Levels](#)” on page 1546). In the recommended configuration, a remote machine designated at the **[edit system syslog host *hostname*]** hierarchy level is not a Juniper Networks router or switch, so its syslogd utility cannot interpret the Junos OS-specific names. To enable the standard syslogd utility to handle messages from these facilities when messages are directed to a remote machine, a standard **localX** facility name is used instead of the Junos OS-specific facility name.

[Table 117](#) lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The syslogd utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called **local-router** direct messages from the **authorization** facility to the remote machine *monitor.mycompany.com*:

```
[edit system syslog]
```

```
host monitor.mycompany.com {  
    authorization info;  
}
```

The default alternative facility for the local **authorization** facility is also **authorization**. If the syslogd utility on **monitor** is configured to write messages belonging to the **authorization** facility to the file `/var/log/auth-attempts`, then the file contains the messages generated when users log in to **local-router** and the messages generated when users log in to **monitor**. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the **auth-attempts** file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on **local-router** when they are directed to **monitor**. You can then configure the syslogd utility on **monitor** to write messages with the alternative facility to a different file from messages generated on **monitor** itself.

To change the facility used for all messages directed to a remote machine, include the **facility-override** statement at the `[edit system syslog host hostname]` hierarchy level:

```
[edit system syslog host hostname]  
    facility severity;  
    facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the **localX** facilities. On the remote machine, you must also configure the syslogd utility to handle the messages in the desired manner.

[Table 118](#) lists the facilities that you can specify in the **facility-override** statement.

We do not recommend including the **facility-override** statement at the `[edit system syslog host other-routing-engine]` hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the error level or higher to the local0 facility on the remote machine called **monitor.mycompany.com**:

```
[edit system syslog]  
host monitor.mycompany.com {  
    any error;  
    facility-override local0;  
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called **central-logger.mycompany.com**. The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- Configure California routers to aggregate messages in the local0 facility:

```
[edit system syslog]  
host central-logger.mycompany.com {  
    change-log info;
```

```
    facility-override local0;
}
```

- Configure New York routers to aggregate messages in the local2 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On central-logger, you can then configure the system logging utility to write messages from the local0 facility to the file **change-log** and the messages from the local2 facility to the file **new-york-config**.

Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

```
match "regular-expression";
```

You can include this statement at the following hierarchy levels:

- **[edit system syslog file *filename*]** (for a file)
- **[edit system syslog user (*username* | *)]** (for a specific user session or for all user sessions on a terminal)
- **[edit system syslog host (*hostname* | *other-routing-engine*)]** (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, <http://www.ieee.org>).

[Table 119](#) specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

NOTE: The match statement is not case-sensitive.

Table 119: Regular Expression Operators for the match Statement

Operator	Matches
. (period)	One instance of any character except the space.
* (asterisk)	Zero or more instances of the immediately preceding term.
+ (plus sign)	One or more instances of the immediately preceding term.
? (question mark)	Zero or one instance of the immediately preceding term.
(pipe)	One of the terms that appears on either side of the pipe operator.
! (exclamation point)	Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.
^ (caret)	Start of a line, when the caret appears outside square brackets. One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.
\$ (dollar sign)	End of a line.
[] (paired square brackets)	One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen (-) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number.
() (paired parentheses)	One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.

Using Regular Expressions

Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
  interactive-commands any;
  match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (**snmpd**), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
  daemon error;
  match "!(.*snmpd.*)";
}
file snmpd-errors {
  daemon error;
  match ".*snmpd.*";
}
```

Managing Host OS System Log and Core Files

On Junos OS switches with a host OS, the Junos OS might generate system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

On OCX Series switches:

- System log messages are logged in the **/var/log/dcpfe.log** file in the host OS in the following scenarios:
 - When the forwarding daemon is initialized.
 - Messages are tagged as emergency (LOG_EMERG). A copy of the message is also sent to the **/var/log** directory on the switch.
- Messages from processes are available on the host system in the **/var/log** directory. System log messages from the host chassis management process are recorded in the **lcmd.log** file in the **/var/log** directory.

On QFX switches with a host OS:

- The Junos OS and host OS record log messages for system and process events, and generate core files upon certain system failures.
- These files are stored in directories such as **/var/log** for log messages, and **/var/tmp** or **/var/crash** for core files, depending on the type of host OS running on the switch.

For diagnostic purposes, you can access these host OS system log and core files from the Junos OS CLI on the switch. You can also clean up directories where the host OS stores temporary log and other files.

This topic includes these sections:

- [Viewing Log Files On the Host OS System on page 1554](#)
- [Copying Log Files From the Host System To the Switch on page 1554](#)
- [Viewing Core Files On the Host OS System on page 1554](#)
- [Copying Core Files From the Host System To the Switch on page 1554](#)
- [Cleaning Up Temporary Files on the Host OS on page 1555](#)

Viewing Log Files On the Host OS System

To view a list of the log files created on the host OS, enter the following command:

```
user@switch> show app-engine logs
```

Copying Log Files From the Host System To the Switch

To copy log files from the host OS to the switch, enter the following command:

```
user@switch> request app-engine file-copy log from-jhost source to-vjunos destination
```

For example, to copy the *lcmd log* file to the switch, enter the following command:

```
user@switch> request app-engine file-copy log from-jhost lcmd.log to-vjunos /var/tmp
```

Viewing Core Files On the Host OS System

To view the list of core files generated and stored on the host OS system, enter the following command:

```
user@switch> show app-engine crash
```

The list might look like this example output:

```
Compute cluster: default-cluster
Compute node: default-node

Crash Info
=====
total 13480
-rw-r--r-- 1 root root 178046 Feb 14 23:08 localhost.lcmd.26653.1455520135.core.tgz

-rw-r--r-- 1 root root 4330343 Feb 15 00:45 localhost.dcpfe.7155.1455525926.core.tgz

-rw-r--r-- 1 root root 4285901 Feb 15 01:49 localhost.dcpfe.25876.1455529782.core.tgz

-rw-r--r-- 1 root root 4288508 Feb 15 02:39 localhost.dcpfe.713.1455532774.core.tgz
-rw-r--r-- 1 root root 264079 Feb 15 17:02 localhost.lcmd.1144.1455584540.core.tgz
```

Copying Core Files From the Host System To the Switch

To copy core files from the host OS to the switch, enter the following command:

```
user@switch> request app-engine file-copy crash from-jhost source to-vjunos
destination-dir-or-file-path
```

When the destination Junos OS path is a directory, the source filename is used by default. To rename the file at the destination, enter the destination argument as a full path including the desired filename.

For example, to copy the *localhost.lcmd.26653.1455520135.core.tgz* core archive file to the switch, enter the following command:

```
user@switch> request app-engine file-copy crash from-jhost
localhost.lcmd.26653.1455520135.core.tgz to-vjunos /var/tmp
```

To see the results on the switch, enter the following command:

```
user@switch> show system core-dumps
re0:
-----
-rw-r--r-- 1 root field 178046 Feb 15 17:15
/var/tmp/localhost.lcmd.26653.1455520135.core.tgz
total files: 1
```

Cleaning Up Temporary Files on the Host OS

To remove temporary files created on the host OS, enter the following command:

```
user@switch> request app-engine cleanup
```

For example, the following sample output on a switch with a Linux host OS shows cleanup of temporary files stored in */var/tmp*:

```
Compute cluster: default-cluster

Compute node: default-node

Cleanup (/var/tmp)
=====
```

Monitoring System Log Messages

Purpose Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

Action To view system log messages:

```
user@switch1> show log messages
```

Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
```

```
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

Meaning The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

Examples: Configuring System Logging

The system log provides an excellent way of tracking all management activity on the switch by recording events such as user authentication, access authorization, and command execution. Logged command executions include commands entered by users at the CLI prompt or by client applications such as the Junos XML protocol or NETCONF XML client. Because system log files contain information about commands executed on the switch and the user who executed the commands, checking system log files for failed authentication events can help identify attempts to hack in to the switch. You can also analyze network activity by correlating executed commands with events and changes that occurred on the network at a particular time.

System log files are stored locally on the switch in the default `/var/log` directory.

The following example shows how to configure system log messages to record all commands entered by users and all authentication or authorization attempts. Logged commands include those entered by users at the CLI prompt and by client applications. Authentication and authorization attempts include events that are saved in the file named `cli-commands` and those that are sent to the terminal of a user who is logged in.

```
[edit system]
syslog {
  file cli-commands {
    interactive-commands info;
    authorization info;
  }
  user * {
    interactive-commands info;
    authorization info;
  }
}
```

The following example shows how to log all alarms state changes to the file `/var/log/alarms`:

```
[edit system]
syslog {
  file alarms {
    kernel warning;
  }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user alex, to a remote machine, and to the console:

```
[edit system]
syslog {
  /* write all security-related messages to file /var/log/security */
  file security {
    authorization info;
    interactive-commands info;
  }
  /* write messages about potential problems to file /var/log/messages: */
  /* messages from "authorization" facility at level "notice"
  and above, */
  /* messages from all other facilities at level "warning" and above */
  file messages {
    authorization notice;
    any warning;
  }
  /* write all messages at level "critical" and above to terminal of user
  "alex" if */
  /* that user is logged in */
  user alex {
    any critical;
  }
}
```

```
/* write all messages from the &ldquo;daemon&rdquo; facility at level &ldquo;info&rdquo;
and above, and */
/* messages from all other facilities at level &ldquo;warning&rdquo; and above, to the
*/
/* machine monitor.mycompany.com */
host monitor.mycompany.com {
    daemon info;
    any warning;
}
/* write all messages at level &ldquo;error&rdquo; and above to the system console */
console {
    any error;
}
}
```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the interactive-commands facility at the info, notice, and warning severity levels:

```
[edit system]
file user-actions {
    interactive-commands info;
}
user philip {
    interactive-commands notice;
}
console {
    interactive-commands warning;
}
}
```

The following list describes the security levels used in the example:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file `/var/log/user-actions`.
- **notice**—Logs a message when users issue the configuration mode command **commit**. The example writes the messages to the terminal of user philip.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

Examples: Assigning an Alternative Facility

This topic contains examples of configuring system log messages to use an alternative facility for logging.

The following example shows how to log all messages generated on the switch at the **error** level or higher to the **local0** facility on the remote host called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example contains two sets of statements that show how to configure switches located in California and in New York to send messages to a single remote host called **central-logger.mycompany.com**. The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- The following statements configure the California switch to aggregate messages in the **local0** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- The following statements configure the New York switch to aggregate messages in the **local2** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On the remote host named **central-logger** you can subsequently configure the system logging utility to write messages from the **local0** facility to one file (for example, **california-config**) and the messages from the **local2** facility to another file (for example, **new-york-config**).

- [Alternate Facilities for System Log Messages Directed to a Remote Destination on page 1548](#)

Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- [Requirements on page 1560](#)
- [Overview on page 1560](#)
- [Configuration on page 1560](#)

Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

NOTE: You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

NOTE: On the QFabric system, a syslog file named `messages` is configured implicitly with facility and severity levels of `any any` and a file size of 100 MBs. Therefore, you cannot specify the filename `messages` in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
user@switch# set file qflogs
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

Results From configuration mode, confirm your configuration by entering the `show system` command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter `commit` from configuration mode.

connection-limit

Syntax	<code>connection-limit <i>limit</i>;</code>
Hierarchy Level	<code>[edit system services finger],</code> <code>[edit system services ftp],</code> <code>[edit system services netconf ssh],</code> <code>[edit system services ssh],</code> <code>[edit system services telnet],</code> <code>[edit system services xnm-clear-text],</code> <code>[edit system services xnm-ssl]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).
Options	<p>limit—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).</p> <p>Range: 1 through 250</p> <p>Default: 75</p>

NOTE: The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

Required Privilege	system—To view this statement in the configuration.
Level	system-control—To add this statement to the configuration.

------------------------------	---

destination-override

Syntax	<code>destination-override { syslog host <i>ip-address</i>; }</code>
Hierarchy Level	[edit system tracing]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Override the system-wide configuration of the switch at the [edit system tracing] hierarchy level. This statement has no effect if system tracing is not configured.
Options	syslog —System process log files to send to the remote tracing host. <ul style="list-style-type: none"> • syslog—System process log files to send to the remote tracing host. • host <i>ip-address</i>—IP address to which to send tracing information.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding Tracing and Logging Operations on page 1409 • tracing on page 1572

no-remote-trace

Syntax	<code>no-remote-trace</code>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the switch to disable remote tracing after remote tracing has been enabled.
Default	Remote tracing is disabled.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • tracing on page 1572

protocol-version

Syntax	<code>protocol-version <i>version</i>;</code>
Hierarchy Level	[edit system services ssh]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Specify the secure shell (SSH) protocol version.
Default	v2—SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.
Options	<i>version</i> —SSH protocol version: v1, v2, or both.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the SSH Protocol Version on page 1413

rate-limit

Syntax	<code>rate-limit <i>limit</i>;</code>
Hierarchy Level	<code>[edit system services finger],</code> <code>[edit system services ftp],</code> <code>[edit system services netconf ssh],</code> <code>[edit system services ssh],</code> <code>[edit system services telnet],</code> <code>[edit system services tftp-server],</code> <code>[edit system services xnm-clear-text],</code> <code>[edit system services xnm-ssl]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Configure the maximum number of connections attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 telnet session connection attempts per minute and 10 IPv4 telnet session connection attempts per minute.
Default	150 connections
Options	<p>rate-limit <i>limit</i>—(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6).</p> <p>Range: 1 through 250</p> <p>Default: 150</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

allow-transients

Syntax	allow-transients;
Hierarchy Level	[edit system scripts commit]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS commit scripts, enable transient configuration changes to be committed.
Default	Transient changes are disabled by default. If you do not include the allow-transients statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Generating a Persistent or Transient Configuration Change Using Commit Scripts</i>• <i>Creating a Commit Script Macro to Read the Custom Syntax and Generate Related Configuration Statements</i>

apply-macro

Syntax	<code>apply-macro <i>apply-macro-name</i> { <i>parameter-name parameter-value</i>; }</code>
Hierarchy Level	All hierarchy levels
Release Information	Statement introduced in Junos OS Release 7.4.
Description	<p>With commit script macros, use custom syntax in your configuration.</p> <p>Macros work by locating apply-macro statements that you include in the candidate configuration and using the values specified in the apply-macro statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.</p> <p>In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or <i>hooks</i>) that are used by a commit script macros.</p> <p>You can include the apply-macro statement at any level of the configuration hierarchy. You can include multiple apply-macro statements at each level of the configuration hierarchy; however, each must have a unique name.</p>
Options	<p><i>apply-macro-name</i>—Name of the apply-macro statement.</p> <p><i>parameter-name</i>—One or more parameters. Parameters can be any text you want to include in your configuration.</p> <p><i>parameter-value</i>—A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.</p>
Required Privilege Level	configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.
Related Documentation	<ul style="list-style-type: none"> • <i>Overview of Creating Custom Configuration Syntax with Commit Script Macros</i>

checksum

Syntax	<code>checksum (md5 sha-256 sha1) hash;</code>
Hierarchy Level	[edit event-options event-script file <i>filename</i>], [edit system scripts commit file filename], [edit system scripts op file filename]
Release Information	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	For Junos OS commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event, commit, or op script, Junos OS verifies the authenticity of the script by using the configured checksum hash.
Options	md5 hash —MD5 checksum of this script. sha-256 hash —SHA-256 checksum of this script. sha1 hash —SHA-1 checksum of this script.
Required Privilege Level	maintenance —To view this statement in the configuration. maintenance-control —To add this statement to the configuration.

Hierarchy Level [edit system [scripts](#)]

Release Information Statement introduced in Junos OS Release 7.6.

Description For Junos OS op scripts, configure an operation scripting mechanism.

Options The statements are explained separately.

Required Privilege Level maintenance—To view this statement in the configuration.
 maintenance-control—To add this statement to the configuration.

Related Documentation

- *Storing and Enabling Scripts*

optional

Syntax	optional;
Hierarchy Level	[edit system scripts commit file <i>filename</i>]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS commit scripts, allow a commit operation to succeed even if the script specified in the file statement is missing from the /var/db/scripts/commit directory on the device.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Controlling Execution of Commit Scripts During Commit Operations</i>

refresh (Commit Scripts)

Syntax	refresh;
Hierarchy Level	[edit system scripts commit], [edit system scripts commit file <i>filename</i>]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the /var/db/scripts/commit directory with the copy located at the source URL, as specified in the source statement at the same hierarchy level.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Using a Master Source Location for a Script</i>• refresh-from (Commit Scripts) on page 1585• source (Commit Scripts) on page 1589

refresh (Op Scripts)

Syntax	refresh;
Hierarchy Level	[edit system scripts op], [edit system scripts op file filename]
Release Information	Statement introduced in Junos OS Release 7.6.
Description	For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the <code>/var/db/scripts/op</code> directory with the copy located at the source URL, specified in the source statement at the same hierarchy level.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Using a Master Source Location for a Script</i> • refresh-from (Op Scripts) on page 1586 • source (Op Scripts) on page 1589

refresh-from (Commit Scripts)

Syntax	refresh-from <i>url</i> ;
Hierarchy Level	[edit system scripts commit], [edit system scripts commit file filename]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at a URL other than the URL specified in the source statement.
Options	<i>url</i> —The source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Using an Alternate Source Location for a Script</i> • refresh (Commit Scripts) on page 1584 • source (Commit Scripts) on page 1589

refresh-from (Op Scripts)

Syntax	<code>refresh-from url;</code>
Hierarchy Level	[edit system scripts op], [edit system scripts op file filename]
Release Information	Statement introduced in Junos OS Release 7.6.
Description	For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the <code>/var/db/scripts/op</code> directory with the copy located at a URL other than the URL specified in the source statement.
Options	url —Source specified as a Hypertext Transfer Protocol (HTTP) URL, FTP URL, or secure copy (scp)-style remote file specification.
Required Privilege Level	maintenance —To view this statement in the configuration. maintenance-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Using an Alternate Source Location for a Script</i>• refresh (Op Scripts) on page 1585• source (Op Scripts) on page 1589

Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS commit or op scripts, configure scripting mechanisms.
Options	The statements are explained separately.
Required Privilege Level	maintenance—To view this statement in the configuration. maintenance-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <i>Storing and Enabling Scripts</i>

source (Commit Scripts)

Syntax	<code>source url;</code>
Hierarchy Level	[edit system scripts commit file <i>filename</i>]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS commit scripts, specify the location of the source file for an enabled script located in the <code>/var/db/scripts/commit</code> directory. When you include the refresh statement at the same hierarchy level and commit the configuration, the local copy is overwritten by the version stored at the specified URL.
Options	<i>url</i> —The source specified as an HTTP URL, FTP URL, or scp-style remote file specification.
Required Privilege Level	<i>maintenance</i> —To view this statement in the configuration. <i>maintenance-control</i> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Using a Master Source Location for a Script</i> • <i>Overview of Updating Scripts from a Remote Source</i> • refresh (Commit Scripts) on page 1584 • refresh-from (Commit Scripts) on page 1585

source (Op Scripts)

Syntax	<code>source url;</code>
Hierarchy Level	[edit system scripts op file <i>filename</i>]
Release Information	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	For Junos OS op scripts, specify the location of the source file for an enabled script located in the <code>/var/db/scripts/op</code> directory. When you include the refresh statement at the same hierarchy level, the local copy is overwritten by the version stored at the specified URL.
Options	<i>url</i> —Master source file for an op script specified as an HTTP URL, FTP URL, or scp-style remote file specification.
Required Privilege Level	<i>maintenance</i> —To view this statement in the configuration. <i>maintenance-control</i> —To add this statement to the configuration.

[agent-id](#)

Syntax	<code>agent-id <i>ip-address</i>;</code>
Hierarchy Level	[edit protocols sflow]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the IP address of the sFlow agent. If you do not configure the sFlow agent ID, the IP address for the agent is dynamically created using the IP address of an interface configured on the QFX Series device.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• sflow on page 1596

collector (sFlow Technology)

Syntax	<code>collector <i>ip-address</i> { <i>udp-port</i> <i>port-number</i>; }</code>
Hierarchy Level	[edit protocols sflow]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the configured collector for analysis. You can configure up to four collectors on the device. You specify the IP address for each collector you configure.</p> <p>The remaining statement is explained separately.</p>
Options	<i>ip-address</i> —IP address of the collector.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• Example: Monitoring Network Traffic Using sFlow Technology on page 1453

interfaces (sFlow)

Syntax	<pre>interfaces <i>interface-name</i> { polling-interval <i>seconds</i>; sample-rate <i>number</i>; }</pre>
Hierarchy Level	[edit protocols sflow]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure sFlow network traffic monitoring on the specified interface on the device. You can configure sFlow parameters (polling interval, sample rate) with different values on different interfaces.</p> <p>The remaining statements are explained separately.</p>
Options	<i>interface-name</i> —Name of the interface on which to configure sFlow parameters.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• Example: Monitoring Network Traffic Using sFlow Technology on page 1453

polling-interval

Syntax	<code>polling-interval <i>seconds</i>;</code>
Hierarchy Level	[edit protocols sflow], [edit protocols sflow interfaces <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the rate (in seconds) at which successive samples of interface statistics (counters) are taken.
Default	If no polling interval is configured for a particular interface, the device uses the global polling interval configured at the [edit protocols sflow] hierarchy level. If no global interval is configured, the device uses the default polling interval of 20 seconds.
Options	<i>seconds</i> —Number of seconds between successive samples of interface statistics. Specifying a value of 0 (zero) disables the polling. Range: 0 through 3600 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• Example: Monitoring Network Traffic Using sFlow Technology on page 1453

sample-rate

Syntax	<code>sample-rate <i>number</i>;</code>
Hierarchy Level	[edit protocols sflow], [edit protocols sflow interfaces <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the denominator (<i>number</i>) of the ratio that is the sample rate in sFlow traffic monitoring. For example, to configure a sample rate of 1 in 1000 packets, you specify a <i>number</i> of 1000.
Default	If no sample rate is configured for a particular interface, the device uses the global sample rate configured at the [edit protocols sflow] hierarchy level. If no global rate is configured, the device uses the default sample rate of 1 in 2000 packets.
Options	<i>number</i> —Denominator of the ratio representing the sample rate (one packet out of <i>number</i>). Range: 1 through 16,777,215
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring sFlow Technology on page 1457 • Example: Monitoring Network Traffic Using sFlow Technology on page 1453

sflow

Syntax	<pre>sflow { agent-id <i>ip-address</i>; collector <i>ip-address</i> { udp-port <i>port-number</i>; } interfaces <i>interface-name</i> { polling-interval <i>number</i>; sample-rate { egress <i>number</i>; ingress <i>number</i>; } } polling-interval <i>number</i>; sample-rate { egress <i>number</i>; ingress <i>number</i>; } source-ip <i>ip-address</i>; traceoptions { file <i>filename</i> <files <i>number</i>> <no-stamp> <replace> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; } }</pre>
Hierarchy Level	[edit protocols]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure sFlow technology to monitor traffic continuously on specified interfaces simultaneously. sFlow data can be used to characterize network activity.</p> <p>The remaining statements are explained separately.</p>
Default	The sFlow protocol is disabled by default.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• Example: Monitoring Network Traffic Using sFlow Technology on page 1453

source-ip

Syntax	<code>source-ip <i>ip-address</i>;</code>
Hierarchy Level	[edit protocols sflow]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the source IP address to be used for sFlow datagrams. If you do not configure a source IP address, it is dynamically created based on the IP address of an Ethernet interface configured on the QFX Series device.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring sFlow Technology on page 1457• sflow on page 1596

traceoptions (sFlow Technology)

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <no-stamp> <replace> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; }</pre>
Hierarchy Level	[edit protocols sflow]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Define tracing operations for sFlow technology.
Default	The traceoptions feature is disabled.
Options	<p>file <i>filename</i>—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the <code>/var/log/</code> directory.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0. Incoming trace file data is logged in the now empty trace-file. When trace-file again reaches its maximum size, trace-file.0 is renamed trace-file.1 and trace-file is renamed trace-file.0. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify the maximum number of files, you must also specify the maximum file size using the size option.</p> <p>Range: 2 through 1000 files Default: 1 trace file</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements.</p> <ul style="list-style-type: none">• all—Trace all sFlow monitoring events.• client-server—Trace sFlow monitoring client-server events.• configuration—Trace sFlow monitoring configuration events.• interface—Trace sFlow monitoring interface events.• rtsock—Trace routing socket code events. <p>no-stamp—(Optional) Do not place timestamp information at the beginning of each line in the trace file.</p> <p>no-world-readable—(Optional) Prevent any user from reading the trace file.</p> <p>replace—(Optional) Replace an existing trace file if there is one.</p>

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through the maximum file size of 4 GB

Default: 128 KB

world-readable—(Optional) Allow any user to read the trace file.

Required Privilege Level	routing and trace—To view this statement in the configuration.
	routing-control and trace-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Overview of sFlow Technology

udp-port

Syntax	<code>udp-port <i>port-number</i>;</code>
Hierarchy Level	[edit protocols sflow collector]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the UDP port for a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the collector for analysis.
Default	Port 6343
Options	<i>port-number</i> —UDP port number for this collector.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring sFlow Technology on page 1457 • Example: Monitoring Network Traffic Using sFlow Technology on page 1453

access (SNMP)

Syntax	<pre>access { group group-name { (default-context-prefix context-prefix context-prefix) { security-model (any usm v1 v2c) { security-level (authentication none privacy) { notify-view view-name; read-view view-name; write-view view-name; } } } } }</pre>
Hierarchy Level	[edit snmp v3 vacm]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set SNMP access limits. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

address (SNMP)

Syntax	<pre>address address;</pre>
Hierarchy Level	[edit snmp v3 target-address target-address-name]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Specify the SNMP target address for receiving traps or informs.
Options	address —IPv4 address of the system to receive traps or informs. You must specify an address, not a hostname.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding the Implementation of SNMP on the QFabric System• Configuring SNMP on page 1499• Example: Configuring SNMP on page 1523

address-mask

Syntax	<code>address-mask <i>address-mask</i>;</code>
Hierarchy Level	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 on the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Verify the source addresses for a group of target addresses.
Options	<i>address-mask</i> combined with the address defines a range of addresses.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the Address Mask</i>

agent-address

Syntax	<code>agent-address outgoing-interface;</code>
Hierarchy Level	<code>[edit snmp trap-options]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is outgoing-interface , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.
Options	outgoing-interface —Value of the agent address of all SNMPv1 traps generated by this router or switch. The outgoing-interface option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap. Default: Disabled (the agent address is not specified in SNMPv1 traps).
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

commit-delay

Syntax	commit-delay <i>seconds</i> ;
Hierarchy Level	[edit snmp nonvolatile]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the timer for the SNMP Set reply and start of the commit.
Options	seconds —Delay between an affirmative SNMP Set reply and start of the commit operation. Default: 5 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the Commit Delay Timer</i>

community (SNMP)

Syntax	<pre>community <i>community-name</i> { authorization <i>authorization</i>; client-list-name <i>client-list-name</i>; clients { address restrict; } view <i>view-name</i>; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.
<div> NOTE: The authorization read-write option is not supported on the QFX3000 QFabric system.</div>	
The SNMP client application specifies an SNMP community name in Get , GetBulk , GetNext , and Set SNMP requests.	
Default	If you omit the community statement, all SNMP requests are denied.
Options	<i>community-name</i> —Community string. If the name includes spaces, enclose it in quotation marks (" "). The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the SNMP Community String on page 1503

community (RMON)

Syntax	<code>community <i>community-name</i>;</code>
Hierarchy Level	[edit snmp rmon event <i>index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure the SNMP trap group that is used when generating a trap (if the eventType object is configured to send traps). If that trap group has the rmon-alarm trap category configured, a trap is sent to all the targets configured for that trap group. The community string in the trap matches the name of the trap group (and hence, the value of eventCommunity). If nothing is configured, traps are sent to each group that has the rmon-alarm category configured.</p> <p>The event community is not the same as an SNMP community.</p>
Options	<i>community-name</i> —Name of the trap group that is used when generating a trap if the event is configured to send traps.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • RMON MIB Event, Alarm, Log, and History Control Tables on page 1464 • Configuring RMON Alarms and Events on page 1507 • Monitoring RMON MIB Tables on page 1516 • Understanding RMON on page 1463 • Junos OS Network Management Configuration Guide

community-name

Syntax	<code>community-name <i>community-name</i>;</code>
Hierarchy Level	<code>[edit snmp v3 snmp-community <i>community-index</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	The community name defines an SNMP community. The SNMP community authorizes SNMPv1 or SNMPv2 clients. The access privileges associated with the configured security name define which MIB objects are available and the operations (notify, read, or write) allowed on those objects.
Options	<i>community-name</i> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose it in quotation marks (" ").
<div> NOTE: Community names must be unique. You cannot configure the same community name at the <code>[edit snmp community]</code> and <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy levels.</div> <p>The community name at the <code>[edit snmp v3 snmp-community <i>community-index</i>]</code> hierarchy level is encrypted and not displayed in the command-line interface (CLI).</p>	
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.

engine-id

Syntax	engine-id { (local <i>engine-id-suffix</i> use-default-ip-address use-mac-address); }
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> and cannot be configured. The suffix is configured here.
<div>  <p>NOTE: SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.</p> <p>By default, the engine ID suffix is configured with the MAC address of the management interface (the <i>use-mac-address</i> option) on the QFX Series and OCX Series. You can override this configuration by using the local <i>engine-id-suffix</i> or <i>use-default-ip-address</i> option.</p> </div>	
Default	use-mac-address
Options	<p>local <i>engine-id-suffix</i>—The engine ID suffix is set based on the data entered.</p> <p>use-default-ip-address—The engine ID suffix is generated from the default IP address.</p> <p>use-mac-address—The engine ID suffix is generated from the MAC address of the management interface on the switch.</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>

falling-event-index (RMON)

Syntax	<code>falling-event-index <i>index</i>;</code>
Hierarchy Level	<code>[edit snmp rmon alarm <i>index</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set the index number of the event entry that is used when a falling threshold is crossed. You specify the falling-event index when you configure an SNMP RMON alarm. If this value is zero, no event is triggered.
Options	<i>index</i> —Index of the event entry that is used when a falling threshold is crossed. Range: 0 through 65,535 Default: 0
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• RMON MIB Event, Alarm, Log, and History Control Tables on page 1464• Configuring RMON Alarms and Events on page 1507• Monitoring RMON MIB Tables on page 1516• Understanding RMON on page 1463• Junos OS Network Management Configuration Guide

falling-threshold (Health Monitor)

Syntax	<code>falling-threshold <i>percentage</i>;</code>
Hierarchy Level	[edit snmp health-monitor]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
Options	<i>percentage</i> —Lower threshold for the alarm entry. Range: 1 through 100 Default: 70 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• rising-threshold on page 1653• Configuring Health Monitoring on page 1509

falling-threshold (RMON)

Syntax	<code>falling-threshold <i>integer</i>;</code>
Hierarchy Level	<code>[edit snmp rmon alarm <i>index</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set the lower threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
Options	<p><i>integer</i>—Lower threshold for the alarm entry.</p> <p>Range: -2,147,483,648 through 2,147,483,647</p> <p>Default: 20 percent less than the rising-threshold value</p>
Required Privilege Level	<p><code>snmp</code>—To view this statement in the configuration.</p> <p><code>snmp-control</code>—To add this statement to the configuration.</p>

group (Configuring Group Name)

Syntax `group group-name {
 (default-context-prefix | context-prefix context-prefix){
 security-model (any | usm | v1 | v2c) {
 security-level (authentication | none | privacy) {
 notify-view view-name;
 read-view view-name;
 write-view view-name;
 }
 }
 }
 }`

Hierarchy Level [edit snmp v3 vacm access]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series and OCX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

Options *group-name*—SNMPv3 group name created for the SNMPv3 group.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

Related Documentation • *Configuring the Group*

health-monitor

Syntax	health-monitor { falling-threshold <i>percentage</i> ; interval <i>seconds</i> ; rising-threshold <i>percentage</i> ; }
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure health monitoring. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Health Monitoring on page 1509• Understanding Health Monitoring on page 1467

history

Syntax	<pre>history <i>history-index</i> { <i>bucket-size</i> <i>number</i>; <i>interface</i> <i>interface-name</i>; <i>interval</i> <i>seconds</i>; <i>owner</i> <i>owner-name</i>; }</pre>
Hierarchy Level	[edit snmp rmon]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent on the network to monitor all the traffic flowing among devices on all connected LAN segments. The RMON history feature collects statistics in accordance with user-configurable parameters.</p> <p>The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. If you use the history statement, you must also configure the interface <i>interface-name</i> statement.</p>
Options	<p>history-index—Provide a number for this history entry.</p> <p>Range: 1 through 65535</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• RMON MIB Event, Alarm, Log, and History Control Tables on page 1464• Monitoring RMON MIB Tables on page 1516• Understanding RMON on page 1463• Junos OS Network Management Configuration Guide

interface (SNMP)

Syntax	<code>interface [<i>interface-names</i>];</code>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the interfaces on which SNMP requests can be accepted.
Default	If you omit this statement, SNMP requests entering the router or switch through any interface are accepted.
Options	<i>interface-names</i> —Names of one or more logical interfaces.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Interfaces on Which SNMP Requests Can Be Accepted on page 1506

interface (RMON)

Syntax	<code>interface <i>interface-name</i>;</code>
Hierarchy Level	[edit snmp rmon history <i>history-index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	<p>Specify the interface to be monitored in the specified RMON history entry.</p> <p>Only one interface can be specified for a particular RMON history index. There is a one-to-one relationship between the interface and the history index. The interface must be specified in order for the RMON history to be created.</p>
Options	<i>interface-name</i> —Specify the interface to be monitored within the specified entry of the RMON history of Ethernet statistics.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• RMON MIB Event, Alarm, Log, and History Control Tables on page 1464• Configuring RMON Alarms and Events on page 1507• Monitoring RMON MIB Tables on page 1516• Understanding RMON on page 1463• Junos OS Network Management Configuration Guide

interval (Health Monitor)

Syntax	interval <i>seconds</i> ;
Hierarchy Level	[edit snmp health-monitor]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the interval between sampling of the object being monitored by the health monitor.
Options	seconds —Time between samples, in seconds. Range: 1 through 2147483647 seconds Default: 300 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Health Monitoring on page 1509

interval (RMON)

Syntax	<code>interval seconds;</code>
Hierarchy Level	[edit snmp rmon alarm <i>index</i>], [edit snmp rmon history <i>index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the interval over which data is to be sampled for the specified alarm or interface.
Default	60 sec for alarm sampling. 1800 sec for history sampling.
Options	<i>seconds</i> —Interval at which data is to be sampled for the specified alarm or interface.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

rising-threshold (Health Monitor)

Syntax	<code>rising-threshold <i>percentage</i>;</code>
Hierarchy Level	[edit snmp health-monitor]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.
Options	<i>percentage</i> —Upper threshold for the alarm entry. Range: 1 through 100 Default: 80 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Health Monitoring on page 1509• falling-threshold on page 1624

rising-threshold (RMON)

Syntax	<code>rising-threshold <i>integer</i>;</code>
Hierarchy Level	<code>[edit snmp rmon alarm <i>index</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set the upper threshold for the sampled variable (monitored object) when you configure an SNMP RMON alarm. By setting a rising and a falling threshold for a variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
Options	<i>integer</i> —Upper threshold for the alarm entry. Range: -2,147,483,648 through 2,147,483,647
Required Privilege Level	snmp —To view this statement in the configuration. snmp-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• RMON MIB Event, Alarm, Log, and History Control Tables on page 1464• Configuring RMON Alarms and Events on page 1507• Monitoring RMON MIB Tables on page 1516• Understanding RMON on page 1463• Junos OS Network Management Configuration Guide

            owner owner-name;
        }
    }
```

Hierarchy Level [edit snmp]

Release Information Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Provide comprehensive network fault diagnosis, planning, and performance tuning information. RMON delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports the RMON statistics, history, alarm, and event groups.

The remaining statements are explained separately.

Default Disabled.

Required Privilege Level snmp—To view this statement in the configuration.
snmp-control—To add this statement to the configuration.

sample-type

Syntax	sample-type (absolute-value delta-value);
Hierarchy Level	[edit snmp rmon alarm <i>index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the method of sampling the selected variable (monitored object). When you configure an SNMP RMON alarm, you can specify the sample type.
Options	absolute-value —Actual value of the selected variable is used when comparing against the thresholds. delta-value —Difference between samples of the selected variable is used when comparing against the thresholds.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• RMON MIB Event, Alarm, Log, and History Control Tables on page 1464• Configuring RMON Alarms and Events on page 1507• Monitoring RMON MIB Tables on page 1516• Understanding RMON on page 1463• Junos OS Network Management Configuration Guide

snmp-community

Syntax	snmp-community <i>community-index</i> { <i>community-name</i> <i>community-name</i> ; <i>security-name</i> <i>security-name</i> ; tag <i>tag-name</i> ; }
Hierarchy Level	[edit snmp v3]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure the SNMP community.
Options	<i>community-index</i> —(Optional) String that identifies an SNMP community. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the SNMPv3 Community</i>

source-address (SNMP)

Syntax	source-address <i>address</i> ;
Hierarchy Level	[edit snmp trap-options]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.
Options	<p><i>address</i>—Source address of SNMP traps. You can configure the source address of trap packets two ways: lo0 or a valid IPv4 address configured on one of the interfaces. The value lo0 indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface lo0.</p> <p>Default: Disabled. (The source address is the address of the outgoing interface.)</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the Source Address for SNMP Traps</i>

startup-alarm

Syntax	startup-alarm (falling-alarm rising-alarm rising-or-falling-alarm);
Hierarchy Level	[edit snmp rmon alarm <i>index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Set an initial alarm that is sent after the configured SNMP RMON alarm becomes active.
Default	rising-or-falling-alarm
Options	<p>falling-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the falling threshold.</p> <p>rising-alarm—Generated if the first sample after the alarm becomes active is equal to or greater than the rising threshold.</p> <p>rising-or-falling-alarm—Generated if the first sample after the alarm entry becomes active is equal to or greater than either the rising threshold or the falling threshold.</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

syslog-subtag

Syntax	<code>syslog-subtag <i>syslog-subtag</i>;</code>
Hierarchy Level	[edit snmp rmon alarm <i>index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Add the syslog-subtag tag to the system log message. The tag should not exceed 80 uppercase characters.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • RMON MIB Event, Alarm, Log, and History Control Tables on page 1464 • Monitoring RMON MIB Tables on page 1516 • Understanding RMON on page 1463 • Junos OS Network Management Configuration Guide

tag (Configuring Notification Targets)

Syntax	<code>tag <i>tag-name</i>;</code>
Hierarchy Level	[edit snmp v3 notify <i>name</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure a set of target addresses to receive SNMP traps or informs (for IPv4 packets only).
Options	tag-name —Define the target addresses to which an SNMP notification is sent. Target addresses containing the same tag in their tag list are sent the same notification. The tag-name is not included in the notification.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • SNMPv3 Overview on page 1460 • Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1461 • Configuring SNMP on page 1499 • Configuring the SNMPv3 Trap Notification

tag (Configuring the SNMP Community)

Syntax	<code>tag tag-name;</code>
Hierarchy Level	[edit snmp v3 snmp-community <i>community-index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure a set of SNMP managers that are authorized to use a community string.
Options	tag-name —Identify the set of addresses for the SNMP managers authorized to use the community string.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

tag-list

Syntax	<code>tag-list tag-list;</code>
Hierarchy Level	[edit snmp v3 target-address <i>target-address-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure an SNMP tag list used to select target addresses.
Options	tag-list —Define sets of target addresses (tags). To specify more than one tag, specify the tag names as a space-separated list enclosed within double quotes.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Trap Target Address

target-address

Syntax	<pre>target-address <i>target-address-name</i> { address <i>address</i>; address-mask <i>address-mask</i>; port <i>port-number</i>; retry-count <i>number</i>; tag-list <i>tag-list</i>; target-parameters <i>target-parameters-name</i>; timeout <i>seconds</i>; }</pre>
Hierarchy Level	[edit snmp v3]
Release Information	<p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Configure the address of an SNMP management application and the parameters to be used in sending notifications.
Options	<p><i>target-address-name</i>—String that identifies the target address.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Understanding the Implementation of SNMP • SNMP MIBs Support on page 1468 • SNMP Traps Support on page 1484 • snmp on page 1665 • Configuring SNMP on page 1499 • Monitoring SNMP on page 1516 • Example: Configuring SNMP on page 1523

target-parameters

Syntax At the `[edit snmp v3]` hierarchy level:

```
target-parameters target-parameters-name {  
  profile-name;  
  parameters {  
    message-processing-model (v1 | v2c | V3);  
    security-level (authentication | none | privacy);  
    security-model (usm | v1 | v2c);  
    security-name security-name;  
  }  
}
```

At the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
target-parameters target-parameters-name;
```

Hierarchy Level `[edit snmp v3]`
`[edit snmp v3 target-address target-address-name]`

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the `[edit snmp v3]` hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level to the target address configuration at the `[edit snmp v3]` hierarchy level.

Required Privilege snmp—To view this statement in the configuration.
Level snmp-control—To add this statement to the configuration.

targets

Syntax	<code>targets { <i>address</i>; }</code>
Hierarchy Level	<code>[edit snmp trap-group <i>group-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure one or more systems to receive SNMP traps.
Options	<i>address</i> —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring SNMP Trap Groups on page 1504

timeout

Syntax	<code>timeout <i>seconds</i>;</code>
Hierarchy Level	<code>[edit snmp v3 target-address <i>target-address-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the timeout period (in seconds) for SNMP informs.
Default	15 seconds
Options	<i>seconds</i> —Number of seconds to wait for an inform acknowledgment. If no acknowledgment is received within the timeout period, the inform is retransmitted.
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Understanding the Implementation of SNMP • Configuring SNMP Informs on page 1515 • retry-count (SNMPv3) on page 1651

traceoptions (SNMP)

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; no-remote-trace; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Track the activities of SNMP agents on the switch and record the information in log files.

NOTE: The **traceoptions** statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

Options **file *filename***—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.

files *number*—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

size *size*—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

Range: 10 KB through 1 GB

Default: 1000 KB

world-readable | no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

Required Privilege Level **snmp**—To view this statement in the configuration.
 snmp-control—To add this statement to the configuration.

trap-group

Syntax	<pre>trap-group group-name { categories { category; } destination-port port-number; targets { address; } }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 11.1 for QFX Series switches. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
Options	<p>group-name—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring SNMP Trap Groups on page 1504

trap-options

Syntax	<pre>trap-options { agent-address outgoing-interface; source-address address; }</pre>
Hierarchy Level	[edit snmp]
Release Information	<p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p> <p>The remaining statements are explained separately.</p>
Default	Disabled
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring SNMP Trap Options</i>

type (RMON Notification)

Syntax	<code>type type;</code>
Hierarchy Level	[edit snmp rmon event <i>index</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure the type of notification generated when a rising or falling threshold is crossed.
Default	<code>log-and-trap</code>
Options	type —Type of notification. It can be one of the following: <ul style="list-style-type: none">• log—Add an entry to the logTable object.• log-and-trap—Send an SNMP trap and add a log entry.• none—No notifications are sent.• snmptrap—Send an SNMP trap.
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.

version

Syntax	version (all v1 v2);
Hierarchy Level	[edit snmp trap-group <i>group-name</i>]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify the version number of SNMP traps.
Default	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
Options	all—Send an SNMPv1 and SNMPv2 trap for every trap condition. v1—Send SNMPv1 traps only. v2—Send SNMPv2 traps only.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring SNMP Trap Groups on page 1504

view (Configuring a MIB View)

Syntax	<code>view <i>view-name</i> { oid <i>object-identifier</i> (include exclude); }</code>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The view statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the view statement at the [edit snmp community <i>community-name</i>] hierarchy level.
<div>  NOTE: To remove an OID completely, use the <code>delete view all oid oid-number</code> command but omit the <code>include</code> parameter. </div>	
Options	<p><i>view-name</i>—Name of the view.</p> <p>The remaining statement is explained separately.</p>
Required Privilege Level	<p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>

Syntax	<code>archive <files <i>number</i>> <size <i>size</i>> <start-time <i>time</i>> <transfer-interval <i>interval</i>> <binary-data no-binary-data>; <world-readable no-world-readable> ;</code>
Hierarchy Level	[edit system syslog]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure archiving properties for all system log files.
Options	<p>files <i>number</i>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file logfile, it closes the file, compresses it, and renames it logfile.0.gz (the amount of data is determined by the size statement at this hierarchy level). The utility then opens and writes to a new file called logfile. When the new file reaches the maximum size, the logfile.0.gz file is renamed to logfile.1.gz, and the new file is closed, compressed, and renamed logfile.0.gz. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p>Range: 1 through 1000</p> <p>Default: 10 files</p> <p>size <i>size</i>—Maximum amount of data that the Junos OS logging utility writes to a log file logfile before archiving it (closing it, compressing it, and changing its name to logfile.0.gz). The utility then opens and writes to a new file called logfile.</p> <p>Syntax: <i>x k</i> to specify the number of kilobytes, <i>x m</i> for the number of megabytes, or <i>x g</i> for the number of gigabytes</p> <p>Range: 64 KB through 1 GB</p> <p>Default:</p> <ul style="list-style-type: none">• 128 KB for EX Series switches• 1 MB for M Series, MX Series, and T Series routers, OCX Series, and the QFX3500 switch• 10 MB for TX Matrix and TX Matrix Plus routers <p>binary-data no-binary-data—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..</p> <p>Default: no-binary-data</p> <p>world-readable no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the root user and users who have the Junos OS maintenance permission.</p>

Default: no-world-readable

Required Privilege system—To view this statement in the configuration.
Level system-control—To add this statement to the configuration.

archive (Individual System Log File)

Syntax	archive <archive-sites (<i>ftp-url</i> <password <i>password</i> >)> <files <i>number</i> > <size <i>size</i> > <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval <i>minutes</i> > <world-readable no-world-readable>;
Hierarchy Level	[edit system syslog file <i>filename</i>]
Release Information	Statement introduced before Junos OS Release 7.4. start-time and transfer-interval statements introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure archiving properties for a specific system log file.
Options	<p>archive-sites <i>site-name</i>—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see “Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 40). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the [edit system syslog] hierarchy level.</p> <p>files <i>number</i>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i>, it closes the file, compresses it, and renames it <i>logfile.0.gz</i> (the amount of data is determined by the size statement at this hierarchy level). The utility then opens and writes to a new file called <i>logfile</i>. When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i>, and the new file is closed, compressed, and renamed <i>logfile.0.gz</i>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p>Range: 1 through 1000</p> <p>Default: 10 files</p> <p>password <i>password</i>—Password for authenticating with the site specified by the archive-sites statement.</p> <p>size <i>size</i>—Maximum amount of data that the Junos OS logging utility writes to a log file <i>logfile</i> before archiving it (closing it, compressing it, and changing its name to <i>logfile.0.gz</i>). The utility then opens and writes to a new file called <i>logfile</i>.</p> <p>Syntax: xk to specify the number of kilobytes, xm for the number of megabytes, or xg for the number of gigabytes</p> <p>Range: 64 KB through 1 GB</p> <p>Default: 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers</p>

start-time "YYYY-MM-DD.hh:mm"—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

transfer-interval *interval*—Interval at which to transfer the log file to an archive site.

Range: 5 through 2880 minutes

world-readable | no-world-readable—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

Default: no-world-readable

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

console (System Logging)

Syntax

```
console {
    facility severity;
}
```

Hierarchy Level [edit system [syslog](#)]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Configure the logging of system messages to the system console.

Options **facility**—Class of messages to log. To specify multiple classes, include multiple **facility severity** statements. For a list of the facilities, see “[Junos OS System Logging Facilities and Message Severity Levels](#)” on page 1546.

severity—Severity of the messages that belong to the facility specified by the paired **facility** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see “[Junos OS System Logging Facilities and Message Severity Levels](#)” on page 1546.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

host

Syntax	<pre> host (hostname other-routing-engine) { facility severity; explicit-priority; facility-override facility; log-prefix (System) string; match "regular-expression"; source-address source-address; structured-data { brief; } } </pre>
QFX Series	<pre> host (hostname { facility severity; explicit-priority; facility-override facility; log-prefix (System) string; match "regular-expression"; port; source-address source-address; } </pre>
TX Matrix Router and EX Series Switches	<pre> host (hostname other-routing-engine scc-master) { facility severity; explicit-priority; facility-override facility; log-prefix (System) string; match "regular-expression"; port; source-address source-address; } </pre>
TX Matrix Plus Router	<pre> host (hostname other-routing-engine sfc0-master) { facility severity; explicit-priority; facility-override facility; log-prefix (System) string; match "regular-expression"; port; source-address source-address; } </pre>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> system syslog], [edit system syslog]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the logging of system messages to a remote destination.

Options *facility*—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements. For a list of the facilities, see [“Junos OS System Logging Facilities and Message Severity Levels” on page 1546](#).

hostname—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

other-routing-engine—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

NOTE: The **other-routing-engine** option is not applicable to the QFX Series.

port—Port number of the remote syslog server that can be modified.

scc-master—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

severity—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities of the specified level and higher are logged. For a list of the severities, see [“Junos OS System Logging Facilities and Message Severity Levels” on page 1546](#).

sfc0-master—(TX Matrix Plus routers only) On a T1600 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

CHAPTER 55

Network Management

- monitor traffic
- ping

monitor traffic

Syntax `monitor traffic`
 `<brief | detail | extensive>`
 `<absolute-sequence>`
 `<count count>`
 `<interface interface-name>`
 `<layer2-headers>`
 `<matching matching>`
 `<no-domain-names>`
 `<no-promiscuous>`
 `<no-resolve>`
 `<no-timestamp>`
 `<print-ascii>`
 `<print-hex>`
 `<resolve-timeout>`
 `<size size>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
 - Delays from DNS resolution can be eliminated by using the **no-resolve** option.
-

NOTE: This command is not supported on the QFabric system.

Options **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

brief | detail | extensive—(Optional) Display the specified level of output.

absolute-sequence—(Optional) Display absolute TCP sequence numbers.

count count—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The **monitor traffic** command quits automatically after displaying the number of packets specified.

interface *interface-name*—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

layer2-headers—(Optional) Display the link-level header on each line.

matching *matching*—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

no-domain-names—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

no-promiscuous—(Optional) Do not put the interface into promiscuous mode.

no-resolve—(Optional) Suppress reverse lookup of the IP addresses.

no-timestamp—(Optional) Suppress timestamps on displayed packets.

print-ascii—(Optional) Display each packet in ASCII format.

print-hex—(Optional) Display each packet, except the link-level header, in hexadecimal format.

resolve-timeout *timeout*—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

size *size*—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

Additional Information In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

```
monitor traffic matching "expression"
```

Replace ***expression*** with one or more of the match conditions listed in [Table 120](#).

Table 120: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	host [<i>address</i> <i>hostname</i>]	Matches packets that contain the specified address or hostname. The protocol match conditions arp , ip , or rarp , or any of the directional match conditions can be prepended to the host match condition.
	net <i>address</i>	Matches packets with source or destination addresses containing the specified network address.
	net <i>address mask mask</i>	Matches packets containing the specified network address and subnet mask.
	port (<i>port-number</i> <i>port-name</i>)	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as bgp (179), dhcp (67), or domain (53) (the port numbers are also listed).
Directional	dst	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	src	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	src and dst	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	src or dst	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	less <i>value</i>	Matches packets shorter than or equal to the specified value, in bytes.
	greater <i>value</i>	Matches packets longer than or equal to the specified value, in bytes.

Table 120: Match Conditions for the monitor traffic Command (*continued*)

Match Type	Condition	Description
Protocol	amt	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	arp	Matches all ARP packets.
	ether	Matches all Ethernet packets.
	ether (broadcast multicast)	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with src and dst .
	ether protocol (address (arp ip rarp))	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The ether protocol arguments arp , ip , and rarp are also independent match conditions, so they must be preceded by a backslash (\) when used in the ether protocol match condition.
	icmp	Matches all ICMP packets.
	ip	Matches all IP packets.
	ip (broadcast multicast)	Matches broadcast or multicast IP packets.
	ip protocol (address (icmp igmp tcp udp))	Matches packets with the specified address or protocol type. The ip protocol arguments icmp , tcp , and udp are also independent match conditions, so they must be preceded by a backslash (\) when used in the ip protocol match condition.
	isis	Matches all IS-IS routing messages.
	proto ip-protocol-number	Matches packets whose headers contain the specified IP protocol number.
	rarp	Matches all RARP packets.
	tcp	Matches all TCP datagrams.
	udp	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in [Table 121](#).

Table 121: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
()	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 122](#).

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (**| match**) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 120](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 122: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.

Table 122: Arithmetic and Relational Operators for the monitor traffic Command (*continued*)

Arithmetic or Relational Operator	Description
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

<wait *seconds*>

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Check host reachability and network connectivity. The ping command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.</p>
Options	<p>host—IP address or hostname of the remote system to ping.</p> <p>bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p>count requests—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.</p> <p>detail—(Optional) Include in the output the interface on which the ping reply was received.</p> <p>do-not-fragment—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> NOTE: In Junos OS Release 11.1 and later, when issuing the ping command for an IPv6 route with the do-not-fragment option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.</p> </div> <p>inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.</p> <p>inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.</p> <p>interface source-interface—(Optional) Interface to use to send the ping requests.</p> <p>interval seconds—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.</p> <p>logical-system logical-system-name—(Optional) Name of logical system from which to send the ping requests.</p> <p>Alternatively, enter the set cli logical-system logical-system-name command and then run the ping command. To return to the main router or switch, enter the clear cli logical-system command.</p>

loose-source value—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address mac-address—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern string—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance routing-instance-name—(Optional) Name of the routing instance for the ping attempt.

size bytes—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

strict—(Optional) Use the strict source route option (IPv4).

strict-source value—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos type-of-service—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point value** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

ttl value—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

verbose—(Optional) Display detailed output.

vpls instance-name—(Optional) Ping the instance to which this VPLS belongs.

wait seconds—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

Required Privilege Level	network
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages</i>
List of Sample Output	ping hostname on page 1727 ping hostname rapid on page 1727 ping hostname size count on page 1727
Output Fields	<p>When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.</p>

sFlow Technology

- `clear sflow collector statistics`
- `show sflow`
- `show sflow collector`
- `show sflow interface`

clear sflow collector statistics

Syntax	clear sflow collector statistics
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Clear the sample counters for all sFlow collectors.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• Example: Monitoring Network Traffic Using sFlow Technology on page 1453• Configuring sFlow Technology on page 1457• show sflow collector on page 1733
List of Sample Output	clear sflow collector statistics on page 1730

Sample Output

clear sflow collector statistics

The following example shows two output examples for the **show sflow collector** command, one before and one after the **clear sflow collector statistics** command was issued.

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          3174
10.1.2.1       6343          3562
```

```
user@host> clear sflow collector statistics
```

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          0
10.1.2.1       6343          0
```

show sflow

Syntax	show sflow <collector> <interface>
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display sFlow configuration information.
Options	<p>none—Display all sFlow configuration information.</p> <p>collector—(Optional) Display a list of configured sFlow collectors and their properties.</p> <p>interface—(Optional) Display the interfaces on which sFlow technology is enabled and the sampling parameters.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show sflow interface on page 1734 • show sflow collector on page 1733 • clear sflow collector statistics on page 1730 • Example: Monitoring Network Traffic Using sFlow Technology on page 1453 • Configuring sFlow Technology on page 1457
List of Sample Output	show sflow on page 1732
Output Fields	Table 123 lists the output fields for the show sflow command. Output fields are listed in the approximate order in which they appear.

Table 123: show sflow Output Fields

Field Name	Field Description	Level of Output
sFlow	Status of the feature: Enabled or Disabled .	All levels
Sample limit	Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second.	All levels
Polling interval	Interval at which the sFlow agent polls the interface.	All levels
Sample rate egress	Rate at which egress packets are sampled.	All levels
Sample rate ingress	Rate at which ingress packets are sampled.	All levels
Agent ID	IP address assigned to the sFlow agent.	All levels

Table 123: show sflow Output Fields (*continued*)

Field Name	Field Description	Level of Output
Source IP address	Source IP address for the sFlow packets.	All levels

Sample Output

show sflow

```
user@host> show sflow
```

```
sFlow           : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate egress : 1:2048: Disabled
Sample rate ingress : 1:1000: Enabled
Agent ID        : 10.93.54.7
Source IP address : 10.93.54.7
```

show sflow collector

Syntax	show sflow collector
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display a list of configured sFlow collectors and their properties.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear sflow collector statistics on page 1730 • show sflow on page 1731 • show sflow interface on page 1734 • Example: Monitoring Network Traffic Using sFlow Technology on page 1453 • Configuring sFlow Technology on page 1457
List of Sample Output	show sflow collector on page 1733
Output Fields	Table 124 lists the output fields for the show sflow collector command. Output fields are listed in the approximate order in which they appear.

Table 124: show sflow collector Output Fields

Field Name	Field Description	Level of Output
Collector address	IP address of the collector.	All levels
UDP-Port	UDP port number of the collector.	All levels
No. of samples	Number of samples collected.	All levels

Sample Output

show sflow collector

```
user@host> show sflow collector
```

```

Collector      Udp-port      No. of samples
address
10.204.32.46   6343          1000
100.204.32.76 3400          1000
```

show sflow interface

Syntax	show sflow interface
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the interfaces on which sFlow is enabled and the sampling parameters for the interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show sflow on page 1731 • show sflow collector on page 1733 • Example: Monitoring Network Traffic Using sFlow Technology on page 1453 • Configuring sFlow Technology on page 1457

clear snmp history

Syntax	clear snmp history (<i>index</i> all)
Release Information	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Delete the samples of Ethernet statistics collected for a history group.
Options	all —Clear all the entries in the history index. index —Clear the contents of the specified entry in the history index.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• clear snmp statistics on page 1739

clear snmp statistics

Syntax	clear snmp statistics
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Clear Simple Network Management Protocol (SNMP) statistics.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show snmp statistics on page 1764
List of Sample Output	clear snmp statistics on page 1739
Output Fields	See show snmp statistics for an explanation of output fields.

Sample Output

clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290
```

```
user@host> clear snmp statistics
```

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
```

```
Total request varbinds: 0, Total set varbinds: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0,  
Silent drops: 0, Proxy drops 0  
Output:  
Packets: 0, Too bigs: 0, No such names: 0,  
Bad values: 0, General errors: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0
```

request snmp spoof-trap

Syntax	request snmp spoof-trap <trap> variable-bindings <object> <instance> <value>
Release Information	Command introduced in Junos OS Release 8.2. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.
Options	<p><trap>—Name of the trap to spoof.</p> <p>variable-bindings <object> <instance> <value>—(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, ifIndex[14] = 14). Enclose the list of variable bindings in quotation marks (" ") and use a comma to separate each object name, instance, and value definition (for example, variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values.</p> <p><dummy name>—A dummy trap name to display the list of available traps.</p> <p>Question mark (?)—Question mark? to display possible completions.</p>
Required Privilege Level	request
List of Sample Output	request snmp spoof-trap (with Variable Bindings) on page 1741 request snmp spoof-trap (Illegal Trap Name) on page 1741 request snmp spoof-trap (Question Mark ?) on page 1745

Sample Output

request snmp spoof-trap (with Variable Bindings)

```
user@host> request snmp spoof-trap linkUp variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"
Spoof trap request result: trap sent successfully
```

request snmp spoof-trap (Illegal Trap Name)

```
user@host> request snmp spoof-trap xx
Spoof trap request result: trap not found

request snmp utility-mib clear instance

Syntax	request snmp utility-mib clear instance <i>name</i> object-type <i>type</i>
Release Information	Command introduced in Junos OS Release 12.2 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Clear the data stored in the specified container object in the SNMP Utility MIB.
Options	<p><i>name</i>—Name of the SNMP instance that is used to identify the data stored in the container object.</p> <p><i>object-type type</i>—Type of container object in which the data is stored. The following container object types are supported:</p> <ul style="list-style-type: none">• counter—Stores a 32-bit counter value.• counter64—Stores a 64-bit counter value.• integer—Stores a 32-bit signed integer value.• unsigned-integer—Stores a 32-bit unsigned integer value.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• Utility MIB on page 1460• <i>Understanding the Implementation of SNMP on the QFabric System</i>• request snmp utility-mib set instance on page 1748

request snmp utility-mib set instance

Syntax	<code>request snmp utility-mib set instance <i>name</i></code> <code>object-type <i>type</i></code> <code>object-value <i>value</i></code>
Release Information	Command introduced in Junos OS Release 12.2 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Store data in the specified container object in the SNMP Utility MIB. The data may be retrieved by SNMP operations.
Options	<p><i>name</i>—Name of the SNMP instance that is used to identify the data stored in the container object.</p> <p><i>object-type type</i>—Type of container object in which to store data. The following container object types are supported:</p> <ul style="list-style-type: none">• counter—Stores a 32-bit counter value.• counter64—Stores a 64-bit counter value.• integer—Stores a 32-bit signed integer value.• unsigned-integer—Stores a 32-bit unsigned integer value.• string—Stores an octet string value. <p><i>object-value value</i>—Data that is stored in the container object.</p>
Required Privilege Level	request

show snmp health-monitor

Syntax	show snmp health-monitor <alarms (brief detail) logs>
Release Information	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.
Options	<p>none—Display information about all health monitor alarms and logs.</p> <p>alarms (brief detail)—(Optional) Display information about health monitor alarms. Optionally, specify brief or detailed information about the alarms.</p> <p>logs—(Optional) Display information about health monitor logs.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Understanding Health Monitoring on page 1467 • Configuring Health Monitoring on page 1509
List of Sample Output	show snmp health-monitor on page 1751 show snmp health-monitor alarms detail on page 1751
Output Fields	Table 126 describes the output fields for the show snmp health-monitor command. Output fields are listed in the approximate order in which they appear.

Table 126: show snmp health-monitor Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 126: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the alarm or event entry:</p> <ul style="list-style-type: none"> Alarms: <ul style="list-style-type: none"> active—Entry is fully configured and activated. falling threshold crossed—Value of the variable has crossed the lower threshold limit. rising threshold crossed—Value of the variable has crossed the upper threshold limit. under creation—Entry is being configured and is not yet activated. startup—Alarm is waiting for the first sample of the monitored variable. object not available—Monitored variable of that type is not available to the health monitor agent. instance not available—Monitored variable's instance is not available to the health monitor agent. object type invalid—Monitored variable is not a numeric value. object processing errored—An error occurred when the monitored variable was processed. unknown—State is not one of the above. 	All levels
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.	detail
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value <i>absolute value</i> or <i>delta value</i> .	detail
Startup alarm	<p>Alarm that might be sent when this entry is first activated, depending on the following criteria:</p> <ul style="list-style-type: none"> Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. <i>falling alarm</i> Value of the alarm is below or equal to the falling threshold and the startup type is either <i>falling alarm</i> or <i>rising or falling alarm</i>. Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is <i>falling alarm</i>. Value of the alarm is below or equal to the falling threshold and the startup type is <i>rising alarm</i>. Value of the alarm is between the thresholds. 	detail
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has monitor prepended to it.	detail
Creator	Mechanism by which the entry was configured (Health Monitor).	detail
Sample interval	Time period between samples (in seconds).	detail
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.	detail

Table 126: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description	Level of Output
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.	detail
Rising event index	Index number of the event triggered when the rising threshold is crossed.	detail
Falling event index	Index number of the event triggered when the falling threshold is crossed. Details include the value of the falling event instance and the state of the falling event instance.	detail

Sample Output

show snmp inform-statistics

Syntax	show snmp inform-statistics
Release Information	<p>Command introduced in Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display information about Simple Network Management Protocol (SNMP) inform requests.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show snmp inform-statistics on page 1754
Output Fields	<p>Table 127 describes the output fields for the show snmp inform-statistics command.</p> <p>Output fields are listed in the approximate order in which they appear.</p>

Table 127: show snmp inform-statistics Output Fields

Field Name	Field Description
Target Name	Name of the device configured to receive and respond to SNMP informs.
Address	IP address of the target device.
Sent	Number of informs sent to the target device and acknowledged by the target device.
Pending	Number of informs held in memory pending a response from the target device.
Discarded	Number of informs discarded after the specified number of retransmissions to the target device were attempted.
Timeouts	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
Probe Failures	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

Sample Output

show snmp inform-statistics

```

user@host> show snmp inform-statistics
Inform Request Statistics:
Target Name: TA1_v3_md5_none Address: 172.17.20.184
Sent: 176, Pending: 0
Discarded: 0, Timeouts: 0, Probe Failures: 0

```

Target Name: TA2_v3_sha_none Address: 192.168.110.59
Sent: 0, Pending: 4
Discarded: 84, Timeouts: 0, Probe Failures: 258
Target Name: TA5_v2_none Address: 172.17.20.184
Sent: 0, Pending: 0
Discarded: 2, Timeouts: 10, Probe Failures: 0

show snmp mib

Syntax	<code>show snmp mib (get get-next walk) (ascii decimal) <i>object-id</i></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>ascii and decimal options introduced in Junos OS Release 9.6.</p> <p>ascii and decimal options introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.
Options	<p>get—Retrieve and display one or more SNMP object values.</p> <p>get-next—Retrieve and display the next SNMP object values.</p> <p>walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p>ascii—Display the SNMP object's string indices as an ASCII-key representation.</p> <p>decimal—Display the SNMP object values in the decimal (default) format. The decimal option is the default option for this command. Therefore, issuing the show snmp mib (get get-next walk) decimal object-id and the show snmp mib (get get-next walk) object-id commands display the same output.</p> <p>object-id—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as interfaces). When entering multiple objects, enclose the objects in quotation marks.</p>
Required Privilege Level	snmp—To view this statement in the configuration.
List of Sample Output	<p>show snmp mib get on page 1757</p> <p>show snmp mib get (Multiple Objects) on page 1757</p> <p>show snmp mib get (Layer 2 Policer) on page 1757</p> <p>show snmp mib get-next on page 1757</p> <p>show snmp mib get-next (Specify an OID) on page 1757</p> <p>show snmp mib walk on page 1757</p> <p>show snmp mib walk (QFX Series) on page 1757</p> <p>show snmp mib walk decimal on page 1758</p> <p>show snmp mib walk (ASCII) on page 1758</p> <p>show snmp mib walk (Multiple Indices) on page 1758</p> <p>show snmp mib walk decimal (Multiple Indices) on page 1758</p>
Output Fields	Table 128 describes the output fields for the show snmp mib command. Output fields are listed in the approximate order in which they appear.

Table 128: show snmp mib Output Fields

Field Name	Field Description
<i>name</i>	Object name and numeric instance value.
<i>object value</i>	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output

Output Fields	Table 129 describes the output fields for the show snmp rmon command. Output fields are listed in the approximate order in which they appear.

Table 129: show snmp rmon Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels

Table 129: show snmp rmon Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the alarm or event entry:</p> <p>Alarms:</p> <ul style="list-style-type: none"> • active—Entry is fully configured and activated. • falling threshold crossed—Value of the variable has crossed the lower threshold limit. • rising threshold crossed—Value of the variable has crossed the upper threshold limit. • under creation—Entry is being configured and is not yet activated. • startup—Alarm is waiting for the first sample of the monitored variable. • object not available—Monitored variable of that type is not available to the SNMP agent. • instance not available—Monitored variable's instance is not available to the SNMP agent. • object type invalid—Monitored variable is not a numeric value. • object processing errored—An error occurred when the monitored variable was processed. • unknown—State is not one of the above. <p>Events:</p> <ul style="list-style-type: none"> • active—Entry has been fully configured and activated. • under creation—Entry is being configured and is not yet activated. • unknown—State is not one of the above. 	All levels
Variable name	Name of the SNMP object instance being monitored.	All levels
Event Index	Event identifier.	All levels
Type	<p>Type of notification made when an event is triggered. It can be one of the following:</p> <ul style="list-style-type: none"> • log—A system log message is generated and an entry is made to the log table. • snmptrap—An SNMP trap is sent to the configured destination. • log and trap—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination. • none—Neither log nor trap will be sent. 	detail
Last Event	Date and time of the last event. It has the format <i>yyyy-mm-dd hh:mm:ss timezone</i> .	brief
Community	Trap group used for sending the SNMP trap.	detail
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.	detail
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of absolute value or delta value .	detail

Table 129: show snmp rmon Output Fields (*continued*)

Field Name	Field Description	Level of Output
Startup alarm	Alarm that might be sent when this entry is first activated, depending on the following criteria: <ul style="list-style-type: none"> Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is either falling alarm or rising or falling alarm. Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is rising alarm. Value of the alarm is between the thresholds. 	detail
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has monitor prepended to it.	detail
Creator	Mechanism by which the entry was configured (CLI or SNMP).	detail
Sample interval	Time period between samples (in seconds).	detail
Rising threshold	Upper limit threshold value configured by the user.	detail
Falling threshold	Lower limit threshold value configured by the user.	detail
Rising event index	Event triggered when the rising threshold is crossed.	detail
Falling event index	Event triggered when the falling threshold is crossed.	detail
Current value	Current value of the monitored variable in the most recent sample interval.	detail

Sample Output

show snmp statistics

Syntax	<code>show snmp statistics</code> <code><subagents></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Option subagents introduced in Junos OS Release 14.2.
Description	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
Options	subagents —(Optional) Display the statistics of the protocol data unit (PDU), the number of SNMP requests and responses per subagent, and the SNMP statistics received from each subagent per logical system.
Required Privilege Level	view

Output Fields	Table 130 describes the output fields for the show snmp statistics command. Output fields are listed in the approximate order in which they appear.

Table 130: show snmp statistics Output Fields

Field Name	Field Description
Input	<p>Information about received packets:</p> <ul style="list-style-type: none"> • Packets(snmplnPkts)—Total number of messages delivered to the SNMP entity from the transport service. • Bad versions—(snmplnBadVersions) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • Bad community names—(snmplnBadCommunityNames) Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • Bad community uses—(snmplnBadCommunityUses) Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • ASN parse errors—(snmplnASNParseErrs) Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • Too bigs—(snmplnTooBigs) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of tooBig. • No such names—(snmplnNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName. • Bad values—(snmplnBadValues) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of badValue. • Read onlys—(snmplnReadOnlys) Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of readOnly. Only incorrect implementations of SNMP generate this error.

Table 130: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> • General errors—(snmpInGenErrs) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of genErr. • Total requests varbinds—(snmpInTotalReqVars) Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP GetRequest and GetNext PDUs. • Total set varbinds—(snmpInSetVars) Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP SetRequest PDUs. • Get requests—(snmpInGetRequests) Total number of SNMP GetRequest PDUs that have been accepted and processed by the SNMP entity. • Get nexts—(snmpInGetNexts) Total number of SNMP GetNext PDUs that have been accepted and processed by the SNMP entity. • Set requests—(snmpInSetRequests) Total number of SNMP SetRequest PDUs that have been accepted and processed by the SNMP entity. • Get responses—(snmpInGetResponses) Total number of SNMP GetResponse PDUs that have been accepted and processed by the SNMP entity. • Traps—(snmpInTraps) Total number of SNMP traps generated by the SNMP entity. • Silent drops—(snmpSilentDrops) Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • Proxy drops—(snmpProxyDrops) Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned. • Commit pending drops—Number of SNMP packets for Set requests dropped because of a previous pending SNMP Set request on the committed configuration. • Throttle drops—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 130: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> • Unknown security models—(snmpUnknownSecurityModels) Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • Invalid messages—(snmpInvalidMsgs) Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • Unknown pdu handlers—(snmpUnknownPDUHandlers) Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • Unavailable contexts—(snmpUnavailableContexts) Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • Unknown contexts—(snmpUnknownContexts) Total number of requests received for a context that is unknown to the SNMP engine. • Unsupported security levels—(usmStatsUnsupportedSecLevels) Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • Not in time windows—(usmStatsNotInTimeWindows) Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • Unknown user names—(usmStatsUnknownUserNames) Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • Unknown engine ids—(usmStatsUnknownEngineIDs) Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine. • Wrong digests—(usmStatsWrongDigests) Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • Decryption errors—(usmStatsDecryptionErrors) Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.

Table 130: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Output	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> • Packets—(snmpOutPkts) Total number of messages passed from the SNMP entity to the transport service. • Too big—(snmpOutTooBigs) Total number of SNMP PDUs generated by the SNMP entity with an error status field of tooBig. • No such names—(snmpOutNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName. • Bad values—(snmpOutBadValues) Total number of SNMP PDUs generated by the SNMP entity with an error status field of badValue. • General errors—(snmpOutGenErrs) Total number of SNMP PDUs generated by the SNMP entity with an error status field of genErr. • Get requests—(snmpOutGetRequests) Total number of SNMP GetRequest PDUs generated by the SNMP entity. • Get nexts—(snmpOutGetNexts) Total number of SNMP GetNext PDUs generated by the SNMP entity. • Set requests—(snmpOutSetRequests) Total number of SNMP SetRequest PDUs generated by the SNMP entity. • Get responses—(snmpOutGetResponses) Total number of SNMP GetResponse PDUs generated by the SNMP entity. • Traps—(snmpOutTraps) Total number of SNMP traps generated by the SNMP entity.

Table 131 describes the output fields for the **show snmp statistics subagents** command. Output fields are listed in the approximate order in which they appear.

Table 131: show snmp statistics subagents Output Fields

Field Name	Field Description
Subagent	Location of the SNMP subagent.
Request PDUs	Number of PDUs requested by the SNMP manager.
Response PDUs	Number of response PDUs sent by the SNMP subagent.
Request Variables	Number of variable bindings on the PDUs requested by the SNMP manager.
Response Variables	Number of variable bindings on the PDUs sent by the SNMP subagent.
Average Response Time	Average time taken by the SNMP subagent to send statistics response.
Maximum Response Time	Maximum time taken by the SNMP subagent to send the statistics response.

Sample Output

show snmp v3

Syntax	<code>show snmp v3</code> <code><access <brief detail> community general groups notify <filter> target <address parameters> users></code>
Release Information	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.
Options	<p>none—Display all of the SNMPv3 operating configuration.</p> <p>access—(Optional) Display SNMPv3 access information.</p> <p>brief detail—(Optional) Display brief or detailed information about SNMPv3 access information.</p> <p>community—(Optional) Display SNMPv3 community information.</p> <p>general—(Optional) Display SNMPv3 general information.</p> <p>groups—(Optional) Display SNMPv3 security-to-group information.</p> <p>notify <filter>—(Optional) Display SNMPv3 notify information and, optionally, notify filter information.</p> <p>target <address parameters>—(Optional) Display SNMPv3 target information and, optionally, either target address or target parameter information.</p> <p>users—(Optional) Display SNMPv3 user information.</p>
Additional Information	To edit the default display of the show snmp v3 command, specify options in the show statement at the [edit snmp v3] hierarchy level.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• SNMPv3 Overview on page 1460• Minimum SNMPv3 Configuration on a Device Running Junos OS on page 1461• Configuring Access Privileges for a Group on page 1511
List of Sample Output	show snmp v3 on page 1773
Output Fields	Table 132 describes the output fields for the show snmp v3 command. Output fields are listed in the approximate order in which they appear.

Table 132: show snmp v3 Output Fields

Field Name	Field Description
Local engine	<p>Information about the local SNMP engine configuration:</p> <ul style="list-style-type: none"> • Local engine ID—Unique Identifier of the local SNMPv3 engine. • Engine boots—Number of times the local SNMPv3 engine has rebooted or reinitialized since this engine ID was configured. • Engine time—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • Max msg size—Maximum message size the sender can accommodate.
Engine ID (local engine)	<p>Information about the local SNMP engine ID and the associated users:</p> <ul style="list-style-type: none"> • User—SNMPv3 username. • Auth/Priv—Authentication and encryption algorithm that is configured for the user. • Storage—Indicates whether a username is saved to the configuration file (nonvolatile) or not saved (volatile). Applies only to users with active status. • Status—Status of the user as listed in the SNMPv3 user table. Only rows with an active status in the table are used by the SNMPv3 engine.
Engine ID (remote engine)	<p>Information about a remote SNMP engine, associated users, user groups, and user access policies:</p> <ul style="list-style-type: none"> • User—SNMPv3 username. • Auth/Priv—Authentication and encryption algorithm that is configured for the user. • Storage—Indicates whether a username is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status. • Status—Status of a new user that has been activated. Only users with an active status can use SNMPv3. • Group name—Name of a group of users for which the configured access privileges apply. • Security model—Security model (such as usm, v1, v2c, or any) that is configured for the group. The security model is used with the security name to ensure messaging security. • Security name—Security name that is associated with a user, and which is used with the security model to ensure messaging security. • Storage type—Indicates whether a username is saved to the configuration file (nonvolatile) or not saved (volatile). Applies only to users with active status. • Status—Status of a user in a group. Only users with an active status can use SNMPv3.
Access control	<p>Information about access control:</p> <ul style="list-style-type: none"> • Group name—Name of a group of users for which the configured access privileges apply. • Context prefix—SNMPv3 context for which the configured access privileges apply. • Security model/level—Security model and security level combination that is configured for user access privileges. • Read view—Identifies the MIB view used for SNMPv3 read operations. • Write view—Identifies the MIB view used for SNMPv3 write operations. • Notify view—Identifies the MIB view used for outbound SNMP notifications.

Sample Output

CHAPTER 58

System Logging

- request app-engine file-copy (crash | log) from-jhost to-vjunos
- request app-engine cleanup
- show app-engine crash
- show app-engine logs
- show log

request app-engine file-copy (crash | log) from-jhost to-vjunos

Syntax	<code>request app-engine file-copy (crash log) from-jhost <i>host-os-filename</i> to-vjunos <i>vjunos-filename</i></code>
Release Information	Command introduced in Junos OS Release 13.1X51-D10 for the QFX Series.
Description	<p>In Junos OS environments with a host OS, copies core files (crash option) or system log files (log option) from the host OS to a Junos OS filename.</p> <ul style="list-style-type: none">• crash option—Core files are copied from the directory where the host OS normally stores core files. For example, when the host OS is Linux, the source directory is <code>/var/crash</code>. The show app-engine crash command displays the list of core files available to copy from the host OS source directory.• log option—Log files are copied from the directory where the host OS normally stores system log files. For example, when the host OS is Linux, the source directory is <code>/var/log</code>. The show app-engine logs command displays the list of system log files available to copy from the host OS source directory. <p>Either the crash or log option is required. When the destination Junos OS path for the to-vjunos argument is a directory, the destination filename is the source filename by default. To rename the file at the destination, specify a full path that includes a destination filename in the path with the to-vjunos argument.</p>
Options	<ul style="list-style-type: none">• from-jhost <i>host-os-filename</i>—Source filename to copy from the host OS.• to-vjunos <i>vjunos-filename</i>—Junos OS destination path (with or without a filename) to which the file is copied. If this path is a directory, the source filename is used as the destination filename by default.
Additional Information	This command does not apply to accessing files on guest virtual machines (VMs) on QFX Series devices that support guest VMs.
Required Privilege Level	view

total files: 1
```

request app-engine cleanup

Syntax	request app-engine cleanup <compute-cluster <i>compute-cluster-name</i> > <compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i> >
Release Information	Command introduced in Junos OS Release 13.1X51-D10 for the QFX Series.
Description	Cleans up temporary files on the Junos V App Engine or the host OS of QFX Series switches. This command deletes all files from the directories where temporary files are normally stored, such as /var/tmp.
Options	<ul style="list-style-type: none"> compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i>—Name of the compute cluster and name of the compute node. On QFX Series switches, the default names of the compute cluster and compute node are default-cluster and default-node, which applies to the host OS.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show app-engine crash on page 1780 show app-engine logs on page 1782 request app-engine file-copy on page 1776
List of Sample Output	request app-engine cleanup (QFX 5100 Switches) on page 1778
Output Fields	For a description of the output fields, see Table 133 . Output fields are listed in the approximate order in which they appear.

Table 133: request app-engine cleanup Output Fields

Field Name	Field Description
Compute Cluster	Name of compute cluster.
Compute Node	Name of compute node.
Cleanup	Lists the directories that were cleaned up.

Sample Output

request app-engine cleanup (QFX 5100 Switches)

```

user@host> request app-engine cleanup
user@host> request app-engine cleanup
Compute cluster: default-cluster

Compute node: default-node

Cleanup (/var/tmp)

```

=====

show app-engine crash

Syntax	<pre>show app-engine crash <compute-cluster <i>compute-cluster-name</i>> <compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i>></pre>
Release Information	Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.
Description	Displays information regarding crashes on the Junos V App Engine or host OS. The command displays the list of files present in the <code>/var/crash/</code> directory, as well as some core files located in the <code>/var/tmp/</code> directory.
Options	<ul style="list-style-type: none"> compute-cluster <i>compute-cluster-name</i> compute-node <i>compute-node-name</i>—Name of the compute cluster and compute node. On QFX switches with a host OS, the default compute cluster and compute node names are default-cluster and default-node, and the command applies to the host OS by default.
Additional Information	<p>In the operational mode of the CLI when you type <code>?</code> for a name, for example a compute-node name, you would expect to get a list of available compute nodes plus the option to type in a name not listed. This is the auto-complete feature in the CLI. However, in JunosV App Engine, if you specify compute cluster and compute node in the operational command, the auto-complete works only if the compute cluster is put before the compute node.</p> <p>For commands with an optional compute-cluster <i>compute-cluster-name</i> option, if that option is omitted, the command will be executed on all compute nodes of all compute clusters. For commands with an optional compute-node <i>compute-node-name</i> option, if that option is omitted, the command will be executed on all compute nodes of the specified compute cluster.</p>

show log

List of Syntax	Syntax on page 1784 Syntax (QFX Series and OCX Series) on page 1784 Syntax (TX Matrix Router) on page 1784
Syntax	<code>show log</code> <code><filename user <username>></code>
Syntax (QFX Series and OCX Series)	<code>show log filename</code> <code><device-type (device-id device-alias)></code>
Syntax (TX Matrix Router)	<code>show log</code> <code><all-lcc lcc <i>number</i> scc></code> <code><filename user <username>></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <i>device-type (device-id device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.

NOTE: On MX Series routers, modifying a configuration to replace a service interface with another service interface is treated as a catastrophic event. When you modify a configuration, the entire configuration associated with the service interface—including NAT pools, rules, and service sets—is deleted and then re-created for the newly specified service interface. If there are active sessions associated with the service interface that is being replaced, these sessions are deleted and the NAT pools are then released, which leads to the generation of the NAT_POOL_RELEASE system log messages. However, because NAT pools are already deleted as a result of the catastrophic configuration change and no longer exist, the NAT_POOL_RELEASE system log messages are not generated for the changed configuration.

Options **none**—List all log files.

<all-lcc | lcc *number* | scc>—(Routing matrix only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace *number* with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(device-id | device-alias)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include **username**, display logging information about the specified user.

Understanding the Software

- [Understanding Junos OS Infrastructure and Processes on page 1793](#)
- [Understanding LLDP on page 1795](#)
- [Monitoring SNMP on page 1796](#)

Understanding Junos OS Infrastructure and Processes

Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 1793](#)
- [Junos OS Processes on page 1794](#)

Routing Engine and Packet Forwarding Engine

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
 - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
 - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
 - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 136 describes the primary Junos OS processes.

Table 136: Junos OS Processes

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.

Table 136: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Multicast snooping process	multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operation, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

Understanding LLDP

The device uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port

identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The device supports the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The device supports the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

Documentation**

- *Configuring LLDP*

Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.

- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                               Value State

32768 Health Monitor: root file system utilization
      jnxHrStoragePercentUsed.1                      58 active

32769 Health Monitor: /config file system utilization
      jnxHrStoragePercentUsed.2                      0 active

32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                        0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0                    35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                                    0 active
      Chassis daemon                                50 active
      Firewall daemon                               0 active
      Interface daemon                              5 active
      SNMP daemon                                   11 active
      MIB2 daemon                                   42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system

sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:

CHAPTER 60

Understanding Access and Authentication Methods

- [Understanding Junos OS Access Privilege Levels on page 1799](#)
- [Junos OS User Authentication Methods on page 1804](#)
- [Understanding Login Authentication on page 1804](#)

Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 1799](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 1802](#)

Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in [Table 137](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

[Table 137](#) lists the Junos OS login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

Table 137: Login Class Permission Flags

Permission Flag	Description
access	Can view the access configuration in configuration mode and with the show configuration operational mode command.
access-control	Can view and configure access information at the [edit access] hierarchy level.
admin	Can view user account information in configuration mode and with the show configuration operational mode command.
admin-control	Can view user accounts and configure them at the [edit system login] hierarchy level.
all-control	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
clear	Can clear (delete) information learned from the network that is stored in various network databases by using the clear commands.
configure	Can enter configuration mode by using the configure command.
control	Can perform all control-level operations—all operations configured with the -control permission flags.
field	Can view field debug commands. Reserved for debugging support.
firewall	Can view the firewall filter configuration in configuration mode.
firewall-control	Can view and configure firewall filter information at the [edit firewall] hierarchy level.
floppy	Can read from and write to the removable media.
flow-tap	Can view the flow-tap configuration in configuration mode.
flow-tap-control	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the [edit services flow-tap] hierarchy level.
flow-tap-operation	<p>Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must authenticate itself to the Junos OS as an administrative user. That account must have flow-tap-operation permission.</p> <p>NOTE: The flow-tap-operation option is not included in the all-control permissions flag.</p>
idp-profiler-operation	Can view profiler data.

Table 137: Login Class Permission Flags (*continued*)

Permission Flag	Description
interface	Can view the interface configuration in configuration mode and with the show configuration operational mode command.
interface-control	Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: <ul style="list-style-type: none"> • [edit chassis] • [edit class-of-service] • [edit groups] • [edit forwarding-options] • [edit interfaces]
maintenance	Can perform system maintenance, including starting a local shell on the router or switch and becoming the superuser in the shell by using the su root command, and can halt and reboot the router or switch by using the request system commands.
network	Can access the network by using the ping , ssh , telnet , and traceroute commands.
pgcp-session-mirroring	Can view the pgcp session mirroring configuration.
pgcp-session-mirroring-control	Can modify the pgcp session mirroring configuration.
reset	Can restart software processes by using the restart command and can configure whether software processes are enabled or disabled at the [edit system processes] hierarchy level.
rollback	Can use the rollback command to return to a previously committed configuration other than the most recently committed one.
routing	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
routing-control	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the [edit routing-options] hierarchy level, routing protocols at the [edit protocols] hierarchy level, and routing policy at the [edit policy-options] hierarchy level.
secret	Can view passwords and other authentication keys in the configuration.
secret-control	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.

Table 137: Login Class Permission Flags (*continued*)

Permission Flag	Description
security	Can view security configuration in configuration mode and with the show configuration operational mode command.
security-control	Can view and configure security information at the [edit security] hierarchy level.
shell	Can start a local shell on the router or switch by using the start shell command.
snmp	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
snmp-control	Can view SNMP configuration information and can modify SNMP configuration at the [edit snmp] hierarchy level.
system	Can view system-level information in configuration and operational modes.
system-control	Can view system-level configuration information and configure it at the [edit system] hierarchy level.
trace	Can view trace file settings and configure trace file properties.
trace-control	Can modify trace file settings and configure trace file properties.
view	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.
view-configuration	Can view all of the configuration excluding secrets, system scripts, and event options. NOTE: Only users with the maintenance permission can view commit script, op script, or event script configuration.

Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all**

permissions flag. For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

- The **all** login class permission bits take precedence over extended regular expressions when a user with **rollback** permission issues the **rollback** command.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration-regexps** and **deny-configuration-regexps**, **allow-commands** and **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

- [Access Privilege User Permission Flags Overview](#)

Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

Related Documentation

- *Configuring RADIUS Server Authentication*
- *Configuring TACACS+ Authentication*
- [Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 1859](#)

Understanding Login Authentication

You can control access to your network using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the **authentication-whitelist** statement.

You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.

On a single interface you can configure one or a combination of several authentication methods.

This topic covers:

- [MAC RADIUS Authentication on page 1805](#)

MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices.

The EAP method supported for MAC RADIUS authentication is EAP-MD5.

When you configure the **mac-radius restrict** option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

- [Troubleshooting Overview on page 1816](#)
- [Recovering the Root Password on page 1818](#)

Configuring Management Access

To define the management access settings for the routing platform:

1. Next to Allow Telnet Access, select the check box to allow remote Telnet access to the routing platform.
2. Next to Allow SSH Access, selected the check box to allow remote SSH access to the routing platform.
3. Click **Apply** to apply the configuration.

- [Configuring Junos OS User Accounts on page 125](#)
- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 30](#)
- [Example: Configuring User Permissions with Access Privilege Levels on page 1831](#)

Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
permissions [ permissions ];
```

**Related
Documentation**

- [Example: Configuring User Permissions with Access Privilege Levels on page 1831](#)
- [Understanding Junos OS Access Privilege Levels on page 1799](#)
- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 30](#)
- *permissions*

Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

**Related
Documentation**

- [Defining Junos OS Login Classes](#)

Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.

5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:

- Bits per second: 9600
- Data bits: 8
- Parity: None
- Stop bits: 1
- Flow control: None

9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1  
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit  
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

Related Documentation

- [Configuring the Root Password](#)

Example: Configuring a Plain-Text Password for Root Logins

This example shows how to configure a plain-text password for the root-level user (whose username is *root*). Configuring a plain-text password is one way to protect access to the root level by unauthorized users. You must prevent unauthorized users from gaining access to superuser commands that can be used to alter your system configuration.

- [Requirements on page 1812](#)
- [Overview on page 1812](#)
- [Configuration on page 1812](#)
- [Verification on page 1813](#)

Requirements

No special configuration beyond device initialization is required before configuring this example.

Make sure that you understand the requirements for a valid plain-text password. For Junos OS, the default requirements for a plain-text password are as follows:

- Must be from 6 up to 128 characters long.
- Can include most character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Must contain at least one change of case or character class.

Overview

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the root-level user with no password. To set the root password, you have several options. This example shows how to enter a plain-text password that Junos OS then encrypts for you.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following command and paste it into the window. When prompted, type the new password, and then when prompted, retype it.

```
set system root-authentication plain-text-password
```

Configuring a Plain-Text Password for User Root

Step-by-Step Procedure To configure a plain-text password for the root-level user:

1. Type the **set** command for the plain-text password and press Enter.

```
[edit]
```

```
user@host# set system root-authentication plain-text-password
```

New password:

2. Type the new password next to the **New password** prompt and press Enter.

New password: *new-password*

Retype new password:

3. Retype the same password next to the **Retype new password** prompt and press Enter.

Results

From configuration mode, confirm your configuration by using the **show** command. It should look something like this:

```
[edit ]
user@host# show system
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

After you have confirmed that the configuration is correct, enter **commit** from configuration mode.

Verification

Verifying the Configuration of a Plain-Text Password for User Root

Purpose Verify the configuration of a plain-text password for the root-level user.

Action From operational mode, confirm your configuration by entering the **show configuration system** command.

```
user@host> show configuration system
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

Meaning If you use a clear-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see the unencrypted password. That is, as you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are hidden and marked as ## SECRET-DATA in the configuration.

Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series or OCX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 138 provides a list of some of the troubleshooting resources.

Table 138: Troubleshooting Resources on the QFX and OCX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	<i>Chassis Alarm Messages on a QFX3500 Device</i>
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	<i>Chassis Status LEDs on a QFX3500 Device</i>
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	<i>Interface Alarm Messages</i>
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	<i>Understanding Alarms</i>
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> • Overview of Single-Chassis System Logging Configuration on page 1528 • Junos OS System Log Configuration Statements on page 1530

Table 138: Troubleshooting Resources on the QFX and OCX Series (*continued*)

Troubleshooting Resource	Description	Documentation
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the traceroute monitor command to locate points of failure in a network.	<ul style="list-style-type: none"> • Monitoring System Process Information on page 165 • Monitoring System Properties on page 166 • traceroute monitor
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	<i>Automation Scripting Feature Guide</i>
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	<i>Junos XML API Operational Developer Reference</i>
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as show , set , and commit to perform those operations.	<i>NETCONF XML Management Protocol Developer Guide</i>
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	<ul style="list-style-type: none"> • SNMP MIBs Support on page 1468 • SNMP Traps Support on page 1484 • Using the Traceroute MIB for SNMP Remote Operations
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	Advanced Insight Scripts (AI-Scripts) Release Notes
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	<i>Service Automation</i>

Table 138: Troubleshooting Resources on the QFX and OCX Series (*continued*)

Troubleshooting Resource	Description	Documentation
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	<i>Service Automation</i>
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	http://kb.juniper.net

Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series or OCX Series product.

[Table 139](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 139: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	<i>See Chassis Alarm Messages on a QFX3500 Device.</i>
	Fan tray LED is blinking amber.	<i>See Fan Tray LED on a QFX3500 Device.</i>

	Interface on built-in network port is down.	See “Troubleshooting Network Interfaces” on page 2845.
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See “Troubleshooting Ethernet Switching” on page 2134.
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See “Troubleshooting Firewall Filters” on page 5989.

Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
 - Bits per second: 9600
 - Data bits: 8
 - Parity: None
 - Stop bits: 1
 - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

ok **boot -s**
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: **recovery**
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

user@switch# **set system root-authentication plain-text-password**
15. At the following prompt, enter the new root password. For example:

New password: **juniper1**
Retype new password:

16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 1804](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User's full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.
- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.
- User's access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in ["Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies"](#) on page 1826.
- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user's password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user user-name]  
user@switch# set authentication plain-text-password  
New password: type password here  
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
 - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
 - Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
207404962528390382038690141584534964170019610608358722961563
475784918273603361276441874265946893207739108344813125957722
625461667999278316123500438660915866283822489746732605661192
181489539813862940327687806538169602027491641637359132693963
44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in *Configuring the Root Password*.

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

- [Configuring Junos OS User Accounts on page 125](#)
 - [Junos OS Login Classes Overview on page 1823](#)

Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in [Table 140](#). The predefined login classes cannot be modified.

Table 140: Predefined System Login Classes

Login Class	Permission Flag Set
operator	clear, network, reset, trace, and view

Table 140: Predefined System Login Classes (*continued*)

Login Class	Permission Flag Set
read-only	view
superuser or super-user	all
unauthorized	None

**NOTE:**

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:

warning: '<class-name>' is a predefined class name; changing to
'<class-name>-local'

- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:

error: target '<class-name>' is a predefined class

**Related
Documentation**

- [Defining Junos OS Login Classes](#)

Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. [Table 141](#) shows the default requirements.

Table 141: Special Requirements for Plain-Text Passwords

Junos OS	Junos-FIPS
The password must be between 6 and 128 characters long.	FIPS passwords must be between 10 and 20 characters long
You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.	You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
Valid passwords must contain at least one change of case or character class.	Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # \$ % ^ & *, + < >

NOTE: "!" and "," are punctuation characters, but are listed under "special characters".

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- [edit system diag-port-authentication]
- [edit system pic-console-authentication]
- [edit system root-authentication]
- [edit system login user *username* authentication]

The **change-type** statement specifies whether the password is checked for the following:

- The total number of character sets used (**character-set**)
- The total number of character set changes (**set-transitions**)

For example, the following password:

MyPassWd@2

has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (M–y, y–P, P–a, s–W, W–d, d–@, and @–2).

The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be 5 or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1**, **sha256**, **sha512** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

NOTE: Starting with Junos OS Release 13.3, the sha1 does not enable secure, protected specification of passwords and we recommend that you do not use the sha1 algorithm to configure passwords. Instead, you can use the sha256 or sha512 to specify passwords by using the 256-bit and 512-bit cryptographic hash algorithm respectively for a robust and reliable operation.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
  change-type character-sets;
  format md5;
  minimum-changes 1;
  minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
  change-type set-transitions;
  format sha1;
  maximum-length 20;
  minimum-changes 3;
  minimum-length 10;
}
```

Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the **allow/deny-configuration-regexps** and **allow/deny-configuration** statements at the **[edit**

system login class] hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

[Table 142](#) lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

Table 142: Configuration Mode Hierarchies—Common Regular Expression Operators

Operator	Match
	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses (), with no spaces between the pipe and the adjacent parentheses. For example, (show system alarms) (show system software).
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, allow-commands "show interfaces\$" means that the user can issue the show interfaces command but cannot issue show interfaces detail or show interfaces extensive .
[]	Range of letters or digits. To separate the start and end of a range, use a hyphen (-).
()	A group of commands, indicating a complete, standalone expression to be evaluated the result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained .
*	Zero or more terms.
+	One or more terms.
.	Any character except for a space " ".

Related Documentation

- *Specifying Access Privileges for Junos OS Configuration Mode Hierarchies*

Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands

Use extended regular expressions to specify which operational mode commands are denied or allowed. [Table 143](#) lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

Table 143: Common Regular Expression Operators to Allow or Deny Operational Mode Commands

Operator	Match
	One of two or more terms separated by the pipe () symbol. Each term must be a complete standalone expression enclosed in parentheses (), with no spaces between the pipe and the adjacent parentheses. For example, (show system alarms) (show system software).
^	At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, allow-commands "show interfaces\$" means that the user can issue the show interfaces command but cannot issue the show interfaces detail or show interfaces extensive command.
[]	Range of letters or digits. To separate the start and end of a range, use a hyphen (-).
()	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

Related Documentation

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 30](#)

Examples of Defining Access Privileges Using allow/deny-configuration Statements

You can define access privileges using a combination of the following types of statements:

- permission flags
- **allow-configuration** and **deny-configuration** statements

The permission flags define the larger boundaries of what a person or login class can access and control. The **allow-configuration** and **deny-configuration** statements take precedence over permission flags and give the administrator finer control over exactly what the user has access to.

This topic explains defining access privileges using **allow-configuration** and **deny-configuration** statements by showing a series of examples of login class configuration using these statements. Examples 1 through 3 use both permission flags and **deny-configuration** statements to create login classes that allow users access to all except something. Each **allow-configuration** or **deny-configuration** statement is configured with one or more regular expressions to be allowed or denied.

The following examples show how to configure access privileges for individual configuration mode hierarchy levels.

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@switch# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@switch# set deny-configuration "system login class m.*"
```

Example 3 This next example shows the creation of a login class with the **all** permission bit that prevents the user from editing a configuration or issuing commands (such as **commit**) at the **[edit system login class]** or **[edit system services]** hierarchy levels:

To create a login class that allows the user to configure everything except at the **[edit system login class]** or **[edit system services]** hierarchy levels:

1. Set the user's login class permission bit to **all**.

```
[edit system login]
user@host# set class all-except-login-class-or-system-services permissions all
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit a configuration or issue commands (such as **commit**) at the login class or system services hierarchy levels:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

The following example shows how to configure permissions for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$1$poPPeY";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$1$14c5.$sBopasdFFdssdfFFdsdfs0";
      }
    }
  }
}
```

```

        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
    }
}
user darius {
    full-name "Darius King of Persia";
    uid 1003;
    class operator;
    authentication {
        ssh-rsa "1024 37 12341234@ecbatana.per";
    }
}
user anonymous {
    class unauthorized;
}
user remote {
    full-name "All remote users";
    uid 9999;
    class read-only;
}
}
}

```

- Related Documentation**
- *Junos OS User Accounts Overview*
 - *Limiting the Number of User Login Attempts for SSH and Telnet Sessions*

Example: Configuring User Permissions with Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

In this example, you create two custom login classes on the router or switch and assign access privileges to each class through permission flags. The first custom login class is called **user-accounts** and it only includes access privileges for configuring and viewing user accounts. The second custom login class is called **network-mgmt** and only includes access privileges for configuring SNMP parameters.

```

[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}

```

1. Create the **user-accounts** custom login class and give it control over user accounts with the **configure admin admin-control** permission flag.

```

[edit system login]
user@router# set class user-accounts permissions configure admin admin-control

```

2. Create the **network-mgmt** custom login class and use the **configure snmp snmp-control** permission flag to assign it SNMP configuration privileges.

```
[edit system login]
user@router# set class network-mgmt permissions configure snmp snmp-control
```

3. Check your configuration by using the **show system login** command.

```
user@router# show system login
class user-accounts {
  permissions [ configure admin admin-control ];
}
class network-mgmt {
  permissions [ configure snmp snmp-control ];
}
```

Related Documentation

- [Configuring Access Privilege Levels on page 1809](#)

Example: Configuring User Permissions with Access Privileges for Operational Mode Commands

Each operational mode command has an access privilege level associated with it. Access privileges control the commands that each custom login class can execute, configure, and view. Custom login classes are groups of users who are assigned with customized levels of access to different commands and statements. This ensures that each group of users can only use commands appropriate to their function, preventing unauthorized users from executing sensitive commands that could potentially cause damage to the network.

In this example, you create three custom login classes on the router or switch and assign access privileges for operational mode commands through the **allow-commands** and **deny-commands** settings. Each custom login class uses the same set of permission flags as the default login class **operator**, but the login class is allowed or denied certain operational mode commands. The first custom login class is called **operator-and-boot** and it has access to the **request system reboot** operational mode command. The second custom login class is called **operator-no-set** and it is denied access to any **set** commands. The third login class is called **operator-and-install-but-no-bgp** and it has access to the **request system software add** and **show route** operational mode commands, but it is denied access to the **show bgp** command.

```
[edit]
system {
  login {
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
    class operator-no-set {
      permissions [ clear network reset trace view ];
      deny-commands "set";
    }
    class operator-and-install-but-no-bgp {
      permissions [ clear network reset trace view ];
      allow-commands "(request system software add)|(show route$)";
      deny-commands "show bgp";
    }
  }
}
```

```

    }
  }
}

```

1. Create the **operator-and-boot** custom login class, give it **operator** level permission flags, and authorize it to use the **request system reboot** command.

```

[edit system login]
user@router# set class operator-and-boot permissions clear network reset trace view
user@router# set class operator-and-boot allow-commands request system reboot

```

2. Create the **operator-no-set** custom login class, give it **operator** level permission flags, and deny it access to the **set** command.

```

[edit system login]
user@router# set class operator-no-set clear network reset trace view
user@router# set class operator-no-set deny-commands set

```

3. Create the **operator-and-install-but-no-bgp** custom login class, give it **operator** level permission flags, authorize it to use the **request system software add** and **show route** commands, and deny it access to the **show bgp** command.

```

[edit system login]
user@router# set class operator-and-install-but-no-bgp clear network reset trace view
user@router# set class operator-and-install-but-no-bgp request system software add show route
user@router# set class operator-and-install-but-no-bgp show bgp

```

4. Check your configuration by using the **show system login** command.

```

user@router# show system login
class operator-and-boot {
  permissions [ clear network reset trace view ];
  allow-commands "request system reboot";
}
class operator-no-set {
  permissions [ clear network reset trace view ];
  deny-commands "set";
}
class operator-and-install-but-no-bgp {
  permissions [ clear network reset trace view ];
  allow-commands "(request system software add)|(show route$)";
  deny-commands "show bgp";
}

```

- [Specifying Access Privileges for Junos OS Operational Mode Commands on page 30](#)

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 1834](#)
- [Overview on page 1834](#)
- [Configuration on page 1834](#)

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**s, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
set system login password maximum-length 22
set system login password minimum-numeric 1
set system login password minimum-upper-cases 1
set system login password minimum-lower-cases 1
set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure

This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the **[system login password]** hierarchy level.

```
user@host> edit
[edit]
user@host# edit system login password
```

2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```
4. Require users to set a password that has at least one punctuation-class character and at least one number.

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

 - *password (Login)*

Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions to Prevent Unauthorized Access

Limiting the number of SSH and Telnet login attempts per user is one of the most effective methods of stopping brute force attacks from compromising your network security. Brute force attackers execute a large number of login attempts in a short period of time to illegitimately gain access to a private network. By configuring the **retry-options** command, you can create an increasing delay after each failed login attempt, eventually disconnecting any user who passes your set threshold of login attempts.

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet. Set the **backoff-threshold** to 2, the

back-off-factor to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
  login {
    retry-options {
      backoff-threshold 2;
      backoff-factor 5;
      minimum-time 40;
      tries-before-disconnect 4;
    }
    password {
    }
  }
}
```

NOTE: This sample only shows the portion of the [edit system login] hierarchy level being modified.

Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series or OCX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 138 provides a list of some of the troubleshooting resources.

Table 144: Troubleshooting Resources on the QFX and OCX Series

Troubleshooting Resource	Description	Documentation
Chassis alarms	Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.	<i>Chassis Alarm Messages on a QFX3500 Device</i>
Chassis Status LEDs and Fan Tray LEDs	A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.	<i>Chassis Status LEDs on a QFX3500 Device</i>

Table 144: Troubleshooting Resources on the QFX and OCX Series (*continued*)

Troubleshooting Resource	Description	Documentation
Interface alarms	A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.	<i>Interface Alarm Messages</i>
System alarms	A predefined alarm is triggered by a missing rescue configuration or problem with the software license.	<i>Understanding Alarms</i>
System log messages	The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.	<ul style="list-style-type: none"> • Overview of Single-Chassis System Logging Configuration on page 1528 • Junos OS System Log Configuration Statements on page 1530
Junos OS operational mode commands	Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the tracert monitor command to locate points of failure in a network.	<ul style="list-style-type: none"> • Monitoring System Process Information on page 165 • Monitoring System Properties on page 166 • tracert monitor
Junos OS automation scripts (event scripts)	Event scripts can be used to automate network troubleshooting and management tasks.	<i>Automation Scripting Feature Guide</i>
Junos OS XML operational tags	XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.	<i>Junos XML API Operational Developer Reference</i>
NETCONF XML management protocol	The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as show , set , and commit to perform those operations.	<i>NETCONF XML Management Protocol Developer Guide</i>
SNMP MIBs and traps	MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.	<ul style="list-style-type: none"> • SNMP MIBs Support on page 1468 • SNMP Traps Support on page 1484 • Using the Traceroute MIB for SNMP Remote Operations
AI-Scripts and Advanced Insight Manager (AIM)	AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.	Advanced Insight Scripts (AI-Scripts) Release Notes

Table 144: Troubleshooting Resources on the QFX and OCX Series (*continued*)

Troubleshooting Resource	Description	Documentation
Junos Space Service Now	This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.	<i>Service Automation</i>
Junos Space Service Insight	This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.	<i>Service Automation</i>
Juniper Networks Knowledge Base	You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.	http://kb.juniper.net

Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series or OCX Series product.

[Table 139](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 145: Troubleshooting on the QFX Series

Problem Category	Symptom or Problem	Recommended Action
Switch hardware components	LCD panel shows a chassis alarm count.	<i>See Chassis Alarm Messages on a QFX3500 Device.</i>
	Fan tray LED is blinking amber.	<i>See Fan Tray LED on a QFX3500 Device.</i>
	Chassis status LED for the power is blinking amber.	<i>See Chassis Status LEDs on a QFX3500 Device.</i>
	Chassis status LED for the fan (on the management board) is blinking amber.	Replace the management board as soon as possible. <i>See Chassis Status LEDs on a QFX3500 Device.</i>

Table 145: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Port configuration	Cannot configure a port as a Gigabit Ethernet port.	<p>Check whether the port is a valid Gigabit Ethernet port (6 through 41).</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a port as a Fibre Channel port.	<p>Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a port as a 10-Gigabit Ethernet port.	<p>If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.</p> <p>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <i>QFX3500 Device Overview</i>.</p>
	Cannot configure a 40-Gbps QSFP+ interface.	<p>The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <i>QFX3500 Device Overview</i>.</p>
External devices (USB devices)	Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state.	Unplug the USB device and reboot the switch.
Initial device configuration	Cannot configure management Ethernet ports.	<p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p>NOTE: The management ports are on the front panel of the QFX3500 switch. They are labeled C0 and C1 on the front panel. In the CLI they are referred to as me0 and me1.</p> <p>See <i>Configuring a QFX3500 Device as a Standalone Switch</i>.</p>

Table 145: Troubleshooting on the QFX Series (*continued*)

Problem Category	Symptom or Problem	Recommended Action
Software upgrade and configuration	Failed software upgrade.	See “Recovering from a Failed Software Installation” on page 160 .
	Active partition becomes inactive after upgrade.	
	Problem with the active configuration file.	See the following topics: <ul style="list-style-type: none"> • Loading a Previous Configuration File on page 1330 • Reverting to the Default Factory Configuration on page 1344 • Reverting to the Rescue Configuration on page 1346 • Performing a Recovery Installation
	Root password is lost or forgotten.	Recover the root password. See “Recovering the Root Password” on page 147 .
Network interfaces	An aggregated Ethernet interface is down.	See “Troubleshooting an Aggregated Ethernet Interface” on page 2886 .
	Interface on built-in network port is down.	See “Troubleshooting Network Interfaces” on page 2845 .
	Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.	
Ethernet switching	A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch.	See “Troubleshooting Ethernet Switching” on page 2134 .
Firewall filter	Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.	See “Troubleshooting Firewall Filters” on page 5989 .

Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
 - Bits per second: 9600
 - Data bits: 8
 - Parity: None
 - Stop bits: 1
 - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN
for /bin/sh: recovery
```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```
15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 1804](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- **Username**—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- **User's full name**—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.

- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.
- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.
- User's access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in ["Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies"](#) on page 1826.
- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user's password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user user-name]
user@switch# set authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
 - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
```

```
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
207404962528390382038690141584534964170019610608358722961563
475784918273603361276441874265946893207739108344813125957722
625461667999278316123500438660915866283822489746732605661192
181489539813862940327687806538169602027491641637359132693963
44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in *Configuring the Root Password*.

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

- Related Documentation**
- [Configuring Junos OS User Accounts on page 125](#)
 - [Junos OS Login Classes Overview on page 1823](#)

Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

- Related Documentation**
- [Configuring RADIUS Server Authentication](#)
 - [Configuring TACACS+ Authentication](#)
 - [Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 1859](#)

Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in [Table 140](#). The predefined login classes cannot be modified.

Table 146: Predefined System Login Classes

Login Class	Permission Flag Set
operator	clear, network, reset, trace, and view
read-only	view
superuser or super-user	all
unauthorized	None

NOTE:

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:

warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'

- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:

error: target '<class-name>' is a predefined class

Related Documentation

- [Defining Junos OS Login Classes](#)

Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the `allow/deny-configuration-regexps` and `allow/deny-configuration` statements at the `[edit`

system login class] hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

[Table 142](#) lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

Table 147: Configuration Mode Hierarchies—Common Regular Expression Operators

Operator	Match
	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses (), with no spaces between the pipe and the adjacent parentheses. For example, (show system alarms) (show system software).
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, allow-commands "show interfaces\$" means that the user can issue the show interfaces command but cannot issue show interfaces detail or show interfaces extensive .
[]	Range of letters or digits. To separate the start and end of a range, use a hyphen (-).
()	A group of commands, indicating a complete, standalone expression to be evaluated the result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained .
*	Zero or more terms.
+	One or more terms.
.	Any character except for a space " ".

Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands

Use extended regular expressions to specify which operational mode commands are denied or allowed. [Table 143](#) lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

Table 148: Common Regular Expression Operators to Allow or Deny Operational Mode Commands

Operator	Match
	One of two or more terms separated by the pipe () symbol. Each term must be a complete standalone expression enclosed in parentheses (), with no spaces between the pipe and the adjacent parentheses. For example, (show system alarms) (show system software).
^	At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, allow-commands "show interfaces\$" means that the user can issue the show interfaces command but cannot issue the show interfaces detail or show interfaces extensive command.
[]	Range of letters or digits. To separate the start and end of a range, use a hyphen (-).
()	A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. [Table 141](#) shows the default requirements.

Table 149: Special Requirements for Plain-Text Passwords

Junos OS	Junos-FIPS
The password must be between 6 and 128 characters long.	FIPS passwords must be between 10 and 20 characters long

Table 149: Special Requirements for Plain-Text Passwords (*continued*)

Junos OS	Junos-FIPS
You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.	You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
Valid passwords must contain at least one change of case or character class.	Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # \$ % ^ & * , + < >

NOTE: "!" and "," are punctuation characters, but are listed under "special characters".

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- [edit system diag-port-authentication]
- [edit system pic-console-authentication]
- [edit system root-authentication]
- [edit system login user *username* authentication]

The **change-type** statement specifies whether the password is checked for the following:

- The total number of character sets used (**character-set**)
- The total number of character set changes (**set-transitions**)

For example, the following password:

MyPassWd@2

has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (M–y, y–P, P–a, s–W, W–d, d–@, and @–2).

The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be 5 or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1**, **sha256**, **sha512** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

NOTE: Starting with Junos OS Release 13.3, the **sha1** does not enable secure, protected specification of passwords and we recommend that you do not use the **sha1** algorithm to configure passwords. Instead, you can use the **sha256** or **sha512** to specify passwords by using the 256-bit and 512-bit cryptographic hash algorithm respectively for a robust and reliable operation.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
  change-type character-sets;
  format md5;
  minimum-changes 1;
  minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
  change-type set-transitions;
  format sha1;
```

```
maximum-length 20;  
minimum-changes 3;  
minimum-length 10;  
}
```

- [Changing the Requirements for Junos OS Plain-Text Passwords](#)
 - [Configuring the Root Password on page 145](#)

Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]  
user username {  
  class class-name;  
  class {  
    (encrypted-password "password" | plain-text-password);  
    ssh-rsa "public-key";  
    ssh-dsa "public-key";  
  }  
  full-name complete-name;  
  uid uid-value;  
  class class-name;  
}
```

- Related Documentation**

 - [Junos OS User Accounts Overview on page 1821](#)
 - [Limiting the Number of User Login Attempts for SSH and Telnet Sessions](#)

Configuring a Local Administrator Account

The following example shows how to configure a password-protected local administration account called **admin** with superuser privileges. Superuser privileges give a user permission to use any command on the router and are generally reserved for a select few users such as system administrators. It is important to protect the local administrator account with a password to prevent unauthorized users from gaining access to superuser commands that can be used to alter the system configuration. Even users with RADIUS authentication should configure a local password. If RADIUS fails or becomes unreachable, the login process will revert to password authentication on the local administrator account.

```
[edit]
system {
  login {
    user admin {
      uid 1000;
      class superuser;
      authentication {
        encrypted-password "<PASSWORD>"; # SECRET-DATA
      }
    }
  }
}
```

**Related
Documentation**

- [Junos OS Login Classes Overview on page 1823](#)
- *Configuring Junos OS User Accounts by Using a Configuration Group*

Example: Creating Login Classes with Specific Privileges

Login classes are used to assign certain permissions or restrictions to groups of users, ensuring that sensitive commands are only accessible to the appropriate users. By default, Juniper Networks devices have four types of login classes with preset permissions: operator, read-only, superuser or super-user, and unauthorized.

You can create new custom login classes to make different combinations of permissions that are not found in the default login classes. The following example shows how to create three custom login classes, each with specific privileges and timers to disconnect the class members after a period of inactivity. Inactivity timers help protect network security by disconnecting a user from the network if the user is away from his computer for too long, preventing potential security risks created by leaving an unattended account logged in to a switch or router. The permissions and inactivity timers shown here are only examples and should be customized to your organization.

The first class of users is called **observation** and they can only view statistics and configuration. They are not allowed to modify any configuration. The second class of users is called **operation** and they can view and modify the configuration. The third class of users is called **engineering** and they have unlimited access and control. All three login classes use the same inactivity timer of 5 minutes.

```
[edit]
system {
  login {
    class observation {
      idle-timeout 5;
      permissions [ view ];
    }
    class operation {
      idle-timeout 5;
      permissions [ admin clear configure interface interface-control network
        reset routing routing-control snmp snmp-control trace-control
        firewall-control rollback ];
    }
    class engineering {
```

```

        idle-timeout 5;
        permissions all;
    }
}
}

```

**Related
Documentation**

- [Junos OS Login Classes Overview on page 1823](#)
- [Defining Junos OS Login Classes](#)
- [Configuring a Local Administrator Account on page 1853](#)

Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Using Local Password Authentication” on page 1860](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```

[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class operator;
    }
  }
}
}

```

NOTE: For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication”](#) on page 1899.

When a user logs in to a device, the user’s login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the `[edit system login user]` hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the `edit system login user remote` hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 1857](#)
- [Overview on page 1857](#)
- [Configuration on page 1857](#)

Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**s, **minimum-punctuations**, or **minimum-upper-cases**.

Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

Configuration

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
set system login password maximum-length 22
set system login password minimum-numeric 1
set system login password minimum-upper-cases 1
set system login password minimum-lower-cases 1
set system login password minimum-punctuations 1
```

Configuring Requirements for Plain-Text Passwords

Step-by-Step Procedure This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```
4. Require users to set a password that has at least one punctuation-class character and at least one number.

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

CHAPTER 64

Configuring and Managing TACACS+ Authentication

- Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 1859
- Juniper Networks Vendor-Specific TACACS+ Attributes on page 1863
- Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication on page 1865

Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However; if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or

TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.

- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

Order of Authentication Attempts

[Table 150](#) describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 150: Order of Authentication Attempts

Syntax	Order of Authentication Attempts
authentication-order radius;	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS server is available but authentication is rejected, deny access. 4. If RADIUS servers are not available, try password authentication. <p>NOTE: If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [radius password];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [radius tacplus];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ server is available but authentication is rejected, deny access. 6. If both RADIUS and TACACS+ servers are not available, try password authentication. <p>NOTE: If either RADIUS or TACACS+ servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [radius tacplus password];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.

Table 150: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
authentication-order tacplus;	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ server is available but authentication is rejected, deny access. 4. If TACACS+ servers are not available, try password authentication. <p>NOTE: If a TACACS+ server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [tacplus password];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [tacplus radius];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS server is available but authentication is rejected, deny access. 6. If both TACACS+ and RADIUS servers are not available, try password authentication. <p>NOTE: If either TACACS+ or RADIUS servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [tacplus radius password];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.

Table 150: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<code>authentication-order password;</code>	<ol style="list-style-type: none"> 1. Try to authenticate the user, using the password configured at the <code>[edit system login]</code> hierarchy level. 2. If the authentication is accepted, grant access. 3. If the authentication is rejected, deny access.

NOTE: If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the `authentication-order` statement. If you want SSH logins to use the authentication methods configured in the `authentication-order` statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the `authentication-order` statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the `authentication-order` statement.

Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute

with the vendor ID set to the Juniper Networks ID number, 2636. [Table 151](#) lists the Juniper Networks VSAs you can configure.

Table 151: Juniper Networks Vendor-Specific TACACS+ Attributes

Name	Description	Length	String
local-user-name	Indicates the name of the user template used by this user when logging in to a device.	≥3	One or more octets containing printable ASCII characters.
allow-commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 143 .
allow-configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See “Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies” on page 1826.
deny-commands	Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 143 .
deny-configuration	Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 142 .
user-permissions	<p>Contains information the server uses to specify user permissions.</p> <p>NOTE: When the user-permissions attribute is configured to grant the Junos OS maintenance or all permissions on an IPv4 or IPv6 TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the su root command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions maintenance or all, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	≥3	One or more octets containing printable ASCII characters. See Table 137 .

Table 151: Juniper Networks Vendor-Specific TACACS+ Attributes (*continued*)

Name	Description	Length	String
authentication-type	Indicates the authentication method (local database, or TACACS+ server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using TACACS+ server, the attribute value shows 'remote'.	≥5	One or more octets containing printable ASCII characters.
session-port	Indicates the source port number of the established session.	size of integer	Integer

Related Documentation

- *Configuring TACACS+ Authentication*

Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Using Local Password Authentication” on page 1860](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class operator;
    }
  }
}
```

NOTE: For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication”](#) on page 1899.

When a user logs in to a device, the user's login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the `[edit system login user]` hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the `edit system login user remote` hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However, if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

Order of Authentication Attempts

[Table 150](#) describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 152: Order of Authentication Attempts

Syntax	Order of Authentication Attempts
authentication-order radius;	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS server is available but authentication is rejected, deny access. 4. If RADIUS servers are not available, try password authentication. <p>NOTE: If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [radius password];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [radius tacplus];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ server is available but authentication is rejected, deny access. 6. If both RADIUS and TACACS+ servers are not available, try password authentication. <p>NOTE: If either RADIUS or TACACS+ servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [radius tacplus password];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.

Table 152: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
authentication-order tacplus;	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ server is available but authentication is rejected, deny access. 4. If TACACS+ servers are not available, try password authentication. <p>NOTE: If a TACACS+ server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [tacplus password];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [tacplus radius];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS server is available but authentication is rejected, deny access. 6. If both TACACS+ and RADIUS servers are not available, try password authentication. <p>NOTE: If either TACACS+ or RADIUS servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [tacplus radius password];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.

Table 152: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<code>authentication-order password;</code>	<ol style="list-style-type: none"> 1. Try to authenticate the user, using the password configured at the <code>[edit system login]</code> hierarchy level. 2. If the authentication is accepted, grant access. 3. If the authentication is rejected, deny access.

NOTE: If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the `authentication-order` statement. If you want SSH logins to use the authentication methods configured in the `authentication-order` statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the `authentication-order` statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the `authentication-order` statement.

Related Documentation

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1899](#)
- [Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication](#)
- [Limiting the Number of User Login Attempts for SSH and Telnet Sessions](#)
- [Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication on page 1855](#)

Configuring RADIUS Authentication (QFX Series or OCX Series)

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

NOTE: The `source-address` statement is not supported at the `[edit system radius-options]` or `[edit system-radius-server name]` hierarchies on the QFabric system.

- [Configuring RADIUS Server Details on page 1874](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 1875](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1876](#)

Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one `radius-server` statement at the `[edit system]` hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
  secret password;
  source-address source-address;
  timeout seconds;
}
```

`server-address` is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the `secret password` statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the `timeout` statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the `retry` statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the `source-address` statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple `radius-server` statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the `user` statement at the `[edit system login]`

hierarchy level, as described in [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1899](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile *profile-name* radius-server *server-address*]**
2. **[edit access radius-server *server-address*]**
3. **[edit system radius-server *server-address*]**

Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters
- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
  }
  login {
    user bob {
      class operator;
    }
  }
}
```

Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```
[edit system radius-server server-address]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

- [Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands on page 1876](#)
- [Junos OS User Authentication Methods on page 1804](#)

Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```

Juniper-Allow-Commands+="cmd1"
Juniper-Allow-Commands+="cmd2"
Juniper-Allow-Commands+="cmdn"
Juniper-Deny-Commands+="cmd1"
Juniper-Deny-Commands+="cmd2"
Juniper-Deny-Commands+="cmdn"
Juniper-Allow-Configuration+="regex1"
Juniper-Allow-Configuration+="regex2"
Juniper-Allow-Configuration+="regexn"
Juniper-Deny-Configuration+="regex1"
Juniper-Deny-Configuration+="regex2"
Juniper-Deny-Configuration+="regexn"
Juniper-User-Permissions+="permission-flag1"
Juniper-User-Permissions+="permission-flag2"
Juniper-User-Permissions+="permission-flagn"

```

For TACACS+ server, specify the individual regular expressions using the following syntax:

```

allow-commands1="cmd1"
allow-commands2="cmd2"
allow-commandsn="cmdn"
deny-commands1="cmd1"
deny-commands2="cmd2"
deny-commandsn="cmdn"
allow-configuration1="regex1"
allow-configuration2="regex2"
allow-configurationn="regexn"
deny-configuration1="regex1"
deny-configuration2="regex2"
deny-configurationn="regexn"
user-permissions1="permission-flag1"
user-permissions2="permission-flag2"
user-permissionsn="permission-flagn "

```

NOTE:

- Numeric values 1 to *n* in the syntax (for TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```

allow-commands1="cmd1"
allow-commands3="cmd3"
allow-commands2="cmd2"
deny-commands3="cmd3"
deny-commands2="cmd2"
deny-commands1="cmd1"

```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 1888](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 1863](#).

NOTE: When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the [edit system login class] hierarchy level using the allow-commands, deny-commands, allow-configuration, deny-configuration, or permissions statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

**Related
Documentation**

- [Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 1859](#)

Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
  authentication-order [ radius password ];
  root-authentication {
    encrypted-password "$9$aHlj8gqQ1gjyjjhgjgiiii"; # SECRET-DATA
  }
  name-server {
    10.1.1.1;
    10.1.1.2;
  }
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
```

```

system {
  radius-server {
    10.1.2.1 {
      secret "$9$aH1j8gqQ1sdjerrrhser"; # SECRET-DATA
      timeout 5;
    }
    10.1.2.2 {
      secret "$9$aH1j8gqQ1csdoiuardwefoiud"; # SECRET-DATA
      timeout 5;
    }
  }
}

```

Related Documentation

- [Configuring RADIUS Server Authentication](#)

Example: Configuring RADIUS Template Accounts

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```

[edit]
system {
  login {
    user observation {
      uid 1001;
      class observation;
    }
    user operation {
      uid 1002;
      class operation;
    }
    user engineering {
      uid 1003;
      class engineering;
    }
  }
}

```

Related Documentation

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1899](#)

Configuring a Local Administrator Account

The following example shows how to configure a password-protected local administration account called **admin** with superuser privileges. Superuser privileges give a user permission to use any command on the router and are generally reserved for a select few users such as system administrators. It is important to protect the local administrator account with a password to prevent unauthorized users from gaining access to superuser commands that can be used to alter the system configuration. Even users with RADIUS authentication should configure a local password. If RADIUS fails or becomes unreachable, the login process will revert to password authentication on the local administrator account.

```
[edit]
system {
  login {
    user admin {
      uid 1000;
      class superuser;
      authentication {
        encrypted-password "<PASSWORD>"; # SECRET-DATA
      }
    }
  }
}
```

**Related
Documentation**

- [Junos OS Login Classes Overview on page 1823](#)
- [Configuring Junos OS User Accounts by Using a Configuration Group](#)

Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Using Local Password Authentication” on page 1860](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class operator;
    }
  }
}
```

NOTE: For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication”](#) on page 1899.

When a user logs in to a device, the user’s login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the `[edit system login user]` hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the `edit system login user remote` hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the `user-name` parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

- [Example: Configuring RADIUS System Accounting on page 1898](#)

Understanding RADIUS Accounting

Devices support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the device supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the device, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the device and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The device forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 122.69.1.250.
4. The accounting server sends an *accounting-response* packet back to the device confirming it has received the accounting request.
5. If the device does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However, if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

Order of Authentication Attempts

[Table 150](#) describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 153: Order of Authentication Attempts

Syntax	Order of Authentication Attempts
authentication-order radius;	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS server is available but authentication is rejected, deny access. 4. If RADIUS servers are not available, try password authentication. <p>NOTE: If a RADIUS server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [radius password];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [radius tacplus];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ server is available but authentication is rejected, deny access. 6. If both RADIUS and TACACS+ servers are not available, try password authentication. <p>NOTE: If either RADIUS or TACACS+ servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [radius tacplus password];	<ol style="list-style-type: none"> 1. Try configured RADIUS authentication servers. 2. If RADIUS server is available and authentication is accepted, grant access. 3. If RADIUS servers fail to respond or return a reject response, try configured TACACS+ servers. 4. If TACACS+ server is available and authentication is accepted, grant access. 5. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.

Table 153: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
authentication-order tacplus;	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ server is available but authentication is rejected, deny access. 4. If TACACS+ servers are not available, try password authentication. <p>NOTE: If a TACACS+ server is available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [tacplus password];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.
authentication-order [tacplus radius];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS server is available but authentication is rejected, deny access. 6. If both TACACS+ and RADIUS servers are not available, try password authentication. <p>NOTE: If either TACACS+ or RADIUS servers are available, password authentication is not attempted, because it is not explicitly configured in the authentication order.</p>
authentication-order [tacplus radius password];	<ol style="list-style-type: none"> 1. Try configured TACACS+ authentication servers. 2. If TACACS+ server is available and authentication is accepted, grant access. 3. If TACACS+ servers fail to respond or return a reject response, try configured RADIUS servers. 4. If RADIUS server is available and authentication is accepted, grant access. 5. If RADIUS servers fail to respond or return a reject response try password authentication, because it is explicitly configured in the authentication order.

Table 153: Order of Authentication Attempts (*continued*)

Syntax	Order of Authentication Attempts
<code>authentication-order password;</code>	<ol style="list-style-type: none"> 1. Try to authenticate the user, using the password configured at the <code>[edit system login]</code> hierarchy level. 2. If the authentication is accepted, grant access. 3. If the authentication is rejected, deny access.

NOTE: If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the `authentication-order` statement. If you want SSH logins to use the authentication methods configured in the `authentication-order` statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the `authentication-order` statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the `authentication-order` statement.

Juniper Networks Vendor-Specific RADIUS Attributes

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute

with the vendor ID set to the Juniper Networks ID number, 2636. [Table 154](#) lists the Juniper Networks VSAs you can configure.

Table 154: Juniper Networks Vendor-Specific RADIUS Attributes

Name	Description	Type	Length	String
Juniper-Local-User-Name	Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets.	1	≥3	One or more octets containing printable ASCII characters.
Juniper-Allow-Commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	2	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands" on page 1827.
Juniper-Deny-Commands	Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	3	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands" on page 1827.
Juniper-Allow-Configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	4	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1826.
Juniper-Deny-Configuration	Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.	5	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1826.
Juniper-Interactive-Command	Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.	8	≥3	One or more octets containing printable ASCII characters.

Table 154: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

Name	Description	Type	Length	String
Juniper-Configuration-Change	Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.	9	≥3	One or more octets containing printable ASCII characters.
Juniper-User-Permissions	<p>Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets.</p> <p>NOTE: When the Juniper-User-Permissions attribute is configured to grant the Junos OS maintenance or all permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the su root command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions maintenance or all, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	10	≥3	<p>One or more octets containing printable ASCII characters.</p> <p>The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See Table 137.</p>
Juniper-Authentication-Type	Indicates the authentication method (local database, or RADIUS server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using RADIUS server, the attribute value shows 'remote'.	11	≥5	One or more octets containing printable ASCII characters.
Juniper-Session-Port	Indicates the source port number of the established session.	12	size of integer	Integer

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

Related Documentation

- [Configuring RADIUS Server Authentication](#)

Configuring RADIUS System Accounting

With RADIUS accounting enabled, Juniper Networks routers or switches, acting as RADIUS clients, can notify the RADIUS server about user activities such as software logins, configuration changes, and interactive commands. The framework for RADIUS accounting is described in RFC 2866.

Tasks for configuring RADIUS system accounting are:

1. [Configuring Auditing of User Events on a RADIUS Server on page 1891](#)
2. [Specifying RADIUS Server Accounting and Auditing Events on page 1891](#)
3. [Configuring RADIUS Server Accounting on page 1892](#)

Configuring Auditing of User Events on a RADIUS Server

To audit user events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        max-outstanding-requests value;
        port port-number;
        retry value;
        secret password;
        source-address address;
        timeout seconds;
      }
    }
  }
}
```

Specifying RADIUS Server Accounting and Auditing Events

To specify the events you want to audit when using a RADIUS server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

events is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes

- **interactive-commands**—Audit interactive commands (any command-line input)

Configuring RADIUS Server Accounting

To configure RADIUS server accounting, include the **server** statement at the **[edit system accounting destination radius]** hierarchy level:

```
server {  
  server-address {  
    accounting-port port-number;  
    max-outstanding-requests value;  
    port port-number;  
    retry value;  
    secret password;  
    source-address address;  
    timeout seconds;  
  }  
}
```

server-address specifies the address of the RADIUS server. To configure multiple RADIUS servers, include multiple **server** statements.

NOTE: If no RADIUS servers are configured at the **[edit system accounting destination radius]** statement hierarchy level, the Junos OS uses the RADIUS servers configured at the **[edit system radius-server]** hierarchy level.

accounting-port *port-number* specifies the RADIUS server accounting port number.

The default port number is 1813.

NOTE: If you enable RADIUS accounting at the **[edit access profile *profile-name* accounting-order]** hierarchy level, accounting is triggered on the default port of 1813 even if you do not specify a value for the **accounting-port** statement.

You must specify a secret (password) that the local router or switch passes to the RADIUS client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (" ").

In the **source-address** statement, specify a source address for the RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. The source address is a valid IPv4 address (in case if radius-server address is IPv4) or IPv6 address (in case if radius-server address is IPv6) configured on one of the router or switch interfaces.

Optionally, you can specify the number of times that the router or switch attempts to contact a RADIUS authentication server by including the **retry** statement. By default, the router or switch retries three times. You can configure the router or switch to retry from 1 through 10 times.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a RADIUS server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure the timeout to be from 1 through 90 seconds.

If you use the **enhanced-accounting** statement at the **[edit system radius-options]** hierarchy level, the RADIUS attributes such as access method, remote port, and access privileges can be audited. You can limit the number of attribute values to be displayed for auditing by using the **enhanced-avs-max <number>** statement at the **[edit system accounting]** hierarchy level.

```
[edit system radius-options]
enhanced-accounting;

[edit system accounting]
enhanced-avs-max <number>;
```

When a Juniper Networks router or switch is configured with RADIUS accounting, it sends **Accounting-Start** and **Accounting-Stop** messages to the RADIUS server. These messages contain information about user activities such as software logins, configuration changes, and interactive commands. This information is typically used for monitoring a network, collecting usage statistics, and ensuring that users are billed properly.

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting:

```
system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
      radius {
        server {
          10.5.5.5 {
            accounting-port 3333;
            secret $9$dkafeqwrew;
            source-address 10.1.1.1;
            retry 3;
            timeout 3;
          }
          10.6.6.6 secret $9$fe3erqwrez;
          10.7.7.7 secret $9$f34929ftby;
        }
      }
    }
  }
}
```

Configuring RADIUS Authentication (QFX Series or OCX Series)

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

NOTE: The `source-address` statement is not supported at the `[edit system radius-options]` or `[edit system-radius-server name]` hierarchies on the QFabric system.

- [Configuring RADIUS Server Details on page 1894](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 1895](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1896](#)

Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one `radius-server` statement at the `[edit system]` hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
  secret password;
  source-address source-address;
  timeout seconds;
}
```

`server-address` is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the `secret password` statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the `timeout` statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the `retry` statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the `source-address` statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple `radius-server` statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the `user` statement at the `[edit system login]`

hierarchy level, as described in [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1899](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile *profile-name* radius-server *server-address*]**
2. **[edit access radius-server *server-address*]**
3. **[edit system radius-server *server-address*]**

Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters
- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
  }
  login {
    user bob {
      class operator;
    }
  }
}
```

Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```
[edit system radius-server server-address]
source-address source-address;
```

source-address is a valid IP address configured on one of the router or switch interfaces.

- [Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands on page 1876](#)
- [Junos OS User Authentication Methods on page 1804](#)

Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```

Juniper-Allow-Commands+="cmd1"
Juniper-Allow-Commands+="cmd2"
Juniper-Allow-Commands+="cmdn"
Juniper-Deny-Commands+="cmd1"
Juniper-Deny-Commands+="cmd2"
Juniper-Deny-Commands+="cmdn"
Juniper-Allow-Configuration+="regex1"
Juniper-Allow-Configuration+="regex2"
Juniper-Allow-Configuration+="regexn"
Juniper-Deny-Configuration+="regex1"
Juniper-Deny-Configuration+="regex2"
Juniper-Deny-Configuration+="regexn"
Juniper-User-Permissions+="permission-flag1"
Juniper-User-Permissions+="permission-flag2"
Juniper-User-Permissions+="permission-flagn"

```

For TACACS+ server, specify the individual regular expressions using the following syntax:

```

allow-commands1="cmd1"
allow-commands2="cmd2"
allow-commandsn="cmdn"
deny-commands1="cmd1"
deny-commands2="cmd2"
deny-commandsn="cmdn"
allow-configuration1="regex1"
allow-configuration2="regex2"
allow-configurationn="regexn"
deny-configuration1="regex1"
deny-configuration2="regex2"
deny-configurationn="regexn"
user-permissions1="permission-flag1"
user-permissions2="permission-flag2"
user-permissionsn="permission-flagn"

```

NOTE:

- Numeric values 1 to *n* in the syntax (for TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```

allow-commands1="cmd1"
allow-commands3="cmd3"
allow-commands2="cmd2"
deny-commands3="cmd3"
deny-commands2="cmd2"
deny-commands1="cmd1"

```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 1888](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 1863](#).

NOTE: When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the [edit system login class] hierarchy level using the allow-commands, deny-commands, allow-configuration, deny-configuration, or permissions statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

Example: Configuring RADIUS System Accounting

When a Juniper Networks router or switch is configured with RADIUS accounting, it sends **Accounting-Start** and **Accounting-Stop** messages to the RADIUS server. These messages contain information about user activities such as software logins, configuration changes, and interactive commands. This information is typically used for monitoring a network, collecting usage statistics, and ensuring that users are billed properly.

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting:

```
system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
      radius {
        server {
          10.5.5.5 {
            accounting-port 3333;
            secret $9$dkafeqwrew;
            source-address 10.1.1.1;
            retry 3;
            timeout 3;
          }
          10.6.6.6 secret $9$fe3erqwrez;
          10.7.7.7 secret $9$f34929ftby;
        }
      }
    }
  }
}
```

**Related
Documentation**

- [Configuring RADIUS System Accounting on page 1891](#)

Configuring and Managing RADIUS Template Accounts

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1899](#)
- [Example: Configuring RADIUS Template Accounts on page 1899](#)

Overview of Template Accounts for RADIUS and TACACS+ Authentication

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

Understanding Vendor-Specific Attributes (VSAs)

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS).

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the device as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the device during authentication, and the device takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the device directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the device port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and devices.

Juniper-Switching-Filter VSA Match Conditions and Actions

Switching devices support the configuration of RADIUS server attributes specific to Juniper Networks, which are known as vendor-specific attributes (VSAs). The Juniper-Switching-Filter VSA works in conjunction with 802.1X authentication to centrally control access of supplicants to the network. You can use this VSA to configure filters on the RADIUS server, which are sent to the switch and applied to users that have been authenticated using 802.1X authentication.

The Juniper-Switching-Filter VSA can contain one or more filter terms. Filter terms are configured using one or more *match conditions* with a resulting *action*. Match conditions are the criteria that a packet must meet for a configured action to be applied on it. The action is the action that the switch takes if a packet meets the criteria in the match conditions. The action that the switch can take is either accept or deny a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- If no match condition is specified, any packet is considered a match by default.
- If no action is specified, the default action is to deny the packet.
- Any or all options can be included in each **match** and **action** statement.
- The AND operation is performed on fields that are of a different type, which are separated by commas. Fields of the same type cannot be repeated.
- For the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If the forwarding class is not configured on the switch, this option is ignored.

Table 155 describes the match conditions that you can specify when you configure a VSA attribute as a firewall filter by using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

Table 155: Match Conditions

Option	Description
destination-mac <i>mac-address</i>	Destination media access control (MAC) address of the packet.
source-vlan <i>source-vlan</i>	Name of the source VLAN.
source-dot1q-tag <i>tag</i>	Tag value in the 802.1Q header, in the range 0 through 4095.
destination-ip <i>ip-address</i>	Address of the final destination node.
ip-protocol <i>protocol-id</i>	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms: ah , egp (8), esp (50), gre (47), icmp (1), igmp (2), ipip (4), ipv6 (41), ospf (89), pim (103), rsvp (46), tcp (6), or udp (17)

Table 155: Match Conditions (*continued*)

Option	Description
source-port <i>port</i>	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the ip-protocol match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under destination-port .
destination-port <i>port</i>	<p>TCP or UDP destination port field. Normally, you specify this match statement in conjunction with the ip-protocol match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p>afs (1483), bgp (179), biff (512), bootpc (68), bootps (67), cvspserver (2401), cmd (514), dhcp (67), domain (53), eklogin (2105), ekshell (2106), exec (512), finger (79), ftp (21), ftp-data (20), http (80), https (443), ident (113), imap (143), kerberos-sec (88), klogin (543), kpasswd (761), krb-prop (754), krbupdate (760), kshell (544), ldap (389), login (513), mobileip-agent (434), mobilip-mn (435), msdp (639), netbios-dgm (138), netbios-ns (137), netbios-ssn (139), nfsd (2049), nntp (119), ntalk (518), ntp (123), pop3 (110), pptp (1723), printer (515), radacct (1813), radius (1812), rip (520), rkinit (2108), smtp (25), snmp (161), snmptrap (162), snpp (444), socks (1080), ssh (22), sunrpc (111), syslog (514), telnet (23), tacacs-ds (65), talk (517), tftp (69), timed (525), who (513), xdmcp (177), zephyr-clt (2103), zephyr-hm (2104)</p>

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 156](#) shows the actions that you can specify in a term.

Table 156: Actions for VSAs

Option	Description
(allow deny)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.
forwarding-class <i>class-of-service</i>	<p>(Optional) Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> assured-forwarding best-effort expedited-forwarding network-control
loss-priority (low medium high)	(Optional) Set the packet loss priority (PLP) to low , medium , or high . Specify both the forwarding class and the loss priority.

Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 151](#) lists the Juniper Networks VSAs you can configure.

Table 157: Juniper Networks Vendor-Specific TACACS+ Attributes

Name	Description	Length	String
local-user-name	Indicates the name of the user template used by this user when logging in to a device.	≥3	One or more octets containing printable ASCII characters.
allow-commands	Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 143 .
allow-configuration	Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See "Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies" on page 1826.
deny-commands	Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 143 .
deny-configuration	Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.	≥3	One or more octets containing printable ASCII characters, in the form of an extended regular expression. See Table 142 .

Table 157: Juniper Networks Vendor-Specific TACACS+ Attributes (*continued*)

Name	Description	Length	String
user-permissions	<p>Contains information the server uses to specify user permissions.</p> <p>NOTE: When the user-permissions attribute is configured to grant the Junos OS maintenance or all permissions on an IPv4 or IPv6 TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the su root command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions maintenance or all, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p>	≥3	One or more octets containing printable ASCII characters. See Table 137.
authentication-type	Indicates the authentication method (local database, or TACACS+ server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using TACACS+ server, the attribute value shows 'remote'.	≥5	One or more octets containing printable ASCII characters.
session-port	Indicates the source port number of the established session.	size of integer	Integer

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
Description	<p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([]). For example, "scp://username<:password>@[ipv6-host-address]<:port>/url-path"</p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.</p> <p>The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> <p><i>router-name_YYYYMMDD_HHMMSS_juniper.conf.n.gz</i></p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> NOTE: The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> NOTE: The [edit system archival] hierarchy is not available on QFabric systems.</p> </div>
Options	<p>The prefix used in the configuration statement determines the form of transfer:</p> <p>file:// —transfer on a path to a named file</p> <p>ftp:// —transfer using active FTP server</p> <p>http:// —transfer using HTTP server</p>

pasvftp:// —transfer to a device that only accepts passive FTP services

scp:// —transfer to a known host using background SCP file transfers

Required Privilege Level system—To view this statement in the configuration.
 system-control—To add this statement to the configuration.

authentication-order

Syntax authentication-order [none | password | radius];

Hierarchy Level [edit [access profile](#) *profile-name*],
 [edit [system](#)]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 11.1 for the QFX Series.
 Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

Description Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

Default Not enabled

Options **none**—No authentication for specified subscribers.

password—Password authentication.

radius—RADIUS authentication.

NOTE: The [edit [access](#)] hierarchy is not available on QFabric systems.

Required Privilege Level admin—To view this statement in the configuration.
 admin-control—To add this statement to the configuration.

authentication-server

Syntax	<code>authentication-server [server-addresses];</code>
Hierarchy Level	[edit access profile <i>profile-name</i> radius]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Configure the RADIUS server for authentication. To configure multiple RADIUS servers, include multiple server addresses. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.
Options	server-addresses —Configure one or more RADIUS server addresses.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i>• <i>show network-access aaa statistics authentication</i>

authorization

Syntax	<code>authorization <i>authorization</i>;</code>
Hierarchy Level	[edit snmp community <i>community-name</i>]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Set the access authorization for SNMP Get , GetBulk , GetNext , and Set requests.
Options	<p><i>authorization</i>—Access authorization level:</p> <ul style="list-style-type: none">• read-only—Enable Get, GetNext, and GetBulk requests.• read-write—Enable all requests, including Set requests. You must configure a view to enable Set requests.
	<div> NOTE: The read-write option is not supported on the QFX3000 QFabric system.</div>
	Default: read-only
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the SNMP Community String on page 1503

categories

Syntax	<code>categories { category; }</code>
Hierarchy Level	<code>[edit snmp trap-group group-name]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Define the types of traps that are sent to the targets of the named trap group.
Default	If you omit the categories statement, all trap types are included in trap notifications.
Options	category —Name of a trap type: authentication , chassis , configuration , link , remote-operations , rmon-alarm , or startup .
Required Privilege Level	snmp —To view this statement in the configuration. snmp-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring SNMP Trap Groups on page 1504

client-list

Syntax	<code>client-list client-list-name { ip-addresses; }</code>
Hierarchy Level	<code>[edit snmp]</code>
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Define a list of SNMP clients.
Options	client-list-name —Name of the client list. ip-addresses —IP addresses of the SNMP clients to be added to the client list,
Required Privilege Level	snmp —To view this statement in the configuration. snmp-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Adding a Group of Clients to an SNMP Community on page 1505

client-list-name

Syntax	<code>client-list-name <i>client-list-name</i>;</code>
Hierarchy Level	<code>[edit snmp community <i>community-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Add a client list or prefix list to an SNMP community.
Options	<i>client-list-name</i> —Name of the client list or prefix list.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Adding a Group of Clients to an SNMP Community on page 1505

clients

Syntax	<pre>clients { <i>address</i> <restrict>; }</pre>
Hierarchy Level	<code>[edit snmp community <i>community-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify the IPv4 or IPv6 addresses of the SNMP client hosts that are authorized to use this community.
Default	If you omit the clients statement, all SNMP clients using this community string are authorized to access the switch.
Options	<i>address</i> —Address of an SNMP client that is authorized to access this switch. You must specify an address, not a hostname. To specify more than one client, include multiple <i>address</i> options. <i>restrict</i> —(Optional) Do not allow the specified SNMP client to access the switch.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring SNMP Communities

commit-delay

Syntax	<code>commit-delay <i>seconds</i>;</code>
Hierarchy Level	[edit snmp nonvolatile]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the timer for the SNMP Set reply and start of the commit.
Options	<i>seconds</i> —Delay between an affirmative SNMP Set reply and start of the commit operation. Default: 5 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring the Commit Delay Timer</i>

community (SNMP)

Syntax	<pre>community <i>community-name</i> { authorization <i>authorization</i>; client-list-name <i>client-list-name</i>; clients { address restrict; } view <i>view-name</i>; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.
<div> NOTE: The authorization read-write option is not supported on the QFX3000 QFabric system.</div>	
The SNMP client application specifies an SNMP community name in Get , GetBulk , GetNext , and Set SNMP requests.	
Default	If you omit the community statement, all SNMP requests are denied.
Options	<i>community-name</i> —Community string. If the name includes spaces, enclose it in quotation marks (" "). The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the SNMP Community String on page 1503

configuration

Syntax	<pre> configuration { transfer-interval interval; transfer-on-commit; archive-sites { file://<path>/<filename>; ftp://username@host:<port>url-path password password; http://username@host:<port>url-path password password; pasvftp://username@host:<port>url-path password password; scp://username@host:<port>url-path password password; } } </pre>
Hierarchy Level	[edit system archival]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
Description	Configure the router or switch to periodically transfer its currently active configuration (or after each commit).
<div>  <p>NOTE: The [edit system archival] hierarchy is not available on QFabric systems.</p> </div>	
Options	The remaining statements are explained separately.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

------------------------------	---

contact

Syntax	<code>contact <i>contact</i>;</code>
Hierarchy Level	<code>[edit snmp]</code>
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define the value of the MIB II sysContact object, which is the contact person for the managed system.
Options	contact —Name of the contact person. If the name includes spaces, enclose it in quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the System Contact on a Device Running Junos OS</i>

disable (LLDP)

Syntax	<code>disable;</code>
Hierarchy Level	<code>[edit protocols lldp],</code> <code>[edit protocols interface lldp]</code>
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Disable the LLDP configuration on the switch or on one or more interfaces.
Default	If you do not configure LLDP, it is disabled on the switch and on specific switch interfaces.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • show lldp on page 2002 • <i>Configuring LLDP (CLI Procedure)</i> • <i>Understanding LLDP and LLDP-MED on EX Series Switches</i> • <i>Configuring LLDP</i> • Understanding LLDP on page 1795

falling-threshold (Health Monitor)

Syntax	<code>falling-threshold <i>percentage</i>;</code>
Hierarchy Level	<code>[edit snmp health-monitor]</code>
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Set the lower threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range.
Options	<i>percentage</i> —Lower threshold for the alarm entry. Range: 1 through 100 Default: 70 percent of the maximum possible value
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• rising-threshold on page 1653• Configuring Health Monitoring on page 1509

filter-duplicates

Syntax	<code>filter-duplicates;</code>
Hierarchy Level	<code>[edit snmp]</code>
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Filter duplicate Get , GetNext , or GetBulk SNMP requests.
Required Privilege Level	<code>snmp</code> —To view this statement in the configuration. <code>snmp-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Understanding the Implementation of SNMP on the QFabric System• Example: Configuring SNMP on page 1523

full-name

Syntax	<code>full-name <i>complete-name</i>;</code>
Hierarchy Level	[edit system login user]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Configure the complete name of a user.
Options	<i>complete-name</i> —Full name of the user. If the name contains spaces, enclose it in quotation marks.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Junos OS User Accounts by Using a Configuration Group</i> • <i>user</i>

health-monitor

Syntax	<pre>health-monitor { falling-threshold <i>percentage</i>; interval <i>seconds</i>; rising-threshold <i>percentage</i>; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure health monitoring. The remaining statements are explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Health Monitoring on page 1509 • Understanding Health Monitoring on page 1467

hold-multiplier

Syntax	hold-multiplier <i>number</i> ;
Hierarchy Level	[edit protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series.
Description	Specify the multiplier used in combination with the advertisement-interval value to determine the length of time LLDP information is held before it is discarded. The default value is 4 (or 120 seconds).
Default	Disabled.
Options	<i>number</i> —A number used as a multiplier. Range: 2 through 10 Default: 4 (or 120 seconds)
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• show lldp on page 2002• <i>Configuring LLDP (CLI Procedure)</i>• <i>Understanding LLDP and LLDP-MED on EX Series Switches</i>• <i>Configuring LLDP</i>• Understanding LLDP on page 1795

idle-timeout (Access)

Syntax	<code>idle-timeout seconds;</code>
Hierarchy Level	<code>[edit access group-profile <i>profile-name</i> ppp],</code> <code>[edit access profile <i>profile-name</i> client <i>client-name</i> ppp]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Configure the idle timeout for a user. The router might consider a PPP session to be idle because of the following reasons: <ul style="list-style-type: none"> • There is no ingress traffic on the PPP session. • There is no egress traffic. • There is neither ingress or egress traffic on the PPP session. • There is no ingress or egress PPP control traffic. This is applicable only if keepalives are enabled.
Options	seconds —Number of seconds a user can remain idle before the session is terminated. Range: 0 through 4,294,967,295 seconds Default: 0

NOTE: The `[edit access]` hierarchy is not available on QFabric systems.

Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

interval (Health Monitor)

Syntax	interval <i>seconds</i> ;
Hierarchy Level	[edit snmp health-monitor]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the interval between sampling of the object being monitored by the health monitor.
Options	seconds —Time between samples, in seconds. Range: 1 through 2147483647 seconds Default: 300 seconds
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Health Monitoring on page 1509

lldp

```
Syntax  lldp {
    advertisement-interval seconds;
    disable;
    hold-multiplier number;
    interface (all | [interface-name]) {
        disable;
        power-negotiation {
            disable;
        }
    }
    lldp-configuration-notification-interval seconds;
    management-address ip-management-address;
    netbios-snooping;
    no-tagging;
    ptopo-configuration-maximum-hold-time seconds;
    ptopo-configuration-trap-interval seconds;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>
        <no-stamp> <replace>;
        flag flag <disable>;
    }
    transmit-delay seconds;
}
```

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for QFX Series.

Description Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as to receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

NOTE: The `transmit-delay` and `netbios-snooping` options are not available on QFabric systems.

NOTE: On EX4300 switches, LLDP cannot be configured on the `me0` or `vme` interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

.....

Default LLDP is enabled.

The following statements have default values:

- **advertisement-interval**—The default value is 30 seconds. The allowable range is from 5 through 32768 seconds.
- **hold-multiplier**—The default values is 4. The allowable range is from 2 through 10.
- **ptopo-configuration-maximum-hold-time**—The default value is 300 seconds. The allowable range is from 1 through 2147483647 seconds.
- **transmit-delay**—The default values is 2 seconds. The allowable range is from 1 through 8192 seconds.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

lldp-configuration-notification-interval

Syntax	lldp-configuration-notification-interval <i>seconds</i> ;
Hierarchy Level	[edit protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify how often SNMP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, trap notifications of database changes are disabled.
Default	SNMP trap notifications of LLDP database changes are disabled.
Options	seconds —Interval between trap notifications about LLDP database changes. Range: 0 through 3600
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• show lldp on page 2002

location

Syntax	location <i>location</i> ;
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Define the value of the MIB II sysLocation object, which is the physical location of the managed system.
Options	location —Location of the local system. You must enclose the name within quotation marks (" ").
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

management-address

Syntax	<code>management-address <i>ip-management-address</i>;</code>
Hierarchy Level	[edit protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.5 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify the management address to be used in LLDP Management Address type, length, and value (TLV) messages. The Management Address TLV typically contains the IPv4 or IPv6 management addresses of the local system. Only out-of-band management addresses must be used for the management-address. Other remote managers can use this address to obtain information related to the local device.
Default	The LLDP Management Address TLV uses the IP address of the switch's management Ethernet interface (me0), or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis member.
Options	<i>ip-management-address</i> —You can specify either an IPv4 or an IPv6 management address for the switch.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

nonvolatile

Syntax	nonvolatile { commit-delay <i>seconds</i> ; }
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure options for SNMP Set requests. The statement is explained separately.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring the Commit Delay Timer</i> • <i>commit-delay</i>

oid

Syntax	oid <i>object-identifier</i> (exclude include);
Hierarchy Level	[edit snmp view <i>view-name</i>]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify an object identifier (OID) used to represent a subtree of MIB objects.
Options	<p>exclude—Exclude the subtree of MIB objects represented by the specified OID.</p> <p>include—Include the subtree of MIB objects represented by the specified OID.</p> <p>object-identifier—OID used to represent a subtree of MIB objects. All MIB objects represented by this statement have the specified OID as a prefix. You can specify the OID using either a sequence of dotted integers or a subtree name.</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring MIB Views on page 1506

order

Syntax	<code>order (radius [<i>accounting-order-data-list</i>]);</code>
Hierarchy Level	[edit access profile <i>profile-name</i> accounting]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending accounting messages and updates.
Default	No order specified
Options	radius —RADIUS accounting for specified subscribers. [<i>accounting-order-data-list</i>]— Set of data listing the authentication order to be used, enclosed by brackets. This can be any combination of the authentication methods, up to and including a full list of the entire authentication order.
<hr/> <div> NOTE: The [edit access] hierarchy is not available on QFabric systems.</div> <hr/>	
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i>• <i>Configuring RADIUS Accounting</i>

port (RADIUS Server)

Syntax	<code>port <i>port-number</i>;</code>
Hierarchy Level	[edit system radius-server <i>address</i>], [edit system accounting destination radius server <i>address</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the port number on which to contact the RADIUS server.
Options	<i>number</i> —Port number on which to contact the RADIUS server. Default: 1812 (as specified in RFC 2865)

NOTE: The [edit system accounting] hierarchy is not available on QFabric systems.

Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring RADIUS Server Authentication</i>

profile

Syntax `profile profile-name {
 accounting (Access Profile) {
 accounting-stop-on-access-deny;
 accounting-stop-on-failure;
 order (radius | [accounting-order-data-list]);
 }
 authentication-order (Access Profile) [authentication-method];
 radius {
 accounting-server [server-addresses];
 authentication-server [server-addresses];
 }
 }`

Hierarchy Level [edit access]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

Default Not enabled

Options *profile-name*—Profile name of up to 32 characters.

The remaining statements are explained separately.

NOTE: The [edit access] hierarchy is not available on QFabric systems.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure protocols.

The remaining statements are explained separately.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

Related Documentation • [Junos OS Routing Protocols Configuration Guide](#)

protocol-version

Syntax	<code>protocol-version version;</code>
Hierarchy Level	[edit system services ssh]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Specify the secure shell (SSH) protocol version.
Default	v2 —SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.
Options	version —SSH protocol version: v1 , v2 , or both.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	• Configuring the SSH Protocol Version on page 1413

ptopo-configuration-maximum-hold-time

Syntax	<code>ptopo-configuration-maximum-hold-time <i>seconds</i>;</code>
Hierarchy Level	[edit protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure how long to maintain the physical topology database entries. The physical topology identifies the devices on the network and their physical interconnections.
Options	<i>seconds</i> —Time to maintain physical topology database entries. Default: 300 Range: 1 through 2147483647
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • show lldp on page 2002 • <i>Understanding LLDP and LLDP-MED on EX Series Switches</i> • Understanding LLDP on page 1795

ptopo-configuration-trap-interval

Syntax	<code>ptopo-configuration-trap-interval <i>seconds</i>;</code>
Hierarchy Level	[edit protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify how often SNMP trap notifications are sent regarding changes in physical topology global statistics.
Default	SNMP trap notifications of changes in physical topology global statistics are disabled.
Options	<i>seconds</i> —Interval between SNMP trap notifications about physical topology global statistics. Range: 0 through 3600
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

radius

Syntax	<pre>radius { accounting-server [server-addresses]; authentication-server [server-addresses]; }</pre>
Hierarchy Level	[edit access profile <i>profile-name</i>]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	<p>Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple radius statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p> <p>The statements are explained separately.</p>
<div> NOTE: The [edit access] hierarchy is not available on QFabric systems.</div>	
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch</i>• <i>Configuring 802.1X RADIUS Accounting (CLI Procedure)</i>• <i>Filtering 802.1X Supplicants by Using RADIUS Server Attributes</i>• <i>Configuring RADIUS Accounting</i>

radius-options (edit system)

Syntax	<pre>radius-options { attributes { nas-ip-address <i>ip-address</i>; } enhanced-accounting; password-protocol <i>mschap-v2</i>; }</pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
	<p> NOTE: The <code>radius-options</code> statement is not available on QFabric systems.</p>
	<p>enhanced-accounting statement introduced in Junos OS Release 14.1.</p>
Description	Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.
Options	<p>enhanced-accounting—View the attribute values of a logged in user.</p> <p>nas-ip-address <i>ip-address</i>—IP address of the network access server (NAS) that requests user authentication.</p> <p>password-protocol <i>mschap-v2</i>—Protocol MS-CHAPv2, used for password authentication and password changing.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring MS-CHAPv2 for Password-Change Support • Configuring RADIUS System Accounting on page 1891 • <i>enhanced-accounting</i>

radius-server

Syntax	<pre>radius-server server-address { accounting-port <i>port-number</i>; port <i>number</i>; retry <i>number</i>; secret <i>password</i>; source-address <i>source-address</i>; timeout <i>seconds</i>; }</pre>
Hierarchy Level	[edit system]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	<p>Configure a RADIUS server for Point-to-Point Protocol (PPP).</p> <p>To configure multiple RADIUS servers, include multiple radius-server statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p>
Options	<p>server-address—Address of the RADIUS authentication server.</p> <p>The remaining statements are explained separately.</p>
<div> NOTE: The accounting-port and source-address options are not available on QFabric systems.</div>	
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring RADIUS Authentication (QFX Series or OCX Series) on page 1873• accounting-port• port on page 1945• retry on page 235• secret on page 318• source-address on page 291• timeout on page 321

rate-limit

Syntax	<code>rate-limit <i>limit</i>;</code>
Hierarchy Level	<code>[edit system services finger],</code> <code>[edit system services ftp],</code> <code>[edit system services netconf ssh],</code> <code>[edit system services ssh],</code> <code>[edit system services telnet],</code> <code>[edit system services tftp-server],</code> <code>[edit system services xnm-clear-text],</code> <code>[edit system services xnm-ssl]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Configure the maximum number of connections attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 telnet session connection attempts per minute and 10 IPv4 telnet session connection attempts per minute.
Default	150 connections
Options	<p>rate-limit <i>limit</i>—(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6).</p> <p>Range: 1 through 250</p> <p>Default: 150</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i>

remote-debug-permission

Syntax	remote-debug-permission (qfabric-admin qfabric-operator qfabric-user);
Hierarchy Level	[edit system login user <i>username</i> authentication] [edit system root-authentication]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series.
Description	(QFabric systems only) Configure authentication classes that permit or deny user access to individual components of the QFabric system.
Default	qfabric-user
Options	<p>qfabric-admin—Permits a user to log in to individual QFabric system components, view operations, and change component configurations.</p> <p>qfabric-operator—Permits a user to log in to individual QFabric system components and view component operations.</p> <p>qfabric-user—Prevents a user from logging in to individual QFabric system components.</p>
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring QFabric System Login Classes</i>• request component login on page 1996• <i>Understanding QFabric System Login Classes</i>

retry

Syntax	<code>retry <i>number</i>;</code>
Hierarchy Level	[edit system radius server <i>server-address</i>], [edit system accounting destination radius server <i>server-address</i>]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Number of times the router or switch is allowed to try to contact a RADIUS authentication or accounting server.
Options	<i>number</i> —Number of retries allowed for contacting a RADIUS server. Range: 1 through 10 Default: 3

NOTE: The [edit system accounting] hierarchy is not available on QFabric systems.

Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring RADIUS Authentication (QFX Series or OCX Series) on page 1873 • Configuring RADIUS Accounting • timeout on page 321

rising-threshold (Health Monitor)

Syntax	<code>rising-threshold <i>percentage</i>;</code>
Hierarchy Level	[edit snmp health-monitor]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Set the upper threshold for the monitored object when you configure a health monitor alarm. By setting a rising and a falling threshold for a monitored object, you can be alerted whenever the value of the variable falls outside the allowable operational range.
Options	<i>percentage</i> —Upper threshold for the alarm entry. Range: 1 through 100 Default: 80 percent of the maximum possible value
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Health Monitoring on page 1509• falling-threshold on page 1624

root-login

Syntax	root-login (allow deny deny-password);
Hierarchy Level	[edit system services ssh]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Control user access through SSH.
Default	Allow user access through SSH.
Options	allow —Allow users to log in to the router or switch as root through SSH. deny —Disable users from logging in to the router or switch as root through SSH. deny-password —Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Root Login Through SSH on page 1413

services (Switches)

Syntax

```
services {  
  service-deployment {  
    servers address {  
      port-number port-number;  
    }  
    source-address address;  
  }  
  ssh {  
    connection-limit limit;  
    protocol-version [v1 v2];  
    rate-limit limit;  
    root-login (allow | deny | deny-password);  
  }  
}
```

Hierarchy Level [edit system]

Release Information Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the switch so that users on remote systems can access the local switch through SSH.

The remaining statements are explained separately.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure system management properties.

NOTE: The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

tacplus-options

Syntax	<pre>tacplus-options { (exclude-cmd-attribute no-cmd-attribute-value); enhanced-accounting; service-name <i>service-name</i>; timestamp-and-timezone; }</pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>no-cmd-attribute-value and exclude-cmd-attribute options introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for QFX Series.</p> <p>timestamp-and-timezone option introduced in Junos OS Release 12.2.</p> <p>enhanced-accounting option introduced in Junos OS Release 14.1.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
Description	Configure TACACS+ options for authentication and accounting.
Options	<p>enhanced-accounting—View the attribute values of a logged in user.</p> <p>exclude-cmd-attribute—Exclude the cmd attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p>no-cmd-attribute-value—Set the cmd attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p>service-name <i>service-name</i>—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.</p> <p>Default: junos-exec</p> <p>timestamp-and-timezone—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• <i>Configuring TACACS+ Authentication</i>• <i>Configuring TACACS+ System Accounting</i>• Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 1859• <i>enhanced-accounting</i>

targets

Syntax	<pre>targets { address; }</pre>
Hierarchy Level	[edit snmp trap-group <i>group-name</i>]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure one or more systems to receive SNMP traps.
Options	address —IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring SNMP Trap Groups on page 1504

traceoptions (LLDP)

Syntax `traceoptions {
 file filename <files number> <size size> <world-readable | no-world-readable> <no-stamp>
 <replace>;
 flag flag <disable>;
 }`

Hierarchy Level [edit protocols [lldp](#)]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.

NOTE: The traceoptions statement is not supported on the QFX3000 QFabric system.

Default Tracing operations are disabled.

Options **file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000

Default: 3 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **all**—All tracing operations.
- **configuration**—Trace configuration operations.
- **interface**—Trace interface update events.
- **netbios**—Trace NetBIOS events.
- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.

- **vlan**—Trace VLAN update events.

no-stamp—(Optional) Do not timestamp the trace file.

Default: If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

no-world-readable—(Optional) Restrict file access to the user who created the file.

replace—(Optional) Replace an existing trace file if there is one rather than appending output to it.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

Syntax: **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

Default: If you do not include this option, tracing output is appended to an existing trace file.

world-readable—(Optional) Enable unrestricted file access.

NOTE: The **traceoptions** statement is not supported on the QFX3000 QFabric system.

Required Privilege Level routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

transfer-interval (Configuration)

Syntax	<code>transfer-interval <i>interval</i>;</code>
Hierarchy Level	[edit system archival configuration]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the router or switch to periodically transfer its currently active configuration to an archive site.
Options	interval —Interval at which to transfer the current configuration to an archive site. Range: 15 through 2880 minutes

NOTE: The [edit system archival] hierarchy is not available on QFabric systems.

Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the Periodic Transfer of the Active Configuration to an Archive Site on page 1334• archive on page 1692• configuration on page 1363• transfer-on-commit on page 1365

transfer-on-commit

Syntax	transfer-on-commit;
Hierarchy Level	[edit system archival configuration]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

NOTE: When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([]). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path" .

NOTE: The [edit system archival] hierarchy is not available on QFabric systems.

Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the Transfer of the Currently Active Configuration When a Configuration Is Committed on page 1334 • archive on page 1692 • configuration on page 1363 • transfer-interval on page 1364

trap-group

Syntax	<pre>trap-group <i>group-name</i> { categories { <i>category</i>; } destination-port <i>port-number</i>; routing-instance <i>instance</i>; targets { <i>address</i>; } version (all v1 v2); }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.
Options	<p><i>group-name</i>—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring SNMP Trap Groups</i>

trap-options

Syntax	<pre>trap-options { agent-address outgoing-interface; source-address address; }</pre>
Hierarchy Level	[edit snmp]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p> <p>The remaining statements are explained separately.</p>
Default	Disabled
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring SNMP Trap Options</i>

user (Access)

Syntax `user username {
 authentication {
 (encrypted-password "password" | plain-text-password);
 load-key-file URL;
 remote-debug-permission (qfabric-admin | qfabric-operator | qfabric-user);
 ssh-dsa "public-key" <from hostname>;
 ssh-rsa "public-key" <from hostname>;
 }
 class class-name;
 full-name "complete-name";
 uid uid-value;
 }`

Hierarchy Level [edit system login]

Release Information Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
 Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure access permission for individual users.

Options The remaining statements are explained separately.

Required Privilege Level admin—To view this statement in the configuration.
 admin-control—To add this statement to the configuration.

version

Syntax	version (all v1 v2);
Hierarchy Level	[edit snmp trap-group <i>group-name</i>]
Release Information	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Specify the version number of SNMP traps.
Default	all—Send an SNMPv1 and SNMPv2 trap for every trap condition.
Options	all—Send an SNMPv1 and SNMPv2 trap for every trap condition. v1—Send SNMPv1 traps only. v2—Send SNMPv2 traps only.
Required Privilege Level	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.

Operational Commands

- `clear lldp neighbors`
- `clear lldp statistics`
- `request component login`
- `show ethernet-switching interfaces`
- `show lldp`
- `show lldp local-information`
- `show lldp neighbors`
- `show lldp statistics`
- `show route instance`
- `show snmp statistics`
- `ssh`

clear lldp neighbors

Syntax	clear lldp neighbors <interface <i>interface</i> >
Release Information	Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Clear the learned remote neighbor information on all or selected interfaces.
Options	none —Clear the remote neighbor information on all interfaces. interface <i>interface</i> —(Optional) Clear the remote neighbor information from the selected interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• <i>Configuring LLDP</i>• Understanding LLDP on page 1795
List of Sample Output	clear lldp neighbors on page 1994 clear lldp neighbors interface on page 1994

Sample Output

clear lldp neighbors

```
user@switch> clear lldp neighbors
```

clear lldp neighbors interface

```
user@switch> clear lldp neighbors interface ge-0/1/1.0
```

clear lldp statistics

Syntax	<code>clear lldp statistics</code> <code><interface <i>interface</i>></code>
Release Information	Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Clear LLDP statistics on one or more interfaces.
Options	none —Clears LLDP statistics on all interfaces. interface <i>interface-names</i> —(Optional) Clear LLDP statistics on an interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Configuring LLDP • Understanding LLDP on page 1795

```

clear lldp statistics interface

```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

request component login

Syntax	<code>request component login <i>component-name</i></code>
Release Information	Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	(QFabric systems only) Log in to a QFabric system component. To gain access to individual components by way of the request component login command, you must first provide the qfabric-admin or qfabric-operator class privilege to your user (for more information, see: remote-debug-permission).
Options	<i>component-name</i> —Specify the QFabric system component to which you wish to log in.
Required Privilege Level	admin
Related Documentation	<ul style="list-style-type: none">• remote-debug-permission on page 1966
List of Sample Output	request component login (with qfabric-admin Privileges) on page 1996 request component login (with qfabric-operator Privileges) on page 1997 request component login (with qfabric-user Privileges) on page 1997

Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

request component login (with qfabric-admin Privileges)

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.

show ethernet-switching interfaces

Syntax	show ethernet-switching interfaces <brief detail summary> <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display information about switched Ethernet interfaces.
Options	<p>none—(Optional) Display brief information for Ethernet-switching interfaces.</p> <p>brief detail summary—(Optional) Display the specified level of output.</p> <p>interface <i>interface-name</i>—(Optional) Display Ethernet-switching information for a specific interface.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Troubleshooting Ethernet Switching on page 2134Understanding Bridging and VLANs on page 2089 • Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 2096 • Example: Setting Up Bridging with Multiple VLANs • Understanding FCoE on page 6436 • Interfaces Overview on page 2785
List of Sample Output	show ethernet-switching interfaces on page 1999 show ethernet-switching interfaces summary on page 2000 show ethernet-switching interfaces brief on page 2000 show ethernet-switching interfaces detail on page 2000 show ethernet-switching interfaces interface-name on page 2001
Output Fields	Table 158 lists the output fields for the show ethernet-switching interfaces command. Output fields are listed in the approximate order in which they appear.

Table 158: show ethernet-switching interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a switching interface.	All levels
State	Interface state. Values are up or down .	none, brief , detail , summary
VLAN members	Name of a VLAN.	none, brief , detail , summary

Table 158: show ethernet-switching interfaces Output Fields (*continued*)

Field Name	Field Description	Level of Output
Blocking	Forwarding state of the interface: <ul style="list-style-type: none"> • blocked—Traffic is not being forwarded on the interface. • unblocked—Traffic is forwarded on the interface. • MAC limit exceeded—The interface is temporarily disabled because of a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • MAC move limit exceeded—The interface is temporarily disabled because of a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires. • Storm control in effect —The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the disable timeout expires. • Storm control shutdown in effect —The interface is temporarily disabled because of a storm control shutdown error. The disabled interface is automatically restored to service when the disable timeout expires. 	none, brief , detail , summary
Index	VLAN index internal to Junos OS software.	detail
untagged tagged	Specifies whether the interface forwards IEEE802.1Q-tagged or untagged traffic.	detail

Sample Output

show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces
```

Interface	State	VLAN members	Blocking
xe-0/0/0.0	up	T1122	unblocked
xe-0/0/1.0	down	default	– MAC limit exceeded
xe-0/0/2.0	down	default	– MAC move limit exceeded
xe-0/0/3.0	down	default	– Storm control in effect
xe-0/0/4.0	down	default	unblocked
xe-0/0/5.0	down	default	unblocked
xe-0/0/6.0	down	default	unblocked
xe-0/0/7.0	down	default	unblocked
xe-0/0/8.0	down	default	unblocked
xe-0/0/9.0	up	T111	unblocked
xe-0/0/10.0	down	default	unblocked
xe-0/0/11.0	down	default	unblocked
xe-0/0/12.0	down	default	unblocked
xe-0/0/13.0	down	default	unblocked
xe-0/0/14.0	down	default	unblocked
xe-0/0/15.0	down	default	unblocked
xe-0/0/16.0	down	default	unblocked
xe-0/0/17.0	down	default	unblocked
xe-0/0/18.0	down	default	unblocked
xe-0/0/19.0	up	T111	unblocked
xe-0/1/0.0	down	default	unblocked
xe-0/1/1.0	down	default	unblocked
xe-0/1/2.0	down	default	unblocked
xe-0/1/3.0	down	default	unblocked

show ethernet-switching interfaces summary

```

  State: down
  VLANs:
    employee-vlan          tagged      unblocked
```

show ethernet-switching interfaces interface-name

```
user@switch> show ethernet-switching interfaces xe-0/0/0.0
  Interface  State   VLAN members  Blocking
xe-0/0/0.0  down    default        unblocked
```

show lldp

Syntax `show lldp`
`<detail>`

Release Information Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol—Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

NOTE: LLDP-MED is not available on the QFX Series.

Options **none**—Display LLDP information for all interfaces.
detail—(Optional) Display detailed LLDP information for all interfaces.

Output Fields [Table 159](#) lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 159: show lldp Output Fields

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be enabled or disabled . NOTE: If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as disabled .	All levels

Table 159: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Advertisement interval	Frequency, in seconds, at which LLDP advertisements are sent. This value is set by the <code>advertisement-interval</code> configuration statement.	All levels
Transmit delay	Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system. This value is set by the <code>transmit-delay</code> configuration statement.	All levels
Hold timer	On EX4300 switches, the hold timer shows the length of time LLDP information is held before it is discarded. The hold timer value is equal to the advertisement interval multiplied by the hold multiplier. On all other switches, the hold timer shows the value of the hold multiplier. The hold multiplier value is set by the <code>hold-multiplier</code> configuration statement.	All levels
Notification interval	How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications on database changes are disabled. This value is set by the <code>lldp-configuration-notification-interval</code> configuration statement.	All levels
Config Trap Interval	How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications on topology changes are disabled. This value is set by the <code>ptopo-configuration-trap-interval</code> configuration statement.	All levels
Connection Hold timer	Amount of time the system maintains dynamic topology entries. This value is set by the <code>ptopo-configuration-maximum-hold-time</code> configuration statement.	All levels
LLDP-MED	LLDP-MED operating state. The state can be Enabled or Disabled .	All levels
MED fast start count	Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second. This value is set by using the <code>fast-start</code> configuration statement. NOTE: <code>fast-start</code> is not available on the QFX Series.	All levels
Interface	Name of the interface for which LLDP configuration information is being reported.	All levels
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.	All levels

Table 159: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be Enabled or Disabled .	All levels
Power Negotiation	LLDP power negotiation operating state. The state can be Enabled or Disabled .	All levels
Neighbor count	Total number of new LLDP neighbors detected since the last switch reboot.	detail
Interface	Name of the interface that is advertising VLAN information.	All levels
Vlan-id	VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.	detail
Vlan-name	VLAN name associated with the VLAN ID.	detail
LLDP basic TLVs supported	<p>Basic TLVs supported on the switch:</p> <ul style="list-style-type: none"> • Chassis identifier—TLV that advertises the MAC address associated with the local system. • Port identifier—TLV that advertises the port identification for the specified port in the local system. • Port description—Interface name for the port. • System name—TLV that advertises the user-configured name of the local system. • System description—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable. • System capabilities—TLV that advertises the primary functions performed by the system—for example, bridge or router. • Management address—TLV that advertises the IP management address of the local system. 	detail
Supported LLDP 802 TLVs	<p>802.3 TLVs supported on the switch:</p> <ul style="list-style-type: none"> • MAC/PHY configuration status—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable. • Power via MDI—TLV that advertises MDI power support, PSE power pair, and power class information. • Link aggregation—TLV that advertises if the interface is aggregated and its aggregated interface ID. • Maximum frame size—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames. • Port VLAN tag—TLV that advertises the VLAN tag configured on the interface. • Port VLAN name—TLV that advertises the VLAN name configured on the interface. 	detail

Table 159: show lldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Supported LLDP MED TLVs	<p>LLDP-MED TLVs supported on the switch:</p> <ul style="list-style-type: none"> • LLDP MED capabilities—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15: <ul style="list-style-type: none"> • 0—Capabilities • 1—Network Policy • 2—Location Identification • 3—Extended Power via MDI-PSE • 4—Inventory • 5–15—Reserved • Network policy—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points. • Endpoint location—TLV that advertises the physical location of the endpoint. • Extended power Via MDI—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port. 	detail

Sample Output

show lldp (EX3200 switches)

LLDP basic TLVs supported:

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

Supported LLDP 802 TLVs:

MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port VLAN name.

Supported LLDP MED TLVs:

LLDP MED capabilities, Network policy, Endpoint location, Extended power Via MDI.

show lldp local-information

Syntax	show lldp local-information
Release Information	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the information that the switch provides in Link Layer Discovery Protocol (LLDP) advertisements to its neighbors.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring LLDP (CLI Procedure)</i> • <i>Understanding LLDP and LLDP-MED on EX Series Switches</i> • management-address on page 1941 • <i>Configuring LLDP</i> • Understanding LLDP on page 1795
List of Sample Output	show lldp local-information (EX Series Switch) on page 2008
Output Fields	Table 160 lists the output fields for the show lldp local-information command. Output fields are listed in the approximate order in which they appear.

Table 160: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information about the local system (the switch): <ul style="list-style-type: none"> • Chassis ID—MAC address associated with the switch. • System name—User-configured name of the switch. • System descr—System description containing information about the switch model and the current software image running on the switch. This information is taken from the software and is not configurable.
System Capabilities	Capabilities (such as bridge or router) that are supported or enabled on the system.
Management Information	Details of the management information: Port Name , Port Address (such as 10.204.34.35), Address Type (such as ipv4 or ipv6), Port ID (SNMP interface index), Port ID Subtype , and Port Subtype . <p>The Port Subtype displays:</p> <ul style="list-style-type: none"> • ifindex(2)—IP address of the switch's management Ethernet interface (me0) or virtual management Ethernet (VME) interface address (for a virtual chassis) is used to manage the switch. • unknown(1)—IP management address has been configured with set protocols lldp management-address.

Table 160: show lldp local-information Output Fields (*continued*)

Field Name	Field Description
Interface name	Name of the local interface which is configured for either LLDP or LLDP-MED.
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the local interface belongs.
SNMP Index	SNMP interface index.
Interface description	User-configured port description.
Status	Administrative status of the interface: either up or down .
Tunneling	Status of tunneling on the interface: either enabled or disabled .

Sample Output

show lldp neighbors

Syntax <show lldp *neighbors*>
<interface *interface-ids*>

Release Information Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display learned information about Link Layer Discovery Protocol (LLDP) on all neighboring interfaces or on selected interfaces.

Options **none**—Display learned LLDP information on all neighboring interfaces and devices.

interface *interface-ids*—(Optional) Display learned LLDP information on the selected interfaces or devices.

NOTE: When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors in order to interoperate with a wider variety of converged network adapters (CNAs). As a result, information for those ports will not be listed in the output for this command.

Output Fields [Table 161](#) lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 161: show lldp neighbors Output Fields

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.
Chassis ID	List of chassis identifiers for neighbors.
Port info	List of port information gathered from neighbors. This could be the port identifier or port description.

Table 161: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
System name	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both the local system (the switch) and a neighbor system on the interface (appears when the interface option is used).
Local Information	Information about the local system (appears when the interface option is used).
Index	Local interface index (appears when the interface option is used).
Time to live	Number of seconds for which this information is valid (appears when the interface option is used).
Time mark	Date and timestamp of information (appears when the interface option is used).
Local Interface	Name of the local physical interface (appears when the interface option is used).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the interface option is used).
Local Port ID	Local interface SNMP index (appears when the interface option is used).
Ageout Count	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the interface option is used).
Neighbor Information	Information about a neighbor system on the interface (appears when the interface option is used).
Chassis type	Type of chassis identifier supplied, such as MAC address (appears when the interface option is used).
Chassis ID	Chassis identifier of the chassis type listed (appears when the interface option is used).
Port type	Type of port identifier supplied, such as locally assigned (appears when the interface option is used).
Port ID	Port identifier of the port type listed (appears when the interface option is used).
Port description	Port description (appears when the interface option is used).
System name	Name supplied by the system on the interface (appears when the interface option is used).

Table 161: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
System Description	Description supplied by the system on the interface (appears when the interface option is used).
System capabilities	Capabilities (such as Bridge , Router , and Telephone) that are supported or enabled by the system on the interface (appears when the interface option is used).
Management Info	<p>Details of management information: Type (such as ipv4 or ipv6), Address (such as 10.204.34.35), Port ID, Subtype, Interface Subtype, and organization identifier (OID) (appears when the interface option is used).</p> <p>The Interface Subtype displays:</p> <ul style="list-style-type: none"> • ifIndex(2)—IP address of the neighbor's management Ethernet interface (me0) or virtual management Ethernet (VME) interface address (for a virtual chassis) is used to manage the switch. • unknown(1)—Neighbor's IP management address has been configured with set protocols lldp management-address.
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include Media endpoint class (such as Class 3 for communication devices such as IP phones), MED Hardware revision , MED Firmware revision , MED Software revision , MED Serial number , MED Manufacturer name , or MED Model name .
Organization Info	One or more entries listing remote information by organizationally unique identifier (OUI), Subtype , Index , and Info (appears when the interface option is used).
Age	How long the neighbor has been identified (appears when the interface option is used and NetBIOS snooping is enabled on the switch).
Local Interface	Name of the local physical interface (appears when the interface option is used and NetBIOS snooping is enabled on the switch).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the interface option is used and NetBIOS snooping is enabled on the switch).
Chassis ID	Chassis identifier of the chassis type listed (appears when the interface option is used and NetBIOS snooping is enabled on the switch).
Port description	Port description (appears when the interface option is used and NetBIOS snooping is enabled on the switch).
System name	NetBIOS name of the host (appears when the interface option is used and NetBIOS snooping is enabled on the switch).

Sample Output

show lldp neighbors

```

show lldp statistics

Syntax	<code>show lldp statistics</code> <code><interface <i>interface-ids</i>></code>
Release Information	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
Description	Display LLDP statistics on all or selected interfaces.
Options	none —Display LLDP statistics on all interfaces and devices. interface <i>interface-ids</i> —(Optional) Display LLDP statistics on the selected devices.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Configuring LLDP • Understanding LLDP on page 1795
List of Sample Output	show lldp statistics on page 2014
Output Fields	Table 162 lists the output fields for the show lldp statistics command. Output fields are listed in the approximate order in which they appear.

Table 162: show lldp statistics Output Fields

Field Name	Field Description	Level of Output
Interface	Name of an interface.	All levels
Received	Total number of LLDP frames received on an interface.	All levels
Unknown-TLVs	Number of unrecognized LLDP TLVs received on an interface.	All levels
With Errors	Number of LLDP frames received that contain errors.	All levels
Discarded TLVs	Number of LLDP TLVs received and then discarded on an interface.	All levels
Transmitted	Total number of LLDP frames transmitted on an interface.	All levels
Untransmitted	Total number of LLDP frames not transmitted on an interface.	All levels

Sample Output

show lldp statistics

```
user@switch> show lldp statistics
```

```
Interface  Received  Unknown TLVs  With Errors  Discarded TLVs  Transmitted
Untransmitted
```

show route instance

Syntax	show route instance <brief detail summary> <instance-name> <operational>
Release Information	Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	(QFabric systems only) Display routing instance information.
Options	<p>none—(Same as brief) Display standard information about all routing instances.</p> <p>brief detail summary—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief. (These options are not available with the operational keyword.)</p> <p>instance-name—(Optional) Display information for a specified routing instance.</p> <p>operational—(Optional) Display operational routing instances.</p>
Required Privilege Level	view
List of Sample Output	show route instance on page 2017 show route instance detail on page 2017 show route instance operational on page 2018 show route instance summary on page 2018
Output Fields	Table 163 lists the output fields for the show route instance command. Output fields are listed in the approximate order in which they appear.

Table 163: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or <i>instance-name</i>	Name of the routing instance.	All levels
Operational Routing Instances	(operational keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: forwarding or virtual-router .	All levels
State	State of the routing instance: active or inactive .	detail
Interfaces	Name of interfaces belonging to this routing instance.	detail
Tables	Tables (and number of routes) associated with this routing instance.	detail
Router ID	Identifier for the router.	detail

Table 163: show route instance Output Fields (*continued*)

Field Name	Field Description	Level of Output
Primary RIB	Primary table for this routing instance.	brief none summary
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

Sample Output

show route instance

```

user@switch> show route instance

show snmp statistics

Syntax	<code>show snmp statistics</code> <code><subagents></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Option subagents introduced in Junos OS Release 14.2.
Description	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
Options	subagents —(Optional) Display the statistics of the protocol data unit (PDU), the number of SNMP requests and responses per subagent, and the SNMP statistics received from each subagent per logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• clear snmp statistics on page 1739
List of Sample Output	show snmp statistics on page 2025 show snmp statistics subagents on page 2025
Output Fields	Table 130 describes the output fields for the show snmp statistics command. Output fields are listed in the approximate order in which they appear.

Table 164: show snmp statistics Output Fields

Field Name	Field Description
Input	<p>Information about received packets:</p> <ul style="list-style-type: none"> • Packets(snmplnPkts)—Total number of messages delivered to the SNMP entity from the transport service. • Bad versions—(snmplnBadVersions) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • Bad community names—(snmplnBadCommunityNames) Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • Bad community uses—(snmplnBadCommunityUses) Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • ASN parse errors—(snmplnASNParseErrs) Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • Too big—(snmplnTooBigs) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of tooBig. • No such names—(snmplnNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName. • Bad values—(snmplnBadValues) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of badValue. • Read onlys—(snmplnReadOnlys) Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of readOnly. Only incorrect implementations of SNMP generate this error.

Table 164: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> • General errors—(snmpInGenErrs) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of genErr. • Total requests varbinds—(snmpInTotalReqVars) Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP GetRequest and GetNext PDUs. • Total set varbinds—(snmpInSetVars) Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP SetRequest PDUs. • Get requests—(snmpInGetRequests) Total number of SNMP GetRequest PDUs that have been accepted and processed by the SNMP entity. • Get nexts—(snmpInGetNexts) Total number of SNMP GetNext PDUs that have been accepted and processed by the SNMP entity. • Set requests—(snmpInSetRequests) Total number of SNMP SetRequest PDUs that have been accepted and processed by the SNMP entity. • Get responses—(snmpInGetResponses) Total number of SNMP GetResponse PDUs that have been accepted and processed by the SNMP entity. • Traps—(snmpInTraps) Total number of SNMP traps generated by the SNMP entity. • Silent drops—(snmpSilentDrops) Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • Proxy drops—(snmpProxyDrops) Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned. • Commit pending drops—Number of SNMP packets for Set requests dropped because of a previous pending SNMP Set request on the committed configuration. • Throttle drops—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 164: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> • Unknown security models—(snmpUnknownSecurityModels) Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • Invalid messages—(snmpInvalidMsgs) Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • Unknown pdu handlers—(snmpUnknownPDUHandlers) Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • Unavailable contexts—(snmpUnavailableContexts) Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • Unknown contexts—(snmpUnknownContexts) Total number of requests received for a context that is unknown to the SNMP engine. • Unsupported security levels—(usmStatsUnsupportedSecLevels) Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • Not in time windows—(usmStatsNotInTimeWindows) Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • Unknown user names—(usmStatsUnknownUserNames) Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • Unknown engine ids—(usmStatsUnknownEngineIDs) Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine. • Wrong digests—(usmStatsWrongDigests) Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • Decryption errors—(usmStatsDecryptionErrors) Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.

Table 164: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Output	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> • Packets—(snmpOutPkts) Total number of messages passed from the SNMP entity to the transport service. • Too big—(snmpOutTooBigs) Total number of SNMP PDUs generated by the SNMP entity with an error status field of tooBig. • No such names—(snmpOutNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName. • Bad values—(snmpOutBadValues) Total number of SNMP PDUs generated by the SNMP entity with an error status field of badValue. • General errors—(snmpOutGenErrs) Total number of SNMP PDUs generated by the SNMP entity with an error status field of genErr. • Get requests—(snmpOutGetRequests) Total number of SNMP GetRequest PDUs generated by the SNMP entity. • Get nexts—(snmpOutGetNexts) Total number of SNMP GetNext PDUs generated by the SNMP entity. • Set requests—(snmpOutSetRequests) Total number of SNMP SetRequest PDUs generated by the SNMP entity. • Get responses—(snmpOutGetResponses) Total number of SNMP GetResponse PDUs generated by the SNMP entity. • Traps—(snmpOutTraps) Total number of SNMP traps generated by the SNMP entity.

Table 131 describes the output fields for the **show snmp statistics subagents** command. Output fields are listed in the approximate order in which they appear.

Table 165: show snmp statistics subagents Output Fields

Field Name	Field Description
Subagent	Location of the SNMP subagent.
Request PDUs	Number of PDUs requested by the SNMP manager.
Response PDUs	Number of response PDUs sent by the SNMP subagent.
Request Variables	Number of variable bindings on the PDUs requested by the SNMP manager.
Response Variables	Number of variable bindings on the PDUs sent by the SNMP subagent.
Average Response Time	Average time taken by the SNMP subagent to send statistics response.
Maximum Response Time	Maximum time taken by the SNMP subagent to send the statistics response.

Sample Output

show snmp statistics

```
user@host> show snmp statistics
SNMP statistics:

ssh

List of Syntax [Syntax on page 2028](#)
 [Syntax \(EX Series Switch and the QFX Series\) on page 2028](#)

Syntax `ssh host`
 `<bypass-routing>`
 `<inet | inet6>`
 `<interface interface-name>`
 `<logical-system logical-system-name>`
 `<routing-instance routing-instance-name>`
 `<source address>`
 `<v1 | v2>`

Syntax (EX Series Switch and the QFX Series) `ssh host`
 `<bypass-routing>`
 `<inet | inet6>`
 `<interface interface-name>`
 `<routing-instance routing-instance-name>`
 `<source address>`
 `<v1 | v2>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

Description Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the **ssh** command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

```
ssh address 'cli-command1 ; cli-command2 '
```

Options **host**—Name or address of the remote system.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

inet | inet6—(Optional) Create an IPv4 or IPv6 connection, respectively.

interface interface-name—(Optional) Interface name for the SSH session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

logical-system logical-system-name—(Optional) Name of a particular logical system for the SSH attempt.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the SSH attempt.

source address—(Optional) Source address of the SSH connection.

v1 | v2—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

Additional Information To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

Understanding Enhanced Layer 2 Software Support

Enhanced Layer 2 Software (ELS) is automatically supported if your device is running a Junos OS release that supports it. You do not need to take any action to enable ELS, and you cannot disable ELS.

Table 1 lists the EX Series and QFX Series switches that support ELS and the initial ELS release they support..

Table 166: ELS Support

Device	Initial ELS Release
EX4300 switches	13.2X50-D10
EX4600 switches	13.2X51-D25
EX9200 switches	12.3R2
QFX3500 switches	13.2X50-D15

Table 166: ELS Support (*continued*)

Device	Initial ELS Release
QFX3600 switches	13.2X50-D15
QFX5100 switches	13.2X51-D10
QFX10000 switches	15.1X53-D10

ELS is supported on the EX4300, EX4600, and EX9200 switches for all Junos OS releases, starting with the initial releases shown in [Table 3](#).

ELS support was introduced on QFX3500 and QFX3600 switches in Junos OS Release 13.2X50-D15. ELS is supported only on the software package that supports Virtual Chassis (the **jinstall-qfx-3-*** software package) for QFX3500 and QFX3600 switches.

For QFX5100 switches, ELS support was introduced in Junos OS Release 13.2X51-D10 and is supported on the **jinstall-qfx-5-*** software package.

NOTE: ELS is not supported on software packages that can be installed in a QFabric system.

Using the ELS Translator

ELS Translator is a Web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations. This conversion tool supports all Juniper Networks EX Series, MX Series, and QFX Series devices with ELS installed. ELS Translator is hosted on the Juniper Networks Customer Support website for EX Series switches, MX Series routers, and QFX Series switches and is available to registered users, internal users, partners, and premium service contract customers. You need to log in using your Juniper Networks username and password to access the ELS Translator.

[Click here](#) to access the ELS translator.

If you are upgrading from a version of Junos OS that does not support ELS to a version of Junos OS that supports ELS, we recommend that you update your configuration with the ELS Translator using the following procedure:

1. Log in to your device by using the console port.

NOTE: Perform this procedure only from the console port. You will lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Copy the entire existing configuration to another file. Save the file in a remote location. See [“Saving a Configuration to a File” on page 1331](#).

3. Retain the portion of your existing configuration related to management network connectivity (such as **[edit system]** hierarchy level). Delete all other top-level configuration hierarchy levels (such as the **[edit interfaces]**, **[edit protocols]**, and **[edit vlans]**). Issue the **commit** command to remove the deleted configuration hierarchy levels.
4. Perform the software upgrade. Reboot your device to complete the upgrade. See [“Software Installation Overview” on page 174](#).

NOTE: Ensure that the console port connection is up during the reboot.

5. [Click here](#) to access the ELS Translator in a web browser. Follow the instructions on the page to update your configuration.
6. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator to your switch. See [“Uploading a Configuration File” on page 1332](#).
7. Commit the new configuration.

NOTE: It is possible that scripts do not translate correctly. Therefore, review translated scripts carefully before loading the converted configuration on your switch or other device.

Configuring a VLAN

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series and QFX Series switches can function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting a unique VLAN name and configuring the VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id-number
```
2. Assign at least one interface to the VLAN:

```
[edit]
user@host# set interface interface-name family ethernet-switching vlan members vlan-name
```

Configuring the Native VLAN Identifier

EX Series and QFX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets, but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to **trunk**, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name native-vlan-id number
```

3. Assign the interface to the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching vlan
members native-vlan-id-number
```

Configuring Layer 2 Interfaces

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch's network interfaces.

To configure a Gigabit Ethernet interface or a 10-Gigabit Ethernet interface as a **trunk** interface:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

To configure a Gigabit Ethernet interface or a 10-Gigabit Ethernet interface as a **access** interface:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode access
```

Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when you configure the protocol family. For the **inet** or **inet6** family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To specify an IP4 address for the logical unit:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation by using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP6 address for the logical unit:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRB interfaces enable the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named *irb* functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```

3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces aex
```

3. Specify the minimum number of links for the aggregated Ethernet interface (*aex*)—that is, the defined bundle—to be labeled *up*:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
```

```
user@host# set aex aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp periodic interval
```

Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 CLI feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some of the Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following sections provide a list of existing commands that were moved to new hierarchy levels or changed on EX Series switches as part of this CLI enhancement effort. These sections are provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided or see the technical documentation.

Changes to the ethernet-switching-options Hierarchy Level

This section outlines the changes to the **ethernet-switching-options** hierarchy level.

NOTE: The **ethernet-switching-options** hierarchy level has been renamed as **switch-options**.

Table 167: Renaming the ethernet-switching-options hierarchy

Original Hierarchy	Changed Hierarchy
<pre>ethernet-switching-options { authentication-whitelist { ... } }</pre>	<pre>switch-options { ... authentication-whitelist { ... } }</pre>
<pre>ethernet-switching-options { interfaces <i>interface-name</i> { no-mac-learning; ... } }</pre>	<pre>switch-options { interfaces <i>interface-name</i> { no-mac-learning; ... } }</pre>
<pre>ethernet-switching-options { unknown-unicast-forwarding { (...) } }</pre>	<pre>switch-options { unknown-unicast-forwarding { (...) } }</pre>
<pre>ethernet-switching-options { voip { interface (all [<i>interface-name</i> access-ports]) { forwarding-class (assured-forwarding best-effort expedited-forwarding network-control); vlan <i>vlan-name</i>; ... } } }</pre>	<pre>switch-options { voip { interface (all [<i>interface-name</i> access-ports]) { forwarding-class (assured-forwarding best-effort expedited-forwarding network-control); vlan <i>vlan-name</i>; ... } } }</pre>

Table 168: RTG Statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { redundant-trunk-group { group name { description; interface interface-name { primary; } } preempt-cutover-timer seconds; ... } } </pre>	<pre> switch-options { redundant-trunk-group { group name { description; interface interface-name { primary; } } preempt-cutover-timer seconds; ... } } </pre>

Table 169: Deleted Statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { mac-notification { notification-interval seconds; ... } } </pre>	The statements have been removed from the switch-options hierarchy.
<pre> ethernet-switching-options { traceoptions { file filename <files number> <no-stamp> <replace> <size size> <world-readable no-world-readable>; flag flag <disable>; ... } } </pre>	The statements have been removed from the switch-options hierarchy.
<pre> ethernet-switching-options { port-error-disable { disable-timeout timeout; ... } } </pre>	<p>NOTE: The port-error-disable statement has been replaced with a new statement.</p> <pre> interfaces interface-name family ethernet-switching { recovery-timeout seconds; } </pre>

Changes to the Port Mirroring Hierarchy Level

NOTE: Statements have moved from the **ethernet-switching-options** hierarchy level to the **forwarding-options** hierarchy level.

Table 170: Port Mirroring hierarchy

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { analyzer (Port Mirroring) { name { ... } } } </pre>	<pre> forwarding-options { analyzer (Port Mirroring) { name { ... } } } </pre>

Changes to the Layer 2 Control Protocol Hierarchy Level

The Layer 2 control protocol statements have moved from the **ethernet-switching-options** hierarchy to the **protocols** hierarchy.

Table 171: Layer 2 Control Protocol

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { bpdv-block { ... } } </pre>	<pre> protocols { layer2-control { bpdv-block { ... } } } </pre>

Changes to the dot1q-tunneling Statement

The **dot1q-tunneling** statement has been replaced with a new statement and moved to a different hierarchy level.

Table 172: dot1q-tunneling

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { dot1q-tunneling { ether-type (0x8100 0x88a8 0x9100); ... } } </pre>	<pre> interfaces interface-name { ether-options { ethernet-switch-profile { tag-protocol-id [tpids]; } } } interfaces interface-name { aggregated-ether-options { ethernet-switch-profile { tag-protocol-id [tpids]; } } } </pre>

Changes to the L2 Learning Protocol

The **mac-table-aging-time** statement has been replaced with a new statement and moved to a different hierarchy level.

Table 173: mac-table-aging-time statement

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { mac-table-aging-time seconds; ... }</pre>	<pre> protocols { l2-learning { global-mac-table-aging-time seconds; ... } }</pre>

Changes to Nonstop Bridging

The **nonstop-bridging** statement has moved to a different hierarchy level.

Table 174: Nonstop Bridging statement

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { nonstop-bridging; }</pre>	<pre> protocols { layer2-control { nonstop-bridging { } } }</pre>

Changes to Port Security and DHCP Snooping

Port security and DHCP snooping statements have moved to different hierarchy levels.

NOTE: The statement **examine-dhcp** does not exist in the changed hierarchy. DHCP snooping is now enabled automatically when other DHCP security features are enabled on a VLAN. See *Configuring Port Security Features* for additional information.

Table 175: Port Security statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { secure-access-port { interface (all <i>interface-name</i>) { (dhcp-trusted no-dhcp-trusted); static-ip <i>ip-address</i> { mac <i>mac-address</i>; vlan <i>vlan-name</i>; } } } vlan (all <i>vlan-name</i>) { (arp-inspection no-arp-inspection); dhcp-option82 { disable; circuit-id { prefix <i>hostname</i>; use-interface-description; use-vlan-id; } remote-id { prefix (<i>hostname</i> mac none); use-interface-description; use-string <i>string</i>; } vendor-id [<i>string</i>]; } (examine-dhcp no-examine-dhcp); } (ip-source-guard no-ip-source-guard); } </pre>	<pre> vlans <i>vlan-name</i> forwarding-options{ dhcp-security { arp-inspection; group <i>group-name</i> { interface <i>interface-name</i> { static-ip <i>ip-address</i> { mac <i>mac-address</i>; } } } overrides { no-option82; trusted; } } ip-source-guard; no-dhcp-snooping; option-82 { circuit-id { prefix { host-name; routing-instance-name; } use-interface-description (device logical); use-vlan-id; } remote-id { host-name; use-interface-description (device logical); use-string <i>string</i>; } vendor-id { use-string <i>string</i>; } } } </pre>

NOTE: DHCP snooping statements have moved to a different hierarchy level.

Table 176: DHCP Snooping Statements

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { secure-access-port { dhcp-snooping-file { location <i>local_pathname</i> <i>remote_URL</i>; timeout <i>seconds</i>; write-interval <i>seconds</i>; } } } </pre>	<pre> system [processes [dhcp-service dhcp-snooping-file <i>local_pathname</i> <i>remote_URL</i>; write-interval <i>interval</i>;]] </pre>

Changes to Configuring VLANs

The statements for configuring VLANs have moved to a different hierarchy level.

NOTE: When configuring xSTP on EX4300 and EX4600 switches, you must add all the interfaces in the applied VLANs in configurations. For MSTP, configure all interfaces in all VLANs at the [edit protocols mstp interface] hierarchy level.

Table 177: VLAN hierarchy

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { secure-access-port vlan (all <i>vlan-name</i>) { mac-move-limit } </pre>	<pre> vlangs <i>vlan-name</i> switch-options { mac-move-limit } </pre>
<pre> ethernet-switching-options { static { vlan <i>vlan-id</i> { mac <i>mac-address</i> next-hop <i>interface-name</i>; ... } } } </pre>	<p>NOTE: Statement is replaced with a new statement and has moved to a different hierarchy level.</p> <pre> vlangs { <i>vlan-name</i> { switch-options { interface <i>interface-name</i> { static-mac <i>mac-address</i>; ... } } } } </pre>
<pre> vlangs { <i>vlan-name</i> { interface <i>interface-name</i> { egress; ingress; mapping (native (push swap) policy tag (push swap)); pvlan-trunk; ... } } } </pre>	<p>These statements have been removed. You can assign interfaces to a VLAN using the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching vlan members <i>vlan-name</i>] hierarchy.</p>
<pre> vlangs { <i>vlan-name</i> { isolation-id <i>id-number</i>; ... } } </pre>	<p>Statements have been removed.</p>

Table 177: VLAN hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre> vlangs { vlan-name { l3-interface vlan.logical-interface-number; ... } } </pre>	<p>NOTE: Syntax is changed.</p> <pre> vlangs { vlan-name { l3-interface irb.logical-interface-number; ... } } </pre>
<pre> vlangs { vlan-name { l3-interface-ingress-counting layer-3-interface-name; ... } } </pre>	Statement is removed. Ingress traffic is automatically tracked.
<pre> vlangs { vlan-name { no-local-switching; ... } } </pre>	Statement is removed.
<pre> vlangs { vlan-name { no-mac-learning; ... } } </pre>	<p>Statement has been moved to different hierarchy.</p> <pre> vlangs { vlan-name { switch-options { no-mac-learning limit ... } } } </pre>
<pre> vlangs { vlan-name { primary-vlan vlan-name; ... } } </pre>	Statement has been removed.
<pre> vlangs { vlan-name { vlan-prune; ... } } </pre>	Statement is removed.
<pre> vlangs { vlan-name { vlan-range vlan-id-low-vlan-id-high; ... } } </pre>	<p>NOTE: Statement has been replaced with a new statement.</p> <pre> vlangs { vlan-name { vlan-id-list [vlan-id-numbers]; ... } } </pre>

Table 177: VLAN hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre> vlangs { vlan-name { l3-interface vlan.logical-interface-number; ... } } </pre>	<p>NOTE: Syntax is changed.</p> <pre> vlangs { vlan-name { l3-interface irb.logical-interface-number; ... } } </pre>

Table 178: Statements Moved to a Different Hierarchy

Original Hierarchy	Changed Hierarchy
<pre> vlangs { vlan-name { dot1q-tunneling { customer-vlangs (id native range); layer2-protocol-tunneling all protocol-name { drop-threshold number; shutdown-threshold number; ... } } } } </pre>	<pre> interface interface-name { encapsulation extended-vlan-bridge; flexible-vlan-tagging; native-vlan-id number; unit logical-unit-number { input-vlan-map action; output-vlan-map action; vlan-id number; vlan-id-list [vlan-id vlan-id-vlan-id]; } } </pre>
<pre> vlangs { vlan-name { filter { input filter-name output filter-name; ... } } } </pre>	<pre> vlangs { vlan-name { forwarding-options { filter { input filter-name output filter-name; ... } } } } </pre>

Table 178: Statements Moved to a Different Hierarchy (*continued*)

Original Hierarchy	Changed Hierarchy
<pre> vlangs { vlan-name { mac-limit limit action action; ... } } </pre>	<pre> vlangs { vlan-name { switch-options { interface-mac-limit limit { packet-action action; ... } } } } vlangs { vlan-name { switch-options { interface interface-name { interface-mac-limit limit { packet-action action; ... } } } } } </pre>
<pre> vlangs { vlan-name { mac-table-aging-time seconds; ... } } </pre>	<pre> protocols { l2-learning { global-mac-table-aging-time seconds; ... } } </pre>

Changes to Storm Control Profiles

Storm control is configured in two steps. The first step is to create a storm control profile at the **[edit forwarding-options]** hierarchy level, and the second step is to bind the profile to a logical interface at the **[edit interfaces]** hierarchy level. See *Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches* for the changed procedure.

Table 179: Changes to the Storm Control Profile hierarchy level

Original Hierarchy	Changed Hierarchy
<pre> ethernet-switching-options { storm-control { (...) } } </pre>	<pre> forwarding-options { storm-control-profiles profile-name { (...) } } interfaces interface-name unit number family ethernet-switching { storm-control storm-control-profile; } </pre>

Changes to the Interfaces Hierarchy

NOTE: Statements have been moved to a different hierarchy.

Table 180: Changes to the Interfaces hierarchy

Original Hierarchy	Changed Hierarchy
<pre> interfaces <i>interface-name</i> { ether-options { link-mode <i>mode</i>; speed (auto-negotiation <i>speed</i>) } }</pre>	<pre> interfaces <i>interface-name</i> { link-mode <i>mode</i>; speed <i>speed</i>) }</pre>
<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { native-vlan-id <i>vlan-id</i> } } }</pre>	<pre> interfaces <i>interface-name</i> { native-vlan-id <i>vlan-id</i> }</pre>
<pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { port-mode <i>mode</i> } } }</pre>	<p>NOTE: Statement has been replaced with a new statement.</p> <pre> interfaces <i>interface-name</i> { unit <i>logical-unit-number</i> { family ethernet-switching { interface-mode <i>mode</i> } } }</pre>
<pre> interfaces vlan</pre>	<p>NOTE: Statement has been replaced with a new statement.</p> <pre> interfaces irb</pre>

Changes to IGMP Snooping

Table 181: IGMP Snooping hierarchy

Original Hierarchy	Changed Hierarchy
<pre> protocols { igmp-snooping { traceoptions { file <i>filename</i> <files <i>number</i>> <no-stamp> <replace> <size <i>maximum-file-size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier> <disable>; } vlan (all <i>vlan-identifier</i>) { disable; data-forwarding { receiver { install; source-vlans <i>vlan-name</i>; } source { groups <i>ip-address</i>; } } immediate-leave; interface (all <i>interface-name</i>) { multicast-router-interface; static { group <i>mcast-ip-address</i>; } } proxy { source-address <i>ip-address</i>; } robust-count <i>number</i>; } } } </pre>	<pre> protocols { igmp-snooping { vlan <i>vlan-name</i> { immediate-leave; interface <i>interface-name</i> { group-limit <1..65535> host-only-interface multicast-router-interface; immediate-leave; static { group <i>mcast-ip-address</i> { source <> } } } } l2-querier { source-address <i>ip-address</i>; } proxy { source-address <i>ip-address</i>; } query-interval <i>number</i>; query-last-member-interval <i>number</i>; query-response-interval <i>number</i>; robust-count <i>number</i>; traceoptions { file <i>filename</i> <files <i>number</i>> <no-stamp> <replace> <size <i>maximum-file-size</i>> <world-readable no-world-readable>; flag <i>flag</i> <flag-modifier>; } } } </pre>

Ethernet Ring Protection Switching Overview

Ethernet ring protection switching (ERPS) helps achieve high reliability and network stability. Links in the ring will never form loops that fatally affect the network operation and services availability. The basic idea of an Ethernet ring is to use one specific link to protect the whole ring. This special link is called a *ring protection link (RPL)*. If no failure happens in other links of the ring, the RPL blocks the traffic and is not used. The RPL is controlled by a special node called an *RPL owner*. There is only one RPL owner in a ring. The RPL owner is responsible for blocking traffic over the RPL. Under ring failure conditions, the RPL owner is responsible for unblocking traffic over the RPL. A ring failure results in protection switching of the RPL traffic. An automatic protection switching (APS) protocol is used to coordinate the protection actions over the ring. Protection switching blocks traffic on the failed link and unblocks the traffic on the RPL. When the failure clears, revertive protection switching blocks traffic over the RPL and unblocks traffic on the link on which the failure is cleared.

The following standards provide detailed information on Ethernet ring protection switching:

- IEEE 802.1Q - 1998
- IEEE 802.1D - 2004
- IEEE 802.1Q - 2003
- Draft ITU-T Recommendation G.8032/Y.1344, *Ethernet Ring protection switching*
- ITU-T Y.1731, *OAM functions and mechanisms for Ethernet-based networks*

For additional information on configuring Ethernet ring protection switching on EX Series switches, see *Example: Configuring Ethernet Ring Protection Switching on EX Series Switches*.

For additional information on configuring Ethernet ring protection switching on MX Series routers, see the *Layer 2 Configuration Guide* for a complete example of Ethernet rings and information about STP loop avoidance and prevention.

Acronyms

The following acronyms are used in the discussion about Ethernet ring protection switching (ERPS):

- MA—Maintenance association
- MEP—Maintenance association end point
- OAM—Operations, administration, and management (Ethernet ring protection switching uses connectivity fault management daemon)

- FDB—MAC forwarding database
- STP—Spanning Tree Protocol
- RAPS—Ring automatic protection switching
- WTB—Wait to block
- WTR—Wait to restore
- RPL—Ring protection link

Ring Nodes

Multiple nodes are used to form a ring. There are two different node types:

- Normal node—The node has no special role on the ring.
- RPL owner node—The node owns the RPL and blocks or unblocks traffic over the RPL.

Ring Node States

The following are the different states for each node of a specific ring:

- init—Not a participant of a specific ring.
- idle—No failure on the ring; the node is performing normally. For a normal node, traffic is unblocked on both ring ports. For the RPL owner or RPL neighbor, traffic is blocked on the ring port that connects to the RPL and unblocked on the other ring port.
- protection—A failure occurred on the ring. For a normal node, traffic is blocked on the ring port that connects to the failing link and unblocked on working ring ports. For the RPL owner, traffic is unblocked on both ring ports if they connect to non-failure links.
- pending—The node is recovering from failure or its state after a **clear** command is used to remove the previous manual command. When a protection group is configured, the node enters the pending state. When a node is in pending state, the WTR or WTB timer will be running. All nodes are in pending state till WTR or WTB timer expiry.
- force switch—A force switch is issued. When a force switch is issued on a node in the ring all nodes in the ring will move into the force switch state.
- manual switch—A manual switch is issued. When a manual switch is issued on a node in the ring all nodes in the ring will move into the manual switch state.

There can be only one RPL owner for each ring. The user configuration must guarantee this, because the APS protocol cannot check this.

Default Logging of Basic State Transitions on EX Series Switches

NOTE: This section applies only to EX Series switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style.

EX Series switches automatically log basic state transitions for the ERPS protocol. No configuration is required to initiate this logging. Basic state transitions include ERPS

interface transitions from up to down, and down to up; and ERPS state transitions from idle to protection, and protection to idle.

The basic state transitions are logged in a single file named **erp-default**, which resides in the **/var/log** directory of the switch. The maximum size of this file is 15 MB.

Default logging for ERPS can capture initial ERPS interface and state transitions, which can help you troubleshoot issues that occur early in the ERPS protocol startup process. However, if more robust logging is needed, you can enable traceoptions for ERPS by entering the **traceoptions** statement in the **[edit protocols protection-group]** hierarchy.

Be aware that for ERPS, only default logging or traceoptions can be active at a time on the switch. That is, default logging for ERPS is automatically enabled and if you enable traceoptions for ERPS, the switch automatically disables default logging. Conversely, if you disable traceoptions for ERPS, the switch automatically enables default logging.

Failure Detection

Ethernet ring operation depends on quick and accurate failure detection. The failure condition *signal failure (SF)* is supported. For SF detection, an Ethernet continuity check MEP must be configured for each ring link. For fast protection switching, a 10-ms transmission period for this MEP group is supported. OAM monitors the MEP group's MA and reports SF or SF clear events to the Ethernet ring control module. For this MEP group, the action profile must be configured to update the interface device IFF_LINKDOWN flag. OAM updates the IFF_LINKDOWN flag to notify the Ethernet ring control module.

Logical Ring

You can define multiple logical-ring instances on the same physical ring. The logical ring feature currently supports only the physical ring, which means that two adjacent nodes of a ring must be physically connected and the ring must operate on the physical interface, not the VLAN. Multiple ring instances are usually defined with trunk mode ring interfaces.

FDB Flush

When ring protection switching occurs, normally an *FDB flush* is executed. The Ethernet ring control module uses the same mechanism as the STP to trigger the FDB flush. The Ethernet ring control module controls the ring port physical interface's default STP index to execute the FDB flush.

Starting with Junos OS Release 14.2, the FDB flush depends on the RAPS messages received on the both the ports of the ring node.

Traffic Blocking and Forwarding

Ethernet ring control uses the same mechanism as the STP to control forwarding or discarding of user traffic. The Ethernet ring control module sets the ring port physical interface default STP index state to forwarding or discarding in order to control user traffic.

RPL Neighbor Node

Starting with Junos OS Release 14.2, ring protection link neighbor nodes are supported. An RPL neighbor node is adjacent to the RPL and is not the RPL owner. If a node is configured with one interface as the protection-link-end and no protection-link-owner is present in its configuration, the node is an RPL neighbor node.

RAPS Message Blocking and Forwarding

The router or switch treats the ring automatic protection switching (RAPS) message the same as it treats user traffic for forwarding RAPS messages between two ring ports. The ring port physical interface default STP index state also controls forwarding RAPS messages between the two ring ports. Other than forwarding RAPS messages between the two ring ports, as shown in Figure 20, the system also needs to forward the RAPS message between the CPU (Ethernet ring control module) and the ring port. This type of forwarding does not depend on the ring port physical interfaces' STP index state. The RAPS message is always sent by the router or switch through the ring ports, as shown in Figure 21. A RAPS message received from a discarding ring port is sent to the Ethernet ring control module, but is not sent to the other ring port.

Figure 20: Protocol Packets from the Network to the Router

Figure 21: Protocol Packets from the Router or Switch to the Network

Juniper Networks switches and Juniper Networks routers use different methods to achieve these routes.

The switches use forwarding database entries to direct the RAPS messages. The forwarding database entry (keyed by the RAPS multicast address and VLAN) has a composite next hop associated with it—the composite next hop associates the two ring interfaces with the forwarding database entry and uses the split horizon feature to prevent sending the packet out on the interface that it is received on. This is an example of the forwarding database entry relating to the RAPS multicast MAC (a result of the **show ethernet-switching table detail** command):

```

VLAN: v1, Tag: 101, MAC: 01:19:a7:00:00:01, Interface: ERP
Interfaces:      ge-0/0/9.0, ge-0/0/3.0
Type: Static
Action: Mirror
Nexthop index: 1333
  
```

The routers use an implicit filter to achieve ERP routes. Each implicit filter binds to a bridge domain. Therefore, the east ring port control channel and the west ring port control channel of a particular ring instance must be configured to the same bridge domain. For each ring port control channel, a filter term is generated to control RAPS message forwarding. The filter number is the same as the number of bridge domains that contain the ring control channels. If a bridge domain contains control channels from multiple rings, the filter related to this bridge domain will have multiple terms and each term will relate to a control channel. The filter has command parts and control-channel related parts, as follows:

- Common terms:
 - term 1: if [Ethernet type is not OAM Ethernet type (0x8902)]
 { accept packet }
 - term 2: if [source MAC address belongs to this bridge]
 { drop packet, our packet loop through the ring and come back to home }
 - term 3: if [destination is the RAPS PDU multicast address(0x01,0x19,0xa7,0x00,0x00,0x01) AND[ring port STP status is DISCARDING]
 { send to CPU }
- Control channel related terms:
 - if [destination is the RAPS PDU multicast address(0x01,0x19,0xa7,0x00,0x00,0x01) AND[ring port STP status is FORWARDING] AND [Incoming interface IFL equal to control channel IFL]
 { send packet to CPU and send to the other ring port }
 - default term: accept packet.

Dedicated Signaling Control Channel

For each ring port, a dedicated signaling control channel with a dedicated VLAN ID must be configured. In Ethernet ring configuration, only this control logical interface is configured and the underlying physical interface is the physical ring port. Each ring requires that two control physical interfaces be configured. These two logical interfaces must be configured in a bridge domain for routers (or the same VLAN for switches) in order to forward RAPS protocol data units (PDUs) between the two ring control physical interfaces. If the router control channel logical interface is not a trunk port, only control logical interfaces will be configured in ring port configuration. If this router control channel logical interface is a trunk port, in addition to the control channel logical interfaces, a dedicated VLAN ID must be configured for routers. For switches, always specify either a VLAN name or VLAN ID for all links.

RAPS Message Termination

The RAPS message starts from the originating node, travels through the entire ring, and terminates in the originating node unless a failure is present in the ring. The originating node must drop the RAPS message if the source MAC address in the RAPS message belongs to itself. The source MAC address is the node's node ID.

Revertive and Non-revertive Modes

In revertive operation, once the condition causing a switch has cleared, traffic is blocked on the RPL and restored to the working transport entity. In nonrevertive operation, traffic is allowed to use the RPL if it has not failed, even after a switch condition has cleared.

Multiple Rings

The Ethernet ring control module supports multiple rings in each node (two logical interfaces are part of each ring). The ring control module also supports the interconnection of multiple rings. Interconnection of two rings means that two rings might share the same link or share the same node. Ring interconnection is supported only using non-virtual-channel mode. Ring interconnection using virtual channel mode is not supported.

Node ID

For each node in the ring, a unique *node ID* identifies each node. The node ID is the node's MAC address.

For routers only, you can configure this node ID when configuring the ring on the node or automatically select an ID like STP does. In most cases, you will not configure this and the router will select a node ID, like STP does. It should be the manufacturing MAC address. The ring node ID should not be changed, even if you change the manufacturing MAC address. Any MAC address can be used if you make sure each node in the ring has a different node ID. The node ID on switches is selected automatically and is not configurable.

Ring ID

The ring ID is used to determine the value of the last octet of the MAC destination address field of the RAPS protocol data units (PDUs) generated by the ERP control process. The ring ID is also used to discard any RAPS PDU, received by this ERP control process with a non-matching ring ID. Ring ID values 1 through 239 are supported.

Bridge Domains with the Ring Port (MX Series Routers Only)

On the routers, the protection group is seen as an abstract logical port that can be configured to any bridge domain. Therefore, if you configure one ring port or its logical interface in a bridge domain, you must configure the other related ring port or its logical interface to the same bridge domain. The bridge domain that includes the ring port acts as any other bridge domain and supports the IRB Layer 3 interface.

Wait-to-Block Timer

The RPL owner node uses a delay timer before initiating an RPL block in revertive mode of operation or before reverting to IDLE state after clearing manual commands. The Wait-to-Block (WTB) timer is used when clearing **force switch** and **manual switch** commands. As multiple **force switch** commands are allowed to coexist in an Ethernet ring, the WTB timer ensures that clearing of a single **force switch** command does not trigger the re-blocking of the RPL. When clearing a **manual switch** command, the WTB timer prevents the formation of a closed loop due to a possible timing anomaly where

the RPL Owner Node receives an outdated remote **manual switch** request during the recovery process.

When recovering from a **manual switch** command, the delay timer must be long enough to receive any latent remote **force switch**, signal failure, or **manual switch** commands. This delay timer is called the WTB timer and is defined to be 5 seconds longer than the guard timer. This delay timer is activated on the RPL Owner Node. When the WTB timer expires, the RPL Owner Node initiates the reversion process by transmitting an RAPS (NR, RB) message. The WTB timer is deactivated when any higher-priority request preempts it.

Adding and Removing a Node

Starting with Junos OS Release 14.2, you can add or remove a node between two nodes in an Ethernet ring. Nodes are added or removed using the **force switch** command.

Configuring Ethernet Ring Protection Switching (CLI Procedure)

You can configure Ethernet ring protection switching (ERPS) on connected switches to prevent fatal loops from disrupting a network. ERPS is similar to spanning-tree protocols, but ERPS is more efficient than spanning-tree protocols because it is customized for ring topologies. You must configure at least three switches to form a ring. One of the links, called the ring protection link (RPL) end interface, is blocked until another link fails—at this time the RPL link is unblocked, ensuring connectivity.

NOTE: Ethernet OAM connectivity fault management (CFM) can be used with ERPS to detect link faults faster in some cases. See *Configuring Ethernet OAM Connectivity Fault Management (CLI Procedure)*.

The time needed for switchover to the ERPS link is affected by three settings—link failure detection time, the number of nodes in the ring, and the time it takes to unblock the RPL after a failure is detected.

NOTE: Do not configure redundant trunk groups on ERPS interfaces. You can configure VSTP on ERPS interfaces if the VSTP uses a VLAN that is not part of the ERPS control VLAN or data channel VLANs. The total number of ERPS and VSTP or MSTP instances is limited to 253.

Before you begin:

- Configure a VLAN to act as a control channel for ERPS. Two interfaces (east and west) on each switch in the ring must be associated with the control VLAN. See *Configuring VLANs for EX Series Switches (CLI Procedure)*.
- The interfaces on the ERPS control channel are usually (but not required to be) configured as trunk ports. See *Configuring Gigabit Ethernet Interfaces (CLI Procedure)*. Note that if one switch has trunk ports as the ERPS control interfaces, the same must be true of all switches on the ring (the ERPS control interfaces must also be trunk ports).
- Data channels are optional on the ERPS link. If you plan to use them, configure a VLAN for each data channel. If you have multiple ERPS instances, the control VLANs and data channel VLANs must not overlap.

To configure ERPS:

NOTE: You must configure at least three switches, with only one switch designated as the RPL owner node.

1. Spanning tree protocols and ERPS cannot both be configured on the ring ports, so on each ERPS interface, you must disable any configured spanning tree protocols (such

as STP, RSTP, VSTP, or MSTP). Spanning tree protocols are disabled for individual interfaces in two different ways, depending on which Junos OS version and release is running on the switch. RSTP is enabled in the default configuration, so disabling RSTP is shown here.

For switches without Enhanced Layer 2 (ELS) software support, and switches running ELS software with Junos OS release 15.1 or later, use this command to disable RSTP on the individual ERPS interfaces:

```
[edit protocols]
user@switch# set rstp interface interface-name disable
```

For switches running Enhanced Layer 2 (ELS) software with Junos OS releases prior to 15.1, you disable spanning tree protocols on individual interfaces by deleting that configuration item. Use this command to delete the RSTP configuration item on the individual ERPS interfaces:

```
[edit protocols]
user@switch# delete rstp interface interface-name
```

2. Create a node ring on each switch:

```
[edit protocols]
user@switch# set protection-group ethernet-ring ring-name
```

3. Configure a control VLAN for the node ring:

```
[edit protocols protection-group ethernet-ring ring name]
user@switch# set control-vlan vlan-name-or-vlan-id
```

4. Configure the east and west interfaces of the node ring with the control-channel interface.

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set east-interface control-channel control-channel-name
user@switch# set west-interface control-channel control-channel-name
```

For switches with ELS support, additionally associate the east and west interfaces with the control VLAN:

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set east-interface control-channel vlan vlan-name-or-vlan-id
user@switch# set west-interface control-channel vlan vlan-name-or-vlan-id
```

5. In addition, configure either the east interface or the west interface (but not both) as a link end. For example, configure the east interface:

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set east-interface ring-protection-link-end
```

6. Configure only one switch as the RPL owner node:

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set ring-protection-link-owner
```

7. The restore interval is the time the RPL owner node waits after the last ring automatic protection switching (RAPS) signal failure (SF) event has been cleared, to see if any further RAPS events occur. During this time interval, the RPL owner continues to process RAPS packets, and the ring remains in protection state with the RPL link unblocked. When this interval expires, if no further RAPS SF events have been reported,

the RPL owner reverts the protection switching, blocks the RPL link, and returns the protection ring to idle state. Optionally, configure a local restore interval for the ERPS ring on each switch:

```
[edit protocols protection-group ethernet-ring ring-name]
user@switch# set restore-interval restore-interval-value
```

NOTE: The restore interval can also be set globally to apply to any ERPS rings configured on the switch. Local per-ring settings take priority over global settings.

8. The guard interval prevents ring nodes from receiving outdated RAPS messages. Optionally, configure the guard interval on each switch:

```
[edit protocols protection-group ethernet-ring ring name]
user@switch# set guard-interval guard-interval-value
```

NOTE: The guard interval can also be set globally to apply to any ERPS rings configured on the switch. Local per-ring settings take priority over global settings.

9. Global restore and guard interval settings are used when no local settings are configured. If these intervals are not configured globally or locally, the default values apply. Optionally configure global interval settings on the switch to apply to all rings that do not have a corresponding interval configured locally for the ring:

- restore interval:

```
[edit protocols protection-group]
user@switch# set restore-interval restore-interval-value
```

- guard interval:

```
[edit protocols protection-group]
user@switch# set guard-interval guard-interval-value
```

NOTE: You can also configure other global settings, such as ERP traceoptions (file, page size, file size, flag name).

10. Optionally, configure VLANs for data channels on the ERPS link:

```
[edit protocols protection-group ethernet-ring ring name]
user@switch# set data-channel vlan-name
```

- [Ethernet Ring Protection Switching Overview on page 2055](#)

- [Understanding Ethernet Ring Protection Switching Functionality on page 2056](#)

Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS

You can configure Ethernet ring protection switching (ERPS) on connected EX Series or QFX Series switches to prevent fatal loops from disrupting a network. ERPS is similar to the Spanning Tree Protocol, but ERPS is more efficient because it is customized for ring topologies. You must connect and configure at least three switches to form a ring.

This example shows how to configure Ethernet ring protection switching on four switches with ELS support, connected to one another on a dedicated link in a ring topology. You can include different types of switches in an ERPS ring, including those with and without ELS support. If any of your EX Series switches runs software that does not support ELS, use these configuration directions: *Example: Configuring Ethernet Ring Protection Switching on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 41](#).

- [Requirements on page 2066](#)
- [Overview and Topology on page 2067](#)
- [Configuration on page 2068](#)
- [Verification on page 2081](#)

Requirements

This example uses the following hardware and software components:

- Four connected EX Series switches or QFX Series switches that support the Enhanced Layer 2 Software (ELS) to function as nodes in the ring topology. You could use any of these QFX Series switches: QFX5100, QFX5200, and QFX10000. This configuration also applies to EX Series switches that support the Enhanced Layer 2 Software (ELS) configuration style that runs on EX4300 and EX4600 switches.
- Junos OS Release 13.2X50-D10 or later for EX Series switches.
- Junos OS Release 14.1X53-D10 or later for QFX5100 switches. Junos OS Release 15.1X53-D30 or later for QFX5200, and QFX10000 switches.

Before you begin, be sure you have:

- Configured two trunk interfaces on each of the four switches. See [Table 182](#) for a list of the interface names used in this example.
- Configured a VLAN (with name **erp-control-vlan-1** and ID **100**) on all four switches and associated two network interfaces from each of the four switches with the VLAN. See *Configuring VLANs for the QFX Series OR Configuring VLANs for EX Series Switches (CLI Procedure)*. See [Table 182](#) for a list of the interface names used in this example.

- Configured two more VLANs (one with name **erp-data-1** and vlan ID **101** and a second vlan with the name **erp-data-2** and vlan ID **102**) on all four switches and associated both the east and west interfaces on each switch.

Overview and Topology

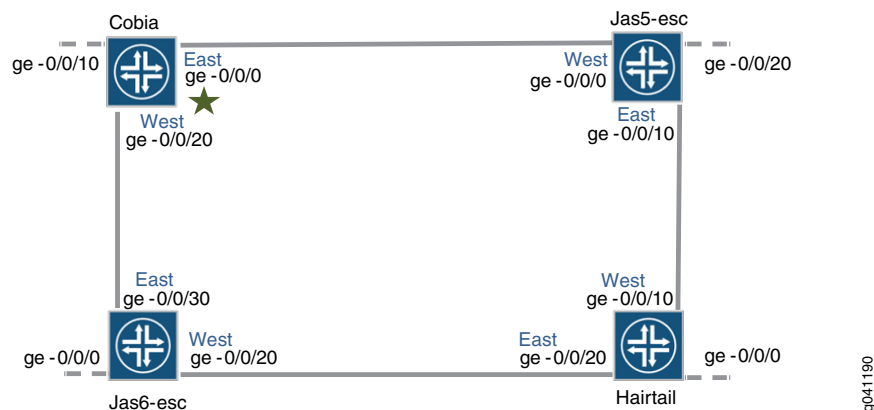

ERPS uses a dedicated physical link, including a control VLAN for trunk ports, between all of the switches to protect the active links. ERPS VLANs are all located on this link and are also blocked by default. When traffic between the switches is flowing with no problems, the active links take care of all traffic. Only if an error occurs on one of the data links would the ERPS control channel take over and start forwarding traffic.

NOTE: Trunk ports on switches use a VLAN to create individual control channels for ERPS. When multiple ERPS instances are configured for a ring, there are multiple sets of ring protection links (RPLs) and RPL owners on the ERPS link, and a different channel is blocked for each instance. Nontrunk ports use the physical link as the control channel and protocol data units (PDUs) are untagged, with no VLAN information in the packet.

This example creates one protection ring (called a node ring) named **erp1** on four switches connected in a ring by trunk ports as shown in [Figure 22](#). Because the links are trunk ports, VLAN 100 is used for **erp1** traffic. The east interface of each switch is connected with the west interface of an adjacent switch. Cobia is the RPL owner, with interface **ge-0/0/0** configured as an RPL end interface. The interface **ge-0/0/0** of **Jas5-esc** is configured as the RPL neighbor interface. In the idle state, the RPL end blocks the control VLAN and data channel VLAN for this particular ERP instance—the blocked port on Cobia is marked with a star in [Figure 22](#).

Figure 22: Ethernet Ring Protection Switching Example

In this example, we configure the four switches with the interfaces indicated in both [Figure 22](#) and [Table 182](#).

Table 182: Components to Configure for This Example

Interfaces	Cobia	Jas5-esc	Jas6-esc	Hairtail
East	ge-0/0/0	ge-0/0/10	ge-0/0/30	ge-0/0/20
West	ge-0/0/20	ge-0/0/0	ge-0/0/20	ge-0/0/10
Third	ge-0/0/10	ge-0/0/20	ge-0/0/0	ge-0/0/0

Configuration

- [Configuring ERPS on Cobia, the RPL Owner Node on page 2068](#)
- [Configuring ERPS on Jas5-esc on page 2071](#)

Configuring ERPS on Cobia, the RPL Owner Node

CLI Quick Configuration

To quickly configure Cobia, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

ERPS cannot be configured on an interface if any spanning-tree protocol is configured. (RSTP is configured by default.) Therefore, in this example, RSTP is disabled on each ring port before configuring ERPS. Spanning-tree protocols are disabled two different ways, depending on which version of the Junos OS you are running. Therefore, the first two statements in this example vary: Junos release 15.1 or later uses one command to turn off RSTP and Junos releases prior to 15.1 uses another command.

```

Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/0 disable
Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/20 disable
Junos OS release prior to 15.1: delete rstp interface ge-0/0/0
Junos OS release prior to 15.1: delete rstp interface ge-0/0/20
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 ring-protection-link-owner
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
    ge-0/0/0.0
set protocols protection-group ethernet-ring erp1 east-interface ring-protection-link-end
set protocols protection-group ethernet-ring erp1 east-interface control-channel
    ge-0/0/20.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
    100
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan
    100

```

**Step-by-Step
Procedure**

To configure ERPS on Cobia:

1. Disable any spanning-tree protocol currently configured on the ERPS interfaces. RSTP, VSTP, and MSTP are all available spanning-tree protocols. RSTP is enabled in the default configuration, so this example shows disabling RSTP. Spanning-tree protocols are disabled two different ways, depending on which version of the Junos OS you are running.

If you are running Junos release 15.1 or later, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# set rstp interface ge-0/0/0 disable
user@switch# set rstp interface ge-0/0/20 disable
```

If you are running a Junos release prior to 15.1, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# delete rstp interface ge-0/0/0
user@switch# delete rstp interface ge-0/0/20
```

2. Create a node ring named erp1:

```
[edit protocols]
user@switch# set protection-group ethernet-ring erp1
```

3. Designate Cobia as the RPL owner node:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set ring-protection-link-owner
```

4. Configure the VLANs 101 and 102 as data channels:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel 101
user@switch# set data-channel 102
```

5. Configure the control vlan 100 for this ERP instance on the trunk interface:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100
```

6. Configure the east interface of the node ring erp1 with control channel ge-0/0/0.0 and indicate that this particular ring protection link ends here:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel ge-0/0/0.0
user@switch# set east-interface ring-protection-link-end
```

7. Configure the west interface of the node ring erp1 with control channel ge-0/0/20.0 :

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/20.0
```

8. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign 100 as the control VLAN on both interfaces:

```
[edit protocols protection-group ethernet-ring erp1]
```

```
user@switch# set west-interface control-channel vlan 100
user@switch# set east-interface control-channel vlan 100
```

Results In configuration mode, check your ERPS configuration by entering the **show configuration protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show configuration protocols
  protection-group {
    ethernet-ring ERP1 {
      restore-interval 5;
      east-interface {
        control-channel {
          ge-0/0/13.0;
          vlan 4000;
        }
      }
    }
    west-interface {
      control-channel {
        ge-0/0/15.0;

Configuring ERPS on Jas5-esc

CLI Quick Configuration

To quickly configure Jas5-esc, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

ERPS cannot be configured on an interface if any spanning tree protocol is configured. (RSTP is configured by default.) Therefore, in this example, RSTP is disabled on each ring port before configuring ERPS. Spanning tree is disabled two different ways, depending on which version of the Junos OS you are running. Therefore, the first two statements will vary: Junos release 15.1 or later uses one command to turn off RSTP and Junos releases prior to 15.1 uses another command.

Junos OS release 15.1 or later: **set protocols rstp interface ge-0/0/10 disable**

```
Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/0 disable
Junos OS release prior to 15.1: delete rstp interface ge-0/0/10
Junos OS release prior to 15.1: delete rstp interface ge-0/0/0
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
  ge-0/0/0.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel
  ge-0/0/20.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
  100
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
  100
```

Step-by-Step Procedure

To configure ERPS on Jas5-esc:

1. Disable any spanning-tree protocol currently configured on the ERPS interfaces. RSTP, VSTP, and MSTP are all available spanning-tree protocols. RSTP is enabled in the default configuration, so this example shows disabling RSTP. Spanning-tree protocols are disabled two different ways, depending on which version of the Junos OS you are running.

If you are running Junos release 15.1 or later, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# set rstp interface ge-0/0/10 disable
user@switch# set rstp interface ge-0/0/0 disable
```

If you are running a Junos release prior to 15.1, disable any version of spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# delete rstp interface ge-0/0/10
user@switch# delete rstp interface ge-0/0/0
```

2. Create a node ring named erp1:

```
[edit protocols]
user@switch# set protection-group ethernet-ring erp1
```
3. Configure two data channels named erp-data-1 and erp-data-2 to define a set of VLAN IDs that belong to a ring instance.

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel vlan 101
user@switch# set data-channel vlan 102
```
4. Configure a control VLAN with ID 100 for the node ring erp1:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100
```
5. Configure the east interface of the node ring erp1 with the control channel ge-0/0/10.0:

```
[edit protocols protection-group ethernet-ring erp1]
```

```
user@switch# set east-interface control-channel ge-0/0/10.0
```

6. Configure the west interface of the node ring erp1 with the control channel ge-0/0/0.0 vlan 100:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/0.0
```

7. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign vlan # 100 as the control VLAN:

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel vlan 100
user@switch# set east-interface control-channel vlan 100
```

Results In configuration mode, check your ERPS configuration by entering the **show configuration protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show configuration protocols
  protection-group {
    ethernet-ring ERP1 {
      restore-interval 5;
      east-interface {
        control-channel {
          ge-0/0/13.0;
          vlan 4000;
        }
      }
      west-interface {
        control-channel {
          ge-0/0/15.0;
          vlan 4000;
        }
      }
      control-vlan 4000;
      data-channel {
        vlan 2052;
      }
    }
  }
user@switch# show configuration protocols | display set
set protocols protection-group ethernet-ring ERP1 restore-interval 5
set protocols protection-group ethernet-ring ERP1 east-interface control-channel
ge-0/0/13.0
set protocols protection-group ethernet-ring ERP1 east-interface control-channel vlan
4000
set protocols protection-group ethernet-ring ERP1 west-interface control-channel
ge-0/0/15.0
set protocols protection-group ethernet-ring ERP1 west-interface control-channel vlan
4000
set protocols protection-group ethernet-ring ERP1 control-vlan 4000
set protocols protection-group ethernet-ring ERP1 data-channel vlan 2052
```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interface configurations by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
show vlans
  erp-control-vlan-1 {
    vlan-id 100;
  }
  erp-data-1 {
    vlan-id 101;
  }

Configuring ERPS on Hairtail

CLI Quick Configuration To quickly configure Hairtail, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

ERPS cannot be configured on an interface if any spanning tree protocol is configured. (RSTP is configured by default.) Therefore, in this example, RSTP is disabled on each ring port before configuring ERPS. Spanning tree is disabled two different ways, depending on which version of the Junos OS you are running. Therefore, the first two statements will vary: Junos release 15.1 or later uses one command to turn off RSTP and Junos releases prior to 15.1 uses another command.

```
Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/10 disable
Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/20 disable
Junos OS release prior to 15.1: delete rstp interface ge-0/0/10
Junos OS release prior to 15.1: delete rstp interface ge-0/0/20
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
Set protocols protection-group ethernet-ring erp1 east-interface control-channel
ge-0/0/0.0
set protocols protection-group ethernet-ring erp1 east-interface control-channel
ge-0/0/20.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
100
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan
100
```

Step-by-Step Procedure To configure ERPS on Hairtail:

1. Disable any spanning-tree protocol currently configured on the ERPS interfaces. RSTP, VSTP, and MSTP are all available spanning-tree protocols. RSTP is enabled in the default configuration, so this example shows disabling RSTP. Spanning-tree protocols are disabled two different ways, depending on which version of the Junos OS you are running.

If you are running Junos release 15.1 or later, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# set rstp interface ge-0/0/10 disable
user@switch# set rstp interface ge-0/0/20 disable
```

If you are running a Junos release prior to 15.1, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# delete rstp interface ge-0/0/10
user@switch# delete rstp interface ge-0/0/20
```

2. Create a node ring named erp1:

```
[edit protocols]
```

- ```
user@switch# set protection-group ethernet-ring erp1
```
3. Configure the control vlan 100 for the node ring erp1:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100
```
  4. Configure two data channels numbered 101 and 102 to define a set of VLAN IDs that belong to a ring instance:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel vlan 101
user@switch# set data-channel vlan 102
```
  5. Configure the east interface of the node ring erp1 with the control channel ge-0/0/20.0:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel ge-0/0/20.0
```
  6. Configure the west interface of the node ring erp1 with the control channel ge-0/0/10.0:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/10.0
```
  7. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign 100 as the control VLAN:  

```
[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel vlan 100
user@switch# set east-interface control-channel vlan 100
```

**Results** In configuration mode, check your ERPS configuration by entering the **show configuration protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@switch# show configuration protocols
 protection-group {
 ethernet-ring ERP1 {
 restore-interval 5;
 east-interface {
 control-channel {
 ge-0/0/13.0;
 vlan 4000;
 }
 }
 west-interface {
 control-channel {
 ge-0/0/15.0;
 vlan 4000;
 }
 }
 control-vlan 4000;
 data-channel {
 vlan 2052;
 }
 }
 }
```

```

 }
 }
}
user@switch# show configuration protocols | display set
set protocols protection-group ethernet-ring ERP1 restore-interval 5
set protocols protection-group ethernet-ring ERP1 east-interface control-channel
ge-0/0/13.0
set protocols protection-group ethernet-ring ERP1 east-interface control-channel vlan
4000
set protocols protection-group ethernet-ring ERP1 west-interface control-channel
ge-0/0/15.0
set protocols protection-group ethernet-ring ERP1 west-interface control-channel vlan
4000
set protocols protection-group ethernet-ring ERP1 control-vlan 4000
set protocols protection-group ethernet-ring ERP1 data-channel vlan 2052

```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interface configurations by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]

### Configuring ERPS on Jas6-esc

---

#### CLI Quick Configuration

To quickly configure Jas6-esc, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

ERPS cannot be configured on an interface if any spanning tree protocol is configured. (RSTP is configured by default.) Therefore, in this example, RSTP is disabled on each ring port before configuring ERPS. Spanning tree is disabled two different ways, depending on which version of the Junos OS you are running. Therefore, the first two statements will vary: Junos release 15.1 or later uses one command to turn off RSTP and Junos releases prior to 15.1 uses another command.

```
Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/30 disable
Junos OS release 15.1 or later: set protocols rstp interface ge-0/0/20 disable
Junos OS release prior to 15.1: delete rstp interface ge-0/0/30
Junos OS release prior to 15.1: delete rstp interface ge-0/0/20
set protocols protection-group ethernet-ring erp1
set protocols protection-group ethernet-ring erp1 data-channel 101
set protocols protection-group ethernet-ring erp1 data-channel 102
set protocols protection-group ethernet-ring erp1 control-vlan 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel
 ge-0/0/30.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel
 ge-0/0/20.0
set protocols protection-group ethernet-ring erp1 west-interface control-channel vlan
 100
set protocols protection-group ethernet-ring erp1 east-interface control-channel vlan
 100
```

#### Step-by-Step Procedure

To configure ERPS on Jas6-esc:

1. Disable any spanning-tree protocol currently configured on the ERPS interfaces. RSTP, VSTP, and MSTP are all available spanning-tree protocols. RSTP is enabled in the default configuration, so this example shows disabling RSTP. Spanning-tree protocols are disabled two different ways, depending on which version of the Junos OS you are running.

If you are running Junos release 15.1 or later, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
user@switch# set rstp interface ge-0/0/30 disable
user@switch# set rstp interface ge-0/0/20 disable
```

If you are running a Junos release prior to 15.1, disable any spanning-tree protocol with these commands. To disable RSTP:

```
[edit protocols]
```

- ```

user@switch# delete rstp interface ge-0/0/30
user@switch# delete rstp interface ge-0/0/20

```
2. Create a node ring named erp1:

```

[edit protocols]
user@switch# set protection-group ethernet-ring erp1

```
 3. Configure the control vlan 100 for the node ring erp1:

```

[edit protocols protection-group ethernet-ring erp1]
user@switch# set control-vlan 100

```
 4. Configure two data channels numbered 101 and 102 to define VLAN IDs that belong to a ring instance.

```

[edit protocols protection-group ethernet-ring erp1]
user@switch# set data-channel 101
user@switch# set data-channel 102

```
 5. Configure the east interface of the node ring erp1 with the control channel ge-0/0/30.0 :

```

[edit protocols protection-group ethernet-ring erp1]
user@switch# set east-interface control-channel ge-0/0/30.0

```
 6. Configure the west interface of the node ring erp1 with the control channel ge-0/0/20.0:

```

[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel ge-0/0/20.0

```
 7. Every ring instance on a trunk port has one control VLAN in which ERP packets traverse. The control VLAN also controls data VLANs, if any are configured. Assign vlan number 100 as the control VLAN:

```

[edit protocols protection-group ethernet-ring erp1]
user@switch# set west-interface control-channel vlan 100
user@switch# set east-interface control-channel vlan 100

```

Results In configuration mode, check your ERPS configuration by entering the **show configuration protocols** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

[edit]
user@switch# show configuration protocols
}
  protection-group {
    ethernet-ring ERP1 {
      restore-interval 5;
      east-interface {
        control-channel {
          ge-0/0/13.0;
          vlan 4000;
        }
      }
      west-interface {
        control-channel {
          ge-0/0/15.0;

```

```
        vlan 4000;
    }
}
control-vlan 4000;
data-channel {
    vlan 2052;
}
}
}
user@switch# show configuration protocols | display set
set protocols protection-group ethernet-ring ERP1 restore-interval 5
set protocols protection-group ethernet-ring ERP1 east-interface control-channel
ge-0/0/13.0
set protocols protection-group ethernet-ring ERP1 east-interface control-channel vlan
4000
set protocols protection-group ethernet-ring ERP1 west-interface control-channel
ge-0/0/15.0
set protocols protection-group ethernet-ring ERP1 west-interface control-channel vlan
4000
set protocols protection-group ethernet-ring ERP1 control-vlan 4000
set protocols protection-group ethernet-ring ERP1 data-channel vlan 2052
```

In configuration mode, check your VLAN configuration by entering the **show vlans** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

In configuration mode, check your interfaces configuration by entering the **show interfaces** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
show vlans
  erp-control-vlan-1 {
    vlan-id 100;
  }
  erp-data-1 {
    vlan-id 101;
  }
  erp-data-2 {
    vlan-id 102;
  }
}
user@switch# show interfaces
ge-0/0/0 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
      vlan {
        members [ 101 102 ];
      }
    }
  }
}
ge-0/0/20 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;

```

```

        vlan {
            members [ 100 101 102 ];
        }
    }
}
ge-0/0/30 {
    unit 0 {
        family ethernet-switching {
            interface-mode trunk;
            vlan {
                members [ 100 101 102 ];
            }
        }
    }
}
}

```

Verification

Verify that ERPS is working correctly.

Verifying That ERPS Is Working Correctly

Purpose Verify that ERPS is working on the four EX switches that function as nodes in the ring topology.

Action Check the state of the ring links in the output of the **show protection-group ethernet-ring interface** command. When the ring is configured but not being used (no error exists on the data links), one ERP interface is forwarding traffic and one is discarding traffic. Discarding blocks the ring.

```
user@switch> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group ERP1

Interface	Control Channel	Forward State	Ring Protection Link End	Signal Failure
ge-0/0/13	ge-0/0/13.0	forwarding	No	Clear
	IFF ready			
ge-0/0/15	ge-0/0/15.0	forwarding	No	Clear
	IFF ready			

To find out what has occurred since the last restart, check the RPS statistics for ring-blocked events. **NR** is a No Request ring block, which means that the switch is not blocking either of the two ERP interfaces. **NR-RB** is a No Request Ring Blocked event, which means that the switch is blocking one of its ERP interfaces and sending a packet out to notify the other switches.

```
user@switch> show protection-group ethernet-ring statistics
```

```

Ethernet Ring statistics for PG erp1
RAPS event sent           : 0
RAPS event received       : 1
Local SF happened:        : 0
Remote SF happened:       : 0
NR event happened:        : 0
NR-RB event happened:     : 1

```

Meaning The **show protection-group ethernet-ring interface** command output from the RPL owner node indicates that one interface is forwarding traffic and one is discarding traffic, meaning that the ERP is ready but not active. If at least one interface in the ring is not forwarding, the ring is blocked and therefore ERP is working.

The **show protection-group ethernet-ring statistics** command output indicates that, since the last reboot, both local and remote signal failures have occurred (**Local SF** and **Remote SF**).

The **NR Event** count is 2, indicating that the NR state was entered into twice. **NR** stands for No Request. This means that the switch either originated NR PDUs or received an NR PDU from another switch and stopped blocking the interface to allow ERP to function.

The three **NR-RB** events indicate that on three occasions, this switch either sent out NR-RB PDUs or received NR-RB PDUs from another switch. This occurs when a network problem is resolved and the switch once again blocks the ERP link at one end.

Overview of Layer 2 Networking

Layer 2, also known as the Data Link Layer, is the second level in the seven-layer OSI reference model for network protocol design. Layer 2 is equivalent to the link layer (the lowest layer) in the TCP/IP network model. Layer 2 is the network layer used to transfer data between adjacent network nodes in a wide area network or between nodes on the same local area network.

A *frame* is a protocol data unit, the smallest unit of bits on a Layer 2 network. Frames are transmitted to and received from devices on the same local area network (LAN). Unlike bits, frames have a defined structure and can be used for error detection, control plane activities and so forth. Not all frames carry user data. The network uses some frames to control the data link itself..

At Layer 2, *unicast* refers to sending frames from one node to a single other node, whereas *multicast* denotes sending traffic from one node to multiple nodes, and *broadcasting*

refers to the transmission of frames to all nodes in a network. A *broadcast domain* is a logical division of a network in which all nodes of that network can be reached at Layer 2 by a broadcast.

Segments of a LAN can be linked at the frame level using *bridges*. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN.

Forwarding is the relaying of packets from one network segment to another by nodes in the network. On a VLAN, a frame whose origin and destination are in the same VLAN are forwarded only within the local VLAN. A network segment is a portion of a computer network wherein every device communicates using the same physical layer.

Layer 2 contains two sublayers:

- Logical link control (LLC) sublayer, which is responsible for managing communications links and handling frame traffic.
- Media access control (MAC) sublayer, which governs protocol access to the physical network medium. By using the MAC addresses that are assigned to all ports on a switch, multiple devices on the same physical link can uniquely identify one another.

The ports, or interfaces, on a switch operate in either access mode, tagged-access, or trunk mode:

- *Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode.
- *Tagged-Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:
- *Trunk mode* ports handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to other devices or switches.

With native VLAN configured, frames that do not carry VLAN tags are sent over the trunk interface. If you have a situation where packets pass from a device to a switch in access mode, and you want to then send those packets from the switch over a trunk port, use native VLAN mode. Configure the single VLAN on the switch's port (which is in access mode) as a native VLAN. The switch's trunk port will then treat those frames differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, frames on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag). There is another native VLAN option. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Including the sublayers, Layer 2 on the QFX Series supports the following functionality:

- Unicast, multicast, and broadcast traffic.
- Bridging.
- VLAN 802.1Q—Also known as *VLAN tagging*, this protocol allows multiple bridged networks to transparently share the same physical network link by adding VLAN tags to an Ethernet frame.
- Extension of Layer 2 VLANs across multiple switches using Spanning Tree Protocol (STP) prevents looping across the network.
- *MAC learning*, including per-VLAN MAC learning and Layer 2 learning suppression—This process obtains the MAC addresses of all the nodes on a network
- Link aggregation—This process groups of Ethernet interfaces at the physical layer to form a single link layer interface, also known as a *link aggregation group (LAG)* or LAG bundle
- Storm control on the physical port for unicast, multicast, and broadcast
- STP support, including 802.1d, RSTP, MSTP, and Root Guard

Understanding Layer 2 Broadcasting

In a Layer 2 network, *broadcasting* refers to sending traffic to all nodes on a network.

Layer 2 broadcast traffic stays within a local area network (LAN) boundary; known as the *broadcast domain*. Layer 2 broadcast traffic is sent to the broadcast domain using a MAC address of FF:FF:FF:FF:FF:FF. Every device in the broadcast domain recognizes this MAC address and passes the broadcast traffic on to other devices in the broadcast

domain, if applicable. Broadcasting can be compared to unicasting (sending traffic to a single node) or multicasting (delivering traffic to a group of nodes simultaneously).

Layer 3 broadcast traffic, however, is sent to all devices in a network using a broadcast network address. For example, if your network address is 192.0.0.0, the broadcast network address is 192.255.255.255. In this case, only devices that belong to the 192.0.0.0 network receive the Layer 3 broadcast traffic. Devices that do not belong to this network drop the traffic.

Broadcasting is used in the following situations:

- Address Resolution Protocol (ARP) uses broadcasting to map MAC addresses to IP addresses. ARP dynamically binds the IP address (the logical address) to the correct MAC address. Before IP unicast packets can be sent, ARP discovers the MAC address used by the Ethernet interface where the IP address is configured.
- Dynamic Host Configuration Protocol (DHCP) uses broadcasting to dynamically assign IP addresses to hosts on a network segment or subnet.
- Routing protocols use broadcasting to advertise routes.

Excessive broadcast traffic can sometimes create a broadcast storm. A broadcast storm occurs when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses that create a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service.

Layer 2 Learning and Forwarding for VLANs Overview

When you configure a VLAN, Layer 2 address learning is enabled by default. The VLAN learns unicast media access control (MAC) addresses to avoid flooding the packets to all the ports in the VLAN. Each VLAN creates a source MAC entry in its source and destination MAC tables for each source MAC address learned from packets received on the ports that belong to the VLAN.

NOTE: Traffic is not flooded back onto the interface on which it was received. However, because this “split horizon” occurs at a late stage, the packet statistics displayed by commands such as `show interfaces queue` will include flood traffic.

You can optionally disable MAC learning either for the entire device or for a specific VLAN or logical interface. You can also configure the following Layer 2 learning and forwarding properties:

- Static MAC entries for logical interfaces only
- Limit to the number of MAC addresses learned from a specific logical interface or from all the logical interfaces in a VLAN
- Size of the MAC address table for the VLAN
- MAC accounting for a VLAN

Understanding Bridging and VLANs

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN. This topic explains the following concepts regarding bridging and VLANs:

- [History of VLANs on page 2089](#)

History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

How Bridging of VLAN Traffic Works

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

Flooding finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it

can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

Filtering, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

Packets Are Either Tagged or Untagged

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The number of available VLANs and VLAN IDs are listed below:

- On a switch running ELS software, you can configure 4093 VLANs.
- On a switch running non-ELS software, you can configure 4091 VLANs.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet. The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

Junos OS switches support the TPID value 0x9100 for Q-in-Q, and switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also support values of 0x88a8 (Provider Bridging and Shortest Path Bridging).

For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

Switch Interface Modes—Access, Trunk, or Tagged Access

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

Access Mode

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot a switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that VLAN instead of **default**.

On a switch that runs Junos OS that supports ELS, the VLAN named **default** is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see [“Trunk Mode and Native VLAN” on page 2092](#).

Trunk Mode

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination.

On a switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on switches that run either type of software, you must configure the single VLAN on a trunk port as a *native VLAN*. For more information about native VLANs, see [“Trunk Mode and Native VLAN” on page 2092](#).

Trunk Mode and Native VLAN

On a switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a

trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch's trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Tagged-Access Mode

Only switches that run Junos OS that does not use the ELS configuration style support tagged-access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.
- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.

NOTE: Control packets are never reflected back on the downstream port.

Additional Advantages of Using VLANs

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network

resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.

- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For a switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

Maximum VLANs and VLAN Members Per Switch

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On a switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports ($\text{vmember limit} = \text{vlan max} * 8$). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.

On a switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports ($\text{vmember limit} = \text{vlan max} * 24$). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

A QFabric system supports up to 131,008 VLAN members (vmembers) on a single network node group, server node group, or redundant server node group. The number of vmembers is calculated by multiplying the maximum number of VLANs by 32.

For example, to calculate how many interfaces are required to support 4,000 VLANs, divide the maximum number of vmembers (128,000) by the number of configured VLANs (4,000). In this case, 32 interfaces are required.

On network Node groups and server Node groups, you can configure link aggregation groups (LAGs) across multiple interfaces. Each LAG and VLAN combination is considered a vmember.

A Virtual Chassis Fabric supports up to 512,000 vmembers. The number of vmembers is based on the number of VLANs, and the number of interfaces configured in each VLAN.

A Default VLAN Is Configured on Most Switches

Some switches that run Junos OS that do not support the ELS configuration style are preconfigured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

NOTE: When a Juniper Networks QFX3500 or QFX3600 switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

Assigning Traffic to VLANs

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.

NOTE: Two logical interfaces that are configured on the same physical interface cannot be mapped to the same VLAN.

Assign VLAN Traffic According to the Interface Port Source

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

Assign VLAN Traffic According to the Source MAC Address

In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on a switch that supports ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. To configure a static MAC-based VLAN on a switch that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*.

Forwarding VLAN Traffic

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols.

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. The same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under [“Trunk Mode” on page 2092](#).

VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

Switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named `irb`, while switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named `vlan`. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

Example: Setting Up Basic Bridging and a VLAN on the QFX Series

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices—storage devices, file servers, and other LAN components—in a LAN and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

NOTE: You cannot configure more than one logical interface that belongs to the same physical interface in the same bridge domain.

This example describes how to configure basic bridging and VLANs for the QFX Series:

- [Requirements on page 2097](#)
- [Overview and Topology on page 2097](#)
- [Configuration on page 2098](#)
- [Verification on page 2107](#)

Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX Series
- A configured and provisioned QFX Series product

Overview and Topology

To use a switch to connect network devices on a LAN, you must at a minimum configure bridging and VLANs. By default, bridging is enabled on all switch interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **employee-vlan**, which is automatically configured. When you plug in access devices—such as desktop computers, file servers, and printers—they are joined immediately into the **employee-vlan** VLAN, and the LAN is up and running.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.) You use the ports to connect devices that have their own power sources. Table 1 details the topology used in this configuration example.

Table 183: Components of the Basic Bridging Configuration Topology

Property	Settings
Switch hardware	QFX3500 switch, with 48 10-Gbps Ethernet ports
VLAN name	employee-vlan

Table 183: Components of the Basic Bridging Configuration Topology (*continued*)

Property	Settings
VLAN ID	10
Connections to file servers	xe-0/0/17 and xe-0/0/18
Direct connections to desktop PCs and laptops	xe-0/0/0 through xe-0/0/16
Connections to integrated printer/fax/copier machines	xe-0/0/19 through xe-0/0/40
Unused ports	xe-0/0/41 through xe-0/0/47

Configuration

CLI Quick Configuration To quickly configure a VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 10
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
```

```

set interfaces xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan

```

Step-by-Step Procedure

To set up basic bridging and a VLAN:

1. Create a VLAN named employee-vlan and specify the VLAN ID of 10 for it:

```

[edit vlans]
user@switch# set employee-vlan vlan-id 10

```

2. Assign interfaces xe-0/0/0 through xe-0/0/40 to the employee-vlan VLAN:

```

[edit interface]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan

```

3. Connect the two file servers to ports xe-0/0/17 and xe-0/0/18.

4. Connect the desktop PCs and laptops to ports xe-0/0/0 through xe-0/0/16.
5. Connect the integrated printer/fax/copier machines to ports xe-0/0/19 through xe-0/0/40.

Results Check the results of the configuration:

```
user@switch> show configuration
xe-0/0/0 {

Verification

To verify that switching is operational and that **employee-vlan** has been created, perform these tasks:

- [Verifying That the VLAN Has Been Created on page 2107](#)
- [Verifying That Interfaces Are Associated with the Proper VLANs on page 2108](#)

Verifying That the VLAN Has Been Created

Purpose Verify that the VLAN named **employee-vlan** has been created on the switch.

Action List all VLANs configured on the switch:

```
user@switch> show vlans
Routing instance      VLAN name      Tag      Interfaces
default-switch        employee-vlan   10
                      xe-0/0/0.0
                      xe-0/0/1.0
                      xe-0/0/2.0
                      xe-0/0/3.0
                      xe-0/0/4.0
                      xe-0/0/5.0
                      xe-0/0/6.0
                      xe-0/0/7.0
                      xe-0/0/8.0
                      xe-0/0/9.0
                      xe-0/0/10.0
                      xe-0/0/11.0
                      xe-0/0/12.0
                      xe-0/0/13.0
                      xe-0/0/14.0
                      xe-0/0/15.0
                      xe-0/0/16.0
                      xe-0/0/17.0
                      xe-0/0/18.0
                      xe-0/0/19.0
                      xe-0/0/20.0
                      xe-0/0/21.0
                      xe-0/0/22.0
                      xe-0/0/23.0
                      xe-0/0/24.0
                      xe-0/0/25.0
                      xe-0/0/26.0
                      xe-0/0/27.0
                      xe-0/0/28.0
                      xe-0/0/29.0
                      xe-0/0/30.0
                      xe-0/0/31.0
                      xe-0/0/32.0
                      xe-0/0/33.0
                      xe-0/0/34.0
                      xe-0/0/35.0
                      xe-0/0/36.0
                      xe-0/0/37.0
                      xe-0/0/38.0
                      xe-0/0/39.0
                      xe-0/0/40.0
...

```

Meaning The `show vlans` command lists the VLANs configured on the switch. This output shows that the VLAN `employee-vlan` has been created.

Verifying That Interfaces Are Associated with the Proper VLANs

Purpose Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

Action List all interfaces on which switching is enabled:

```

user@switch> show ethernet-switching interfaces
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members   limit state   interface flags
xe-0/0/0.0                65535                    untagged
                        employee-vlan 10
                        65535    Discarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )

```

Meaning The `show ethernet-switching interfaces` command lists all interfaces on which switching is enabled (in the **Logical interface** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, xe-0/0/0 through xe-0/0/40, are all part of VLAN **employee-vlan**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows xe-0/0/0.0 instead of xe-0/0/0. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

Example: Setting Up Bridging with Multiple VLANs

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices in a LAN—storage devices, file servers, and other network components—and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure bridging for the QFX Series and how to create two VLANs to segment the LAN:

NOTE: This task supports the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 41](#). If your switch runs software that does not support ELS, see *Example: Setting Up Bridging with Multiple VLANs*.

- [Overview and Topology on page 2115](#)
- [Configuration on page 2116](#)
- [Verification on page 2118](#)

Requirements

This example uses the following hardware and software components:

- A configured and provisioned QFX3500 switch
- Junos OS Release 13.2X50-D15 or later for the QFX Series

Overview and Topology

Switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as file servers. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and enables you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers and other resources. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.)

Table 184: Components of the Multiple VLAN Topology

Property	Settings
Switch hardware	QFX3500 switch configured with 48 10-Gbps Ethernet ports (xe-0/0/0 through xe-0/0/47)

Table 184: Components of the Multiple VLAN Topology (*continued*)

Property	Settings
VLAN names and tag IDs	sales , tag 100 support , tag 200
VLAN subnets	sales : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) support : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Interfaces in VLAN sales	File servers: xe-0/0/20 and xe-0/0/21
Interfaces in VLAN support	File servers: xe-0/0/46 and xe-0/0/47
Unused interfaces	xe-0/0/2 and xe-0/0/25

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

Configuration

CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/20 unit 0 description "Sales file server port"
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/46 unit 0 description "Support file server port"
set interfaces xe-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3-interface irb.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface irb.1
```

Step-by-Step Procedure Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the file server in the **sales** VLAN:

```
[edit interfaces xe-0/0/20 unit 0]
user@switch# set description "Sales file server port"
user@switch# set family ethernet-switching vlan members sales
```
2. Configure the interface for the file server in the **support** VLAN:

```
[edit interfaces xe-0/0/46 unit 0]
user@switch# set description "Support file server port"
user@switch# set family ethernet-switching vlan members support
```
3. Create the subnet for the **sales** broadcast domain:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25
```
4. Create the subnet for the **support** broadcast domain:

```
[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25
```
5. Configure the VLAN tag IDs for the **sales** and **support** VLANs:

```
[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200
```
6. To route traffic between the **sales** and **support** VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:

```
[edit vlans]
user@switch# set sales l3-interface irb.0
