| <b>Hierarchy Level</b>                                           | [edit <a href="#">class-of-service schedulers scheduler-name</a> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Release Information</b>                                       | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.<br>Exact option introduced in Junos OS Release 15.1X53-D10 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>                                               | <p>On QFX5100, EX4600, QFX3500, and QFX3600 switches, and on QFabric systems, the transmit rate specifies the minimum guaranteed transmission rate or percentage for a queue (forwarding class) scheduler. The queue transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share on switches that support enhanced transmission selection (ETS) hierarchical scheduling.</p> <p>On QFX10000 switches, the transmit rate specifies the minimum guaranteed transmission rate or percentage for a queue (forwarding class) scheduler. The queue transmit rate also determines the amount of excess (extra) port bandwidth the queue can share if you do not explicitly configure an excess rate in the scheduler. The transmit rate also determines the amount of excess (extra) priority group bandwidth that the queue can share on switches that support enhanced transmission selection (ETS) hierarchical scheduling.</p> <p>On QFX10000 switch strict-high priority queues, the transmit rate limits the amount of traffic the switch treats as strict-high priority traffic. Traffic up to the transmit rate receives strict-high priority treatment. The switch treats traffic that exceeds the transmit rate as best-effort traffic that receives an excess bandwidth sharing weight of “1”; you cannot configure an excess rate on a strict-high priority queue, and unlike queues with other scheduling priorities, the switch does not use the transmit rate to determine extra bandwidth sharing for strict-high priority queues.</p> |

**CAUTION:** We strongly recommend that you configure a transmit rate on strict-high priority queues to limit the amount of traffic the switch treats as strict-high priority traffic on those queues. This is especially important if you configure more than one strict-high priority queue on a port. To prevent a strict-high priority queue from starving the other queues on a port, we recommend that you always configure a transmit rate, even if you only configure one strict-high priority queue.

NOTE: For ETS, the transmit-rate setting works only if you also configure the **guaranteed-rate** in the traffic control profile that is attached to the forwarding class set to which the queue belongs. If you do not configure the guaranteed rate, the minimum guaranteed rate for individual queues that you set using the transmit-rate statement does not work. The sum of all queue transmit rates in a forwarding class set should not exceed the traffic control profile guaranteed rate.

NOTE: On QFX5100, EX4600, QFX3500, and QFX3600 switches, and on QFabric systems, you cannot configure a transmit rate for a strict-high priority queue. Queues (forwarding classes) with a configured transmit rate cannot be included in a forwarding class set that has a strict-high priority queue. To prevent strict-high priority queues from consuming all of the available bandwidth on these switches, we recommend that you configure a shaping rate to set a maximum amount of bandwidth for strict-high priority queues.

NOTE: For transmit rates below 1 Gbps, we recommend that you configure the transmit rate as a percentage instead of as a fixed rate. This is because the system converts fixed rates into percentages and may round small fixed rates to a lower percentage. For example, a fixed rate of 350 Mbps is rounded down to 3 percent instead of 3.5 percent.

**Default** On QFX5100, EX4600, QFX3500, and QFX3600 switches, and on QFabric systems, if you do not configure the transmit rate, the default scheduler transmission rate and buffer size percentages for queues 0 through 11 are:

**Table 605: Default Transmit Rates for QFX5100, EX4600, QFX3500, and QFX3600 Switches, and QFabric Systems**

| Queue Number        | Default Minimum Guaranteed Bandwidth (Transmit Rate) |
|---------------------|------------------------------------------------------|
| 0 (best-effort)     | 5 %                                                  |
| 1                   | 0                                                    |
| 2                   | 0                                                    |
| 3 (fcoe)            | 35 %                                                 |
| 4 (no-loss)         | 35 %                                                 |
| 5                   | 0                                                    |
| 6                   | 0                                                    |
| 7 (network control) | 5 %                                                  |
| 8 (mcast)           | 20 %                                                 |
| 9                   | 0                                                    |
| 10                  | 0                                                    |
| 11                  | 0                                                    |

**NOTE:** OCX Series switches do not support lossless transport. The OCX Series default DSCP classifier does not classify traffic into the default lossless fcoe and no-loss forwarding classes. The bandwidth that the default scheduler allocates to the default fcoe and no-loss forwarding classes on other switches is allocated to the default best-effort, network-control, and mcast forwarding classes on OCX Series switches.

On QFX10000 switches, if you do not configure the transmit rate, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are:

Table 606: Default Transmit Rates for QFX10000 Switches

| Queue Number        | Default Minimum Guaranteed Bandwidth (Transmit Rate) |
|---------------------|------------------------------------------------------|
| 0 (best-effort)     | 15 %                                                 |
| 1                   | 0                                                    |
| 2                   | 0                                                    |
| 3 (fcoe)            | 35 %                                                 |
| 4 (no-loss)         | 35 %                                                 |
| 5                   | 0                                                    |
| 6                   | 0                                                    |
| 7 (network control) | 15 %                                                 |

Configure schedulers if you want to change the minimum guaranteed bandwidth and other queue characteristics.

**Options** **rate**—Minimum transmission rate for the queue, in bps. You can specify a value in bits-per-second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

**Range:** 1000 through 10,000,000,000 bps on 10-Gigabit interfaces, 1000 through 40,000,000,000 bps on 40-Gigabit interfaces.

**percent** **percentage**—Minimum percentage of transmission capacity allocated to the queue. A percentage of zero means that there is no minimum bandwidth guarantee for the queue.

**Range:** 0 through 100 percent

**exact**—(QFX10000 switches only) Shape queues that are not strict-high priority queues to the transmit rate so that the transmit rate is the maximum bandwidth limit. Traffic that exceeds the exact transmit rate is dropped. You cannot set an excess rate on queues configured as **transmit-rate (rate | percentage) exact** because the purpose of setting an exact transmit rate is to set a maximum bandwidth (shaping rate) on the traffic.

**Required Privilege Level** interfaces—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Specify the IEEE 802.1p code point bits that identify the traffic you want to enable for priority-based flow control (PFC) pause.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>                  | <p>By default, IEEE 802.1p priorities 3 and 4 (code points 011 and 100, respectively) are enabled for PFC pause on all Ethernet interfaces. If you explicitly configure priorities to pause and the output queues on which to enable pause, the explicit configuration overrides the default configuration. When you apply an explicit output congestion notification profile to an interface, only the priorities and queues specified in the output congestion notification profile are enabled for pause on that interface.</p> <p>For example, if you configure an output congestion notification profile that specifies priority 2 (code point 010), then traffic with IEEE 802.1p priority 2 is paused on the configured output queue during periods of congestion. However, traffic with priority 3 and priority 4 is not programmed to pause, because the explicit configuration overwrites the default configuration, and the explicit configuration does not pause priority 3 and priority 4. If you configure an explicit output congestion notification profile, all of the priorities you want to enable for PFC and all of the output queues you want to pause must be explicitly configured.</p> |
| <b>Options</b>                  | <p><i>code-point-bits</i>—3-bit value in decimal form.</p> <p>The remaining statements are described separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>                                   | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>                                           | Configure a congestion notification profile to enable priority-based flow control (PFC) on traffic specified by an IEEE 802.1 code point, and apply the profile to an interface.                                                                                                                                                                                                                                               |

**NOTE:** You must configure PFC for FCoE traffic. Each interface that carries FCoE traffic should be configured for PFC on the FCoE code point (usually 011).

You can attach a maximum of one congestion notification profile to an interface. There is no limit to the total number of congestion notification profiles you can create.

**NOTE:** Configuring or changing PFC on an interface blocks the entire port until the PFC change is completed. After a PFC change is completed, the port is unblocked and traffic resumes. Blocking the port stops ingress and egress traffic, and causes packet loss on all queues on the port until the port is unblocked.

**Options**    *profile-name*—Name of the congestion notification profile.

The remaining statements are explained separately.

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.</p> <p>You can configure asymmetric flow control by including the <b>configured-flow-control</b> statement at the [edit <a href="#">interfaces</a> <i>interface-name</i> <a href="#">ether-options</a> hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> <div><div></div><div><p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p><p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p><p>OCX Series switches do not support PFC.</p></div></div> <div><ul style="list-style-type: none"><li>• <b>flow-control</b>—Enable flow control; flow control is useful when the remote device is a Gigabit Ethernet switch.</li><li>• <b>no-flow-control</b>—Disable flow control.</li></ul></div> |
| <b>Default</b>                  | Flow control is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Specify one or more output queues to pause, to support priority-based flow control (PFC). The specified queues pause when the interface receives a PFC frame with a matching IEEE 802.1p code point.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | <p>Queue 3 (mapped to the fcoe forwarding class) and queue 4 (mapped to the no-loss forwarding class) are programmed as flow control queues to pause. No other output queues are programmed to pause by default.</p> <p>If you configure flow control queues explicitly, only the queues that you specify are programmed to pause. The explicit flow control queue to pause configuration overrides the default setting, so the queues paused in the default configuration are no longer paused by default.</p> <p>For example, if you configure queue 2 as a flow control queue, then queue 2 pauses when congestion occurs, but queues 3 and 4 do not pause because they were not explicitly specified. To enable pause on output queues 2, 3, and 4, you must explicitly configure all three of the queues as flow control queues.</p> <p>The same behavior applies to the IEEE 802.1p code points (priorities) on which PFC is enabled. By default, priorities 3 (011) and 4 (100) are enabled for PFC pause. If you explicitly configure flow control queues to pause, you must also explicitly configure pause for each priority (code point) that you want to pause, because the explicit configuration overrides the default configuration.</p> |
| <b>Options</b>                  | <code>[ <i>queue</i>   <i>list-of-queues</i> ]</code> —The output queue or a list of output queues to pause.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## interfaces (Class of Service)

```
Syntax interfaces {
 interface-name {
 congestion-notification-profile profile-name {
 }
 forwarding-class forwarding-class-name;
 forwarding-class-set forwarding-class-set-name {
 output-traffic-control-profile profile-name;
 }
 rewrite-value {
 input {
 ieee-802.1{
 code-point code-point-bits;
 }
 }
 }
 scheduler-map scheduler-map-name
 unit logical-unit-number {
 classifiers {
 (dscp | dscp-ipv6 | ieee-802.1 | exp) (classifier-name | default);
 }
 forwarding-class class-name;
 rewrite-rules {
 (dscp | dscp-ipv6 | ieee-802.1 | exp) (classifier-name | default);
 }
 }
 }
}
```

**Hierarchy Level** [edit [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series

**Description** Configure interface-specific CoS properties for incoming packets.

**NOTE:** Only switches that support direct port scheduling also support applying a scheduler map directly to an interface. When using enhanced transmission selection (ETS) hierarchical port scheduling, you cannot apply a scheduler map directly to an interface; instead, you associate the scheduler map with a traffic control profile and apply the traffic control profile to the interface.

**NOTE:** Only switches that support native Fibre Channel interfaces support the rewrite-value statement, which enables you to rewrite the IEEE 802.1p code points on native Fibre Channel interfaces.

**NOTE:** OCX Series switches do not support MPLS, so they do not support EXP classifiers or rewrite rules. OCX Series switches do not support the congestion-notification-profile configuration statement, which applies priority-based flow control (PFC) to interface output queues.

**Options**    *interface-name*—Name of the interface.

The statements are explained separately.

**Required Privilege Level**    interfaces—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the maximum receive unit (MRU) of the interface in bytes (incoming packet sizes must be less than or equal to the MRU, or the packets are dropped). The system uses the MRU and the cable length to calculate the amount of buffer headroom reserved to support priority-based flow control (PFC). The lower the MRU and the shorter the cable length, the less headroom buffer space is required for PFC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                 | <div>  <p><b>NOTE:</b> You can also set a maximum transmission unit (MTU) value (the largest packet size the interface sends) for interfaces by including the <code>mtu</code> statement at the [edit <a href="#">interfaces interface-name</a>] hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Syntax**    `policy-options`  
             `application-maps` *application-map-name* {  
               `application` *application-name* {  
                 `code-points` [ *aliases* ] [ *bit-patterns* ];  
               }  
             }  
             `policy-statement` *policy-name* {  
               `term` *term-name* {  
                 `from` {  
                   *family* *family-name*;  
                   *match-conditions*;  
                   *policy* *subroutine-policy-name*;  
                   *prefix-list* *prefix-list-name*;  
                   *prefix-list-filter* *prefix-list-name* *match-type* <*actions*>;  
                   *route-filter* *destination-prefix* *match-type* <*actions*>;  
                   *source-address-filter* *source-prefix* *match-type* <*actions*>;  
                 }  
                 `to` {  
                   *match-conditions*;  
                   *policy* *subroutine-policy-name*;  
                 }  
                 `then` *actions*;  
               }  
             }

**Hierarchy Level**    [edit]

**Release Information**    Statement introduced in Junos OS Release 12.1 for the QFX Series.  
                             Statement introduced in Junos OS Release 12.1 for the EX Series.  
                             Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level**    `storage`—To view this statement in the configuration.  
                                     `storage-control`—To add this statement to the configuration.

| <b>Description</b>              | Disable autonegotiation of priority-based flow control (PFC) on one or more Ethernet interfaces. Autonegotiation enables PFC on an interface only if the switch and the peer device connected to the switch both support PFC and have the same PFC configuration. Disabling autonegotiation on an interface forces the interface to use the PFC state (enabled or disabled) that is configured on the switch by the configuration and assignment of the congestion notification profile.                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <b>no-auto-negotiation</b> —Disable automatic negotiation of PFC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Enable DCBX to send the ETS Recommendation TLV (also known as the Information TLV) on egress. This feature is valid only if the interface DCBX mode is IEEE DCBX. If the interface DCBX mode is DCBX version 1.01, this statement has no effect. (DCBX version 1.01 does not advertise separate TLVs for individual attributes.) |
| <b>Default</b>                  | DCBX-enabled interfaces send the ETS recommendation TLV unless it is disabled.                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <b>no-auto-negotiation</b> —Disable sending of the ETS recommendation TLV.                                                                                                                                                                                                                                                       |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Enable or disable an interface to generate and send Ethernet PAUSE messages. If you enable the receive buffers to generate and send PAUSE messages, when the receive buffers reach a certain level of fullness, the interface sends a PAUSE message to the connected peer. If the connected peer is properly configured, it stops transmitting frames to the interface on the entire link. When the interface receive buffer empties below a certain threshold, the interface sends a message to the connected peer to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>rx-buffers</b> statement with the <b>tx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> |
| <div>  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Enable or disable an interface to respond to received Ethernet PAUSE messages. If you enable the transmit buffers to respond to PAUSE messages, when the interface receives a PAUSE message from the connected peer, the interface stops transmitting frames on the entire link. When the receive buffer on the connected peer empties below a certain threshold, the peer interface sends a message to the paused interface to resume sending frames.</p> <p>Ethernet PAUSE prevents buffers from overflowing and dropping packets during periods of network congestion. If the other devices in the network are also configured to support PAUSE, PAUSE supports lossless operation. Use the <b>tx-buffers</b> statement with the <b>rx-buffers</b> statement to configure asymmetric Ethernet PAUSE on an interface. (Use the <b>flow-control</b> statement to enable symmetric PAUSE and the <b>no-flow-control</b> statement to disable symmetric PAUSE on an interface. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.)</p> |
|                                 | <p> <b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | Flow control is disabled. You must explicitly configure Ethernet PAUSE flow control on interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | on   off—Enable or disable an interface to respond to an Ethernet PAUSE message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Monitoring Interfaces That Have CoS Components

**Purpose** Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

**Action** To monitor interfaces that have CoS components in the CLI, enter the command:

```
user@switch> show class-of-service interface
```

To monitor a specific interface in the CLI, enter the command:

```
user@switch> show class-of-service interface interface-name
```

**Meaning** [Table 607](#) summarizes key output fields for CoS interfaces.

**Table 607: Summary of Key CoS Interfaces Output Fields**

| Field              | Values                                                              |
|--------------------|---------------------------------------------------------------------|
| Physical interface | Name of a physical interface to which CoS components are assigned.  |
| Index              | Index of this interface or the internal index of a specific object. |
| Queues supported   | Number of queues you can configure on the interface.                |

Table 607: Summary of Key CoS Interfaces Output Fields (*continued*)

| Field                         | Values                                                                                                                                                                                                                                        |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queues in use                 | Number of queues currently configured.                                                                                                                                                                                                        |
| Scheduler map                 | Name of the scheduler map associated with this interface.                                                                                                                                                                                     |
| Congestion-notification       | Status of congestion notification (enabled or disabled).<br><br><b>NOTE:</b> OCX Series switches do not support congestion notification profiles.                                                                                             |
| Rewrite Input IEEE Code-point | (Fibre Channel NP_Port interfaces only) IEEE 802.1p code point (priority) the interface assigns to incoming Fibre Channel (FC) traffic when the interface encapsulates the FC traffic in Ethernet before forwarding it onto the FCoE network. |
| Logical Interface             | Name of a logical interface on the physical interface to which CoS components are assigned.                                                                                                                                                   |
| Object                        | Category of an object—for example, <b>classifier</b> , <b>scheduler-map</b> , or <b>rewrite</b> .                                                                                                                                             |
| Name                          | Name of the object—for example, <b>ba-classifier</b> .                                                                                                                                                                                        |
| Type                          | Type of the object—for example, <b>ieee8021p</b> for a classifier.                                                                                                                                                                            |

| <b>Output Fields</b>            | <a href="#">Table 608</a> lists the output fields for the <b>show class-of-service</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                 |

**Table 608: show class-of-service Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                            | Level of Output |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Forwarding class</b> | The forwarding class configuration: <ul style="list-style-type: none"> <li>• <b>Forwarding class</b>—Name of the forwarding class.</li> <li>• <b>ID</b>—Forwarding class ID.</li> <li>• <b>Queue</b>—Queue number.</li> </ul>                                | All levels      |
| <b>Code point type</b>  | The type of code-point alias: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Aliases for DiffServ code point (DSCP) values.</li> <li>• <b>ieee-802.1</b>—Aliases for IEEE 802.1p values.</li> <li>• <b>exp</b>—Aliases for MPLS EXP values.</li> </ul> | All levels      |
| <b>Alias</b>            | Names given to CoS values.                                                                                                                                                                                                                                   | All levels      |
| <b>Bit pattern</b>      | Set of bits associated with an alias.                                                                                                                                                                                                                        | All levels      |
| <b>Classifier</b>       | Name of the classifier.                                                                                                                                                                                                                                      | All levels      |
| <b>Code point</b>       | Code-point values.                                                                                                                                                                                                                                           | All levels      |
| <b>Loss priority</b>    | Loss priority assigned to specific CoS values and aliases of the classifier.                                                                                                                                                                                 | All levels      |

Table 608: show class-of-service Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                              | Level of Output |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Rewrite rule</b>            | Name of the rewrite rule if one has been configured.                                                                                                                                                                                           | All levels      |
| <b>Drop profile</b>            | Name of the drop profile.                                                                                                                                                                                                                      | All levels      |
| <b>Type</b>                    | Type of drop profile. QFX Series supports only the <b>discrete</b> type of drop-profile.                                                                                                                                                       | All levels      |
| <b>Fill level</b>              | Percentage of queue buffer fullness in a drop profile at which packets begin to drop during periods of congestion.                                                                                                                             | All levels      |
| <b>Scheduler map</b>           | Name of the scheduler map.                                                                                                                                                                                                                     | All levels      |
| <b>Scheduler</b>               | Name of the scheduler.                                                                                                                                                                                                                         | All levels      |
| <b>Transmit rate</b>           | Transmission rate of the scheduler.                                                                                                                                                                                                            | All levels      |
| <b>Buffer size</b>             | Delay buffer size in the queue.                                                                                                                                                                                                                | All levels      |
| <b>Drop profiles</b>           | Drop profiles configured for the specified scheduler.                                                                                                                                                                                          | All levels      |
| <b>Protocol</b>                | Transport protocol corresponding to the drop profile.                                                                                                                                                                                          | All levels      |
| <b>Name</b>                    | Name of the drop profile.                                                                                                                                                                                                                      | All levels      |
| <b>Queues supported</b>        | Number of queues that can be configured on the interface.                                                                                                                                                                                      | All levels      |
| <b>Queues in use</b>           | Number of queues currently configured.                                                                                                                                                                                                         | All levels      |
| <b>Physical interface</b>      | Name of the physical interface.                                                                                                                                                                                                                | All levels      |
| <b>Scheduler map</b>           | Name of the scheduler map.                                                                                                                                                                                                                     | All levels      |
| <b>Congestion-notification</b> | Enabled if a congestion notification profile is applied to the interface; disabled if no congestion notification profile is applied to the interface.<br><br><b>NOTE:</b> OCX Series switches do not support congestion notification profiles. | All levels      |
| <b>Forwarding class set</b>    | Name of the forwarding class set (priority group).<br><br><b>NOTE:</b> Only on systems that support enhanced transmission selection (ETS) hierarchical port scheduling.                                                                        |                 |
| <b>Index</b>                   | Internal index of an object.                                                                                                                                                                                                                   | All levels      |

## Sample Output

### show class-of- service

```
user@switch> show class-of-service
```

## show class-of-service interface

**Syntax** `show class-of-service interface`  
`<comprehensive | detail> <interface-name>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Forwarding class map information added in Junos OS Release 9.4.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.  
 Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
 Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.  
 Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description** Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

**NOTE:** On routing platforms with dual Routing Engines, running this command on the backup Routing Engine, with or without any of the available options, is not supported and produces the following error message:

**error: the class-of-service subsystem is not running**

**Options** **none**—Display CoS associations for all physical and logical interfaces.

**comprehensive**—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

**detail**—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface

- Information about filters or policers for the logical interface
- CoS information about the logical interface

**interface-name**—(Optional) Display class-of-service (CoS) associations for the specified interface.

**none**—Display CoS associations for all physical and logical interfaces.

**Required Privilege Level**

**Output Fields**

[Table 609](#) describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

**Table 609: show class-of-service interface Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                                          |                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| Physical interface | Name of a physical interface.                                                                                                                                                                                                                                                                              |                                                      |
| Index              | Index of this interface or the internal index of this object.<br><br>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles and dynamic scheduler maps are larger for enhanced subscriber management than they are for legacy subscriber management. |                                                      |
| Dedicated Queues   | Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                                     | Number of queues you can configure on the interface. |
| Queues supported   | Number of queues you can configure on the interface.                                                                                                                                                                                                                                                       |                                                      |
| Queues in use      | Number of queues currently configured.                                                                                                                                                                                                                                                                     |                                                      |

Table 609: show class-of-service interface Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total non-default queues created</b>    | Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.<br><br>(Enhanced subscriber management for MX Series routers) This field is not displayed for enhanced subscriber management.                                             |
| <b>Rewrite Input IEEE Code-point</b>       | (QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.         |
| <b>Shaping rate</b>                        | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.                    |
| <b>Scheduler map</b>                       | Name of the output scheduler map associated with this interface.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.          |
| <b>Scheduler map forwarding class sets</b> | (QFX Series only) Name of the output fabric scheduler map associated with a QFabric system Interconnect device interface.                                                                                                                                                                             |
| <b>Input shaping rate</b>                  | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                                      |
| <b>Input scheduler map</b>                 | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                                        |
| <b>Chassis scheduler map</b>               | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                                     |
| <b>Rewrite</b>                             | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                                    |
| <b>Traffic-control-profile</b>             | Name of the associated traffic control profile.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic traffic control profile object is associated with a generated UID (for example, <b>TC_PROF_100_199_SERIES_UID1006</b> ) instead of with a subscriber interface. |
| <b>Classifier</b>                          | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                                          |
| <b>Forwarding-class-map</b>                | Name of the forwarding map associated with this interface.                                                                                                                                                                                                                                            |
| <b>Congestion-notification</b>             | (QFX Series and EX4600 switches only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                              |
| <b>Logical interface</b>                   | Name of a logical interface.                                                                                                                                                                                                                                                                          |
| <b>Object</b>                              | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , <b>Translation Table</b> (for IQE PICs only), or <b>traffic-class-map</b> (for T4000 routers with Type 5 FPCs).                                                |
| <b>Name</b>                                | Name of an object.                                                                                                                                                                                                                                                                                    |

Table 609: show class-of-service interface Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Input Filter</b>            | Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Output Filter</b>           | Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Link flags</b>              | Provides information about the physical link and displays one or more of the following values: <ul style="list-style-type: none"> <li>• <b>ACFC</b>—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.</li> <li>• <b>Give-Up</b>—Link protocol does not continue connection attempts after repeated failures.</li> <li>• <b>Loose-LCP</b>—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-LMI</b>—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-NCP</b>—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.</li> <li>• <b>Keepalives</b>—Link protocol keepalives are enabled.</li> <li>• <b>No-Keepalives</b>—Link protocol keepalives are disabled.</li> <li>• <b>PFC</b>—Protocol field compression is configured. The PPP session negotiates the PFC option.</li> </ul> |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>CoS queues</b>              | Number of CoS queues configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Statistics last cleared</b> | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 609: show class-of-service interface Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input errors</b>  | <p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul> |
| <b>Output errors</b> | <p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                |
| <b>Egress queues</b> | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 609: show class-of-service interface Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue counters</b>                       | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                   |
| <b>SONET alarms</b><br><b>SONET defects</b> | <p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>SONET PHY</b>                            | <p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET PHY</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>PLL Lock</b>—Phase-locked loop</li> <li>• <b>PHY Light</b>—Loss of optical signal</li> </ul>                                                                                                                                                                                                                                                                                        |
| <b>SONET section</b>                        | <p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET section</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-BI</b>—Bit interleaved parity for SONET section overhead</li> <li>• <b>SEF</b>—Severely errored framing</li> <li>• <b>LOS</b>—Loss of signal</li> <li>• <b>LOF</b>—Loss of frame</li> <li>• <b>ES-S</b>—Errored seconds (section)</li> <li>• <b>SES-S</b>—Severely errored seconds (section)</li> <li>• <b>SEFS-S</b>—Severely errored framing seconds (section)</li> </ul> |

| Received SONET overhead                | <p>Values of the received and transmitted SONET overhead:</p> <ul style="list-style-type: none"> <li><b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li><b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li><b>K1 and K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li><b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-N signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li><b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-N signal.</li> <li><b>Z3 and Z4</b>—Allocated for future use.</li> </ul>                                                                                                                                                                                |
| Transmitted SONET overhead             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Received path trace                    | <p>SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Transmitted path trace                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Queued Bytes         | Number of bytes queued to this queue. The byte counts vary by PIC type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Transmitted Packets  | Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Transmitted Bytes    | Number of bytes transmitted by this queue. The byte counts vary by PIC type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Tail-dropped packets | Number of packets dropped because of tail drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| RED-dropped packets  | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>• (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li>• <b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li>• <b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li>• <b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li>• <b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>• (MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li>• <b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li>• <b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li>• <b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li>• <b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |

Table 609: show class-of-service interface Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Adjustment information</b> | <p>Display the assignment of shaping-rate adjustments on a scheduler node or queue.</p> <ul style="list-style-type: none"> <li>• <b>Adjusting application</b>—Application that is performing the shaping-rate adjustment. <ul style="list-style-type: none"> <li>• The adjusting application can appear as <b>ancp LS-0</b>, which is the Junos OS Access Node Control Profile process (<b>ancpd</b>) that performs shaping-rate adjustments on schedule nodes.</li> <li>• The adjusting application can also appear as <b>pppoe</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</li> </ul> </li> <li>• <b>Adjustment type</b>—Type of adjustment: <b>absolute</b> or <b>delta</b>.</li> <li>• <b>Configured shaping rate</b>—Shaping rate configured for the scheduler node or queue.</li> <li>• <b>Adjustment value</b>—Value of adjusted shaping rate.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment overhead-accounting mode</b>—Configured shaping mode: <b>frame</b> or <b>cell</b>.</li> <li>• <b>Adjustment overhead bytes</b>—Number of bytes that the ANCP agent adds to or subtracts from the actual downstream frame overhead before reporting the adjusted values to CoS.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment multicast index</b>—</li> </ul> |

## Sample Output

### show class-of-service interface (Physical)

```

user@host> show class-of-service interface so-0/2/3
Physical interface: so-0/2/3, Index: 135
Queues supported: 8, Queues in use: 4
Total non-default queues created: 4
Scheduler map: <default>, Index: 2032638653

Logical interface: fe-0/0/1.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000
Object Name Type Index
Scheduler-map <default> exp 27
Rewrite exp-default exp 21
Classifier exp-default exp 5

```

|                      |                      |     |   |
|----------------------|----------------------|-----|---|
| Classifier           | ipprec-compatibility | ip  | 8 |
| Forwarding-class-map | exp-default          | exp | 5 |

### show class-of-service interface (Logical)

```
user@host> show class-of-service interface so-0/2/3.0
Logical interface: so-0/2/3.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000
Object Name Type Index
Scheduler-map <default> 27
Rewrite exp-default exp 21
Classifier exp-default exp 5
Classifier ipprec-compatibility ip 8
Forwarding-class-map exp-default exp 5
```

### show class-of-service interface (Gigabit Ethernet)

```
user@host> show class-of-service interface ge-6/2/0
Physical interface: ge-6/2/0, Index: 175
Queues supported: 4, Queues in use: 4
Scheduler map: <default>, Index: 2
Input scheduler map: <default>, Index: 3
Chassis scheduler map: <default-chassis>, Index: 4
```

### show class-of-service interface (ANCP)

```
user@host> show class-of-service interface pp0.1073741842
Logical interface: pp0.1073741842, Index: 341
Object Name Type Index
Traffic-control-profile TCP-CVLAN Output 12408
Classifier dscp-ipv6-compatibility dscp-ipv6 9
Classifier ipprec-compatibility ip 13

Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 4000000
Adjustment value: 11228000
Adjustment overhead-accounting mode: Frame Mode
Adjustment overhead bytes: 50
Adjustment target: node
```

### show class-of-service interface (PPPoE Interface)

```
user@host> show class-of-service interface pp0.1
Logical interface: pp0.1, Index: 85
Object Name Type Index
Traffic-control-profile tcp-pppoe.o.pp0.1 Output 2726446535
Classifier ipprec-compatibility ip 13

Adjusting application: PPPoE
Adjustment type: absolute
Adjustment value: 5000000
Adjustment overhead-accounting mode: cell
Adjustment target: node
```

### show class-of-service interface (T4000 Routers with Type 5 FPCs)

```
user@host> show class-of-service interface xe-4/0/0
Physical interface: xe-4/0/0, Index: 153
Queues supported: 8, Queues in use: 4
Shaping rate: 5000000000 bps
Scheduler map: <default>, Index: 2
```

## show class-of-service shared-buffer

**Syntax** `show class-of-service shared-buffer`  
`<egress | ingress>`

**Release Information** Command introduced in Junos OS Release 12.3 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the shared buffer allocation and partitioning configuration.

**NOTE:** Due to QFX5200 cross-point architecture, all buffer usage counters are maintained separately. When usage counters are displayed with the command `show class-of-service shared-buffer` on QFX5200, various pipe counters are displayed separately.

**Options** **none**—Display ingress and egress shared buffer settings.  
**egress**—(Optional) Display the egress shared buffer settings.  
**ingress**—(Optional) Display the ingress shared buffer settings.

**Required Privilege Level** view

**List of Sample Output** [show class-of-service shared-buffer on page 7197](#)

**Output Fields** [Table 610](#) describes the output fields for the `show class-of-service shared-buffer` command. Output fields are listed in the approximate order in which they appear.

**Table 610: show class-of-service shared-buffer Output Fields**

| Field Name          | Field Description                                                                                                   |
|---------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Ingress</b>      | Ingress shared buffer configuration.                                                                                |
| <b>Total Buffer</b> | Total buffer space available to the ports in KB. This is the combined dedicated buffer pool and shared buffer pool. |

Table 610: show class-of-service shared-buffer Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                                                                                       |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Dedicated Buffer</b>              | Buffer space allocated to the dedicated buffer pool in KB.                                                                                                                                                                                                              |
| <b>Shared Buffer</b>                 | Buffer space allocated to the shared buffer pool in KB.                                                                                                                                                                                                                 |
| <b>Lossless</b>                      | Buffer space allocated to the lossless traffic buffer pool in KB.                                                                                                                                                                                                       |
| <b>Lossless Headroom</b>             | Buffer space allocated to the lossless headroom traffic buffer pool to support priority-based flow control (PFC) and Ethernet PAUSE in KB. (Ingress ports only.)<br><br><i>NOTE:</i> OCX Series switches do not support PFC.                                            |
| <b>Lossy</b>                         | Buffer space allocated to the lossy (best-effort) traffic buffer pool in KB.                                                                                                                                                                                            |
| <b>Lossless Headroom Utilization</b> | Utilization of the ingress lossless headroom buffer pool. (These fields can help you to determine how much headroom buffer space you need to reserve to support PFC and Ethernet PAUSE for lossless flows.)<br><br><i>NOTE:</i> OCX Series switches do not support PFC. |
| <b>Node Device</b>                   | Index number that identifies the switch. On a QFX3500 switch, this field always has a value of zero (0).                                                                                                                                                                |
| <b>Total</b>                         | Size of the lossless headroom ingress buffer pool in KB.                                                                                                                                                                                                                |
| <b>Used</b>                          | Amount in KB of lossless headroom ingress buffer used.                                                                                                                                                                                                                  |
| <b>Free</b>                          | Amount in KB of lossless headroom ingress buffer free (unused).                                                                                                                                                                                                         |
| <b>Egress</b>                        | Egress shared buffer configuration.                                                                                                                                                                                                                                     |
| <b>Multicast</b>                     | Buffer space allocated to the multicast traffic buffer pool in KB. (Egress ports only.)                                                                                                                                                                                 |

## Sample Output

### show class-of-service shared-buffer

```
user@switch> show class-of-service shared-buffer
```

```
Ingress:
```

```
Total Buffer : 9360.00 KB
Dedicated Buffer : 2158.00 KB
Shared Buffer : 7202.00 KB
 Lossless : 648.18 KB
 Lossless Headroom : 3240.90 KB
 Lossy : 3312.92 KB
```

```
Lossless Headroom Utilization:
```

```
Node Device Total Used Free
0 3240.90 KB 0.00 KB 3240.90 KB
```

Egress:

|                  |   |            |
|------------------|---|------------|
| Total Buffer     | : | 9360.00 KB |
| Dedicated Buffer | : | 2704.00 KB |
| Shared Buffer    | : | 6656.00 KB |
| Lossless         | : | 3328.00 KB |
| Multicast        | : | 1264.64 KB |
| Lossy            | : | 2063.36 KB |

## show pfe filter hw summary

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>                                   | Display Packet Forwarding Engine next-hop information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                                       | <p><b>none</b>—Display all Packet Forwarding Engine next-hop information.</p> <p><b>fpc <i>slot</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.</p> <p>On a TX Matrix router, if you specify the number of a T640 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot</i></b> with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot</i></b> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre>user@host&gt; show pfe next-hop fpc 1 lcc 1 user@host&gt; show pfe next-hop fpc 9</pre> <p><b>interface <i>interface-name</i></b>—(Optional) Display the Packet Forwarding Engine next-hop interface.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the T1600 router (or line-card chassis) that houses the FPC. Replace <b><i>number</i></b> with a value from 0 through 3.</p> |
| <b>Required Privilege Level</b>                      | admin                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

- *Routing Matrix with a TXP-Mixed-LCC-3D Configuration*

**List of Sample Output**    [show pfe next-hop on page 7203](#)  
                                  [show pfe next-hop fpc \(TX Matrix Router\) on page 7203](#)  
                                  [show pfe next-hop fpc \(TX Matrix Plus Router\) on page 7204](#)

**Output Fields** Table 612 lists the output fields for the **show pfe next-hop** command. Output fields are listed in the approximate order in which they appear.

**Table 612: show pfe next-hop Output Fields**

| Field Name    | Field Description                                      |
|---------------|--------------------------------------------------------|
| ID            | The next-hop ID for the entry.                         |
| Type          | The next-hop type for the entry.                       |
| Interface     | The interface to which the next-hop entry is assigned. |
| Protocol      | The protocol type for the next-hop entry.              |
| Encap         | Encapsulation type for the next-hop entry.             |
| Next Hop Addr | Next-hop address for the next-hop entry.               |
| MTU           | MTU value for the nexthop entry.                       |

## Sample Output

### show pfe next-hop

```

user@host> show pfe next-hop
Nexthop Info:
 ID Type Interface Protocol Encap Next Hop Addr MTU
 ---- - - - - - -
 4 Mcast - IPv4 - 0.0.0.0 0
 5 Bcast - IPv4 - - 0
 7 Discard - IPv4 - - 0
 8 MDiscard - IPv4 - - 0
 9 Reject - IPv4 - - 0
 13 Local - IPv4 - 192.168.4.60 0
 14 Resolve fxp0.0 IPv4 Unspecified - 0
 17 Local - IPv4 - 127.0.0.1 0
 18 Unicast fxp0.0 IPv4 Unspecified 192.168.4.254 0
 21 Local - IPv4 - 11.1.0.1 0
 22 Unicast at-0/1/0.0 IPv4 ATM SNAP 11.1.0.2 4482
 ...

```

### show pfe next-hop fpc (TX Matrix Router)

```

user@host> show pfe next-hop fpc 1
Slot 1
Nexthop Info:
 ID Type Interface Next Hop Addr Protocol Encap MTU

| <b>Release Information</b>                           | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Command introduced in Junos OS Release 13.3 for the MX Series.<br>Command option <b>hw</b> introduced in Junos OS Release 14.1X53-D10 for the QFX Series.<br>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series. |
| <b>Description</b>                                   | Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.                                                                                                                                                                                                                                                                         |

**NOTE:** The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the **show route forwarding table** command. For more information, see the [CLI Explorer](#).

**Options** **none**—Display all Packet Forwarding Engine forwarding table information.

**clnp**—(Optional) Show International Standards Organization (ISO) connectionless-mode network protocol (CLNP) route table information.

**dhcp**—(Optional) Display Packet Forwarding Engine DHCP-Snooping route table information.

**fpc slot**—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

**host**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display host routes installed in the on-chip hardware table.

**hw**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display routes installed in the on-chip hardware table (as opposed to displaying routes from the routing table and the PFE forwarding table before they are installed in the hardware).

**index index**—(Optional) Display table index.

**inet6**—(Optional) Display Packet Forwarding Engine IPv6 routes.

**ip**—(Optional) Display Packet Forwarding Engine IPv4 routes.

**iso**—(Optional) Display ISO version routing tables.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the T1600 router (or line-card chassis) that houses the FPC. Replace *number* with a value from 0 through 3.

**mpls**—(Optional) Display Packet Forwarding Engine MPLS information.

**multicast**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display multicast routes installed in the on-chip hardware table.

**prefix *prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

**summary**—(Optional) Display summary of Packet Forwarding Engine information.

**table <*table-name*>**—(Optional) Display table information.

**Required Privilege Level**

admin

**Output Fields**

Table 613 lists the output fields for the **show pfe route** command. Output fields are listed in the approximate order in which they appear.

**Table 613: show pfe route Output Fields**

| Field Name  | Field Description                  |
|-------------|------------------------------------|
| Destination | Destination address for the entry. |
| NH IP Addr  | Next-hop IP address for the entry. |
| Type        | Next-hop type for the entry        |
| NH ID       | Next-hop ID for the entry          |

Table 613: show pfe route Output Fields (*continued*)

| Field Name       | Field Description                                  |
|------------------|----------------------------------------------------|
| <b>Encap</b>     | Encapsulation type for the next-hop entry.         |
| <b>Interface</b> | Interface to which the next-hop entry is assigned. |

Table 614 lists the output fields for the QFX Series **show pfe route** hardware table (**hw**) commands. Output fields are listed in the approximate order in which they appear.

Table 614: QFX Series, EX4600 switches, and OCX Series show pfe route Hardware Table Output Fields

| Field Name             | Field Description                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Max</b>             | Maximum routing entries per route type.                                                                                                                                                             |
| <b>Used</b>            | Number of routing entries consumed per route type.                                                                                                                                                  |
| <b>Free</b>            | Number of unused routing entries per route type.                                                                                                                                                    |
| <b>% Free</b>          | Percentage of unused routing entries per route type.                                                                                                                                                |
| <b>Rtt</b>             | Internal routing engine index number of the route table.                                                                                                                                            |
| <b>VRF</b>             | Internal hardware index number for the corresponding route table.                                                                                                                                   |
| <b>Destination</b>     | Destination address for the entry.                                                                                                                                                                  |
| <b>Type</b>            | ( <b>show pfe route summary hw</b> )—Route type for the entry: IPv4 or IPv6 route, and host, LPM, or multicast route.<br><br>( <b>show pfe route (ip   inet6) hw</b> )—Next-hop type for the entry. |
| <b>NH ID</b>           | Next-hop ID for the entry                                                                                                                                                                           |
| <b>Interface</b>       | Interface to which the next-hop entry is assigned.                                                                                                                                                  |
| <b>HW NH-ID</b>        | Internal hardware index number of the next-hop.                                                                                                                                                     |
| <b>Src-MAC-Address</b> | Source MAC address.                                                                                                                                                                                 |
| <b>Port</b>            | Port number.                                                                                                                                                                                        |
| <b>Dst-MAC-Address</b> | Destination MAC address.                                                                                                                                                                            |
| <b>VLAN</b>            | ID of the multicast group VLAN.                                                                                                                                                                     |
| <b>GROUP</b>           | Internal hardware index number of the multicast group next-hop.                                                                                                                                     |

Table 614: QFX Series, EX4600 switches, and OCX Series show pfe route Hardware Table Output Fields (*continued*)

| Field Name | Field Description                             |
|------------|-----------------------------------------------|
| CLASS      | Internal class number of the multicast group. |

## Sample Output

### show pfe route ip

```
user@host> show pfe route ip
```

```

## show interfaces voq

---

**Syntax**    `show interfaces voq interface-name`  
              `<forwarding-class forwarding-class-name>`  
              `<non-zero>`  
              `<source-fpc source-fpc-number>`

**Release Information**    Command introduced in Junos OS Release 14.1 for the PTX Series Routers  
                              Command introduced in Junos OS Release 15.1X53-D20 for QFX10000 switches.

**Description**    Display the random early detection (RED) drop statistics from all ingress Packet Forwarding Engines associated with the specified physical egress interface. In the VOQ architecture, egress output queues (shallow buffers) buffer data in virtual queues on ingress Packet Forwarding Engines. In cases of congestion, you can use this command to identify which ingress Packet Forwarding Engine is the source of RED-dropped packets contributing to congestion.

**NOTE:** On the PTX Series routers and QFX10000 switches, these statistics include tail-dropped packets.

---

**Options**    **interface *interface-name***—Display the ingress VOQ RED drop statistics for the specified egress interface.

**forwarding-class *forwarding-class-name***—Display VOQ RED drop statistics for a specified forwarding class.

**non-zero**—Display only non-zero VOQ RED drop statistics counters.

**source-fpc *source-fpc-number***—Display VOQ RED drop statistics for the specified source FPC.

**Additional Information**

- On PTX Series routers, you can display VOQ statistics for only the WAN physical interface.
- VOQ statistics for aggregated physical interfaces are not supported. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can use the **show interfaces queue** command to identify the child link which is experiencing congestion and then view the VOQ statistics on the respective child link using the **show interfaces voq** command.

For information on virtual output queuing on PTX routers, see *Understanding Virtual Output Queues on PTX Series Packet Transport Routers*. For information on virtual output queueing on QFX10000 switches, see [“Understanding CoS Virtual Output Queues \(VOQs\) on QFX10000 Switches” on page 6724](#).

**Output Fields** [Table 615](#) lists the output fields for the show interfaces queue command. Output fields are listed in the approximate order in which they appear.

**Table 615: show interfaces voq Output Fields**

| Field Name          | Field Description                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface  | Name of the physical interface.                                                                                                                                                              |
| Enabled             | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                         |
| Interface index     | Physical interface's index number, which reflects its initialization sequence.                                                                                                               |
| SNMP ifIndex        | SNMP index number for the interface.                                                                                                                                                         |
| Queue               | Egress queue number.                                                                                                                                                                         |
| Forwarding classes  | Forwarding class name.                                                                                                                                                                       |
| FPC number          | Number of the Flexible PIC Concentrator (FPC) located on ingress.                                                                                                                            |
| PFE                 | Number of the Packet Forwarding Engine providing virtual output queues on the ingress.                                                                                                       |
| RED-dropped packets | Number of packets per second (pps) dropped because of random early detection (RED).<br><br><b>NOTE:</b> On the PTX Series routers, these statistics include tail-dropped packets.            |
| RED-dropped bytes   | Number of bytes per second dropped because of RED. The byte counts vary by interface hardware.<br><br><b>NOTE:</b> On the PTX Series routers, these statistics include tail-dropped packets. |

## Sample Output

### show interfaces voq (For a Specific Physical Interface) (PTX Series Routers)

The following example shows ingress RED-dropped statistics for the egress Ethernet interface configured on port 0 of Physical Interface Card (PIC) 0, located on the FPC in slot 7.

The sample output below shows that the cause of the congestion is ingress Packet Forwarding Engine PFE 0, which resides on FPC number 4, as denoted by the count of RED-dropped packets and RED-dropped bytes for egress queue 0, forwarding classes best-effort and egress queue 3, forwarding class network control.

### Monitoring CoS Classifiers

**Purpose** Display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

**Action** To monitor CoS classifiers in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier
```

To monitor a particular classifier in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier name classifier-name
```

To monitor a particular type of classifier in the CLI, enter the CLI command:

```
user@switch> show class-of-service classifier type classifier-type
```

**Meaning** Table 616 summarizes key output fields for CoS classifiers.

**Table 616: Summary of Key CoS Classifier Output Fields**

| Field            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Classifier       | Name of a classifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Code point type  | <p>Type of classifier:</p> <ul style="list-style-type: none"> <li>• <b>dscp</b>—All classifiers of the DSCP type.</li> <li>• <b>ieee-802.1</b>—All classifiers of the IEEE 802.1 type.</li> <li>• <b>ieee-mcast</b>—All classifiers of the IEEE 802.1 multicast type.</li> </ul> <p><b>NOTE:</b> QFX10000 switches do not use different classifiers for unicast and multdestination (multicast, broadcast, destination lookup fail) traffic, so multicast-specific classifiers are not supported.</p> <ul style="list-style-type: none"> <li>• <b>exp</b>—All classifiers of the MPLS exp type.</li> </ul> <p><b>NOTE:</b> OCX Series switches do not support MPLS.</p> |
| Index            | Internal index of the classifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Code point       | DSCP or IEEE 802.1 code point value of the incoming packets, in bits. These values are used for classification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Forwarding Class | Name of the forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Loss Priority    | Loss priority value that the classifier assigns to the incoming packet based on its code point value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Monitoring CoS Forwarding Classes

**Purpose** Use the monitoring functionality to view the current assignment of CoS forwarding classes to queue numbers on the system.

**Action** To monitor CoS forwarding classes in the CLI, enter the following CLI command:

```
user@switch> show class-of-service forwarding-class
```

**Meaning** Some switches use different forwarding classes, output queues, and classifiers for unicast and multdestination (multicast, broadcast, destination lookup fail) traffic. These switches support 12 forwarding classes and output queues, eight for unicast traffic and four for multdestination traffic.

Some switches use the same forwarding classes, output queues, and classifiers for unicast and multdestination traffic. These switches support eight forwarding classes and eight output queues.

[Table 617](#) summarizes key output fields on switches that use different forwarding classes and output queues for unicast and multdestination traffic.

**Table 617: Summary of Key CoS Forwarding Class Output Fields on Switches that Separate Unicast and Multidestination Traffic**

| Field            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarding Class | <p>Names of forwarding classes assigned to queue numbers. By default, the following unicast forwarding classes are assigned to queues 0, 3, 4, and 7, respectively:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value.</li> <li>• <b>fcoe</b>—Provides guaranteed delivery for Fibre Channel over Ethernet (FCoE) traffic.</li> <li>• <b>no-loss</b>—Provides guaranteed delivery for TCP lossless traffic</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> <p>By default, the following multdestination forwarding class is assigned to queue 8:</p> <ul style="list-style-type: none"> <li>• <b>mcast</b>—Provides no special CoS handling of packets.</li> </ul> |
| Queue            | <p>Queue number corresponding to (mapped to) the forwarding class name.</p> <p>By default, four queues (0, 3, 4, and 7) are assigned to unicast forwarding classes and one queue (8) is assigned to a multdestination forwarding class:</p> <ul style="list-style-type: none"> <li>• Queue 0—<b>best-effort</b></li> <li>• Queue 3—<b>fcoe</b></li> <li>• Queue 4—<b>no-loss</b></li> <li>• Queue 7—<b>network-control</b></li> <li>• Queue 8—<b>mcast</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                    |

**Table 617: Summary of Key CoS Forwarding Class Output Fields on Switches that Separate Unicast and Multidestination Traffic (*continued*)**

| Field   | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No-Loss | <p>Packet drop attribute associated with each forwarding class:</p> <ul style="list-style-type: none"> <li>Disabled—The forwarding class is configured for lossy transport (packets might drop during periods of congestion)</li> <li>Enabled—The forwarding class is configured for lossless transport</li> </ul> <p><b>NOTE:</b> To achieve lossless transport, you must ensure that priority-based flow control (PFC) and DCBX are properly configured on the lossless priority (IEEE 802.1p code point), and that sufficient port bandwidth is reserved for the lossless traffic flows.</p> <p>OCX Series switches do not support lossless transport.</p> |

**NOTE:** OCX Series switches do not support the default lossless forwarding classes `fcoe` and `no-loss`, and do not support the no-loss packet drop attribute used to configure lossless forwarding classes. On OCX Series switches, do not map traffic to the default `fcoe` and `no-loss` forwarding classes (both of these default forwarding classes carry the no-loss packet drop attribute), and do not configure the no-loss packet drop attribute on forwarding classes.

Table 618 summarizes key output fields on switches that use the same forwarding classes and output queues for unicast and multidestination traffic.

**Table 618: Summary of Key CoS Forwarding Class Output Fields on Switches That Do Not Separate Unicast and Multidestination Traffic**

| Field            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Monitoring CoS Rewrite Rules

**Purpose** Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action** To monitor CoS rewrite rules in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule
```

To monitor a particular rewrite rule in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule name rewrite-rule-name
```

To monitor a particular type of rewrite rule (for example, DSCP, DSCP IPv6, IEEE-802.1, or MPLS EXP) in the CLI, enter the CLI command:

```
user@switch> show class-of-service rewrite-rule type rewrite-rule-type
```

**Meaning** [Table 619](#) summarizes key output fields for CoS rewrite rules.

**Table 619: Summary of Key CoS Rewrite Rule Output Fields**

| Field            | Values                                                                                                                                                                                                                                                                                                                      |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rewrite rule     | Name of the rewrite rule.                                                                                                                                                                                                                                                                                                   |
| Code point type  | Rewrite rule type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 DiffServ traffic.</li> <li>• <b>dscp-ipv6</b>—For IPv6 Diffserv traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> <li>• <b>exp</b>—For MPLS traffic.</li> </ul> <p><b>NOTE:</b> OCX Series switches do not support MPLS.</p> |
| Index            | Internal index for the rewrite rule.                                                                                                                                                                                                                                                                                        |
| Forwarding class | Name of the forwarding class that is used to determine CoS values for rewriting in combination with loss priority.<br><br>Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.                                                                                  |
| Loss priority    | Level of loss priority that is used to determine CoS values for rewriting in combination with forwarding class.                                                                                                                                                                                                             |
| Code point       | Rewrite code point value.                                                                                                                                                                                                                                                                                                   |

## Monitoring CoS Code-Point Value Aliases

**Purpose** Use the monitoring functionality to display information about the CoS code-point value aliases that the system is currently using to represent DSCP and IEEE 802.1p code point bits.

**Action** To monitor CoS value aliases in the CLI, enter the CLI command:

```
user@switch> show class-of-service code-point-aliases
```

To monitor a specific type of code-point alias (DSCP, DSCP IPv6, IEEE 802.1, or MPLS EXP) in the CLI, enter the CLI command:

```
user@switch> show class-of-service code-point-aliases ieee-802.1
```

**Meaning** [Table 620](#) summarizes key output fields for CoS value aliases.

Table 620: Summary of Key CoS Value Alias Output Fields

| Field           | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Code point type | Type of the CoS value: <ul style="list-style-type: none"><li>• <b>dscp</b>—Examines Layer 3 packet headers for IP packet classification.</li><li>• <b>dscp-ipv6</b>—Examines Layer 3 packet headers for IPv6 packet classification.</li><li>• <b>ieee-802.1</b>—Examines Layer 2 packet headers for packet classification.</li><li>• <b>exp</b>—Examines MPLS packet headers for packet classification.</li></ul> <p><b>NOTE:</b> OCX Series switches do not support MPLS.</p> |
| Alias           | Name given to a set of bits—for example, <b>af11</b> is a name for bits <b>001010</b> .                                                                                                                                                                                                                                                                                                                                                                                        |
| Bit pattern     | Set of bits associated with the alias.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Output Fields</b>            | <p><a href="#">Table 621</a> describes the output fields for the <b>show class-of-service classifier</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 621: show class-of-service classifier Output Fields**

| Field Name      | Field Description                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Classifier      | Name of the classifier.                                                                                                                                                 |
| Code point type | Type of the classifier: <b>exp</b> (not on EX Series switch), <b>dscp</b> , <b>dscp-ipv6</b> (not on EX Series switch), <b>ieee-802.1</b> , or <b>inet-precedence</b> . |
| Index           | Internal index of the classifier.                                                                                                                                       |
| Code point      | Code point value used for classification                                                                                                                                |

Table 621: show class-of-service classifier Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                 |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                                                                  |
| <b>Loss priority</b>    | Loss priority value used for classification. For most platforms, the value is <b>high</b> or <b>low</b> . For some platforms, the value is <b>high</b> , <b>medium-high</b> , <b>medium-low</b> , or <b>low</b> . |

## Sample Output

### show class-of-service classifier type ieee-802.1

```

user@host> show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point Forwarding Class Loss priority
000 best-effort low
001 best-effort high
010 expedited-forwarding low
011 expedited-forwarding high
100 assured-forwarding low
101 assured-forwarding medium-high
110 network-control low
111 network-control high

Classifier: users-ieee802.1, Code point type: ieee-802.1
Code point Forwarding class Loss priority
100 expedited-forwarding low

```

### show class-of-service classifier type ieee-802.1 (QFX Series)

```

user@switch> show class-of-service classifier type ieee-802.1
Classifier: ieee8021p-default, Code point type: ieee-802.1, Index: 11
Code point Forwarding class Loss priority
000 best-effort low
001 best-effort low
010 best-effort low
011 fcoe low
100 no-loss low
101 best-effort low
110 network-control low
111 network-control low

Classifier: ieee8021p-untrust, Code point type: ieee-802.1, Index: 16
Code point Forwarding class Loss priority
000 best-effort low
001 best-effort low
010 best-effort low
011 best-effort low
100 best-effort low
101 best-effort low
110 best-effort low
111 best-effort low

Classifier: ieee-mcast, Code point type: ieee-802.1, Index: 46
Code point Forwarding class Loss priority
000 mcast low

```

|     |       |     |
|-----|-------|-----|
| 001 | mcast | low |
| 010 | mcast | low |
| 011 | mcast | low |
| 100 | mcast | low |
| 101 | mcast | low |
| 110 | mcast | low |
| 111 | mcast | low |

## show class-of-service code-point-aliases

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 623: show class-of-service forwarding-class Output Fields**

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding class</b>  | Name of the forwarding class.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ID</b>                | Forwarding class identifier.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Queue</b>             | CoS output queue mapped to the forwarding class.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Policing priority</b> | Not supported on EX Series switches or the QFX Series and can be ignored.                                                                                                                                                                                                                                                                                                                                    |
| <b>Fabric priority</b>   | (EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b> . Determines the priority of packets entering the switch fabric.                                                                                                                                                                                                                                           |
| <b>No-Loss</b>           | (QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes: <ul style="list-style-type: none"> <li>• Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is <b>drop</b>).</li> <li>• Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is <b>no-loss</b>).</li> </ul> |

## Sample Output

### show class-of-service forwarding-class

```

user@switch> show class-of-service forwarding-class
Forwarding class ID Queue Policing priority
best-effort 0 0 normal
expedited-forwarding 1 5 normal
assured-forwarding 2 1 normal
network-control 3 7 normal

```

## Sample Output

### show class-of-service forwarding-class (EX8200 Switch)

```

user@switch> show class-of-service forwarding-class
Forwarding class ID Queue Fabric priority
best-effort 0 0 low
expedited-forwarding 1 5 low
assured-forwarding 2 1 low
network-control 3 7 low
mcast-be 4 2 low
mcast-ef 5 4 low
mcast-af 6 6 low

```

## Sample Output

### show class-of-service forwarding-class (QFX Series)

```

user@switch> show class-of-service forwarding-class
Forwarding class ID Queue Policing priority No-Loss
best-effort 0 0 normal Disabled
fcoe 1 3 normal Enabled
no-loss 2 4 normal Enabled
network-control 3 7 normal Disabled
mcast 8 8 normal Disabled

```

On switches that do not use different forwarding classes and output queues for unicast and multdestination (multicast, broadcast, destination lookup fail) traffic, there is no **mcast** forwarding class and there is no queue 8. (Switches that use different forwarding classes and output queues for unicast and multdestination traffic support 12 forwarding classes and output queues, of which four of each are dedicated to multdestination traffic. Switches that use the same forwarding classes and output queues for unicast and multdestination traffic support eight forwarding classes and eight output queues.)

| <b>Output Fields</b>            | <a href="#">Table 624</a> describes the output fields for the <b>show class-of-service forwarding-class-set</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                         |

**Table 624: show class-of-service forwarding-class-set Output Fields**

| Field Name                        | Field Description                   |
|-----------------------------------|-------------------------------------|
| <b>Forwarding class set</b>       | Name of the forwarding class set.   |
| <b>Type</b>                       | Internal Junos OS type.             |
| <b>Forwarding class set index</b> | Index of this forwarding class set. |
| <b>Forwarding class</b>           | Name of a forwarding class.         |
| <b>Index</b>                      | Index of this forwarding class.     |

## Sample Output

### show class-of-service forwarding-class-set

```

user@switch> show class-of-service forwarding-class-set
Forwarding class set: san_fcset, Type: normal-type, Forwarding class set index:
37839
 Forwarding class Index
 fcoe 1

Forwarding class set: lan_fcset, Type: normal-type, Forwarding class set index:

```

37840

| Forwarding class | Index |
|------------------|-------|
| best-effort      | 0     |

Forwarding class set: multicast\_fcset, Type: normal-type, Forwarding class set index: 37841

| Forwarding class | Index |

**Table 625: show class-of-service forwarding-table classifier Output Fields**

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Classifier table index</b> | Index of the classifier table.                                                                                                                                                                                                                                                                                                                                                   |
| <b>entries</b>                | Total number of entries.                                                                                                                                                                                                                                                                                                                                                         |
| <b>Table type</b>             | Type of code points in the table: <b>DSCP</b> , <b>EXP</b> (not on the QFX Series), <b>IEEE 802.1</b> , <b>IPv4 precedence</b> (not on the QFX Series), or <b>IPv6 DSCP</b> .                                                                                                                                                                                                    |
| <b>Entry #</b>                | Entry number.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Code point</b>             | Code point value used for classification.                                                                                                                                                                                                                                                                                                                                        |
| <b>Forwarding-class #</b>     | Forwarding class to which the code point is assigned.                                                                                                                                                                                                                                                                                                                            |
| <b>PLP</b>                    | Packet loss priority value set by classification. For most platforms, the value can be <b>0</b> or <b>1</b> . For some platforms, the value is <b>0</b> , <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>0</b> represents low PLP. The value <b>1</b> represents <b>high</b> PLP. The value <b>2</b> represents medium-low PLP. The value <b>3</b> represents medium-high PLP. |

## Sample Output

### show class-of-service forwarding-table classifier

```

user@host> show class-of-service forwarding-table classifier
Classifier table index: 62436, # entries: 64, Table type: DSCP

Entry # Code point Forwarding-class # PLP

```

## show class-of-service interface

---

**Syntax**    `show class-of-service interface`  
              `<comprehensive | detail> <interface-name>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Forwarding class map information added in Junos OS Release 9.4.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.  
                              Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                              Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**    Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

**NOTE:** On routing platforms with dual Routing Engines, running this command on the backup Routing Engine, with or without any of the available options, is not supported and produces the following error message:

**error: the class-of-service subsystem is not running**

**Options**    **none**—Display CoS associations for all physical and logical interfaces.

**comprehensive**—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

**detail**—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface

- Information about filters or policers for the logical interface
- CoS information about the logical interface

**interface-name**—(Optional) Display class-of-service (CoS) associations for the specified interface.

**none**—Display CoS associations for all physical and logical interfaces.

| Queues in use      | Number of queues currently configured.                                                                                                                                                                                                                                                                     |                                                      |

Table 629: show class-of-service interface Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total non-default queues created</b>    | Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.<br><br>(Enhanced subscriber management for MX Series routers) This field is not displayed for enhanced subscriber management.                                             |
| <b>Rewrite Input IEEE Code-point</b>       | (QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.         |
| <b>Shaping rate</b>                        | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.                    |
| <b>Scheduler map</b>                       | Name of the output scheduler map associated with this interface.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.          |
| <b>Scheduler map forwarding class sets</b> | (QFX Series only) Name of the output fabric scheduler map associated with a QFabric system Interconnect device interface.                                                                                                                                                                             |
| <b>Input shaping rate</b>                  | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                                      |
| <b>Input scheduler map</b>                 | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                                        |
| <b>Chassis scheduler map</b>               | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                                     |
| <b>Rewrite</b>                             | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                                    |
| <b>Traffic-control-profile</b>             | Name of the associated traffic control profile.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic traffic control profile object is associated with a generated UID (for example, <b>TC_PROF_100_199_SERIES_UID1006</b> ) instead of with a subscriber interface. |
| <b>Classifier</b>                          | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                                          |
| <b>Forwarding-class-map</b>                | Name of the forwarding map associated with this interface.                                                                                                                                                                                                                                            |
| <b>Congestion-notification</b>             | (QFX Series and EX4600 switches only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                              |
| <b>Logical interface</b>                   | Name of a logical interface.                                                                                                                                                                                                                                                                          |
| <b>Object</b>                              | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , <b>Translation Table</b> (for IQE PICs only), or <b>traffic-class-map</b> (for T4000 routers with Type 5 FPCs).                                                |
| <b>Name</b>                                | Name of an object.                                                                                                                                                                                                                                                                                    |

Table 629: show class-of-service interface Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>             | Type of an object: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>ieee-802.1</b> , <b>ip</b> , <b>inet-precedence</b> , or <b>ieee-802.1ad</b> (for traffic class map on T4000 routers with Type 5 FPCs)..                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Link-level type</b>  | Encapsulation on the physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Device flags</b>     | The <b>Device flags</b> field provides information about the physical device and displays one or more of the following values: <ul style="list-style-type: none"> <li>• <b>Down</b>—Device has been administratively disabled.</li> <li>• <b>Hear-Own-Xmit</b>—Device receives its own transmissions.</li> <li>• <b>Link-Layer-Down</b>—The link-layer protocol has failed to connect with the remote endpoint.</li> <li>• <b>Loopback</b>—Device is in physical loopback.</li> <li>• <b>Loop-Detected</b>—The link layer has received frames that it sent, thereby detecting a physical loopback.</li> <li>• <b>No-Carrier</b>—On media that support carrier recognition, no carrier is currently detected.</li> <li>• <b>No-Multicast</b>—Device does not support multicast traffic.</li> <li>• <b>Present</b>—Device is physically present and recognized.</li> <li>• <b>Promiscuous</b>—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.</li> <li>• <b>Quench</b>—Transmission on the device is quenched because the output buffer is overflowing.</li> <li>• <b>Recv-All-Multicasts</b>—Device is in multicast promiscuous mode and therefore provides no multicast filtering.</li> <li>• <b>Running</b>—Device is active and enabled.</li> </ul> |

Table 629: show class-of-service interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface flags</b> | <p>The <b>Interface flags</b> field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Admin-Test</b>—Interface is in test mode and some sanity checking, such as loop detection, is disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Hardware-Down</b>—Interface is nonfunctional or incorrectly connected.</li> <li>• <b>Link-Layer-Down</b>—Interface keepalives have indicated that the link is incomplete.</li> <li>• <b>No-Multicast</b>—Interface does not support multicast traffic.</li> <li>• <b>No-receive No-transmit</b>—Passive monitor mode is configured on the interface.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>Pop all MPLS labels from packets of depth</b>—MPLS labels are removed as packets arrive on an interface that has the <b>pop-all-labels</b> statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> <li>• <b>1</b>—Takes effect for incoming packets with one label only.</li> <li>• <b>2</b>—Takes effect for incoming packets with two labels only.</li> <li>• <b>[ 1 2 ]</b>—Takes effect for incoming packets with either one or two labels.</li> </ul> </li> <li>• <b>Promiscuous</b>—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.</li> <li>• <b>Recv-All-Multicasts</b>—Interface is in multicast promiscuous mode and provides no multicast filtering.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul> |
| <b>Flags</b>           | <p>The <b>Logical interface flags</b> field provides information about the logical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC Encapsulation</b>—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).</li> <li>• <b>Device-down</b>—Device has been administratively disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Clear-DF-Bit</b>—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit.</li> <li>• <b>Hardware-Down</b>—Interface protocol initialization failed to complete successfully.</li> <li>• <b>PFC</b>—Protocol field compression is enabled for the PPP session.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Encapsulation</b>   | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Admin</b>           | Administrative state of the interface ( <b>Up</b> or <b>Down</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Input Filter</b>            | Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Output Filter</b>           | Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Link flags</b>              | Provides information about the physical link and displays one or more of the following values: <ul style="list-style-type: none"> <li>• <b>ACFC</b>—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.</li> <li>• <b>Give-Up</b>—Link protocol does not continue connection attempts after repeated failures.</li> <li>• <b>Loose-LCP</b>—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-LMI</b>—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-NCP</b>—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.</li> <li>• <b>Keepalives</b>—Link protocol keepalives are enabled.</li> <li>• <b>No-Keepalives</b>—Link protocol keepalives are disabled.</li> <li>• <b>PFC</b>—Protocol field compression is configured. The PPP session negotiates the PFC option.</li> </ul> |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>CoS queues</b>              | Number of CoS queues configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Statistics last cleared</b> | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 629: show class-of-service interface Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input errors</b>  | <p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul> |
| <b>Output errors</b> | <p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                |
| <b>Egress queues</b> | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 629: show class-of-service interface Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue counters</b>                       | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                   |
| <b>SONET alarms</b><br><b>SONET defects</b> | <p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                         |

| Received SONET overhead                | Values of the received and transmitted SONET overhead: <ul style="list-style-type: none"> <li>• <b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1 and K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-N signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-N signal.</li> <li>• <b>Z3 and Z4</b>—Allocated for future use.</li> </ul>                                                                                                                                                                                  |
| Transmitted SONET overhead             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Received path trace                    | SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transmitted path trace                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| Transmit rate     | Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Rate Limit        | <p>Rate limiting configuration of the queue. Possible values are :</p> <ul style="list-style-type: none"> <li><b>None</b>—No rate limit.</li> <li><b>exact</b>—Queue transmits at the configured rate.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Buffer size       | Delay buffer size in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Priority          | Scheduling priority configured as <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Excess Priority   | Priority of the excess bandwidth traffic on a scheduler: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Adjustment information</b> | <p>Display the assignment of shaping-rate adjustments on a scheduler node or queue.</p> <ul style="list-style-type: none"> <li>• <b>Adjusting application</b>—Application that is performing the shaping-rate adjustment. <ul style="list-style-type: none"> <li>• The adjusting application can appear as <b>ancp LS-0</b>, which is the Junos OS Access Node Control Profile process (<b>ancpd</b>) that performs shaping-rate adjustments on schedule nodes.</li> <li>• The adjusting application can also appear as <b>pppoe</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</li> </ul> </li> <li>• <b>Adjustment type</b>—Type of adjustment: <b>absolute</b> or <b>delta</b>.</li> <li>• <b>Configured shaping rate</b>—Shaping rate configured for the scheduler node or queue.</li> <li>• <b>Adjustment value</b>—Value of adjusted shaping rate.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment overhead-accounting mode</b>—Configured shaping mode: <b>frame</b> or <b>cell</b>.</li> <li>• <b>Adjustment overhead bytes</b>—Number of bytes that the ANCP agent adds to or subtracts from the actual downstream frame overhead before reporting the adjusted values to CoS.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment multicast index</b>—</li> </ul> |

## Sample Output

### show class-of-service interface (Physical)

```

user@host> show class-of-service interface so-0/2/3
Physical interface: so-0/2/3, Index: 135
Queues supported: 8, Queues in use: 4
Total non-default queues created: 4
Scheduler map: <default>, Index: 2032638653

Logical interface: fe-0/0/1.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000

```

| Object        | Name        | Type | Index |
|---------------|-------------|------|-------|
| Scheduler-map | <default>   |      | 27    |
| Rewrite       | exp-default | exp  | 21    |
| Classifier    | exp-default | exp  | 5     |

|                      |                      |     |   |
|----------------------|----------------------|-----|---|
| Classifier           | ipprec-compatibility | ip  | 8 |
| Forwarding-class-map | exp-default          | exp | 5 |

### show class-of-service interface (Logical)

```

user@host> show class-of-service interface so-0/2/3.0
Logical interface: so-0/2/3.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000
Object Name Type Index
Scheduler-map <default>
Rewrite exp-default exp 21
Classifier exp-default exp 5
Classifier ipprec-compatibility ip 8
Forwarding-class-map exp-default exp 5

```

### show class-of-service interface (Gigabit Ethernet)

```

user@host> show class-of-service interface ge-6/2/0
Physical interface: ge-6/2/0, Index: 175
Queues supported: 4, Queues in use: 4
Scheduler map: <default>, Index: 2
Input scheduler map: <default>, Index: 3
Chassis scheduler map: <default-chassis>, Index: 4

```

### show class-of-service interface (ANCP)

```

user@host> show class-of-service interface pp0.1073741842
Logical interface: pp0.1073741842, Index: 341
Object Name Type Index
Traffic-control-profile TCP-CVLAN Output 12408
Classifier dscp-ipv6-compatibility dscp-ipv6 9
Classifier ipprec-compatibility ip 13

Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 4000000
Adjustment value: 11228000
Adjustment overhead-accounting mode: Frame Mode
Adjustment overhead bytes: 50
Adjustment target: node

```

### show class-of-service interface (PPPoE Interface)

```

user@host> show class-of-service interface pp0.1
Logical interface: pp0.1, Index: 85
Object Name Type Index
Traffic-control-profile tcp-pppoe.o.pp0.1 Output 2726446535
Classifier ipprec-compatibility ip 13

Adjusting application: PPPoE
Adjustment type: absolute
Adjustment value: 5000000
Adjustment overhead-accounting mode: cell
Adjustment target: node

```

### show class-of-service interface (T4000 Routers with Type 5 FPCs)

```

user@host> show class-of-service interface xe-4/0/0
Physical interface: xe-4/0/0, Index: 153
Queues supported: 8, Queues in use: 4
Shaping rate: 5000000000 bps
Scheduler map: <default>, Index: 2

```

```

Congestion-notification: Disabled

| <b>List of Sample Output</b>    | <a href="#">show class-of-service rewrite-rule type dscp on page 7289</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Output Fields</b>            | Table 631 describes the output fields for the <b>show class-of-service rewrite-rule</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 631: show class-of-service rewrite-rule Output Fields**

| Field Name              | Field Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rewrite rule</b>     | Name of the rewrite rule.                                                                                                                  |
| <b>Code point type</b>  | Type of rewrite rule: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>frame-relay-de</b> , or <b>inet-precedence</b> .                    |
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router or switch. |
| <b>Index</b>            | Internal index for this particular rewrite rule.                                                                                           |

Table 631: show class-of-service rewrite-rule Output Fields (*continued*)

| Field Name    | Field Description            |
|---------------|------------------------------|
| Loss priority | Loss priority for rewriting. |
| Code point    | Code point value to rewrite. |

## Sample Output

### show class-of-service rewrite-rule type dscp

```

user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp
 Forwarding class Loss priority Code point
 gold high 000000
 silver low 110000
 silver high 111000
 bronze low 001010
 bronze high 001100
 lead high 101110

Rewrite rule: abc-dscp-rewrite, Code point type: dscp, Index: 3245
 Forwarding class Loss priority Code point
 gold low 000111
 gold high 001010
 silver low 110000
 silver high 111000
 bronze high 001100
 lead low 101110
 lead high 110111

## Monitoring CoS Scheduler Maps

**Purpose** Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

**Action** To monitor CoS scheduler maps in the CLI, enter the CLI command:

```
user@switch> show class-of-service scheduler-map
```

To monitor a specific scheduler map in the CLI, enter the CLI command:

```
user@switch> show class-of-service scheduler-map scheduler-map-name
```

**Meaning** [Table 632](#) summarizes key output fields for CoS scheduler maps.

**Table 632: Summary of Key CoS Scheduler Maps Output Fields**

| Field         | Values                                                                   |
|---------------|--------------------------------------------------------------------------|
| Scheduler map | Name of a scheduler map that maps forwarding classes to schedulers.      |
| Index         | Index of a specific object—scheduler maps, schedulers, or drop profiles. |

**Table 632: Summary of Key CoS Scheduler Maps Output Fields** (*continued*)

| Field            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler        | Name of a scheduler that controls queue properties such as bandwidth and scheduling priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Forwarding class | Name(s) of the forwarding class(es) to which the scheduler is mapped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transmit rate    | Guaranteed minimum bandwidth configured on the queue mapped to the scheduler. On strict-high priority queues on QFX10000 switches, defines the maximum amount of traffic on the queue that is treated as strict-high priority traffic.                                                                                                                                                                                                                                                                                                                                                                              |
| Priority         | <p>Scheduling priority of traffic on a queue:</p> <ul style="list-style-type: none"> <li>• <b>strict-high</b>—Packets on a strict-high priority queue are transmitted first, before all other traffic, up to the configured maximum bandwidth (shaping rate). On QFX3500, QFX3600, EX4600, and OCX series switches, and on QFabric system, only one queue can be configured as <b>strict-high</b> priority. On QFX10000 switches, you can configure more than one strict-high priority queue.</li> <li>• <b>low</b>—Packets in this queue are transmitted after packets in the <b>strict-high</b> queue.</li> </ul> |
| Drop Profiles    | Name and index of a drop profile that is mapped to a specific loss priority and protocol pair. The drop profile determines the way best effort queues drop packets during periods of congestion.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Loss Priority    | Packet loss priority mapped to the drop profile. You can configure different drop profiles for <b>low</b> , <b>medium-high</b> , and <b>high</b> loss priority traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Protocol         | Transport protocol of the drop profile for the particular priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Name             | Name of the drop profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## show class-of-service drop-profile

|                                 |                                                                                                                                                                                                                                                                    |

| <b>Description</b>                                  | Display the entire class-of-service (CoS) configuration as it exists in the forwarding table. Executing this command is equivalent to executing all <b>show class-of-service forwarding-table</b> commands in succession.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                                      | <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the forwarding table configuration for a specific T640 router (or line-card chassis) configured in a routing matrix. On a TX Matrix Plus router, display the forwarding table configuration for a specific router (or line-card chassis) configured in the routing matrix.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li><li>• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li><li>• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li></ul> <p><b>sfc <i>number</i></b>—(TX Matrix Plus routers only) (Optional) Display the forwarding table configuration for the TX Matrix Plus router. Replace <i>number</i> with 0.</p> |
| <b>Required Privilege Level</b>                     | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 635: show class-of-service forwarding-table scheduler-map Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface          | Name of the physical interface.                                                                                                                                                                                                                                                             |
| Index              | Physical interface index.                                                                                                                                                                                                                                                                   |
| Map index          | Scheduler map index.                                                                                                                                                                                                                                                                        |
| Num of queues      | Number of queues defined in this scheduler map.                                                                                                                                                                                                                                             |
| Entry              | Number of this entry in the scheduler map.                                                                                                                                                                                                                                                  |
| Scheduler index    | Scheduler policy index.                                                                                                                                                                                                                                                                     |
| Forwarding-class # | Forwarding class number to which this entry is applied.                                                                                                                                                                                                                                     |
| Tx rate            | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                      |
| Max buffer delay   | Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword <b>remainder</b> , which indicates that the buffer is sized according to what remains after other scheduler buffer allocations. |
| Priority           | <ul style="list-style-type: none"> <li><b>high</b>—Queue priority is high.</li> <li><b>low</b>—Queue priority is low.</li> </ul>                                                                                                                                                            |

Table 635: show class-of-service forwarding-table scheduler-map Output Fields (*continued*)

| Field Name      | Field Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------|
| PLP high        | Drop profile index for a high packet loss priority profile.                                                 |
| PLP low         | Drop profile index for a low packet loss priority profile.                                                  |
| PLP medium-high | Drop profile index for a medium-high packet loss priority profile.                                          |
| PLP medium-low  | Drop profile index for a medium-low packet loss priority profile.                                           |
| TCP PLP high    | Drop profile index for a high TCP packet loss priority profile.                                             |
| TCP PLP low     | Drop profile index for a low TCP packet loss priority profile.                                              |
| Policy is exact | If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled. |

## Sample Output

### show class-of-service forwarding-table scheduler-map

```

user@host> show class-of-service forwarding-table scheduler-map
Interface: so-5/0/0 (Index: 9, Map index: 17638, Num of queues: 2):
 Entry 0 (Scheduler index: 6090, Forwarding-class #: 0):
 Tx rate: 0 Kb (30%), Max buffer delay: 39 bytes (0%)
 Priority low
 PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low: 8742
 Policy is exact
 Entry 1 (Scheduler index: 38372, Forwarding-class #: 1):
 Traffic chunk: Max = 0 bytes, Min = 0 bytes
 Tx rate: 0 Kb (40%), Max buffer delay: 68 bytes (0%)

```

## show class-of-service interface

---

**Syntax**    `show class-of-service interface`  
              `<comprehensive | detail> <interface-name>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              Forwarding class map information added in Junos OS Release 9.4.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.  
                              Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
                              Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.  
                              Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**    Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

**NOTE:** On routing platforms with dual Routing Engines, running this command on the backup Routing Engine, with or without any of the available options, is not supported and produces the following error message:

**error: the class-of-service subsystem is not running**

**Options**    **none**—Display CoS associations for all physical and logical interfaces.

**comprehensive**—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

**detail**—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface

- Information about filters or policers for the logical interface
- CoS information about the logical interface

**interface-name**—(Optional) Display class-of-service (CoS) associations for the specified interface.

**none**—Display CoS associations for all physical and logical interfaces.

**Required Privilege Level** view

**Output Fields** [Table 609](#) describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

**Table 636: show class-of-service interface Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                                          |                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| Physical interface | Name of a physical interface.                                                                                                                                                                                                                                                                              |                                                      |
| Index              | Index of this interface or the internal index of this object.<br><br>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles and dynamic scheduler maps are larger for enhanced subscriber management than they are for legacy subscriber management. |                                                      |
| Dedicated Queues   | Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                                     | Number of queues you can configure on the interface. |
| Queues supported   | Number of queues you can configure on the interface.                                                                                                                                                                                                                                                       |                                                      |
| Queues in use      | Number of queues currently configured.                                                                                                                                                                                                                                                                     |                                                      |

Table 636: show class-of-service interface Output Fields (*continued*)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total non-default queues created</b>    | Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.<br><br>(Enhanced subscriber management for MX Series routers) This field is not displayed for enhanced subscriber management.                                             |
| <b>Rewrite Input IEEE Code-point</b>       | (QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.         |
| <b>Shaping rate</b>                        | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.                    |
| <b>Scheduler map</b>                       | Name of the output scheduler map associated with this interface.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.          |
| <b>Scheduler map forwarding class sets</b> | (QFX Series only) Name of the output fabric scheduler map associated with a QFabric system Interconnect device interface.                                                                                                                                                                             |
| <b>Input shaping rate</b>                  | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                                      |
| <b>Input scheduler map</b>                 | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                                        |
| <b>Chassis scheduler map</b>               | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                                     |
| <b>Rewrite</b>                             | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                                    |
| <b>Traffic-control-profile</b>             | Name of the associated traffic control profile.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic traffic control profile object is associated with a generated UID (for example, <b>TC_PROF_100_199_SERIES_UID1006</b> ) instead of with a subscriber interface. |
| <b>Classifier</b>                          | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                                          |
| <b>Forwarding-class-map</b>                | Name of the forwarding map associated with this interface.                                                                                                                                                                                                                                            |
| <b>Congestion-notification</b>             | (QFX Series and EX4600 switches only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                              |
| <b>Logical interface</b>                   | Name of a logical interface.                                                                                                                                                                                                                                                                          |
| <b>Object</b>                              | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , <b>Translation Table</b> (for IQE PICs only), or <b>traffic-class-map</b> (for T4000 routers with Type 5 FPCs).                                                |
| <b>Name</b>                                | Name of an object.                                                                                                                                                                                                                                                                                    |

Table 636: show class-of-service interface Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Speed</b>            | Speed at which the interface is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Loopback</b>         | Whether loopback is enabled and the type of loopback.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Source filtering</b> | Whether source filtering is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flow control</b>     | Whether flow control is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Auto-negotiation</b> | (Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status. <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Device flags</b>     | The <b>Device flags</b> field provides information about the physical device and displays one or more of the following values: <ul style="list-style-type: none"> <li>• <b>Down</b>—Device has been administratively disabled.</li> <li>• <b>Hear-Own-Xmit</b>—Device receives its own transmissions.</li> <li>• <b>Link-Layer-Down</b>—The link-layer protocol has failed to connect with the remote endpoint.</li> <li>• <b>Loopback</b>—Device is in physical loopback.</li> <li>• <b>Loop-Detected</b>—The link layer has received frames that it sent, thereby detecting a physical loopback.</li> <li>• <b>No-Carrier</b>—On media that support carrier recognition, no carrier is currently detected.</li> <li>• <b>No-Multicast</b>—Device does not support multicast traffic.</li> <li>• <b>Present</b>—Device is physically present and recognized.</li> <li>• <b>Promiscuous</b>—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.</li> <li>• <b>Quench</b>—Transmission on the device is quenched because the output buffer is overflowing.</li> <li>• <b>Recv-All-Multicasts</b>—Device is in multicast promiscuous mode and therefore provides no multicast filtering.</li> <li>• <b>Running</b>—Device is active and enabled.</li> </ul> |

Table 636: show class-of-service interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface flags</b> | <p>The <b>Interface flags</b> field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Admin-Test</b>—Interface is in test mode and some sanity checking, such as loop detection, is disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Hardware-Down</b>—Interface is nonfunctional or incorrectly connected.</li> <li>• <b>Link-Layer-Down</b>—Interface keepalives have indicated that the link is incomplete.</li> <li>• <b>No-Multicast</b>—Interface does not support multicast traffic.</li> <li>• <b>No-receive No-transmit</b>—Passive monitor mode is configured on the interface.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>Pop all MPLS labels from packets of depth</b>—MPLS labels are removed as packets arrive on an interface that has the <b>pop-all-labels</b> statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> <li>• <b>1</b>—Takes effect for incoming packets with one label only.</li> <li>• <b>2</b>—Takes effect for incoming packets with two labels only.</li> <li>• <b>[ 1 2 ]</b>—Takes effect for incoming packets with either one or two labels.</li> </ul> </li> <li>• <b>Promiscuous</b>—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.</li> <li>• <b>Recv-All-Multicasts</b>—Interface is in multicast promiscuous mode and provides no multicast filtering.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul> |
| <b>Flags</b>           | <p>The <b>Logical interface flags</b> field provides information about the logical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC Encapsulation</b>—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).</li> <li>• <b>Device-down</b>—Device has been administratively disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Clear-DF-Bit</b>—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit.</li> <li>• <b>Hardware-Down</b>—Interface protocol initialization failed to complete successfully.</li> <li>• <b>PFC</b>—Protocol field compression is enabled for the PPP session.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Encapsulation</b>   | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Admin</b>           | Administrative state of the interface ( <b>Up</b> or <b>Down</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Input Filter</b>            | Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Output Filter</b>           | Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Link flags</b>              | Provides information about the physical link and displays one or more of the following values: <ul style="list-style-type: none"> <li>• <b>ACFC</b>—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.</li> <li>• <b>Give-Up</b>—Link protocol does not continue connection attempts after repeated failures.</li> <li>• <b>Loose-LCP</b>—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-LMI</b>—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-NCP</b>—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.</li> <li>• <b>Keepalives</b>—Link protocol keepalives are enabled.</li> <li>• <b>No-Keepalives</b>—Link protocol keepalives are disabled.</li> <li>• <b>PFC</b>—Protocol field compression is configured. The PPP session negotiates the PFC option.</li> </ul> |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>CoS queues</b>              | Number of CoS queues configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Statistics last cleared</b> | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 636: show class-of-service interface Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input errors</b>  | <p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul> |
| <b>Output errors</b> | <p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                |
| <b>Egress queues</b> | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 636: show class-of-service interface Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queue counters</b>                       | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                   |
| <b>SONET alarms</b><br><b>SONET defects</b> | <p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                         |

| Received SONET overhead                | Values of the received and transmitted SONET overhead: <ul style="list-style-type: none"> <li>• <b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1 and K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-N signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-N signal.</li> <li>• <b>Z3 and Z4</b>—Allocated for future use.</li> </ul>                                                                                                                                                                                  |
| Transmitted SONET overhead             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Received path trace                    | SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Transmitted path trace                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| Transmit rate     | Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Rate Limit        | <p>Rate limiting configuration of the queue. Possible values are :</p> <ul style="list-style-type: none"> <li><b>None</b>—No rate limit.</li> <li><b>exact</b>—Queue transmits at the configured rate.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Buffer size       | Delay buffer size in the queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Priority          | Scheduling priority configured as <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Excess Priority   | Priority of the excess bandwidth traffic on a scheduler: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Adjustment information</b> | <p>Display the assignment of shaping-rate adjustments on a scheduler node or queue.</p> <ul style="list-style-type: none"> <li>• <b>Adjusting application</b>—Application that is performing the shaping-rate adjustment. <ul style="list-style-type: none"> <li>• The adjusting application can appear as <b>ancp LS-0</b>, which is the Junos OS Access Node Control Profile process (<b>ancpd</b>) that performs shaping-rate adjustments on schedule nodes.</li> <li>• The adjusting application can also appear as <b>pppoe</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</li> </ul> </li> <li>• <b>Adjustment type</b>—Type of adjustment: <b>absolute</b> or <b>delta</b>.</li> <li>• <b>Configured shaping rate</b>—Shaping rate configured for the scheduler node or queue.</li> <li>• <b>Adjustment value</b>—Value of adjusted shaping rate.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment overhead-accounting mode</b>—Configured shaping mode: <b>frame</b> or <b>cell</b>.</li> <li>• <b>Adjustment overhead bytes</b>—Number of bytes that the ANCP agent adds to or subtracts from the actual downstream frame overhead before reporting the adjusted values to CoS.</li> <li>• <b>Adjustment target</b>—Level of shaping-rate adjustment performed: <b>node</b> or <b>queue</b>.</li> <li>• <b>Adjustment multicast index</b>—</li> </ul> |

## Sample Output

### show class-of-service interface (Physical)

```

user@host> show class-of-service interface so-0/2/3
Physical interface: so-0/2/3, Index: 135
Queues supported: 8, Queues in use: 4
Total non-default queues created: 4
Scheduler map: <default>, Index: 2032638653

Logical interface: fe-0/0/1.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000

```

| Object        | Name        | Type | Index |
|---------------|-------------|------|-------|
| Scheduler-map | <default>   |      | 27    |
| Rewrite       | exp-default | exp  | 21    |
| Classifier    | exp-default | exp  | 5     |

|                      |                      |     |   |

#### show class-of-service interface (Logical)

```
user@host> show class-of-service interface so-0/2/3.0
Logical interface: so-0/2/3.0, Index: 68, Dedicated Queues: no
Shaping rate: 32000
Object Name Type Index
Scheduler-map <default> 27
Rewrite exp-default exp 21
Classifier exp-default exp 5
Classifier ipprec-compatibility ip 8
Forwarding-class-map exp-default exp 5
```

#### show class-of-service interface (Gigabit Ethernet)

```
user@host> show class-of-service interface ge-6/2/0
Physical interface: ge-6/2/0, Index: 175
Queues supported: 4, Queues in use: 4
Scheduler map: <default>, Index: 2
Input scheduler map: <default>, Index: 3
Chassis scheduler map: <default-chassis>, Index: 4
```

#### show class-of-service interface (ANCP)

```
user@host> show class-of-service interface pp0.1073741842
Logical interface: pp0.1073741842, Index: 341
Object Name Type Index
Traffic-control-profile TCP-CVLAN Output 12408
Classifier dscp-ipv6-compatibility dscp-ipv6 9
Classifier ipprec-compatibility ip 13

Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 4000000
Adjustment value: 11228000
Adjustment overhead-accounting mode: Frame Mode
Adjustment overhead bytes: 50
Adjustment target: node
```

#### show class-of-service interface (PPPoE Interface)

```
user@host> show class-of-service interface pp0.1
Logical interface: pp0.1, Index: 85
Object Name Type Index
Traffic-control-profile tcp-pppoe.o.pp0.1 Output 2726446535
Classifier ipprec-compatibility ip 13

Adjusting application: PPPoE
Adjustment type: absolute
Adjustment value: 5000000
Adjustment overhead-accounting mode: cell
Adjustment target: node
```

#### show class-of-service interface (T4000 Routers with Type 5 FPCs)

```
user@host> show class-of-service interface xe-4/0/0
Physical interface: xe-4/0/0, Index: 153
Queues supported: 8, Queues in use: 4
Shaping rate: 5000000000 bps
Scheduler map: <default>, Index: 2
```

```

Congestion-notification: Disabled

| <b>Output Fields</b>            | <a href="#">Table 637</a> describes the output fields for the <b>show class-of-service scheduler-map</b> command. Output fields are listed in the approximate order in which they appear.                                    |

**Table 637: show class-of-service scheduler-map Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scheduler map</b>    | Name of the scheduler map.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.                                                                                        |
| <b>Index</b>            | Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.<br><br>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles are larger for enhanced subscriber management than they are for legacy subscriber management. |
| <b>Scheduler</b>        | Name of the scheduler.                                                                                                                                                                                                                                                                                                                        |
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                                                                                                                                                                                              |

Table 637: show class-of-service scheduler-map Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transmit rate</b>                    | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                                     |
| <b>Rate Limit</b>                       | Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.                                                                                                                          |
| <b>Maximum buffer delay</b>             | Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations. |
| <b>Priority</b>                         | Scheduling priority: <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                           |
| <b>Excess priority</b>                  | Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                                                                         |
| <b>Explicit Congestion Notification</b> | (QFX Series, OCX Series, and EX4600 switches only) Explicit congestion notification (ECN) state: <ul style="list-style-type: none"> <li>• Disable—ECN is disabled on the specified scheduler</li> <li>• Enable—ECN is enabled on the specified scheduler</li> </ul> ECN is disabled by default.            |
| <b>Adjust minimum</b>                   | Minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                        |
| <b>Adjust percent</b>                   | Bandwidth adjustment applied to a queue, in percent.                                                                                                                                                                                                                                                       |
| <b>Drop profiles</b>                    | Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.                                                                                                                                                                                             |
| <b>Loss priority</b>                    | Packet loss priority for drop profile assignment.                                                                                                                                                                                                                                                          |
| <b>Protocol</b>                         | Transport protocol for drop profile assignment.                                                                                                                                                                                                                                                            |
| <b>Name</b>                             | Name of the drop profile.                                                                                                                                                                                                                                                                                  |

## Sample Output

### show class-of-service scheduler-map

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84
```

```
Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
 Loss priority Protocol Index Name
 Low non-TCP 8724 aa-drop-profile
 Low TCP 9874 bb-drop-profile
 High non-TCP 8833 cc-drop-profile
 High TCP 8484 dd-drop-profile
```

Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class  
Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,  
Priority: high  
Drop profiles:

| Loss priority | Protocol | Index | Name            |
|---------------|----------|-------|-----------------|
| Low           | non-TCP  | 8724  | aa-drop-profile |
| Low           | TCP      | 9874  | bb-drop-profile |
| High          | non-TCP  | 8833  | cc-drop-profile |
| High          | TCP      | 8484  | dd-drop-profile |

## show class-of-service traffic-control-profile

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Shaping rate priority high</b>   | Configured shaping rate for high-priority traffic, in bps.                                                                                                                                                                                                                                                           |
| <b>Shaping rate priority medium</b> | Configured shaping rate for medium-priority traffic, in bps.                                                                                                                                                                                                                                                         |
| <b>Shaping rate priority low</b>    | Configured shaping rate for low-priority traffic, in bps.                                                                                                                                                                                                                                                            |
| <b>Shaping rate excess high</b>     | Configured shaping rate for high-priority excess traffic, in bps.                                                                                                                                                                                                                                                    |
| <b>Shaping rate excess low</b>      | Configured shaping rate for low-priority excess traffic, in bps.                                                                                                                                                                                                                                                     |
| <b>Scheduler map</b>                | Name of the associated scheduler map.<br><br>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.                                                    |
| <b>Delay Buffer rate</b>            | Configured delay buffer rate, in bps.                                                                                                                                                                                                                                                                                |

**Table 638: show class-of-service traffic-control-profile Output Fields (*continued*)**

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Excess rate</b>              | Configured excess rate, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Excess rate high</b>         | Configured excess rate for high priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Excess rate low</b>          | Configured excess rate for low priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Guaranteed rate</b>          | <p>Configured guaranteed rate, in bps or cps.</p> <p><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>cbr</b>—Guaranteed rate is equal to the configured peak rate in cps.</li> <li>• <b>rtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> <li>• <b>nrtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> </ul> |
| <b>Guaranteed rate burst</b>    | Configured burst size for the guaranteed rate, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>adjust-minimum</b>           | Configured minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>overhead accounting mode</b> | Configured shaping mode: <b>Frame Mode</b> or <b>Cell Mode</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Overhead bytes</b>           | Configured byte adjustment value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Adjust parent</b>            | <p>Configured shaping-rate adjustment for parent scheduler nodes. If enabled, this field appears.</p> <p><b>flow-aware</b> indicates that the parent scheduler node is adjusted only once per multicast channel.</p>                                                                                                                                                                                                                                                                                          |

## Sample Output

### show class-of-service traffic-control-profile

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
 Scheduler map: m1
 Delay Buffer rate: 500000
 Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
 Scheduler map: m2
 Delay Buffer rate: 600000
 Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
 Scheduler map: m3

```

```

Delay Buffer rate: 800000
Guaranteed rate: 3000000
.Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
Scheduler map: m4
Delay Buffer rate: 750000
Guaranteed rate: 4000000
..adjust-minimum 20000000

Traffic control profile: foo, Index: 57626
Shaping rate: 100000000
Scheduler map: <default>
Overhead accounting mode: Frame Mode
Frame mode overhead accounting bytes: -12
Adjust parent: flow-aware

```

#### show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
ATM Service: RTVBR
Scheduler map: m3
Shaping rate: 1000 cps
Shaping rate burst: 500 cells
Delay Buffer rate: 2000 cps
Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
ATM Service: UBR
Scheduler map: m3
overhead accounting mode: Frame Mode

```

#### show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
ATM Service: RTVBR
Shaping rate: 2000 cps
Shaping rate burst: 200 cells
Scheduler map: <default>
Delay Buffer rate: 1000 cps
Guaranteed rate: 1700 cps

```

#### show class-of-service traffic-control-profile (Enhanced Subscriber Management)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: TC_PROF_100_199_SERIES_UID1000, Index: 4294967313
Shaping rate: 11000000
Shaping rate burst: 1 bytes
Scheduler map: SMAP-1_UID1002
Delay Buffer rate: 5000000
Overhead accounting mode: Cell Mode
Frame mode overhead accounting bytes: -4
Cell mode overhead accounting bytes: 20

```

## show interfaces queue

---

**Syntax**    show interfaces queue  
              <aggregate | remaining-traffic>  
              <both-ingress-egress>  
              <egress>  
              <forwarding-class *forwarding-class*>  
              <ingress>  
              <interface-name *interface-name*>  
              <l2-statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **both-ingress-egress**, **egress**, and **ingress** options introduced in Junos OS Release 7.6.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              **l2-statistics** option introduced in Junos OS Release 12.1.  
                              Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Display class-of-service (CoS) queue information for physical interfaces.

**Options**    **none**—Show detailed CoS queue statistics for all physical interfaces.

**aggregate**—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

**both-ingress-egress**—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

**egress**—(Optional) Display egress queue statistics.

**forwarding-class *forwarding-class***—(Optional) Forwarding class name for this queue.  
                              Shows detailed CoS statistics for the queue associated with the specified forwarding class.

**ingress**—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

**interface-name *interface-name***—(Optional) Show detailed CoS queue statistics for the specified interface.

**l2-statistics**—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

**remaining-traffic**—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.

### Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 280](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in [Table 280](#).

Table 639: Layer 2 Overhead and Transmitted Packets or Byte Counts

| Protocol       | Fragmentation       |                                   | LFI |
|----------------|---------------------|-----------------------------------|-----|
|                | First fragmentation | Second to <i>n</i> fragmentations |     |
|                | Bytes               | Bytes                             |     |
| MLPPP (Long)   | 13                  | 12                                | 8   |
| MLPPP (short)  | 11                  | 10                                | 8   |
| MLFR (FRF15)   | 12                  | 10                                | 8   |
| MFR (FRF16)    | 10                  | 8                                 | -   |

## Layer 2 Statistics—Fragmentation Overhead Calculation

## MLPPP/MC-MLPPP Overhead details:

=====

## Fragment 1:

```

Outer PPP header : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
Inner PPP header : 1 byte
HDLC flag and FCS bytes : 4 bytes

```

## Fragments 2 .. n :

```

Outer PPP header : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
HDLC flag and FCS bytes : 4 bytes

```

## MLFR (FRF15) Overhead details:

=====

## Fragment 1:

```

Framereelay header : 2 bytes
Control,NLPID : 2 bytes
Fragmentaion header : 2 bytes
Inner proto : 2 bytes
HDLC flag and FCS : 4 bytes

```

## Fragments 2 ...n :

```

Framereelay header : 2 bytes
Control,NLPID : 2 bytes
Fragmentaion header : 2 bytes
HDLC flag and FCS : 4 bytes

```

## MFR (FRF16) Overhead details:

=====

Fragment 1:

|                     |   |         |
|---------------------|---|---------|
| Fragmentaion header | : | 2 bytes |
| Framereelay header  | : | 2 bytes |
| Inner proto         | : | 2 bytes |
| HDLC flag and FCS   | : | 4 bytes |

Fragments 2 ...n :

|                     |   |         |
|---------------------|---|---------|
| Fragmentaion header | : | 2 bytes |
| Framereelay header  | : | 2 bytes |
| HDLC flag and FCS   | : | 4 bytes |

## Overhead with LFI

MLPPP(Long & short sequence):

=====

|                   |   |         |
|-------------------|---|---------|
| Outer PPP header  | : | 4 bytes |
| HDLC flag and FCS | : | 4 bytes |

MLFR (FRF15):

=====

|                    |   |         |
|--------------------|---|---------|
| Framereelay header | : | 2 bytes |
| Control,NLPID      | : | 2 bytes |
| HDLC flag and FCS  | : | 4 bytes |

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

**remaining-traffic**—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

## Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs), Modular Port Concentrators (MPCs), or Enhanced Queuing DPCs, rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

**NOTE:** For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the [CLI Explorer](#).

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Forwarding classes</b>                                                                                                                           | Forwarding class name.                                                                                                                                                                                                                                                                                                                                                    |

Table 640: show interfaces queue Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queued Packets</b>       | <p>Number of packets queued to this queue.</p> <p><b>NOTE:</b> For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 3148</a>.</p> |
| <b>Queued Bytes</b>         | <p>Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 282</a>.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 3148</a>.</p>                                                                                                                                                                                                                                                                |
| <b>Transmitted Packets</b>  | <p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 3146</a></p>                                                                                                                                                                                          |
| <b>Transmitted Bytes</b>    | <p>Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 282</a>.</p> <p><b>NOTE:</b> On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 3146</a></p>                                                    |
| <b>Tail-dropped packets</b> | <p>Number of packets dropped because of tail drop.</p> <p><b>NOTE:</b> The <b>Tail-dropped packets</b> counter is not supported on the PTX Series Packet Transport Routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>RL-dropped packets</b>   | <p>Number of packets dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 3148</a>.</p> <p><b>NOTE:</b> The <b>RL-dropped packets</b> counter is not supported on the PTX Series Packet Transport Routers, and is omitted from the output.</p>                                                                                                                                                                            |
| <b>RL-dropped bytes</b>     | <p>Number of bytes dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 3148</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 640: show interfaces queue Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RED-dropped packets</b> | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| <b>RED-dropped bytes</b>   | <p>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see <a href="#">Table 282</a>.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Byte counts vary by interface hardware. [Table 282](#) shows how the byte counts on the outbound interfaces vary depending on the interface hardware. [Table 282](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 641: Byte Count by Interface Hardware

| Interface Hardware               | Output Level                | Byte Count Includes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Comments                                                                                                                                                                                                     |

## Sample Output

### show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the

command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

### show interfaces queue (Aggregated Ethernet on a T320 Router)

The following example shows that the aggregated Ethernet interface, **ae1**, has traffic on queues **af1** and **af12**:

```
user@host> show interfaces queue ae1
Physical interface: ae1, Enabled, Physical link is Up
 Interface index: 158, SNMP ifIndex: 33 Forwarding classes: 8 supported, 8 in use
Output queues: 8 supported, 8 in use
Queue: 0, Forwarding classes: be
 Queued:
 Packets : 5 0 pps
 Bytes : 242 0 bps
 Transmitted:
 Packets : 5 0 pps
 Bytes : 242 0 bps
 Tail-dropped packets : 0 0 pps
 RED-dropped packets : 0 0 pps
 RED-dropped bytes : 0 0 bps
Queue: 1, Forwarding classes: af1
 Queued:
 Packets : 42603765 595484 pps
```

```

Bytes : 5453281920 609776496 bps
Transmitted:
Packets : 42603765 595484 pps
Bytes : 5453281920 609776496 bps
Tail-dropped packets : 0 0 pps
RED-dropped packets : 0 0 pps
RED-dropped bytes : 0 0 bps

## show interfaces voq

**Syntax** `show interfaces voq interface-name  
<forwarding-class forwarding-class-name>  
<non-zero>  
<source-fpc source-fpc-number>`

**Release Information** Command introduced in Junos OS Release 14.1 for the PTX Series Routers  
Command introduced in Junos OS Release 15.1X53-D20 for QFX10000 switches.

**Description** Display the random early detection (RED) drop statistics from all ingress Packet Forwarding Engines associated with the specified physical egress interface. In the VOQ architecture, egress output queues (shallow buffers) buffer data in virtual queues on ingress Packet Forwarding Engines. In cases of congestion, you can use this command to identify which ingress Packet Forwarding Engine is the source of RED-dropped packets contributing to congestion.

**NOTE:** On the PTX Series routers and QFX10000 switches, these statistics include tail-dropped packets.

**Options** `interface interface-name`—Display the ingress VOQ RED drop statistics for the specified egress interface.

`forwarding-class forwarding-class-name`—Display VOQ RED drop statistics for a specified forwarding class.

`non-zero`—Display only non-zero VOQ RED drop statistics counters.

`source-fpc source-fpc-number`—Display VOQ RED drop statistics for the specified source FPC.

**Additional Information**

- On PTX Series routers, you can display VOQ statistics for only the WAN physical interface.
- VOQ statistics for aggregated physical interfaces are not supported. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can use the **show interfaces queue** command to identify the child link which is experiencing congestion and then view the VOQ statistics on the respective child link using the **show interfaces voq** command.

For information on virtual output queuing on PTX routers, see *Understanding Virtual Output Queues on PTX Series Packet Transport Routers*. For information on virtual output queueing on QFX10000 switches, see [“Understanding CoS Virtual Output Queues \(VOQs\) on QFX10000 Switches” on page 6724](#).

[show interfaces voq et-7/0/0 \(For a Specific Forwarding Class and Non-Zero\) on page 7391](#)

**Output Fields** [Table 615](#) lists the output fields for the show interfaces queue command. Output fields are listed in the approximate order in which they appear.

**Table 642: show interfaces voq Output Fields**

| Field Name          | Field Description                                                                                                                                                                            |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface  | Name of the physical interface.                                                                                                                                                              |
| Enabled             | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                         |
| Interface index     | Physical interface's index number, which reflects its initialization sequence.                                                                                                               |
| SNMP ifIndex        | SNMP index number for the interface.                                                                                                                                                         |
| Queue               | Egress queue number.                                                                                                                                                                         |
| Forwarding classes  | Forwarding class name.                                                                                                                                                                       |
| FPC number          | Number of the Flexible PIC Concentrator (FPC) located on ingress.                                                                                                                            |
| PFE                 | Number of the Packet Forwarding Engine providing virtual output queues on the ingress.                                                                                                       |
| RED-dropped packets | Number of packets per second (pps) dropped because of random early detection (RED).<br><br><b>NOTE:</b> On the PTX Series routers, these statistics include tail-dropped packets.            |
| RED-dropped bytes   | Number of bytes per second dropped because of RED. The byte counts vary by interface hardware.<br><br><b>NOTE:</b> On the PTX Series routers, these statistics include tail-dropped packets. |

## Sample Output

### show interfaces voq (For a Specific Physical Interface) (PTX Series Routers)

The following example shows ingress RED-dropped statistics for the egress Ethernet interface configured on port 0 of Physical Interface Card (PIC) 0, located on the FPC in slot 7.

The sample output below shows that the cause of the congestion is ingress Packet Forwarding Engine PFE 0, which resides on FPC number 4, as denoted by the count of RED-dropped packets and RED-dropped bytes for egress queue 0, forwarding classes best-effort and egress queue 3, forwarding class network control.

| <b>Output Fields</b>            | <a href="#">Table 643</a> describes the output fields for the <b>show class-of-service congestion-notification</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 643: show class-of-service congestion-notification Output Fields**

| Field Name          | Field Description                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Type</b>         | Type of interfaces on which congestion notification is applied. Congestion notification is applied on input interfaces. |
| <b>Index</b>        | Index of this congestion notification profile.                                                                          |
| <b>Name</b>         | Name of the congestion notification profile.                                                                            |
| <b>Cable Length</b> | Length of the attached physical cable in meters. The default value is 100 meters.                                       |
| <b>Priority</b>     | IEEE 802.1p code point.                                                                                                 |
| <b>PFC</b>          | State of PFC for the corresponding code point, either <b>enabled</b> or <b>disabled</b> .                               |

Table 643: show class-of-service congestion-notification Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MRU</b>                 | <p>Maximum receive unit of the interface in bytes. (Incoming traffic that exceeds the MRU size of an interface is dropped.) The default values are:</p> <ul style="list-style-type: none"> <li>• 2500 bytes for priority 3 traffic</li> <li>• 9216 bytes for priority 4 traffic</li> </ul> <p><b>NOTE:</b> If you configure flow control on a priority that is not one of the default flow control priorities, the default MRU value is 2500 bytes. For example, if you configure flow control on priority 5 and you do not configure an MRU value, the default MRU value is 2500 bytes.</p> |
| <b>Flow-Control-Queues</b> | <p>Output queue mapping to IEEE 802.1p code points (priorities). Explicit output queue to priority mapping overwrites the default configuration, and only explicitly mapped queues are displayed in the output. Flow control is only enabled on a queue when you enable PFC on the corresponding priority in the input stanza of the congestion notification profile.</p>                                                                                                                                                                                                                    |
