| <b>Description</b>              | Configure the local end of an MSDP session. You must configure at least one peer for MSDP to function. When configuring a peer, you must include this statement. This address is used to accept incoming connections to the peer and to establish connections to the remote peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.4 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Enable MSDP on the router or switch. You must also configure at least one peer for MSDP to function.

**Default** MSDP is disabled on the router or switch.

**Options** The statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Define an MSDP peering relationship. An MSDP routing device must know which routing devices are its peers. You define the peer relationships explicitly by configuring the neighboring routing devices that are the MSDP peers of the local routing device. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. To configure multiple MSDP peers, include multiple <b>peer</b> statements.</p> <p>By default, the peer's options are identical to the global or group-level MSDP options. To override the global or group-level options, include peer-specific options within the <b>peer (Protocols MSDP)</b> statement.</p> <p>At least one peer must be configured for MSDP to function. You must configure <b>address</b> and <b>local-address</b>.</p> |
| <b>Options</b>             | <p><b>address</b>—Name of the MSDP peer.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

---

## rib-group (Protocols MSDP)

---

**Syntax** `rib-group group-name;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols [msdp](#)],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols [msdp](#)],  
[edit protocols [msdp](#)],  
[edit routing-instances *routing-instance-name* protocols [msdp](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Associate a routing table group with MSDP.

**Options** *group-name*—Name of the routing table group. The name must be one that you defined with the **rib-groups** statement at the [edit routing-options] hierarchy level.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure MSDP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>             | <p>The default MSDP trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>msdp-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

If you specify a maximum number of files, you must also include the **size** statement to specify the maximum file size.

**Range:** 2 through 1000 files

**Default:** 2 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### MSDP Tracing Flags

- **keepalive**—Keepalive messages
- **packets**—All MSDP packets
- **route**—MSDP changes to the routing table
- **source-active**—Source-active packets
- **source-active-request**—Source-active request packets
- **source-active-response**—Source-active response packets

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

***flag-modifier***—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

## Sample Output

### clear igmp membership

The following sample output displays IGMP group information before and after the **clear igmp membership** command is entered:

```

user@host> show igmp group
Interface Group Last Reported Timeout
so-0/0/0 224.2.127.253 10.1.128.1 186
so-0/0/0 224.2.127.254 10.1.128.1 186
so-0/0/0 239.255.255.255 10.1.128.1 187
so-0/0/0 224.1.127.255 10.1.128.1 188
local 224.0.0.6 (null) 0
local 224.0.0.5 (null) 0
local 224.2.127.254 (null) 0
local 239.255.255.255 (null) 0
local 224.0.0.2 (null) 0
local 224.0.0.13 (null) 0

```

```

user@host> clear igmp membership
Clearing Group Membership Info for so-0/0/0
Clearing Group Membership Info for so-1/0/0
Clearing Group Membership Info for so-2/0/0

```

```

user@host> show igmp group
Interface Group Last Reported Timeout
local 224.0.0.6 (null) 0
local 224.0.0.5 (null) 0
local 224.2.127.254 (null) 0
local 239.255.255.255 (null) 0
local 224.0.0.2 (null) 0
local 224.0.0.13 (null) 0

```

### clear igmp membership interface

The following sample output displays IGMP group information before and after the **clear igmp membership interface** command is issued:

```

user@host> show igmp group
Interface Group Last Reported Timeout
so-0/0/0 224.2.127.253 10.1.128.1 210
so-0/0/0 239.255.255.255 10.1.128.1 210
so-0/0/0 224.1.127.255 10.1.128.1 215
so-0/0/0 224.2.127.254 10.1.128.1 216
local 224.0.0.6 (null) 0
local 224.0.0.5 (null) 0
local 224.2.127.254 (null) 0
local 239.255.255.255 (null) 0
local 224.0.0.2 (null) 0
local 224.0.0.13 (null) 0

```

```

user@host> clear igmp membership interface so-0/0/0
Clearing Group Membership Info for so-0/0/0

```

```

user@host> show igmp group
Interface Group Last Reported Timeout
local 224.0.0.6 (null) 0
local 224.0.0.5 (null) 0
local 224.2.127.254 (null) 0
local 239.255.255.255 (null) 0
local 224.0.0.2 (null) 0
local 224.0.0.13 (null) 0

```

## clear igmp membership group

The following sample output displays IGMP group information before and after the **clear igmp membership group** command is entered:

```
user@host> show igmp group
```

| Interface | Group           | Last Reported | Timeout |
|-----------|-----------------|---------------|---------|
| so-0/0/0  | 224.2.127.253   | 10.1.128.1    | 210     |
| so-0/0/0  | 239.255.255.255 | 10.1.128.1    | 210     |
| so-0/0/0  | 224.1.127.255   | 10.1.128.1    | 215     |
| so-0/0/0  | 224.2.127.254   | 10.1.128.1    | 216     |
| local     | 224.0.0.6       | (null)        | 0       |
| local     | 224.0.0.5       | (null)        | 0       |

## Sample Output

### clear igmp statistics

The following sample output displays IGMP statistics information before and after the **clear igmp statistics** command is entered:

```
user@host> show igmp statistics
IGMP packet statistics for all interfaces
IGMP Message type Received Sent Rx errors
Membership Query 8883 459 0
V1 Membership Report 0 0 0
DVMRP 19784 35476 0
PIM V1 18310 0 0
Cisco Trace 0 0 0
V2 Membership Report 0 0 0
Group Leave 0 0 0
Mtrace Response 0 0 0
Mtrace Request 0 0 0
Domain Wide Report 0 0 0
V3 Membership Report 0 0 0
Other Unknown types 0 0 0
```

|                                     |   |
|-------------------------------------|---|
| IGMP v3 unsupported type            | 0 |
| IGMP v3 source required for SSM     | 0 |
| IGMP v3 mode not applicable for SSM | 0 |

|                        |      |
|------------------------|------|
| IGMP Global Statistics |      |
| Bad Length             | 0    |
| Bad Checksum           | 0    |
| Bad Receive If         | 0    |
| Rx non-local           | 1227 |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                     |

**Table 439: show igmp group Output Fields**

| Field Name        | Field Description                                                                                                                                       | Level of Output |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>  | Name of the interface that received the IGMP membership report. A name of <b>local</b> indicates that the local routing device joined the group itself. | All levels      |
| <b>Group</b>      | Group address.                                                                                                                                          | All levels      |
| <b>Group Mode</b> | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                  | All levels      |
| <b>Source</b>     | Source address.                                                                                                                                         | All levels      |

Table 439: show igmp group Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                         | Level of Output |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Source timeout   | Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.      | detail          |
| Last reported by | Address of the host that last reported membership in this group.                                                                                                                                                          | All levels      |
| Timeout          | Time remaining until the group membership is removed.                                                                                                                                                                     | brief none      |
| Group timeout    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer. | detail          |
| Type             | Type of group membership: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Host reported the membership.</li> <li>• <b>Static</b>—Membership is configured.</li> </ul>                                             | All levels      |

## Sample Output

### show igmp group (Include Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
 Group: 232.1.1.1
 Group mode: Include
 Source: 10.0.0.2
 Last reported by: 10.9.5.2
 Timeout: 24 Type: Dynamic
 Group: 232.1.1.1

**Table 440: show igmp group Output Fields**

| Field Name              | Field Description                                                                                        | Level of Output |
|-------------------------|----------------------------------------------------------------------------------------------------------|-----------------|
| accounting              | Enables notification for join and leave events.                                                          | All levels      |
| igmp-querier            | Configured source address for the IGMP querier.                                                          | All levels      |
| interface               | Name of the interface that receives IGMP membership reports.                                             | All levels      |
| query-interval          | Interval at which the IGMP querier sends general host-query messages to solicit membership information.  | All levels      |
| query-response-interval | How long the IGMP querier waits to receive a response from a query message before sending another query. | All levels      |
| src-address             | Source address of IGMP queries.                                                                          |                 |
| version                 | IGMP version.                                                                                            | All levels      |

## Sample Output

### show configuration protocols igmp

```

user@switch> show configuration protocols igmp
query-interval 150;
query-response-interval 50;
accounting;
interface vlan.43 {
 version 2;
}
igmp-querier {

```

```
src-address 10.0.0.2;
}
```

## show igmp interface

| <b>Configured Parameters</b> | Information configured by the user: <ul style="list-style-type: none"> <li><b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li><b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li><b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li><b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| <b>Derived Parameters</b>    | Derived information: <ul style="list-style-type: none"> <li><b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li><b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                              | All levels      |

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
 Querier: 10.111.30.1
 State: Up Timeout: None Version: 2 Groups: 4
 SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
 Querier: 10.111.10.1
 State: Up Timeout: None Version: 2 Groups: 2
 SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
 Querier: 10.111.20.1
 State: Up Timeout: None Version: 2 Groups: 4
 SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 5803](#).

### [show igmp interface detail](#)

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 5803](#).

## show igmp statistics

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                |

On a TX Matrix Plus router, display system statistics for IGMP for all connected T1600 or T4000 LCCs.<br><br><b>all-members</b> —(EX4200 switches only) (Optional) Display IGMP statistics for all members of the Virtual Chassis configuration.<br><br><b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for a specific router that is connected to the TX Matrix Plus router. |

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Display IGMP statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Display IGMP statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for IGMP for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system statistics for IGMP for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system statistics igmp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Table 443: show igmp-snooping membership Output Fields**

| Field Name | Field Description                 | Level of Output |
|------------|-----------------------------------|-----------------|
| VLAN       | Name of the VLAN.                 | All             |
| Interfaces | Interfaces assigned to the VLAN.  | All             |
| Tag        | Numerical identifier of the VLAN. | <b>detail</b>   |

Table 443: show igmp-snooping membership Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                     | Level of Output |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Router interfaces   | Names of multicast router interfaces.                                                                                                                                                                 | <b>detail</b>   |
| • static or dynamic | Whether the multicast router interface is <b>static</b> or <b>dynamic</b> .                                                                                                                           | <b>detail</b>   |
| • Uptime            | For static interfaces, length of time since the interface was configured as a multicast router interface; for dynamic interfaces, length of time since the first query was received on the interface. | <b>detail</b>   |
| • timeout           | Query timeout in seconds.                                                                                                                                                                             | <b>detail</b>   |
| Group               | IP multicast address of the multicast group.                                                                                                                                                          | <b>detail</b>   |
| Receiver count      | Number of interfaces that have membership in a multicast group.                                                                                                                                       | <b>detail</b>   |
| Flags               | IGMP version of the host sending a join message.                                                                                                                                                      | <b>detail</b>   |
| Uptime              | Length of time a multicast group has been active on the interface.                                                                                                                                    | <b>detail</b>   |
| timeout             | Time (in seconds) left until the entry for the multicast group is removed.                                                                                                                            | All             |
| Last reporter       | Last host to report membership for the multicast group.                                                                                                                                               | <b>detail</b>   |
| Include source      | Source addresses from which multicast streams are allowed based on IGMPv3 reports.                                                                                                                    | <b>detail</b>   |

## Sample Output

### show igmp-snooping membership

```

user@switch> show igmp-snooping membership

| <b>Output Fields</b>            | Table 444 lists the output fields for the <b>show igmp-snooping route</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                 |

**Table 444: show igmp-snooping route Output Fields**

| Field Name | Field Description                              |
|------------|------------------------------------------------|
| Table      | (For internal use only. Value is always 0.)    |
| VLAN       | Name of the VLAN.                              |
| Group      | Multicast group address.                       |
| Interfaces | Interfaces on which IGMP packets were snooped. |
| Next-hop   | ID associated with the next-hop device.        |

## Sample Output

### show igmp-snooping route

```
user@switch> show igmp-snooping route
VLAN Group Next-hop
V11 224.1.1.1, * 533
 Interfaces: ge-0/0/13.0, ge-0/0/1.0
VLAN Group Next-hop
v12 224.1.1.3, * 534
 Interfaces: ge-0/0/13.0, ge-0/0/0.0
```

### show igmp-snooping route vlan v1

```
user@switch> show igmp-snooping route vlan v1
Table: 0
VLAN Group Next-hop
v1 224.1.1.1, * 1266
 Interfaces: ge-0/0/0.0
v1 224.1.1.3, * 1266
 Interfaces: ge-0/0/0.0
v1 224.1.1.5, * 1266
 Interfaces: ge-0/0/0.0
v1 224.1.1.7, * 1266
 Interfaces: ge-0/0/0.0
v1 224.1.1.9, * 1266
 Interfaces: ge-0/0/0.0
v1 224.1.1.11, * 1266
 Interfaces: ge-0/0/0.0
```

| <b>Output Fields</b>            | Table 446 lists the output fields for the <b>show igmp-snooping vlans</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                         |

**Table 446: show igmp-snooping vlans Output Fields**

| Field Name             | Field Description                                                       | Level of Output |
|------------------------|-------------------------------------------------------------------------|-----------------|
| <b>VLAN</b>            | Name of the VLAN.                                                       | All levels      |
| <b>IGMP-L2-Querier</b> | Source address for IGMP snooping queries (if switch is an IGMP querier) | All levels      |
| <b>Interfaces</b>      | Number of interfaces in the VLAN.                                       | All levels      |
| <b>Groups</b>          | Number of groups in the VLAN.                                           | All levels      |
| <b>MRouters</b>        | Number of multicast routers associated with the VLAN.                   | All levels      |
| <b>Receivers</b>       | Number of host receivers in the VLAN.                                   | All levels      |

Table 446: show igmp-snooping vlans Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                          | Level of Output |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Tag                | Numerical identifier of the VLAN.                                                                                                                                                                          | detail          |
| tagged   untagged  | Interface participates in a tagged (802.1Q) or untagged (native) VLAN.                                                                                                                                     | detail          |
| vlan-interface     | Internal VLAN interface identifier.                                                                                                                                                                        | detail          |
| Membership timeout | Membership timeout value.                                                                                                                                                                                  | detail          |
| Querier timeout    | Timeout value for interfaces dynamically marked as router or switch interfaces (interfaces that receive queries). When the querier timeout is reached, the switch marks the interface as a host interface. | detail          |
| Interface          | Name of the interface.                                                                                                                                                                                     | detail          |
| Reporters          | Number of dynamic groups on an interface.                                                                                                                                                                  | detail          |

## Sample Output

### show igmp-snooping vlans

```

user@switch> show igmp-snooping vlans
VLAN Interfaces Groups MRouters Receivers
default 0 0 0 0
v1 11 50 0 0
v10 1 0 0 0
v11 1 0 0 0
v180 3 0 1 0
v181 3 0 0 0
v182 3 0 0 0

```

### show igmp-snooping vlans vlan

```

user@switch> show igmp-snooping vlans vlan v10
user@switch> show igmp-snooping vlans vlan v10
VLAN Interfaces Groups MRouters Receivers
v10 1 0 0 0

```

### show igmp-snooping vlans vlan detail

```

user@switch> show igmp-snooping vlans vlan v10 detail
VLAN: v10, Tag: 10, vlan-interface: vlan.10
 Interface: ge-0/0/10.0, tagged, Groups: 0
IGMP-L2-Querier: Stopped, SourceAddress: 10.10.1.2

```

## Operational Commands (PIM)

- clear multicast bandwidth-admission
- clear multicast scope
- clear multicast sessions
- clear multicast statistics
- clear pim join
- clear pim register
- clear pim statistics
- mtrace
- mtrace from-source
- mtrace monitor
- mtrace to-gateway
- show multicast flow-map
- show multicast interface
- show multicast mrinfo
- show multicast next-hops
- show multicast pim-to-igmp-proxy
- show multicast pim-to-mld-proxy
- show multicast route
- show multicast rpf
- show multicast scope
- show multicast sessions
- show multicast usage
- show pim bootstrap
- show pim interfaces
- show pim join
- show pim neighbors
- show pim rps

- `show pim source`
- `show pim statistics`

## clear multicast bandwidth-admission

| <b>Description</b>              | Display trace information about an IP multicast path.                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <i>source</i> —Source hostname or address.<br><br><i>logical-system (logical-system-name)</i> —(Optional) Perform this operation on a logical system.<br><br><i>routing-instance routing-instance-name</i> —(Optional) Trace a particular routing instance.                                                                                                            |
| <b>Additional Information</b>   | The <b>mtrace</b> command for multicast traffic is similar to the <b>traceroute</b> command used for unicast traffic. Unlike <b>traceroute</b> , <b>mtrace</b> traces traffic backwards, from the receiver to the source.                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                   |
| <b>List of Sample Output</b>    | <a href="#">mtrace source on page 5841</a>                                                                                                                                                                                                                                                                                                                             |
| <b>Output Fields</b>            | <a href="#">Table 447</a> describes the output fields for the <b>mtrace</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                           |

**Table 447: mtrace Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <i>number-of-hops</i>             | Number of hops from the source to the named router or switch. |
| <i>router-name</i>                | Name of the router or switch for this hop.                    |
| <i>address</i>                    | Address of the router or switch for this hop.                 |

Table 447: mtrace Output Fields (*continued*)

| Field Name      | Field Description                              |
|-----------------|------------------------------------------------|
| <i>protocol</i> | Protocol used (for example, PIM).              |
| Round trip time | Average round-trip time, in milliseconds (ms). |
| total ttl of    | Time-to-live (TTL) threshold.                  |

## Sample Output

### mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-2 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
-3 hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

## mtrace from-source

---

**Syntax** `mtrace from-source source source`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl ttl>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

**Options** `brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. The range of values is **1** through **32**. The default is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

`no-router-alert`—(Optional) Do not use the router-alert IP option.

`response response`—(Optional) Send trace response to a host or multicast address.

**routing-instance** *routing-instance-name*—(Optional) Trace a particular routing instance.

**source** *source*—Source hostname or address.

**ttl** *tll*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time** *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level** view

**List of Sample Output** [mtrace from-source on page 5844](#)

**Output Fields** Table 448 describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

**Table 448: mtrace from-source Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b>number-of-hops</b>             | Number of hops from the source to the named router or switch. |
| <b>router-name</b>                | Name of the router or switch for this hop.                    |
| <b>address</b>                    | Address of the router or switch for this hop.                 |
| <b>protocol</b>                   | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |
| <b>source</b>                     | Source address.                                               |
| <b>Response Dest</b>              | Response destination address.                                 |
| <b>Overall</b>                    | Average packet rate for all traffic at each hop.              |

Table 448: mtrace from-source Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Packet Statistics for Traffic From</b> | Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop. |
| <b>Receiver</b>                           | IP address receiving the multicast.                                                                              |
| <b>Query source</b>                       | IP address sending the mtrace query.                                                                             |

## Sample Output

### mtrace from-source

```

user@host> mtrace from-source source 192.1.4.2 group 225.1.1.1
Mtrace from 192.1.4.2 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-2 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
-3 hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.

Waiting to accumulate statistics...Results after 10 seconds:

| <b>Release Information</b> | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | Display trace information about a multicast path from this router or switch to a gateway router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>gateway gateway</b>—Send the trace query to a gateway multicast address.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>extra-hops extra-hops</b>—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between <b>0</b> and <b>255</b>.</p> <p><b>group group</b>—(Optional) Group address for which to trace the path. The default group address is <b>0.0.0.0</b>.</p> <p><b>interface interface-name</b>—(Optional) Source address for sending the trace query.</p> <p><b>interval interval</b>—(Optional) Number of seconds to wait before gathering statistics again. The default value is <b>10</b>.</p> <p><b>loop</b>—(Optional) Loop indefinitely, displaying rate and loss statistics.</p> <p><b>max-hops max-hops</b>—(Optional) Maximum hops to trace toward the source. You can specify a number between <b>0</b> and <b>255</b>. The default value is <b>32</b>.</p> <p><b>max-queries max-queries</b>—(Optional) Maximum number of query attempts for any hop. You can specify a number between <b>0</b> and <b>255</b>. The default value is <b>3</b>.</p> <p><b>multicast-response</b>—(Optional) Always request the response using multicast.</p> <p><b>no-resolve</b>—(Optional) Do not attempt to display addresses symbolically.</p> |

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance *routing-instance-name***—(Optional) Trace a particular routing instance.

**ttl *tll***—(Optional) IP time-to-live value. You can specify a number between 0 and 225.

Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time *wait-time***—(Optional) Number of seconds to wait for a response. The default value is 3.

List of Sample Output [mtrace to-gateway on page 5848](#)

Output Fields [Table 450](#) describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

**Table 450: mtrace to-gateway Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b><i>number-of-hops</i></b>      | Number of hops from the source to the named router or switch. |
| <b><i>router-name</i></b>         | Name of the router or switch for this hop.                    |
| <b><i>address</i></b>             | Address of the router or switch for this hop.                 |
| <b><i>protocol</i></b>            | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |

## Sample Output

### mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief
```

```
Mtrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
```

```
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerA.lab.mycompany.net (192.1.1.2) PIM thresh^ 1
-2 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-3 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

Table 451: show multicast flow-map Output Fields (*continued*)

| Field Name                | Field Description                                         | Levels of Output |
|---------------------------|-----------------------------------------------------------|------------------|
| <b>Adaptive Bandwidth</b> | Whether or not adaptive mode is enabled for the flow map. | <b>detail</b>    |
| <b>Redundant Sources</b>  | Redundant sources defined for the same destination group. | <b>detail</b>    |

## Sample Output

### show multicast flow-map

```

user@host> show multicast flow-map
Instance: master
Name Policy Cache timeout Bandwidth Adaptive
map2 policy2 never 2000000 no
map1 policy1 60 seconds 2000000 no

```

## Sample Output

### show multicast flow-map detail

```

user@host> show multicast flow-map detail
Instance: master
Flow-map: map1
 Policy: policy1
 Cache Timeout: 600 seconds
 Bandwidth: 2000000
 Adaptive Bandwidth: yes
 Redundant Sources: 11.11.11.11
 Redundant Sources: 11.11.11.12
 Redundant Sources: 11.11.11.13

```

| <i>source-address</i>                | Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>ip-address-1—&gt;ip-address-2</i> | Queried router interface address and directly attached neighbor interface address, respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>(name or ip-address)</i>          | Name or IP address of neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>[metric/threshold/type/flags]</i> | Neighbor's multicast profile: <ul style="list-style-type: none"> <li><b>metric</b>—Always has a value of 1, because <b>mrinfo</b> queries the directly connected interfaces of a device.</li> <li><b>threshold</b>—Multicast threshold time-to-live (TTL). The range of values is 0 through 255.</li> <li><b>type</b>—Multicast connection type: <b>pim</b> or <b>tunnel</b>.</li> <li><b>flags</b>—Flags for this route: <ul style="list-style-type: none"> <li><b>querier</b>—Queried router is the designated router for the neighboring session.</li> <li><b>leaf</b>—Link is a leaf in the multicast network.</li> <li><b>down</b>—Link status indicator.</li> </ul> </li> </ul> |

## Sample Output

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
 192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
 10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
 10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
 0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

## show multicast next-hops

**Output Fields** Table 454 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 454: show multicast next-hops Output Fields**

| Field Name                     | Field Description                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>                  | Protocol family (such as <b>INET</b> ).                                                                                                                |
| <b>ID</b>                      | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.                                        |
| <b>Refcount</b>                | Number of cache entries that are using this next hop.                                                                                                  |
| <b>KRefcount</b>               | Kernel reference count for the next hop.                                                                                                               |
| <b>Downstream interface</b>    | Interface names associated with each multicast next-hop ID.                                                                                            |
| <b>Incoming interface list</b> | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM. |

## Sample Output

### show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID Refcount KRefcount Downstream interface
262142 4 2 so-1/0/0.0
262143 2 1 mt-1/1/0.49152
262148 2 1 mt-1/1/0.32769
```

### show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops
Family: INET
ID Refcount KRefcount Downstream interface
2097151 8 4 ge-0/0/1.0

Family: INET6
ID Refcount KRefcount Downstream interface
2097157 2 1 ge-0/0/1.0

Family: Incoming interface list
ID Refcount KRefcount Downstream interface
513 5 2 lo0.0
 ge-0/0/1.0
514 5 2 lo0.0
 ge-0/0/1.0
 xe-4/1/0.0
515 3 1 lo0.0
 ge-0/0/1.0
 xe-4/1/0.0
544 1 0 lo0.0
 xe-4/1/0.0
```

### show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see [show multicast next-hops on page 5857](#).

### show multicast next-hops detail

```
user@host> show multicast next-hops detail
Family: INET
ID Refcount KRefCount Downstream interface
1048577 2 1 fe-0/1/2.0-(1048574)
 ge-0/2/3.0-(1048576)
```

## show multicast pim-to-igmp-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## show multicast route

**List of Syntax**    [Syntax on page 5863](#)  
                          [Syntax \(EX Series Switch and the QFX Series\) on page 5863](#)

**Syntax**    show multicast route  
                  <brief | detail | extensive | summary>  
                  <active | all | inactive>  
                  <group *group*>  
                  <inet | inet6>  
                  <instance *instance name*>  
                  <logical-system (all | *logical-system-name*)>  
                  <*regular-expression*>  
                  <source-prefix *source-prefix*>

**Syntax (EX Series Switch and the QFX Series)**    show multicast route  
                  <brief | detail | extensive | summary>  
                  <active | all | inactive>  
                  <group *group*>  
                  <inet | inet6>  
                  <instance *instance name*>  
                  <*regular-expression*>  
                  <source-prefix *source-prefix*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                  Support for bidirectional PIM added in Junos OS Release 12.1.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

**Options**    **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

**group *group***—(Optional) Display the cache entries for a particular group.

**inet | inet6**—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

**source-prefix source-prefix**—(Optional) Display the cache entries for a particular source prefix.

**Required Privilege Level** view

**Output Fields** [Table 457](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 457: show multicast route Output Fields**

| Field Name                    | Field Description                                                                                                                                                                               | Level of Output         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| family                        | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                                    | All levels              |
| Group                         | Group address.<br><br>For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.                                                         | All levels              |
| Source                        | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                                     | All levels              |
| Incoming interface list       | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                          | All levels              |
| Upstream interface            | Name of the interface on which the packet with this source prefix is expected to arrive.                                                                                                        | All levels              |
| Upstream rpf interface list   | When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. | All levels              |
| Downstream interface list     | List of interface names to which the packet with this source prefix is forwarded.                                                                                                               | All levels              |
| Number of outgoing interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                       | <b>extensive</b>        |
| Session description           | Name of the multicast session.                                                                                                                                                                  | <b>detail extensive</b> |

Table 457: show multicast route Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Statistics                             | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .<br><br><b>NOTE:</b> On QFX Series switches and OCX Series switches, this field does not report valid statistics. | detail extensive  |
| Next-hop ID                            | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.                                                                                                                                                                                                                                                             | detail extensive  |
| Incoming interface list ID             | For bidirectional PIM, incoming interface list identifier.<br><br>Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                                              | detail extensive  |
| Upstream protocol                      | The protocol that maintains the active multicast forwarding route for this group or source.<br><br>When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.                                                                                   | detail extensive  |
| Route type                             | Type of multicast route. Values can be (S,G) or (*G).                                                                                                                                                                                                                                                                                                                                                                                                         | summary           |

**Output Fields** Table 458 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

**Table 458: show multicast rpf Output Fields**

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                                                                                                                                                                                                                                             |
| <b>Source prefix</b> | Prefix and length of the source as it exists in the multicast forwarding table.                                                                                                                                                                                                                                                                                                                               |
| <b>Protocol</b>      | How the route was learned.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Interface</b>     | Upstream RPF interface.<br><br><b>NOTE:</b> The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured. |
| <b>Neighbor</b>      | Upstream RPF neighbor.<br><br><b>NOTE:</b> The displayed neighbor information does not apply to bidirectional PIM. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured.                 |

## Sample Output

### show multicast rpf

```

user@host> show multicast rpf

Multicast RPF table: inet.0, 12 entries

0.0.0.0/0
 Protocol: Static

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 459: show multicast scope Output Fields**

| Field Name          | Field Description                                           |
|---------------------|-------------------------------------------------------------|
| <b>Scope name</b>   | Name of the multicast scope.                                |
| <b>Group Prefix</b> | Range of multicast groups that are scoped.                  |
| <b>Interface</b>    | Interface that is the boundary of the administrative scope. |

Table 459: show multicast scope Output Fields (*continued*)

| Field Name      | Field Description                 |
|-----------------|-----------------------------------|
| Resolve Rejects | Number of kernel resolve rejects. |

## Sample Output

### show multicast scope

```
user@host> show multicast scope
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |
| local      | ff05::/16      | fe-0/0/0.1 | 0               |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0               |

### show multicast scope inet

```
user@host> show multicast scope inet
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |

### show multicast scope inet6

```
user@host> show multicast scope inet6
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| local      | ff05::/16      | fe-0/0/0.1 | 0               |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0               |

## show multicast sessions

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Output Fields</b>                                | <a href="#">Table 461</a> describes the output fields for the <b>show multicast usage</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 461: show multicast usage Output Fields

| Field Name      | Field Description                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                        |
| <b>Group</b>    | Group address.                                                                                                                                                                           |
| <b>Sources</b>  | Number of sources.                                                                                                                                                                       |
| <b>Packets</b>  | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>    | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>   | IP address.                                                                                                                                                                              |
| <b>/len</b>     | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>   | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group Sources Packets Bytes
228.0.0.0 1 52847 4439148
239.1.1.1 2 13450 1125530

Prefix /len Groups Packets Bytes
10.255.14.144 /32 2 66254 5561304
10.255.70.15 /32 1 43 3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 5879](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group Sources Packets Bytes
224.2.127.254 1 5538 509496
224.0.1.39 1 13 624
224.0.1.40 1 13 624

Prefix /len Groups Packets Bytes
192.168.195.34 /32 1 5538 509496
10.255.14.30 /32 1 13 624
```

```
10.255.245.91 /32 1 13 624
...
```

#### show multicast usage detail

```
user@host> show multicast usage detail
```

| Group                                                   | Sources | Packets | Bytes   |

| <b>Pri</b>           | Local routing device address priority to be elected as the bootstrap router. |

Table 462: show pim bootstrap Output Fields (*continued*)

| Field Name     | Field Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------|
| <b>State</b>   | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> .      |
| <b>Timeout</b> | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

| BSR                     | Pri | Local address           | Pri | State      | Timeout |
|-------------------------|-----|-------------------------|-----|------------|---------|
| None                    | 0   | 10.255.71.46            | 0   | InEligible | 0       |
| feco:1:1:1:1:0:aff:785c | 34  | feco:1:1:1:1:0:aff:7c12 | 0   | InEligible | 0       |

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

| BSR  | Pri | Local address   | Pri | State      | Timeout |
|------|-----|-----------------|-----|------------|---------|
| None | 0   | 192.168.196.105 | 0   | InEligible | 0       |

## show pim interfaces

**List of Syntax** [Syntax on page 5883](#)

[Syntax \(EX Series Switch and the QFX Series\) on page 5883](#)

**Syntax** show pim interfaces  
 <inet | inet6>  
 <instance *instance-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switch and the QFX Series)** show pim interfaces  
 <inet | inet6>  
 <instance *instance-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Support for bidirectional PIM added in Junos OS Release 12.1.

**Description** Display information about the interfaces on which Protocol Independent Multicast (PIM) is configured.

**Options** **none**—Display interface information for all family addresses for all routing instances.

**inet | inet6**—(Optional) Display interface information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about interfaces for a specific PIM-enabled routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show pim interfaces on page 5884](#)

**Output Fields** [Table 463](#) describes the output fields for the **show pim interfaces** command. Output fields are listed in the approximate order in which they appear.

**Table 463: show pim interfaces Output Fields**

| Field Name      | Field Description                                                                          |
|-----------------|--------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance.                                                              |
| <b>Name</b>     | Interface name.                                                                            |
| <b>State</b>    | State of the interface. The state also is displayed in the <b>show interfaces</b> command. |

Table 463: show pim interfaces Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. (Not supported on QFX Series.)</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>V</b>            | PIM version running on the interface: 1 or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>State</b>        | <p>State of PIM on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—Bidirectional mode is enabled on the interface and on all PIM neighbors.</li> <li>• <b>DR</b>—Designated router.</li> <li>• <b>NotCap</b>—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol.</li> <li>• <b>NotDR</b>—Not the designated router.</li> <li>• <b>P2P</b>—Point to point.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description                                  | <p>Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.</p> <p>For bidirectional PIM, display information about PIM group ranges (*G-range) for each active bidirectional RP group range, in addition to each of the joined (*G) routes.</p>                                                                                                                                                                                                                                                                                                                                |
| Options                                      | <p><b>none</b>—Display the standard information about PIM groups for all supported family addresses for all routing instances.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>bidirectional   dense   sparse</b>—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.</p> <p><b>exact</b>—(Optional) Display information about only the group that exactly matches the specified group address.</p>                                                             |

**inet | inet6**—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**range**—(Optional) Address range of the group, specified as *prefix/prefix-length*.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Display information about PIM (S,G) or (\*,G) entries.

**Required Privilege Level**

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 465: show pim neighbors Output Fields

| Field Name                                       | Field Description                                                                                                                                                                                                                                                                                                                                | Level of Output   |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Instance</b>                                  | Name of the routing instance.                                                                                                                                                                                                                                                                                                                    | All levels        |
| <b>Interface</b>                                 | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                                                               | All levels        |
| <b>Neighbor addr</b>                             | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                                                   | All levels        |
| <b>IP</b>                                        | IP version: 4 or 6.                                                                                                                                                                                                                                                                                                                              | All levels        |
| <b>V</b>                                         | PIM version running on the neighbor: 1 or 2.                                                                                                                                                                                                                                                                                                     | All levels        |
| <b>Mode</b>                                      | PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .                                                                                                                                                               | All levels        |
| <b>Option</b>                                    | Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>T</b>—Tracking bit.</li> </ul> | <b>brief</b> none |
| <b>Uptime</b>                                    | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                                                                                  | All levels        |
| <b>Address</b>                                   | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                                                   | <b>detail</b>     |
| <b>BFD</b>                                       | Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .                                                                                                                                                                   | <b>detail</b>     |
| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                                                   | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                                                      | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                                                       | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                                                           | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Hello Option LAN Prune Delay</b>              | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                                                                   | <b>detail</b>     |

Table 465: show pim neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Join Suppression supported | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |
| Rx Join                    | Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul> | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority, T = Tracking bit

Interface IP V Mode Option Uptime Neighbor addr
so-1/0/0.0 4 2 HPLG 00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 5909](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority, T = Tracking bit

Interface IP V Mode Option Uptime Neighbor addr
at-0/3/1.0 4 2 HPLG 00:07:54 10.111.30.2
mt-1/1/0.32768 4 2 HPLG 00:07:22 10.10.47.101
so-1/0/1.0 4 2 HPLG 00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsf
Join Count: 2
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

```

```
Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
 BFD: Disabled
 Hello Option Holdtime: 105 seconds 93 remaining
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1734018161
 Hello Option Bi-Directional PIM supported
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
 Join Suppression supported
```

Interface: lo0.0

```
Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count:
0, tsg Join Count: 0
 Hello Option Holdtime: 65535 seconds
 Hello Option DR Priority: 1
 Hello Option Generation ID: 1997462267
 Hello Option Bi-Directional PIM supported
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
 Join Suppression supported
```

#### show pim neighbors detail (With BFD)

```
user@host> show pim neighbors detail
```

Instance: PIM.master

Interface: fe-1/0/0.0

```
Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
 Hello Option Holdtime: 65535 seconds
 Hello Option DR Priority: 1
 Hello Option Generation ID: 836607909
 Hello Option LAN Prune Delay: delay 500 ms override 2000 ms

| RP selected                    | For sparse mode and bidirectional mode, the identity of the RP for the specified group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>group-address</i> |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address Type Mode Holdtime Timeout Groups Group prefixes
10.10.1.3 static bidir 150 None 2 224.1.3.0/24
 225.1.3.0/24
10.10.13.2 static bidir 150 None 2 224.1.1.0/24
 225.1.1.0/24

```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 5914](#).

### show pim rps <group-address>

```

user@host> show pim rps 235.100.100.0
Instance: PIM.master
Instance: PIM.master

RP selected: 100.100.100.100

```

### show pim rps <group-address> (Bidirectional PIM)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

224.1.0.0/16
 11.4.12.75 (Bidirectional)

RP selected: 11.4.12.75

```

**show pim rps <group-address> (PIM Dense Mode)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Dense Mode active for group 224.1.1.1
```

**show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Source-specific Mode (SSM) active for group 224.1.1.1
```

**show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16
 11.4.12.75

RP selected: 11.4.12.75
```

**show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)**

```
user@host> show pim rps 224.1.1.1
Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16
 11.4.12.75 (Bidirectional)

RP selected: (null)
```

**show pim rps instance**

```
user@host> show pim rps instance VPN-A
Instance: PIM.VPN-A
Address family INET
RP address Type Holdtime Timeout Groups Group prefixes
10.10.47.100 static 0 None 1 224.0.0.0/4

Address family INET6
```

**show pim rps extensive (PIM Sparse Mode)**

```
user@host> show pim rps extensive
Instance: PIM.master

Family: INET
RP: 10.255.245.91
Learned via: static configuration
Time Active: 00:05:48
Holdtime: 45 with 36 remaining

| <b>Output Fields</b>                                | <a href="#">Table 467</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 467: show pim source Output Fields

| Field Name         | Field Description                                                     |
|--------------------|-----------------------------------------------------------------------|
| Instance           | Name of the routing instance.                                         |
| Source             | Address of the source or reverse path.                                |
| Prefix/length      | Prefix and prefix length for the route used to reach the RPF address. |
| Upstream interface | RPF interface toward the source address.                              |
| Upstream Neighbor  | Address of the RPF neighbor used to reach the source address.         |

## Sample Output

### show pim source

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6

```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 5919](#).

### show pim source detail

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
 Prefix 10.255.14.144/32
 Upstream interface Local
 Upstream neighbor Local
 Active groups:228.0.0.0
 239.1.1.1
 239.1.1.1

Source 10.255.70.15
 Prefix 10.255.70.15/32
 Upstream interface so-1/0/0.0
 Upstream neighbor 10.111.10.2
 Active groups:239.1.1.1

```

Instance: PIM.master Family: INET6

## show pim statistics

| V1 Graft Ack                     | PIM version 1 graft acknowledgment packets.                                                                                                                    |
| AutoRP Announce                  | Auto-RP announce packets.                                                                                                                                      |
| AutoRP Mapping                   | Auto-RP mapping packets.                                                                                                                                       |
| AutoRP Unknown type              | Auto-RP packets with an unknown type.                                                                                                                          |
| Anycast Register                 | Auto-RP announce packets.                                                                                                                                      |
| Anycast Register Stop            | Auto-RP announce packets.                                                                                                                                      |
| Global Statistics                | Summary of PIM statistics for all interfaces.                                                                                                                  |
| Hello dropped on neighbor policy | Number of hello packets dropped because of a configured neighbor policy.                                                                                       |
| Unknown type                     | Number of PIM control packets received with an unknown type.                                                                                                   |
| V1 Unknown type                  | Number of PIM version 1 control packets received with an unknown type.                                                                                         |
| Unknown Version                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.                                                     |

Table 468: show pim statistics Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                         |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor unknown</b>                | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.                    |
| <b>Bad Length</b>                      | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.       |
| <b>Bad Checksum</b>                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| <b>Bad Receive If</b>                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| <b>Rx Bad Data</b>                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| <b>Rx Intf disabled</b>                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| <b>Rx V1 Require V2</b>                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| <b>Rx V2 Require V1</b>                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| <b>Rx Register not RP</b>              | Number of PIM register packets received when the router is not the RP for the group.                                      |
| <b>Rx Register no route</b>            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| <b>Rx Register no decap if</b>         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| <b>Null Register Timeout</b>           | Number of NULL register timeout packets.                                                                                  |
| <b>RP Filtered Source</b>              | Number of PIM packets received when the router has a source address filter configured for the RP.                         |
| <b>Rx Unknown Reg Stop</b>             | Number of register stop messages received with an unknown type.                                                           |
| <b>Rx Join/Prune no state</b>          | Number of join and prune messages received for which the router has no state.                                             |
| <b>Rx Join/Prune on upstream if</b>    | Number of join and prune messages received on the interface used to reach the upstream router, toward the RP.             |
| <b>Rx Join/Prune for invalid group</b> | Number of join or prune messages received for invalid multicast group addresses.                                          |

Table 468: show pim statistics Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                           |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rx Join/Prune messages dropped</b> | Number of join and prune messages received and dropped.                                                                                                     |
| <b>Rx sparse join for dense group</b> | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                                                             |
| <b>Rx Graft/Graft Ack no state</b>    | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                     |
| <b>Rx Graft on upstream if</b>        | Number of graft messages received on the interface used to reach the upstream router, toward the RP.                                                        |
| <b>Rx CRP not BSR</b>                 | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                 |
| <b>Rx BSR when BSR</b>                | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                 |
| <b>Rx BSR not RPF if</b>              | Number of BSR messages received on an interface that is not the RPF interface.                                                                              |
| <b>Rx unknown hello opt</b>           | Number of PIM hello packets received with options that Junos OS does not support.                                                                           |
| <b>Rx data no state</b>               | Number of PIM control packets received for which the router has no state for the data type.                                                                 |
| <b>Rx RP no state</b>                 | Number of PIM control packets received for which the router has no state for the RP.                                                                        |
| <b>Rx aggregate</b>                   | Number of PIM aggregate MDT packets received.                                                                                                               |
| <b>Rx malformed packet</b>            | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                             |
| <b>No RP</b>                          | Number of PIM control packets received with no RP address.                                                                                                  |
| <b>No register encaps if</b>          | Number of PIM register packets received when the first-hop router does not have an encapsulation interface.                                                 |
| <b>No route upstream</b>              | Number of PIM control packets received when the router does not have a unicast route to the the interface used to reach the upstream router, toward the RP. |
| <b>Nexthop Unusable</b>               | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                  |
| <b>RP mismatch</b>                    | Number of PIM control packets received for which the router has an RP mismatch.                                                                             |

Table 468: show pim statistics Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RP mode mismatch</b>                    | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>RPF neighbor unknown</b>                | Number of PIM control packets received for which the router has an unknown RPF neighbor for the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Rx Joins/Prunes filtered</b>            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tx Joins/Prunes filtered</b>            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Embedded-RP invalid addr</b>            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Embedded-RP limit exceed</b>            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Embedded-RP added</b>                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the router:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| <b>Embedded-RP removed</b>                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Rx Register msgs filtering drop</b>     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Tx Register msgs filtering drop</b>     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Rx Bidir Join/Prune on non-Bidir if</b> | Error counter for join and prune messages received on non-bidirectional PIM interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 468: show pim statistics Output Fields (*continued*)

| Field Name                              | Field Description                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------------------------|
| <b>Rx Bidir Join/Prune on non-DF if</b> | Error counter for join and prune messages received on non-designated forwarder interfaces. |

## Sample Output

### show pim statistics

```

user@host> show pim statistics

## CHAPTER 220

# Operational Commands (MSDP)

- `clear msdp cache`
- `clear msdp statistics`
- `show msdp`
- `show msdp source`
- `show msdp source-active`
- `show msdp statistics`
- `test msdp`

## clear msdp cache

---

| <b>Output Fields</b>            | Table 469 describes the output fields for the <b>show msdp</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                             |

Table 469: show msdp Output Fields

| Field Name    | Field Description                                                                        | Level of Output |
|---------------|------------------------------------------------------------------------------------------|-----------------|
| Peer address  | IP address of the peer.                                                                  | All levels      |
| Local address | Local address of the peer.                                                               | All levels      |
| State         | Status of the MSDP connection: <b>Listen</b> , <b>Established</b> , or <b>Inactive</b> . | All levels      |
| Last up/down  | Time at which the most recent peer-state change occurred.                                | All levels      |

Table 469: show msdp Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                   | Level of Output |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Peer-Group           | Peer group name.                                                                                                                                                                    | All levels      |
| SA Count             | Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format <i>number-accepted/number-received</i> . | All levels      |
| Peer Connect Retries | Number of peer connection retries.                                                                                                                                                  | detail          |
| State timer expires  | Number of seconds before another message is sent to a peer.                                                                                                                         | detail          |
| Peer Times out       | Number of seconds to wait for a response from the peer before the peer is declared unavailable.                                                                                     | detail          |
| SA accepted          | Number of entries in the source-active cache accepted from the peer.                                                                                                                | detail          |
| SA received          | Number of entries in the source-active cache received by the peer.                                                                                                                  | detail          |

## Sample Output

### show msdp

```

user@host> show msdp
Peer address Local address State Last up/down Peer-Group SA Count
198.32.8.193 198.32.8.195 Established 5d 19:25:44 North23 120/150
198.32.8.194 198.32.8.195 Established 3d 19:27:27 North23 300/345
198.32.8.196 198.32.8.195 Established 5d 19:39:36 North23 10/13
198.32.8.197 198.32.8.195 Established 5d 19:32:27 North23 5/6
198.32.8.198 198.32.8.195 Established 3d 19:33:04 North23 2305/3000

```

### show msdp brief

The output for the **show msdp brief** command is identical to that for the **show msdp** command. For sample output, see [show msdp on page 5935](#).

### show msdp detail

```

user@host> show msdp detail
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
SA accepted: 0
SA received: 0

```

## show msdp source

**Output Fields** Table 470 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

**Table 470: show msdp source Output Fields**

| Field Name     | Field Description                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source address | IP address of the source.                                                                                                                                                                                                                                               |
| /Len           | Length of the prefix for this IP address.                                                                                                                                                                                                                               |
| Type           | Discovery method for this multicast source: <ul style="list-style-type: none"> <li>• <b>Configured</b>—Source-active limit explicitly configured for this source.</li> <li>• <b>Dynamic</b>—Source-active limit established when this source was discovered.</li> </ul> |
| Maximum        | Source-active limit applied to this source.                                                                                                                                                                                                                             |
| Threshold      | Source-active threshold applied to this source.                                                                                                                                                                                                                         |
| Exceeded       | Number of source-active messages received from this source exceeding the established maximum.                                                                                                                                                                           |

## Sample Output

**show msdp source**

```

user@host> show msdp source
Source address /Len Type Maximum Threshold Exceeded
0.0.0.0 /0 Configured 5 none 0
10.1.0.0 /16 Configured 500 none 0
10.1.1.1 /32 Configured 10000 none 0
10.1.1.2 /32 Dynamic 6936 none 0
10.1.5.5 /32 Dynamic 500 none 123
10.2.1.1 /32 Dynamic 2 none 0

```

## show msdp source-active

**Output Fields** Table 471 describes the output fields for the **show msdp source-active** command. Output fields are listed in the approximate order in which they appear.

**Table 471: show msdp source-active Output Fields**

| Field Name                              | Field Description                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                                                   |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                                                        |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.                                         |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                                                        |
| Group address                           | Multicast address of the group.                                                                                                                            |
| Source address                          | IP address of the source.                                                                                                                                  |
| Peer address                            | IP address of the peer.                                                                                                                                    |
| Originator                              | Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured. |
| Flags                                   | Flags: <b>Accept</b> , <b>Reject</b> , or <b>Filtered</b> .                                                                                                |

## Sample Output

### show msdp source-active

```

user@host> show msdp source-active
Group address Source address Peer address Originator Flags
230.0.0.0 192.168.195.46 local 10.255.14.30 Accept
230.0.0.1 192.168.195.46 local 10.255.14.30 Accept
230.0.0.2 192.168.195.46 local 10.255.14.30 Accept
230.0.0.3 192.168.195.46 local 10.255.14.30 Accept
230.0.0.4 192.168.195.46 local 10.255.14.30 Accept

```

### show msdp source-active brief

The output for the **show msdp source-active brief** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 5939](#).

### show msdp source-active detail

The output for the **show msdp source-active detail** command is identical to that for the **show msdp source-active** command. For sample output, see [show msdp source-active on page 5939](#).

### show msdp source-active source

```
user@host> show msdp source-active source 192.168.215.246
```

```
Global active source limit exceeded: 0
```

```
Global active source limit maximum: 25000
```

```
Global active source limit threshold: 24000
```

```
Global active source limit log-warning: 100
```

```
Global active source limit log interval: 0
```

| Group address | Source address  | Peer address   | Originator     | Flags  |
|---------------|-----------------|----------------|----------------|--------|
| 226.2.2.1     | 192.168.215.246 | 10.255.182.140 | 10.255.182.140 | Accept |

| <b>Output Fields</b>            | Table 472 describes the output fields for the <b>show msdp statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                  |

**Table 472: show msdp statistics Output Fields**

| Field Name                              | Field Description                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Global active source limit exceeded     | Number of times all peers have exceeded configured active source limits.                                                    |
| Global active source limit maximum      | Configured number of active source messages accepted by the device.                                                         |
| Global active source limit threshold    | Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.          |
| Global active source limit log-warning  | Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device). |
| Global active source limit log interval | Time (in seconds) between consecutive log messages.                                                                         |

Table 472: show msdp statistics Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                     |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Peer</b>                                       | Address of peer.                                                                                                                                                                                      |
| <b>Last State Change</b>                          | How long ago the peer state changed.                                                                                                                                                                  |
| <b>Last message received from the peer</b>        | How long ago the last message was received from the peer.                                                                                                                                             |
| <b>RPF Failures</b>                               | Number of reverse path forwarding (RPF) failures.                                                                                                                                                     |
| <b>Remote Closes</b>                              | Number of times the remote peer closed.                                                                                                                                                               |
| <b>Peer Timeouts</b>                              | Number of peer timeouts.                                                                                                                                                                              |
| <b>SA messages sent</b>                           | Number of source-active messages sent.                                                                                                                                                                |
| <b>SA messages received</b>                       | Number of source-active messages received.                                                                                                                                                            |
| <b>SA request messages sent</b>                   | Number of source-active request messages sent.                                                                                                                                                        |
| <b>SA request messages received</b>               | Number of source-active request messages received.                                                                                                                                                    |
| <b>SA response messages sent</b>                  | Number of source-active response messages sent.                                                                                                                                                       |
| <b>SA response messages received</b>              | Number of source-active response messages received.                                                                                                                                                   |
| <b>SA messages with zero Entry Count received</b> | Entry Count is a field within SA message that defines how many source/group tuples are present in the SA message. The counter is incremented each time an SA with an Entry Count of zero is received. |
| <b>Active source exceeded</b>                     | Number of times this peer has exceeded configured source-active limits.                                                                                                                               |
| <b>Active source Maximum</b>                      | Configured number of active source messages accepted by this peer.                                                                                                                                    |
| <b>Active source threshold</b>                    | Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.                                                                       |
| <b>Active source log-warning</b>                  | Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device).                                                   |
| <b>Active source log-interval</b>                 | Time (in seconds) between consecutive log messages on this peer.                                                                                                                                      |
| <b>Keepalive messages sent</b>                    | Number of keepalive messages sent.                                                                                                                                                                    |

Table 472: show msdp statistics Output Fields (*continued*)

| Field Name                  | Field Description                      |
|-----------------------------|----------------------------------------|
| Keepalive messages received | Number of keepalive messages received. |
| Unknown messages received   | Number of unknown messages received.   |
| Error messages received     | Number of error messages received.     |

## Sample Output

### show msdp statistics

```

user@host> show msdp statistics
Global active source limit exceeded: 0
Global active source limit maximum: 10
Global active source limit threshold: 8
Global active source limit log-warning: 60
Global active source limit log interval: 60

Peer: 10.255.245.39
Last State Change: 11:54:49 (00:24:59)
Last message received from peer: 11:53:32 (00:26:16)
RPF Failures: 0
Remote Closes: 0
Peer Timeouts: 0
SA messages sent: 376
SA messages received: 459
SA messages with zero Entry Count received: 0
SA request messages sent: 0
SA request messages received: 0
SA response messages sent: 0
SA response messages received: 0
Active source exceeded: 0
Active source Maximum: 10
Active source threshold: 8
Active source log-warning: 60
Active source log-interval 120
Keepalive messages sent: 17
Keepalive messages received: 19
Unknown messages received: 0
Error messages received: 0

```

### show msdp statistics peer

```

user@host> show msdp statistics peer 10.255.182.140
Peer: 10.255.182.140
 Last State Change: 8:19:23 (00:01:08)
 Last message received from peer: 8:20:05 (00:00:26)
 RPF Failures: 0
 Remote Closes: 0
 Peer Timeouts: 0
 SA messages sent: 17
 SA messages received: 16
 SA request messages sent: 0
 SA request messages received: 0

```

SA response messages sent: 0  
SA response messages received: 0  
Active source exceeded: 20  
Active source Maximum: 10  
Active source threshold: 8  
Active source log-warning: 60  
Active source log-interval: 120  
Keepalive messages sent: 0  
Keepalive messages received: 0  
Unknown messages received: 0  
Error messages received: 0

## test msdp

## Overview of Firewall Filters

---

Firewall filters provide rules that define whether to accept or discard packets that are transiting an interface. If a packet is accepted, you can configure additional actions to perform on the packet, such as class-of-service (CoS) marking (grouping similar types of traffic together and treating each type of traffic as a class with its own level of service priority) and traffic policing (controlling the maximum rate of traffic sent or received). You configure firewall filters to determine whether to accept or discard a packet before it enters or exits any of these:

- Port
- VLAN

- Layer 3 (routed) interface
- Routed VLAN interface (RVI)

An *ingress* firewall filter is applied to packets that are entering an interface or VLAN, and an *egress* firewall filter is applied to packets that are exiting an interface or VLAN.

**NOTE:** Firewall filters are sometimes called *access control lists (ACLs)*.

- [Firewall Filter Components on page 5953](#)
- [Firewall Filter Processing on page 5953](#)
- [How Many Filters Are Supported? on page 5953](#)

## Firewall Filter Types

The following firewall filter types are supported:

- Port (Layer 2) firewall filter—Port firewall filters apply to Layer 2 traffic transiting system ports.
- VLAN firewall filter—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN.
- Router (Layer 3) firewall filter—You can apply a router firewall filter in both ingress and egress directions on IPv4 or IPv6 Layer 3 (routed) interfaces, routed VLAN interfaces (RVI) and a loopback interface, which filters traffic sent to the switch itself or generated by the switch. (You apply a filter to a loopback interface in the input direction to protect the switch from unwanted traffic. You also might want to apply a filter to a loopback interface in the output direction so that you can set the forwarding class and DSCP bit value for packets that originate on the switch itself. This feature gives you very fine control over the classification of CPU generated packets. For example, you might want to assign different DSCP values and forwarding classes to traffic generated by different routing protocols so the traffic for those protocols can be treated in a differentiated manner by other devices. You can apply a filter to a loopback interface in the output direction starting with Junos OS 13.2X51-D15.)

**NOTE:** You can apply a firewall filter to a management interface (for example, `me0`) on a QFX and EX4600 standalone switch. You cannot apply a firewall filter to a management interface on a QFX3000-G or QFX3000-M system.

- MPLS filter—You can apply a firewall filter to an MPLS interface

To apply a firewall filter:

1. Configure the firewall filter.
2. Apply the firewall filter to a port, VLAN, or router interface.

**NOTE:** You can apply only one firewall filter to a port, VLAN, or interface for a given direction. For example, for interface `ge-0/0/6.0`, you can apply one filter for the ingress direction and one for the egress direction.

## Firewall Filter Components

In a firewall filter, you first define the family address type (ethernet-switching, inet (for IPv4), inet6 (for IPv6), or mpls) and then define one or more terms that specify the filtering criteria and the action to take if a match occurs.

Each term consists of the following components:

- **Match conditions**—Specify values that a packet must contain to be considered a match. You can specify values for most fields in the IP, TCP, UDP, or ICMP headers. You can also match on interface names.
- **Action**—Specifies what to do if a packet matches the match conditions. A filter can accept, discard, or reject a matching packet and then perform additional actions, such as counting, classifying, and policing. If no action is specified for a term, the default is to accept the matching packet.

## Firewall Filter Processing

If there are multiple terms in a filter, the order of the terms is important. If a packet matches the first term, the switch executes the action defined by that term, and no other terms are evaluated. If the switch does not find a match between the packet and the first term, it compares the packet to the next term. If no match occurs between the packet and the second term, the system continues to compare the packet to each successive term in the filter until a match is found. If the packet does not match any terms in the filter, the switch discards the packet by default.

## How Many Filters Are Supported?

QFX10000 switches support 8K firewall filters and 64K firewall filter terms.

QFX3500, QFX3600, QFX5100, QFX5200, and EX4600 switches, QFabric Node devices, and VCF members support the maximum numbers of firewall filter terms per type of attachment point shown in [Table 473](#).

**Table 473: Supported Firewall Filter Numbers for Specific Switches**

| Filter Type | QFX3500, QFX3600 | QFX5100, EX4600 | QFX5200 |
|-------------|------------------|-----------------|---------|
| Ingress     | 768              | 1536            | 768     |
| Egress      | 1024             | 1024            | 1024    |

These totals are applied in aggregate. For example, on the QFX3500 and QFX3600 you can apply a total of 768 terms in all your port filters, Layer 3 filters, and VLAN filters that are applied in the input direction and 1024 terms in port filters, Layer 3 filters, and VLAN filters that are applied in the output direction. The actual number of filters that these

switches will support depends on how the filters are stored in ternary content addressable memory (TCAM). See [“Planning the Number of Firewall Filters to Create” on page 5973](#) for detailed information about this topic.

## Understanding How Firewall Filters Are Evaluated

---

A firewall filter consists of one or more terms, and the order of the terms within a filter is important. Before you configure firewall filters, you should understand how switches evaluate the terms within a filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the **then** statement is taken.
- If the packet matches all the conditions, and no action is specified in the **then** statement, the default action **accept** is taken.
- If the packet does not match all the conditions, the switch discards it.

When a firewall filter consists of more than one term, the filter is evaluated sequentially:

1. The packet is evaluated against the conditions in the **from** statement in the first term.
2. If the packet matches all the conditions in the term, the action in the **then** statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the **from** statement in the second term.

This process continues until the packet matches all the conditions in the **from** statement in one of the subsequent terms or there are no more terms in the filter.

4. If a packet passes through all the terms in the filter without a match, the switch discards it.

**NOTE:** The order of conditions in a **from** statement is not important because a packet must match all the conditions to be considered a match.

---

Figure 196 shows how switches evaluate the terms within a firewall filter.

Figure 196: Evaluation of Terms Within a Firewall Filter

If you do not include a **from** statement in a term, all packets will match the term and be processed by the **then** statement. If a term does not contain a **then** statement or if an action has not been configured in the **then** statement, the term accepts any matching packets.

Every firewall filter contains an implicit **deny** statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {
 then discard;
}
```

Consequently, a packet that does not match any of the terms in a firewall filter is discarded. If you configure a filter that has no terms, all packets that pass through the filter are discarded.

**NOTE:** Firewall filtering is supported on packets that are at least 64 bytes long.

## Understanding How Firewall Filters Control Packet Flows

A switch supports firewall filters that allow you to control flows of data packets and local packets. *Data packets* transit a switch as they are forwarded from a source to a destination. *Local packets* are destined for or sent by a Routing Engine (they do not transit a switch). Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, or data for administrative protocols such as the Internet Control Message Protocol (ICMP).

Firewall filters affect packet flows entering into or exiting from a switch as follows:

- Ingress firewall filters affect the flow of data packets that are received on switch interfaces. When a switch receives a data packet, the Packet Forwarding Engine in the system that contains the ingress interface determines where to forward the packet by looking in its Layer 2 or Layer 3 forwarding table for the best route to the destination. Data packets are forwarded to an egress interface. Locally destined packets are forwarded to the Routing Engine.
- Egress firewall filters affect data packets that are transiting a switch but do not affect packets sent by the Routing Engine. These filters are applied by the Packet Forwarding Engine in the system that contains the egress interface.

Figure 197 illustrates the application of ingress and egress firewall filters to control the flow of packets through a switch:

1. Ingress firewall filter applied to locally destined packets that are received on switch interfaces and are destined for the Routing Engine.
2. Ingress firewall filter applied to data packets that are received on switch interfaces and will transit the switch.
3. Egress firewall filter applied to data packets that are transiting the switch.

## Understanding Firewall Filter Match Conditions

Before you define terms for firewall filters, you must understand how the conditions in a term are handled and how to specify interface, numeric, address, and bit-field filter match conditions to achieve the desired filter results.

- [Filter Match Conditions on page 5957](#)
- [Numeric Filter Match Conditions on page 5957](#)
- [Interface Filter Match Conditions on page 5958](#)
- [IP Address Filter Match Conditions on page 5958](#)
- [MAC Address Filter Match Conditions on page 5959](#)
- [Bit-Field Filter Match Conditions on page 5959](#)

### Filter Match Conditions

In the **from** statement of a firewall filter term, you specify the conditions that the packet must match for the action in the **then** statement to be taken. All conditions must match for the action to be implemented. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify multiple values for the same condition, a match on any one of those values matches that condition. For example, if you specify multiple IP source addresses using the **source-address** statement, a packet that contains any one of those IP source addresses matches the condition. In some cases you can specify multiple values for the same condition by enclosing the possible values in square brackets, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set protocol (icmp | udp)
```

In other cases you must enter multiple statements, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.1.1.1
user@switch# set source-address 10.1.1.2
```

If you specify no match conditions in a term, that term matches all packets.

**NOTE:** Unlike traditional Junos OS firewall filters, you cannot use **except** in a condition statement to negate the condition.

### Numeric Filter Match Conditions

You can specify numeric filter match conditions that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify the

condition and a single value that a field in a packet must contain to be considered a match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example, to match Telnet traffic:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port 23
```

- Text synonym for a single number—A match occurs if the value of the field matches the number that corresponds to the synonym. For example, to match Telnet traffic:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port telnet
```

- To specify multiple values for the same match condition in a filter term, enter each value in its own match statement. For example, a match occurs in the following term if the value of the source port in the packet is 22 or 23.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-port 22
user@switch# set source-port 23
```

## Interface Filter Match Conditions

You can specify an interface filter match condition to match an interface on which a packet is received or transmitted. For example, if you apply a filter to a VLAN you might want the filter to match on some interfaces that participate in the VLAN and not match on other interfaces in the VLAN. When you specify the name of the interface, you must include a logical unit.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/0/6.0
```

In this example, the final character (0) specifies the logical unit. You can include the wildcard (\*) as part of the interface name. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/*/6.0
user@switch# set interface ge-0/1/*0
user@switch# set interface ge-0/0/6.*
```

Note that you must specify a value or a wildcard for the logical unit.

## IP Address Filter Match Conditions

You can specify an address filter match condition to match an IP source or destination address or prefix in a packet. Specify the address or prefix type and the address or prefix itself. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10.2.1.0/24;
```

If you omit the prefix length, it defaults to /32. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10
[edit firewall family family-name filter filter-name term term-name from]
user@switch# show
destination-address {
```

```
10.0.0.0/32;
}
```

To specify more than one IP address or prefix in a filter term, enter each address or prefix in its own match statement. For example, a match occurs in the following term if the source address of a packet matches either of the following prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.1.0.0/16
user@switch# set source-address 10.2.0.0/16
```

## MAC Address Filter Match Conditions

You can specify a MAC address filter match condition to match a source or destination MAC address. You specify the address type and value that a packet must contain to be considered a match.

You can specify the MAC address as six hexadecimal bytes in any of the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 00:11:22:33:44:55
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 0011.2233.4455
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 001122334455
```

Regardless of the formats you use, the system resolves the address to the standard format, in this case 00:11:22:33:44:55.

To specify more than one MAC address in a filter term, enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the MAC source address matches either of the following addresses:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-mac-address 00:11:22:33:44:55
user@switch# set source-mac-address 00:11:22:33:20:15
```

## Bit-Field Filter Match Conditions

You can specify bit-field filter match conditions to match particular bits within certain fields in Ethernet frames and IP, TCP, UDP, and ICMP headers. You usually specify the field and the bit within the field that must be set in a packet to be considered a match.

In most cases you can use a keyword to specify the bit you want to match on. For example, to match on a TCP SYN packet you can enter **syn**, as in:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags syn
```

You can also enter **0x02** because the SYN bit is the third least-significant bit of the 8-bit tcp-flags field:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags 0x02
```

To match multiple bit-field values, use the logical operators, which are described in [Table 474](#). The operators are listed in order from highest precedence to lowest precedence. Operations are evaluated from left to right.

Table 474: Actions for Firewall Filters

| Logical Operators | Description |
|-------------------|-------------|
| !                 | Negation    |
| &                 | Logical AND |
|                   | Logical OR  |

If you use a logical operator, enclose the values in quotation marks and do not include any spaces. For example, the following statement matches the second packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&ack"
```

To negate a match, precede the value with an exclamation point. For example, the following statement matches only the initial packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn!ack"
```

You can use text synonyms to specify some common bit-field matches. For example, the following statement also matches the initial packet of a TCP handshake:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-initial
```

## Firewall Filter Match Conditions and Actions for QFX10000 Switches

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the fields and values that a packet must contain to be considered a match. You can define single or multiple match conditions in *match statements*. You can also include no match statement, in which case the term matches all packets.

When a packet matches a filter, a switch takes the action specified in the term. In addition, you can specify action modifiers to count, mirror, rate-limit, and classify packets. If no match conditions are specified for the term, the switch accepts the packet by default.

This topic describes the various match conditions, actions, and action modifiers that you can define in firewall filters on QFX10000 switches. For similar information about other QFX switches, see *Firewall Filter Match Conditions and Actions*.

- [Table 475](#) describes the match conditions you can specify when configuring a firewall filter. Some of the numeric range and bit-field match conditions allow you to specify a text synonym. To see a list of all the synonyms for a match condition, type ? at the appropriate place in a statement.

- [Table 476](#) shows the actions that you can specify in a term.
- [Table 477](#) shows the action modifiers you can use to count, mirror, rate-limit, and classify packets.

**NOTE:** On QFX10000 switches, do not combine match conditions for Layer 2 and any other layer in a family ethernet-switching filter. (For example, do not include conditions that match MAC addresses and IP addresses in the same filter.) If you do so, the filter will commit successfully but will not work. You will also see the following log message: *L2 filter **filter-name** doesn't support mixed L2 and L3/L4 match conditions. Please re-config.*

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches

| Match Condition                                      | Description                                                                       | Direction and Interface                                                                                                       |
|------------------------------------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-address</b><br><i>ip-address</i>      | IP destination address field, which is the address of the final destination node. | Ingress Pv4 (inet) interfaces and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces, and IPv6 (inet6) interfaces. |
| <b>destination-mac-address</b><br><i>mac-address</i> | Destination media access control (MAC) address of the packet.                     | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                                                       |

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches (*continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Direction and Interface                                                                                                                                            |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port <i>value</i></b>              | <p>TCP or UDP destination port field. Typically, you specify this match in conjunction with the <b>protocol</b> match statement. For the following well-known ports you can specify text synonyms (the port numbers are also listed):</p> <p><b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67),</p> <p><b>cmd</b> (514), <b>cvspserver</b> (2401),</p> <p><b>dhcp</b> (67), <b>domain</b> (53),</p> <p><b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512),</p> <p><b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20),</p> <p><b>http</b> (80), <b>https</b> (443),</p> <p><b>ident</b> (113), <b>imap</b> (143),</p> <p><b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544),</p> <p><b>ldap</b> (389), <b>login</b> (513),</p> <p><b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639),</p> <p><b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123),</p> <p><b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515),</p> <p><b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108),</p> <p><b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514),</p> <p><b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525),</p> <p><b>who</b> (513),</p> <p><b>xmcp</b> (177),</p> <p><b>zephyr-clt</b> (2103), <b>zephyr-hm</b> (2104)</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> |
| <b>destination-prefix-list <i>prefix-list</i></b> | <p>IP destination prefix list field. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the <b>[edit policy-options]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> |

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches (*continued*)

| Match Condition         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Direction and Interface                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>dscp value</b>       | <p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most-significant 6 bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>be</b>—best effort (default)</li> <li>• <b>ef (46)</b>—as defined in <a href="#">RFC 3246</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• <b>af11 (10), af12 (12), af13 (14); af21 (18), af22 (20), af23 (22); af31 (26), af32 (28), af33 (30); af41 (34), af42 (36), af43 (38)</b></li> </ul> <p>These four classes, with three drop precedences in each class, for a total of 12 code points, are defined in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB</i>.</p> <ul style="list-style-type: none"> <li>• <b>cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, cs5</b></li> </ul>                                                                                                                                   | <p>Ingress ports, VLANs, and IPv4 (inet) interfaces.</p> <p>Egress ports, VLANs, and IPv4 (inet) interfaces.</p> |
| <b>ether-type value</b> | <p>Ethernet type field of a packet. The EtherType value specifies what protocol is being transported in the Ethernet frame. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>aarp (0x80F3)</b>—EtherType value AARP</li> <li>• <b>appletalk (0x809B)</b>—EtherType value AppleTalk</li> <li>• <b>arp (0x0806)</b>—EtherType value ARP</li> <li>• <b>fcoe (0x8906)</b>—EtherType value FCoE</li> <li>• <b>fip (0x8914)</b>—EtherType value FIP</li> <li>• <b>ipv4 (0x0800)</b>—EtherType value IPv4</li> <li>• <b>ipv6 (0x08DD)</b>—EtherType value IPv6</li> <li>• <b>mpls-multicast (0x8848)</b>—EtherType value MPLS multicast</li> <li>• <b>mpls-unicast (0x8847)</b>—EtherType value MPLS unicast</li> <li>• <b>oam (0x88A8)</b>—EtherType value OAM</li> <li>• <b>ppp (0x880B)</b>—EtherType value PPP</li> <li>• <b>pppoe-discovery (0x8863)</b>—EtherType value PPPoE Discovery Stage</li> <li>• <b>pppoe-session (0x8864)</b>—EtherType value PPPoE Session Stage</li> <li>• <b>sna (0x80D5)</b>—EtherType value SNA</li> </ul> | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                   |

| <b>icmp-code value</b>      | <p>ICMP code field. Because the meaning of the value depends upon the associated <b>icmp-type</b>, you must specify a value for <b>icmp-type</b> along with a value for <b>icmp-code</b>. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>• <i>IPv4</i>: parameter-problem—<b>ip-header-bad (0)</b>, <b>required-option-missing (1)</b></li> <li>• <i>IPv6</i>: parameter-problem—<b>ip6-header-bad (0)</b>, <b>unrecognized-next-header (1)</b>, <b>unrecognized-option (2)</b></li> <li>• <b>redirect—redirect-for-network (0)</b>, <b>redirect-for-host (1)</b>, <b>redirect-for-tos-and-net (2)</b>, <b>redirect-for-tos-and-host (3)</b></li> <li>• <b>time-exceeded—ttl-eq-zero-during-reassembly (1)</b>, <b>ttl-eq-zero-during-transit (0)</b></li> <li>• <i>IPv4</i>: <b>unreachable—network-unreachable (0)</b>, <b>host-unreachable (1)</b>, <b>protocol-unreachable (2)</b>, <b>port-unreachable (3)</b>, <b>fragmentation-needed (4)</b>, <b>source-route-failed (5)</b>, <b>destination-network-unknown (6)</b>, <b>destination-host-unknown (7)</b>, <b>source-host-isolated (8)</b>, <b>destination-network-prohibited (9)</b>, <b>destination-host-prohibited (10)</b>, <b>network-unreachable-for-TOS (11)</b>, <b>host-unreachable-for-TOS (12)</b>, <b>communication-prohibited-by-filtering (13)</b>, <b>host-precedence-violation (14)</b>, <b>precedence-cutoff-in-effect (15)</b></li> <li>• <i>IPv6</i>: <b>unreachable—address-unreachable (3)</b>, <b>administratively-prohibited (1)</b>, <b>no-route-to-destination (0)</b>, <b>port-unreachable (4)</b></li> </ul> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces</p> |

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches (*continued*)

| Match Condition                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Direction and Interface                                                                                                                                            |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-type</b> <i>value</i>                      | <p>ICMP message type field. Typically, you specify this match in conjunction with the <b>protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><i>IPv4</i>: <b>echo-reply</b> (0), <b>destination unreachable</b> (3), <b>source-quench</b> (4), <b>redirect</b> (5), <b>echo-request</b> (8), <b>IPv4 (inet)-advertisement</b> (9), <b>IPv4 (inet)-solicit</b> (10), <b>time-exceeded</b> (11), <b>parameter-problem</b> (12), <b>timestamp</b> (13), <b>timestamp-reply</b> (14), <b>info-request</b> (15), <b>info-reply</b> (16), <b>mask-request</b> (17), <b>mask-reply</b> (18)</p> <p><i>IPv6</i>: <b>destination-unreachable</b> (1), <b>packet-too-big</b> (2), <b>time-exceeded</b> (3), <b>parameter-problem</b> (4), <b>echo-request</b> (128), <b>echo-reply</b> (129), <b>membership-query</b> (130), <b>membership-report</b> (131), <b>membership-termination</b> (132), <b>router-solicit</b> (133), <b>router-advertisement</b> (134), <b>neighbor-solicit</b> (135), <b>neighbor-advertisement</b> (136), <b>redirect</b> (137), <b>router-renumbering</b> (138), <b>node-information-request</b> (139), <b>node-information-reply</b> (140)</p> <p>See also <b>icmp-code</b> <i>variable</i>.</p> | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> |
| <b>interface</b> <i>interface-name</i>             | <p>Interface on which the packet is received, including the logical unit. You can include the wildcard character (*) as part of an interface name or logical unit.</p> <p><b>NOTE:</b> An interface from which a packet is sent cannot be used as a match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p>                |
| <b>ip-destination-address</b> <i>address</i>       | IPv4 address that is the final destination node address for the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Ingress ports, egress ports, and VLANs.                                                                                                                            |
| <b>ip-options</b>                                  | Specify <b>any</b> to create a match if anything is specified in the options field in the IP header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Ingress ports, VLANs, and IPv4 (inet) interfaces.                                                                                                                  |
| <b>ip-precedence</b><br><b>ip-precedence-field</b> | <p>IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                                                                     |
| <b>ip-protocol</b> <i>number</i>                   | IP protocol field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                                                                     |

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches (*continued*)

| Match Condition                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                          | Direction and Interface                                                                               |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>ip-source-address</b> <i>address</i> | IPv4 address of the source node sending the packet.                                                                                                                                                                                                                                                                                                                                                                                  | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                               |
| <b>ip-version</b> <i>address</i>        | IP version of the packet. Use this condition to match IPv4 or IPv6 header fields in traffic that arrives on a Layer 2 port or VLAN interface.                                                                                                                                                                                                                                                                                        | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                               |
| <b>is-fragment</b>                      | Using this condition causes a match if the More Fragments flag is enabled in the IP header or if the fragment offset is not zero.                                                                                                                                                                                                                                                                                                    | Ingress ports, VLANs, and IPv4 (inet) interfaces.<br><br>Egress IPv4 (inet) interfaces.               |
| <b>learn-ip-priority</b> <i>number</i>  | Matches the specified IEEE 802.1p VLAN priority bits in the range 0-7.                                                                                                                                                                                                                                                                                                                                                               | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                               |
| <b>learn-vlan-id</b> <i>number</i>      | Matches the ID of a normal VLAN or the ID of the outer (service) VLAN (for Q-in-Q VLANs). To use filter memory most efficiently and maximize the number of possible filters, use this condition in addition to <b>user-id</b> when you want to match on the inner (customer) VLAN ID. The acceptable values are 1-4095.                                                                                                              | Ingress ports and VLANs.<br><br>Egress ports and VLANs.                                               |
| <b>next-header</b> <i>value</i>         | IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):<br><br><b>hop-by-hop (0), icmp (1), icmp6 (58), igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b> | Ingress IPv6 (inet6) interfaces.<br><br>Egress IPv6 (inet6) interfaces.                               |
| <b>packet-length</b> <i>number</i>      | Packet length in bytes. You must enter a number between 0 and 65535.                                                                                                                                                                                                                                                                                                                                                                 | Ingress ports, VLANs, IPv4 (inet), and IPv6 (inet6) interfaces.<br><br>Egress IPv4 (inet) interfaces. |

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches (*continued*)

| Match Condition                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Direction and Interface                                                                                                                                            |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>precedence value</b>                         | <p>IP precedence bits in the type-of-service (ToS) byte in the IP header. (This byte can also be used for the DiffServ DSCP.) In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>routine (0)</b></li> <li>• <b>priority (1)</b></li> <li>• <b>immediate (2)</b></li> <li>• <b>flash (3)</b></li> <li>• <b>flash-override (4)</b></li> <li>• <b>critical-ecp (5)</b></li> <li>• <b>internet-control (6)</b></li> <li>• <b>net-control (7)</b></li> </ul> | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                                                                       |
| <b>protocol type</b>                            | <p>IPv4 or IPv6 protocol value. In place of the numeric value, you can specify one of the following text synonyms (the numeric values are also listed):</p> <p><b>hop-by-hop (0), icmp (1), icmp6, igmp (2), ipip (4), tcp (6), egp (8), udp (17), ipv6 (41), routing (43), fragment (44), rsvp (46), gre (47), esp (50), ah (51), icmp6 (58), no-next-header (59), dstopts (60), ospf (89), pim (103), vrrp (112), sctp (132)</b></p>                                                                                                                                       | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                                                                       |
| <b>source-address</b><br><b>ip-address</b>      | IP source address field, which is the address of the node that sent the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Ingress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces and IPv6 (inet6) interfaces.</p>                               |
| <b>source-mac-address</b><br><b>mac-address</b> | Source media access control (MAC) address of the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                                                                     |
| <b>source-port value</b>                        | TCP or UDP source port. Typically, you specify this match in conjunction with the <b>protocol</b> match statement. In place of the numeric field, you can specify one of the text synonyms listed under <b>destination-port</b> .                                                                                                                                                                                                                                                                                                                                            | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> |
| <b>source-prefix-list</b> <i>prefix-list</i>    | IP source prefix list. You can define a list of IP address prefixes under a prefix-list alias for frequent use. Define this list at the <b>[edit policy-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                        | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> |

Table 475: Supported Match Conditions for Firewall Filters on QFX10000 Switches (*continued*)

| Match Condition            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Direction and Interface                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>tcp-established</b>     | <p>Match packets of an established TCP connection. This condition matches packets other than those used to set up a TCP connection—that is, three-way handshake packets are not matched.</p> <p>When you specify <b>tcp-established</b>, a switch does not implicitly verify that the protocol is TCP. You must also specify the <b>protocol tcp</b> match condition.</p>                                                                                                                                                                                                                                                                                                 | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| <b>tcp-flags value</b>     | <p>One or more TCP flags:</p> <ul style="list-style-type: none"> <li>• <b>ack</b> (0x10)</li> <li>• <b>fin</b> (0x01)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>urgent</b> (0x20)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| <b>tcp-initial</b>         | <p>Match the first TCP packet of a connection. A match occurs when the TCP flag <b>SYN</b> is set and the TCP flag <b>ACK</b> is not set.</p> <p>When you specify <b>tcp-initial</b>, a switch does not implicitly verify that the protocol is TCP. You must also specify the <b>protocol tcp</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                    | <p>Ingress ports, VLANs, IPv4 (inet) interfaces, and IPv6 (inet6) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p> |
| <b>traffic-class value</b> | <p>8-bit field that specifies the class-of-service (CoS) priority of the packet. The traffic-class field is used to specify a DiffServ code point (DSCP) value. This field was previously used as the type-of-service (ToS) field in IPv4, and, the semantics of this field (for example, DSCP) are identical to those of IPv4.</p> <p>You can specify one of the following text synonyms (the field values are also listed):</p> <p><b>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38), cs0 (0), cs1 (8), cs2 (16), cs3 (24), cs4 (32), cs5 (40), cs6 (48), cs7 (56), ef (46)</b></p> | <p>Ingress IPv6 (inet6) interfaces.</p> <p>Egress IPv6 (inet6) interfaces.</p>                                          |
| <b>ttl value</b>           | <p>IP Time-to-live (TTL) field in decimal. The value can be 1–255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Ingress IPv4 (inet) interfaces.</p> <p>Egress IPv4 (inet) interfaces.</p>                                            |
| <b>user-vlan-id number</b> | <p>Matches the ID of the inner (customer) VLAN in a Q-in-Q VLAN. To use filter memory most efficiently and maximize the number of possible filters, use in combination with <b>learn-vlan-id</b> to match the outer (service) VLAN ID. The acceptable values are 1–4095.</p>                                                                                                                                                                                                                                                                                                                                                                                              | <p>Ingress ports and VLANs.</p> <p>Egress ports and VLANs.</p>                                                          |

Use **then** statements to define actions that should occur if a packet matches all conditions in a **from** statement. [Table 476](#) shows the actions that you can specify in a term. (If you do not include a **then** statement, the system accepts packets that match the filter.)

**Table 476: Actions for Firewall Filters on QFX10000 Switches**

| Action                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>accept</b>                                | Accept a packet. This is the default action for packets that match a term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>discard</b>                               | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>reject <i>message-type</i></b>            | <p>Discard a packet and send a “destination unreachable” ICMPv4 message (type 3). To log rejected packets, configure the <b>syslog</b> action modifier.</p> <p>You can specify one of the following message types: <b>administratively-prohibited</b> (default), <b>bad-host-tos</b>, <b>bad-network-tos</b>, <b>host-prohibited</b>, <b>host-unknown</b>, <b>host-unreachable</b>, <b>network-prohibited</b>, <b>network-unknown</b>, <b>network-unreachable</b>, <b>port-unreachable</b>, <b>precedence-cutoff</b>, <b>precedence-violation</b>, <b>protocol-unreachable</b>, <b>source-host-isolated</b>, <b>source-route-failed</b>, or <b>tcp-reset</b>.</p> <p>If you specify <b>tcp-reset</b>, the system sends a TCP reset if the packet is a TCP packet; otherwise nothing is sent.</p> <p>If you do not specify a message type, the ICMP notification “destination unreachable” is sent with the default message “communication administratively filtered.”</p> <p><b>NOTE:</b> The <b>reject</b> action is supported on ingress interfaces only.</p> |
| <b>routing-instance <i>instance-name</i></b> | Forward matched packets to a virtual routing instance. (The only supported instance type is <b>virtual-router</b> .) Packets can be forwarded to the default instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>vlan <i>VLAN-name</i></b>                 | <p>Forward matched packets to a specific VLAN.</p> <p><b>NOTE:</b> The <b>vlan</b> action is supported on ingress interfaces only.</p> <p><b>NOTE:</b> This action is not supported on OCX series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

You can also specify the action modifiers listed in [Table 477](#) to count, mirror, rate-limit, and classify packets.

**Table 477: Action Modifiers for Firewall Filters on QFX10000 Switches**

| Action Modifier                  | Description                                      |
|----------------------------------|--------------------------------------------------|
| <b>count <i>counter-name</i></b> | Count the number of packets that match the term. |

Table 477: Action Modifiers for Firewall Filters on QFX10000 Switches (*continued*)

| Action Modifier                                              | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>forwarding-class</b> <i>class</i>                         | <p>Classify the packet in one of the following default forwarding classes, or in a user-defined forwarding class:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b></li> <li>• <b>fcoe</b></li> <li>• <b>mcast</b></li> <li>• <b>network-control</b></li> <li>• <b>no-loss</b></li> </ul> <p><b>NOTE:</b> To configure a forwarding class, you must also configure loss priority.</p> |
| <b>log</b>                                                   | <p>Log the packet's header information in the Routing Engine. To view this information, enter the <b>show firewall log</b> operational mode command.</p> <p><b>NOTE:</b> The <b>log</b> action modifier is supported on ingress interfaces only.</p>                                                                                                                                                |
| <b>loss-priority</b> (low   medium-low   medium-high   high) | <p>Set the packet loss priority (PLP).</p> <p><b>NOTE:</b> The <b>loss-priority</b> action modifier is supported on ingress interfaces only.</p> <p><b>NOTE:</b> The <b>loss-priority</b> action modifier is not supported in combination with the <b>policer</b> action.</p>                                                                                                                       |
| <b>policer</b> <i>policer-name</i>                           | <p>Send packets to a policer (for the purpose of applying rate limiting).</p> <p>You can specify a policer for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) firewall filters.</p> <p><b>NOTE:</b> The <b>policer</b> action modifier is not supported in combination with the <b>loss-priority</b> action.</p>                                                                      |
| <b>port-mirror</b>                                           | <p>(ELS platforms) Mirror traffic (copy packets) to an output interface configured in a port-mirroring instance at the <b>[edit forwarding-options port-mirroring]</b> hierarchy level.</p> <p>You can specify port mirroring for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) firewall filters.</p>                                                                                |
| <b>port-mirror-instance</b> <i>port-mirror-instance-name</i> | <p>(ELS platforms) Mirror traffic to a port-mirroring instance configured at the <b>[edit forwarding-options port-mirroring]</b> hierarchy level.</p> <p>You can specify port mirroring for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) firewall filters.</p> <p><b>NOTE:</b></p>                                                                                                  |
| <b>syslog</b>                                                | <p>Log an alert for this packet.</p> <p><b>NOTE:</b> The <b>syslog</b> action modifier is supported on ingress interfaces only.</p>                                                                                                                                                                                                                                                                 |

Table 477: Action Modifiers for Firewall Filters on QFX10000 Switches (*continued*)

| Action Modifier                                            | Description                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>three-color-policer</b> <i>three-color-policer-name</i> | <p>Send packets to a three-color policer (for the purpose of applying rate limiting).</p> <p>You can specify a three-color policer for ingress and egress port, VLAN, IPv4 (inet), and IPv6 (inet6) filters.</p> <p><b>NOTE:</b> The <b>policer</b> action modifier is not supported in combination with the <b>loss-priority</b> action.</p> |

## Understanding How a Firewall Filter Tests a Protocol

When examining match conditions in a firewall filter, a switch tests only the fields that you specify. It does not implicitly test any fields that you do not explicitly configure. For example, if you specify a match condition of **source-port ssh**, there is no implied test to determine if the protocol is TCP. In this case, the switch considers any packet that has a value of **22** (decimal) in the 2-byte field that follows a *presumed* IP header to be a match. To ensure that the term matches on TCP packets, you also specify an **ip-protocol tcp** match condition.

For the following match conditions, you should explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify protocol **tcp** or protocol **udp**.
- **icmp-code**—Specify protocol **icmp** and **icmp-type**.
- **icmp-type**—Specify protocol **icmp** or protocol **icmp6**.
- **source-port**—Specify protocol **tcp** or protocol **udp**.
- **tcp-flags**—Specify protocol **tcp**.

## Understanding Firewall Filter Planning

---

Before you create a firewall filter and apply it, determine what you want the filter to accomplish and how to use its match conditions and actions to achieve your goals. It is important that you understand how packets are matched, the default and configured actions of the firewall filter, and where to apply the firewall filter.

You can apply no more than one firewall filter per port, VLAN, or router interface per direction (input and output). For example, for a given port you can apply at most one filter in the input direction and one filter in the output direction. You should try to be conservative in the number of terms (rules) that you include in each firewall filter, because a large number of terms requires longer processing time during a commit operation and can make testing and troubleshooting more difficult.

Before you configure and apply firewall filters, answer the following questions for each of them:

1. What is the purpose of the filter?

For example, the system can drop packets based on header information, rate-limit traffic, classify packets into forwarding classes, log and count packets, or prevent denial-of-service attacks.

2. What are the appropriate match conditions? Determine the packet header fields that the packet must contain for a match. Possible fields include:

- Layer 2 header fields—Source and destination MAC addresses, 802.1Q tag, Ethernet type, or VLAN.
- Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, or TTL type).
- TCP header fields—Source and destination ports and flags.
- ICMP header fields—Packet type and code.

3. What are the appropriate actions to take if a match occurs?

The system can accept, discard, or reject packets.

4. What additional action modifiers might be required?

For example, you can configure the system to mirror (copy) packets to a specified port, count matching packets, apply traffic management, or police packets.

5. On what port, router interface, or VLAN should the firewall filter be applied?

Start with the following basic guidelines:

- If packets entering or leaving a Layer 2 interface (port) need to be filtered, apply the filter at the **[edit family ethernet switching filter]** hierarchy level. This is a port filter.
- If packets entering or leaving any port in a specific VLAN need to be filtered, use a VLAN filter.

- If packets entering or leaving a Layer 3 (routed) interface or routed VLAN interface (RVI) need to be filtered, use a router firewall filter. Apply the filter to the interface at the **[edit family inet]** hierarchy level. You can also apply a router firewall filter on a loopback interface.

Before you choose the interface or VLAN on which to apply a firewall filter, understand how that placement can affect traffic flow to other interfaces. In general, apply a filter close to the source device if the filter matches on source or destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP or UDP port numbers. However, you should apply a filter close to the destination device if the filter matches *only* on a source IP address. When you apply a filter too close to the source device, the filter could prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

6. In which direction should the firewall filter be applied?

You typically configure different actions for traffic entering an interface than you configure for traffic exiting an interface.

7. How many filters should I create?

See “[Planning the Number of Firewall Filters to Create](#)” on page 5973 for information about how many firewall filters you can apply.

## Understanding How Many Firewall Filters Are Supported

QFX3500, QFX3600, QFX5100, and EX4600 switches, QFabric Node devices, and VCF members support the maximum numbers of firewall filter terms per type of attachment point shown in [Table 478](#).

Table 478: Supported Firewall Filter Numbers

| Filter Type | QFX3500, QFX3600 | QFX5100, EX4600 | QFX5200 | QFX10000 |
|-------------|------------------|-----------------|---------|----------|
| Ingress     | 768              | 1536            | 768     | 8192     |
| Egress      | 1024             | 1024            | 1024    | 8192     |

On QFX5100 and QFX5200 switches, you can see how many filters have been programmed of each type by entering **show pfe filter hw summary**.

The totals are applied in aggregate. For example, on the QFX3500 and QFX3600 you can apply a total of 768 terms in all your port filters, Layer 3 filters, and VLAN filters that are applied in the input direction and 1024 terms in port filters, Layer 3 filters, and VLAN filters that are applied in the output direction.

**NOTE:** If you want to create more than 512 egress VLAN filters, your first VLAN ID should be 6 and the subsequent VLAN IDs should increase by 1. For example, to create 1024 egress VLAN filters, the first VLAN ID would be 6, the second ID would be 7, and the sequence would continue through VLAN ID 1029. Similarly, if you want to create fewer than 512 egress VLAN filters but want the total number of terms in those filters to exceed 512, you should number your VLAN IDs in the same manner. If you do not use this approach to create your VLAN IDs, the total number of allowed terms or filters will be less than 1024 and might be 512.

The ternary content addressable memory (TCAM) for firewall filters is divided into slices that accommodate 256 terms, and all the terms in a memory slice must be in filters of the same type and applied in the same direction. A memory slice is reserved as soon as you commit a filter. For example, if you create a port filter and apply it in the input direction, a memory slice is reserved that will only store ingress port filters. If you create and apply only one ingress port filter and that filter has only one term, the rest of this slice is unused and is unavailable for other filter types.

Continuing with the above example for QFX3500 and QFX3600 switches, assume that you create and apply 256 ingress port filters with one term each so that one memory slice is filled. This leaves two more memory slices available for ingress filters. (Remember that the maximum number of ingress terms is 768.) If you then create and apply an ingress Layer 3 filter with one term, another memory slice is reserved for ingress Layer 3 filters. As before, the rest of the slice is unused and is unavailable for different filter types. At this point there is one memory slice available for any ingress filter type.

Now assume that you create and apply a VLAN ingress filter. The final memory slice is reserved for VLAN ingress filters. Memory allocation for ingress filters (once again assuming one term per filter) is as follows:

- Slice 1: Filled with 256 ingress port filters. You cannot commit any more ingress port filters.

- Slice 2: Contains one ingress Layer 3 filter with one term. You can commit 255 more terms in ingress Layer 3 filters.
- Slice 3: Contains one ingress VLAN filter with one term. You can commit 255 more terms in ingress VLAN filters.

Here is another example for QFX3500 and QFX3600 switches. Assume that you create 257 ingress port filters with one term per filter—that is, you create one more term than a single memory slice can accommodate. When you apply the filters and commit the configuration, the filter memory allocation is:

- Slice 1: Filled with 256 ingress port filters. You cannot apply any more ingress port filters.
- Slice 2: Contains one ingress port filter. You can apply 255 more terms in ingress port filters.
- Slice 3: This slice is unassigned. You can create and apply 256 terms in ingress filters of any type (port, Layer 3, or VLAN), but all the filters must be of the same type.

## Egress Filters

All of the preceding principles also apply to egress filters, but four memory slices are used because IPv4 Layer 3 filters and IPv6 Layer 3 filters are stored in separate slices. The memory slices for egress filters are the same size as those for ingress filters, so the maximum number of egress filter terms is therefore 1024.

## Avoid Configuring too Many Filters

If you violate any of these restrictions and commit a configuration that is not in compliance, Junos OS rejects the excessive filters. For example, if you configure 300 ingress port filters and 300 ingress Layer 3 filters and try to commit the configuration, Junos OS does the following (again assuming one term per filter):

- Accepts the 300 ingress port filters (storing them in two memory slices).
- Accepts the first 256 ingress Layer 3 filters it processes (storing them in the third memory slice).
- Rejects the remaining 44 ingress Layer 3 filters.

**NOTE:** In this situation, be sure to delete excessive filters (for example, the remaining 44 ingress Layer 3 filters) from the configuration before you reboot the device. If you reboot a device that has a noncompliant configuration, you cannot predict which filters are installed after the reboot. Using the example above, the 44 ingress Layer 3 filters that were originally rejected might be installed, and 44 of the port filters that were originally accepted might be rejected.

## Configuring TCAM Error Messages

You can configure your switch to display error messages if a filter cannot be installed because there isn't enough TCAM space available. To have TCAM error messages sent to a syslog file, enter

```
set system syslog file filename pfe emergency
```

To have TCAM error messages sent to the console, enter

```
set system syslog console pfe emergency
```

To have TCAM error messages sent to an SSH terminal session, enter

```
set system syslog user user-login pfe emergency
```

## Policers can Limit Egress Filters

On some switches, the number of egress policers that you configure can affect the total number of allowed egress firewall filters. (This issue does not affect QFX10000 switches.) On the affected switches, every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem from occurring by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Planning for Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented above to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Planning for Filter-Based Forwarding

You can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature—called filter-based forwarding—you specify a filter and match criteria and then specify the virtual routing instance to send packets to. Filters used in this way also consume memory in an additional TCAM. See *Understanding FIP Snooping, FBF, and MVR Filter Scalability* for more information. The section *FBF Filter VFP TCAM Consumption* in this topic specifically addresses the number of supported filters when using filter-based forwarding.

**WARNING:** Filter-based forwarding does not work with IPv6 interfaces on some Juniper switches.

## Understanding Firewall Filter Processing Points for Bridged and Routed Packets

---

You apply firewall filters at multiple processing points in the forwarding path. At each processing point, the action to be taken on a packet is determined by the configuration of the filter and the results of the lookup in the forwarding or routing table.

For both bridged (Layer 2) unicast packets and routed (Layer 3) unicast packets, firewall filters are applied in the prescribed order shown below (assuming that each filter is present and a packet is accepted by each one).

Bridged packets:

1. Ingress port filter
2. Ingress VLAN filter
3. Egress VLAN filter
4. Egress port filter

Routed packets:

1. Ingress port firewall filter
2. Ingress VLAN firewall filter (Layer 2 CoS)
3. Ingress router firewall filter (Layer 3 CoS)
4. Egress router firewall filter
5. Egress VLAN firewall filter
6. Egress port filter

**NOTE:** MAC learning occurs before filters are applied, so switches learn the MAC addresses of packets that are dropped by ingress filters.

## Configuring Firewall Filters

---

You can configure firewall filters in a switch to control traffic that enters switch ports or enters and exits VLANs and Layer 3 (routed) interfaces. To use a firewall filter, you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

- [Configuring a Firewall Filter on page 5979](#)
- [Applying a Firewall Filter to a Port on page 5980](#)

- [Applying a Firewall Filter to a VLAN on page 5981](#)
- [Applying a Firewall Filter to a Layer 3 \(Routed\) Interface on page 5981](#)

## Configuring a Firewall Filter

To configure a firewall filter:

1. Configure the family address type, filter name, term name, and at least one match condition—for example, match on packets that contain a specific source address:

```
[edit]
user@switch# set firewall family ethernet-switching filter ingress-port-filter term term-one
from source-address 192.0.2.14
```

For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching**. For a firewall filter that is applied to a Layer 3 (routed) interface, specify the family address type **inet**.

The filter and term names can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. Each filter name must be unique. A filter can contain one or more terms, and each term name must be unique within a filter.

2. Configure additional match conditions. For example, match on packets that contain a specific source port:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one from]
user@switch# set source-port 80
```

You can specify one or more match conditions in a single **from** statement. For a match to occur, the packet must match all the conditions in the term. The **from** statement is optional, but if included in a term, it cannot be empty. If you omit the **from** statement, all packets are considered to match.

3. If you want to apply a firewall filter to multiple interfaces and be able to see counters specific to each interface, configure the **interface-specific** option:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set interface-specific
```

4. In each firewall filter term, specify the actions to take if the packet matches all the conditions in that term. You can specify an action and action modifiers:

- To specify a filter action, for example, to discard packets that match the conditions of the filter term:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one then]
user@switch# set discard
```

You can specify no more than one action (**accept**, **discard**, **reject**, **routing-instance**, or **vlan**) per term.

- To specify action modifiers, for example, to count and classify packets to a forwarding class:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one then]
user@switch# set count counter-one
user@switch# set forwarding-class expedited-forwarding
user@switch# set loss-priority high
```

You can specify any of the following action modifiers in a **then** statement:

- **analyzer** *analyzer-name*—Mirror port traffic to a specified analyzer, which you must configure at the **[ethernet-switching-options]** level.
- **count** *counter-name*—Count the number of packets that pass this filter term.

**NOTE:** We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

**NOTE:** On QFX3500 and QFX3600 switches, filters automatically count packets that have been dropped on ingress because of cyclic redundancy check (CRC) errors.

- **forwarding-class** *class*—Assign packets to a forwarding class.
- **log**—Log the packet header information in the Routing Engine.
- **loss-priority** *priority*—Set the priority of dropping a packet.
- **policer** *policer-name*—Apply rate-limiting to the traffic.
- **syslog**—Log an alert for this packet.

If you omit the **then** statement or do not specify an action, packets that match all the conditions in the **from** statement are accepted. However, you should always explicitly configure an action in the **then** statement. You can include no more than one action statement, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the **from** statement must match.

**NOTE:** Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

## Applying a Firewall Filter to a Port

To apply a firewall filter to an ingress port:

1. Provide a meaningful description of the firewall filter in the configuration of the port to which the filter will be applied:

```
[edit]
user@switch# set interfaces ge-0/0/6 description "filter to limit tcp traffic at trunk port for employee-vlan"
```

2. Apply the filter to the interface, specifying the unit number, family address type, the direction of the filter (for packets entering the port), and the filter name:

```
[edit]
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input ingress-port-filter
```

For firewall filters that are applied to ports, the family address type must be **ethernet-switching**.

**NOTE:** You can apply only one filter to a port for a given direction (ingress or egress).

## Applying a Firewall Filter to a VLAN

To apply a firewall filter to a VLAN:

1. Provide a meaningful description of the firewall filter in the configuration of the VLAN to which the filter will be applied:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 description "filter to block rogue devices
on employee-vlan"
```

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:

- To apply a filter to match packets that are entering the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter input ingress-vlan-rogue-block
```

- To apply a firewall filter to match packets that are exiting the VLAN:

```
[edit]
user@switch# set vlans employee-vlan vlan-id 20 filter output egress-vlan-filter
```

**NOTE:** You can apply only one filter to a VLAN for a given direction (ingress or egress).

## Applying a Firewall Filter to a Layer 3 (Routed) Interface

To apply a firewall filter to a Layer 3 routed interface:

1. Provide a meaningful description of the firewall filter in the configuration of the interface to which the filter will be applied:

```
[edit]
user@switch# set interfaces ge-0/1/6 description "filter to count and monitor traffic on layer
3 interface"
```

2. You can apply firewall filters to filter packets that enter or exit a Layer 3 routed interface:

- To apply a firewall filter to filter packets that enter a Layer 3 interface:

```
[edit]
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter input ingress-router-filter
```

- To apply a firewall filter to filter packets that exit a Layer 3 interface:

```
[edit]
user@switch# set interfaces ge-0/1/6 unit 0 family inet filter output egress-router-filter
```

For firewall filters applied to Layer 3 routed interfaces, the family address type must be **inet**.

**NOTE:** You can apply only one filter to an interface for a given direction (ingress or egress).

---

## Applying Firewall Filters to Interfaces

For a firewall filter to work, you must apply it to at least one interface. To do this, include the **filter** statement when configuring a logical interface at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family family-name filter (input |
output) filter-name
```

In the **input** statement, specify a firewall filter to be evaluated when packets are received on the interface. Input filters applied to a loopback interface affect only traffic destined for the Routing Engine.

In the **output** statement, specify a filter to be evaluated when packets exit the interface.

**NOTE:** When you create a loopback interface, it is important to apply an ingress filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface **lo0**, you include the **apply-groups** statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including **lo0** and other loopback interfaces.

**Related  
Documentation**

- [Configuring Firewall Filters on page 5978](#)

## Understanding Filter-Based Forwarding

You can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature—called filter-based forwarding—you specify a filter and match criteria and then specify the virtual routing instance to send packets to.

You might want to use filter-based forwarding to route specific types of traffic through a firewall or other security device before the traffic continues on its path. You can also use filter-based forwarding to give certain types of traffic preferential treatment. For example, you might want to ensure that the highest-priority traffic is forwarded over a 40-Gigabit Ethernet link. You might also use filter-based forwarding to obtain more control over load balancing than dynamic routing protocols provide.

**NOTE:** You can create as many as 128 filters or terms that direct packets to a given virtual routing instance.

### Related Documentation

- [Understanding Virtual Router Routing Instances on page 3232](#)
- [Overview of Firewall Filters on page 5951](#)
- [Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on page 5983](#)

## Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device

You can configure filter-based forwarding by using a firewall filter to forward matched traffic to a specific virtual routing instance.

This example describes how to set up filter-based forwarding:

- [Requirements on page 5983](#)
- [Overview and Topology on page 5983](#)
- [Configuration on page 5984](#)
- [Verification on page 5986](#)

### Requirements

This example requires Junos OS Release 15.1X53-D10 or later on a QFX10000 switch..

### Overview and Topology

In this example, traffic from one application server that is destined for a different application server is matched by a firewall filter based on the IP address of the source application server. Any matching packets are routed to a virtual routing instance that sends the traffic to a security device. In this case, the security device must be able to

forward the traffic to the destination application server. For this example, assume that the address of the destination application server is 192.168.0.1.

**WARNING:** Filter-based forwarding does not work with IPv6 interfaces on some Juniper switches.

## Configuration

To configure filter-based forwarding:

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste them into the CLI at the **[edit]** hierarchy level.

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.0.1/24
set interfaces xe-0/0/3 unit 0 family inet address 10.1.3.1/24
set firewall family inet filter f1 term t1 from source-address 10.1.0.50/32
set firewall family inet filter f1 term t1 from protocol tcp
set interfaces xe-0/0/0 unit 0 family inet filter input f1
set routing-instances vrf01 instance-type virtual-router
set routing-instances vrf01 interface xe-0/0/3.0
set routing-instances vrf01 routing-options static route 192.168.0.1/24 next-hop 10.1.3.254
set firewall family inet filter f1 term t1 then routing-instance vrf01
```

### Step-by-Step Procedure

To configure filter-based forwarding:

1. Configure an interface to connect to the application server:  

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet address 10.1.0.1/24
```
2. Configure an interface to connect to the security device:  

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet address 10.1.3.1/24
```
3. Create a firewall filter that matches packets based on the address of the application server that the traffic will be sent from. Also configure the filter so that it matches only TCP packets:  

```
[edit firewall]
user@switch# set family inet filter f1 term t1 from source-address 10.1.0.50/32
user@switch# set firewall family inet filter f1 term t1 from protocol tcp
```
4. Apply the filter to the interface that connects to the source application server and configure it to match incoming packets:  

```
[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family inet filter input f1
```
5. Create a virtual router:  

```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```
6. Associate the virtual router with the interface that connects to the security device:  

```
[edit routing-instances]
user@switch# set vrf01 interface xe-0/0/3.0
```
7. Configure the routing information for the virtual routing instance:  

```
[edit routing-instances]
```

```

user@switch# set vrf01 routing-options static route 192.168.0.1/24 next-hop 10.1.3.254
8. Set the filter to forward packets to the virtual router:

[edit firewall]
user@switch# set family inet filter f1 term t1 then routing-instance vrf01

```

## Results

Check the results of the configuration:

```

user@switch> show configuration
interfaces {
 xe-0/0/0 {
 unit 0 {
 family inet {
 filter {
 input f1;
 }
 address 10.1.0.1/24;
 }
 }
 }
 xe-0/0/3 {
 unit 0 {
 family inet {
 address 10.1.3.1/24;
 }
 }
 }
}
firewall {
 family inet {
 filter f1 {
 term t1 {
 from {
 source-address {
 10.1.0.50/32;
 }
 protocol tcp;
 }
 then {
 routing-instance vrf01;
 }
 }
 }
 }
}
routing-instances {
 vrf01 {
 instance-type virtual-router;
 interface xe-0/0/1.0;
 routing-options {
 static {
 route 12.34.56.0/24 next-hop 10.1.3.254;
 }
 }
 }
}

```

```

 }
 }

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That Filter-Based Forwarding Was Configured on page 5986](#)

### Verifying That Filter-Based Forwarding Was Configured

**Purpose** Verify that filter-based forwarding was properly enabled on the switch.

**Action** 1. Use the `show interfaces filters` command:

```

user@switch> show interfaces filters xe-0/0/0.0
Interface Admin Link Proto Input Filter Output Filter
xe-0/0/0.0 up down inet f1

```

2. Use the `show route forwarding-table` command:

```

user@switch> show route forwarding-table

Routing table: default.inet

Routing table: default.iso
ISO:

```

| Destination | Type | RtRef | Next hop | Type | Index | NhRef | Netif |
|-------------|------|-------|----------|------|-------|-------|-------|
| default     | perm | 0     |          | rjct | 60    | 1     |       |

Routing table: vrf01.iso

ISO:

| Destination | Type | RtRef | Next hop | Type | Index | NhRef | Netif |
|-------------|------|-------|----------|------|-------|-------|-------|
| default     | perm | 0     |          | rjct | 600   | 1     |       |

**Meaning** The output indicates that the filter was created on the interface and that the virtual routing instance is forwarding matching traffic to the correct IP address.

## Monitoring Firewall Filter Traffic

You can use operational mode commands to monitor firewall filter traffic.

- [Monitoring Traffic for All Firewall Filters and Policers That Are Configured on page 5987](#)
- [Monitoring Traffic for a Specific Firewall Filter on page 5988](#)
- [Monitoring Traffic for a Specific Policar on page 5988](#)

### Monitoring Traffic for All Firewall Filters and Policers That Are Configured

**Purpose** Monitor the number of packets and bytes that matched the firewall filters and monitor the number of packets that exceeded policer rate limits:

**Action** Use the **show firewall** operational mode command:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name Bytes Packets
counter-employee-web 3348 27
Filter: ingress-port-limit-tcp-icmp
Counters:
Name Bytes Packets
icmp-counter 560 10
Policers:
Name Packets
icmp-connection-policer 10
tcp-connection-policer 0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show firewall** command displays the names of all firewall filters, counters, and policers that are configured. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter

is specified. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits.

## Monitoring Traffic for a Specific Firewall Filter

**Purpose** Monitor the number of packets and bytes that matched a firewall filter and monitor the number of packets that exceeded policer rate limits.

**Action** Use the **show firewall filter *filter-name*** operational mode command:

```
user@switch> show firewall filter ingress-port-limit-tcp-icmp
Filter: ingress-port-limit-tcp-icmp
Counters:
Name Bytes Packets
icmp-counter 560 10
```

**Meaning** The **show firewall filter *filter-name*** command limits the display information to the counters and policers that are defined for the specified filter.

## Monitoring Traffic for a Specific Policer

**Purpose** Monitor the number of packets that exceeded the rate limits of a policer:

**Action** Use the **show firewall policer *policer-name*** operational mode command:

```
user@switch> show firewall policer icmp-connection-policer
Filter: ingress-port-limit-tcp-icmp
Policers:
Name Packets
icmp-connection-policer 10
```

**Meaning** The **show firewall policer *policer-name*** command displays the number of packets that exceeded the rate limits for the specified policer.

**Related Documentation**

---

## Verifying That Firewall Filters Are Operational

**Purpose** Verify that firewall filters are working properly.

**Action** Use the **show firewall** operational mode command to verify that the firewall filters are working properly:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name Bytes Packets
counter-employee-web 0 0
Filter: ingress-port-limit-tcp-icmp
Counters:
```

| Name                             | Bytes   | Packets |
|----------------------------------|---------|---------|
| icmp-counter                     | 560     | 10      |
| Policers:                        |         |         |
| Name                             | Packets |         |
| icmp-connection-policer          | 10      |         |
| tcp-connection-policer           | 0       |         |
| Filter: ingress-vlan-rogue-block |         |         |
| Filter: ingress-vlan-limit-guest |         |         |

**Meaning** The **show firewall** command displays the names of all firewall filters, counters, and policers that are configured. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. In the above example, the **icmp-counter** in the filter **ingress-port-limit-tcp-icmp** shows that the filter matched 10 packets. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits. The policer **icmp-connection-policer** shows that 10 ICMP packets were policed.

## Troubleshooting Firewall Filters

Use the following information to troubleshoot your firewall filter configuration.

- [Troubleshooting QFX10000 Switches on page 5989](#)
- [Troubleshooting Other Switches on page 5990](#)

## Troubleshooting QFX10000 Switches

This section describes issues specific to QFX10000 switches:

- [Do Not Combine Match Conditions for Different Layers on page 5989](#)
- [Layer 2 Packets Cannot be Discarded with Firewall Filters on page 5989](#)
- [Protect-RE \(loopback\) Firewall Filter Does Not Filter Packets Applied to EM0 Interfaces on page 5990](#)

### Do Not Combine Match Conditions for Different Layers

On QFX10000 switches, do not combine match conditions for Layer 2 and any other layer in a **family ethernet-switching** filter. (For example, do not include conditions that match MAC addresses and IP addresses in the same filter.) If you do so, the filter will commit successfully but will not work. You will also see the following log message: **L2 filter *filter-name* doesn't support mixed L2 and L3/L4 match conditions. Please re-config.**

### Layer 2 Packets Cannot be Discarded with Firewall Filters

**Problem Description:** Layer 2 (L2) control packets such as Link Layer Discovery Protocol (LLDP) and bridge protocol data unit (BPDU) cannot be discarded with firewall filters.

**Solution** Configure distributed denial-of-service (DDoS) protection on the L2 control packet and set the aggregate policer bandwidth and burst values to the minimum value of 1. For example,

```
[edit system ddos-protection protocols protocol name]
user@host# set aggregate bandwidth 1
```

```
[edit system ddos-protection protocols protocol name]
user@host# set aggregate burst 1
```

### Protect-RE (loopback) Firewall Filter Does Not Filter Packets Applied to EMO Interfaces

**Problem** **Description:** On QFX10000 switches, the Protect-RE (loopback) firewall filter does not filter packets applied to EMO interfaces including SNMP, Telnet, and other services.

**Solution** This is expected behavior.

## Troubleshooting Other Switches

This section describes issues specific to QFX switches other than QFX10000 switches. This information also applies to OCX1100 switches and EX4600 switches.

### Firewall Filter Configuration Returns a No Space Available in TCAM Message

**Problem** **Description:** When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available

in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

**Solution** When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

---

### Filter Counts Previously Dropped Packet

---

- Problem**    **Description:** If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:
- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
  - You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

**Solution**    This is expected behavior.

### Matching Packets Not Counted

---

**Problem** **Description:** If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet. For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **adminVLAN**, and interface xe-0/0/1 is a member of that VLAN.
- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

**Solution** This is expected behavior.

### Counter Reset When Editing Filter

---

**Problem** **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

### Cannot Include loss-priority and policer Actions in Same Term

---

**Problem** **Description:** You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: "cannot support policer action if loss-priority is configured."

**Solution** This is expected behavior.

### Cannot Egress Filter Certain Traffic Originating on QFX Switch

---

**Problem** **Description:** On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

**Solution** This is expected behavior.

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

---

**Problem** **Description:** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same Ethertype.

### Egress Firewall Filters with Private VLANs

---

**Problem** **Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

---

#### Egress Filtering of L2PT Traffic Not Supported

**Problem** **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

---

#### Cannot Drop BGP Packets in Certain Circumstances

**Problem** **Description:** BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

**Solution** This is expected behavior.

---

#### Invalid Statistics for Policer

**Problem** **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

---

#### Policers can Limit Egress Filters

**Problem** **Description:** On some switches, the number of egress policers that you configure can affect the total number of allowed egress firewall filters. (This issue does not affect

QFX10000 switches.) On the affected switches, every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Overview of Policers

---

A switch polices traffic by limiting the input or output transmission rate of a class of traffic according to user-defined criteria. Policing (or rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service.

- [Policer Overview on page 6000](#)
- [Policer Types on page 6000](#)
- [Policer Actions on page 6001](#)
- [Policer Colors on page 6002](#)

- [Policer Algorithms on page 6003](#)

- [How Many Policers Are Supported? on page 6004](#)
- [Policies Can Limit Egress Firewall Filters on page 6004](#)

## Policer Overview

You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.

Policers provide two functions: metering and marking. A policer meters (measures) each packet against traffic rates and burst sizes that you configure. It then passes the packet and the metering result to the marker, which assigns a packet loss priority that corresponds to the metering result. [Figure 198](#) illustrates this process.

**Figure 198: Flow of Tricolor Marking Policer Operation**

After you name and configure a policer, you can use it by specifying it as an action in one or more firewall filters.

## Policer Types

A switch supports three types of policers:

- **Single-rate two-color marker**—A two-color policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit with a specified PLP or simply discard them.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-color policer is most useful for metering traffic at the port (physical interface) level.

- **Single-rate three-color marker**—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on one rate—the configured committed information rate (CIR) as well as the committed burst size (CBS) and the excess burst size (EBS). The CIR specifies the average rate at which bits are admitted to the switch. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes. The EBS must be greater than or equal to the CBS, and neither can be 0.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A single-rate three-color marker (TCM) is most useful when a service is structured according to packet length and not peak arrival rate.

- **Two-rate three-color marker**—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding per-hop-behavior classification system for a Differentiated Services environment. This type of policer meters traffic based on two rates—the CIR and peak information rate (PIR) along with their associated burst sizes, the CBS and peak burst size (PBS). The PIR specifies the maximum rate at which bits are admitted to the network and must be greater than or equal to the CIR.

You can specify this type of policer in an ingress or egress firewall.

**NOTE:** A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

See [Table 479](#) for information about how metering results are applied for each of these policer types.

## Policer Actions

Policer actions are implicit or explicit and vary by policer type. *Implicit* means that Junos OS assigns the loss priority automatically. [Table 479](#) describes the policer actions.

**Table 479: Policer Actions**

| Policer                 | Marking                        | Implicit Action                  | Configurable Action |
|-------------------------|--------------------------------|----------------------------------|---------------------|
| Single-rate two-color   | Green (conforming)             | Assign low loss priority         | None                |
|                         | Red (nonconforming)            | None                             | Discard             |
| Single-rate three-color | Green (conforming)             | Assign low loss priority         | None                |
|                         | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                         | Red (above the EBS)            | Assign high loss priority        | Discard             |

Table 479: Policer Actions (*continued*)

| Policer              | Marking                        | Implicit Action                  | Configurable Action |
|----------------------|--------------------------------|----------------------------------|---------------------|
| Two-rate three-color | Green (conforming)             | Assign low loss priority         | None                |
|                      | Yellow (above the CIR and CBS) | Assign medium-high loss priority | None                |
|                      | Red (above the PIR and PBS)    | Assign high loss priority        | Discard             |

**NOTE:** If you specify a policer in an egress firewall filter, the only supported action is **discard**.

## Policer Colors

Single-rate and two-rate three-color policers can operate in two modes:

- **Color-blind**—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- **Color-aware**—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but cannot decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high but cannot reduce the PLP level to low.

## Filter-Specific Policers

You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this on some QFX switches, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in TCAM. If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps. (This behavior does not occur in QFX10000 switches.)

To prevent this unexpected behavior from occurring, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 5973](#) to

organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Suggested Naming Convention for Policers

We recommend that you use the naming convention ***policer#-color type*** when configuring three-color policers and ***policer#*** when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly. For example, the first single-rate, color-aware three-color policer configured would be named ***srTCM1-ca***. The second two-rate, color-blind three-color configured would be named ***trTCM2-cb***. The elements of this naming convention are explained below:

- sr (single-rate)
- tr (two-rate)
- TCM (tricolor marking)
- 1 or 2 (number of marker)
- ca (color-aware)
- cb (color-blind)

## Policer Counters

On some QFX switches, each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or in different filters—the implicit counter counts all the packets that are policed in all of these terms and provides the total amount. (This does not apply to QFX10000 switches.) If you want to obtain separate packet counts for each term on an affected switch, use these options:

- Configure a unique policer for each term.
- Configure only one policer, but use a unique, explicit counter in each term.

## Policer Algorithms

Policing uses the *token-bucket algorithm*, which enforces a limit on average bandwidth while allowing bursts up to a specified maximum value. It offers more flexibility than the *leaky bucket algorithm* in allowing a certain amount of bursty traffic before it starts discarding packets.

**NOTE:** In an environment of light bursty traffic, QFX5200 might not replicate all multicast packets to two or more downstream interfaces. This occurs only at a line rate burst—if traffic is consistent, the issue does not occur. In addition, the issue occurs only when packet size increases beyond 6k in a one gigabit traffic flow.

## How Many Policers Are Supported?

QFX10000 switches support 8K policers (all policer types). QFX5100 and QFX5200 switches support 1535 ingress policers and 1024 egress policers (assuming one policer per firewall filter term).

QFX3500 and QFX3600 standalone switches and QFabric Node devices support the following numbers of policers (assuming one policer per firewall filter term):

- Two-color policers used in ingress firewall filters: 767
- Three-color policers used in ingress firewall filters: 767
- Two-color policers used in egress firewall filters: 1022
- Three-color policers used in egress firewall filters: 512

## Policers Can Limit Egress Firewall Filters

On some switches, the number of egress policers that you configure can affect the total number of allowed egress firewall filters. (This issue does not affect QFX10000 switches.) On the affected switches, every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In

this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Understanding Policers with Link Aggregation Groups

If you apply a policer to a link aggregation group (LAG) on a standalone switch or QFabric node, the policer applies to all the interfaces in the LAG in aggregate. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer (by using a firewall filter) to a LAG that has two member interfaces on a single switch or node, the total allowed throughput for both members is 1 Gbps.

If you apply a policer to a LAG that has members on different nodes in a QFabric network Node group or redundant server Node group, the configured rate applies to the interface on each node. For example, if you configure a policer to rate-limit at 1 Gbps and apply the policer to a LAG that has one member on server node A and one member on server node B, the allowed throughput for each member is 1 Gbps, for a total allowed throughput of 2 Gbps.

## Understanding Color-Blind Mode for Single-Rate Tricolor Marking

With the color-blind mode of single-rate tricolor marking, all packets are evaluated against the CBS. If a packet exceeds the CBS, it is evaluated against the EBS. In color-blind mode, the policer supports three loss priorities only: low, medium-high, and high.

Packets that exceed the CBS but are below the EBS are marked yellow (medium-high). Packets that exceed the EBS are marked red (high), as shown in [Table 480](#).

Table 480: Color-Blind Mode TCM Color-to-PLP Mapping

| Color  | PLP         | Meaning                                                     |
|--------|-------------|-------------------------------------------------------------|
| Green  | low         | Conforming.                                                 |
| Yellow | medium-high | Packet exceeds the CIR and CBS but does not exceed the EBS. |
| Red    | high        | Packet exceeds the EBS.                                     |

## Understanding Color-Aware Mode for Single-Rate Tricolor Marking

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase a preassigned PLP but cannot decrease it.

### Summary of PLP Changes

Table 481 shows how a packet's incoming priority can be modified with single-rate marking.

Table 481: Color-Aware Mode Single-Rate PLP Mapping

| Incoming PLP | Packet Metered Against      | Possible Cases                                              | Outgoing PLP |
|--------------|-----------------------------|-------------------------------------------------------------|--------------|
| low          | CIR, CBS, and EBS           | Conforming                                                  | low          |
|              |                             | Packet exceeds the CIR and CBS but does not exceed the EBS. | medium-high  |
|              |                             | Packet exceeds the EBS.                                     | high         |
| medium-low   | EBS only                    | Packet does not exceed the EBS.                             | medium-low   |
|              |                             | Packet exceeds the EBS.                                     | high         |
| medium-high  | EBS only                    | Packet does not exceed the EBS.                             | medium-high  |
|              |                             | Packet exceeds the EBS.                                     | high         |
| high         | Not metered by the policer. | All cases.                                                  | high         |

The following sections describe single-rate color-aware PLP mapping in more detail.

### Effect on Green Packets (Low PLP)

---

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the PLP unchanged or increase it to medium-high or high, so these packets are therefore metered against both the CBS and the EBS. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, packets remain marked as low PLP.
- If bursts exceed the CBS but not the EBS, some of the packets are marked as medium-high PLP, and some of the packets remain marked as low PLP.
- If bursts exceed the EBS, some of the packets are marked as high PLP, and some of the packets remain marked as low PLP.

### Effect on Yellow Packets (Medium PLP)

---

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high, so these packets are therefore metered against the EBS only. For example, if a behavior aggregate or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CBS but less than the EBS, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the EBS, some of the packets are marked as high PLP and some remain marked as medium-high PLP.

### Effect on Red Packets (High PLP)

---

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CBS or the EBS.

## Understanding Color-Blind Mode for Two-Rate Tricolor Marking

With the color-blind mode of two-rate tricolor marking, all packets are evaluated against the committed information rate (CIR). If a packet exceeds the CIR, it is evaluated against the peak information rate (PIR). Packets that exceed the CIR but are below the PIR are marked yellow (medium-high). Packets that exceed the PIR are marked red (high).

**Table 482: Color-Blind Mode TCM Color-to-PLP Mapping**

| Color  | PLP                | Meaning                                             |
|--------|--------------------|-----------------------------------------------------|
| Green  | <b>low</b>         | Packet does not exceed the CIR.                     |
| Yellow | <b>medium-high</b> | Packet exceeds the CIR but does not exceed the PIR. |
| Red    | <b>high</b>        | Packet exceeds the PIR.                             |

- Related Documentation**

  - [Configuring Color-Blind Egress Policers for Medium-Low PLP on page 6016](#)

## Understanding Color-Aware Mode for Two-Rate Tricolor Marking

In color-aware mode, the treatment the packet receives depends on its classification. Marking can increase the preassigned PLP but cannot decrease it

### Summary of PLP Changes

Table 483 shows how a packet's incoming priority can be modified with two-rate marking.

**Table 483: Color-Aware Mode Two-Rate PLP Mapping**

| Incoming PLP      | Packet Metered Against | Possible Cases                          | Outgoing PLP       |
|-------------------|------------------------|-----------------------------------------|--------------------|
| <b>low</b>        | CIR and PIR            | Packet does not exceed the CIR.         | <b>low</b>         |
|                   |                        | Packet exceeds the CIR but not the PIR. | <b>medium-high</b> |
|                   |                        | Packet exceeds the PIR.                 | <b>high</b>        |
| <b>medium-low</b> | PIR only               | Packet does not exceed the PIR.         | <b>medium-low</b>  |
|                   |                        | Packet exceeds the PIR.                 | <b>high</b>        |

Table 483: Color-Aware Mode Two-Rate PLP Mapping (*continued*)

| Incoming PLP | Packet Metered Against      | Possible Cases                  | Outgoing PLP |
|--------------|-----------------------------|---------------------------------|--------------|
| medium-high  | PIR only                    | Packet does not exceed the PIR. | medium-high  |
|              |                             | Packet exceeds the PIR.         | high         |
| high         | Not metered by the policer. | All cases.                      | high         |

The following sections describe color-aware two-rate PLP mapping in more detail.

### Effect on Green Packets (Low PLP)

Packets belonging to the green class have already been marked by a classifier with low PLP. The marking policer can leave the packet's PLP unchanged or increase the PLP to medium-high or high. These packets are therefore metered against both the CIR and the PIR. For example, if a behavior aggregate or multifield classifier marks a packet with low PLP and the two-rate TCM policer is in color-aware mode, the output loss priority is as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, some of the packets are marked as medium-high PLP and some of the packets remain marked as low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as low PLP.

### Effect on Yellow Packets (Medium PLP)

Packets belonging to the yellow class have already been marked by a classifier with medium-low or medium-high PLP. The marking policer can leave the PLP unchanged or increase it to high. These packets are therefore metered against the PIR only. For example, if a behavior aggregate (BA) or multifield classifier marks a packet with medium-low PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-low PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-low PLP.

If a BA or multifield classifier marks a packet with medium-high PLP and the two-rate TCM policer is in color-aware mode, the policer assigns output loss priority as follows:

- If the rate of traffic flow is less than the CIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the CIR but less than the PIR, the packets remain marked as medium-high PLP.
- If the rate of traffic flow is greater than the PIR, some of the packets are marked as high PLP and some of the packets remain marked as medium-high PLP.

### Effect on Red Packets (High PLP)

Packets belonging to the red class have already been marked by a classifier with high PLP. Because the policer cannot decrease the PLP, it does not change it, and these packets are not metered against the CIR or the PIR.

- [Configuring Color-Blind Egress Policers for Medium-Low PLP on page 6016](#)

---

## Example: Using Two-Color Policers and Prefix Lists

If you provide specific amounts of bandwidth to internal or external customers, you can use policing to make sure that customers do not consume more bandwidth than they should receive. For example, you might connect many customers to one 10-Gbps interface and want to ensure that none of them congest the interface by using more bandwidth than they have been allotted.

You could accomplish this by creating a two-color policer similar to the following for each customer:

```
firewall {
 policer Limit-Customer-1 {
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 150m;
 }
 then discard;
 }
}
```

Creating a policer for each customer is clearly not a scalable solution, however. As an alternative, you can create prefix lists that group classes of customers and then create policers for each prefix list. For example, you could create prefix lists such as **Class-A-Customer-Prefixes**, **Class-B-Customer-Prefixes**, and **Class-C-Customer-Prefixes** (at the **[edit policy-options]** hierarchy level) and create the following corresponding policers:

```
firewall {
 policer Class-A {
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 150m;
 }
 then discard;
 }
}
```

```

}
policer Class-B {
 if-exceeding {
 bandwidth-limit 75m;
 burst-size-limit 100m;
 }
 then discard;
}
policer Class-C {
 if-exceeding {
 bandwidth-limit 50m;
 burst-size-limit 75m;
 }
 then discard;
}
}

```

You must create filter terms that specify the prefix lists in their **from** statements and the corresponding policers in their **then** statements similar to the following:

```

firewall
family inet {
 filter Class-A-Customers {
 term term-1 {
 from {
 destination-prefix-list {
 Class-A-Customer-Prefixes;
 }
 }
 then policer Class-A;
 }
 }
 filter Class-B-Customers {
 term term-1 {
 from {
 destination-prefix-list {
 Class-B-Customer-Prefixes;
 }
 }
 then policer Class-B;
 }
 }
 filter Class-C-Customers {
 term term-1 {
 from {
 destination-prefix-list {
 Class-C-Customer-Prefixes;
 }
 }
 then policer Class-C;
 }
 }
}
}

```

Here are the steps to create this firewall configuration:

1. Create the first policer:

```
[edit firewall]
user@switch# set policer Class-A if-exceeding bandwidth-limit 100m burst-size-limit 150m
user@switch# set policer Class-A then discard
```

2. Create the second policer:

```
[edit firewall]
user@switch# set policer Class-B if-exceeding bandwidth-limit 75m burst-size-limit 100m
user@switch# set policer Class-B then discard
```

3. Create the third policer:

```
[edit firewall]
user@switch# set policer Class-C if-exceeding bandwidth-limit 50m burst-size-limit 75m
user@switch# set policer Class-C then discard
```

4. Create a filter for class A customers:

```
[edit firewall]
user@switch# edit family inet filter Class-A-Customers
```

5. Configure the filter to send packets matching the Class-A-Customer-Prefixes prefix list to the Class-A policer:

```
[edit firewall family inet filter Class-A-Customers]
user@switch# set term term-1 from source-prefix-list Class-A-Customers
user@switch# set term term-1 then policer Class-A
```

6. Create a filter for class B customers:

```
[edit firewall]
user@switch# edit family inet filter Class-B-Customers
```

7. Configure the filter to send packets matching the Class-B-Customer-Prefixes prefix list to the Class-B policer:

```
[edit firewall family inet filter Class-B-Customers]
user@switch# set term term-1 from source-prefix-list Class-B-Customers
user@switch# set term term-1 then policer Class-B
```

8. Create a filter for class C customers:

```
[edit firewall]
user@switch# edit family inet filter Class-C-Customers
```

9. Configure the filter to send packets matching the Class-C-Customer-Prefixes prefix list to the Class-C policer:

```
[edit firewall family inet filter Class-C-Customers]
user@switch# set term term-1 from source-prefix-list Class-C-Customers
user@switch# set term term-1 then policer Class-C
```

10. Apply the filters you created to the appropriate interfaces in the output direction.

**NOTE:** Note that the implicit deny statement in this filter will block traffic from any source that does not match one of the prefix lists. If you want the filter to allow this traffic, you must include an explicit term for this purpose.

- Related Documentation**
- [Overview of Policers on page 5999](#)
  - [prefix-list](#)

## Example: Using Policers to Manage Oversubscription

You might want to use a policer when an interface is oversubscribed and you want to control what will happen if congestion occurs. For example, you might have servers connected to a switch as listed in [Table 484](#).

**Table 484: Servers Connected to Switch**

| Server Type                | Connection           | IP Address |
|----------------------------|----------------------|------------|
| Network application server | 1-gigabit interface  | 10.0.0.1   |
| Authentication server      | 1-gigabit interface  | 10.0.0.2   |
| Database server            | 10-gigabit interface | 10.0.0.3   |

In this example, users access services provided by the network application server, which requests information from the database server as appropriate. When it receives a request from a user, the network application server first contacts the authentication server to verify the user's credentials. When a user is authenticated and the network application server provides the requested service, all the packets sent from the database server to the application server must transit the 1-Gigabit Ethernet interface connected to the application server twice—once on ingress to the application server and again on egress to the user.

The sequence of events for a user session is as follows:

1. A user connects to the application server and requests a service.
2. The application server requests the user's credentials and relays them to the authentication server.
3. If the authentication server verifies the credentials, the application server initiates the requested service.
4. The application server requests the files necessary to meet the user's request from the database server.
5. The database server sends the requested files to the application server.
6. The application server includes the requested files in its response to the user.

Traffic from the database server to the application server might congest the 1-gigabit interface to which that the application server is connected. This congestion might prevent the server from responding to requests from users and creating new sessions for them. You can use policing to make sure that this does not occur.

To create this firewall configuration, perform the following steps on the database server:

1. Create a policer to drop traffic from the database server to the application server if it exceeds certain limits:

```
[edit firewall]
user@switch# set policer Database-Egress-Policer if-exceeding bandwidth-limit 400
burst-size-limit 500m
user@switch# set policer Database-Egress-Policer then discard
```

2. Create a filter to examine traffic from the database server to the application server:

```
[edit firewall]
user@switch# edit family inet filter Database-Egress-Filter
```

3. Configure the filter to apply the policer to traffic egressing the database server and destined for the application server:

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-1 from destination-address 10.0.0.1
user@switch# set term term-1 then policer Database-Egress-Policer
```

4. If required, configure a term to allow traffic from the database server to other destinations (otherwise the traffic will be dropped by the implicit deny statement):

```
[edit firewall family inet filter Database-Egress-Filter]
user@switch# set term term-2 then accept
```

Note that omitting a **from** statement causes the term to match all packets, which is the desired behavior.

5. Install the egress filter as an output filter on the database server interface that is connected the application server:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 family inet filter output Database-Egress-Filter
```

Here is how the final configuration would appear:

```
firewall {
 policer Database-Egress-Policer {
 if-exceeding {
 bandwidth-limit 400;
 burst-size-limit 500m;
 }
 then discard;
 }
 family inet {
 filter Database-Egress-Filter {
 term term-1 {
 from {
 destination-address {
 10.0.0.1/24;
 }
 }
 then policer Database-Egress-Policer;
 }
 term term-2 { # If required, include this term so that traffic from the database server
 # to other destinations is allowed.
 then accept;
 }
 }
 }
}
```

```
}
]
```

- [Overview of Policers on page 5999](#)

## Assigning Forwarding Classes and Loss Priority

You can configure firewall filters to assign packet loss priority (PLP) and forwarding classes so that if congestion occurs, the marked packets can be dropped according to the priority you set. The valid match conditions are one or more of the six packet header fields: destination address, source address, IP protocol, source port, destination port, and DSCP. In other words, you can set the forwarding class and the PLP for each packet entering or an interface with a specific destination address, source address, IP protocol, source port, destination port, or DSCP.

**NOTE:** Junos OS assigns forwarding classes and PLP on ingress only. Do not use a filter that assigns forwarding classes or PLP as an egress filter.

When tricolor marking is enabled, a switch supports four PLP designations: **low**, **medium-low**, **medium-high**, and **high**. You can also specify any of the forwarding classes listed in [Table 485](#)

**Table 485: Unicast Forwarding Classes**

| Unicast Forwarding Class | For CoS Traffic Type                                               |
|--------------------------|--------------------------------------------------------------------|
| <b>be</b>                | Best-effort traffic                                                |
| <b>no-loss</b>           | Guaranteed delivery for TCP traffic                                |
| <b>fcoe</b>              | Guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic |
| <b>nc</b>                | Network-control traffic                                            |

To assign forwarding classes in firewall filters:

1. Configure the family address type and filter name:

```
[edit]
user@switch# edit firewall family ethernet-switching filter ingress-filter
```

2. Configure the terms of the filter as appropriate, including the **forwarding-class** and **loss-priority** action modifiers. For example, each of the following terms in the filter examines various packet header fields and assigns the appropriate forwarding class and packet loss priority:

- The term **corp-traffic** matches all IPv4 packets with a **10.1.1.0/24** source address and assigns the packets to forwarding class **no-loss** with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term corp-traffic from source-address 10.1.1.0/24;
```

```
user@switch# set term corp-traffic then forwarding-class no-loss
user@switch# set term corp-traffic then loss-priority low
```

- The term **data-traffic** matches all IPv4 packets with a **10.1.2.0/24** source address and assigns the packets to forwarding class **be** (best effort) with a loss priority of **medium-high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term data-traffic from source-address 10.1.2.0/24;
user@switch# set term data-traffic then forwarding-class be
user@switch# set term data-traffic then loss-priority medium-high
```

- Because the loss of network-generated packets can jeopardize proper network operation, the delay of these packets is preferable to discarding these packets. The term **network-traffic** assigns the packets with an IP precedence of **net-control** to forwarding class **nc** (network control) with a loss priority of **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term network-traffic from precedence net-control
user@switch# set term network-traffic then forwarding-class nc
user@switch# set term network-traffic then loss-priority low
```

- The last term **accept-traffic** matches any packets that did not match on any of the preceding terms and assigns the packets to forwarding class **be** with a loss priority of **high**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term accept-traffic then forwarding-class be
user@switch# set term accept-traffic then loss-priority high
```

3. Apply the filter **ingress-filter** to a port, VLAN, or Layer 3 interface. For information about applying the filter, see [“Configuring Firewall Filters” on page 5978](#). (Assigning forwarding classes and PLP is supported only on ingress filters.)

## Configuring Color-Blind Egress Policers for Medium-Low PLP

If you use color-blind mode and want to configure an egress policer that marks packets to have medium-low PLP, you must configure a single-rate two-color policer at the **[edit firewall policer *policer-name*]** hierarchy level, because color-blind mode does not support medium-low priority. For example:

1. Specify the name of the policer, the bandwidth limit in bits per second (bps) to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit]
```

```
user@switch# set firewall policer policer-name if-exceeding bandwidth-limit bytes
burst-size-limit bytes
```

2. Specify medium-low loss priority for matching packets:

```
[edit]
```

```
user@switch# set firewall policer policer-name then loss-priority medium-low;
```

3. Apply the filter to a port, VLAN, or Layer 3 interface.

- [Configuring Two-Color and Three-Color Policers to Control Traffic Rates on page 6017](#)

## Configuring Two-Color and Three-Color Policers to Control Traffic Rates

You can rate-limit traffic by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

1. [Configuring Two-Color Policers on page 6017](#)
2. [Configuring Three-Color Policers on page 6018](#)
3. [Specifying Policers in a Firewall Filter Configuration on page 6018](#)
4. [Applying a Firewall Filter That Includes a Policer on page 6019](#)

### Configuring Two-Color Policers

To configure a two-color policer:

1. Specify the name of the policer, the bandwidth limit to control the traffic rate on an interface, and the maximum allowed burst size to control the amount of traffic bursting:

```
[edit firewall]
```

```
user@switch# set policer policer-name <filter-specific> if-exceeding bandwidth-limit bps
burst-size-limit bytes
```

The policer name can contain letters, numbers, and hyphens (-) and can have as many as 64 characters.

The range for the bandwidth limit is 32000 (32k) through 102,300,000,000 (102300m) bps.

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur and divide the result by 8:

**maximum burst size = (interface bandwidth) X (allowable time for burst) / (8 bits/byte)**

The range for the burst-size limit is 1 through 2,147,450,880 bytes.

2. Specify the policer action to discard or assign a loss priority to packets that exceed the rate limits:

```
[edit firewall policer policer-name]
user@switch# set then (discard | loss-priority low | loss-priority high)
```

## Configuring Three-Color Policers

To configure a three-color policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

```
[edit firewall]
user@switch# set three-color-policer policer-name
user@switch# set three-color-policer policer-name action loss-priority high then discard
```

2. Specify whether the three-color policer should be single-rate or two-rate and whether it should be color-aware or color-blind:

```
[edit firewall three-color-policer policer-name]
user@switch# set (single-rate | two-rate) (color-aware | color-blind)
```

3. For single-rate three-color policers, configure the CIR, CBS, and EBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set excess-burst-size bytes
```

4. For two-rate three-color policers, configure the CIR, CBS, PIR, and PBS:

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set peak-information-rate bps
user@switch# set peak-burst-size bytes
```

## Specifying Policers in a Firewall Filter Configuration

To use a two-color policer, configure a filter term that includes the action **policer**:

```
[edit firewall family family-name]
user@switch# set filter filter-name term name then name
```

For example, the following commands apply a two-color policer to all packets sent from 192.0.2.0/24.

```
[edit firewall family family-name]
user@switch# set filter limit—hosts term term1 from source-address 192.0.2.0/24
```

```
user@switch# set filter limit—hosts term term1 then policer policer1
```

To use a three-color policer, configure a filter term that includes the action **three-color-policer**:

```
[edit firewall family name]
```

```
user@switch# set filter name term name from match-condition
```

```
user@switch# set filter name term name then three-color-policer (single-rate | two-rate) name
```

For example, the following commands apply a single-rate three-color policer to all packets received or sent by interface **ge-0/0/6** (depending on whether the filter is an ingress or egress filter).

```
[edit firewall family name]
```

```
user@switch# set filter srTCM term term-one from interface ge-0/0/6
```

```
user@switch# set filter srTCM term term-one then three-color-policer single-rate srTCM1-ca
```

You must specify whether the three-color policer is single-rate or two-rate, and this must match the policer itself. Otherwise, the configuration listing includes an error message indicating that the three-color policer you referenced in the filter does not exist.

## Applying a Firewall Filter That Includes a Policer

A firewall filter that includes one or more policer action modifiers must be applied to a port, VLAN, or Layer 3 interface like any other filter. For information about applying firewall filters, see “[Configuring Firewall Filters](#)” on page 5978.

**NOTE:** You can include two-color policer actions on ingress firewall filters only. You can include three-color policer actions on ingress and egress filters.

- [Verifying That Three-Color Policers Are Operational on page 6020](#)
- [Configuring Color-Blind Egress Policers for Medium-Low PLP on page 6016](#)

## Verifying That Two-Color Policers Are Operational

**Purpose** Verify that two-color policers in firewall filter configurations are working properly.

**Action** Use the **show firewall policer** operational mode command to verify that the policers are working properly:

```
user@switch> show firewall policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-limit-tcp-icmp
Policies:
Name Packets
icmp-connection-policer 10
tcp-connection-policer 539
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show firewall policer** command displays the names of all firewall filters and policers that are configured. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

## Troubleshooting Policer Configuration

- [Incomplete Count of Packet Drops on page 6020](#)
- [Counter Reset When Editing Filter on page 6021](#)
- [Invalid Statistics for Policer on page 6021](#)
- [Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured on page 6021](#)
- [Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured on page 6022](#)
- [Policers Can Limit Egress Filters on page 6023](#)

### Incomplete Count of Packet Drops

**Problem Description:** Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the

ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

**Solution** This is expected behavior.

### Counter Reset When Editing Filter

**Problem Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

### Invalid Statistics for Policer

**Problem Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

### Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

**Problem Description:** If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/12 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

**Solution** This is expected behavior.

## Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

**Problem** **Description:** You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

**Solution** To prevent this unexpected behavior, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 5973](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

## Policers Can Limit Egress Filters

**Problem** **Description:** On some switches, the number of egress policers that you configure can affect the total number of allowed egress firewall filters. (This issue does not affect QFX10000 switches.) On the affected switches, every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

## Overview of Access Port Protection

---

Port security features on QFX10000 switches can protect a switch against various types of attacks. Protection methods against some common attacks are:

- [Mitigation of Ethernet Switching Table Overflow Attacks on page 6027](#)
- [Mitigation of Rogue DHCP Server Attacks on page 6028](#)
- [Protection Against DHCP Starvation Attacks on page 6028](#)

## Mitigation of Ethernet Switching Table Overflow Attacks

In an overflow attack on an Ethernet switching table, an intruder sends so many requests from new MAC addresses that the table cannot learn all the addresses. The attack forces the switch to send broadcast messages when it needs to send traffic to addresses for which it lacks MAC addresses. In addition to generating unnecessary traffic, the attacker might be able to sniff the broadcast packets.

To mitigate such attacks, you can configure a limit for learned MAC addresses or allow only specific MAC addresses. Use the MAC limit feature to control the total number of MAC addresses that can be added to the Ethernet switching table for the specified interface or interfaces. By setting the MAC addresses that are explicitly allowed, you

ensure that the addresses of network devices whose network access is critical are guaranteed to be included in the Ethernet switching table.

## Mitigation of Rogue DHCP Server Attacks

By default, all access ports are untrusted, and all trunk ports are trusted with regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. If someone connects an unauthorized DHCP server to a trusted port, the unauthorized server can start issuing IP addresses and configuration information to the network's DHCP clients. The information provided to the clients by this server can disrupt their network access. The unauthorized server might also assign itself as the default gateway device for the network. An attacker can then sniff the network traffic and perpetrate a man-in-the-middle attack—that is, it misdirects traffic intended for a legitimate network device to a device of its choice.

To mitigate this problem, set the interface to which the unauthorized server is connected as untrusted. That action blocks all ingress DHCP server messages from that interface.

**NOTE:** The switch logs all DHCP server packets that are received on untrusted ports. For example:

```
5 untrusted DHCPOFFER received, interface xe-0/0/2.0[65], vlan v1[10] server
ip/mac 12.12.12.1/00:00:00:00:01:12 offer ip/client mac
12.12.12.253/00:AA:BB:CC:DD:01
```

You can use these messages to detect unauthorized DHCP servers on the network.

**NOTE:** If you attach a DHCP server to an access port, you must configure the port as trusted.

## Protection Against DHCP Starvation Attacks

In a DHCP starvation attack, an attacker floods an Ethernet LAN with DHCP requests from spoofed (counterfeit) MAC addresses so that trusted DHCP servers cannot keep up with requests from legitimate DHCP clients. The address space of those servers is completely used up, so they can no longer assign IP addresses and lease times to clients. DHCP requests from those clients are either dropped—that is, the result is a denial of service (DoS)—or directed to a rogue DHCP server set up by the attacker to imitate a legitimate DHCP server.

To protect the switch from DHCP starvation attacks, use the MAC limiting feature. Specify the maximum number of MAC addresses that the switch can learn on the access interfaces to which DHCP clients connect. The DHCP server or servers can then supply only the specified number of IP addresses over each of those interfaces. If a DHCP starvation attack occurs after the maximum number of IP addresses has been assigned, the attack fails.

## Understanding MAC Limiting and MAC Move Limiting for Port Security

MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on Layer 2 interfaces (ports). MAC move limiting detects MAC movement and MAC spoofing on access interfaces. You enable this feature on VLANs.

- [MAC Limiting on page 6029](#)
- [MAC Move Limiting on page 6030](#)
- [Actions for MAC Limiting on page 6030](#)
- [MAC Addresses That Exceed the MAC Limit or MAC Move Limit on page 6030](#)

### MAC Limiting

MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface or on all the Layer 2 access interfaces on the switch. Junos OS provides two MAC limiting methods:

- **Maximum number of MAC addresses**—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
- **Allowed MAC addresses**—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

**NOTE:** If you do not want the system to log messages about invalid MAC addresses received by an interface that has been configured for allowed MAC addresses, disable the logging by configuring the `no-allowed-mac-log` statement.

You configure MAC limiting per interface, not per VLAN. You can specify the maximum number of dynamic MAC addresses that can be learned on a single Layer 2 access interface (including tagged-access interfaces) or on all Layer 2 access interfaces.

## MAC Move Limiting

MAC move limiting causes the switch to track the number of times a MAC address can move to a new interface (port). It can help to prevent MAC spoofing, and it can also detect and prevent loops.

If a MAC address moves more than the configured number of times within 1 second, the switch performs the configured action. You can configure MAC move limiting to apply to all VLANs or to a specific VLAN.

**CAUTION:** Mac move limiting does not work properly on a QFX5100 switch used as a Node device in a QFabric system. Do not use this feature on a QFX5100 switch in a QFabric system.

## Actions for MAC Limiting

You can choose to have one of the following actions performed when the limit of MAC addresses or the limit of MAC moves is exceeded:

- **drop**—Drop the packet and generate a system log entry. This is the default.
- **log**—Do not drop the packet but generate a system log entry.
- **none**—Take no action.
- **shutdown**—Disable the interface and generate an alarm. If you configure the switch with the **port-error-disable** statement, the disabled interface recovers automatically upon expiration of the specified timeout. If this is not configured, you can bring up the disabled interfaces by running the **clear ethernet-switching port-error** command.

See descriptions of results of these various action settings in “[Verifying That MAC Limiting Is Working Correctly](#)” on page 6031.

If you set a MAC limit to apply to all interfaces on the switch, you can override that setting for a particular interface by specifying action **none**. See *mac-limit* for more information.

## MAC Addresses That Exceed the MAC Limit or MAC Move Limit

If you have configured the **port-error-disable** statement, you can view which interfaces are temporarily disabled because the MAC limit or MAC move limit was exceeded. Use the **show ethernet-switching interfaces** command.

The log messages that indicate the MAC limit or MAC move limit has been exceeded include the offending MAC addresses.

## Verifying That MAC Limiting Is Working Correctly

---

MAC limiting protects against flooding of the Ethernet switching table by setting a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface (port).

Junos OS provides two MAC limiting methods:

- **Maximum number of MAC addresses**—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
- **Allowed MAC addresses**—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. The allowed MAC method binds MAC addresses to a VLAN so that the address is not registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.

This topic includes the following tasks:

1. [Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly on page 6031](#)
2. [Verifying That Allowed MAC Addresses Are Working Correctly on page 6032](#)
3. [Verifying That Interfaces Are Shut Down on page 6032](#)
4. [Customizing the Ethernet Switching Table Display to View Information for a Specific Interface on page 6033](#)

## Verifying That MAC Limiting for Dynamic MAC Addresses Is Working Correctly

**Purpose**    Verify that MAC limiting for dynamic MAC addresses is working.

**Action** Display the MAC addresses that have been learned. The following sample output shows the results of sending two packets from hosts connected to **xe-1:0/0/1** and five packets from hosts connected to **xe-1:0/0/2**, with both interfaces configured with a MAC limit of **4** and the action **drop**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 7 entries, 6 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces   |
|---------------|-------------------|-------|-----|--------------|
| employee-vlan | *                 | Flood | -   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:77 | Learn | 0   | xe-1:0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:79 | Learn | 0   | xe-1:0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | xe-1:0/0/2.0 |

**Meaning** The output shows that the fifth packet received on the **xe-1:0/0/2** interface was dropped because it exceeded the MAC limit for that interface. The address was not learned, and thus an asterisk (\*) rather than an address appears in the MAC address column in the first line of the sample output.

## Verifying That Allowed MAC Addresses Are Working Correctly

**Purpose** Verify that allowed MAC addresses are working.

**Action** Display the MAC cache information after allowed MAC addresses have been configured on an interface. The following sample shows the MAC cache after four allowed MAC addresses had been configured on interface **xe-1:0/0/2** and a fifth MAC address appeared on the interface.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 5 entries, 4 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces   |
|---------------|-------------------|-------|-----|--------------|
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:83 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:85 | Learn | 0   | xe-1:0/0/2.0 |
| employee-vlan | *                 | Flood | -   | xe-1:0/0/2.0 |

**Meaning** Because the fifth address was not allowed it was not learned, and an asterisk (\*) rather than an address appears in the MAC address column in the last line of the sample output.

## Verifying That Interfaces Are Shut Down

**Purpose** Verify that an interface is shut down when the MAC limit is exceeded.

**Action** For more information about interfaces that have been shut down because the MAC limit was exceeded, use the **show ethernet-switching interfaces** command.

```
user@switch> show ethernet-switching interfaces
Interface State VLAN members Tag Tagging Blocking

bme0.32770 down mgmt untagged unblocked
xe-0/0/0.0 down v1 untagged MAC limit exceeded
xe- 0/0/1.0 up v1 untagged unblocked
xe-0/0/2.0 up v1 untagged unblocked
me0.0 up mgmt untagged unblocked
```

**NOTE:** You can configure interfaces to recover automatically when the MAC limit has been exceeded by specifying the **port-error-disable** statement with a **disable timeout** value. The switch automatically restores the disabled interface to service when the disable timeout expires. The **port-error-disable** configuration does not apply to preexisting error conditions—it affects only error conditions that are detected after the **port-error-disable** statement has been enabled and the configuration has been committed. To clear a preexisting error condition and restore the interface to service, use the **clear ethernet-switching port-error** command.

## Customizing the Ethernet Switching Table Display to View Information for a Specific Interface

**Purpose** You can use the **show ethernet-switching table** command to view information for a specific interface.

**Action** For example, to display the MAC addresses that have been learned on the **xe-0/0/2** interface, enter:

```
user@switch> show ethernet-switching table interface xe-0/0/2.0
Ethernet-switching table: 1 unicast entries
```

| VLAN | MAC address       | Type  | Age | Interfaces  |
|------|-------------------|-------|-----|-------------|
| v1   | *                 | Flood | -   | All-members |
| v1   | 00:00:06:00:00:00 | Learn | 0   | xe-0/0/2.0  |

**Meaning** The MAC limit value for the **xe-0/0/2** interface had been set to 1, and the output shows that only one MAC address was learned and added to the MAC cache.

---

## Verifying That MAC Move Limiting Is Working Correctly

---

**Purpose** Verify that MAC move limiting is working on the switch.

**Action** Display the MAC addresses in the Ethernet switching table when MAC move limiting has been configured for a VLAN. The following sample shows the results after two of the hosts on **ge-0/0/2** sent packets after the MAC addresses for those hosts had moved to other interfaces more than five times in 1 second. The VLAN, **employee-vlan**, was set to a MAC move limit of **5** with the action **drop**:

```
user@switch> show ethernet-switching table
```

```
Ethernet-switching table: 7 entries, 4 learned
```

| VLAN          | MAC address       | Type  | Age | Interfaces |
|---------------|-------------------|-------|-----|------------|
| employee-vlan | 00:05:85:3A:82:77 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:79 | Learn | 0   | ge-0/0/1.0 |
| employee-vlan | 00:05:85:3A:82:80 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | 00:05:85:3A:82:81 | Learn | 0   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |
| employee-vlan | *                 | Flood | -   | ge-0/0/2.0 |

**Meaning** The last two lines of the sample output show that MAC addresses for two hosts on **ge-0/0/2** were not learned, because the hosts had been moved back and forth from the original interfaces more than five times in 1 second.

---

## Verifying That the Port Error Disable Setting Is Working Correctly

---

**Purpose** Verify that the port error disable setting is working as expected for MAC limited and storm control interfaces.

**Action** Display information about interfaces:

```
user@switch> show ethernet-switching interfaces
```

| Interface    | State | VLAN members | Blocking                |
|--------------|-------|--------------|-------------------------|
| xe-2:0/0/0.0 | up    | T1122        | unblocked               |
| xe-2:0/0/1.0 | down  | default      | MAC limit exceeded      |
| xe-2:0/0/2.0 | down  | default      | Storm control in effect |
| xe-2:0/0/3.0 | down  | default      | unblocked               |
| xe-2:0/0/4.0 | down  | default      | unblocked               |
| xe-2:0/0/5.0 | down  | default      | unblocked               |
| xe-2:0/0/6.0 | down  | default      | unblocked               |

**Meaning** For interfaces disabled by port security features, the sample output from the **show ethernet-switching interfaces** command specifies the reasons that the interfaces are disabled:

- **MAC limit exceeded**—The interface is temporarily disabled because of a *mac-limit* error. The disabled interface is automatically restored to service when the disable-timeout expires.
- **MAC move limit exceeded**—The interface is temporarily disabled because of a *mac-move-limit* error. The disabled interface is automatically restored to service when the disable-timeout expires.
- **Storm control in effect**—The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the disable-timeout expires.

## Configuring Persistent MAC Learning (CLI Procedure)

**NOTE:** This topic uses Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Persistent MAC Learning (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on [page 41](#).

Persistent MAC address learning is disabled by default. You can enable it to:

- Help prevent traffic losses for trusted workstations and servers because, if persistent MAC address learning is enabled on an interface, the interface does not have to relearn the addresses from ingress traffic after a restart.
- Protect the switch against security attacks—Use persistent MAC learning in combination with MAC limiting to protect against attacks while still obviating the need to statically configure MAC addresses. When the initial learning of MAC addresses up to the number specified by the MAC limit is done, new addresses are not allowed even after a restart.

The port is secured because after the limit has been reached, additional devices cannot connect to the interface.

To configure persistent MAC learning on an interface and limit the number of allowed MAC addresses:

1. Enable persistent MAC learning on an interface:

```
[edit switch-options]
user@switch# set interface interface-name persistent-learning
```

2. Configure the MAC limit on an interface, and specify the action that the switch takes after the specified limit is exceeded:

```
[edit switch-options]
user@switch# set interface interface-name interface-mac-limit limit packet-action action
```

After you set a new MAC limit for the interface, the system clears existing entries in the MAC address forwarding table associated with the interface.

Values for *action* are:

**drop**—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.

**drop-and-log**—(EX Series switches only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

**log**—(EX Series switches only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.

**none**—(EX Series switches only) Forward packets with new source MAC addresses, and learn the new source MAC address.

**shutdown**—(EX Series switches only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

**TIP:** If you move a device within your network that has a persistent MAC address entry on the switch, use the [clear ethernet-switching table persistent-mac](#) command to clear the persistent MAC address entry from the interface. If you move the device and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address of the device and the device will not be able to connect.

If the original port is down when you move the device, then the new port will learn the MAC address and the device can connect. However, if you do not clear the persistent MAC address on the original port, then when the port restarts, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the persistent MAC address is removed from the new port and the device loses connectivity.

## Understanding Trusted and Untrusted Ports

---

By default, all access ports are untrusted and all trunk ports are trusted in regard to DHCP. Trusted ports allow DHCP servers to provide IP addresses and other information to requesting devices. Untrusted ports drop traffic from DHCP servers to prevent unauthorized servers from providing any configuration information to clients.

If you attach a DHCP server to an access port, you must configure the port as trusted. Before you do so, ensure that the server is physically secure—that is, that access to the server is monitored and controlled.

- Related Documentation**
- *Understanding DHCP Snooping for Monitoring DHCP Messages Received from Untrusted Devices*
  - *Example: Configuring Basic Port Security Features*

## Understanding Trusted DHCP Servers for Port Security

---

Any interface on the switching device that connects to a DHCP server can be configured as a trusted port. Configuring a DHCP server on a trusted port protects against rogue DHCP servers sending leases.

Ensure that the DHCP server interface is physically secure—that is, that access to the server is monitored and controlled at the site—before you configure the port as trusted.

- Related Documentation**
- *Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks*
  - *Enabling a Trusted DHCP Server (CLI Procedure)*

## Verifying That a Trusted DHCP Server Is Working Correctly

---

- Purpose** Verify that a DHCP trusted server is working on the switch. See what happens when the DHCP server is trusted and then untrusted.

**Action** Send some DHCP requests from network devices (here they are DHCP clients) connected to the switch.

Display the DHCP snooping information when the interface on which the DHCP server connects to the switch is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

```
user@switch> show dhcp snooping binding
```

DHCP Snooping Information:

| MAC Address       | IP Address | Lease | Type    | VLAN          | Interface  |
|-------------------|------------|-------|---------|---------------|------------|
| -----             | -----      | ----- | ----    | ----          | -----      |
| 00:05:85:3A:82:77 | 192.0.2.17 | 600   | dynamic | employee-vlan | ge-0/0/1.0 |
| 00:05:85:3A:82:79 | 192.0.2.18 | 653   | dynamic | employee-vlan | ge-0/0/1.0 |
| 00:05:85:3A:82:80 | 192.0.2.19 | 720   | dynamic | employee-vlan | ge-0/0/2.0 |
| 00:05:85:3A:82:81 | 192.0.2.20 | 932   | dynamic | employee-vlan | ge-0/0/2.0 |
| 00:05:85:3A:82:83 | 192.0.2.21 | 1230  | dynamic | employee-vlan | ge-0/0/2.0 |
| 00:05:85:27:32:88 | 192.0.2.22 | 3200  | dynamic | employee-vlan | ge-0/0/2.0 |

**Meaning** When the interface on which the DHCP server connects to the switch has been set to trusted, the output (see preceding sample) shows, for each MAC address, the assigned IP address and lease time—that is, the time, in seconds, remaining before the lease expires.

If the DHCP server had been configured as untrusted, no entries would be added to the DHCP snooping database and nothing would be shown in the output of the **show dhcp snooping binding** command.

- Related Documentation**

## Understanding DHCP Option 82 for Port Security

---

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switch against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Hosts on untrusted access interfaces on Ethernet LAN switches send requests for IP addresses in order to access the Internet. The switch forwards or relays these requests to DHCP servers, and the servers send offers for IP address leases in response. Attackers can use these messages to perpetrate address spoofing and starvation.

Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client. The Juniper Networks Junos operating system (Junos OS) implementation of DHCP option 82 supports RFC 3046, *DHCP Relay Agent Information Option*, at <http://tools.ietf.org/html/rfc3046>.

This topic covers:

- [DHCP Option 82 Processing on page 6039](#)
- [Suboption Components of Option 82 on page 6040](#)
- [Configurations That Support Option 82 on page 6040](#)

### DHCP Option 82 Processing

If DHCP option 82 is enabled on the switch, then when a DHCP client that is connected to the switch on an untrusted interface sends a DHCP request, the switch inserts information about the client's network location into the packet header of that request. The switch then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or another parameter for the client. See "[Suboption Components of Option 82](#)" on [page 6040](#) for details about option 82 information.

You can enable DHCP option 82 on a single VLAN or on all VLANs on the switch. You can also configure it on Layer 3 interfaces (in routed VLAN interfaces, or RVIs) when the switch is functioning as a relay agent.

When option 82 is enabled on the switch, then this sequence of events occurs when a DHCP client sends a DHCP request:

1. The switch receives the request and inserts the option 82 information in the packet header.
2. The switch forwards or relays the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response back to the switch. It does not alter the option 82 information.
4. The switch strips the option 82 information from the response packet.
5. The switch forwards the response packet to the client.

**NOTE:** To use the DHCP option 82 feature, you must ensure that the DHCP server is configured to accept option 82. If it is not configured to accept option 82, then when it receives requests containing option 82 information, it does not use the information in setting parameters and it does not echo the information in its response message.

---

## Suboption Components of Option 82

When configuring DHCP option 82, you can use the following suboptions:

- **circuit ID**—Identifies the circuit (interface and/or VLAN) on the switch on which the request was received. The circuit ID contains the interface name and/or VLAN name, with the two elements separated by a colon—for example, **xe-0/0/10:vlan1**. If the request packet is received on a Layer 3 interface, the circuit ID is just the interface name—for example, **xe-0/0/10**.

Use the **prefix** option to add an optional prefix to the circuit ID. If you enable the **prefix** option, the hostname for the switch is used as the prefix; for example, **switch1:xe-0/0/10:vlan1**.

You can also specify that the interface description be used rather than the interface name and that the VLAN ID be used rather than the VLAN name.

- **remote ID**—Identifies the host. By default, the remote ID is the MAC address of the switch. You can specify that the remote ID be the hostname of the switch, the interface description, or a character string of your choice. You can also add an optional prefix to the remote ID.
- **vendor ID**—Identifies the vendor of the host. If you specify the **vendor-id** option but do not enter a value, the default value **Juniper** is used. To specify a value, you type a character string.

## Configurations That Support Option 82

You can use option 82 with the following configurations:

- The DHCP client and the DHCP server are on the same VLAN. In this case the switch forwards the requests from the clients on untrusted access interfaces to the server on a trusted interface. For this configuration, you set DHCP option 82 at the **[edit ethernet-switching-options secure-access-port vlan]** hierarchy level.
- The DHCP client or the DHCP server is connected to the switch through a Layer 3 interface and the switch is configured to relay DHCP requests. [Figure 199](#) illustrates a scenario for the switch-as-relay-agent; in this instance, the switch relays requests through a router to the server.

Figure 199: Switch Relays DHCP Requests to Server

For the configuration shown in [Figure 199](#), you set DHCP option 82 at the **[edit forwarding-options helpers bootp]** hierarchy level.

## Understanding Static ARP Entries

You can create explicit mappings between IP addresses and MAC addresses, which are called static ARP table entries. Unlike dynamically learned ARP entries, static entries do not age out. You might want to create static ARP entries in a troubleshooting situation or if your device is unable to learn a MAC address dynamically for any reason.

## Understanding Storm Control

---

A traffic storm occurs when broadcast packets prompt receiving devices to broadcast packets in response. This prompts further responses, creating a snowball effect. The switch is flooded with packets, which creates unnecessary traffic that leads to poor performance or even a complete loss of service by some clients. Storm control causes a device to monitor traffic levels and take a specified action when a specified traffic level—called the *storm control level*—is exceeded, thus preventing packets from proliferating and degrading service. You can configure devices to drop broadcast and unknown unicast packets, shut down interfaces, or temporarily disable interfaces when the storm control level is exceeded.

Storm control is enabled by default on ELS platforms and disabled by default on non-ELS platforms. If storm control is enabled, the default level is 80 percent of the available bandwidth for ingress traffic. You can change the storm control level by configuring it as a specific bandwidth value. (The **level** configuration statement, which allows you to configure the storm control level as a percentage of the combined broadcast and unknown unicast streams, is deprecated and might be removed from future releases. We recommend that you phase out its use and replace it with the **bandwidth** statement.)

**NOTE:** Storm control is not enabled by default on MX platforms.

**NOTE:** When you configure storm control bandwidth, the value you configure is rounded off internally to the closest multiple of 64 Kbps, and the rounded-off value represents the bandwidth that is actually enforced. For example, if you configure a bandwidth limit of 150 Kbps, storm control enforces a bandwidth limit of 128 Kbps.

**NOTE:** On an FCoE-FC gateway, storm control must be disabled on all Ethernet interfaces that belong to an FCoE VLAN to prevent FCoE traffic from being dropped. Configuring storm control on an Ethernet interface that is included in an FCoE-FC gateway may have undesirable effects, including FCoE packet loss. After disabling storm control on all interfaces, enable storm control on any interfaces that are not part of an FCoE-FC gateway on which you want to use storm control. However, on an FCoE transit switch, you can enable storm control on interfaces that carry FCoE traffic.

**CAUTION:** The Junos OS allows you to configure a storm control value that exceeds the bandwidth of the interface. If you configure an interface this way, storm control does not drop broadcast or unknown unicast packets even if they consume all the available bandwidth.

To recognize a storm, you must be able to identify when traffic has reached an abnormal level. Suspect a storm when operations begin timing out and network response times slow down. Users might be unable to access expected services. Monitor the percentage of broadcast and unknown unicast traffic in the network when it is operating normally. This data can then be used as a benchmark to determine when traffic levels are too high. You can then configure storm control to set the level at which you want to drop broadcast and unknown unicast traffic.

**NOTE:** On a QFX10002 switch, if storm control is configured on a VLAN port associated with an IRB interface, unregistered multicast traffic is classified as registered multicast traffic if IGMP snooping is enabled. If IGMP snooping is disabled, the traffic is classified as unknown unicast traffic.

## Example: Configuring Storm Control to Prevent Network Outages

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on to rate-limit broadcast traffic, multicast

traffic, and unknown unicast traffic at a specified level and to have packets dropped when the specified traffic level is exceeded, thereby preventing packets from proliferating and degrading the LAN.

**NOTE:** This example uses a Junos OS release that supports the Enhanced Layer 2 Software (ELS) configuration style.

- [Requirements on page 6047](#)
- [Overview and Topology on page 6047](#)
- [Configuration on page 6048](#)

## Requirements

This example uses the following hardware and software components:

- One QFX Series switch running Junos OS with ELS
- Junos OS Release 13.2 or later

## Overview and Topology

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the *storm control level*, of broadcast traffic, multicast traffic, and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined applicable traffic streams or as the percentage of available bandwidth used by the combined applicable traffic streams. On ELS systems, storm control is enabled by default on all interfaces at a level of 80 percent of the available bandwidth.

Storm control monitors the level of applicable incoming traffic and compares it with the level that you specify. If the combined level of the applicable traffic exceeds the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure storm control to shut down interfaces or temporarily disable interfaces (see the **action-shutdown** statement or the **recovery-timeout** statement) when the storm control level is exceeded.

**NOTE:** If you configure storm control on an aggregated Ethernet interface, the storm-control level is applied to each member interface individually. For example, if the aggregated interface has two members and you configure a storm-control level of 20 kbps, Junos will not detect a storm if one or both of the member interfaces receives traffic at 15 kbps because in neither of these cases does an individual member receive traffic at a rate greater than the configured storm-control level. In this example, Junos detects a storm only if at least one member interface receives traffic at greater than 20 Kbps.

The topology used in this example consists of one switch connected to various network devices. This example shows how to configure the storm control level on interface xe-0/0/0 by setting the level to a traffic rate of 15,000 Kbps, based on the traffic rate of the combined applicable traffic streams. If the combined traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

## Configuration

### CLI Quick Configuration

To quickly configure storm control based on the traffic rate in kilobits per second of the combined traffic streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set forwarding-options storm-control-profiles sc-profile all bandwidth-level 15000
set interfaces xe-0/0/0 unit 0 family ethernet-switching storm-control sc-profile
```

### Step-by-Step Procedure

To configure storm control:

1. Configure a storm control profile, **sc-profile**, and specify the traffic rate in kilobits per second of the combined traffic streams:

```
[edit]
user@switch> set forwarding-options storm-control-profiles sc-profile all bandwidth-level 15000
```

2. Bind the storm control profile, **sc**, to a logical interface:

```
[edit]
user@switch> set interfaces xe-0/0/0 unit 0 family ethernet-switching storm-control sc-profile
```

### Results

Display the results of the configuration:

```
[edit forwarding-options]
user@switch> show storm-control-profiles sc-profile
all {
 bandwidth 15000;
}

[edit]
user@switch> show interfaces xe-0/0/0
unit 0 {
 family ethernet-switching {
 vlan {
 members default;
 }
 }
 storm-control sc-profile;
```

```
}
}
```

## Verifying That the Port Error Disable Setting Is Working Correctly

**Purpose** Verify that the port error disable setting is working as expected for MAC limited and storm control interfaces.

**Action** Display information about interfaces:

```
user@switch> show ethernet-switching interfaces
```

| Interface    | State | VLAN members | Blocking                |
|--------------|-------|--------------|-------------------------|
| xe-2:0/0/0.0 | up    | T1122        | unblocked               |
| xe-2:0/0/1.0 | down  | default      | MAC limit exceeded      |
| xe-2:0/0/2.0 | down  | default      | Storm control in effect |
| xe-2:0/0/3.0 | down  | default      | unblocked               |
| xe-2:0/0/4.0 | down  | default      | unblocked               |
| xe-2:0/0/5.0 | down  | default      | unblocked               |
| xe-2:0/0/6.0 | down  | default      | unblocked               |

**Meaning** For interfaces disabled by port security features, the sample output from the **show ethernet-switching interfaces** command specifies the reasons that the interfaces are disabled:

- **MAC limit exceeded**—The interface is temporarily disabled because of a *mac-limit* error. The disabled interface is automatically restored to service when the disable-timeout expires.
- **MAC move limit exceeded**—The interface is temporarily disabled because of a *mac-move-limit* error. The disabled interface is automatically restored to service when the disable-timeout expires.
- **Storm control in effect**—The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the disable-timeout expires.

## Understanding Unicast RPF

---

Unicast reverse-path forwarding (RPF) helps protect the switch against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled. It also helps ensure that traffic arriving on ingress interfaces comes from a network source that the receiving interface can reach.

When you enable unicast RPF, by default the switch forwards a packet only if the receiving interface is the best return path to the packet's unicast source address. This is known as strict mode unicast RPF. You can also enable loose mode, which means that the system checks to see if the packet has a source address with a corresponding prefix in the routing table but does not check whether the receiving interface is the best return path to the packet's unicast source address.

.....

**NOTE:** On Juniper Networks EX3200, EX4200, and EX4300 Ethernet Switches, the switch applies unicast RPF *globally* to all interfaces when unicast RPF is configured on any interface. For additional information, see [“Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches” on page 6053](#).

.....

### Unicast RPF for Switches Overview

Unicast RPF functions as an ingress filter that reduces the forwarding of IP packets that might be spoofing an address. By default, unicast RPF is disabled on the switch interfaces.

The type of unicast RPF provided on the switches—that is, strict mode unicast RPF is especially useful on untrusted interfaces. An untrusted interface is an interface where untrusted users or processes can place packets on the network segment.

The switch supports only the active paths method of determining the best return path back to a unicast source address. The active paths method looks up the best reverse path entry in the forwarding table. It does not consider alternate routes specified using routing-protocol-specific methods when determining the best return path.

If the forwarding table lists the receiving interface as the interface to use to forward the packet back to its unicast source, it is the best return path interface.

Use strict mode unicast RPF only on symmetrically routed interfaces. (For information about symmetrically routed interfaces, see [“When to Enable Unicast RPF” on page 6051](#).)

For more information about strict unicast RPF, see RFC 3704, *Ingress Filtering for Multihomed Networks* at <http://www.ietf.org/rfc/rfc3704.txt>.

## Unicast RPF Implementation

This section includes:

- [Unicast RPF Packet Filtering on page 6051](#)
- [Bootstrap Protocol \(BOOTP\) and DHCP Requests on page 6051](#)
- [Default Route Handling on page 6051](#)

### Unicast RPF Packet Filtering

When you enable unicast RPF on the switch, the switch handles traffic in the following manner:

- If the switch receives a packet on the interface that is the best return path to the unicast source address of that packet, the switch forwards the packet.
- If the best return path from the switch to the packet's unicast source address is not the receiving interface, the switch discards the packet.
- If the switch receives a packet that has a source IP address that does not have a routing entry in the forwarding table, the switch discards the packet.

### Bootstrap Protocol (BOOTP) and DHCP Requests

Bootstrap protocol (BOOTP) and DHCP request packets are sent with a broadcast MAC address and therefore the switch does not perform unicast RPF checks on them. The switch forwards all BOOTP packets and DHCP request packets without performing unicast RPF checks.

### Default Route Handling

If the best return path to the source is the default route (0.0.0.0) and the default route points to **reject**, the switch discards the packets. If the default route points to a valid network interface, the switch performs a normal unicast RPF check on the packets.

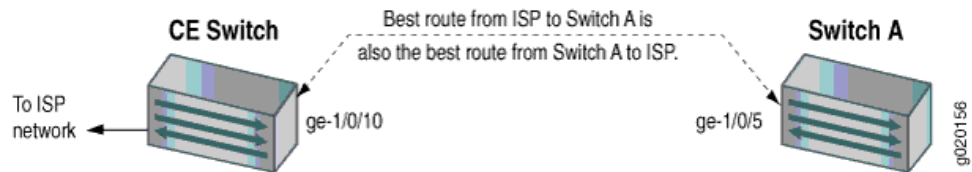

## When to Enable Unicast RPF

Enable unicast RPF when you want to ensure that traffic arriving on a network interface comes from a source that resides on a network that that interface can reach. You can enable unicast RPF on untrusted interfaces to filter spoofed packets. For example, a common application for unicast RPF is to help defend an enterprise network from DoS/DDoS attacks coming from the Internet.

Enable unicast RPF only on symmetrically routed interfaces. A symmetrically routed interface uses the same route in both directions between the source and the destination, as shown in [Figure 200](#). Symmetrical routing means that if an interface receives a packet,

the switch uses the same interface to send a reply to the packet source (the receiving interface matches the forwarding-table entry for the best return path to the source).

**Figure 200: Symmetrically Routed Interfaces**

Enabling unicast RPF on asymmetrically routed interfaces (where different interfaces receive a packet and reply to its source) results in packets from legitimate sources being filtered (discarded) because the best return path is not the same interface that received the packet.

The following switch interfaces are most likely to be symmetrically routed and thus are candidates for unicast RPF enabling:

- The service provider edge to a customer
- The customer edge to a service provider
- A single access point out of the network (usually on the network perimeter)
- A terminal network that has only one link

**NOTE:** Because unicast RPF is enabled globally on EX3200, EX4200, and EX4300 switches, ensure that *all* interfaces are symmetrically routed before you enable unicast RPF on these switches. Enabling unicast RPF on asymmetrically routed interfaces results in packets from legitimate sources being filtered.

**TIP:** Enabling unicast RPF as close as possible to the traffic source stops spoofed traffic before it can proliferate or reach interfaces that do not have unicast RPF enabled.

## When Not to Enable Unicast RPF

Typically, you will not enable unicast RPF if:

- Switch interfaces are multihomed.
- Switch interfaces are trusted interfaces.
- BGP is carrying prefixes and some of those prefixes are not advertised or are not accepted by the ISP under its policy. (The effect in this case is the same as filtering an interface by using an incomplete access list.)
- Switch interfaces face the network core. Core-facing interfaces are usually asymmetrically routed.

An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, as shown in [Figure 201](#). This means that if an interface receives a packet, that interface does not match the forwarding table entry as the best return path back to the source. If the receiving interface is not the best return path to the source of a packet, unicast RPF causes the switch to discard the packet even though it comes from a valid source.

Figure 201: Asymmetrically Routed Interfaces

**NOTE:** Do not enable unicast RPF on EX3200, EX4200, and EX4300 switches if any switch interfaces are asymmetrically routed, because unicast RPF is enabled globally on all interfaces of these switches. All switch interfaces must be symmetrically routed for you to enable unicast RPF without the risk of the switch discarding traffic that you want to forward.

### Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches

On EX3200, EX4200, and EX4300 switches, the switch implements unicast RPF on a global basis. You cannot enable unicast RPF on a per-interface basis. Unicast RPF is globally disabled by default.

- When you enable unicast RPF on any interface, it is automatically enabled on all switch interfaces, including link aggregation groups (LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs).
- When you disable unicast RPF on the interface (or interfaces) on which you enabled unicast RPF, it is automatically disabled on all switch interfaces.

**NOTE:** You must explicitly disable unicast RPF on every interface on which it was explicitly enabled or unicast RPF remains enabled on all switch interfaces.

QFX switches, OCX switches, and EX3200 and EX4200 switches do not perform unicast RPF filtering on equal-cost multipath (ECMP) traffic. The unicast RPF check examines only one best return path to the packet source, but ECMP traffic employs an address block consisting of multiple paths. Using unicast RPF to filter ECMP traffic on these switches can result in the switch discarding packets that you want to forward because the unicast RPF filter does not examine the entire ECMP address block.

---

## Configuring Unicast RPF (CLI Procedure)

---

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. When you enable unicast RPF, by default the switch forwards a packet only if the receiving interface is the best return path to the packet's unicast source address. This is known as strict mode unicast RPF. You can also enable loose mode, which means that the system checks to see if the packet has a source address with a corresponding prefix in the routing table but does not check whether the receiving interface is the best return path to the packet's unicast source address.

**NOTE:** On EX3200, EX4200, and EX4300 switches, you can enable unicast RPF only globally—that is, on all switch interfaces. You cannot enable unicast RPF on a per-interface basis.

Before you begin:

- On an EX8200, EX6200, QFX Series switch, or OCX Series switch, ensure that the selected switch interface is symmetrically routed before you enable unicast RPF. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.
- On an EX3200, EX4200, or EX4300 switch, ensure that *all* switch interfaces are symmetrically routed before you enable unicast RPF on an interface. When you enable unicast RPF on any interface, it is enabled globally on all switch interfaces. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.

To enable unicast RPF, configure it explicitly on a selected customer-edge interface:

[edit interfaces]

user@switch# **set interface-name** unit 0 family inet **rpf-check**

To enable unicast RPF loose mode, enter:

[edit interfaces]

user@switch# **set interface-name** unit 0 family inet **rpf-check mode loose**

**BEST PRACTICE:** On EX3200, EX4200, and EX4300 switches, unicast RPF is enabled globally on *all* switch interfaces, regardless of whether you configure it explicitly on only one interface or only on some interfaces.

On EX3200, EX4200, and EX4300 switches, we recommend that you enable unicast RPF explicitly on either all interfaces or only one interface. To avoid possible confusion, do not enable it on only some interfaces:

- Enabling unicast RPF explicitly on only one interface makes it easier if you choose to disable it in the future because you must explicitly disable unicast RPF on every interface on which you explicitly enabled it. If you explicitly enable unicast RPF on two interfaces and you disable it on only one interface, unicast RPF is still implicitly enabled globally on the switch. The drawback of this approach is that the switch displays the flag that indicates that unicast RPF is enabled only on interfaces on which unicast RPF is explicitly enabled, so even though unicast RPF is enabled on all interfaces, this status is not displayed.
- Enabling unicast RPF explicitly on all interfaces makes it easier to know whether unicast RPF is enabled on the switch because every interface shows the correct status. (Only interfaces on which you explicitly enable unicast RPF display the flag that indicates that unicast RPF is enabled.) The drawback of this approach is that if you want to disable unicast RPF, you must explicitly disable it on every interface. If unicast RPF is enabled on any interface, it is implicitly enabled on all interfaces.

#### Related Documentation

## Disabling Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Unicast

RPF filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. If the network configuration changes so that an interface that has unicast RPF enabled becomes a trusted interface or becomes asymmetrically routed (the interface that receives a packet is not the best return path to the packet's source), disable unicast RPF.

To disable unicast RPF on an EX3200, EX4200, or EX4300 switch, you must delete it from every interface on which you explicitly configured it. If you do not disable unicast RPF on every interface on which you explicitly enabled it, it remains implicitly enabled on all interfaces. If you attempt to delete unicast RPF from an interface on which it was not explicitly enabled, the **warning: statement not found** message appears. If you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces of the EX3200, EX4200, or EX4300 switch.

On EX8200, EX6200, QFX Series switches, and OCX Series switches, the switch does not apply unicast RPF to an interface unless you explicitly enable that interface for unicast RPF.

To disable unicast RPF, delete its configuration from the interface:

[edit interfaces]

user@switch# **delete** ge-1/0/10 unit 0 family inet **rpf-check**

**NOTE:** On EX3200, EX4200, and EX4300 switches, if you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces.

**Related  
Documentation**

```

**Meaning** The `show interfaces ge-1/0/10 extensive` command (and the `show interfaces ge-1/0/10 detail` command) displays in-depth information about the interface. The **Flags:** output field near the bottom of the display reports the unicast RPF status. If unicast RPF has not been enabled, the **uRPF** flag is not displayed.

On EX3200, EX4200, and EX4300 switches, unicast RPF is implicitly enabled on *all* switch interfaces, including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs) when you enable unicast RPF on a single interface. However, the unicast RPF status is shown as enabled only on interfaces for which you have explicitly configured unicast RPF. Thus, the **uRPF** flag is not displayed on interfaces for which you have not explicitly configured unicast RPF even though unicast RPF is implicitly enabled on all interfaces on EX3200 and EX4200 switches.

## Understanding Unknown Unicast Forwarding

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that traverse a VLAN to all interfaces that are members of that VLAN. Forwarding this type of traffic can create unnecessary traffic that leads to poor network performance or even a complete loss of network service. This flooding of packets is known as a traffic storm.

To prevent a traffic storm, you can disable the flooding of unknown unicast packets to all VLAN interfaces by configuring specific VLANs or all VLANs to forward all unknown unicast traffic traversing them to a specific interface. You can configure multiple VLANs to forward unknown unicast packets to the same interface or configure different interfaces for different VLANs. This channels the unknown unicast traffic traversing VLANs to specific interfaces instead of flooding all interfaces.

## Configuring Unknown Unicast Forwarding (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Configuring Unknown Unicast Forwarding (CLI Procedure)*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 41](#)

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets that traverse a VLAN to all interfaces associated with that VLAN. This flooding of packets is known as a traffic storm and can negatively impact network performance.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN to a specific interface.

You can configure each VLAN to divert unknown unicast traffic to a different interface or use the same interface for multiple VLANs.

- [Configuring Unknown Unicast Forwarding on EX4300 Switches on page 6060](#)
- [Configuring Unknown Unicast Forwarding on EX9200 Switches on page 6060](#)

## Configuring Unknown Unicast Forwarding on EX4300 Switches

To configure unknown unicast forwarding options on EX4300 switches:

- Configure unknown unicast forwarding for a specific VLAN and specify the interface to which all unknown unicast traffic will be forwarded:

```
[edit switch-options]
user@switch# set unknown-unicast-forwarding vlan vlan-name interface interface-name
```

- Configure unknown unicast forwarding for all VLANs and specify the interface to which all unknown unicast traffic will be forwarded:

```
[edit switch-options]
user@switch# set unknown-unicast-forwarding vlan all interface interface-name
```

## Configuring Unknown Unicast Forwarding on EX9200 Switches

To configure unknown unicast forwarding on EX9200 switches, you must configure a flood filter and apply it to VLANs for which you want to configure unknown unicast forwarding. Flood filters are firewall filters that are applied only to broadcast, unknown unicast, and multicast (BUM) traffic. If a flood filter is configured, only traffic packets that are of the packet type **unknown-unicast** are forwarded to the interface on which unicast forwarding is configured. A next-hop group redirects the packets according to the action specified in the flood filter.

To configure the next-hop group that receives Layer 2 packets and then configure the interface to which these packets are forwarded:

1. Configure the **next-hop-group** action for the Layer 2 interface expected to receive unknown unicast packets:

```
[edit forwarding-options]
user@switch# set next-hop-group next-hop-group-name group-type layer-2
[edit forwarding-options]
user@switch# set next-hop-group next-hop-group-name interface interface-name
```

For example:

```
[edit forwarding-options]
user@switch# set next-hop-group uuf-nhg group-type layer-2
[edit forwarding-options]
user@switch# set next-hop-group uuf-nhg interface ge-3/1/7.0
```

2. Configure a firewall filter with family address type **ethernet-switching**:

```
[edit firewall]
user@switch# set family ethernet-switching filter filter-name
```

For example:

```
[edit firewall]
user@switch# set family ethernet-switching filter uuf_filter
```

3. Configure a term in the firewall filter for the interface that receives unknown unicast packets (the interface specified in Step 1) to discard unknown unicast packets:

```
[edit firewall family ethernet-switching filter filter-name]
user@switch# set term term-name from interface interface-name
user@switch# set term term-name from traffic-type unknown-unicast
user@switch# set term term-name then discard
```

For example:

```
[edit firewall family ethernet-switching filter uuf_filter]
user@switch# set term source-drop from interface ge-3/1/7.0
user@switch# set term source-drop from traffic-type unknown-unicast
user@switch# set term source-drop then discard
```

4. Configure a term in the firewall filter for unknown unicast packets to be flooded to the interface enabled for unknown unicast forwarding by using **next-hop-group** (in step 1):

```
[edit firewall family ethernet-switching filter filter-name]
user@switch# set term term-name from traffic-type unknown-unicast
user@switch# set term term-name then next-hop-group group-name
```

For example:

```
[edit firewall family ethernet-switching filter uuf_filter]
user@switch# set term uuf-flood from traffic-type unknown-unicast
user@switch# set term uuf-flood then next-hop-group uuf-nhg
```

5. Configure a default term for the firewall filter to forward packets other than unknown unicast packets:

```
[edit firewall family ethernet-switching filter filter-name]
user@switch# set term term-name then accept
```

For example:

```
[edit firewall family ethernet-switching filter uuf_filter]
user@switch# set term fwd-default then accept
```

6. Apply the filter as a flood filter on the VLAN that includes the interface which will receive unknown unicast packets:

```
[edit vlans vlan-name]
user@switch# set forwarding-options flood input filter-name
```

For example:

```
[edit vlans v1]
user@switch# set forwarding-options flood input uuf_filter
```

## Understanding Distributed Denial-of-Service Protection on QFX Series Switches

---

A denial-of-service (DoS) attack is any attempt to deny valid users access to network or server resources by using up all the resources of the network element or server. Distributed denial-of-service attacks (DDoS) involve an attack from multiple sources, enabling a much greater amount of traffic to attack the network. The attacks typically use network protocol control packets to trigger a large number of exceptions to the router or switch control plane. This results in an excessive processing load that disrupts normal network operations.

Junos OS DDoS protection enables both QFX10000 switches and QFX5200 switches to continue functioning while under attack. It identifies and suppresses malicious control packets while enabling legitimate control traffic to be processed. A single point of DDoS protection management enables network administrators to customize profiles for their network control traffic.

To protect against DDoS attacks, you can configure policers for host-bound exception traffic. The policers specify rate limits for all control traffic for a given protocol, or, in some cases, for specific control packet types for a protocol. Control traffic is dropped when it exceeds any configured policer values or, for unconfigured policers, the default policer values. Each violation immediately generates a notification to alert operators about a possible attack. The violation is counted, the time that the violation starts is noted, and the time of the last observed violation is noted. When the traffic rate drops below the bandwidth violation threshold, a recovery timer determines when the traffic flow is considered to have returned to normal. If no further violation occurs before the timer expires, the violation state is cleared and a notification is generated. On QFX Series switches, the timer is set to 300 seconds and cannot be modified.

In addition providing notification of violations through event logging, Junos OS DDoS protection allows you to monitor policers, obtaining information such as the policer configuration, number of violations encountered, date and time of violations, packet arrival rates, and number of packets received or dropped.

## Policer Types and Packet Priorities

DDoS protection includes two types of policers:

- An *aggregate policer* is applied to the complete set of packet types that belong to a protocol group. For example, you can configure an aggregate policer that applies to all RADIUS control packet types or to all DHCP control packet types. You can specify bandwidth and burst limits for aggregate policers. An aggregate policer is available for all protocol groups. Aggregate policers are supported by all protocol groups.
- An *individual policer*, also referred to as a *packet-type policer*, is allocated for a specific control packet type within a protocol group. For example, you can configure a policer for one or more types of RADIUS control packets. You can specify bandwidth and burst limits, prioritize one packet type over another, and enable a packet type to bypass the aggregate policer for the protocol group.

Individual policers are not available for all protocol groups. See [protocols](#) for a list of protocol groups that have individual policers.

A control packet is policed first by its individual policer (if supported) and then by its aggregate policer. A packet dropped by the individual policer never reaches the aggregate policer. A packet that passes the individual policer can subsequently be dropped by the aggregate policer.

Each packet type within a protocol group has a default, configurable priority: low, medium, or high. Each control packet competes with other packets for the bandwidth within the limit imposed by its aggregate policer based on the priority configured for each packet type in the protocol group.

The priority mechanism is absolute. High-priority traffic gets bandwidth in preference to medium-priority and low-priority traffic. Medium-priority traffic gets bandwidth in preference to low-priority traffic. Low-priority traffic can use only the bandwidth left by high-priority and medium-priority traffic. If higher-priority traffic takes all of the bandwidth, then all the lower-priority traffic is dropped.

## Example of Policer Priority Behavior

For example, consider how you might configure packet types within the RADIUS protocol group. Suppose you configure individual policers for accounting and authorization packets, as well as a RADIUS aggregate policer for all RADIUS control packets. You might want to prioritize the RADIUS authorization function over the RADIUS accounting function, and therefore you would assign a high priority to the authorization control packets and a low priority to accounting control packets.

The aggregate policer imposes a total bandwidth limit for the protocol group. Authorization packets passed by their individual policer have access to that bandwidth before accounting packets passed by their individual policer, because the authorization packets have a higher priority. If enough authorization packets are passed that they use all the available bandwidth, then all the accounting packets are dropped, because there is no bandwidth remaining at the aggregate policer.

## Policer Enforcement Points on QFX Series Switches

On both QFX1000 and QFX5200 switches, the DDoS policers operate at the line card level. Control traffic arriving from all ports of a line card converges on the Packet Forwarding Engine, where it is subject to policing. Thus, excess packets are dropped before they reach the Routing Engine, ensuring that the Routing Engine receives only the amount of traffic it can process.

- [Tracing DDoS Protection Operations on page 6078](#)

## Configuring Protection Against DDoS Attacks

---

DDoS protection is enabled by default for all supported protocol groups and packet types. Default values are present for bandwidth, bandwidth scale, burst, burst scale, priority, and recover time. You can change the DDoS configuration for individual packet types within a protocol group or for the aggregate policer for the protocol group. DDoS logging is enabled by default, but you can disable it globally for all DDoS events or for individual packet types within a protocol group. You can also fine-tune monitoring of DDoS events by configuring tracing operations.

You can disable DDoS protection at the Routing Engine and for all line cards either globally or for individual packet types within a protocol group.

**NOTE:** DDoS protection is supported only on MX Series routers that have only MPCs installed, T4000 routers that have only FPC5s installed, EX9200 switches, QFX5200 switches, and QFX10000 switches. If the router platforms have other line cards in addition to MPCs (MX Series) or FPC5s (T4000), the CLI accepts the configuration but the other line cards are not protected and so the router is not protected. Neither QFX10002 switches nor QFX5200 switches support policers at the Routing Engine.

---

To configure DDoS protection:

1. (Optional) Configure global DDoS settings.  
[See “Disabling DDoS Protection Policers and Logging Globally” on page 6074.](#)
2. (Optional) Configure DDoS settings for individual packet types.

For MX Series routers, T4000 routers, or EX9200 switches, see *Configuring DDoS Protection Policers for Individual Packet Types*. For QFX10000 switches, see [“Configuring DDoS Protection Policers on QFX Series Switches” on page 6074](#).

3. (Optional) Configure tracing for DDoS operations.

See *Tracing DDoS Protection Operations*.

---

## Example: Configuring DDoS Protection on QFX Series Switches

This example shows how to configure DDoS protection that enables a switch to quickly identify an attack and prevent a flood of malicious control packets from exhausting system resources.

- [Requirements on page 6070](#)
- [Overview on page 6070](#)
- [Configuration on page 6071](#)
- [Verification on page 6072](#)

### Requirements

DDoS protection requires the following hardware and software:

- QFX Series switch that supports DDoS protection
- Junos OS Release 15.1X53-D10 or later

No special configuration beyond device initialization is required before you can configure this feature.

### Overview

Distributed denial-of-service (DDoS) attacks use multiple sources to flood a network with protocol control packets. This malicious traffic triggers a large number of exceptions in the network and attempts to exhaust the system resources to deny valid users access to the network or server.

DDoS protection is enabled by default on a supported QFX Series switch. This example describes how you can modify the default configuration for the rate-limiting policers that identify excess control traffic and drop the packets before the switch is adversely affected. Sample tasks include configuring an aggregate policer for a protocol group, configuring policers for particular control packet types within a protocol group, and specifying trace options for DDoS operations.

This example does not show all possible configuration choices.

## Configuration

**CLI Quick Configuration** To quickly configure DDoS protection for protocol groups and particular control packet types, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
[edit]
edit system
set ddos-protection protocols radius aggregate bandwidth 150
set ddos-protection protocols radius aggregate burst 2000
set ddos-protection protocols radius accounting bandwidth 100 burst 150
set ddos-protection protocols radius accounting priority low
set ddos-protection protocols radius server bypass-aggregate
set ddos-protection traceoptions file ddos-trace size 10m
set ddos-protection traceoptions flag all
top
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure DDoS protection:

1. Specify a protocol group.  

```
[edit system ddos-protection protocols]
user@host# edit radius
```
2. Configure the maximum traffic rate for the RADIUS aggregate policer; that is, for the combination of all RADIUS packets.  

```
[edit system ddos-protection protocols radius]
user@host# set aggregate bandwidth 150
```
3. Configure the maximum burst rate for the RADIUS aggregate policer.  

```
[edit system ddos-protection protocols radius]
user@host# set aggregate burst 2000
```
4. Configure a different maximum traffic rate and burst size for RADIUS accounting packets.  

```
[edit system ddos-protection protocols radius]
user@host# set accounting bandwidth 100 burst 1500
```
5. Decrease the priority for RADIUS accounting packets.  

```
[edit system ddos-protection protocols radius]
user@host# set accounting priority low
```
6. Prevent RADIUS server control packets from being included in the aggregate bandwidth; that is, server packets do not contribute toward the combined RADIUS traffic to determine whether the aggregate bandwidth is exceeded. However, the server packets are still included in traffic rate statistics.

```
[edit system ddos-protection protocol radius]
user@host# set server bypass-aggregate
```

7. Configure tracing for all DDoS protocol processing events.

```
[edit system ddos-protection traceoptions]
user@host# set file ddos-log
user@host# set file size 10m
user@host# set flag all
```

**Results** From configuration mode, confirm your configuration by entering the **show ddos-protection** command at the **system** hierarchy level.

```
[edit system]

user@host# show ddos-protection

traceoptions {
 file ddos-log size 10m;
 flag all;
}
protocols {

 radius {
 aggregate {
 bandwidth 150;
 burst 2000;
 }
 server {
 bypass-aggregate;
 }
 accounting {
 bandwidth 100;
 burst 1500;
 priority low;
 }
 }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the DDoS protection configuration is working properly, perform these tasks:

- [Verifying the DDoS Protection Configuration on page 6072](#)

### Verifying the DDoS Protection Configuration

**Purpose** Verify that the RADIUS policer values have changed from the default.

**Action** From operational mode, enter the **show ddos-protection protocols radius parameters** command.

```
user@host> show ddos-protection protocols radius parameters
Packet types: 5, Modified: 3
* = User configured value
```

## Protocol Group: Radius

```

Packet type: aggregate (Aggregate for all Radius traffic)
Aggregate policer configuration:
 Bandwidth: 150 pps*
 Burst: 2000 packets*
 Recover time: 300 seconds
 Enabled: Yes
Routing Engine information:
 Bandwidth: 150 pps, Burst: 2000 packets, enabled
FPC slot 0 information:
 Bandwidth: 100% (150 pps), Burst: 100% (2000 packets), enabled

Packet type: server (Radius server traffic)
Individual policer configuration:
 Bandwidth: 200 pps
 Burst: 2048 packets
 Priority: High
 Recover time: 300 seconds
 Enabled: Yes
 Bypass aggregate: Yes*
Routing Engine information:
 Bandwidth: 200 pps, Burst: 2048 packets, enabled
FPC slot 0 information:
 Bandwidth: 100% (200 pps), Burst: 100% (2048 packets), enabled

Packet type: accounting (Radius accounting traffic)
Individual policer configuration:
 Bandwidth: 100 pps*
 Burst: 1500 packets*
 Priority: Low*
 Recover time: 300 seconds
 Enabled: Yes
 Bypass aggregate: No
Routing Engine information:
 Bandwidth: 100 pps, Burst: 1500 packets, enabled
FPC slot 0 information:
 Bandwidth: 100% (100 pps), Burst: 100% (1500 packets), enabled

Packet type: authorization (Radius authorization traffic)
Individual policer configuration:
 Bandwidth: 200 pps
 Burst: 2048 packets
 Priority: High
 Recover time: 300 seconds
 Enabled: Yes
 Bypass aggregate: No
Routing Engine information:
 Bandwidth: 200 pps, Burst: 2048 packets, enabled
FPC slot 0 information:
 Bandwidth: 100% (200 pps), Burst: 100% (2048 packets), enabled

```

**Meaning** The command output shows the current configuration of the RADIUS aggregate policer and the RADIUS accounting, server, and authorization control packet policers. Policers values that have been modified from the default values are marked with an asterisk. The output shows that the RADIUS policer configuration has been modified correctly.

  - [Configuring Protection Against DDoS Attacks on page 6069](#)

---

## Disabling DDoS Protection Policers and Logging Globally

---

DDoS policers are enabled by default for all supported protocol groups and packet types.

On MX Series routers, T4000 routers, and EX9200 switches, policers are established at the level of the individual line card and the Routing Engine. You can disable the line card policers globally for all MPCs or FPC5s. You can also disable the Routing Engine policer. When you disable either of these policers, the policers at that level for all protocol groups and packet types are disabled.

On both QFX10002 switches and QFX5200 switches, policers are established at the level of individual line cards only. If you disable line-card policers globally, DDoS protection is disabled on the switch.

DDoS logging is also enabled by default. You can disable all DDoS event logging (including flow detection event logging) for all protocol groups and packet types across the router or switch.

**NOTE:** The global configuration for disabling policers and logging overrides any local configuration for packet types.

---

To configure global DDoS settings:

1. (Optional) Disable line card policers.  

```
[edit system ddos-protection global]
user@host# set disable-fpc
```
2. (Optional) Disable Routing Engine policers (not supported on QFX10002 switches).  

```
[edit system ddos-protection global]
user@host# set disable-routing-engine
```
3. (Optional) Disable event logging.  

```
[edit system ddos-protection global]
user@host# set disable-logging
```

- Related Documentation**
- [Configuring Protection Against DDoS Attacks on page 6069](#)

---

## Configuring DDoS Protection Policers on QFX Series Switches

---

You can modify the DDoS protection configuration as follows:

- Modify the aggregate policer bandwidth and burst values for a protocol group. Default values exist for all protocol groups. See [protocols](#) for the supported protocol groups and their default policer values.
- Modify the policer bandwidth and burst values for individual control packet types within a protocol group, for those groups that support policers for individual packet types. You can specify that packets of a certain type have a higher or lower priority than other types. You can also specify that a packet type bypass the aggregate policer for the protocol group. See [protocols](#) for the supported packet types and their default policer values.
- Scale the bandwidth and burst values for a policer on a line card so that the policer triggers at lower thresholds than the overall protocol thresholds.
- Disable logging for a specific policer.
- Disable a policer on all line cards or on an individual line card. On devices with a single line card, disabling policers on the line card is effectively the same as disabling the policers globally. Note that deleting the configuration for a policer does not disable it—the policer merely reverts to its default settings.

**BEST PRACTICE:** We recommend that you model your network to determine the best values for your situation. Before you configure policers for your network, you can quickly view the default values for all protocol groups and packet types from operational mode by issuing the [show ddos-protection protocols parameters brief](#) command. You can also use the command to specify a single protocol group of interest; for example, issue the [show ddos-protection protocols radius parameters brief](#) command.

This topic describes:

- [Configuring the Aggregate Policer for a Protocol Group on page 6075](#)
- [Configuring Packet-Type Policers for a Protocol Group on page 6076](#)
- [Configuring Policers on Individual Line Cards on page 6077](#)
- [Disabling Policers and Policer Logging on page 6077](#)

## Configuring the Aggregate Policer for a Protocol Group

An aggregate policer exists for each protocol group. The aggregate policer enforces the traffic limits on the control packets for that protocol as a combined group.

To configure the DDoS aggregate policer for a protocol group:

1. Specify the aggregate policer for the protocol group.

```
[edit system ddos-protection protocols]
user@host# edit protocol-group aggregate
```

For example, to specify the DHCPv4v6 aggregate policer:

```
[edit system ddos-protection protocols]
user@host# edit dhcpv4v6 aggregate
```

2. (Optional) Configure the maximum traffic rate the policer allows for the protocol group.

```
[edit system ddos-protection protocols protocol-group aggregate]
user@host# set bandwidth packets-per-second
```

For example, to set a bandwidth of 300 packets per second for DHCPv4 and DHCPv6 packets:

```
[edit system ddos-protection protocols dhcpv4v6 aggregate]
user@host# set bandwidth 300
```

3. (Optional) Configure the maximum number of packets that the policer allows in a burst of traffic.

```
[edit system ddos-protection protocols protocol-group aggregate]
user@host# set burst size
```

For example, to set a maximum of 1500 DHCPv4v6 packets:

```
[edit system ddos-protection protocols dhcpv4v6 aggregate]
user@host# set burst 1500
```

## Configuring Packet-Type Policers for a Protocol Group

Some protocol groups allow you to configure a separate policer for each control packet type. Control traffic is subject first to the packet-type policer and then to the aggregate policer.

To configure a packet-type policer:

1. Specify the protocol group and packet type.

```
[edit system ddos-protection protocols]
user@host# edit protocol-group packet-type
```

For example, to specify the RADIUS protocol group and the authorization packet type:

```
[edit system ddos-protection protocols]
user@host# edit radius authorization
```

2. (Optional) Configure the maximum traffic rate the policer allows for the packet type.

```
[edit system ddos-protection protocols protocol-group packet-type]
user@host# set bandwidth packets-per-second
```

For example, to set a bandwidth of 150 packets per second for RADIUS authorization packets:

```
[edit system ddos-protection protocols radius authorization]
user@host# set bandwidth 150
```

3. (Optional) Configure the maximum number of packets of the packet type that the policer allows in a burst of traffic.

```
[edit system ddos-protection protocols protocol-group packet-type]
user@host# set burst size
```

For example, to set a maximum of 2000 RADIUS authorization packets:

```
[edit system ddos-protection protocols radius authorization]
```

```
user@host# set burst 2000
```

4. (Optional) Set the traffic priority—either high, medium, or low.

```
[edit system ddos-protection protocols protocol-group packet-type]
```

```
user@host# set priority level
```

For example, to specify a low priority for RADIUS accounting packets:

```
[edit system ddos-protection protocols radius accounting]
```

```
user@host# set priority low
```

5. (Optional) Allow packets of the specified type to bypass the aggregate policer.

```
[edit system ddos-protection protocols protocol-group packet-type]
```

```
user@host# set bypass-aggregate
```

For example, to bypass the aggregate policer for RADIUS server packets:

```
[edit system ddos-protection protocols radius server]
```

```
user@host# set bypass-aggregate
```

## Configuring Policers on Individual Line Cards

You can alter a policer behavior on a specific line card by scaling the policer's configured bandwidth and burst values. On switches with a single fixed line card, such as the QFX10002, scaling the policer values affects the entire switch.

- To scale the maximum bandwidth for a policer on a line card:

```
[edit system ddos-protection protocols protocol-group (aggregate | packet-type)]
```

```
user@host# set fpc slot-number bandwidth-scale percentage
```

For example, to scale the maximum bandwidth allowed by the DHCPv4v6 aggregate policer for the line card in slot 3 to 80 percent:

```
[edit system ddos-protection protocols dhcpv4v6 aggregate]
```

```
user@host# set fpc 3 bandwidth-scale 80
```

- To scale the maximum burst size for a policer on the line card:

```
[edit system ddos-protection protocols protocol-group (aggregate | packet-type)]
```

```
user@host# set fpc slot-number burst-scale percentage
```

For example, to scale the maximum burst size to 75 percent for the RADIUS server packets on the line card in slot 1:

```
[edit system ddos-protection protocols radius server]
```

```
user@host# set fpc 1 burst-scale 75
```

## Disabling Policers and Policer Logging

All supported policers are enabled by default. You can disable specific policers on a line card or line cards. Similarly, event logging by policers is enabled by default. You can selectively disable logging by a policer.

- To disable a policer on a specific line card:

```
[edit system ddos-protection protocols]
```

```
user@host# set protocol-group (aggregate | packet-type fpc slot-number) disable-fpc
```

For example, to disable the DDoS policers for the RADIUS authorization packet type on line card 3:

```
[edit system ddos-protection protocols]
user@host# set radius authorization fpc 3 disable-fpc
```

Because both QFX10002 and QFX5200 have a single line card, disabling a policer on that line card effectively disables it for the switch.

- To disable a policer on all line cards:

```
[edit system ddos-protection protocols]
user@host# set protocol-group (aggregate | packet-type) disable-fpc
```

For example, to disable the aggregate policer for the BFD protocol group on all line cards:

```
[edit system ddos-protection protocols]
user@host# set bfd aggregate disable-fpc
```

- To disable event logging by a policer:

```
[edit system ddos-protection protocols]
user@host# set protocol-group (aggregate | packet-type) disable-logging
```

For example, to disable logging by the aggregate BFD policer:

```
[edit system ddos-protection protocols]
user@host# set bfd aggregate disable-logging
```

## Tracing DDoS Protection Operations

The Junos OS trace feature tracks DDoS protection operations and records events in a log file. The error descriptions captured in the log file provide detailed information to help you solve problems.

By default, nothing is traced. When you enable the tracing operation, the default tracing behavior is as follows:

1. Important events are logged in a file located in the `/var/log` directory. By default, the router uses the filename `jddosd`. You can specify a different filename, but you cannot change the directory in which trace files are located.
2. When the trace log file *filename* reaches 128 kilobytes (KB), it is compressed and renamed *filename.0.gz*. Subsequent events are logged in a new file called *filename*, until it reaches capacity again. At this point, *filename.0.gz* is renamed *filename.1.gz* and *filename* is compressed and renamed *filename.0.gz*. This process repeats until the number of archived files reaches the maximum file number. Then the oldest trace file—the one with the highest number—is overwritten.

You can optionally specify the number of trace files to be from 2 through 1000. You can also configure the maximum file size to be from 10 KB through 1 gigabyte (GB).

(For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)

By default, only the user who configures the tracing operation can access log files. You can optionally configure read-only access for all users.

This topic describes how you can configure all aspects of DDoS tracing operations. It covers:

- [Configuring the DDoS Protection Trace Log Filename on page 6079](#)
- [Configuring the Number and Size of DDoS Protection Log Files on page 6079](#)
- [Configuring Access to the DDoS Protection Log File on page 6080](#)

- [Configuring the Severity Level to Filter Which DDoS Protection Messages Are Logged on page 6081](#)

## Configuring the DDoS Protection Trace Log Filename

By default, the name of the file that records trace output for DDoS protection is **jddosd**. You can specify a different name with the **file** option.

To configure the filename for subscriber management database tracing operations:

- Specify the name of the file used for the trace output.

```
[edit system ddos-protection traceoptions]
user@host# set file ddos_logfile_1
```

## Configuring the Number and Size of DDoS Protection Log Files

You can optionally specify the number of compressed, archived trace log files to be from 2 through 1000. You can also configure the maximum file size to be from 10 KB through 1 gigabyte (GB); the default size is 128 kilobytes (KB).

The archived files are differentiated by a suffix in the format **.number.gz**. The newest archived file is **.0.gz** and the oldest archived file is **.(maximum number)-1.gz**. When the current trace log file reaches the maximum size, it is compressed and renamed, and any existing archived files are renamed. This process repeats until the maximum number of archived files is reached, at which point the oldest file is overwritten.

For example, you can set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation, **filename**, reaches 2 MB, **filename** is compressed and renamed **filename.0.gz**, and a new file called **filename** is created. When the new **filename** reaches 2 MB, **filename.0.gz** is renamed **filename.1.gz** and **filename** is compressed and renamed **filename.0.gz**. This process repeats until there are 20 trace files. Then the oldest file, **filename.19.gz**, is simply overwritten when the next oldest file, **filename.18.gz** is compressed and renamed to **filename.19.gz**.

To configure the number and size of trace files:

- Specify the name, number, and size of the file used for the trace output.

```
[edit system ddos-protection traceoptions]
user@host# set file ddos_1_logfile_1 files 20 size 2097152
```

## Configuring Access to the DDoS Protection Log File

By default, only the user who configures the tracing operation can access the log files. You can enable all users to read the log file and you can explicitly set the default behavior of the log file.

To specify that all users can read the log file:

- Configure the log file to be world-readable.

```
[edit system ddos-protection traceoptions]
user@host# set file ddos_1_logfile_1 world-readable
```

To explicitly set the default behavior, only the user who configured tracing can read the log file:

- Configure the log file to be no-world-readable.

```
[edit system ddos-protection traceoptions]
user@host# set file ddos_1_logfile_1 no-world-readable
```

## Configuring a Regular Expression for DDoS Protection Messages to Be Logged

By default, the trace operation output includes all messages relevant to the logged events.

You can refine the output by including regular expressions to be matched.

To configure regular expressions to be matched:

- Configure the regular expression.

```
[edit system ddos-protection traceoptions]
user@host# set file ddos_1_logfile_1 match regex
```

## Configuring the DDoS Protection Tracing Flags

By default, only important events are logged. You can specify which events and operations are logged by specifying one or more tracing flags.

To configure the flags for the events to be logged:

- Configure the flags.

```
[edit system ddos-protection traceoptions]
user@host# set flag flag
```

## Configuring the Severity Level to Filter Which DDoS Protection Messages Are Logged

The messages associated with a logged event are categorized according to severity level. You can use the severity level to determine which messages are logged for the event type. The severity level that you configure depends on the issue that you are trying to resolve. In some cases you might be interested in seeing all messages relevant to the logged event, so you specify **all** or **verbose**. Either choice generates a large amount of output. You can specify a more restrictive severity level, such as **notice** or **info** to filter the messages. By default, the trace operation output includes only messages with a severity level of **error**.

To configure the type of messages to be logged:

- Configure the message severity level.

```
[edit system ddos-protection traceoptions]
user@host# set level severity
```

## Verifying and Managing DDoS Protection

---

**Purpose** View or clear information about DDoS configurations, states, and statistics.

**Action**

- To display the DDoS policer configuration, violation state, and statistics for all packet types in all protocol groups:

user@host> **show ddos-protection protocols**

If you issue the command before you make any configuration changes, the default policer values are displayed.

- To display the DDoS policer configuration, violation state, and statistics for a particular packet type in a particular protocol group:

user@host> **show ddos-protection protocols protocol-group packet-type**

- To display only the number of DDoS policer violations for all protocol groups:

user@host> **show ddos-protection protocols violations**

- To display a table of the DDoS configuration for all packet types in all protocol groups:

user@host> **show ddos-protection protocols parameters brief**

- To display a complete list of packet statistics and DDoS violation statistics for all packet types in all protocol groups:

user@host> **show ddos-protection protocols statistics detail**

- To display global DDoS violation statistics:

user@host> **show ddos-protection statistics**

- To display the DDoS version number:

user@host> **show ddos-protection version**

- To clear DDoS statistics for all packet types in all protocol groups:

user@host> **clear ddos-protection protocols statistics**

- To clear DDoS statistics for all packet types in a particular protocol group:

user@host> **clear ddos-protection protocols protocol-group statistics**

- To clear DDoS statistics for a particular packet type in a particular protocol group:

user@host> **clear ddos-protection protocols protocol-group statistics packet-type**

- To clear DDoS violation states for all packet types in all protocol groups:

user@host> **clear ddos-protection protocols states**

- To clear DDoS violation states for all packet types in a particular protocol group:

user@host> **clear ddos-protection protocols protocol-group states**

- To clear DDoS violation states for a particular packet type in a particular protocol group:

user@host> **clear ddos-protection protocols protocol-group states packet-type**

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
**evpn** options introduced in Junos OS Release 15.1 for the MX Series.

**Description**    Configure the fields a firewall filter can match on.

**Options**    *family-name*—Type of addressing protocol:

- **ethernet-switching**—Filter Layer 2 Ethernet packets and Layer 3 (IP) packets (allows some Layer 3 filtering). Not supported on OCX Series switches.
- **evpn**—Filter Ethernet VPN (EVPN) packets.
- **inet**—Filter Layer 3 IPv4 packets (provides additional Layer 3 filter options).
- **inet6**—Filter Layer 3 IPv6 packets (provides additional Layer 3 filter options).
- **mpls**—Filter multiprotocol label switched packets. Not supported on OCX Series switches.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure firewall filters and policers.

The remaining statements are explained separately.

| <b>Description</b>              | Configure the way preclassified packets are metered. In color-aware mode, the switch can assign a higher packet-loss priority, but cannot assign a lower packet loss priority (PLP). For example, suppose an upstream device assigns medium-high PLP to a packet because the packet exceeded its committed information rate (CIR). The switch cannot change the PLP to low even if the packet conforms to the configured CIR of the appropriate interface. On the other hand, if an upstream device assigns low PLP to a packet but the packet exceeds the CIR and committed burst size (CBS) of the switch interface, the switch can increase the PLP to medium-high. |
| <b>Default</b>                  | If you omit the <b>color-aware</b> statement, the default behavior is color-aware mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. If you use a filter-specific policer in multiple terms, both of the following are true:</p> <ul style="list-style-type: none"><li>• Traffic is policed at the aggregate rate. For example, if you create a policer that has a bandwidth limit of 100 Mbps and use the policer in two terms, the total allowed bandwidth for both terms is 100 Mbps—not 100 Mbps for each term.</li><li>• The implicit counter counts all the packets are that matched by any of the terms. For example, if you reference the same filter-specific policer in term1 and term2, and term1 matches 1000 packets and term2 matches 500 packets, the implicit counter shows 1500 matches for the policer.</li></ul> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Configure policer rate limits and actions. To activate a policer, you must include the <b>policer</b> action modifier in the <b>then</b> statement in a firewall filter term.</p> <p>Each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limits that are specified for the policer. If you use the same policer in multiple terms—either within the same filter or across filters—the policer’s implicit counter is used to count packets that are policed in all of these terms. If you want to obtain separate packet counts for each term, use these approaches:</p> <ul style="list-style-type: none"> <li>• Configure a unique policer for each term.</li> <li>• Configure only one policer, but use a unique, explicit counter in each term.</li> </ul> |
| <b>Options</b>                  | <p><b><i>policer-name</i></b>—Name that identifies the policer. The name can contain letters, numbers, hyphens (-), and can be up to 64 characters long.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | <p>Configure a two-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), peak information rate (PIR), and peak burst size (PBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the PIR or the PBS are assigned medium-high loss priority (yellow). Packets that exceed the PIR and the PBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Shut down or disable interfaces when the storm control level is exceeded, as follows:</p> <ul style="list-style-type: none"><li>• If you set both the <b>action-shutdown</b> and the <b>port-error-disable</b> statements, the affected interfaces are disabled temporarily and recover automatically when the disable timeout expires.</li><li>• If you set the <b>action-shutdown</b> statement and do not set the <b>port-error-disable</b> statement, the affected interfaces are shut down when the storm control level is exceeded, and they do not recover automatically. You must issue the <b>clear ethernet-switching port-error</b> command to clear the port error and restore the interfaces to service.</li></ul> |
| <b>Default</b>                  | The <b>action-shutdown</b> feature is disabled. If the storm control level is exceeded, the switch drops broadcast and unknown unicast messages on the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Configure the storm control level as the bandwidth in kilobits per second of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.                                                                                                                                                                                                                                                                             |
| <div>  <p><b>NOTE:</b> When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>On EX4300 switches—If you do not specify the storm control level using either the <b>bandwidth-level</b> or the <b>bandwidth-percentage</b> statements, the storm control level defaults to 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.</p> <p>On EX9200 switches—Storm control is not enabled by default.</p> <p>On MX Series routers—Storm control is not enabled by default.</p> |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Configure the storm control level as the percentage of available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams on an interface. The storm control level is configured as part of the storm control profile.                                                                                                                          |
| <div> <b>NOTE:</b> When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</div> |                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | On EX4300 switches—The storm control level is 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.<br><br>On EX9200 switches—Storm control is not enabled by default.<br><br>On MX Series routers—Storm control is not enabled by default.                                                                     |

| <b>Description</b>              | <p>Bind a storm control profile to a logical interface.</p> <p>On switches running ELS software, storm control is enabled by default on all switch interfaces at a level of 80 percent of the combined broadcast and unknown unicast streams. (For the equivalent statement for platforms running non-ELS software, see <i>storm-control</i>.)</p> <div> <b>NOTE:</b> If you configure storm control on an aggregated Ethernet interface, the storm-control level is applied to each member interface individually. For example, if the aggregated interface has two members and you configure a storm-control level of 20 kbps, Junos will not detect a storm if one or both of the member interfaces receives traffic at 15 kbps because in neither of these cases does an individual member receive traffic at a rate greater than the configured storm-control level. In this example, Junos detects a storm only if at least one member interface receives traffic at greater than 20 Kbps.</div> |

     }  
 }`

**Hierarchy Level** [edit forwarding-options]

**Release Information** Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
 Statement introduced in Junos OS Release 13.2 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1 for MX Series routers.

**Description** Configure a storm control profile on a switch or router. Storm control is used to prevent network outages that are caused by broadcast traffic storms. Storm control enables the switching device to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the storm control level or storm control bandwidth—is exceeded, thus preventing packets from proliferating and degrading the LAN.

**NOTE:** The name of the storm control profile can contain no more than 127 characters.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

## fc-map

---

**Syntax** `fc-map fc-map-value;`

**Hierarchy Level** Original CLI

[edit ethernet-switching options secure-access-port vlan (all | *vlan-name*) examine-fip]

ELS CLI for Platforms that Support FCoE

[edit **v**lans *vlan-name* **f**orwarding-**o**ptions fip-security]

**NOTE:** The `fc-map` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

QFX Series that Support FCoE-FC Gateway Configuration

[edit fc-fabrics *fc-fabric-name* protocols fip]

**Release Information** Statement introduced in Junos OS Release 10.4 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

**Description** Set the FCoE mapped address prefix (FC-MAP) value for the FCoE VLAN to match the FC switch (or FCoE forwarder) FC-MAP value for the FC fabric. The FC-MAP value is a unique MAC address prefix an FC switch uses to identify FCoE traffic for a given FC fabric (traffic on a particular FCoE VLAN).

You can configure the FC-MAP value or use the default value. The default FC-MAP value is different for VN\_Port to VF\_Port (VN2VF\_Port) FIP snooping (0x0EFC00) than for VN\_Port to VN\_Port (VN2VN\_Port) FIP snooping.

The FC switch provides the FC-MAP value to FCoE nodes (ENodes) in the FIP discovery advertisement message. If the EX Series switch or the QFX Series FCoE VLAN FC-MAP value does not match the FC switch FC-MAP value, neither device discovers the FC switch on that VLAN, and the ENodes on that VLAN cannot access the FC switch. The FC switch accepts only FCoE traffic that uses the correct FC-MAP value as part of the VN\_Port MAC address.

When the QFX Series acts as an FCoE-FC gateway, the FC-MAP value for the gateway and the FCoE devices must match the FC switch FC-MAP value in order to communicate with the FC switch.

**NOTE:** Changing the FC-MAP value causes all logins to drop and forces the ENodes to log in again.

**Options** `fc-map-value`—FC-MAP value, hexadecimal value preceded by “0x”.

**Range:** 0x0EFC00 through 0x0EFCFF

**Default:** 0x0EFC00 for VN2VF\_Port FIP snooping 0x0EFD00 for VN2VN\_Port FIP snooping

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## fcoe-trusted

**Syntax** `fcoe-trusted;`

**Hierarchy Level** Original CLI

[edit ethernet-switching-options secure-access-port interface *interface-name*]

ELS CLI for Platforms that Support FCoE

[edit **vlan** *vlan-name* **forwarding-options** fip-security interface *interface-name*]

**NOTE:** The `fcoe-trusted` configuration statement is in a different hierarchy on the original CLI than on the Enhanced Layer 2 Software (ELS) CLI.

QFX Series that Support FCoE-FC Gateway Configuration

[edit fc-fabrics *fc-fabric-name* protocols fip]

**Release Information** Statement introduced in Junos OS Release 10.4 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced for the FC fabric in Junos OS Release 11.3 for the QFX Series.  
Statement introduced for the ELS CLI in Junos OS Release 13.2 for the QFX Series.

**Description** Configure the specified 10-Gigabit Ethernet interface to trust Fibre Channel over Ethernet (FCoE) traffic. If an interface is connected to another switch such as an FCoE forwarder (FCF) or a transit switch, you can configure the interface as trusted so that the interface forwards FCoE traffic from the switch to the FCoE devices without installing FIP snooping filters.

(QFX Series FCoE-FC gateway) Configure the specified local Fibre Channel fabric to trust FCoE traffic on all ports in the fabric. Changing the fabric ports from untrusted to trusted removes any existing FIP snooping filters from the ports. Changing the fabric ports from trusted to untrusted by removing the **fcoe-trusted** configuration from the fabric forces all of the FCoE sessions on those ports to log out so that when the ENodes and VN\_Ports log in again, the switch can build the appropriate FIP snooping filters.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Specify the number of times a MAC address can move to a new interface (port) in 1 second and the action to be taken by the switch if the MAC address move limit is exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                 | <div>  <p><b>CAUTION:</b> Mac move limiting does not work properly on a QFX5100 switch used as a Node device in a QFabric system. Do not use this feature on a QFX5100 switch in a QFabric system.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>                  | The default move limit is unlimited. The default action is <b>drop</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>fabric-limit</b>—Specify the maximum number of moves in a QFabric system. If you do not specify a fabric limit, the value for <b>mac-move-limit</b> applies to the QFabric system.</p> <p><b>limit</b>—Maximum number of moves to a new interface per second.</p> <p><b>action <i>action</i></b>—(Optional) Action to take when the MAC address move limit is reached:</p> <ul style="list-style-type: none"> <li>• <b>drop</b>—Drop the packet and generate an alarm, an SNMP trap, or a system log entry. This is the default.</li> <li>• <b>log</b>—Do not drop the packet but generate an alarm, an SNMP trap, or a system log entry.</li> <li>• <b>none</b>—No action.</li> <li>• <b>shutdown</b>—Logically disable the interface and generate a system log entry. If you have configured the switch with the <b>port-error-disable</b> statement, the disabled interfaces recover automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the <b>clear-ethernet-switch-port</b> command.</li> </ul> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system—control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | (MX Series routers with only MPCs, T4000 routers with only FPC5s, EX9200 switches, or QFX10000 switches) Configure the DDoS burst limit; that is, the maximum number of packets that is allowed in a burst of traffic by the specified policer. When this value is exceeded, a violation is declared.                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>size</b>—Number of packets that are allowed in a burst by the aggregate or packet-type policer.</p> <p><b>Range:</b> 1 through 100,000 packets</p> <p><b>Default:</b> The default burst value varies by packet type or protocol. You can view the default values for all packet types or protocols on an unconfigured router or switch by entering the <b>show ddos-protection protocols parameters brief</b> command from operational mode. For QFX10000 switches, the default bandwidth limits are also provided in the <a href="#">protocols (DDoS)</a> statement description.</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | (MX Series routers with only MPCs, T4000 routers with only FPC5s, EX9200 switches, QFX5200 switches, or QFX10000 switches) Disable device-wide logging of all DDoS violation and flow detection events globally. Disable only logging of events other than flow detection culprit flow events for a particular packet type or for a protocol group. Typically used for debugging purposes.                                                                            |

| <b>Description</b>              | (MX Series routers with only MPCs, T4000 routers with only FPC5s, EX9200 switches, QFX5200 switches, or QFX10000 switches) Configure the priority for the packet type within the parent protocol group. In the event of downstream traffic congestion, high priority packets are provided bandwidth before medium priority packets. In turn, medium priority packets are provided bandwidth before low priority packets. Packets are dropped when there is insufficient available bandwidth. |
| <b>Options</b>                  | <b>level</b> —Priority of the packet type, low, medium, or high.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                   |

## protocols (DDoS)

**Syntax** `protocols protocol-group (aggregate | packet-type) {  
     bandwidth packets-per-second;  
     burst size;  
     bypass-aggregate;  
     disable-fpc;  
     disable-logging;  
     fpc slot-number {  
         bandwidth-scale percentage;  
         burst-scale percentage;  
         disable-fpc;  
     }  
     priority level;  
}`

**Hierarchy Level** [edit system `ddos-protection`]

**Release Information** Statement introduced in Junos OS Release 11.2.  
 Statement introduced in Junos OS Release 15.1X53 on QFX10000 switches.  
 Statement introduced in Junos OS Release 15.1X53-D30 on QFX5200 switches.

**Description** Configure DDoS policers for all packet types within a protocol group or for a particular packet type within a protocol group.

**Options** **aggregate**—Configure the policer that polices all control packets belonging to the specified protocol as a combined group. An aggregate policer exists for all protocol groups.

**packet-type**—Name of the control packet type to be policed. You can configure a packet-type policer only for the protocol groups listed in [Table 486](#). For all other protocol groups, only aggregate policers are supported. [Table 486](#) lists the packet-type policers and their default configuration.

**Table 486: Packet Types Supported by DDoS Protection on QFX Switches**

| Protocol Group | Packet Type   | Description                        | Default Bandwidth | Default Burst | Default Priority |
|----------------|---------------|------------------------------------|-------------------|---------------|------------------|
| mcast-snoop    | igmp          | Control packets for IGMP snooping  | 500               | 2048          | High             |
|                | mld           | Control packets for MLD snooping   | 500               | 2048          | High             |
|                | pim           | Control packets for PIM snooping   | 500               | 2048          | High             |
|                | unclassified  | Not supported on QFX10000 switches | —                 | —             | —                |
| radius         | accounting    | RADIUS accounting packets          | 200               | 2048          | High             |
|                | authorization | RADIUS authorization packets       | 200               | 2048          | High             |
|                | server        | RADIUS server traffic              | 200               | 2048          | High             |

***protocol-group***—Name of the protocol group for which traffic is policed. You can configure the aggregate policer for any of the following protocol groups listed in [Table 487](#). The table shows the default configuration for the policers.

Table 487: Protocol Groups Supported by DDoS Protection on QFX Switches

| Protocol Group                 | Description                                                  | Default Bandwidth | Default Burst |
|--------------------------------|--------------------------------------------------------------|-------------------|---------------|
| <b>all-fiber-channel-enode</b> | Fiber channel ENode traffic                                  | 10                | 2048          |
| <b>arp</b>                     | ARP traffic                                                  | 500               | 1024          |
| <b>arp-snoop</b>               | ARP snooping traffic                                         | 500               | 2048          |
| <b>bfd</b>                     | Single-hop BFD traffic                                       | 1000              | 2048          |
| <b>bfdv6</b>                   | BFDv6 traffic                                                | 3000              | 10000         |
| <b>bgp</b>                     | BGP traffic                                                  | 1500              | 2048          |
| <b>bridge-control</b>          | Bridge Control traffic                                       | 10                | 2048          |
| <b>dhcpv4v6</b>                | DHCPv4 and DHCPv6 traffic (limits apply to combined traffic) | 500               | 2048          |
| <b>diameter</b>                | Diameter and Gx-Plus traffic                                 | 200               | 2048          |
| <b>dns</b>                     | DNS traffic                                                  | 200               | 2048          |
| <b>dtcp</b>                    | DTCP traffic                                                 | 200               | 2048          |
| <b>egpv6</b>                   | EGPv6 traffic                                                | 10                | 2048          |
| <b>ethernet-tcc</b>            | TCC-encapsulated Ethernet traffic                            | 100               | 2048          |
| <b>ftp</b>                     | FTP traffic                                                  | 500               | 2048          |
| <b>garp-reply</b>              | Gratuitous ARP reply traffic                                 | 100               | 2048          |
| <b>gre</b>                     | GRE traffic                                                  | 500               | 2048          |
| <b>icmp</b>                    | ICMP traffic                                                 | 500               | 2048          |
| <b>igmp</b>                    | IGMPv4 and IGMPv6 traffic                                    | 1000              | 2048          |
| <b>ip-options</b>              | IP traffic with IP packet header options                     | 100               | 2048          |
| <b>isis</b>                    | IS-IS traffic                                                | 1000              | 2048          |
| <b>iso-tcc</b>                 | TCC-encapsulated ISO traffic                                 | 100               | 2048          |
| <b>l2tp</b>                    | Layer 2 protocol tunneling traffic                           | 500               | 2048          |
| <b>lACP</b>                    | LACP traffic                                                 | 300               | 2048          |

Table 487: Protocol Groups Supported by DDoS Protection on QFX Switches (*continued*)

| Protocol Group         | Description                                        | Default Bandwidth | Default Burst |
|------------------------|----------------------------------------------------|-------------------|---------------|
| <b>ldp</b>             | LDP traffic                                        | 1000              | 200           |
| <b>ldp-hello</b>       | LDP hello packets                                  | 1000              | 2048          |
| <b>lldp</b>            | LLDP traffic                                       | 60                | 2048          |
| <b>lmp</b>             | LMP traffic                                        | 100               | 2048          |
| <b>martian-address</b> | Martian address                                    | 200               | 20            |
| <b>mcast-snoop</b>     | Control traffic for multicast snooping             | 500               | 2048          |
| <b>mld</b>             | MLD traffic                                        | 1000              | 2048          |
| <b>msdp</b>            | MSDP traffic                                       | 300               | 2048          |
| <b>multihop-bfd</b>    | Multihop BFD traffic                               | 1500              | 2048          |
| <b>ndpv6</b>           | NDPv6 traffic                                      | 500               | 1024          |
| <b>ntp</b>             | NTP traffic                                        | 200               | 2048          |
| <b>oam-cfm</b>         | OAM CFM traffic                                    | 200               | 2048          |
| <b>oam-lfm</b>         | OAM LFM traffic                                    | 200               | 2048          |
| <b>ospf</b>            | OSPF traffic                                       | 1000              | 200           |
| <b>ospf-hello</b>      | OSPF hello packets                                 | 1500              | 2048          |
| <b>pim-ctrl</b>        | PIM control packets                                | 1000              | 2048          |
| <b>pim-data</b>        | PIM data                                           | 2000              | 2048          |
| <b>proto-802-lx</b>    | 802.1X traffic                                     | 200               | 2048          |
| <b>ptp</b>             | PTP traffic                                        | 100               | 2048          |
| <b>pvstp</b>           | PVSTP traffic                                      | 2000              | 2048          |
| <b>radius</b>          | RADIUS traffic                                     | 200               | 2048          |
| <b>reject</b>          | Packets rejected by a next-hop forwarding decision | 100               | 2048          |
| <b>resolve</b>         |                                                    | 500               | 2048          |

Table 487: Protocol Groups Supported by DDoS Protection on QFX Switches (*continued*)

| Protocol Group | Description                                                                                             | Default Bandwidth | Default Burst |
|----------------|---------------------------------------------------------------------------------------------------------|-------------------|---------------|
|                | Unclassified IPv4 and IPv6 resolve packets sent to the host because of a traffic request resolve action |                   |               |
| <b>rip</b>     | RIP traffic                                                                                             | 100               | 2048          |
| <b>rsvp</b>    | RSVP traffic                                                                                            | 1000              | 2048          |
| <b>snmp</b>    | SNMP traffic                                                                                            | 500               | 2048          |
| <b>ssh</b>     | SSH traffic                                                                                             | 500               | 2048          |
| <b>stp</b>     | STP traffic                                                                                             | 2000              | 2048          |
| <b>tacacs</b>  | TACACS+ traffic                                                                                         | 200               | 2048          |
| <b>telnet</b>  | Telnet traffic                                                                                          | 500               | 2048          |
| <b>tll</b>     | Time to Live packets                                                                                    | 100               | 2048          |
| <b>vrrp</b>    | VRRP traffic                                                                                            | 1000              | 2048          |

| <b>Description</b>         | (MX Series routers with only MPCs, T4000 routers with only FPC5s, EX9200 switches, QFX5200 switches, or QFX10000 switches) Define tracing operations for DDoS protection processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li><li>• <b>config</b>—Trace processing of the DDoS configuration at an extensive level.</li><li>• <b>events</b>—Trace jddosd event processing; currently only exit events are traced.</li><li>• <b>gres</b>—Trace messages exchanged with the kernel and jddosd process that could affect graceful Routing Engine switchover (GRES).</li><li>• <b>init</b>—Trace jddosd initialization.</li><li>• <b>ipc</b>—Trace interface interprocess communication (IPC) messages.</li><li>• <b>memory</b>—Trace memory management code. This flag is not currently supported.</li><li>• <b>protocol</b>—Trace DDoS protocol state processing. Only the violation state is currently traced.</li><li>• <b>rtsock</b>—Trace messages exchanged with the kernel and jddosd process.</li></ul> |

- **signal**—Trace system signals that are passed to jddosd, such as SIGTERM.
- **socket**—Trace socket messages that are passed to jddosd from the Packet Forwarding Engine.
- **state**—Trace state machine events. This flag is not currently supported.
- **timer**—Trace jddosd timer events.
- **ui**—Trace user interface processing. This flag is not currently supported.

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10,240 through 1,073,741,824

**world-readable**—(Optional) Enable unrestricted file access.

|                                 |                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | trace—To view this statement in the configuration.                                            |
|                                 | trace-control—To add this statement to the configuration.                                     |

### Sample Output

#### clear ddos-protection protocols (Clear Statistics for All Protocols)

```
user@host> clear ddos-protection protocols statistics
```

**clear ddos-protection protocols (Clear Violation States for Packet Type)**

```
user@host> clear ddos-protection protocols radius server states
```

## show ddos-protection protocols

---

**Syntax** `show ddos-protection protocols <protocol-group (aggregate | packet-type)>`

**Release Information** Command introduced in Junos OS Release 11.2.  
Command introduced in Junos OS Release 12.3R2 on EX9200 switches and T4000 routers.  
Command introduced in Junos OS Release 15.1X53 on QFX10000 switches.  
Command introduced in Junos OS Release 15.1X53-D30 on QFX5200 switches.

**Description** Display DDoS protection configuration and statistics for protocol groups or individual packet types.

**Options** **none**—Display information for all packet types in all protocol groups.

**aggregate**—(Optional) Display DDoS protection information for the aggregate policer.  
The **aggregate** option is available for all protocol groups.

**packet-type**—(Optional) Display DDoS protection information for the specified packet type in the protocol group. The available packet types vary by protocol group.  
On QFX10000 switches, only aggregate policers are available for protocol groups that are not in the following list:

- **mcast-snoop**—The following packet types are available for the **mcast-snoop** protocol group:
  - **igmp**—Control packets for IGMP snooping.
  - **mld**—Control packets for MLD snooping.
  - **pim**—Control packets for PIM snooping.
- **radius**—The following packet types are available for the **radius** protocol group:
  - **accounting**—RADIUS accounting packets.
  - **authorization**—RADIUS authorization packets.
  - **server**—RADIUS server traffic.

On MX Series routers, T4000 routers, and EX9200 switches, only aggregate policers are available for protocol groups that are not in the following list:

- **dhcpv4**—The following packet types are available for DHCPv4 traffic:
  - **ack**—DHCPACK packets.
  - **bad-packets**—DHCPv4 packets with bad formats.
  - **bootp**—DHCPBOOTP packets.
  - **decline**—DHCPDECLINE packets.
  - **discover**—DHCDISCOVER packets.
  - **force-renew**—DHCPFORCERENEW packets.

- **inform**—DHCPINFORM packets.
- **lease-active**—DHCPLEASEACTIVE packets.
- **lease-query**—DHCPLEASEQUERY packets.
- **lease-unassigned**—DHCPLEASEUNASSIGNED packets.
- **lease-unknown**—DHCPLEASEUNKNOWN packets.
- **nak**—DHCPNAK packets.
- **no-message-type**—DHCP packets that are missing the message type.
- **offer**—DHCOFFER packets.
- **release**—DHCPACK packets.
- **renew**—DHCPRENEW packets.
- **request**—DHCPREQUEST packets.
- **unclassified**— All unclassified packets in the protocol group.
- **dhcpv6**—The following packet types are available for DHCPv6 traffic:
  - **advertise**—ADVERTISE packets.
  - **confirm**—CONFIRM packets.
  - **decline**—DECLINE packets.
  - **information-request**—INFORMATION-REQUEST packets.
  - **leasequery**—LEASEQUERY packets.
  - **leasequery-data**—LEASEQUERY-DATA packets.
  - **leasequery-done**—LEASEQUERY-DONE packets.
  - **leasequery-reply**—LEASEQUERY-REPLY packets.
  - **rebind**—REBIND packets.
  - **reconfigure**—RECONFIGURE packets.
  - **relay-forward**—RELAY-FORWARD packets.
  - **relay-reply**—RELAY-REPLY packets.
  - **release**—RELEASE packets.
  - **renew**—RENEW packets.
  - **reply**—REPLY packets.
  - **request**—REQUEST packets.
  - **solicit**—SOLICIT packets.
  - **unclassified**— All unclassified packets in the protocol group.
- **filter-action**—The following packet types are available for unclassified firewall filter action packets, sent to the host because of reject terms in firewall filters:

- **filter-v4**—Unclassified IPv4 filter action packets.
- **filter-v6**—Unclassified IPv6 filter action packets.
- **other**—All other unclassified filter action packets that are not IPv4 or IPv6.
- **frame-relay**—The following packet types are available for Frame Relay traffic:
  - **frf15**—Multilink frame relay FRF.15 packets.
  - **frf16**—Multilink frame relay FRF.16 packets.
- **ip-fragments**—The following packet types are available for IP fragments:
  - **first-fragment**—First IP fragment.
  - **trail-fragment**—Last IP fragment.
- **ip-options**—The following packet types are available for IP option traffic:
  - **non-v4v6**—Options packets other than IPv4/v6.
  - **router-alert**—Router alert options packets.
  - **unclassified**— All unclassified packets in the protocol group.
- **l2tp**—The following packet types are available for L2TP traffic:
  - **cdn**—Call-Disconnect-Notify message packets.
  - **hello**—Hello message packets.
  - **iccn**—Incoming-Call-Connected message packets.
  - **icrq**—Incoming-Call-Request message packets.
  - **scccn**—Start-Control-Connection-Connected message packets.
  - **sccrq**—Start-Control-Connection-Request message packets.
  - **stopccn**—Stop-Control-Connection-Notification message packets.
  - **unclassified**—All unclassified packets in the protocol group.
- **mcast-snoop**—Control traffic for multicast snooping.
  - **igmp**—Snooped IGMP traffic.
  - **pim**—Snooped PIM control traffic.
- **mlp**—The following MLP packet types are available:
  - **aging-exception**—MLP aging exception packets.
  - **packets**—MLP packets.
  - **unclassified**— All unclassified packets in the protocol group.
- **ppp**—The following PPP packet types are available:
  - **authentication**—PPP authentication protocol packets.
  - **echo-rep**—LCP echo reply packets.

- **echo-req**—LCP echo request packets.
- **ipcp**—IP Control Protocol packets.
- **ipv6cp**—IPv6 Control Protocol packets.
- **isis**—IS-IS packets.
- **lcp**—Link Control Protocol packets.
- **mlppp-lcp**—MLPPP LCP packets.
- **mplscp**—MPLS Control Protocol packets.
- **unclassified**— All unclassified packets in the protocol group.
- **pppoe**—The following PPPoE packet types are available:
  - **padi**—PADI packets.
  - **padm**—PADM packets.
  - **padn**—PADN packets.
  - **pado**—PADO packets.
  - **padr**—PADR packets.
  - **pads**—PADS packets.
  - **padt**—PADT packets.
- **radius**—The following RADIUS packet types are available:
  - **accounting**—RADIUS accounting packets.
  - **authorization**—RADIUS authorization packets.
  - **server**—RADIUS server traffic.
  - **unclassified**— All unclassified packets in the protocol group.
- **re-services**—The following packet type is available for Routing Engine-based HTTP redirect:
  - **captive-portal**—Routing Engine-based captive portal content delivery packets.
- **resolve**—The following packet types are available for unclassified resolve packets, which are sent to the host because of a traffic request resolve action:
  - **mcast-v4**—Unclassified IPv4 multicast resolve packets.
  - **mcast-v6**—Unclassified IPv6 multicast resolve packets.
  - **ucast-v4**—Unclassified IPv4 unicast resolve packets.
  - **ucast-v6**—Unclassified IPv6 unicast resolve packets.
  - **other**—All other unclassified resolve packets.
- **sample**—The following sample packet types are available:

- **host**—Host packets.
- **pfe**—Packet Forwarding Engine packets.
- **syslog**—System log message packets.
- **tap**—TAP packets.
- **tcp-flags**—The following TCP-flagged packet types are available:
  - **established**—TCP ACK and RST connection packets.
  - **initial**—TCP SYN and SYN ACK packets.
- **unclassified**—The following unclassified packet types are available:
  - **control-layer2**—Unclassified layer 2 control packets.
  - **control-v4**—Unclassified IPv4 control packets.
  - **control-v6**—Unclassified IPv6 control packets.
  - **fw-host**—Unclassified send-to-host firewall packets.
  - **host-route-v4**—Unclassified IPv4 routing protocol and host packets in traffic sent to the router local interface address for broadcast and multicast.
  - **host-route-v6**—Unclassified IPv6 routing protocol and host packets in traffic sent to the router local interface address for broadcast and multicast.
  - **mcast-copy**—Unclassified host copy (due to multicast routing) packets.
  - **other**—All unclassified packets that do not belong to another type.
- **virtual-chassis**—The following packet types are available for virtual chassis packets:
  - **control-low**—Low-priority control packets.
  - **control-high**—High-priority control packets.
  - **unclassified**—All unclassified packets in the protocol group.
  - **vc-packets**—All exception packets on the virtual chassis link.
  - **vc-ttl-errors**—Virtual chassis TTL error packets.

**protocol-group**—(Optional) Display DDoS protection information for a protocol group.

[Table 492](#) lists the protocol groups and the platforms they are supported on.

**Table 492: Supported Protocol Groups**

| Protocol Group                 | Description                 | MX Series Routers, T4000 Routers, EX9200 Switches | QFX10000 Switches |
|--------------------------------|-----------------------------|---------------------------------------------------|-------------------|
| <b>all-fiber-channel-enode</b> | Fiber channel ENode traffic | —                                                 | X                 |
| <b>amtv4</b>                   | IPv4 AMT traffic            | X                                                 | —                 |
| <b>amtv6</b>                   | IPv6 AMT traffic            | X                                                 | —                 |

Table 492: Supported Protocol Groups *(continued)*

| Protocol Group         | Description                    | MX Series Routers, T4000 Routers, EX9200 Switches | QFX10000 Switches |
|------------------------|--------------------------------|---------------------------------------------------|-------------------|
| <b>ancp</b>            | ANCP traffic                   | X                                                 | —                 |
| <b>ancpv6</b>          | ANCPv6 traffic                 | X                                                 | —                 |
| <b>arp</b>             | ARP traffic                    | X                                                 | X                 |
| <b>arp-snoop</b>       | ARP snooping traffic           | —                                                 | X                 |
| <b>atm</b>             | ATM traffic                    | X                                                 | —                 |
| <b>bfd</b>             | Single-hop BFD traffic         | X                                                 | X                 |
| <b>bfdv6</b>           | BFDv6 traffic                  | X                                                 | X                 |
| <b>bgp</b>             | BGP traffic                    | X                                                 | X                 |
| <b>bgpv6</b>           | BGPv6 traffic                  | X                                                 | —                 |
| <b>bridge-control</b>  | Bridge Control traffic         | —                                                 | X                 |
| <b>control</b>         | Control traffic                | X                                                 | —                 |
| <b>demux-autosense</b> | Demux autosensing traffic      | X                                                 | —                 |
| <b>dhcpv4</b>          | DHCPv4 traffic                 | X                                                 | —                 |
| <b>dhcpv6</b>          | DHCPv6 traffic                 | X                                                 | —                 |
| <b>dhcpv4v6</b>        | DHCPv4 and DHCPv6 traffic      | —                                                 | X                 |
| <b>diameter</b>        | Diameter and Gx-Plus traffic   | X                                                 | X                 |
| <b>dns</b>             | DNS traffic                    | X                                                 | X                 |
| <b>dtcp</b>            | DTCP traffic                   | X                                                 | X                 |
| <b>dynamic-vlan</b>    | Dynamic VLAN exception traffic | X                                                 | —                 |
| <b>egpv6</b>           | EGPv6 traffic                  | X                                                 | X                 |
| <b>eoam</b>            | EOAM traffic                   | X                                                 | —                 |
| <b>esmc</b>            | ESMC traffic                   | X                                                 | —                 |

Table 492: Supported Protocol Groups *(continued)*

| Protocol Group       | Description                                                                                               | MX Series Routers, T4000 Routers, EX9200 Switches | QFX10000 Switches |
|----------------------|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------|-------------------|
| <b>ethernet-tcc</b>  | TCC-encapsulated Ethernet traffic                                                                         | –                                                 | X                 |
| <b>fab-probe</b>     | Fab out probe packets                                                                                     | X                                                 | –                 |
| <b>filter-action</b> | IPv4 and IPv6 firewall filter action packets sent to the host because of reject terms in firewall filters | X                                                 | –                 |
| <b>firewall-host</b> | Firewall send-to-host traffic                                                                             | X                                                 | –                 |
| <b>frame-relay</b>   | Frame relay traffic                                                                                       | X                                                 | –                 |
| <b>ftp</b>           | FTP traffic                                                                                               | X                                                 | X                 |
| <b>ftpv6</b>         | FTPV6 traffic                                                                                             | X                                                 | –                 |
| <b>garp-reply</b>    | Gratuitous ARP reply traffic                                                                              | –                                                 | X                 |
| <b>gre</b>           | GRE traffic                                                                                               | X                                                 | X                 |
| <b>icmp</b>          | ICMP traffic                                                                                              | X                                                 | X                 |
| <b>igmp</b>          | IGMP traffic                                                                                              | X                                                 | X                 |
| <b>igmpv4v6</b>      | IGMP and MLD traffic                                                                                      | X                                                 | –                 |
| <b>igmpv6</b>        | MLD traffic                                                                                               | X                                                 | –                 |
| <b>inline-ka</b>     | Inline service interfaces keepalive traffic                                                               | X                                                 | –                 |
| <b>inline-svcs</b>   | Inline services traffic                                                                                   | X                                                 | –                 |
| <b>ip-fragments</b>  | IP fragments traffic                                                                                      | X                                                 | –                 |
| <b>ip-options</b>    | IP traffic with IP packet header options                                                                  | X                                                 | X                 |
| <b>isis</b>          | IS-IS traffic                                                                                             | X                                                 | X                 |
| <b>iso-tcc</b>       | TCC-encapsulated ISO traffic                                                                              | –                                                 | X                 |
| <b>jfm</b>           | JFM traffic                                                                                               | X                                                 | –                 |
| <b>keepalive</b>     | Keepalive traffic                                                                                         | X                                                 | –                 |

Table 492: Supported Protocol Groups *(continued)*

| Protocol Group         | Description                                | MX Series Routers, T4000 Routers, EX9200 Switches | QFX10000 Switches |
|------------------------|--------------------------------------------|---------------------------------------------------|-------------------|
| <b>l2tp</b>            | Layer 2 protocol tunneling traffic         | X                                                 | X                 |
| <b>lACP</b>            | LACP traffic                               | X                                                 | X                 |
| <b>ldp</b>             | LDP traffic                                | X                                                 | X                 |
| <b>ldp-hello</b>       | LDP hello packets                          | —                                                 | X                 |
| <b>ldpv6</b>           | LDPv6 traffic                              | X                                                 | —                 |
| <b>lldp</b>            | LLDP traffic                               | X                                                 | X                 |
| <b>lmp</b>             | LMP traffic                                | X                                                 | X                 |

**Output Fields** [Table 493](#) lists the output fields for the **show ddos-protection protocols** command. Output fields are listed in the approximate order in which they appear.

**Table 493: show ddos-protection protocols Output Fields**

| Field Name                     | Field Description                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Packet types</b>            | Number of packet types                                                                                        |
| <b>Modified</b>                | Number of packets for which policer values have been modified from the default.                               |
| <b>Received traffic</b>        | Number of traffic flows received.                                                                             |
| <b>Currently violated</b>      | Number of flows that are currently violating the flow bandwidth limit.                                        |
| <b>Currently tracked flows</b> | Number of active flows that are being tracked as culprit flows by flow detection.                             |
| <b>Total detected flows</b>    | Total number of culprit flows that have been detected, including those that have recovered or timed out.      |
| <b>Protocol Group</b>          | Name of protocol group.                                                                                       |
| <b>Packet type</b>             | Name of packet type in protocol group.                                                                        |
| <b>Bandwidth</b>               | Bandwidth policer value; number of packets per second that is allowed before a violation is declared.         |
| <b>Burst</b>                   | Burst policer value; the maximum number of packets that is allowed in a burst before a violation is declared. |

Table 493: show ddos-protection protocols Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Priority                     | Priority of the packet type for individual packet policers that enables more important traffic to pass through in the event of traffic congestion: <b>low</b> , <b>medium</b> , or <b>high</b> . Lower priority packets can be dropped when insufficient bandwidth is available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Recover time                 | Time that must pass since the last violation before the traffic flow is considered to have recovered from the attack. A notification is generated when the timer expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enabled                      | State of the policer, enabled ( <b>Yes</b> ), disabled ( <b>No</b> ), or partially disabled ( <b>Partial</b> ); <b>Partial</b> indicates that only some of the policer instances are disabled for the policer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Bypass aggregate             | State of the bypass aggregate configuration: <ul style="list-style-type: none"> <li>• Yes—The aggregate policer is bypassed.</li> <li>• No—The aggregate policer is enforced.</li> </ul> This field appears only for individual policers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Flow detection configuration | State of flow detection configured on the router: <ul style="list-style-type: none"> <li>• Detection mode—Mode of operation for suspicious flow detection: automatic, off, or on.</li> <li>• Log flows—State of automatic logging of suspicious traffic flows: on (<b>Yes</b>) or off (<b>No</b>).</li> <li>• Timeout flows—State of culprit flow timeout behavior: flow is suppressed for a configured timeout period (<b>Yes</b>) or flow is suppressed until it is no longer in violation (<b>No</b>).</li> <li>• Detect time—Time in seconds that must pass before a suspicious flow that has exceeded the bandwidth allowed for the packet type is considered to be a culprit flow.</li> <li>• Recover time—Time in seconds that must pass before a culprit flow is considered to have returned to normal. The period starts when the flow drops below the threshold that triggered the last violation.</li> <li>• Timeout time—Time in seconds that a culprit flow is suppressed, if timeouts have been enabled.</li> <li>• Flow aggregation level configuration—Flow detection mode, flow control mode, and flow bandwidth for traffic at each of the traffic flow aggregation levels: subscriber, logical interface, and physical interface. <ul style="list-style-type: none"> <li>• Detection mode—State of flow detection: automatic, off, or on.</li> <li>• Control mode—Mode of controlling culprit traffic: dropped, kept, or policed back to within the allowed bandwidth.</li> <li>• Flow rate—Bandwidth allowed for the control traffic in packets per second.</li> </ul> </li> </ul> |

| <b>Policer BW (pps)</b>                     | <p>Bandwidth policer value; number of packets per second that is allowed before a violation is declared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Aggr level<br/>Op:Fc:Bandwidth (pps)</b> | <p>Flow operation mode, flow control mode, and flow bandwidth for traffic of the packet type at each traffic flow aggregation level: subscriber (<b>sub</b>), logical interface (<b>ifl</b>), and physical interface (<b>ifd</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 493: show ddos-protection protocols Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Log flow</b> | State of automatic logging of suspicious traffic flows for the packet type: on (Yes) or off (No).                                                                                                             |
| <b>Time out</b> | State of culprit flow timeout behavior for the packet type: flow is suppressed or monitored for a configured timeout period (Yes) or flow is suppressed or monitored until it is no longer in violation (No). |

## Sample Output

### show ddos-protection protocols

```
user@host> show ddos-protection protocols
```

```
Packet types: 190, Modified: 0, Received traffic: 12, Currently violated: 3
Currently tracked flows: 0, Total detected flows: 0
* = User configured value
```

```
Protocol Group: IPv4-Unclassified
```

```
Packet type: aggregate (Aggregate for unclassified host-bound IPv4 traff)
```

```
Aggregate policer configuration:
```

```
Bandwidth: 2000 pps
Burst: 10000 packets
Recover time: 300 seconds
Enabled: Yes
```

```
Flow detection configuration:
```

```
Detection mode: Automatic Detect time: 3 seconds
Log flows: No Recover time: 60 seconds
Timeout flows: No Timeout time: 300 seconds
```

```
Flow aggregation level configuration:
```

```
Aggregation level Detection mode Control mode Flow rate
Subscriber Automatic Drop 10 pps
Logical interface Automatic Drop 10 pps
Physical interface Automatic Drop 2000 pps
```

```
System-wide information:
```

```
Aggregate bandwidth is never violated
Received: 0 Arrival rate: 0 pps
Dropped: 0 Max arrival rate: 0 pps
```

```
Routing Engine information:
```

```
Bandwidth: 2000 pps, Burst: 10000 packets, enabled
Aggregate policer is never violated
Received: 0 Arrival rate: 0 pps
Dropped: 0 Max arrival rate: 0 pps
```

```
Dropped by individual policers: 0
```

```
FPC slot 1 information:
```

```
Bandwidth: 100% (2000 pps), Burst: 100% (10000 packets), enabled
Aggregate policer is never violated
Received: 0 Arrival rate: 0 pps
Dropped: 0 Max arrival rate: 0 pps
```

```
Dropped by individual policers: 0
```

```
Dropped by flow suppression: 0
```

```
...
```

```
Protocol Group: PPPoE
```

```

Packet type: aggregate (Aggregate for all PPPoE control traffic)
Aggregate policer configuration:
 Bandwidth: 2000 pps
 Burst: 2000 packets
 Recover time: 300 seconds
 Enabled: Yes
Flow detection configuration:
 Detection mode: Automatic Detect time: 3 seconds
 Log flows: No Recover time: 60 seconds
 Timeout flows: No Timeout time: 300 seconds
Flow aggregation level configuration:
 Aggregation level Detection mode Control mode Flow rate
 Subscriber Automatic Drop 10 pps
 Logical interface Automatic Drop 10 pps
 Physical interface Automatic Drop 2000 pps
System-wide information:
 Aggregate bandwidth is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
Routing Engine information:
 Bandwidth: 2000 pps, Burst: 2000 packets, enabled
 Aggregate policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by individual policers: 0
FPC slot 1 information:
 Bandwidth: 100% (2000 pps), Burst: 100% (2000 packets), enabled
 Aggregate policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by individual policers: 0
 Dropped by flow suppression: 0

Packet type: padi (PPPoE PADI)
Individual policer configuration:
 Bandwidth: 500 pps
 Burst: 500 packets
 Priority: Low
 Recover time: 300 seconds
 Enabled: Yes
 Bypass aggregate: No
Flow detection configuration:
 Detection mode: Automatic Detect time: 3 seconds
 Log flows: No Recover time: 60 seconds
 Timeout flows: No Timeout time: 300 seconds
Flow aggregation level configuration:
 Aggregation level Detection mode Control mode Flow rate
 Subscriber Automatic Drop 10 pps
 Logical interface Automatic Drop 10 pps
 Physical interface Automatic Drop 500 pps
System-wide information:
 Bandwidth is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
Routing Engine information:
 Bandwidth: 500 pps, Burst: 500 packets, enabled
 Policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by aggregate policer: 0

```

```

FPC slot 1 information:
 Bandwidth: 100% (500 pps), Burst: 100% (500 packets), enabled
 Policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by aggregate policer: 0
 Dropped by flow suppression: 0
...

```

### show ddos-protection protocols (Specific Packet Type with Flow Detection Disabled)

```

user@host> show ddos-protection protocols pppoe padi

### show ddos-protection protocols (Specific Packet Type with Flow Detection Enabled and Automatic)

```

user@host> show ddos-protection protocols pppoe padi
Currently tracked flows: 0, Total detected flows: 0
* = User configured value

Protocol Group: PPPoE

Packet type: padi (PPPoE PADI)

```

```

Individual policer configuration:
 Bandwidth: 500 pps
 Burst: 500 packets
 Priority: Low
 Recover time: 300 seconds
 Enabled: Yes
 Bypass aggregate: No
Flow detection configuration:
 Detection mode: Automatic Detect time: 3 seconds
 Log flows: No Recover time: 60 seconds
 Timeout flows: No Timeout time: 300 seconds
Flow aggregation level configuration:
 Aggregation level Detection mode Control mode Flow rate
 Subscriber Automatic Drop 10 pps
 Logical interface Automatic Drop 10 pps
 Physical interface Automatic Drop 500 pps
System-wide information:
 Bandwidth is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
Routing Engine information:
 Bandwidth: 500 pps, Burst: 500 packets, enabled
 Policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by aggregate policer: 0
FPC slot 1 information:
 Bandwidth: 100% (500 pps), Burst: 100% (500 packets), enabled
 Policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by aggregate policer: 0
 Dropped by flow suppression: 0

### show ddos-protection protocols (Specific Packet Type with Bandwidth Violation)

```

user@host> show ddos-protection protocols bfd
Packet types: 1, Modified: 0, Received traffic: 1, Currently violated: 1
Currently tracked flows: 1, Total detected flows: 1
* = User configured value

```

Protocol Group: BFD

```

Packet type: aggregate (Aggregate for all bfd traffic)
Aggregate policer configuration:
 Bandwidth: 20000 pps
 Burst: 20000 packets
 Recover time: 300 seconds
 Enabled: Yes
Flow detection configuration:
 Detection mode: Automatic Detect time: 3 seconds
 Log flows: No Recover time: 60 seconds
 Timeout flows: No Timeout time: 300 seconds
Flow aggregation level configuration:
 Aggregation level Detection mode Control mode Flow rate
 Subscriber Automatic Drop 10 pps
 Logical interface Automatic Drop 10 pps
 Physical interface Automatic Drop 20000 pps
System-wide information:
 Aggregate bandwidth is being violated!
 No. of FPCs currently receiving excess traffic: 1

```

**No. of FPCs that have received excess traffic: 1**

Violation first detected at: 2012-10-24 23:40:20 EDT

Violation last seen at: 2012-10-25 10:25:48 EDT

Duration of violation: 10:45:28 Number of violations: 1

Received: 1173471731 Arrival rate: 30304 pps

Dropped: 399135607 Max arrival rate: 30331 pps

**Flow counts:**

| Aggregation level | Current | Total detected |
|-------------------|---------|----------------|
| Subscriber        | 1       | 1              |
| Total             | 1       | 1              |

**Routing Engine information:**

Bandwidth: 20000 pps, Burst: 20000 packets, enabled

Aggregate policer is never violated

Received: 366831604 Arrival rate: 0 pps

Dropped: 0 Max arrival rate: 9522 pps

Dropped by individual policers: 0

**FPC slot 1 information:****Bandwidth: 100% (20000 pps), Burst: 100% (20000 packets), enabled****Aggregate policer is currently being violated!**

## Sample Output

### show ddos-protection protocols parameters

```

user@host> show ddos-protection protocols parameters
Protocol Group: IPv4-Unclassified

Packet type: aggregate (Aggregate for unclassified host-bound IPv4 traffic)
Aggregate policer configuration:
 Bandwidth: 20000 pps
 Burst: 20000 packets
 Priority: medium
 Recover time: 300 seconds
 Enabled: Yes
FPC slot 1 information:
 Bandwidth: 100% (20000 pps), Burst: 100% (20000 packets), enabled

Protocol Group: IPv6-Unclassified

Packet type: aggregate (Aggregate for unclassified host-bound IPv6 traffic)
Aggregate policer configuration:
 Bandwidth: 20000 pps
 Burst: 20000 packets
 Priority: medium
 Recover time: 300 seconds
 Enabled: Yes
FPC slot 1 information:
 Bandwidth: 100% (20000 pps), Burst: 100% (20000 packets), enabled

...

Protocol Group: PPPoE

Packet type: aggregate (Aggregate for all PPPoE control traffic)
Aggregate policer configuration:
 Bandwidth: 800 pps
 Burst: 2000 packets
 Priority: medium
 Recover time: 300 seconds
 Enabled: Yes

```

## FPC slot 1 information:

Bandwidth: 100% (800 pps), Burst: 100% (2000 packets), enabled

## Packet type: padi (PPPoE PADI)

## Individual policer configuration:

Bandwidth: 500 pps  
 Burst: 500 packets  
 Priority: low  
 Recover time: 300 seconds  
 Enabled: Yes  
 Bypass aggregate: No

## FPC slot 1 information:

Bandwidth: 100% (500 pps), Burst: 100% (500 packets), enabled

## Packet type: pado (PPPoE PADO)

## Individual policer configuration:

Bandwidth: 0 pps  
 Burst: 0 packets  
 Priority: low  
 Recover time: 300 seconds  
 Enabled: Yes  
 Bypass aggregate: No

## FPC slot 1 information:

Bandwidth: 100% (0 pps), Burst: 100% (0 packets), enabled

## Packet type: padr (PPPoE PADR)

## Individual policer configuration:

Bandwidth: 500 pps  
 Burst: 500 packets  
 Priority: medium  
 Recover time: 300 seconds  
 Enabled: Yes  
 Bypass aggregate: No

## FPC slot 1 information:

Bandwidth: 100% (500 pps), Burst: 100% (500 packets), enabled

**show ddos-protection protocols parameters brief**

user@host&gt; show ddos-protection protocols parameters brief

Number of policers modified: 3

| Protocol group | Packet type | Bandwidth (pps) | Burst (pkts) | Priority | Recover time(sec) | Policer enabled | Bypass aggr. | FPC mod |
|----------------|-------------|-----------------|--------------|----------|-------------------|-----------------|--------------|---------|

```

Protocol Group: DHCPv4

Packet type: aggregate (aggregate for all DHCPv4 traffic)

Aggregate policer configuration:

Bandwidth: 669 pps  
 Burst: 5000 packets  
 Priority: medium  
 Recover time: 300 seconds  
 Enabled: Yes

FPC slot 1 information:

Bandwidth: 100% (669 pps), Burst: 100% (5000 packets), enabled

Packet type: unclassified (Unclassified DHCPv4 traffic)

Individual policer configuration:

Bandwidth: 300 pps  
 Burst: 150 packets  
 Priority: low  
 Recover time: 300 seconds  
 Enabled: Yes  
 Bypass aggregate: No

FPC slot 1 information:

Bandwidth: 100% (300 pps), Burst: 100% (150 packets), enabled

Packet type: discover (DHCPv4 DHCPDISCOVER)

Individual policer configuration:

Bandwidth: 100 pps  
 Burst: 500 packets  
 Priority: low  
 Recover time: 300 seconds  
 Enabled: Yes  
 Bypass aggregate: No

FPC slot 1 information:

Bandwidth: 100% (100 pps), Burst: 100% (500 packets), enabled

Packet type: offer (DHCPv4 DHCPOFFER)

Individual policer configuration:

Bandwidth: 1000 pps  
 Burst: 1000 packets  
 Priority: low  
 Recover time: 300 seconds  
 Enabled: Yes

```
 Bypass aggregate: No
FPC slot 1 information:
 Bandwidth: 100% (1000 pps), Burst: 100% (1000 packets), enabled
```

```
Packet type: request (DHCPv4 DHCPREQUEST)
```

```
Individual policer configuration:
```

```
 Bandwidth: 1000 pps
 Burst: 1000 packets
 Priority: medium
 Recover time: 300 seconds
 Enabled: Yes
 Bypass aggregate: No

## Sample Output

### show ddos-protection protocols statistics

```

user@host> show ddos-protection protocols statistics
Protocol Group: IPv4-Unclassified

Packet type: aggregate
System-wide information:
 Aggregate bandwidth is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
Routing Engine information:
 Aggregate policer is never violated
 Received: 0 Arrival rate: 0 pps
 Dropped: 0 Max arrival rate: 0 pps
 Dropped by individual policers: 0
FPC slot 1 information:
 Aggregate policer is never violated
 Received: 0 Arrival rate: 0 pps

```

Dropped: 0 Max arrival rate: 0 pps  
 Dropped by individual policers: 0

Protocol Group: IPv6-Unclassified

Packet type: aggregate  
 System-wide information:  
 Aggregate bandwidth is never violated  
 Received: 0 Arrival rate: 0 pps  
 Dropped: 0 Max arrival rate: 0 pps  
 Routing Engine information:  
 Aggregate policer is never violated  
 Received: 0 Arrival rate: 0 pps  
 Dropped: 0 Max arrival rate: 0 pps  
 Dropped by individual policers: 0  
 FPC slot 1 information:  
 Aggregate policer is never violated  
 Received: 0 Arrival rate: 0 pps  
 Dropped: 0 Max arrival rate: 0 pps  
 Dropped by individual policers: 0

Protocol Group: PPPoE

Packet type: aggregate  
 System-wide information:  
 Aggregate bandwidth is never violated  
 Received: 61961244 Arrival rate: 4000 pps  
 Dropped: 0 Max arrival rate: 4002 pps  
 Routing Engine information:  
 Aggregate policer is never violated  
 Received: 15488871 Arrival rate: 1001 pps  
 Dropped: 0 Max arrival rate: 1011 pps  
 Dropped by individual policers: 0  
 FPC slot 1 information:  
 Aggregate policer is never violated  
 Received: 61961244 Arrival rate: 4000 pps  
 Dropped: 46473017 Max arrival rate: 4002 pps  
 Dropped by individual policers: 46473017

Packet type: padi  
 System-wide information:  
 Bandwidth is being violated!  
 No. of FPCs currently receiving excess traffic: 1  
 No. of FPCs that have received excess traffic: 1  
 Violation first detected at: 2011-04-19 08:23:17 PDT  
 Violation last seen at: 2011-04-19 12:41:23 PDT  
 Duration of violation: 04:18:06 Number of violations: 1  
 Received: 30980622 Arrival rate: 2000 pps  
 Dropped: 23236505 Max arrival rate: 2001 pps  
 Routing Engine information:  
 Policar is never violated  
 Received: 7744433 Arrival rate: 500 pps  
 Dropped: 0 Max arrival rate: 505 pps  
 Dropped by aggregate policer: 0  
 FPC slot 1 information:  
 Policar is currently being violated!  
 Violation first detected at: 2011-04-19 08:23:17 PDT  
 Violation last seen at: 2011-04-19 12:41:23 PDT  
 Duration of violation: 04:18:06 Number of violations: 1  
 Received: 30980622 Arrival rate: 2000 pps

Dropped: 23236505 Max arrival rate: 2001 pps  
Dropped by this policer: 23236505  
Dropped by aggregate policer: 0

Packet type: pado

System-wide information:

Bandwidth is never violated

Received: 0 Arrival rate: 0 pps

Dropped: 0 Max arrival rate: 0 pps

Routing Engine information:

Policer is never violated

Received: 0 Arrival rate: 0 pps

Dropped: 0 Max arrival rate: 0 pps

Dropped by aggregate policer: 0

FPC slot 1 information:

Policer is never violated

Received: 0 Arrival rate: 0 pps

Dropped: 0 Max arrival rate: 0 pps

Dropped by aggregate policer: 0

Packet type: padr

System-wide information:

Bandwidth is being violated!

No. of FPCs currently receiving excess traffic: 1

No. of FPCs that have received excess traffic: 1

Violation first detected at: 2011-04-19 08:23:17 PDT

Violation last seen at: 2011-04-19 12:43:23 PDT

Duration of violation: 04:20:06 Number of violations: 1

Received: 31220846 Arrival rate: 2000 pps

Dropped: 23416690 Max arrival rate: 2001 pps

Routing Engine information:

Policer is never violated

Received: 7806417 Arrival rate: 499 pps

Dropped: 0 Max arrival rate: 506 pps

Dropped by aggregate policer: 0

FPC slot 1 information:

Policer is currently being violated!

Violation first detected at: 2011-04-19 08:23:17 PDT

Violation last seen at: 2011-04-19 12:43:23 PDT

Duration of violation: 04:20:06 Number of violations: 1

**Table 496: show ddos-protection statistics Output Fields**

| Field Name                        | Field Description                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------|
| Policing on routing engine        | Shows whether or not policing is enabled on the Routing Engine.                                   |
| Policing on FPC                   | Shows whether or not policing is enabled on the line card.                                        |
| Flow detection                    | Shows whether or not flow detection is enabled.                                                   |
| Logging                           | Shows whether or not DDoS event logging is enabled.                                               |
| Policer violation report rate     | Shows the violation report rate as a percentage.                                                  |
| Flow report rate                  | Shows the flow report rate as a percentage.                                                       |
| Currently violated packet types   | Number of packet types currently experiencing a bandwidth violation.                              |
| Packet types have seen violations | Number of packet types that have experienced a bandwidth violation since statistics were cleared. |

Table 496: show ddos-protection statistics Output Fields (*continued*)

| Field Name             | Field Description                     |
|------------------------|---------------------------------------|
| Total violation counts | Total number of bandwidth violations. |

## Sample Output

### show ddos-protection statistics

```
user@host> show ddos-protection statistics
DDOS protection global statistics:

 Policing on routing engine: Yes
 Policing on FPC: Yes
 Flow detection: No
 Logging: Yes
 Policer violation report rate: 100
 Flow report rate: 100
 Currently violated packet types: 2
 Packet types have seen violations: 2
 Total violation counts: 2
 Currently tracked flows: 0
 Total detected flows: 0
```

## show ddos-protection version

|                                 |                                                                                                                                                                                                                                                                                                           |

### Port Mirroring Overview

Port mirroring copies packets entering or exiting a port or entering a VLAN and sends the copies to a local interface for local monitoring or to a VLAN for remote monitoring. Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on.

Port mirroring is needed for traffic analysis on a switch because a switch normally sends packets only to the port to which the destination device is connected. You configure port mirroring on the switch to send copies of unicast traffic to a local interface or a VLAN and run an analyzer application on a device connected to the interface or VLAN. You configure port mirroring by using the **analyzer** statement.

Keep performance in mind when configuring port mirroring. For example, If you mirror traffic from multiple ports, the mirrored traffic may exceed the capacity of the output interface. We recommend that you limit the amount of copied traffic by selecting specific interfaces instead of using the **all** keyword. You can also limit the amount of mirrored traffic by using a firewall filter to send specific traffic to a port mirroring instance. Mirroring only the necessary packets reduces the possibility of a performance impact.

You can use port mirroring to copy any of the following:

- All packets entering or exiting an interface (in any combination)—For example, you can send copies of the packets entering some interfaces and the packets exiting other interfaces to the same local interface or VLAN. If you configure port mirroring to copy packets exiting an interface, traffic that originates on that switch or Node device (in a QFabric system) is not copied when it egresses. Only switched traffic is copied on egress. (See the limitation on egress mirroring below.)
- All packets entering a VLAN—You cannot use port mirroring to copy packets exiting a VLAN.
- Firewall-filtered sample—Sample of packets entering a port or VLAN. Configure a firewall filter to select certain packets for mirroring.

**NOTE:** Firewall filters are not supported on egress ports; therefore, you cannot specify policy-based sampling of packets exiting an interface.

## Port Mirroring Instance Types

To configure port mirroring, you configure an instance of one of the following types:

- Analyzer instance: You must specify the input and output for the instance. This instance type is useful for ensuring that all traffic transiting an interface or VLAN is mirrored and sent to the analyzer device.
- Port-mirroring instance: You do not specify an input for this instance type. Instead, you, create a firewall filter that specifies the required traffic and directs it to the mirror. This instance type is useful for controlling which types of traffic should be mirrored. When you use a port-mirroring instance, you can direct traffic to it in the following ways:
  - Specify the name of the port-mirroring instance in the firewall filter using the **port-mirror-instance *instance-name*** action. You should use this approach if there are multiple port-mirroring instances defined.
  - Configure the filter to send the mirrored packets to the output interface defined in the instance using the **port-mirror** action. You can use this approach if there is only one port-mirroring instance defined.

## Port-Mirroring Terminology

Table 499 lists the terms used in the documentation about port mirroring and provides definitions.

**Table 499: Port Mirroring Terms and Definitions**

| Term              | Description                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Analyzer instance | Port-mirroring configuration that includes a name, source interfaces or source VLAN, and a destination for mirrored packets (either a local access interface or a VLAN). |

Table 499: Port Mirroring Terms and Definitions (*continued*)

|                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port mirroring instance                                         | A port-mirroring configuration that does not specify an input.. A firewall filter must be used to send traffic to the port mirror. Use the action <b>port-mirror-instance <i>instance-name</i></b> in the firewall filter configuration to send packets to the port mirror.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Output interface (also known as monitor interface)              | <p>Access interface to which packet copies are sent and to which a device running an analyzer application is connected.</p> <p>The following limitations apply to an output interface:</p> <ul style="list-style-type: none"> <li>• Cannot also be a source port.</li> <li>• Cannot be used for switching.</li> <li>• Cannot be an aggregated Ethernet interface (LAG).</li> <li>• Does not participate in Layer 2 protocols, such as Spanning Tree Protocol (STP).</li> <li>• Loses any existing VLAN associations when you configure it as an analyzer output interface.</li> </ul> <p>If the capacity of the output interface is insufficient to handle the traffic from the source ports, overflow packets are dropped.</p>                                                                                                                                                                                                                                               |
| Output IP address                                               | <p>IP address of the device running an analyzer application. The device can be on a remote network. When you use this feature, the mirrored packets are GRE-encapsulated. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)</p> <ul style="list-style-type: none"> <li>• An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.</li> <li>• If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).</li> </ul>                                                                                                                                                                    |
| Output VLAN (also known as monitor or analyzer VLAN)            | <p>VLAN to which copies are sent and to which a device running an analyzer application is connected. The analyzer VLAN can span multiple switches.</p> <p>The following limitations apply to an output VLAN:</p> <ul style="list-style-type: none"> <li>• Cannot be a private VLAN or VLAN range.</li> <li>• Cannot be shared by multiple <b>analyzer</b> statements.</li> <li>• An output VLAN interface cannot be a member of any other VLAN.</li> <li>• An output VLAN interface cannot be an aggregated Ethernet interface (LAG).</li> <li>• On some switches, only one interface can be a member of the analyzer VLAN. This limitation does not apply on the QFX10000 switch if traffic is mirrored on ingress. In this case, multiple QFX10000 interfaces can belong to the output VLAN, and traffic is mirrored to all of those interfaces. If traffic is mirrored on egress on a QFX10000 switch, only one interface can be a member of the analyzer VLAN.</li> </ul> |
| Input interface (also known as mirrored or monitored interface) | Interface that provides traffic to be mirrored. This traffic can be entering or exiting the interface. (Ingress or egress traffic can be mirrored.) An input interface cannot also be an output interface for an analyzer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Monitoring station                                              | Computer running an analyzer application.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Local port mirroring                                            | Port-mirroring configuration in which the mirrored packets are sent to an interface on the same switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 499: Port Mirroring Terms and Definitions (*continued*)

|                        |                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote port mirroring  | Flooding mirrored packets to an output (analyzer) VLAN that you create to receive mirror traffic or sending the mirrored packets to a remote IP address. (You cannot send mirrored packets to a remote IP address on a QFabric system.) |
| Policy-based mirroring | Mirroring of packets that match the match a firewall filter term. The action <b>analyzer</b> <i>analyzer-name</i> is used in the firewall filter to send the packets to the analyzer.                                                   |

## Port Mirroring and STP

The behavior of STP in a port-mirroring configuration depends on the version of Junos OS you are using:

- Junos OS 13.2X50, Junos OS 13.2X51-D25 or earlier, Junos OS 13.2X52: If you enable STP, port mirroring might not work because STP might block the mirrored packets.
- Junos OS 13.2X51-D30, Junos OS 14.1X53: STP is disabled for mirrored traffic. You must ensure that your topology prevents loops for this traffic.

## Port Mirroring Constraints and Limitations

- [Local and Remote Port Mirroring on page 6230](#)
- [Remote Port Mirroring Only on page 6232](#)

### Local and Remote Port Mirroring

The following constraints and limitations apply to local and remote port mirroring:

- You can create a total of four port-mirroring configurations.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

**NOTE:** On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:
  - **interface**
  - **ip-address**
  - **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a standalone switch or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface if the input is a VLAN or if traffic is sent to the analyzer by a firewall filter.
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

### Remote Port Mirroring Only

---

The following constraints and limitations apply to remote port mirroring:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.

## Configuring Port Mirroring

---

You use port mirroring to copy packets and send the copies to a device running an application such as a network analyzer or intrusion detection application so that you can analyze traffic without delaying it. You can mirror traffic entering or exiting a port or entering a VLAN, and you can send the copies to a local access interface or to a VLAN through a trunk interface.

We recommend that you disable port mirroring when you are not using it. To avoid creating a performance issue If you do enable port mirroring, we recommend that you select specific input interfaces instead of using the **all** keyword. You can also limit the amount of mirrored traffic by using a firewall filter.

.....

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Port Mirroring*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 41.

.....

.....

**NOTE:** If you want to create additional analyzers without deleting an existing analyzer, first disable the existing analyzer using the **disable analyzer analyzer-name** command.

.....

**NOTE:** You must configure port mirroring output interfaces as family **ethernet-switching**.

- [Configuring Port Mirroring for Local Analysis on page 6233](#)
- [Configuring Port Mirroring for Remote Analysis on page 6233](#)
- [Filtering the Traffic Entering an Analyzer on page 6234](#)

## Configuring Port Mirroring for Local Analysis

To mirror interface traffic to a local interface on the switch:

1. If you want to mirror traffic that is ingressing or egressing specific interfaces, choose a name for the port-mirroring configuration and configure what traffic should be mirrored by specifying the interfaces and direction of traffic:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input (ingress | egress) interface interface-name
```

**NOTE:** If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs. If you do so, some VLAN packets might contain incorrect VLAN IDs.

**NOTE:** If you configure mirroring for packets that egress an access interface, the original packets lose any VLAN tags when they exit the access interface, but the mirrored (copied) packets retain the VLAN tags when they are sent to the analyzer system.

2. If you want to specify that all traffic entering a VLAN should be mirrored, choose a name for the port-mirroring configuration and specify the VLAN:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name input ingress vlan vlan-name
```

**NOTE:** You cannot configure port mirroring to copy traffic that egresses a VLAN.

3. Configure the destination interface for the mirrored packets:

```
[edit forwarding-options]
user@switch# set analyzer analyzer-name output interface interface-name
```

## Configuring Port Mirroring for Remote Analysis

To mirror traffic to a VLAN for analysis at a remote location:

1. Configure a VLAN to carry the mirrored traffic:

```
[edit]
```

```
user@switch# set vlans vlan-name vlan-id number
```

2. Configure the interface that connects to another switch (the uplink interface) to trunk mode and associate it with the appropriate VLAN:

```
[edit]
```

```
user@switch# set interfaces interface-name unit 0 family ethernet-switching port-mode
trunk vlan members (vlan-name | vlan-id)
```

3. Configure the analyzer:

- a. Choose a name for the analyzer:

```
[edit forwarding-options]
```

```
user@switch# set analyzer analyzer-name
```

- b. Specify the interface to be mirrored and whether the traffic should be mirrored on ingress or egress:

```
[edit forwarding-options]
```

```
user@switch# set analyzer analyzer-name input (ingress | egress) interface interface-name
```

- c. Specify the appropriate IP address or VLAN as the output (a VLAN is specified in this example:

```
[edit forwarding-options]
```

```
user@switch# set analyzer analyzer-name output vlan (vlan-name | vlan-id)
```

If you specify an IP address as the output, note the following constraints:

- The address cannot be in the same subnet as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (*inet.0* routing table).
- The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)

## Filtering the Traffic Entering an Analyzer

In addition to specifying which traffic to mirror by configuring an analyzer, you can also use a firewall filter to exercise more control over which packets are copied. For example, you might use a filter to specify that only traffic from certain applications be mirrored. The filter can use any of the available match conditions and must have an action of modifier of **port-mirror-instance** *instance-name*. If you use the same analyzer in multiple filters or terms, the output packets are copied only once.

When you use a firewall filter as the input to a port-mirroring instance, you send the copied traffic to a local interface or a VLAN just as you do when a firewall is not involved.

To configure port mirroring with filters:

1. Configure a port-mirroring instance for local or remote analysis. Configure only the output. For example, for local analysis enter:

```
[edit forwarding-options]
```

```
user@switch# set port-mirroring-instance instance-name output interface interface-name
```

**NOTE:** You cannot configure input to this instance.

2. Create a firewall filter using any of the available match conditions. In a **then** term, specify include the action modifier **port-mirror-instance** *instance-name*.
3. Apply the firewall filter to the interfaces or VLAN that should provide the input to the analyzer:

```
[edit]
user@switch# set interfaces interface-name unit 0 family ethernet-switching filter input
filter-name
[edit]
user@switch# set vlan (vlan-name | vlan-id) filter input filter-name
```

#### Related Documentation

## Examples: Configuring Port Mirroring for Local Analysis

Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on. Port mirroring copies packets entering or exiting an interface or entering a VLAN and sends the copies to a local interface for local monitoring.

**NOTE:** This example uses the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 41](#).

This example describes how to configure port mirroring to copy traffic sent by employee computers to a switch to an access interface on the same switch.

- [Requirements on page 6235](#)
- [Overview and Topology on page 6236](#)
- [Example: Mirroring All Employee Traffic for Local Analysis on page 6236](#)
- [Example: Mirroring Employee Web Traffic with a Firewall Filter on page 6237](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2
- A switch

## Overview and Topology

This topic includes two related examples that describe how to mirror traffic entering interfaces on the switch to an access interface on the same switch. The first example shows how to mirror all traffic sent by employee computers to the switch. The second example includes a filter to mirror only the employee traffic going to the Web.

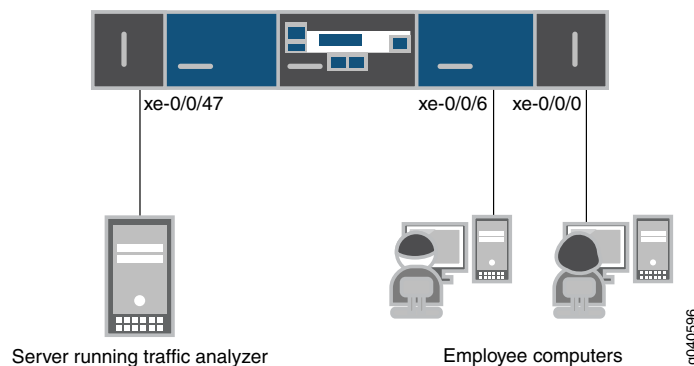

In this example, **xe-0/0/0** and **xe-0/0/6** serve as connections for employee computers. Interface **xe-0/0/47** is connected to a device running an analyzer application.

**NOTE:** Multiple ports mirrored to one interface can cause buffer overflow and dropped packets.

Figure 202 shows the network topology for this example.

Figure 202: Network Topology for Local Port Mirroring Example

### Example: Mirroring All Employee Traffic for Local Analysis

To configure port mirroring for all traffic sent by employee computers for local analysis, perform the tasks explained in this section.

#### CLI Quick Configuration

To quickly configure local port mirroring for ingress traffic to the two ports connected to employee computers, copy the following commands and paste them into a switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching
set interfaces xe-0/0/6 unit 0 family ethernet-switching
set interfaces xe-0/0/47 unit 0 family ethernet-switching
set forwarding-options analyzer employee-monitor input ingress interface xe-0/0/0.0
set forwarding-options analyzer employee-monitor input ingress interface xe-0/0/6.0
set forwarding-options analyzer employee-monitor output interface xe-0/0/47.0
```

#### Step-by-Step Procedure

To configure an analyzer called **employee-monitor** and specify the input (source) interfaces and the output interface:

1. Configure the interfaces connected to employee computers as input interfaces for the port-mirror analyzer **employee-monitor**:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress interface xe-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface xe-0/0/6.0
```

2. Configure the output analyzer interface for the **employee-monitor** analyzer. This will be the destination interface for the mirrored packets:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor output interface xe-0/0/47.0
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show forwarding-options analyzer
employee-monitor {
 input {
 ingress {
 interface xe-0/0/0.0;
 interface xe-0/0/6.0;
 }
 }
 output {
 interface {
 xe-0/0/47.0;
 }
 }
}
```

## Example: Mirroring Employee Web Traffic with a Firewall Filter

- [Requirements on page 6237](#)
- [Overview on page 6237](#)
- [Configuring on page 6238](#)
- [Verification on page 6240](#)

### Requirements

This example uses the following hardware and software components:

- One switch
- Junos 13.2X51

### Overview

Rather than mirror all traffic, it is usually desirable to mirror only certain traffic. This is a more-efficient use of your bandwidth and hardware and might be necessary because constraints on these assets. To select specific traffic for mirroring, you use a firewall filter to match the desired traffic and direct it to a port-mirroring instance. The port-mirroring instance then copies the packets and sends them to the output VLAN, interface, or IP address.

## Configuring

To specify that the only traffic that will be mirrored is traffic sent by employees to the Web, perform the tasks explained in this section. To select this traffic for mirroring, you use a firewall filter to specify this traffic and direct it to a port-mirroring instance.

### CLI Quick Configuration

To quickly configure local port mirroring of traffic from employee computers that is destined for the Web, copy the following commands and paste them into a switch terminal window:

```
[edit]
set forwarding-options port-mirroring instance employee-web-monitor output interface
xe-0/0/47.0
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then
port-mirror-instance employee-web-monitor
set interfaces xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee
```

### Step-by-Step Procedure

To configure local port mirroring of employee-to-web traffic from the two ports connected to employee computers:

1. Configure the output interface:

```
[edit interfaces]
user@switch# set xe-0/0/47 unit 0 family ethernet-switching
```

2. Configure the **employee-web-monitor** output interface. (Configure only the output—the input comes from the filter.)

```
[edit forwarding-options]
user@switch# set port-mirroring instance employee-web-monitor output interface
xe-0/0/47.0
```

3. Configure a firewall filter called **watch-employee** that includes a term to match traffic sent to the Web and send it to the port-mirroring instance **employee-web-monitor**. Traffic to and from the corporate subnet (destination or source address of **192.0.2.16/28**) does not need to be copied, so create another term to accept that traffic before it reaches the term that sends Web traffic to the instance:

```
[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-corp from destination-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
employee-web-monitor
```

4. Apply the firewall filter to the appropriate interfaces as an ingress filter (egress filters do not allow analyzers):

```
[edit interfaces]
```

```

user@switch# set xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee

```

**Results** Check the results of the configuration:

```

[edit]
user@switch# show
forwarding-options {
 port-mirroring {
 instance {
 employee-web-monitor {
 output {
 interface xe-0/0/47.0;
 }
 }
 }
 }
}
...
firewall family ethernet-switching {
 filter watch-employee {
 term employee-to-web {
 from {
 destination-port 80;
 }
 then port-mirror-instance employee-web-monitor;
 }
 }
}
...
interfaces {
 xe-0/0/0 {
 unit 0 {
 family ethernet-switching {
 filter {
 input watch-employee;
 }
 }
 }
 }
 xe-0/0/6 {
 family ethernet-switching {
 filter {
 input watch-employee;
 }
 }
 }
}
}

```

## Verification

---

### *Verifying That the Analyzer Has Been Correctly Created*

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify that the port mirror analyzer has been configured as expected using the **show analyzer** command.

```
user@switch> show forwarding-options analyzer
 Port mirror name : employee-monitor
 Mirror rate : 1
 Maximum packet length : 0
 State : up
 Ingress monitored interfaces : xe-0/0/0.0
 Ingress monitored interfaces : xe-0/0/6.0
 Output interface : xe-0/0/47.0
```

**Meaning** This output shows that the port-mirroring instance **employee-monitor** has a ratio of 1 (mirroring every packet, the default setting), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration (is up indicates that the instance is mirroring the traffic entering the xe-0/0/0, and xe-0/0/6 interfaces, and sending the mirrored traffic to the xe-0/0/47 interface). If the state of the output interface is down or if the output interface is not configured, the value of state will be **down** and the instance will not be programmed for mirroring.

**Related Documentation** [• Understanding Port Mirroring on page 6227](#)

**Related Documentation** [• Understanding Port Mirroring on page 6227](#)

## Example: Configuring Port Mirroring for Remote Analysis

---

Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on. Port mirroring copies packets entering or exiting an interface or entering a VLAN and sends the copies either to a local interface for local monitoring or to a VLAN for remote monitoring. This example describes how to configure port mirroring for remote analysis.

- [Requirements on page 6241](#)
- [Overview and Topology on page 6241](#)
- [Mirroring All Employee Traffic for Remote Analysis on page 6241](#)

- [Mirroring Employee-to-Web Traffic for Remote Analysis on page 6242](#)
- [Verification on page 6244](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2 for the QFX Series
- A switch

## Overview and Topology

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to an analyzer VLAN so that you can perform analysis using a remote device. The first example shows how to mirror all traffic sent by employee computers to the switch. The second example includes a filter to mirror only the employee traffic going to the Web.

In this example:

- Interfaces **ge-0/0/0** and **ge-0/0/1** are Layer 2 interfaces that connect to employee computers.
- Interface **ge-0/0/10** is a Layer 2 interface that connects to another switch.
- VLAN **remote-analyzer** is configured on all switches in the topology to carry the mirrored traffic.

**NOTE:** In addition to performing the configuration steps described here, you must also configure the analyzer VLAN (**remote-analyzer** in this example) on the other switches that are used to connect the source switch (the one in this configuration) to the one that the monitoring station is connected to.

## Mirroring All Employee Traffic for Remote Analysis

### CLI Quick Configuration

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **edit** hierarchy level:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0.0
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
set forwarding-options analyzer employee-monitor output vlan remote-analyzer
```

**Step-by-Step Procedure**

To configure basic remote port mirroring:

1. Configure the analyzer VLAN (called **remote-analyzer** in this example):
 

```
[edit vlans]
user@switch# set vlans remote-analyzer vlan-id 999
```
2. Configure the interface connected to another switch for trunk mode and associate it with the **remote-analyzer** VLAN:
 

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```
3. Configure the **employee-monitor** analyzer:
 

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
user@switch# set analyzer employee-monitor output vlan remote-analyzer
```
4. Configure the **remote-analyzer** VLAN on the switches that connect this switch to the monitoring workstation.

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
forwarding-options {
 analyzer employee-monitor {
 input {
 ingress {
 interface ge-0/0/0.0;
 interface ge-0/0/1.0;
 }
 }
 output {
 vlan {
 remote-analyzer;
 }
 }
 }
}
```

## Mirroring Employee-to-Web Traffic for Remote Analysis

**CLI Quick Configuration**

To quickly configure this section of the example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **edit** hierarchy level:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set forwarding-options port-mirroring instance employee-web-monitor loss-priority high output vlan 999
set firewall family ethernet-switching filter watch-employee term employee-to-web from destination-port 80
```

```

set firewall family ethernet-switching filter watch-employee term employee-to-web then
port-mirror-instance employee-web-monitor employee-web-monitor
set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee

```

#### Step-by-Step Procedure

1. Configure the analyzer VLAN (called **remote-analyzer** in this example):  

```

[edit vlans]
user@switch# set remote-analyzer vlan-id 999

```
2. Configure an interface to associate it with the **remote-analyzer** VLAN:  

```

[edit interfaces]
user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999

```
3. Configure the **employee-web-monitor** analyzer. (Configure only the output—the input comes from the filter.)  

```

[edit forwarding-options]
user@switch# set forwarding-options port-mirroring instance employee-web-monitor output vlan 999

```
4. Configure a firewall filter called **watch-employee** to match traffic sent to the Web and send it to the analyzer **employee-web-monitor**:  

```

[edit firewall family ethernet-switching]
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then port-mirror-instance employee-web-monitor

```
5. Apply the firewall filter to the appropriate interfaces as an ingress filter:  

```

[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee

```
6. Configure the **remote-analyzer** VLAN on the switches that connect this switch to the monitoring workstation.

**Results** Check the results of the configuration:

```

[edit]
user@switch# show
interfaces {
 ...
 ge-0/0/10 {
 unit 0 {
 family ethernet-switching {
 interface-mode trunk;
 vlan {
 members remote-analyzer;
 }
 }
 }
 }
 ge-0/0/0 {
 unit 0 {
 family ethernet-switching {
 filter {
 input watch-employee;
 }
 }
 }
 }
}

```

```
 }
 }
}
ge-0/0/1 {
 unit 0 {
 family ethernet-switching {
 filter {
 input watch-employee;
 }
 }
 }
}
...
firewall {
 family ethernet-switching {
 ...
 filter watch-employee {
 term employee-to-web {
 from {
 destination-port 80;
 }
 then port-mirror-instance employee-web-monitor;
 }
 }
 }
}
forwarding-options analyzer {
 employee-web-monitor {
 output {
 vlan {
 999;
 }
 }
 }
}
vlands {
 remote-analyzer {
 vlan-id 999;
 }
}
```

## Verification

---

### Verifying That the Analyzer Has Been Correctly Created

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify the port mirror analyzer is configured as expected using the **show analyzer** command.

```
user@switch> show analyzer
Analyzer name : employee-monitor
Output VLAN : remote-analyzer
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
```

**Meaning** This output shows that the **employee-monitor** analyzer is mirroring the traffic entering **ge-0/0/0** and **ge-0/0/1** and is sending the mirror traffic to the analyzer **remote-analyzer**.

### Requirements

This example uses the following hardware and software components:

- One switch
- Junos 13.2X51

### Overview

Rather than mirror all traffic, it is usually desirable to mirror only certain traffic. This is a more-efficient use of your bandwidth and hardware and might be necessary because constraints on these assets. To select specific traffic for mirroring, you use a firewall filter to match the desired traffic and direct it to a port-mirroring instance. The port-mirroring instance then copies the packets and sends them to the output VLAN, interface, or IP address.

### Configuring

To specify that the only traffic that will be mirrored is traffic sent by employees to the Web, perform the tasks explained in this section. To select this traffic for mirroring, you use a firewall filter to specify this traffic and direct it to a port-mirroring instance.

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Step-by-Step Procedure</b>  | <p>To configure local port mirroring of employee-to-web traffic from the two ports connected to employee computers:</p> <ol style="list-style-type: none"> <li>1. Configure the output interface: <pre>[edit interfaces] user@switch# set xe-0/0/47 unit 0 family ethernet-switching</pre> </li> <li>2. Configure the <b>employee-web-monitor</b> output interface. (Configure only the output—the input comes from the filter.) <pre>[edit forwarding-options] user@switch# set port-mirroring instance employee-web-monitor output interface xe-0/0/47.0</pre> </li> <li>3. Configure a firewall filter called <b>watch-employee</b> that includes a term to match traffic sent to the Web and send it to the port-mirroring instance <b>employee-web-monitor</b>. Traffic to and from the corporate subnet (destination or source address of <b>192.0.2.16/28</b>) does not need to be copied, so create another term to accept that traffic before it reaches the term that sends Web traffic to the instance: <pre>[edit firewall family ethernet-switching] user@switch# set filter watch-employee term employee-to-corp from destination-address 192.0.2.16/28 user@switch# set filter watch-employee term employee-to-corp from source-address 192.0.2.16/28 user@switch# set filter watch-employee term employee-to-corp then accept user@switch# set filter watch-employee term employee-to-web from destination-port 80 user@switch# set filter watch-employee term employee-to-web then port-mirror-instance employee-web-monitor</pre> </li> <li>4. Apply the firewall filter to the appropriate interfaces as an ingress filter (egress filters do not allow analyzers): <pre>[edit interfaces] user@switch# set xe-0/0/0 unit 0 family ethernet-switching filter input watch-employee user@switch# set xe-0/0/6 unit 0 family ethernet-switching filter input watch-employee</pre> </li> </ol> |
| <b>Results</b>                 | <p>Check the results of the configuration:</p> <pre>[edit] user@switch# show</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

```

## Verification

### Verifying That the Analyzer Has Been Correctly Created

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify that the port mirror analyzer has been configured as expected using the **show analyzer** command.

```
user@switch> show forwarding-options analyzer
 Port mirror name : employee-monitor
 Mirror rate : 1
 Maximum packet length : 0
 State : up
 Ingress monitored interfaces : xe-0/0/0.0
 Ingress monitored interfaces : xe-0/0/6.0
 Output interface : xe-0/0/47.0
```

**Meaning** This output shows that the port-mirroring instance **employee-monitor** has a ratio of 1 (mirroring every packet, the default setting), the maximum size of the original packet that was mirrored (**0** indicates the entire packet), the state of the configuration (is up indicates that the instance is mirroring the traffic entering the xe-0/0/0, and xe-0/0/6 interfaces, and sending the mirrored traffic to the xe-0/0/47 interface). If the state of the output interface is down or if the output interface is not configured, the value of state will be **down** and the instance will not be programmed for mirroring.

### Port Mirroring Constraints and Limitations

- [Local and Remote Port Mirroring on page 6248](#)
- [Remote Port Mirroring Only on page 6250](#)

---

#### Local and Remote Port Mirroring

The following constraints and limitations apply to local and remote port mirroring:

- You can create a total of four port-mirroring configurations.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer**

action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)

- There can be no more than two configurations that mirror egress traffic.

**NOTE:** On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:
  - **interface**
  - **ip-address**
  - **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a standalone switch or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface if the input is a VLAN or if traffic is sent to the analyzer by a firewall filter.
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.

- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

### Remote Port Mirroring Only

---

The following constraints and limitations apply to remote port mirroring:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.

### Egress Port Mirroring with VLAN Translation

**Problem Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

### Egress Port Mirroring with Private VLANs

**Problem Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.

- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

**Solution** This is expected behavior.

## DHCP and BOOTP Relay Overview

---

You can configure a Juniper Networks switch to act as a Dynamic Host Configuration Protocol (DHCP) or Bootstrap Protocol (BOOTP) relay agent. This means that if the switch receives a broadcast DHCP or BOOTP request from a locally attached host (client), it relays the message to a specified DHCP or BOOTP server. You should configure the switch to be a DHCP/BOOTP relay agent if you have locally attached hosts and a distant DHCP or BOOTP server.

**NOTE:** Because DHCP and BOOTP messages are broadcast and are not directed to a specific server, switch, or router, Juniper switches cannot function as both a DHCP server and a DHCP/BOOTP relay agent at the same time. The Junos operating system (Junos OS) generates a commit error if both options are configured at the same time, and the commit operation does not succeed until one of the options is removed.

## Configuring DHCP and BOOTP

---

You can configure a switch to act as a Dynamic Host Configuration Protocol (DHCP) and Bootstrap Protocol (BOOTP) server or DHCP relay agent. When a switch is a relay agent, if a locally attached host issues a DHCP or BOOTP request as a broadcast message, the switch relays the message to a specified DHCP or BOOTP server. You should configure

a switch to be a DHCP and BOOTP relay agent if you have locally attached hosts and a remote DHCP or BOOTP server.

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring DHCP and BOOTP Relay*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 41.

To configure a switch to be a server, use the `dhcp-local-server` statement. To configure a switch to be a relay agent, use the `dhcp-relay` statement.

If you want to enable BOOTP support when the switch is configured to be a DHCP server, enter the following statement:

```
[edit system services dhcp-local-server]
user@switch# set overrides bootp-support
```

If you want to enable BOOTP support when the switch is configured to be a DHCP relay agent, enter the following statement:

```
[edit forwarding-options dhcp-relay]
user@switch# set overrides bootp-support
```

---

## Verifying and Managing DHCP Local Server Configuration

---

**Purpose** View or clear information about client address bindings and statistics for the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

- Action**
- To display the address bindings in the client table on the extended DHCP local server:  
user@host> `show dhcp server binding routing-instance customer routing instance`
  - To display extended DHCP local server statistics:  
user@host> `show dhcp server statistics routing-instance customer routing instance`
  - To clear the binding state of a DHCP client from the client table on the extended DHCP local server:  
user@host> `clear dhcp server binding routing-instance customer routing instance`
  - To clear all extended DHCP local server statistics:  
user@host> `clear dhcp server statistics routing-instance customer routing instance`

## Verifying and Managing DHCPv6 Local Server Configuration

---

**Purpose** View or clear information about client address bindings and statistics for the DHCPv6 local server.

**Action** • To display the address bindings in the client table on the DHCPv6 local server:

user@host> [show dhcpv6 server binding](#)

• To display DHCPv6 local server statistics:

user@host> [show dhcpv6 server statistics](#)

• To clear all DHCPv6 local server statistics:

user@host> [clear dhcpv6 server binding](#)

• To clear all DHCPv6 local server statistics:

user@host> [clear dhcpv6 server statistics](#)

**Related Documentation** • [CLI Explorer](#)

## Verifying and Managing DHCP Relay Configuration

---

**Purpose** View or clear address bindings or statistics for extended DHCP relay agent clients:

**Action** • To display the address bindings for extended DHCP relay agent clients:

user@host> [show dhcp relay binding](#) routing-instance *customer routing instance*

• To display extended DHCP relay agent statistics:

user@host> [show dhcp relay statistics](#) routing-instance *customer routing instance*

• To clear the binding state of DHCP relay agent clients:

user@host> [clear dhcp relay binding](#) routing-instance *customer routing instance*

• To clear all extended DHCP relay agent statistics:

user@host> [clear dhcp relay statistics](#) routing-instance *customer routing instance*

**Related Documentation** • [CLI Explorer](#)

## Verifying and Managing DHCPv6 Relay Configuration

---

**Purpose** View or clear address bindings or statistics for extended DHCPv6 relay agent clients:

**Action** • To display the address bindings for extended DHCPv6 relay agent clients:

user@host> [show dhcpv6 relay binding](#)

• To display extended DHCPv6 relay agent statistics:

user@host> [show dhcpv6 relay statistics](#)

- To clear the binding state of DHCPv6 relay agent clients:

```
user@host> clear dhcpv6 relay binding
```

- To clear all extended DHCPv6 relay agent statistics:

```
user@host> clear dhcpv6 relay statistics
```

## Understanding Layer 3 Logical Interfaces

---

A Layer 3 logical interface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 logical interfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks switch to a Layer 2 switch. Only one physical connection is required between the switches.

To create Layer 3 logical interfaces on a switch, enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

We recommend that you use the VLAN ID as the logical interface number when you configure the logical interface. QFX Series and EX4600 switches support a maximum of 4089 VLANs, which includes the default VLAN. You can, however, assign a VLAN ID in the range of 1 to 4094, but five of these VLAN IDs are reserved for internal use.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces.

## analyzer

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> analyzer {   name {     input {       egress {         interface (all   interface-name);         vlan (vlan-id   vlan-name);       }       ingress {         interface (all   interface-name);         vlan (vlan-id   vlan-name);       }       output {         interface interface-name;         ip-address ip-address;         routing-instance         vlan (vlan-id   vlan-name);       }     }   } } </pre> |
| <b>Hierarchy Level</b>     | <p>For platforms without ELS:</p> <pre>[edit ethernet-switching-options]</pre> <p>For platforms with ELS:</p> <pre>[edit forwarding-options]</pre>                                                                                                                                                                                                                                                                       |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <b>output vlan</b> added in Junos OS Release 12.1 for the QFX Series.</p> <p>Option <b>output ip-address</b> added in Junos OS Release 12.3 for the QFX Series for non-ELS platforms and added in 14.1X53-D10 for ELS platforms.</p>                                                                                                  |
| <b>Description</b>         | <p>Configure port mirroring. You can create a total of four port-mirroring configurations on the QFX Series, subject to the following limits:</p> <ul style="list-style-type: none"> <li>• There can be no more than two configurations that mirror ingress traffic.</li> <li>• There can be no more than two configurations that mirror egress traffic.</li> </ul>                                                      |
| <b>Default</b>             | Port mirroring is disabled, and Junos OS creates no default analyzers.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <b>all</b> —Mirror all the access interfaces. Using this option does not cause the QSFP+ or management interfaces to be mirrored.                                                                                                                                                                                                                                                                                        |

**CAUTION:** Configuring the **all** option in a QFabric system causes all the access interfaces on all the nodes to be mirrored. Be cautious about using this option on a QFabric system.

**name**—Name of the analyzer. The name can include as many as 125 characters; must begin with a letter; and can include uppercase letters, lowercase letters, numbers, dashes, and underscores. No other special characters are allowed.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## egress

**Syntax**

```
egress {
 interface (all | interface-name);
}
vlan (vlan-id | vlan-name);
```

**Hierarchy Level** For platforms without ELS:  
[edit ethernet-switching-options **analyzer name input**]  
For platforms with ELS:  
[edit forwarding-options **analyzer name input**]

**Release Information** Statement introduced in Junos OS Release 11.2 for the QFX Series.

**Description** Specify interface or VLAN for which egressing traffic is mirrored. (The **vlan** statement is not supported on all switches.)

The statement is explained separately.

**NOTE:** If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs. If you do so, some of the mirrored packets might contain incorrect VLAN IDs.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Understanding Port Mirroring on page 6227](#)
- [Configuring Port Mirroring on page 6232](#)
- [Examples: Configuring Port Mirroring for Local Analysis on page 6235](#)

## ethernet-switching (Port Mirroring)

---

**Syntax** ethernet-switching;  
    **output** {  
        **interface** *interface-name* {  
        }  
        no-filter-check;  
        }  
    **vlan** *vlan-name* {  
        no-tag;  
    }  
}

**Hierarchy Level** [edit forwarding-options port-mirroring [instance *name*] family]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description** Specify that the output interface for the port mirror will be configured as an **ethernet-switching** interface.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Understanding Port Mirroring on page 6227](#)
- [Configuring Port Mirroring on page 6232](#)
- [Examples: Configuring Port Mirroring for Local Analysis on page 6235](#)

## family (Port Mirroring)

**Syntax** `family (Port Mirroring)`

```

ethernet-switching {
 output {
 interface interface-name {
 }
 no-filter-check;
 }
 vlan vlan-name {
 no-tag;
 }
}
inet
output {
 ip-address address {
 }
 routing-instance instance-name {
 ip-address address {
 }
 }
}

```

**Hierarchy Level** [edit forwarding-options port-mirroring [*instance name*] ]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description** Specify the type of interface that will be used to forward port mirrored packet to an analyzer device..

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- [Understanding Port Mirroring on page 6227](#)
- [Configuring Port Mirroring on page 6232](#)
- [Examples: Configuring Port Mirroring for Local Analysis on page 6235](#)

## inet (Port Mirroring)

---

**Syntax**

```
inet {
 output {
 ip-address address {
 }
 routing-instance instance-name {
 ip-address address {
 }
 }
 }
}
```

**Hierarchy Level** [edit forwarding-options port-mirroring [instance *name*] family]

**Release Information** Statement introduced in Junos OS Release 14.1X53 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify that the output interface will be of type **inet**. Use this statement so that you can send the mirrored packets to the IP address of the device running an analyzer application. The device can be on a remote network. When you use this feature, the mirrored packets are GRE-encapsulated. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.)

**NOTE:** An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.

---

**NOTE:** If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).

---

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## ingress (Port Mirroring)

---

|                                 |                                                                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <pre>ingress {   interface (all   interface-name);   vlan (vlan-id   vlan-name); }</pre>                                                                                                                                                                                         |

## instance (Port Mirroring)

```
Syntax instance instance-name{
 family
 ethernet-switching {
 output {
 interface interface-name {
 }
 no-filter-check;
 }
 vlan vlan-name {
 no-tag;
 }
 }
 inet
 output {
 ip-address address {
 }
 routing-instance instance-name {
 ip-address address {
 }
 }
 }
 }
```

**Hierarchy Level** [edit forwarding-options port-mirroring]

**Release Information** Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description** Specify a port-mirroring configuration (instance). You do not specify an input for this instance. Instead, you, create a firewall filter that specifies the required traffic and directs it to the mirror. This is useful for controlling which types of traffic should be mirrored.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1X53 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Specify the IP address to which traffic should be mirrored (the IP address of the analyzer system). The device can be on a remote network. The analyzer device must be able to de-encapsulate GRE-encapsulated packets, or the GRE-encapsulated packets must be de-encapsulated before reaching the analyzer device. (You can use a network sniffer to de-encapsulate the packets.) This statement is not supported on QFabric systems. |
|                                 | <div>  <p><b>NOTE:</b> An output IP address cannot be in the same subnetwork as any of the switch's management interfaces.</p> </div>                                                                                                                                                                                                                  |
|                                 | <div>  <p><b>NOTE:</b> If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).</p> </div>                                                                                                   |

## routing-instance (Port Mirroring)

---

**Syntax** routing-instance *instance-name*;

**Hierarchy Level** [edit forwarding-options] [analyzer name](#) [output](#)]  
[edit forwarding-options port-mirroring [instance *name*] family inet [output interface name](#)]

**Release Information** Statement introduced in Junos OS Release 12.3 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure a port mirroring instance. You do not specify an input for this instance. Instead, you, create a firewall filter that specifies the required traffic and directs it to the mirror. This instance type is useful for controlling which types of traffic should be mirrored.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>When used in an <b>input</b> statement, specifies that traffic entering or exiting a VLAN should be mirrored. (You can include this statement in an <b>ingress</b> statement or <b>egress</b> statement within the <b>input</b> statement. It is not supported in an <b>egress</b> statement on all switches)</p> <p>When used in an <b>output</b> statement, specifies that mirrored traffic to be sent to a VLAN for remote monitoring.</p> <p>On some switches, only one interface can be a member of the output (analyzer) VLAN. This limitation does not apply on the QFX10000 switch if traffic is mirrored on ingress. In this case, multiple QFX10000 interfaces can belong to the output VLAN, and traffic is mirrored to all of those interfaces. If traffic is mirrored on egress on a QFX10000 switch, only one interface can be a member of the analyzer VLAN.</p> |
| <b>Options</b>                  | <p><b>vlan-id</b>—Numeric VLAN identifier.</p> <p><b>vlan-name</b>—Name of the VLAN.</p> <p><b>no-tag</b>—Specifies that remote mirrored packets are not tagged with the tag of the output (analyzer) VLAN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.  
 Statement introduced in Junos OS Release 13.2X51 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch and enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The extended DHCP local server is incompatible with the DHCP server on J Series routers and so is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the **[edit forwarding-options helpers]** hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The **dhcpv6** stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

**NOTE:** When you configure the **dhcp-local-server** statement at the routing instance hierarchy level, you must use a routing instance type of **virtual-router**.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

**Hierarchy Level** [edit forwarding-options],  
[edit vlans forwarding-options]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the switch and enable the switch to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

The extended DHCP and DHCPv6 relay agent options configured with the **dhcp-relay** and **dhcpv6** statements are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router at the same time.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Enable DHCP services on the device. DHCP services automate network-parameter assignment to network devices. The DHCP service process is enabled by default. However, by default, IP-MAC bindings in the DHCP snooping database do not persist through device reboots. You can improve performance after rebooting by configuring the IP-MAC bindings to persist, by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.</p> <p>The remaining statements are explained separately.</p> |

| Description              | <p>Configure authentication key updates for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol. When the <b>authentication-key-chains</b> statement is configured at the <b>[edit security]</b> hierarchy level, and is associated with the BGP, LDP, or IS-IS protocols at the <b>[edit protocols]</b> hierarchy level or with the BFD protocol using the <b>bfd-liveness-detection</b> statement, authentication key updates can occur without interrupting routing and signaling protocols such as Open Shortest Path First (OSPF) and Resource Reservation Setup Protocol (RSVP).</p> <p>The remaining statements are explained separately.</p> |

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure security services. Most of the configuration statements do not have default values. If you do not specify an identifier for a statement that does not have a default value, you cannot commit the configuration.

**Required Privilege  
Level**

**Related  
Documentation**

## ssh-known-hosts

---

**Syntax**    ssh-known-hosts {  
              host *host-name* {  
                  fetch-from-server *host-name*;  
                  load-key-file *file-name*;  
              }  
              }

**Hierarchy Level**    [edit security ssh-known-hosts]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.  
                              Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Configure SSH support for known hosts and for administering SSH host key updates.

**Options**    **host *host-name***—Hostname of the SSH known host entry. This option has the following suboptions:

- **fetch-from-server *host-name***—Retrieve SSH public host key information from a specified server.
- **load-key-file *filename***—Import SSH host key information from the `/var/tmp/ssh-known-hosts` file.

**Required Privilege  
Level**    admin—To view this statement in the configuration.  
              admin-control—To add this statement to the configuration.

**Related  
Documentation**    • *Understanding Security Features on the QFabric System*

| <b>Description</b>              | <p>Specify a start time for key transmission. You do not need to specify an end time for the key. If a new key is present with a new start time, the keychain rolls over to the new one. The start time must be unique within the keychain.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b>now</b>—Start time as the current year, month, day, hour, minute, and second.</p> <p><b>daydays</b>—Start time as the specified number of days after the current day. For example, if the current day is the 12th and you configure <b>start-time 2day</b>, the start time will be on the 14th, exactly two days after the configuration is entered.</p> <p><b>hourhours</b>—Start time as the specified number of hours after the current hour. For example, if the current hour is 9:00 and you configure <b>start-time 3hour</b>, the start time will be in 12:00, exactly three hours after the configuration is entered.</p> <p><b>minuteminutes</b>—Start time as the specified number of minutes after the current minute. For example, if the current minute is 27 minutes after the hour and you configure <b>start-time 5min</b>, the start time will be in 32 minutes after the hour, exactly five minutes after the configuration is entered.</p> <p><b>monthmonths</b>—Start time as the specified number of months after the current month. For example, if the current month is March and you configure <b>start-time 4month</b>, the start time will be in July, exactly four months after the configuration is entered.</p> <p><b>secondseconds</b>—Start time as the specified number of seconds after the current second. For example, if the current second is 10:20:40 and you configure <b>start-time 10seconds</b>, the start time will be 10:20:50, exactly 10 seconds after the configuration is entered.</p> <p><b>yearyears</b>—Start time as the specified number of years after the current year. For example, if the current year is 2011 and you configure <b>start-time 1year</b>, the start time will be in 2012, exactly one year after the configuration is entered.</p> <p><b>yyyy-mm-dd.hh:mm:ss</b>—Start time in UTC (Coordinated Universal Time). The start time must be unique within the keychain.</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>                                                                                                                                                                                                                                                                     | <p>Configure security trace options.</p> <p>To specify more than one trace option, include multiple <b>flag</b> statements. Trace option output is recorded in the <code>/var/log/kmd</code> file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> The <code>traceoptions</code> statement is not supported on QFabric systems.</p> </div> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                                                                                                                                                                                                                                                                         | <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file (for example, <code>kmd</code>) reaches its maximum size, it is renamed <code>kmd.0</code>, then <code>kmd.1</code>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 0 files</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB). When a trace file (for example, <code>kmd</code>) reaches this size, it is renamed, <code>kmd.0</code>, then <code>kmd.1</code> and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Default:</b> 1024 KB</p> |

**flag *flag***—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.

- **all**—Trace all security events.
- **certificates**—Trace certificate events.
- **database**—Trace database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.
- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **timer**—Trace internal timer events.

**level *level***—(Optional) Set traceoptions level.

- **all**—match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**no-remote-trace**—(Optional) Disable remote tracing

## CHAPTER 241

# Operational Command (Port Mirroring)

- `show analyzer`

## show analyzer

|                                 |                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <b>show analyzer</b> < <i>analyzer-name</i> >                                                                                                                                  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                |
| <b>Description</b>              | Display information about port mirroring.                                                                                                                                      |
| <b>Options</b>                  | <i>analyzer-name</i> —(Optional) Displays the status of a specific analyzer (port-mirroring configuration).                                                                    |
| <b>Required Privilege Level</b> | view                                                                                                                                                                           |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li><i>Understanding Layer 2 Port Mirroring</i></li> <li><a href="#">Port Mirroring Constraints and Limitations on page 6230</a></li> </ul> |
| <b>List of Sample Output</b>    | <a href="#">show analyzer on page 6320</a>                                                                                                                                     |
| <b>Output Fields</b>            | <a href="#">Table 500</a> describes the output fields for the <b>show analyzer</b> command. Output fields are listed in the approximate order in which they appear.            |

**Table 500: show analyzer Output Fields**

| Field Name                   | Field Description                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Analyzer name                | Name of the analyzer.                                                                                                             |
| Output interface             | Local interface to which mirror packets are sent. If you configure an output interface, you cannot also configure an output VLAN. |
| Output VLAN                  | VLAN to which mirror packets are sent. If you configure an output VLAN, you cannot also configure an output interface.            |
| Egress monitored interfaces  | Interfaces for which egress traffic is mirrored.                                                                                  |
| Egress monitored VLANs       | VLANs for which egress traffic is mirrored.                                                                                       |
| Ingress monitored interfaces | Interfaces for which ingress traffic is mirrored.                                                                                 |
| Ingress monitored VLANs      | VLANs for which ingress traffic is mirrored.                                                                                      |

## Sample Output

### show analyzer

```

user@switch> show analyzer
Analyzer name : employee-monitor
Output interface : ge-0/0/10.0
Output VLAN : remote-analyzer
Egress monitored interfaces : ge-0/0/7.0

```

```
Ingress monitored interfaces : ge-0/0/8.0
Ingress monitored interfaces : ge-0/0/9.0
```

## CHAPTER 242

# Operational Commands (DHCP Local Server)

- clear dhcp server binding
- clear dhcp server statistics
- clear dhcpv6 server binding

## clear dhcp server binding

**Syntax**    `clear dhcp server binding`  
               `<address>`  
               `<all>`  
               `<interface interface-name>`  
               `<interfaces-vlan>`  
               `<interfaces-wildcard>`  
               `<logical-system logical-system-name>`  
               `<routing-instance routing-instance-name>`

**Release Information**    Command introduced in Junos OS Release 9.0.  
                               Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description**    Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options**    ***address***—(Optional) Clear the binding state for the DHCP client, using one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

***all***—(Optional) Clear the binding state for all DHCP clients.

***interface interface-name***—(Optional) Clear the binding state for DHCP clients on the specified interface.

**NOTE:** This option clears all bindings whose initial login requests were received over the specified interface. Dynamic demux login requests are not received over the dynamic demux interface, but rather the underlying interface of the dynamic demux interface. To clear a specific dynamic demux interface, use the *ip-address* or *mac-address* options.

***interfaces-vlan***—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

***interfaces-wildcard***—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (\*).

**logical-system *logical-system-name***—(Optional) Clear the binding state for DHCP clients on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

## Sample Output

### clear dhcp server binding <ip-address>

The following sample output displays the address bindings in the DHCP client table on the extended DHCP local server before and after the **clear dhcp server binding** command is issued.

```
user@host> show dhcp server binding
```

```
2 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

| IP address  | Hardware address  | Type   | Lease expires at        |
|-------------|-------------------|--------|-------------------------|
| 100.20.32.1 | 90:00:00:01:00:01 | active | 2007-01-17 11:38:47 PST |
| 100.20.32.3 | 90:00:00:02:00:01 | active | 2007-01-17 11:38:41 PST |

```
user@host> clear dhcp server binding 10.20.32.1
```

```
user@host> show dhcp server binding
```

```
1 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

| IP address  | Hardware address  | Type   | Lease expires at        |
|-------------|-------------------|--------|-------------------------|
| 100.20.32.3 | 90:00:00:02:00:01 | active | 2007-01-17 11:38:41 PST |

### clear dhcp server binding all

The following command clears all DHCP local server bindings:

```
user@host> clear dhcp server binding all
```

### clear dhcp server binding interface

The following command clears DHCP local server bindings on a specific interface:

```
user@host> clear dhcp server binding interface fe-0/0/2
```

### clear dhcp server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP local server bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp server binding ae0
```

### clear dhcp server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP local server bindings over a specific interface:

```
user@host> clear dhcp server binding ge-1/0/0.*
```

[clear dhcpv6 server binding interface on page 6330](#)  
[clear dhcpv6 server binding <interfaces-vlan> on page 6330](#)  
[clear dhcpv6 server binding <interfaces-wildcard> on page 6330](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear dhcpv6 server binding all

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

### clear dhcpv6 server binding <ipv6-prefix>

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

### clear dhcpv6 server binding interface

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

### clear dhcpv6 server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 local server bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 server binding interface ae0
```

### clear dhcpv6 server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```

## clear dhcpv6 server statistics

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.0.<br>Command introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the <b>clear dhcp server binding</b> command.</p> <p>When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the forcerenew message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the <b>clear-on-abort</b> statement to configure the client to be cleared when reconfiguration fails.</p>                                                                                                                                                    |
| <b>Options</b>                  | <p><b>all</b>—Initiate reconfiguration for all DHCP clients.</p> <p><b>address</b>—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.</p> <p><b>interface <i>interface-name</i></b>—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>NOTE:</b> You cannot use the <b>interface <i>interface-name</i></b> option with the <b>request dhcp server reconfigure</b> command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.</p> </div> <p><b>logical-system <i>logical-system-name</i></b>—Initiate reconfiguration for all DHCP clients on the specified logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.</p> |

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.4.<br>Command introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Initiate reconfiguration processing for the specified DHCPv6 clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the <b>clear dhcpv6 server binding</b> command.</p> <p>When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfigure state and the local server sends a reconfigure message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the reconfigure message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the <b>clear-on-abort</b> statement to configure the client to be cleared when reconfiguration fails.</p> |
| <b>Options</b>                  | <p><b>all</b>—Initiate reconfiguration for all DHCPv6 clients.</p> <p><b>address</b>—Initiate reconfiguration for DHCPv6 client with the specified IPv6 address.</p> <p><b>client-id</b>—Initiate reconfiguration for DHCPv6 client with the specified client ID.</p> <p><b>interface</b> <i>interface-name</i>—Initiate reconfiguration for all DHCPv6 clients on this logical interface (clients whose initial login requests were received over the specified interface).</p> <p><b>logical-system</b> <i>logical-system-name</i>—Initiate reconfiguration for all DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance</b> <i>routing-instance-name</i>—Initiate reconfiguration reconfigured for all DHCPv6 clients in the specified routing instance.</p> <p><b>session-id</b>—Initiate reconfiguration for DHCPv6 client with the specified session ID.</p>                                                                                                                                                                                         |

| <b>Description</b>         | Reboot the software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>none</b>—Reboot the software immediately.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.</p> <p><b>at <i>time</i></b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li> <li>• <b>+<i>minutes</i></b>—Number of minutes from now to reboot the software.</li> <li>• <b><i>yymmddhhmm</i></b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.</li> <li>• <b><i>hh:mm</i></b>—Absolute time on the current day at which to stop the software, specified in 24-hour time.</li> </ul> <p><b>both-routing-engines</b>—(Optional) Reboot both Routing Engines at the same time.</p> <p><b>in <i>minutes</i></b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +<i>minutes</i></b> option.</p> <p><b>lcc <i>number</i></b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> </ul> |

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

**media (compact-flash | disk)**—(Optional) Boot medium for next boot.

**media (external | internal)**—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition**—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace ***number*** with 0.

**slice *slice***—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.

- **alternate**—Reboot from the alternate partition.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc number**, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**List of Sample Output**

[request system reboot on page 6340](#)  
[request system reboot \(at 2300\) on page 6340](#)  
[request system reboot \(in 2 Hours\) on page 6340](#)  
[request system reboot \(Immediately\) on page 6340](#)  
[request system reboot \(at 1:20 AM\) on page 6340](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## show dhcp server binding

**Syntax** `show dhcp server binding`  
`<address>`  
`<interfaces-vlan><brief | detail | summary>`  
`<interface interface-name>`  
`<interfaces-vlan>`  
`<interfaces-wildcard>`  
`<logical-system logical-system-name>`  
`<routing-instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 9.0.  
Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description** Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol (DHCP) local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options** *address*—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

*brief | detail | summary*—(Optional) Display the specified level of output about active client bindings. The default is **brief**, which produces the same output as `show dhcp server binding`.

*interface interface-name*—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

*interfaces-vlan*—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

*interfaces-wildcard*—(Optional) The set of interfaces on which to show the binding state information. This option supports the use of the wildcard character (\*).

*logical-system logical-system-name*—(Optional) Display information about active client bindings for DHCP clients on the specified logical system.

*routing-instance routing-instance-name*—(Optional) Display information about active client bindings for DHCP clients on the specified routing instance.

| Liveness Detection State     | <p>State of the liveness detection status for a subscriber's Bidirectional Forwarding Detection (BFD) protocol session:</p> <p><b>NOTE:</b> This output field displays status only when liveness detection has been explicitly configured for a subscriber and the liveness detection protocol is actively functioning for that subscriber.</p> <ul style="list-style-type: none"> <li><b>DOWN</b>—Liveness detection has been enabled for a subscriber but the broadband network gateway (BNG) detects that the liveness detection session for the BFD protocol is in the <b>DOWN</b> state.<br/>A liveness detection session that was previously in an <b>UP</b> state has transitioned to a <b>DOWN</b> state, beginning with a liveness detection failure, and ending with the deletion of the client binding. The <b>DOWN</b> state is reported only during this transition period of time.</li> <li><b>UNKNOWN</b>—Liveness detection has been enabled for a subscriber but the actual liveness detection state has not yet been determined.<br/>The <b>UNKNOWN</b> state is reported after a DHCP subscriber initially logs in while the underlying liveness detection protocol handshake, such as BFD, is still processing and the BFD session has not yet reached the <b>UP</b> state.</li> <li><b>UP</b>—Liveness detection has been enabled for a subscriber, and the BNG and the subscriber or client have <i>both</i> determined that the liveness detection session for the BFD protocol is in the <b>UP</b> state.</li> <li><b>WENT_DOWN</b>—State is functionally equivalent to the <b>DOWN</b> state. A liveness detection session that was previously in an <b>UP</b> state has transitioned to a <b>DOWN</b> state implying a liveness detection failure.<br/>The <b>WENT_DOWN</b> state applies to the internal distribution of the liveness detection mechanism between the Junos DHCP Daemon for Subscriber Services (JDHCPd), the BFD plug-in within the Broadband Edge Subscriber Management Daemon (BBE-SMGD), and the Packet Forwarding Engine.</li> </ul> | detail          |
| ACI Interface Set Name       | Internally generated name of the dynamic agent circuit identifier (ACI) interface set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | detail          |

| Release Information      | Command introduced in Junos OS Release 9.6.<br>Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description              | Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                  | <p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"><li>• <i>CID</i>—The specified Client ID (CID).</li><li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li><li>• <i>session-id</i>—The specified session ID.</li></ul> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output about active client bindings. The default is <b>brief</b>, which produces the same output as <b>show dhcpv6 server binding</b>.</p> <p><b>interface interface-name</b>—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system logical-system-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.</p> |

## Sample Output

### clear dhcp relay binding

The following sample output displays the address bindings in the DHCP client table before and after the **clear dhcp relay binding** command is issued.

```
user@host> show dhcp relay binding
IP address Hardware address Type Lease expires at
100.20.32.1 90:00:00:01:00:01 active 2007-02-08 16:41:17 EST
192.168.14.8 90:00:01:01:02:01 active 2007-02-10 10:01:06 EST
```

```
user@host> clear dhcp relay binding 100.20.32.1
```

```
user@host> show dhcp relay binding
IP address Hardware address Type Lease expires at
192.168.14.8 90:00:01:01:02:01 active 2007-02-10 10:01:06 EST
```

### clear dhcp relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcp relay binding all
```

### clear dhcp relay binding interface

The following command clears DHCP relay agent bindings on a specific interface:

```
user@host> clear dhcp relay binding interface fe-0/0/3
```

### clear dhcp relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP relay agent bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp relay binding interface ae0
```

### clear dhcp relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP relay agent bindings over a specific interface:

```
user@host> clear dhcp relay binding ge-1/0/0.*
```

## clear dhcp relay statistics

## Sample Output

### clear dhcp relay statistics

The following sample output displays the DHCP relay statistics before and after the **clear dhcp relay statistics** command is issued.

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
 Total 1
 Lease Time Violated 1

Messages received:
 BOOTREQUEST 116
 DHCPDECLINE 0
 DHCPDISCOVER 11
 DHCPINFORM 0
 DHCPRELEASE 0
 DHCPREQUEST 105

Messages sent:
 BOOTREPLY 44
 DHCPOFFER 11
 DHCPACK 11
 DHCPNAK 11
```

```
user@host> clear dhcp relay statistics
```

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
 Total 0

Messages received:
 BOOTREQUEST 0
 DHCPDECLINE 0
 DHCPDISCOVER 0
 DHCPINFORM 0
 DHCPRELEASE 0
 DHCPREQUEST 0

Messages sent:
 BOOTREPLY 0
 DHCPOFFER 0
 DHCPACK 0
 DHCPNAK 0
```

## clear dhcpv6 relay binding

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Sample Output

### clear dhcpv6 relay binding

The following sample output displays the DHCPv6 bindings before and after the **clear dhcpv6 relay binding** command is issued.

```
user@host> show dhcpv6 relay binding
```

### clear dhcpv6 relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcpv6 relay binding all
```

### clear dhcv6p relay binding interface

The following command clears DHCPv6 relay agent bindings on a specific interface:

```
user@host> clear dhcpv6 relay binding interface fe-0/0/2
```

#### clear dhcpv6 relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 relay agent bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 relay binding interface ae0
```

#### clear dhcpv6 relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 relay agent bindings over a specific interface:

```
user@host> clear dhcpv6 relay binding ge-1/0/0.*
```

## clear dhcpv6 relay statistics

## Sample Output

### clear dhcpv6 relay statistics

The following sample output displays the DHCPv6 relay statistics before and after the **clear dhcpv6 relay statistics** command is issued.

```
user@host> show dhcpv6 relay statistics
DHCPv6 Packets dropped:
 Total 0
 Lease Time Violated 1

Messages received:
 DHCPV6_DECLINE 0
 DHCPV6_SOLICIT 10
 DHCPV6_INFORMATION_REQUEST 0
 DHCPV6_RELEASE 0
 DHCPV6_REQUEST 10
 DHCPV6_CONFIRM 0
 DHCPV6_RENEW 0
 DHCPV6_REBIND 0
 DHCPV6_RELAY_REPL 0

Messages sent:
 DHCPV6_ADVERTISE 0
 DHCPV6_REPLY 0
 DHCPV6_RECONFIGURE 0
 DHCPV6_RELAY_FORW 0
```

```
user@host> clear dhcpv6 relay statistics
```

```
user@host> show dhcpv6 relay statistics
```

```
DHCPv6 Packets dropped:
```

```
 Total 0
```

```
Messages received:
```

```

## show dhcp relay binding

---

**Syntax**    **show dhcp relay binding**  
              <address>  
              <brief>  
              <detail>  
              <interface *interface-name*>  
              <interfaces-vlan>  
              <interfaces-wildcard>  
              <ip-address | mac-address>  
              <logical-system *logical-system-name*>  
              <routing-instance *routing-instance-name*>  
              <summary>

**Release Information**    Command introduced in Junos OS Release 8.3.  
                              Options **interface** and **mac-address** added in Junos OS Release 8.4.  
                              Options **interfaces-vlan** and **interfaces-wildcard** added in Junos OS Release 12.1.  
                              Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

**Description**    Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

**Options**    **address**—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**brief**—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as **show dhcp relay binding**.

**detail**—(Optional) Display detailed client binding information.

**interface *interface-name***—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

**interfaces-vlan**—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) The set of interfaces on which to show binding state information. This option supports the use of the wildcard character (\*).

**logical-system *logical-system-name***—(Optional) Perform this operation on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Perform this operation on the specified routing instance.

**summary**—(Optional) Display a summary of DHCP client information.

| Release Information      | Command introduced in Junos OS Release 11.4.<br><i>interfaces-vlan</i> and <i>interfaces-wildcard</i> options introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Display the DHCPv6 address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options                  | <p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"><li>• <i>CID</i>—The specified Client ID (CID).</li><li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li><li>• <i>session-id</i>—The specified session ID.</li></ul> <p><b>brief</b>—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as <b>show dhcpv6 relay binding</b>.</p> <p><b>detail</b>—(Optional) Display detailed client binding information.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and S-VLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on the specified logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Perform this operation on the specified routing instance.</p> <p><b>summary</b>—(Optional) Display a summary of DHCPv6 client information.</p> |
| Required Privilege Level | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
