## Junos<sup>®</sup> OS

### Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices

Release  
15.1

---

Modified: 2016-08-03

Juniper Networks, Inc.  
1133 Innovation Way  
Sunnyvale, California 94089  
USA

#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Table of Contents

	About the Documentation . . . . .	xxxi
	Documentation and Release Notes . . . . .	xxxi
	Supported Platforms . . . . .	xxxi
	Using the Examples in This Manual . . . . .	xxxii
	Merging a Full Example . . . . .	xxxii
	Merging a Snippet . . . . .	xxxiii
	Documentation Conventions . . . . .	xxxiii
	Documentation Feedback . . . . .	xxxv
	Requesting Technical Support . . . . .	xxxvi
	Self-Help Online Tools and Resources . . . . .	xxxvi
	Opening a Case with JTAC . . . . .	xxxvi
<b>Part 1</b>	<b>Overview</b>	
<b>Chapter 1</b>	<b>Understanding the Junos OS Policy Framework . . . . .</b>	<b>3</b>
	Policy Framework Overview . . . . .	3
	Routing Policy and Firewall Filters . . . . .	3
	Reasons to Create a Routing Policy . . . . .	4
	Router Flows Affected by Policies . . . . .	4
	Control Points . . . . .	7
	Policy Components . . . . .	8
	Comparison of Routing Policies and Firewall Filters . . . . .	8
<b>Part 2</b>	<b>Configuring Routing Policies</b>	
<b>Chapter 2</b>	<b>Understanding How Routing Policies Control Routing Information and Packet Flows . . . . .</b>	<b>15</b>
	Understanding Routing Policies . . . . .	15
	Importing and Exporting Routes . . . . .	15
	Active and Inactive Routes . . . . .	17
	Explicitly Configured Routes . . . . .	17
	Dynamic Database . . . . .	17
	Protocol Support for Import and Export Policies . . . . .	18
	Example: Applying Routing Policies at Different Levels of the BGP Hierarchy . . . . .	19
	Default Routing Policies . . . . .	27
	OSPF and IS-IS Import Policies . . . . .	28
	Automatic Export . . . . .	29
	Example: Configuring a Conditional Default Route Policy . . . . .	29

<b>Chapter 3</b>	<b>Evaluating Routing Policies Using Match Conditions, Actions, Terms, and Expressions</b>	<b>37</b>
	How a Routing Policy Is Evaluated	37
	Categories of Routing Policy Match Conditions	38
	Routing Policy Match Conditions	40
	Route Filter Match Conditions	49
	Actions in Routing Policy Terms	51
	Configuring Flow Control Actions	52
	Configuring Actions That Manipulate Route Characteristics	53
	Configuring the Default Action in Routing Policies	60
	Example: Configuring the Default Action in a Routing Policy	60
	Configuring a Final Action in Routing Policies	61
	Logging Matches to a Routing Policy Term	62
	Configuring Separate Actions for Routes in Route Lists	62
	Summary of Routing Policy Actions	62
	Example: Configuring a Routing Policy to Advertise the Best External Route to Internal Peers	65
	Example: Configuring BGP to Advertise Inactive Routes	73
	Example: Using Routing Policy to Set a Preference Value for BGP Routes	79
	Example: Enabling BGP Route Advertisements	84
	Example: Rejecting Known Invalid Routes	91
	Example: Using Routing Policy in an ISP Network	93
	Understanding Policy Expressions	141
	Policy Expression Examples	143
	Policy Expression Evaluation	144
	Evaluating Policy Expressions	145
<b>Chapter 4</b>	<b>Evaluating Complex Cases Using Policy Chains and Subroutines</b>	<b>147</b>
	Understanding How a Routing Policy Chain Is Evaluated	147
	Example: Configuring Policy Chains and Route Filters	148
	Understanding Policy Subroutines in Routing Policy Match Conditions	159
	Configuring Subroutines	160
	Possible Consequences of Termination Actions in Subroutines	160
	How a Routing Policy Subroutine Is Evaluated	162
	Example: Configuring a Policy Subroutine	164
<b>Chapter 5</b>	<b>Configuring Route Filters and Prefix Lists as Match Conditions</b>	<b>175</b>
	Understanding Route Filters for Use in Routing Policy Match Conditions	175
	Radix Trees	176
	Configuring Route Filters	178
	How Route Filters Are Evaluated in Routing Policy Match Conditions	183
	How Prefix Order Affects Route Filter Evaluation	184
	How an Address Mask Match Type Is Evaluated	185
	Common Configuration Problem with the Longest-Match Lookup	185
	Route Filter Examples	186
	Rejecting Routes with Specific Destination Prefixes and Mask Lengths	187
	Rejecting Routes with a Mask Length Greater than Eight	187
	Rejecting Routes with Mask Length Between 26 and 29	187

Rejecting Routes from Specific Hosts . . . . .	187
Accepting Routes with a Defined Set of Prefixes . . . . .	188
Rejecting Routes with a Defined Set of Prefixes . . . . .	188
Rejecting Routes with Prefixes Longer than 24 Bits . . . . .	189
Rejecting PIM Multicast Traffic Joins . . . . .	189
Rejecting PIM Traffic . . . . .	190
Accepting Incoming IPv4 Routes by Applying an Address Mask to the Route Address and the Destination Match Prefix . . . . .	190
Accepting Incoming IPv4 Routes with Similar Patterns But Different Prefix Lengths . . . . .	192
Evaluation of an Address Mask Match Type with Longest-Match Lookup . . . . .	192
Walkup for Route Filters Overview . . . . .	194
Configuring Walkup for Route Filters to Improve Operational Efficiency . . . . .	197
Example: Configuring Walkup for Route Filters Globally to Improve Operational Efficiency . . . . .	202
Example: Configuring Walkup for Route Filters Locally to Improve Operational Efficiency . . . . .	207
Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF . . . . .	212
Example: Configuring the MED Using Route Filters . . . . .	217
Example: Configuring Layer 3 VPN Protocol Family Qualifiers for Route Filters . . . . .	230
Understanding Prefix Lists for Use in Routing Policy Match Conditions . . . . .	233
Configuring Prefix Lists . . . . .	234
How Prefix Lists Are Evaluated in Routing Policy Match Conditions . . . . .	235
Configuring Prefix List Filters . . . . .	236
Example: Configuring Routing Policy Prefix Lists . . . . .	236
<b>Chapter 6</b>	
<b>Configuring AS Paths as Match Conditions . . . . .</b>	<b>249</b>
Understanding AS Path Regular Expressions for Use as Routing Policy Match Conditions . . . . .	249
Configuration of AS Path Regular Expressions . . . . .	249
Configuring a Null AS Path . . . . .	253
How AS Path Regular Expressions Are Evaluated . . . . .	254
Examples: Configuring AS Path Regular Expressions . . . . .	254
Example: Using AS Path Regular Expressions . . . . .	255
Understanding Prepending AS Numbers to BGP AS Paths . . . . .	264
Example: Configuring a Routing Policy to Prepend the AS Path . . . . .	265
Understanding Adding AS Numbers to BGP AS Paths . . . . .	268
Example: Advertising Multiple Paths in BGP . . . . .	269

<b>Chapter 7</b>	<b>Configuring Communities as Match Conditions . . . . .</b>	<b>295</b>
	Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions . . . . .	295
	Understanding How to Define BGP Communities and Extended Communities . . . . .	296
	Defining BGP Communities for Use in Routing Policy Match Conditions . . . . .	297
	Using UNIX Regular Expressions in Community Names . . . . .	298
	Defining BGP Extended Communities for Use in Routing Policy Match Conditions . . . . .	300
	Examples: Defining BGP Extended Communities . . . . .	301
	How BGP Communities and Extended Communities Are Evaluated in Routing Policy Match Conditions . . . . .	302
	Multiple Matches . . . . .	303
	Inverting Community Matches . . . . .	304
	Extended Community Type . . . . .	304
	Multiple Communities Are Matched with Ex-OR Logic . . . . .	305
	Including BGP Communities and Extended Communities in Routing Policy Match Conditions . . . . .	306
	Example: Configuring Communities in a Routing Policy . . . . .	307
	Example: Configuring Extended Communities in a Routing Policy . . . . .	321
	Example: Configuring a Routing Policy Based on the Number of BGP Communities . . . . .	330
	Example: Configuring a Routing Policy That Removes BGP Communities . . . . .	337
<b>Chapter 8</b>	<b>Increasing Network Stability with BGP Route Flapping Actions . . . . .</b>	<b>347</b>
	Understanding Damping Parameters . . . . .	347
	Using Routing Policies to Damp BGP Route Flapping . . . . .	348
	Configuring BGP Flap Damping Parameters . . . . .	349
	Specifying BGP Flap Damping as the Action in Routing Policy Terms . . . . .	351
	Disabling Damping for Specific Address Prefixes . . . . .	351
	Disabling Damping for a Specific Address Prefix . . . . .	352
	Configuring BGP Flap Damping . . . . .	352
	Example: Configuring BGP Route Flap Damping Parameters . . . . .	354
	Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family . . . . .	363
<b>Chapter 9</b>	<b>Tracking Traffic Usage with Source Class Usage and Destination Class Usage Actions . . . . .</b>	<b>373</b>
	Understanding Source Class Usage and Destination Class Usage Options . . . . .	373
	Source Class Usage Overview . . . . .	375
	Guidelines for Configuring SCU . . . . .	376
	System Requirements for SCU . . . . .	377
	Terms and Acronyms for SCU . . . . .	378
	Roadmap for Configuring SCU . . . . .	378
	Roadmap for Configuring SCU with Layer 3 VPNs . . . . .	379
	Configuring Route Filters and Source Classes in a Routing Policy . . . . .	380
	Applying the Policy to the Forwarding Table . . . . .	380
	Enabling Accounting on Inbound and Outbound Interfaces . . . . .	381
	Configuring Input SCU on the vt Interface of the Egress PE Router . . . . .	382

	Mapping the SCU-Enabled vt Interface to the VRF Instance . . . . .	382
	Configuring SCU on the Output Interface . . . . .	383
	Associating an Accounting Profile with SCU Classes . . . . .	384
	Verifying Your SCU Accounting Profile . . . . .	384
	SCU Configuration . . . . .	385
	Configuring SCU . . . . .	385
	Verifying Your Work . . . . .	388
	SCU with Layer 3 VPNs Configuration . . . . .	393
	Configuring SCU in a Layer 3 VPN . . . . .	393
	Verifying Your Work . . . . .	400
	Example: Grouping Source and Destination Prefixes into a Forwarding Class . .	401
<b>Chapter 10</b>	<b>Avoiding Traffic Routing Threats with Conditional Routing Policies . . . .</b>	<b>411</b>
	Conditional Advertisement Enabling Conditional Installation of Prefixes in a Routing Table . . . . .	412
	Conditional Advertisement Enabling Conditional Installation of Prefixes Use Cases . . . . .	414
	Example: Configuring a Routing Policy for Conditional Advertisement Enabling Conditional Installation of Prefixes in a Routing Table . . . . .	415
<b>Chapter 11</b>	<b>Protecting Against DoS Attacks by Forwarding Traffic to the Discard Interface . . . . .</b>	<b>433</b>
	Understanding Forwarding Packets to the Discard Interface . . . . .	433
	Example: Forwarding Packets to the Discard Interface . . . . .	434
<b>Chapter 12</b>	<b>Improving Commit Times with Dynamic Routing Policies . . . . .</b>	<b>445</b>
	Understanding Dynamic Routing Policies . . . . .	445
	Configuring Routing Policies and Policy Objects in the Dynamic Database . . . . .	446
	Configuring Routing Policies Based on Dynamic Database Configuration . .	446
	Applying Dynamic Routing Policies to BGP . . . . .	448
	Preventing Reestablishment of BGP Peering Sessions After NSR Routing Engine Switchover . . . . .	448
	Example: Configuring Dynamic Routing Policies . . . . .	449
<b>Chapter 13</b>	<b>Testing Before Applying Routing Policies . . . . .</b>	<b>463</b>
	Understanding Routing Policy Tests . . . . .	463
	Example: Testing a Routing Policy . . . . .	463
	Example: Testing a Routing Policy with Complex Regular Expressions . . . . .	464
<b>Part 3</b>	<b>Configuring Firewall Filters</b>	
<b>Chapter 14</b>	<b>Understanding How Firewall Filters Protect Your Network . . . . .</b>	<b>473</b>
	Firewall Filters Overview . . . . .	473
	Router Data Flow Overview . . . . .	474
	Flow of Routing Information . . . . .	474
	Flow of Data Packets . . . . .	474
	Flow of Local Packets . . . . .	475
	Interdependent Flows of Routing Information and Packets . . . . .	475

Stateless Firewall Filter Overview .....	476
Packet Flow Control .....	476
Data Packet Flow Control .....	476
Local Packet Flow Control .....	476
Stateless and Stateful Firewall Filters .....	476
Purpose of Stateless Firewall Filters .....	477
Understanding How to Use Standard Firewall Filters .....	477
Using Standard Firewall Filters to Affect Local Packets .....	477
Trusted Sources .....	477
Flood Prevention .....	478
Using Standard Firewall Filters to Affect Data Packets .....	478
Stateless Firewall Filter Types .....	478
Firewall Filters .....	478
Service Filters .....	479
Simple Filters .....	479
Stateless Firewall Filter Components .....	479
Protocol Family .....	479
Filter Type .....	480
Terms .....	481
Match Conditions .....	482
Actions .....	483
Filter-Terminating Actions .....	483
Nonterminating Actions .....	483
Flow Control Action .....	484
Stateless Firewall Filter Application Points .....	485
How Standard Firewall Filters Evaluate Packets .....	488
Firewall Filter Packet Evaluation Overview .....	488
Packet Evaluation at a Single Firewall Filter .....	489
Best Practice: Explicitly Accept Any Traffic That Is Not Specifically Discarded .....	490
Best Practice: Explicitly Reject Any Traffic That Is Not Specifically Accepted .....	491
Multiple Firewall Filters Attached to a Single Interface .....	491
Single Firewall Filter Attached to Multiple Interfaces .....	491
Understanding Firewall Filter Fast Lookup Filter .....	492
Guidelines for Configuring Firewall Filters .....	492
Statement Hierarchy for Configuring Firewall Filters .....	493
Firewall Filter Protocol Families .....	494
Firewall Filter Names and Options .....	494
Firewall Filter Terms .....	495
Firewall Filter Match Conditions .....	495
Firewall Filter Actions .....	497
Guidelines for Applying Standard Firewall Filters .....	498
Applying Firewall Filters Overview .....	498
Statement Hierarchy for Applying Firewall Filters .....	499
Protocol-Independent Firewall Filters on MX Series Routers .....	499
All Other Firewall Filters on Logical Interfaces .....	500

	Restrictions on Applying Firewall Filters . . . . .	500
	Number of Input and Output Filters Per Logical Interface . . . . .	500
	MPLS and Layer 2 CCC Firewall Filters in Lists . . . . .	501
	Layer 2 CCC Firewall Filters on MX Series Routers and EX Series Switches . . . . .	501
	Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers . . . . .	501
	Supported Standards for Filtering . . . . .	504
<b>Chapter 15</b>	<b>Firewall Filter Match Conditions and Actions . . . . .</b>	<b>505</b>
	Standard Firewall Filter Match Conditions and Actions on ACX Series Routers	
	Overview . . . . .	506
	Firewall Filter Flexible Match Conditions . . . . .	508
	Statement Hierarchy . . . . .	508
	Flexible Filter Match Types . . . . .	509
	Flexible Filter Match Start Locations . . . . .	510
	Firewall Filter Match Conditions Based on Numbers or Text Aliases . . . . .	510
	Matching on a Single Numeric Value . . . . .	511
	Matching on a Range of Numeric Values . . . . .	511
	Matching on a Text Alias for a Numeric Value . . . . .	511
	Matching on a List of Numeric Values or Text Aliases . . . . .	511
	Firewall Filter Match Conditions Based on Bit-Field Values . . . . .	511
	Match Conditions for Bit-Field Values . . . . .	512
	Match Conditions for Common Bit-Field Values or Combinations . . . . .	512
	Logical Operators for Bit-Field Values . . . . .	513
	Matching on a Single Bit-Field Value or Text Alias . . . . .	514
	Matching on Multiple Bit-Field Values or Text Aliases . . . . .	515
	Matching on a Negated Bit-Field Value . . . . .	515
	Matching on the Logical OR of Two Bit-Field Values . . . . .	515
	Matching on the Logical AND of Two Bit-Field Values . . . . .	516
	Grouping Bit-Field Match Conditions . . . . .	516
	Firewall Filter Match Conditions Based on Address Fields . . . . .	516
	Implied Match on the '0/0 except' Address for Firewall Filter Match	
	Conditions Based on Address Fields . . . . .	517
	Matching an Address Field to a Subnet Mask or Prefix . . . . .	517
	IPv4 Subnet Mask Notation . . . . .	517
	Prefix Notation . . . . .	517
	Default Prefix Length for IPv4 Addresses . . . . .	517
	Default Prefix Length for IPv6 Addresses . . . . .	517
	Default Prefix Length for MAC Addresses . . . . .	518
	Matching an Address Field to an Excluded Value . . . . .	518
	Excluding IP Addresses in IPv4 or IPv6 Traffic . . . . .	518
	Excluding IP Addresses in VPLS or Layer 2 Bridging Traffic . . . . .	519
	Excluding MAC Addresses in VPLS or Layer 2 Bridging Traffic . . . . .	519
	Excluding All Addresses Requires an Explicit Match on the '0/0' Address . . . . .	520
	Matching Either IP Address Field to a Single Value . . . . .	521
	Matching Either IP Address Field in IPv4 or IPv6 Traffic . . . . .	521
	Matching Either IP Address Field in VPLS or Layer 2 Bridging Traffic . . . . .	521

	Matching an Address Field to Noncontiguous Prefixes . . . . .	522
	Matching an Address Field to a Prefix List . . . . .	523
	Firewall Filter Match Conditions Based on Address Classes . . . . .	524
	Source-Class Usage . . . . .	524
	Destination-Class Usage . . . . .	524
	Guidelines for Applying SCU or DCU Firewall Filters to Output Interfaces . .	525
	Firewall Filter Match Conditions for Protocol-Independent Traffic . . . . .	525
	Firewall Filter Match Conditions for IPv4 Traffic . . . . .	527
	Standard Firewall Filter Match Conditions for IPv4 Traffic on ACX Series Routers . . . . .	537
	Firewall Filter Match Conditions for IPv6 Traffic . . . . .	541
	Firewall Filter Match Conditions for MPLS Traffic . . . . .	550
	Standard Firewall Filter Match Conditions for MPLS Traffic on ACX Series Routers . . . . .	551
	Firewall Filter Match Conditions for MPLS-Tagged IPv4 or IPv6 Traffic . . . . .	552
	Matching on IPv4 or IPv6 Packet Header Address or Port Fields in MPLS Flows . . . . .	552
	IP Address Match Conditions for MPLS Traffic . . . . .	553
	IP Port Match Conditions for MPLS Traffic . . . . .	554
	Firewall Filter Match Conditions for VPLS Traffic . . . . .	554
	Firewall Filter Match Conditions for Layer 2 CCC Traffic . . . . .	565
	Firewall Filter Match Conditions for Layer 2 Bridging Traffic . . . . .	569
	Firewall Filter Nonterminating Actions . . . . .	578
	Standard Firewall Filter Nonterminating Actions on ACX Series Routers . . . . .	585
	Firewall Filter Terminating Actions . . . . .	587
	Standard Firewall Filter Terminating Actions on ACX Series Routers . . . . .	592
<b>Chapter 16</b>	<b>Applying Firewall Filters to Routing Engine Traffic . . . . .</b>	<b>595</b>
	Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List . . . . .	595
	Example: Configuring a Stateless Firewall Filter to Accept Traffic from Trusted Sources . . . . .	598
	Example: Configuring a Filter to Block Telnet and SSH Access . . . . .	604
	Example: Configuring a Filter to Block TFTP Access . . . . .	608
	Example: Configuring a Filter to Accept Packets Based on IPv6 TCP Flags . . . . .	611
	Example: Filtering Packets Received on an Interface Set . . . . .	614
	Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers . . . . .	620
	Example: Configuring a Stateless Firewall Filter to Protect Against TCP and ICMP Floods . . . . .	626
<b>Chapter 17</b>	<b>Applying Firewall Filters to Transit Traffic . . . . .</b>	<b>637</b>
	Statement Hierarchy for Configuring Firewall Fast Lookup Filters . . . . .	637
	Statement Hierarchy for Configuring Interface-Specific Firewall Filters . . . . .	638
	Statement Hierarchy for Applying Interface-Specific Firewall Filters . . . . .	639
	Example: Configuring a Filter to Match on IPv6 Flags . . . . .	639
	Example: Configuring a Filter to Match on Port and Protocol Fields . . . . .	640
	Example: Configuring a Filter to Count Accepted and Rejected Packets . . . . .	644
	Example: Configuring a Filter to Count and Discard IP Options Packets . . . . .	647
	Example: Configuring a Filter to Count IP Options Packets . . . . .	650

	Example: Configuring a Filter to Count and Sample Accepted Packets . . . . .	655
	Example: Configuring a Filter to Set the DSCP Bit to Zero . . . . .	659
	Example: Configuring a Filter to Match on Two Unrelated Criteria . . . . .	662
	Example: Configuring a Filter to Accept DHCP Packets Based on Address . . . . .	665
	Example: Configuring a Filter to Accept OSPF Packets from a Prefix . . . . .	667
	Example: Configuring a Stateless Firewall Filter to Handle Fragments . . . . .	670
	Configuring a Firewall Filter to Prevent or Allow IPv4 Packet Fragmentation . . . . .	675
	Configuring a Firewall Filter to Discard Ingress IPv6 Packets with a Mobility Extension Header . . . . .	676
	Example: Configuring a Rate-Limiting Filter Based on Destination Class . . . . .	676
<b>Chapter 18</b>	<b>Configuring Firewall Filters in Logical Systems . . . . .</b>	<b>681</b>
	Firewall Filters in Logical Systems Overview . . . . .	681
	Logical Systems . . . . .	681
	Firewall Filters in Logical Systems . . . . .	681
	Identifiers for Firewall Objects in Logical Systems . . . . .	682
	Guidelines for Configuring and Applying Firewall Filters in Logical Systems . . . . .	682
	Statement Hierarchy for Configuring Firewall Filters in Logical Systems . . . . .	682
	Filter Types in Logical Systems . . . . .	683
	Firewall Filter Protocol Families in Logical Systems . . . . .	683
	Firewall Filter Match Conditions in Logical Systems . . . . .	684
	Firewall Filter Actions in Logical Systems . . . . .	684
	Statement Hierarchy for Applying Firewall Filters in Logical Systems . . . . .	684
	References from a Firewall Filter in a Logical System to Subordinate Objects . . . . .	685
	Resolution of References from a Firewall Filter to Subordinate Objects . . . . .	685
	Valid Reference from a Firewall Filter to a Subordinate Object . . . . .	685
	References from a Firewall Filter in a Logical System to Nonfirewall Objects . . . . .	686
	Resolution of References from a Firewall Filter to Nonfirewall Objects . . . . .	686
	Valid Reference to a Nonfirewall Object Outside of the Logical System . . . . .	687
	References from a Nonfirewall Object in a Logical System to a Firewall Filter . . . . .	688
	Resolution of References from a Nonfirewall Object to a Firewall Filter . . . . .	689
	Invalid Reference to a Firewall Filter Outside of the Logical System . . . . .	689
	Valid Reference to a Firewall Filter Within the Logical System . . . . .	690
	Valid Reference to a Firewall Filter Outside of the Logical System . . . . .	692
	Example: Configuring Filter-Based Forwarding on Logical Systems . . . . .	693
	Example: Configuring a Stateless Firewall Filter to Protect a Logical System Against ICMP Floods . . . . .	703
	Unsupported Firewall Filter Statements for Logical Systems . . . . .	707
	Unsupported Actions for Firewall Filters in Logical Systems . . . . .	708
<b>Chapter 19</b>	<b>Configuring Firewall Filter Accounting and Logging . . . . .</b>	<b>713</b>
	Accounting for Firewall Filters Overview . . . . .	713
	System Logging Overview . . . . .	714
	System Logging of Events Generated for the Firewall Facility . . . . .	714
	Logging of Packet Headers Evaluated by a Firewall Filter Term . . . . .	717
	Statement Hierarchy for Configuring Firewall Filter Accounting Profiles . . . . .	718
	Statement Hierarchy for Applying Firewall Filter Accounting Profiles . . . . .	718
	Example: Configuring Statistics Collection for a Firewall Filter . . . . .	719
	Example: Configuring Logging for a Firewall Filter Term . . . . .	724

<b>Chapter 20</b>	<b>Attaching Multiple Firewall Filters to a Single Interface . . . . .</b>	<b>729</b>
	Understanding Multiple Firewall Filters in a Nested Configuration . . . . .	729
	The Challenge: Simplify Large-Scale Firewall Filter Administration . . . . .	729
	A Solution: Configure Nested References to Firewall Filters . . . . .	730
	Configuration of Nested Firewall Filters . . . . .	730
	Application of Nested Firewall Filters to a Router or Switch Interface . . . . .	730
	Guidelines for Nesting References to Multiple Firewall Filters . . . . .	730
	Statement Hierarchy for Configuring Nested Firewall Filters . . . . .	731
	Filter-Defining Terms and Filter-Referencing Terms . . . . .	731
	Types of Filters Supported in Nested Configurations . . . . .	731
	Number of Filter References in a Single Filter . . . . .	732
	Depth of Filter Nesting . . . . .	732
	Understanding Multiple Firewall Filters Applied as a List . . . . .	732
	The Challenge: Simplify Large-Scale Firewall Filter Administration . . . . .	732
	A Solution: Apply Lists of Firewall Filters . . . . .	733
	Configuration of Multiple Filters for Filter Lists . . . . .	733
	Application of Filter Lists to a Router Interface . . . . .	733
	Interface-Specific Names for Filter Lists . . . . .	734
	How Filter Lists Evaluate Packets When the Matched Term Includes	
	Terminating or Next Term Actions . . . . .	734
	How Filter Lists Evaluate Packets When the List Includes	
	Protocol-Independent and IP Firewall Filters . . . . .	735
	Guidelines for Applying Multiple Firewall Filters as a List . . . . .	736
	Statement Hierarchy for Applying Lists of Multiple Firewall Filters . . . . .	736
	Filter Input Lists and Output Lists for Router or Switch Interfaces . . . . .	736
	Types of Filters Supported in Lists . . . . .	736
	Restrictions on Applying Filter Lists for MPLS or Layer 2 CCC Traffic . . . . .	737
	Example: Applying Lists of Multiple Firewall Filters . . . . .	737
	Example: Nesting References to Multiple Firewall Filters . . . . .	742
<b>Chapter 21</b>	<b>Attaching a Single Firewall Filter to Multiple Interfaces . . . . .</b>	<b>747</b>
	Interface-Specific Firewall Filter Instances Overview . . . . .	747
	Instantiation of Interface-Specific Firewall Filters . . . . .	747
	Interface-Specific Names for Firewall Filter Instances . . . . .	748
	Interface-Specific Firewall Filter Counters . . . . .	748
	Interface-Specific Firewall Filter Policers . . . . .	749
	Filtering Packets Received on a Set of Interface Groups Overview . . . . .	749
	Filtering Packets Received on an Interface Set Overview . . . . .	750
	Statement Hierarchy for Defining an Interface Set . . . . .	750
	Statement Hierarchy for Configuring a Filter to Match on an Interface Set . . . . .	751
	Statement Hierarchy for Assigning Interfaces to Interface Groups . . . . .	751
	Statement Hierarchy for Configuring a Filter to Match on a Set of Interface	
	Groups . . . . .	752
	Statement Hierarchy for Applying Filters to an Interface Group . . . . .	753
	Example: Configuring Interface-Specific Firewall Filter Counters . . . . .	754
	Example: Configuring a Stateless Firewall Filter on an Interface Group . . . . .	758

<b>Chapter 22</b>	<b>Configuring Filter-Based Tunneling Across IP Networks . . . . .</b>	<b>767</b>
	Understanding Filter-Based Tunneling Across IPv4 Networks . . . . .	767
	Understanding Filter-Based Tunneling Across IPv4 Networks . . . . .	767
	Ingress Firewall Filter on the Ingress PE Router . . . . .	768
	Ingress Firewall Filter on the Egress PE Router . . . . .	768
	Characteristics of Filter-Based Tunneling Across IPv4 Networks . . . . .	768
	Unidirectional Tunneling . . . . .	768
	Transit Traffic Payloads . . . . .	768
	Compact Configuration for Multiple GRE Tunnels . . . . .	769
	Tunneling with Firewall Filters and Tunneling with Tunnel Interfaces . . . . .	769
	Tunnel Security . . . . .	769
	Forwarding Performance . . . . .	769
	Forwarding Scalability . . . . .	770
	Firewall Filter-Based L2TP Tunneling in IPv4 Networks Overview . . . . .	770
	Unidirectional Tunneling . . . . .	772
	Tunnel Security . . . . .	772
	Forwarding Performance . . . . .	772
	Forwarding Scalability . . . . .	773
	Interfaces That Support Filter-Based Tunneling Across IPv4 Networks . . . . .	773
	Interfaces on MX240, MX480, MX960, MX2010, and MX2020 Routers . . . . .	773
	Interfaces on MX5, MX10, MX40, and MX80 Routers . . . . .	774
	CLI Commit Check for Filter-Based Tunneling Across IPv4 Networks . . . . .	774
	Components of Filter-Based Tunneling Across IPv4 Networks . . . . .	775
	Topology of Filter-Based Tunneling Across IPv4 Networks . . . . .	775
	Routing of GRE Packets Across the Tunnel . . . . .	776
	Routing of Passenger Protocol Packets from PE2 to C2 . . . . .	776
	Terminology at the Network Layer Protocols Level . . . . .	776
	Terminology at the Ingress PE Router . . . . .	776
	Terminology at the Egress PE Router . . . . .	777
	GRE Protocol Format for Filter-Based Tunneling Across IPv4 Networks . . . . .	777
	Packet Encapsulation Structure . . . . .	778
	GRE Header Format . . . . .	778
	Example: Transporting IPv6 Traffic Across IPv4 Using Filter-Based Tunneling . . . . .	779
<b>Chapter 23</b>	<b>Configuring Service Filters . . . . .</b>	<b>795</b>
	Service Filter Overview . . . . .	795
	Services . . . . .	795
	Service Rules . . . . .	795
	Service Rule Refinement . . . . .	796
	Service Filter Counters . . . . .	796
	How Service Filters Evaluate Packets . . . . .	796
	Service Filters That Contain a Single Term . . . . .	797
	Service Filters That Contain Multiple Terms . . . . .	797
	Service Filter Terms That Do Not Contain Any Match Conditions . . . . .	797
	Service Filter Terms That Do Not Contain Any Actions . . . . .	797
	Service Filter Default Action . . . . .	797
	Guidelines for Configuring Service Filters . . . . .	798
	Statement Hierarchy for Configuring Service Filters . . . . .	798
	Service Filter Protocol Families . . . . .	798

	Service Filter Names . . . . .	798
	Service Filter Terms . . . . .	799
	Service Filter Match Conditions . . . . .	799
	Service Filter Terminating Actions . . . . .	799
	Guidelines for Applying Service Filters . . . . .	800
	Restrictions for Adaptive Services Interfaces . . . . .	800
	Adaptive Services Interfaces . . . . .	800
	System Logging to a Remote Host from M Series Routers . . . . .	800
	Statement Hierarchy for Applying Service Filters . . . . .	800
	Associating Service Rules with Adaptive Services Interfaces . . . . .	801
	Filtering Traffic Before Accepting Packets for Service Processing . . . . .	801
	Postservice Filtering of Returning Service Traffic . . . . .	802
	Example: Configuring and Applying Service Filters . . . . .	803
	Service Filter Match Conditions for IPv4 or IPv6 Traffic . . . . .	808
	Service Filter Nonterminating Actions . . . . .	815
	Service Filter Terminating Actions . . . . .	815
<b>Chapter 24</b>	<b>Configuring Simple Filters . . . . .</b>	<b>817</b>
	Simple Filter Overview . . . . .	817
	How Simple Filters Evaluate Packets . . . . .	817
	Simple Filters That Contain a Single Term . . . . .	817
	Simple Filters That Contain Multiple Terms . . . . .	818
	Simple Filter Terms That Do Not Contain Any Match Conditions . . . . .	818
	Simple Filter Terms That Do Not Contain Any Actions . . . . .	818
	Simple Filter Default Action . . . . .	818
	Guidelines for Configuring Simple Filters . . . . .	819
	Statement Hierarchy for Configuring Simple Filters . . . . .	819
	Simple Filter Protocol Families . . . . .	819
	Simple Filter Names . . . . .	819
	Simple Filter Terms . . . . .	820
	Simple Filter Match Conditions . . . . .	820
	Simple Filter Terminating Actions . . . . .	821
	Simple Filter Nonterminating Actions . . . . .	821
	Guidelines for Applying Simple Filters . . . . .	822
	Statement Hierarchy for Applying Simple Filters . . . . .	822
	Restrictions for Applying Simple Filters . . . . .	822
	Example: Configuring and Applying a Simple Filter . . . . .	823
<b>Chapter 25</b>	<b>Configuring Firewall Filters for Forwarding, Fragments, and Policing . . .</b>	<b>829</b>
	Filter-Based Forwarding Overview . . . . .	829
	Filters That Classify Packets or Direct Them to Routing Instances . . . . .	829
	Input Filtering to Classify and Forward Packets Within the Router or Switch . . . . .	830
	Output Filtering to Forward Packets to Another Routing Table . . . . .	830
	Restrictions for Applying Filter-Based Forwarding . . . . .	831
	Firewall Filters That Handle Fragmented Packets Overview . . . . .	831
	Stateless Firewall Filters That Reference Policers Overview . . . . .	831
	Statement Hierarchy for Configuring FBF for IPv4 or IPv6 Traffic . . . . .	832
	Statement Hierarchy for Configuring FBF for IPv4 Traffic on ACX Series Routers . . . . .	833

	Statement Hierarchy for Configuring FBF for MPLS-Tagged IPv4 Traffic . . . . .	834
	Matching on IPv4 Address and TCP/UDP Port Fields . . . . .	834
	Configuration Example . . . . .	835
	Statement Hierarchy for Configuring Routing Instances for FBF . . . . .	836
	Statement Hierarchy for Applying FBF Filters to Interfaces . . . . .	837
	Example: Configuring Filter-Based Forwarding on the Source Address . . . . .	838
	Example: Configuring Filter-Based Forwarding to a Specific Outgoing Interface or Destination IP Address . . . . .	846
	Understanding Filter-Based Forwarding to a Specific Outgoing Interface or Destination IP Address . . . . .	847
	Example: Configuring Filter-Based Forwarding to a Specific Outgoing Interface . . . . .	848
	Example: Configuring Filter-Based Forwarding to a Specific Destination IP Address . . . . .	853
<b>Part 4</b>	<b>Configuring Traffic Policers</b>	
<b>Chapter 26</b>	<b>Understanding Traffic Policers . . . . .</b>	<b>865</b>
	Controlling Network Access Using Traffic Policing Overview . . . . .	865
	Congestion Management for IP Traffic Flows . . . . .	865
	Traffic Limits . . . . .	866
	Traffic Color Marking . . . . .	867
	Forwarding Classes and PLP Levels . . . . .	869
	Policer Application to Traffic . . . . .	870
	Traffic Policer Types . . . . .	870
	Single-Rate Two-Color Policers . . . . .	871
	Basic Single-Rate Two-Color Policer . . . . .	871
	Bandwidth Policer . . . . .	871
	Logical Bandwidth Policer . . . . .	871
	Three-Color Policers . . . . .	871
	Single-Rate Three-Color Policers . . . . .	872
	Two-Rate Three-Color Policers . . . . .	872
	Hierarchical Policers . . . . .	872
	Two-Color and Three-Color Policer Options . . . . .	872
	Logical Interface (Aggregate) Policers . . . . .	873
	Physical Interface Policers . . . . .	873
	Policers Applied to Layer 2 Traffic . . . . .	873
	Multifield Classification . . . . .	873
	Order of Policer and Firewall Filter Operations . . . . .	874
	Understanding the Frame Length for Policing Packets . . . . .	875
	Supported Standards for Policing . . . . .	875
	Statement Hierarchy for Configuring Policers . . . . .	876
	Hierarchical Policer Configuration Overview . . . . .	877
	Guidelines for Applying Traffic Policers . . . . .	879
	Policer Support for Aggregated Ethernet Bundle Overview . . . . .	880
	Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers . . . . .	881

<b>Chapter 27</b>	<b>Configuring Policer Rate Limits and Actions . . . . .</b>	<b>885</b>
	Policer Bandwidth and Burst-Size Limits . . . . .	885
	Policer Color-Marking and Actions . . . . .	886
	Single Token Bucket Algorithm . . . . .	888
	Token Bucket Concepts . . . . .	888
	Single Token Bucket Algorithm . . . . .	888
	Conformance Measurement for Two-Color Marking . . . . .	889
	Dual Token Bucket Algorithms . . . . .	890
	Token Bucket Concepts . . . . .	890
	Guaranteed Bandwidth for Three-Color Marking . . . . .	890
	Nonconformance Measurement for Single-Rate Three-Color Marking . . . .	891
	Nonconformance Measurement for Two-Rate Three-Color Marking . . . . .	891
<b>Chapter 28</b>	<b>Implementing Traffic Policers on MX Series, M120, and M320 Routers . .</b>	<b>893</b>
	Policer Implementation Overview . . . . .	893
	Understanding the Benefits of Policers and Token Bucket Algorithms . . . . .	896
	Scenario 1: Single TCP Connection . . . . .	896
	Scenario 2: Multiple TCP Connections . . . . .	897
	Determining Proper Burst Size for Traffic Policers . . . . .	898
	Policer Burst Size Limit Overview . . . . .	898
	Effect of Burst-Size Limit . . . . .	899
	Bursty Traffic Policed Without a Burst-Size Limit . . . . .	899
	Burst-Size Limit Configured to Match Bandwidth Limit and Flow Burstiness . . . . .	899
	Burst-Size Limit That Depletes All Accumulated Tokens . . . . .	899
	Two Methods for Calculating Burst-Size Limit . . . . .	900
	Calculation Based on Interface Bandwidth and Allowable Burst Time . . . . .	900
	Calculation Based on Interface Traffic MTU . . . . .	900
	Comparison of the Two Methods . . . . .	900
	10 x MTU Method for Selecting Initial Burst Size for Gigabit Ethernet with 100 Kbps Bandwidth . . . . .	901
	5 ms Method for Selecting Initial Burst Size for Gigabit Ethernet Interface with 200 Mbps Bandwidth . . . . .	902
	200 Mbps Bandwidth Limit, 5 ms Burst Duration . . . . .	903
	200 Mbps Bandwidth Limit, 600 ms Burst Duration . . . . .	903
<b>Chapter 29</b>	<b>Configuring Layer 2 Policers . . . . .</b>	<b>905</b>
	Hierarchical Policers . . . . .	905
	Hierarchical Policer Overview . . . . .	905
	Example: Configuring a Hierarchical Policer . . . . .	906
	Two-Color and Three-Color Policers at Layer 2 . . . . .	912
	Two-Color Policing at Layer 2 Overview . . . . .	912
	Guidelines for Configuring Two-Color Policing of Layer 2 Traffic . . . . .	912
	Statement Hierarchy for Configuring a Two-Color Policer for Layer 2 Traffic . . . . .	913

	Statement Hierarchy for Applying a Two-Color Policer to Layer 2 Traffic . . . . .	913
	Three-Color Policing at Layer 2 Overview . . . . .	914
	Guidelines for Configuring Three-Color Policing of Layer 2 Traffic . . . . .	914
	Statement Hierarchy for Configuring a Three-Color Policer for Layer 2 Traffic . . . . .	914
	Statement Hierarchy for Applying a Three-Color Policer to Layer 2 Traffic . . . . .	915
	Example: Configuring a Three-Color Logical Interface (Aggregate) Policer . . . . .	915
<b>Chapter 30</b>	<b>Configuring Two-Color Traffic Policers at Layer 3 . . . . .</b>	<b>923</b>
	Two-Color Policer Configuration Overview . . . . .	923
	Basic Single-Rate Two-Color Policers . . . . .	928
	Single-Rate Two-Color Policer Overview . . . . .	928
	Example: Limiting Inbound Traffic at Your Network Border by Configuring an Ingress Single-Rate Two-Color Policer . . . . .	928
	Example: Configuring Interface and Firewall Filter Policers at the Same Interface . . . . .	936
	Bandwidth Policers . . . . .	946
	Bandwidth Policer Overview . . . . .	946
	Guidelines for Configuring a Bandwidth Policer . . . . .	946
	Guidelines for Applying a Bandwidth Policer . . . . .	947
	Example: Configuring a Logical Bandwidth Policer . . . . .	947
	Filter-Specific Counters and Policers . . . . .	955
	Filter-Specific Policer Overview . . . . .	955
	Example: Configuring a Stateless Firewall Filter to Protect Against TCP and ICMP Floods . . . . .	955
	Prefix-Specific Counting and Policing Actions . . . . .	966
	Prefix-Specific Counting and Policing Overview . . . . .	966
	Separate Counting and Policing for Each IPv4 Address Range . . . . .	966
	Prefix-Specific Action Configuration . . . . .	967
	Counter and Policer Set Size and Indexing . . . . .	968
	Filter-Specific Counter and Policer Set Overview . . . . .	968
	Example: Configuring Prefix-Specific Counting and Policing . . . . .	969
	Prefix-Specific Counting and Policing Configuration Scenarios . . . . .	976
	Prefix Length of the Action and Prefix Length of Addresses in Filtered Packets . . . . .	976
	Scenario 1: Firewall Filter Term Matches on Multiple Addresses . . . . .	977
	Scenario 2: Subnet Prefix Is Longer Than the Prefix in the Filter Match Condition . . . . .	979
	Scenario 3: Subnet Prefix Is Shorter Than the Prefix in the Firewall Filter Match Condition . . . . .	980
	Multifield Classification . . . . .	982
	Multifield Classification Overview . . . . .	982
	Forwarding Classes and PLP Levels . . . . .	982
	Multifield Classification and BA Classification . . . . .	982

	Multifield Classification Used In Conjunction with Policers . . . . .	983
	Multifield Classification Requirements and Restrictions . . . . .	984
	Supported Platforms . . . . .	984
	CoS Tricolor Marking Requirement . . . . .	985
	Restrictions . . . . .	985
	Multifield Classification Limitations on M Series Routers . . . . .	985
	Problem: Output-Filter Matching on Input-Filter Classification . . . . .	985
	Workaround: Configure All Actions in the Ingress Filter . . . . .	986
	Example: Configuring Multifield Classification . . . . .	987
	Example: Configuring and Applying a Firewall Filter for a Multifield Classifier . . . . .	994
	Policer Overhead to Account for Rate Shaping in the Traffic Manager . . . . .	1000
	Policer Overhead to Account for Rate Shaping Overview . . . . .	1000
	Example: Configuring Policer Overhead to Account for Rate Shaping . . . . .	1000
<b>Chapter 31</b>	<b>Configuring Three-Color Traffic Policers at Layer 3 . . . . .</b>	<b>1009</b>
	Three-Color Policer Configuration Overview . . . . .	1009
	Three-Color Policer Configuration Guidelines . . . . .	1012
	Platforms Supported for Three-Color Policers . . . . .	1013
	Color Modes for Three-Color Policers . . . . .	1013
	Color-Blind Mode . . . . .	1013
	Color-Aware Mode . . . . .	1013
	Naming Conventions for Three-Color Policers . . . . .	1014
	Basic Single-Rate Three-Color Policers . . . . .	1015
	Single-Rate Three-Color Policer Overview . . . . .	1015
	Example: Configuring a Single-Rate Three-Color Policer . . . . .	1016
	Basic Two-Rate Three-Color Policers . . . . .	1021
	Two-Rate Three-Color Policer Overview . . . . .	1021
	Example: Configuring a Two-Rate Three-Color Policer . . . . .	1022
<b>Chapter 32</b>	<b>Configuring Logical and Physical Interface Traffic Policers at Layer 3 . .</b>	<b>1029</b>
	Two-Color and Three-Color Logical Interface Policers . . . . .	1029
	Logical Interface (Aggregate) Policer Overview . . . . .	1029
	Example: Configuring a Two-Color Logical Interface (Aggregate) Policer . .	1030
	Example: Configuring a Three-Color Logical Interface (Aggregate) Policer . . . . .	1035
	Two-Color and Three-Color Physical Interface Policers . . . . .	1041
	Physical Interface Policer Overview . . . . .	1041
	Example: Configuring a Physical Interface Policer for Aggregate Traffic at a Physical Interface . . . . .	1043

# About the Documentation

- Documentation and Release Notes on page xxxi
- Supported Platforms on page xxxi
- Using the Examples in This Manual on page xxxii
- Documentation Conventions on page xxxiii
- Documentation Feedback on page xxxv
- Requesting Technical Support on page xxxvi

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

## Supported Platforms

---

For the features described in this document, the following platforms are supported:

- ACX Series
- M Series
- MX Series
- PTX Series
- SRX Series
- T Series

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

### Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {  
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]  
user@host# edit system scripts  
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]  
user@host# load merge relative /var/tmp/ex-script-snippet.conf  
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

---

## Documentation Conventions

Table 1 on page xxxiv defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xxxiv defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"><li>To configure a stub area, include the <b>stub</b> statement at the <b>[edit protocols ospf area area-id]</b> hierarchy level.</li><li>The console port is labeled <b>CONSOLE</b>.</li></ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub &lt;default-metric <i>metric</i>&gt;;</b>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  <b>(<i>string1</i>   <i>string2</i>   <i>string3</i>)</b>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members [ <i>community-ids</i> ]</b>
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	<pre>[edit] routing-options {   static {     route default {       nexthop <i>address</i>;       retain;     }   } }</pre>
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"><li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li><li>To cancel the configuration, click <b>Cancel</b>.</li></ul>
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page of the Juniper Networks TechLibrary site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <http://www.juniper.net/techpubs/feedback/>.

- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

---

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

- [Comparison of Routing Policies and Firewall Filters on page 8](#)

## Policy Framework Overview

---

The Junos<sup>®</sup> operating system (Junos OS) provides a *policy framework*, which is a collection of Junos OS policies that allows you to control flows of routing information and packets.

The Junos OS policy architecture is simple and straightforward. However, the actual implementation of each policy adds layers of complexity to the policy as well as adding power and flexibility to your router's capabilities. Configuring a policy has a major impact on the flow of routing information or packets within and through the router. For example, you can configure a routing policy that does not allow routes associated with a particular customer to be placed in the routing table. As a result of this routing policy, the customer routes are not used to forward data packets to various destinations and the routes are not advertised by the routing protocol to neighbors.

Before configuring a policy, determine what you want to accomplish with it and thoroughly understand how to achieve your goal using the various match conditions and actions. Also, make certain that you understand the default policies and actions for the policy you are configuring.

- [Routing Policy and Firewall Filters on page 3](#)
- [Reasons to Create a Routing Policy on page 4](#)
- [Router Flows Affected by Policies on page 4](#)
- [Control Points on page 7](#)
- [Policy Components on page 8](#)

## Routing Policy and Firewall Filters

The policy framework is composed of the following policies:

- Routing policy—Allows you to control the routing information between the routing protocols and the routing tables and between the routing tables and the forwarding table. All routing protocols use the Junos OS routing tables to store the routes that

they learn and to determine which routes they should advertise in their protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table.

- Firewall filter policy—Allows you to control packets transiting the router to a network destination and packets destined for and sent by the router.

**NOTE:** The term *firewall filter policy* is used here to emphasize that a firewall filter is a policy and shares some fundamental similarities with a routing policy. However, when referring to a firewall filter policy in the rest of this manual, the term *firewall filter* is used.

## Reasons to Create a Routing Policy

The following are typical circumstances under which you might want to preempt the default routing policies in the routing policy framework by creating your own routing policies:

- You do not want a protocol to import all routes into the routing table. If the routing table does not learn about certain routes, they can never be used to forward packets and they can never be redistributed into other routing protocols.
- You do not want a routing protocol to export all the active routes it learns.
- You want a routing protocol to announce active routes learned from another routing protocol, which is sometimes called *route redistribution*.
- You want to manipulate route characteristics, such as the preference value, AS path, or community. You can manipulate the route characteristics to control which route is selected as the active route to reach a destination. In general, the active route is also advertised to a router's neighbors.
- You want to change the default BGP route flap-damping parameters.
- You want to perform per-packet load balancing.
- You want to enable class of service (CoS).

## Router Flows Affected by Policies

The Junos OS policies affect the following router flows:

- Flow of routing information between the routing protocols and the routing tables and between the routing tables and the forwarding table. The Routing Engine handles this flow. *Routing information* is the information about routes learned by the routing protocols from a router's neighbors. This information is stored in routing tables and is subsequently advertised by the routing protocols to the router's neighbors. Routing policies allow you to control the flow of this information.
- Flow of data packets in and out of the router's physical interfaces. The Packet Forwarding Engine handles this flow. *Data packets* are chunks of data that transit the router as they are being forwarded from a source to a destination. When a router

receives a data packet on an interface, it determines where to forward the packet by looking in the forwarding table for the best route to a destination. The router then forwards the data packet toward its destination through the appropriate interface. Firewall filters allow you to control the flow of these data packets.

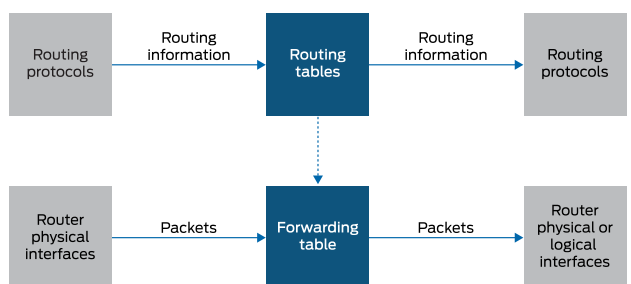

- Flow of local packets from the router's physical interfaces and to the Routing Engine. The Routing Engine handles this flow. *Local packets* are chunks of data that are destined for or sent by the router. Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP). When the Routing Engine receives a local packet, it forwards the packet to the appropriate process or to the kernel, which are both part of the Routing Engine, or to the Packet Forwarding Engine. Firewall filters allow you to control the flow of these local packets.

**NOTE:** In the rest of this chapter, the term *packets* refers to both data and local packets unless explicitly stated otherwise.

Figure 1 on page 5 illustrates the flows through the router. Although the flows are very different from each other, they are also interdependent. Routing policies determine which routes are placed in the forwarding table. The forwarding table, in turn, has an integral role in determining the appropriate physical interface through which to forward a packet.

**Figure 1: Flows of Routing Information and Packets**

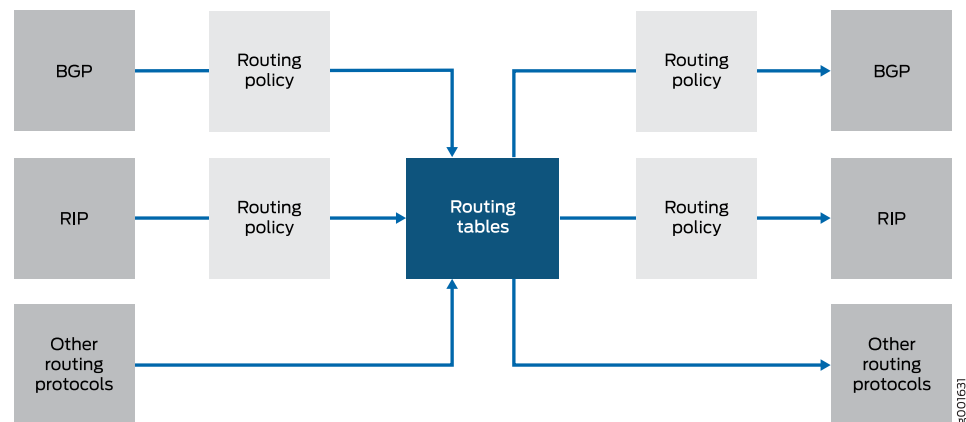

You can configure routing policies to control which routes the routing protocols place in the routing tables and to control which routes the routing protocols advertise from the routing tables (see Figure 2 on page 6). The routing protocols advertise active routes only from the routing tables. (An *active route* is a route that is chosen from all routes in the routing table to reach a destination.)

You can also use routing policies to do the following:

- Change specific route characteristics, which allow you to control which route is selected as the active route to reach a destination. In general, the active route is also advertised to a router's neighbors.
- Change to the default BGP route flap-damping values.
- Perform per-packet load balancing.
- Enable class of service (CoS).

**Figure 2: Routing Policies to Control Routing Information Flow**

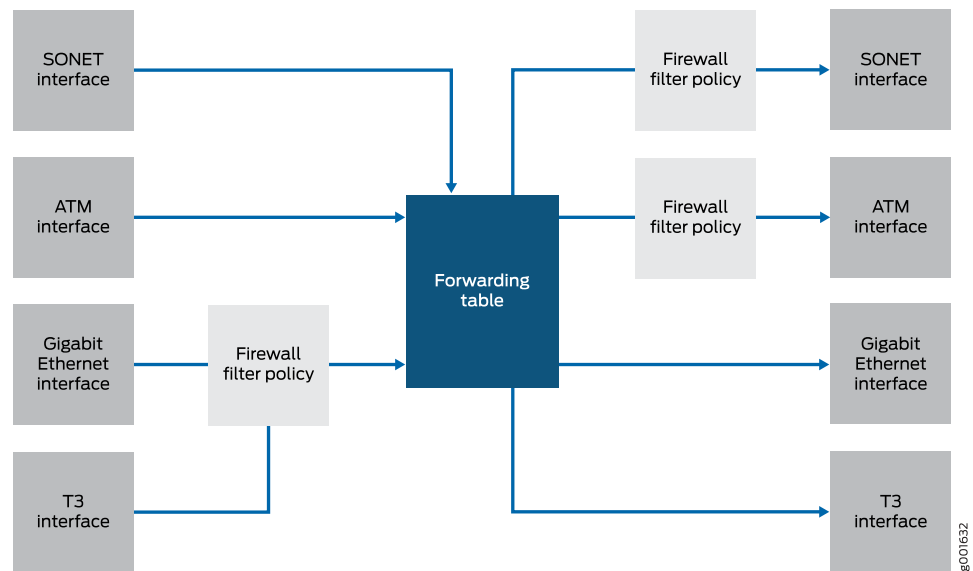

You can configure firewall filters to control the following aspects of packet flow (see [Figure 3 on page 7](#)):

- Which data packets are accepted on and transmitted from the physical interfaces. To control the flow of data packets, you apply firewall filters to the physical interfaces.
- Which local packets are transmitted from the physical interfaces and to the Routing Engine. To control local packets, you apply firewall filters on the loopback interface, which is the interface to the Routing Engine.

Firewall filters provide a means of protecting your router from excessive traffic transiting the router to a network destination or destined for the Routing Engine. Firewall filters that control local packets can also protect your router from external incidents such as denial-of-service attacks.

Figure 3: Firewall Filters to Control Packet Flow

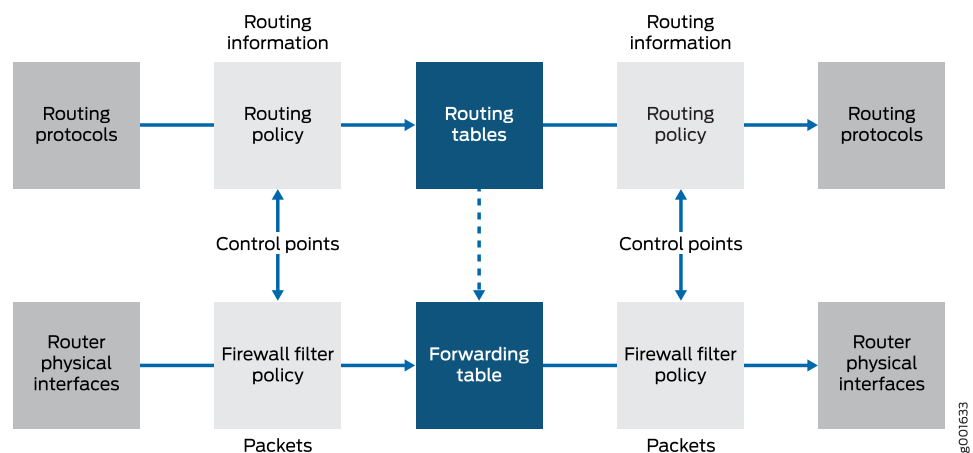

## Control Points

All policies provide two points at which you can control routing information or packets through the router (see [Figure 4 on page 7](#)). These control points allow you to control the following:

- Routing information before and after it is placed in the routing table.
- Data packets before and after a forwarding table lookup.
- Local packets before and after they are received by the Routing Engine.  
([Figure 4 on page 7](#) appears to depict only one control point but because of the bidirectional flow of the local packets, two control points actually exist.)

Figure 4: Policy Control Points

Because there are two control points, you can configure policies that control the routing information or data packets before and after their interaction with their respective tables,

and policies that control local packets before and after their interaction with the Routing Engine. *Import routing policies* control the routing information that is placed in the routing tables, whereas *export routing policies* control the routing information that is advertised from the routing tables. *Input firewall filters* control packets that are received on a router interface, whereas *output firewall filters* control packets that are transmitted from a router interface.

## Policy Components

All policies are composed of the following components that you configure:

- *Match conditions*—Criteria against which a route or packets are compared. You can configure one or more criteria. If all criteria match, one or more actions are applied.
- *Actions*—What happens if all criteria match. You can configure one or more actions.
- *Terms*—Named structures in which match conditions and actions are defined. You can define one or more terms.

The policy framework software evaluates each incoming and outgoing route or packet against the match conditions in a term. If the criteria in the match conditions are met, the defined action is taken.

In general, the policy framework software compares the route or packet against the match conditions in the first term in the policy, then goes on to the next term, and so on. Therefore, the order in which you arrange terms in a policy is relevant.

The order of match conditions within a term is not relevant because a route or packet must match all match conditions in a term for an action to be taken.

## Comparison of Routing Policies and Firewall Filters

Although routing policies and firewall filters share an architecture, their purposes, implementation, and configuration are different. [Table 3 on page 8](#) describes their purposes. [Table 4 on page 9](#) compares the implementation details for routing policies and firewall filters, highlighting the similarities and differences in their configuration.

**Table 3: Purpose of Routing Policies and Firewall Filters**

Policies	Source	Policy Purpose
Routing policies	Routing information is generated by internal networking peers.	To control the size and content of the routing tables, which routes are advertised, and which routes are considered the best to reach various destinations.
Firewall filters	Packets are generated by internal and external devices through which hostile attacks can be perpetrated.	To protect your router and network from excessive incoming traffic or hostile attacks that can disrupt network service, and to control which packets are forwarded from which router interfaces.

**Table 4: Implementation Differences Between Routing Policies and Firewall Filters**

Policy Architecture	Routing Policy Implementation	Firewall Filter Implementation
Control points	Control routing information that is placed in the routing table with an import routing policy and advertised from the routing table with an export routing policy.	Control packets that are accepted on a router interface with an input firewall filter and that are forwarded from an interface with an output firewall filter.
Configuration tasks: <ul style="list-style-type: none"> <li>Define policy</li> <li>Apply policy</li> </ul>	<p>Define a policy that contains terms, match conditions, and actions.</p> <p>Apply one or more export or import policies to a routing protocol. You can also apply a <i>policy expression</i>, which uses Boolean logical operators with multiple import or export policies.</p> <p>You can also apply one or more export policies to the forwarding table.</p>	<p>Define a policy that contains terms, match conditions, and actions.</p> <p>Apply one input or output firewall filter to a physical interface or physical interface group to filter data packets received by or forwarded to a physical interface (on routing platforms with an Internet Processor II application-specific integrated circuit [ASIC] only).</p> <p>You can also apply one input or output firewall filter to the routing platform's loopback interface, which is the interface to the Routing Engine (on all routing platforms). This allows you to filter local packets received by or forwarded from the Routing Engine.</p>
Terms	<p>Configure as many terms as desired. Define a name for each term.</p> <p>Terms are evaluated in the order in which you specify them.</p> <p>Evaluation of a policy ends after a packet matches the criteria in a term and the defined or default policy action of accept or reject is taken. The route is not evaluated against subsequent terms in the same policy or subsequent policies.</p>	<p>Configure as many terms as desired. Define a name for each term.</p> <p>Terms are evaluated in the order in which you specify them.</p> <p>Evaluation of a firewall filter ends after a packet matches the criteria in a term and the defined or default action is taken. The packet is not evaluated against subsequent terms in the firewall filter.</p>
Match conditions	<p>Specify zero or more criteria that a route must match. You can specify criteria based on source, destination, or properties of a route. You can also specify the following match conditions, which require more configuration:</p> <ul style="list-style-type: none"> <li>Autonomous system (AS) path expression—A combination of AS numbers and regular expression operators.</li> <li>Community—A group of destinations that share a common property.</li> <li>Prefix list—A named list of prefixes.</li> <li>Route list—A list of destination prefixes.</li> <li>Subroutine—A routing policy that is called repeatedly from other routing policies.</li> </ul>	<p>Specify zero or more criteria that a packet must match. You must match various fields in the packet's header. The fields are grouped into the following categories:</p> <ul style="list-style-type: none"> <li>Numeric values, such as port and protocol numbers.</li> <li>Prefix values, such as IP source and destination prefixes.</li> <li>Bit-field values—Whether particular bits in the fields are set, such as IP options, Transmission Control Protocol (TCP) flags, and IP fragmentation fields. You can specify the fields using Boolean logical operators.</li> </ul>

**Table 4: Implementation Differences Between Routing Policies and Firewall Filters** (*continued*)

Policy Architecture	Routing Policy Implementation	Firewall Filter Implementation
Actions	<p>Specify zero or one action to take if a route matches all criteria. You can specify the following actions:</p> <ul style="list-style-type: none"> <li>• Accept—Accept the route into the routing table, and propagate it. After this action is taken, the evaluation of subsequent terms and policies ends.</li> <li>• Reject—Do not accept the route into the routing table, and do not propagate it. After this action is taken, the evaluation of subsequent terms and policies ends.</li> </ul> <p>In addition to the preceding actions, you can also specify zero or more of the following types of actions:</p> <ul style="list-style-type: none"> <li>• Next term—Evaluate the next term in the routing policy.</li> <li>• Next policy—Evaluate the next routing policy.</li> <li>• Actions that manipulate characteristics associated with a route as the routing protocol places it in the routing table or advertises it from the routing table.</li> <li>• Trace action, which logs route matches.</li> </ul>	<p>Specify zero or one action to take if a packet matches all criteria. (We recommend that you always explicitly configure an action.) You can specify the following actions:</p> <ul style="list-style-type: none"> <li>• Accept—Accept a packet.</li> <li>• Discard—Discard a packet silently, without sending an ICMP message.</li> <li>• Reject—Discard a packet, and send an ICMP destination unreachable message.</li> <li>• Routing instance—Specify a routing table to which packets are forwarded.</li> <li>• Next term—Evaluate the next term in the firewall filter.</li> </ul> <p>In addition to zero or the preceding actions, you can also specify zero or more action modifiers. You can specify the following action modifiers:</p> <ul style="list-style-type: none"> <li>• Count—Add packet to a count total.</li> <li>• Forwarding class—Set the packet forwarding class to a specified value from 0 through 3.</li> <li>• IPsec security association—Used with the source and destination address match conditions, specify an IP Security (IPsec) security association (SA) for the packet.</li> <li>• Log—Store the header information of a packet on the Routing Engine.</li> <li>• Loss priority—Set the packet loss priority (PLP) bit to a specified value, 0 or 1.</li> <li>• Policer—Apply rate-limiting procedures to the traffic.</li> <li>• Sample—Sample the packet traffic.</li> <li>• Syslog—Log an alert for the packet.</li> </ul>

**Table 4: Implementation Differences Between Routing Policies and Firewall Filters (*continued*)**

Policy Architecture	Routing Policy Implementation	Firewall Filter Implementation
Default policies and actions	<p>If an incoming or outgoing route arrives and a policy related to the route is not explicitly configured, the action specified by the default policy for the associated routing protocol is taken.</p> <p>The following default actions exist for routing policies:</p> <ul style="list-style-type: none"> <li>• If a policy does not specify a match condition, all routes evaluated against the policy match.</li> <li>• If a match occurs but the policy does not specify an accept, reject, next term, or next policy action, one of the following occurs: <ul style="list-style-type: none"> <li>• The next term, if present, is evaluated.</li> <li>• If no other terms are present, the next policy is evaluated.</li> <li>• If no other policies are present, the action specified by the default policy is taken.</li> </ul> </li> <li>• If a match does not occur with a term in a policy and subsequent terms in the same policy exist, the next term is evaluated.</li> <li>• If a match does not occur with any terms in a policy and subsequent policies exist, the next policy is evaluated.</li> <li>• If a match does not occur by the end of a policy and no other policies exist, the accept or reject action specified by the default policy is taken.</li> </ul>	<p>If an incoming or outgoing packet arrives on an interface and a firewall filter is not configured for the interface, the default policy is taken (the packet is accepted).</p> <p>The following default actions exist for firewall filters:</p> <ul style="list-style-type: none"> <li>• If a firewall filter does not specify a match condition, all packets are considered to match.</li> <li>• If a match occurs but the firewall filter does not specify an action, the packet is accepted.</li> <li>• If a match occurs, the defined or default action is taken and the evaluation ends. Subsequent terms in the firewall filter are not evaluated, unless the next term action is specified.</li> <li>• If a match does not occur with a term in a firewall filter and subsequent terms in the same filter exist, the next term is evaluated.</li> <li>• If a match does not occur by the end of a firewall filter, the packet is discarded.</li> </ul>

## Understanding Routing Policies

---

For some routing platform vendors, the flow of routes occurs between various protocols. If, for example, you want to configure redistribution from RIP to OSPF, the RIP process tells the OSPF process that it has routes that might be included for redistribution. In Junos OS, there is not much direct interaction between the routing protocols. Instead, there are central gathering points where all protocols install their routing information. These are the main unicast routing tables `inet.0` and `inet6.0`.

From these tables, the routing protocols calculate the best route to each destination and place these routes in a forwarding table. These routes are then used to forward routing protocol traffic toward a destination, and they can be advertised to neighbors.

- [Importing and Exporting Routes on page 15](#)
- [Active and Inactive Routes on page 17](#)
- [Explicitly Configured Routes on page 17](#)
- [Dynamic Database on page 17](#)

## Importing and Exporting Routes

Two terms—*import* and *export*—explain how routes move between the routing protocols and the routing table.

- When the Routing Engine places the routes of a routing protocol into the routing table, it is *importing* routes into the routing table.

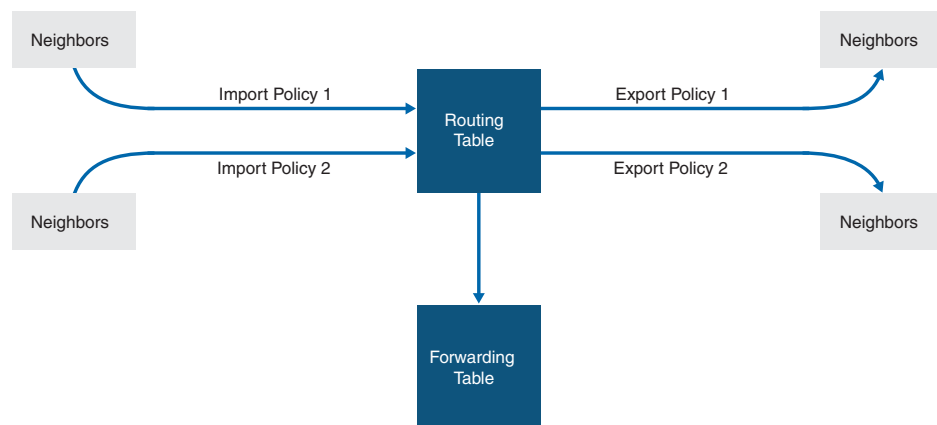

- When the Routing Engine uses active routes from the routing table to send a protocol advertisement, it is *exporting* routes from the routing table.

**NOTE:** The process of moving routes between a routing protocol and the routing table is described always *from the point of view of the routing table*. That is, routes are *imported into* a routing table from a routing protocol and they are *exported from* a routing table to a routing protocol. Remember this distinction when working with routing policies.

As shown in [Figure 5 on page 16](#), you use import routing policies to control which routes are placed in the routing table, and export routing policies to control which routes are advertised from the routing table to neighbors.

**Figure 5: Importing and Exporting Routes**

9001706

In general, the routing protocols place all their routes in the routing table and advertise a limited set of routes from the routing table. The general rules for handling the routing information between the routing protocols and the routing table are known as the *routing policy framework*.

The routing policy framework is composed of default rules for each routing protocol that determine which routes the protocol places in the routing table and advertises from the routing table. The default rules for each routing protocol are known as *default routing policies*.

You can create routing policies to preempt the default policies, which are always present. A *routing policy* allows you to modify the routing policy framework to suit your needs. You can create and implement your own routing policies to do the following:

- Control which routes a routing protocol places in the routing table.
- Control which active routes a routing protocol advertises from the routing table. An *active route* is a route that is chosen from all routes in the routing table to reach a destination.
- Manipulate the route characteristics as a routing protocol places the route in the routing table or advertises the route from the routing table.

You can manipulate the route characteristics to control which route is selected as the active route to reach a destination. The active route is placed in the forwarding table and is used to forward traffic toward the route's destination. In general, the active route is also advertised to a router's neighbors.

## Active and Inactive Routes

When multiple routes for a destination exist in the routing table, the protocol selects an active route and that route is placed in the appropriate routing table. For equal-cost routes, the Junos OS places multiple next hops in the appropriate routing table.

When a protocol is exporting routes from the routing table, it exports active routes only. This applies to actions specified by both default and user-defined export policies.

When evaluating routes for export, the Routing Engine uses only active routes from the routing table. For example, if a routing table contains multiple routes to the same destination and one route has a preferable metric, only that route is evaluated. In other words, an export policy does not evaluate all routes; it evaluates only those routes that a routing protocol is allowed to advertise to a neighbor.

**NOTE:** By default, BGP advertises active routes. However, you can configure BGP to advertise *inactive routes*, which go to the same destination as other routes but have less preferable metrics.

## Explicitly Configured Routes

An *explicitly configured route* is a route that you have configured. *Direct routes* are not explicitly configured. They are created as a result of IP addresses being configured on an interface. Explicitly configured routes include aggregate, generated, local, and static routes. (An *aggregate route* is a route that distills groups of routes with common addresses into one route. A *generated route* is a route used when the routing table has no information about how to reach a particular destination. A *local route* is an IP address assigned to a router interface. A *static route* is an unchanging route to a destination.)

The policy framework software treats direct and explicitly configured routes as if they are learned through routing protocols; therefore, they can be imported into the routing table. Routes cannot be exported from the routing table to the pseudoprotocol, because this protocol is not a real routing protocol. However, aggregate, direct, generated, and static routes can be exported from the routing table to routing protocols, whereas local routes cannot.

## Dynamic Database

In Junos OS Release 9.5 and later, you can configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required by the standard configuration database. As a result, you can quickly commit these routing policies and policy objects, which can be referenced and applied in the standard configuration as needed. BGP is the only protocol to which you can apply routing policies that reference policies configured in the dynamic database. After a routing policy based on the dynamic database is configured and committed in the standard configuration,

you can quickly make changes to existing routing policies by modifying policy objects in the dynamic database. Because Junos OS does not validate configuration changes to the dynamic database, when you use this feature, you should test and verify all configuration changes before committing them.

  - [Example: Redistributing OSPF Routes into IS-IS](#)

## Protocol Support for Import and Export Policies

**Table 5: Protocol Support for Import and Export Policies**

Protocol	Import Policy	Export Policy	Supported Levels
BGP	Yes	Yes	Import: global, group, peer Export: global, group, peer
DVMRP	Yes	Yes	Global
IS-IS	No	Yes	Export: global
LDP	Yes	Yes	Global
MPLS	No	No	—
OSPF	Yes	Yes	Export: global  Import: external routes only
PIM dense mode	Yes	Yes	Global
PIM sparse mode	Yes	Yes	Global
Pseudoprotocol—Explicitly configured routes, which include the following: <ul style="list-style-type: none"> <li>• Aggregate routes</li> <li>• Generated routes</li> </ul>	Yes	No	Import: global
RIP and RIPng	Yes	Yes	Import: global, neighbor Export: group

## Example: Applying Routing Policies at Different Levels of the BGP Hierarchy

This example shows BGP configured in a simple network topology and explains how routing policies take effect when they are applied at different levels of the BGP configuration.

- [Requirements on page 19](#)
- [Overview on page 19](#)
- [Configuration on page 20](#)
- [Verification on page 24](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

For BGP, you can apply policies as follows:

- BGP global **import** and **export** statements—Include these statements at the **[edit protocols bgp]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp]** hierarchy level).
- Group **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name]** hierarchy level).
- Peer **import** and **export** statements—Include these statements at the **[edit protocols bgp group group-name neighbor address]** hierarchy level (for routing instances, include these statements at the **[edit routing-instances routing-instance-name protocols bgp group group-name neighbor address]** hierarchy level).

A peer-level **import** or **export** statement overrides a group **import** or **export** statement. A group-level **import** or **export** statement overrides a global BGP **import** or **export** statement.

In this example, a policy named **send-direct** is applied at the global level, another policy named **send-192.168.0.1** is applied at the group level, and a third policy named **send-192.168.20.1** is applied at the neighbor level.

```
user@host# show protocols
bgp {
  local-address 1.1.1.1;
  export send-direct;
  group internal-peers {
    type internal;
    export send-192.168.0.1;
    neighbor 2.2.2.2 {
      export send-192.168.20.1;
    }
    neighbor 3.3.3.3;
```

```

}
group other-group {
  type internal;
  neighbor 4.4.4.4;
}
}

```

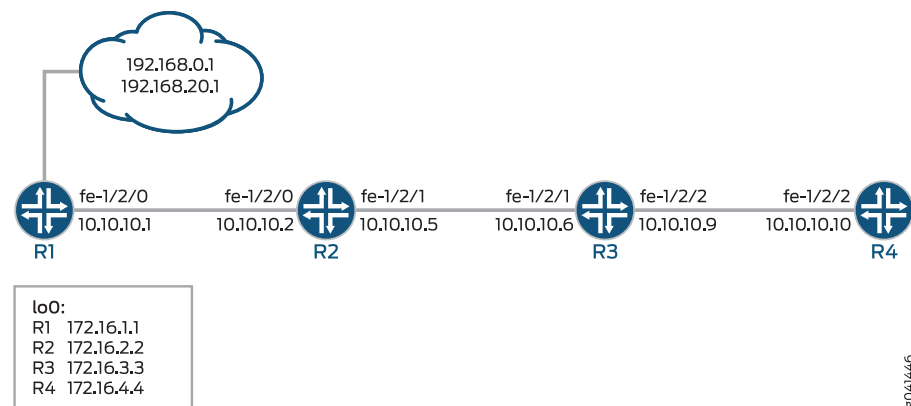

A key point, and one that is often misunderstood and that can lead to problems, is that in such a configuration, only the most explicit policy is applied. A neighbor-level policy is more explicit than a group-level policy, which in turn is more explicit than a global policy.

The neighbor 2.2.2.2 is subjected only to the send-192.168.20.1 policy. The neighbor 3.3.3.3, lacking anything more specific, is subjected only to the send-192.168.0.1 policy. Meanwhile, neighbor 4.4.4.4 in group other-group has no group or neighbor-level policy, so it uses the send-direct policy.

If you need to have neighbor 2.2.2.2 perform the function of all three policies, you can write and apply a new neighbor-level policy that encompasses the functions of the other three, or you can apply all three existing policies, as a chain, to neighbor 2.2.2.2.

Figure 6 on page 20 shows the sample network.

**Figure 6: Applying Routing Policies to BGP**

“CLI Quick Configuration” on page 20 shows the configuration for all of the devices in Figure 6 on page 20.

The section “Step-by-Step Procedure” on page 22 describes the steps on Device R1.

## Configuration

<b>CLI Quick Configuration</b>	To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the <b>[edit]</b> hierarchy level.
<b>Device R1</b>	<pre> set interfaces fe-1/2/0 unit 0 description to-R2 set interfaces fe-1/2/0 unit 0 family inet address 10.10.10.1/30 set interfaces lo0 unit 0 family inet address 1.1.1.1/32 set protocols bgp local-address 1.1.1.1 </pre>

```

set protocols bgp export send-direct
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers export send-static-192.168.0
set protocols bgp group internal-peers neighbor 2.2.2.2 export send-static-192.168.20
set protocols bgp group internal-peers neighbor 3.3.3.3
set protocols bgp group other-group type internal
set protocols bgp group other-group neighbor 4.4.4.4
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.0
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static-192.168.0 term 1 from protocol static
set policy-options policy-statement send-static-192.168.0 term 1 from route-filter
    192.168.0.0/24 orlonger
set policy-options policy-statement send-static-192.168.0 term 1 then accept
set policy-options policy-statement send-static-192.168.20 term 1 from protocol static
set policy-options policy-statement send-static-192.168.20 term 1 from route-filter
    192.168.20.0/24 orlonger
set policy-options policy-statement send-static-192.168.20 term 1 then accept
set routing-options static route 192.168.0.1/32 discard
set routing-options static route 192.168.20.1/32 discard
set routing-options router-id 1.1.1.1
set routing-options autonomous-system 17

```

**Device R4**

```
set interfaces fe-1/2/2 unit 0 description to-R3
set interfaces fe-1/2/2 unit 0 family inet address 10.10.10.10/30
set interfaces lo0 unit 0 family inet address 4.4.4.4/32
set protocols bgp group internal-peers type internal
set protocols bgp group internal-peers local-address 4.4.4.4
set protocols bgp group internal-peers neighbor 2.2.2.2
set protocols bgp group internal-peers neighbor 1.1.1.1
set protocols bgp group internal-peers neighbor 3.3.3.3
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/2.0
set routing-options router-id 4.4.4.4
set routing-options autonomous-system 17
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an IS-IS default route policy:

1. Configure the device interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 0 description to-R2
user@R1# set fe-1/2/0 unit 0 family inet address 10.10.10.1/30
```

```
user@R1# set lo0 unit 0 family inet address 1.1.1.1/32
```

2. Enable OSPF, or another interior gateway protocols (IGP), on the interfaces.

```
[edit protocols OSPF area 0.0.0.0]
user@R1# set interface lo0.0 passive
user@R1# set interface fe-1/2/0.0
```

3. Configure static routes.

```
[edit routing-options]
user@R1# set static route 192.168.0.1/32 discard
user@R1# set static route 192.168.20.1/32 discard
```

4. Enable the routing policies.

```
[edit protocols policy-options]
user@R1# set policy-statement send-direct term 1 from protocol direct
user@R1# set policy-statement send-direct term 1 then accept
```

```
user@R1# set policy-statement send-static-192.168.0 term 1 from protocol static
user@R1# set policy-statement send-static-192.168.0 term 1 from route-filter
192.168.0.0/24 orlonger
user@R1# set policy-statement send-static-192.168.0 term 1 then accept
```

```
user@R1# set policy-statement send-static-192.168.20 term 1 from protocol static
user@R1# set policy-statement send-static-192.168.20 term 1 from route-filter
192.168.20.0/24 orlonger
user@R1# set policy-statement send-static-192.168.20 term 1 then accept
```

5. Configure BGP and apply the export policies.

```
[edit protocols bgp]
user@R1# set local-address 1.1.1.1
user@R1# set group internal-peers type internal
user@R1# set group internal-peers export send-static-192.168.0
user@R1# set group internal-peers neighbor 2.2.2.2 export send-static-192.168.20
user@R1# set group internal-peers neighbor 3.3.3.3
user@R1# set group other-group type internal
user@R1# set group other-group neighbor 4.4.4.4
```

6. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set router-id 1.1.1.1
user@R1# set autonomous-system 17
```

7. If you are done configuring the device, commit the configuration.

```
[edit]
user@R1# commit
```

## Results

From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 0 {
    description to-R2;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 1.1.1.1/32;
    }
  }
}

user@R1# show protocols
bgp {
  local-address 1.1.1.1;
  export send-direct;
  group internal-peers {
    type internal;
    export send-static-192.168.0;
    neighbor 2.2.2.2 {
      export send-static-192.168.20;
    }
  }
}
```

```
        neighbor 3.3.3.3;
    }
    group other-group {
        type internal;
        neighbor 4.4.4.4;
    }
}
ospf {
    area 0.0.0.0 {
        interface lo0.0 {
            passive;
        }
        interface fe-1/2/0.0;
    }
}

user@R1# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}
policy-statement send-static-192.168.0 {
    term 1 {
        from {
            protocol static;
            route-filter 192.168.0.0/24 orlonger;
        }
        then accept;
    }
}
policy-statement send-static-192.168.20 {
    term 1 {
        from {
            protocol static;
            route-filter 192.168.20.0/24 orlonger;
        }
        then accept;
    }
}

user@R1# show routing-options
static {
    route 192.168.0.1/32 discard;
    route 192.168.20.1/32 discard;
}
router-id 1.1.1.1;
autonomous-system 17;
```

## Verification

Confirm that the configuration is working properly.

- [Verifying BGP Route Learning on page 25](#)
- [Verifying BGP Route Receiving on page 26](#)

## Verifying BGP Route Learning

**Purpose** Make sure that the BGP export policies are working as expected by checking the routing tables.

**Action** user@R1> show route protocol direct

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.1.1.1/32      *[Direct/0] 1d 22:19:47
                 > via lo0.0
10.10.10.0/30   *[Direct/0] 1d 22:19:47
                 > via fe-1/2/0.0
```

user@R1> show route protocol static

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
192.168.0.1/32  *[Static/5] 02:20:03
                 Discard
192.168.20.1/32 *[Static/5] 02:20:03
                 Discard
```

user@R2> show route protocol bgp

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
192.168.20.1/32  *[BGP/170] 02:02:40, localpref 100, from 1.1.1.1
                 AS path: I, validation-state: unverified
                 > to 10.10.10.1 via fe-1/2/0.0
```

user@R3> show route protocol bgp

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
192.168.0.1/32  *[BGP/170] 02:02:51, localpref 100, from 1.1.1.1
                 AS path: I, validation-state: unverified
                 > to 10.10.10.5 via fe-1/2/1.0
```

user@R4> show route protocol bgp

```
inet.0: 9 destinations, 11 routes (9 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
1.1.1.1/32      [BGP/170] 1d 20:38:54, localpref 100, from 1.1.1.1
                 AS path: I, validation-state: unverified
                 > to 10.10.10.9 via fe-1/2/2.0
10.10.10.0/30   [BGP/170] 1d 20:38:54, localpref 100, from 1.1.1.1
                 AS path: I, validation-state: unverified
                 > to 10.10.10.9 via fe-1/2/2.0
```

**Meaning** On Device R1, the **show route protocol direct** command displays two direct routes: 1.1.1.1/32 and 10.10.10.0/30. The **show route protocol static** command displays two static routes: 192.168.0.1/32 and 192.168.20.1/32.

On Device R2, the **show route protocol bgp** command shows that the only route that Device R2 has learned through BGP is the 192.168.20.1/32 route.

On Device R3, the **show route protocol bgp** command shows that the only route that Device R3 has learned through BGP is the 192.168.0.1/32 route.

On Device R4, the **show route protocol bgp** command shows that the only routes that Device R4 has learned through BGP are the 1.1.1.1/32 and 10.10.10.0/30 routes.

### Verifying BGP Route Receiving

**Purpose** Make sure that the BGP export policies are working as expected by checking the BGP routes received from Device R1.

**Action** user@R2> **show route receive-protocol bgp 1.1.1.1**

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
* 192.168.20.1/32      1.1.1.1              100       I
```

user@R3> **show route receive-protocol bgp 1.1.1.1**

```
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
* 192.168.0.1/32      1.1.1.1              100       I
```

user@R4> **show route receive-protocol bgp 1.1.1.1**

```
inet.0: 9 destinations, 11 routes (9 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
  1.1.1.1/32           1.1.1.1              100       I
  10.10.10.0/30        1.1.1.1              100       I
```

**Meaning** On Device R2, the **route receive-protocol bgp 1.1.1.1** command shows that Device R2 received only one BGP route, 192.168.20.1/32, from Device R1.

On Device R3, the **route receive-protocol bgp 1.1.1.1** command shows that Device R3 received only one BGP route, 192.168.0.1/32, from Device R1.

On Device R4, the **route receive-protocol bgp 1.1.1.1** command shows that Device R4 received two BGP routes, 1.1.1.1/32 and 10.10.10.0/30, from Device R1.

In summary, when multiple policies are applied at different CLI hierarchies in BGP, only the most specific application is evaluated, to the exclusion of other, less specific policy applications. Although this point might seem to make sense, it is easily forgotten during router configuration, when you mistakenly believe that a neighbor-level policy is combined with a global or group-level policy, only to find that your policy behavior is not as anticipated.

## Default Routing Policies

If an incoming or outgoing route or packet arrives and there is no explicitly configured policy related to the route or to the interface upon which the packet arrives, the action specified by the default policy is taken. A *default policy* is a rule or a set of rules that determine whether the route is placed in or advertised from the routing table, or whether the packet is accepted into or transmitted from the router interface.

You must be familiar with the default routing policies to know when you need to modify them to suit your needs. [Table 6 on page 27](#) summarizes the default routing policies for each routing protocol that imports and exports routes. The actions in the default routing policies are taken if you have not explicitly configured a routing policy. This table also shows direct and explicitly configured routes, which for the purposes of this table are considered a pseudoprotocol. Explicitly configured routes include aggregate, generated, and static routes.

**Table 6: Default Import and Export Policies for Protocols**

Importing or Exporting Protocol	Default Import Policy	Default Export Policy
BGP	Accept all received BGP IPv4 routes learned from configured neighbors and import into the inet.0 routing table. Accept all received BGP IPv6 routes learned from configured neighbors and import into the inet6.0 routing table.	Readvertise all learned BGP routes to all BGP speakers, while following protocol-specific rules that prohibit one IBGP speaker from readvertising routes learned from another IBGP speaker, unless it is functioning as a route reflector.
DVMRP	Accept all DVMRP routes and import into the inet.1 routing table.	Accept and export active DVMRP routes.
IS-IS	Accept all IS-IS routes and import into the inet.0 and inet6.0 routing tables. (You cannot override or change this default policy.)	Reject everything. (The protocol uses flooding to announce local routes and any learned routes.)
LDP	Accept all LDP routes and import into the inet.3 routing table.	Reject everything.
MPLS	Accept all MPLS routes and import into the inet.3 routing table.	Accept and export active MPLS routes.
OSPF	Accept all OSPF routes and import into the inet.0 routing table. (You cannot override or change this default policy.)	Reject everything. (The protocol uses flooding to announce local routes and any learned routes.)

Table 6: Default Import and Export Policies for Protocols (*continued*)

Importing or Exporting Protocol	Default Import Policy	Default Export Policy
PIM dense mode	Accept all PIM dense mode routes and import into the inet.1 routing table.	Accept active PIM dense mode routes.
PIM sparse mode	Accept all PIM sparse mode routes and import into the inet.1 routing table.	Accept and export active PIM sparse mode routes.
Pseudoprotocol: <ul style="list-style-type: none"> <li>• Direct routes</li> <li>• Explicitly configured routes:               <ul style="list-style-type: none"> <li>• Aggregate routes</li> <li>• Generated routes</li> <li>• Static routes</li> </ul> </li> </ul>	Accept all direct and explicitly configured routes and import into the inet.0 routing table.	The pseudoprotocol cannot export any routes from the routing table because it is not a routing protocol.  Routing protocols can export these or any routes from the routing table.
RIP	Accept all RIP routes learned from configured neighbors and import into the inet.0 routing table.	Reject everything. To export RIP routes, you must configure an export policy for RIP.
RIPng	Accept all RIPng routes learned from configured neighbors and import into the inet6.0 routing table.	Reject everything. To export RIPng routes, you must configure an export policy for RIPng.
Test policy	Accept all routes. For additional information about test policy, see <a href="#">“Example: Testing a Routing Policy with Complex Regular Expressions”</a> on page 464.	

## OSPF and IS-IS Import Policies

You cannot change the default import policy for IS-IS. For OSPF, import policies apply to external routes only. An external route is a route that is outside the OSPF autonomous system (AS). For internal routes (routes learned from OSPF), you cannot change the default import policy for OSPF. As link-state protocols, IS-IS and OSPF exchange routes between systems within an autonomous system (AS). All routers and systems within an AS must share the same link-state database, which includes routes to reachable prefixes and the metrics associated with the prefixes. If an import policy is configured and applied to IS-IS or OSPF, some routes might not be learned or advertised or the metrics for learned routes might be altered, which would make a consistent link-state database impossible.

The default export policy for IS-IS and OSPF protocols is to reject everything. These protocols do not actually export their internally learned routes (the directly connected routes on interfaces that are running the protocol). Both IS-IS and OSPF protocols use a procedure called flooding to announce local routes and any routes learned by the protocol. The flooding procedure is internal to the protocol, and is unaffected by the

policy framework. Exporting can be used only to announce information from other protocols, and the default is not to do so.

## Automatic Export

For Layer 3 VPNs, the automatic export feature can be configured to overcome the limitation of local prefix leaking and automatically export routes between local VPN routing and forwarding (VRF) routing instances.

In Layer 3 VPNs, multiple CE routers can belong to a single VRF routing instance on a PE router. A PE router can have multiple VRF routing instances. In some cases, shared services might require routes to be written to multiple VRF routing tables, both at the local and remote PE router. This requires the PE router to share route information among each configured VRF routing instance. This exchange of route information is accomplished with custom **vrf-export** and **vrf-import** policies that utilize BGP extended community attributes to create hub-and-spoke topologies. This exchange of routing information, such as route prefixes, is known as prefix leaking.

The automatic export feature leaks prefixes between VRF routing instances that are locally configured on a given PE router. The automatic export feature is enabled by using the **auto-export** statement.

Automatic export is always applied on the local PE router, because it takes care of only local prefix leaking by evaluating the export policy of each VRF and determining which route targets can be leaked locally. The standard VRF import and export policies still affect only the remote PE prefix leaking.

If the **vrf-export** policy examined by the automatic export does not have an explicit **then accept** action, the automatic export essentially ignores the policy and, therefore, does not leak the route targets specified within it.

For more information, see [Technology Overview: Understanding the Auto Export Feature](#).

## Example: Configuring a Conditional Default Route Policy

This example shows how to configure a conditional default route on one routing device and redistribute the default route into OSPF.

- [Requirements on page 29](#)
- [Overview on page 30](#)
- [Configuration on page 30](#)
- [Verification on page 34](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, OSPF area 0 contains three routing devices. Device R3 has a BGP session with an external peer, for example, an Internet Service Provider (ISP).

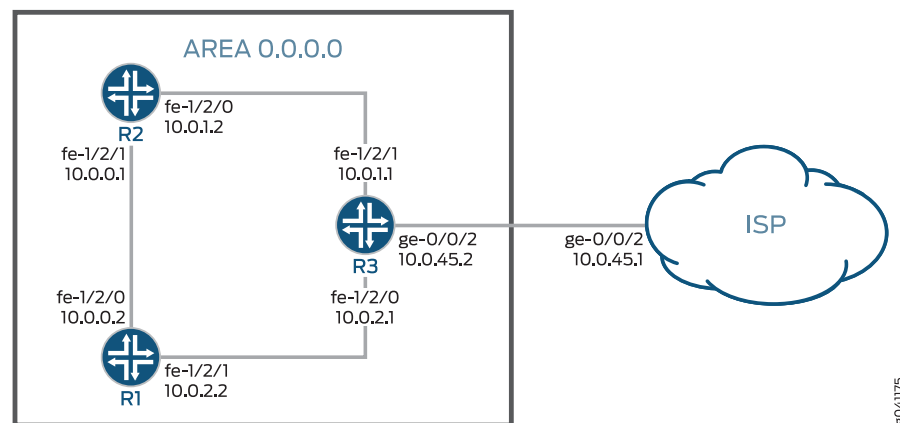

To propagate a static route into BGP, this example includes the **discard** statement when defining the route. The ISP injects a default static route into BGP, which provides the customer network with a default static route to reach external networks. The static route has a discard next hop. This means that if a packet does not match a more specific route, the packet is rejected and a reject route for this destination is installed in the routing table, but Internet Control Message Protocol (ICMP) unreachable messages are not sent. The discard next hop allows you to originate a summary route, which can be advertised through dynamic routing protocols.

Device R3 exports the default route into OSPF. The route policy on Device R3 is conditional such that if the connection to the ISP goes down, the default route is no longer exported into OSPF because it is no longer active in the routing table. This policy prevents packets from being silently dropped without notification (also known as blackholing).

This example shows the configuration for all of the devices and the step-by-step configuration on Device R3.

Figure 7 on page 30 shows the sample network.

Figure 7: OSPF with a Conditional Default Route to an ISP

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1
set interfaces fe-1/2/0 unit 0 description R1->R3
set interfaces fe-1/2/0 unit 0 family inet address 10.0.1.2/30
set interfaces fe-1/2/1 unit 2 description R1->R2
set interfaces fe-1/2/1 unit 2 family inet address 10.0.0.1/30
set protocols ospf area 0.0.0.0 interface fe-1/2/0.0
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
  
```

**Device R2**

```

set interfaces fe-1/2/0 unit 1 description R2->R1
set interfaces fe-1/2/0 unit 1 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 4 description R2->R3
set interfaces fe-1/2/1 unit 4 family inet address 10.0.2.2/30
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4

```

**Device R3**

```

set interfaces fe-1/2/0 unit 3 description R3->R2
set interfaces fe-1/2/0 unit 3 family inet address 10.0.2.1/30
set interfaces fe-1/2/1 unit 5 description R3->R1
set interfaces fe-1/2/1 unit 5 family inet address 10.0.1.1/30
set interfaces ge-0/0/2 unit 0 description R3->ISP
set interfaces ge-0/0/2 unit 0 family inet address 10.0.45.2/30
set protocols bgp group ext type external
set protocols bgp group ext peer-as 65000
set protocols bgp group ext neighbor 10.0.45.1
set protocols ospf export gendefault
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set protocols ospf area 0.0.0.0 interface fe-1/2/0.3
set policy-options policy-statement gendefault term upstreamroutes from protocol bgp
set policy-options policy-statement gendefault term upstreamroutes from as-path
  upstream
set policy-options policy-statement gendefault term upstreamroutes from route-filter
  0.0.0.0/0 upto /16
set policy-options policy-statement gendefault term upstreamroutes then next-hop
  10.0.45.1
set policy-options policy-statement gendefault term upstreamroutes then accept
set policy-options policy-statement gendefault term end then reject
set policy-options as-path upstream "^65000 "
set routing-options generate route 0.0.0.0/0 policy gendefault
set routing-options autonomous-system 65001

```

**Device ISP**

```

set interfaces ge-0/0/2 unit 0 family inet address 10.0.45.1/30
set protocols bgp group ext type external
set protocols bgp group ext export advertise-default
set protocols bgp group ext peer-as 65001
set protocols bgp group ext neighbor 10.0.45.2
set policy-options policy-statement advertise-default term 1 from route-filter 0.0.0.0/0
  exact
set policy-options policy-statement advertise-default term 1 then accept
set routing-options static route 0.0.0.0/0 discard
set routing-options autonomous-system 65000

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.  

```

[edit interfaces]
user@R3# set fe-1/2/0 unit 3 description R3->R2
user@R3# set fe-1/2/0 unit 3 family inet address 10.0.2.1/30
user@R3# set fe-1/2/1 unit 5 description R3->R1

```

```
user@R3# set fe-1/2/1 unit 5 family inet address 10.0.1.1/30
user@R3# set ge-0/0/2 unit 0 description R3->ISP
user@R3# set ge-0/0/2 unit 0 family inet address 10.0.45.2/30
```

2. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 65001
```

3. Configure the BGP session with the ISP device.

```
[edit protocols bgp group ext]
user@R3# set type external
user@R3# set peer-as 65000
user@R3# set neighbor 10.0.45.1
```

4. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R3# set interface fe-1/2/1.4
user@R3# set interface fe-1/2/0.3
```

5. Configure the routing policy.

```
[edit policy-options policy-statement gendefault]
user@R3# set term upstreamroutes from protocol bgp
user@R3# set term upstreamroutes from as-path upstream
user@R3# set term upstreamroutes from route-filter 0.0.0.0/0 upto /16
user@R3# set term upstreamroutes then next-hop 10.0.45.1
user@R3# set term upstreamroutes then accept
```

```
user@R3# set term end then reject
```

```
[edit policy-options]
user@R3# set as-path upstream "^65000 "
```

6. Configure the generated route, associating the routing policy with the generated route.

```
[edit routing-options]
user@R3# set generate route 0.0.0.0/0 policy gendefault
```

7. Apply the export policy to OSPF.

```
[edit protocols ospf]
user@R3# set export gendefault
```

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@R3# commit
```

---

## Results

Confirm your configuration by issuing the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show
interfaces {
  fe-1/2/0 {
    unit 3 {
      description R3->R2;
      family inet {
        address 10.0.2.1/30;
      }
    }
  }
  fe-1/2/1 {
    unit 5 {
      description R3->R1;
      family inet {
        address 10.0.1.1/30;
      }
    }
  }
  ge-1/2/0 {
    unit 0 {
      description R3->ISP;
      family inet {
        address 10.0.45.2/30;
      }
    }
  }
}
protocols {
  bgp {
    group ext {
      type external;
      peer-as 65000;
      neighbor 10.0.45.1;
    }
  }
  ospf {
    export gendefault;
    area 0.0.0.0 {
      interface fe-1/2/1.4;
      interface fe-1/2/0.3;
    }
  }
}
policy-options {
  policy-statement gendefault {
    term upstreamroutes {
      from {
        protocol bgp;
        as-path upstream;
        route-filter 0.0.0.0/0 upto /16;
      }
      then {
        next-hop 10.0.45.1;
        accept;
      }
    }
  }
}
```

```
        term end {  
            then reject;  
        }  
    }  
    as-path upstream "^65000";  
}  
routing-options {  
    generate {  
        route 0.0.0.0/0 policy gendefault;  
    }  
    autonomous-system 65001;  
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying That the Route to the ISP Is Working on page 34](#)
- [Verifying That the Static Route Is Redistributed on page 34](#)
- [Testing the Policy Condition on page 35](#)

---

### Verifying That the Route to the ISP Is Working

**Purpose** Make sure connectivity is established between Device R3 and the ISP's router.

**Action** user@R3> ping 10.0.45.1  
PING 10.0.45.1 (10.0.45.1): 56 data bytes  
64 bytes from 10.0.45.1: icmp\_seq=0 ttl=64 time=1.185 ms  
64 bytes from 10.0.45.1: icmp\_seq=1 ttl=64 time=1.199 ms  
64 bytes from 10.0.45.1: icmp\_seq=2 ttl=64 time=1.186 ms

**Meaning** The ping command confirms reachability.

---

### Verifying That the Static Route Is Redistributed

**Purpose** Make sure that the BGP policy is redistributing the static route into Device R3's routing table. Also make sure that the OSPF policy is redistributing the static route into the routing tables of Device R1 and Device R2.

**Action** user@R3> show route protocol bgp

```
inet.0: 9 destinations, 10 routes (9 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0          *[BGP/170] 00:00:25, localpref 100
                   AS path: 65000 I
                   > to 10.0.45.1 via ge-0/0/2.6
```

user@R1> show route protocol ospf

```
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0          *[OSPF/150] 00:03:58, metric 0, tag 0
                   > to 10.0.1.1 via fe-1/2/0.0
10.0.2.0/30        *[OSPF/10] 03:37:45, metric 2
                   to 10.0.1.1 via fe-1/2/0.0
                   > to 10.0.0.2 via fe-1/2/1.2
224.0.0.5/32       *[OSPF/10] 03:38:41, metric 1
                   MultiRecv
```

user@R2> show route protocol ospf

```
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0          *[OSPF/150] 00:04:04, metric 0, tag 0
                   > to 10.0.2.1 via fe-1/2/1.4
10.0.1.0/30        *[OSPF/10] 03:37:46, metric 2
                   to 10.0.0.1 via fe-1/2/0.1
                   > to 10.0.2.1 via fe-1/2/1.4
224.0.0.5/32       *[OSPF/10] 03:38:47, metric 1
                   MultiRecv
```

**Meaning** The routing tables contain the default 0.0.0.0/0 route. If Device R1 and Device R2 receive packets destined for networks not specified in their routing tables, those packets will be sent to Device R3 for further processing. If Device R3 receives packets destined for networks not specified in its routing table, those packets will be sent to the ISP for further processing.

### Testing the Policy Condition

**Purpose** Deactivate the interface to make sure that the route is removed from the routing tables if the external network becomes unreachable.

**Action**    user@R3> **deactivate interfaces ge-0/0/2 unit 0 family inet address 10.0.45.2/30**  
user@R3> **commit**

user@R1> **show route protocol ospf**

inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.2.0/30          *[OSPF/10] 03:41:48, metric 2
                    to 10.0.1.1 via fe-1/2/0.0
                    > to 10.0.0.2 via fe-1/2/1.2
224.0.0.5/32        *[OSPF/10] 03:42:44, metric 1
                    MultiRecv
```

user@R2> **show route protocol ospf**

inet.0: 6 destinations, 6 routes (6 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

```
10.0.1.0/30          *[OSPF/10] 03:42:10, metric 2
                    to 10.0.0.1 via fe-1/2/0.1
                    > to 10.0.2.1 via fe-1/2/1.4
224.0.0.5/32        *[OSPF/10] 03:43:11, metric 1
                    MultiRecv
```

**Meaning**    The routing tables on Device R1 and Device R2 do not contain the default 0.0.0.0/0 route. This verifies that the default route is no longer present in the OSPF domain. To reactivate the ge-0/0/2.6 interface, issue the **activate interfaces ge-0/0/2 unit 0 family inet address 10.0.45.2/30** configuration mode command.

### How a Routing Policy Is Evaluated

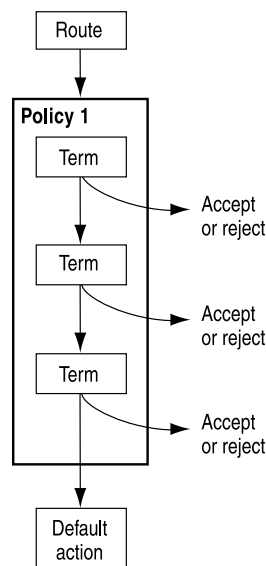

---

[Figure 8 on page 38](#) shows how a single routing policy is evaluated. This routing policy consists of multiple terms. Each term consists of match conditions and actions to apply to matching routes. Each route is evaluated against the policy as follows:

1. The route is evaluated against the first term. If it matches, the specified action is taken. If the action is to accept or reject the route, that action is taken and the evaluation of the route ends. If the next term action is specified, if no action is specified, or if the route does not match, the evaluation continues as described in Step 2. If the next policy action is specified, any accept or reject action specified in this term is skipped, all remaining terms in this policy are skipped, all other actions are taken, and the evaluation continues as described in Step 3.

2. The route is evaluated against the second term. If it matches, the specified action is taken. If the action is to accept or reject the route, that action is taken and the evaluation of the route ends. If the next term action is specified, if no action is specified, or if the route does not match, the evaluation continues in a similar manner against the last term. If the next policy action is specified, any accept or reject action specified in this term is skipped, all remaining terms in this policy are skipped, all other actions are taken, and the evaluation continues as described in Step 3.
3. If the route matches no terms in the routing policy or the next policy action is specified, the accept or reject action specified by the default policy is taken. For more information about the default routing policies, see [“Default Routing Policies” on page 27](#).

**Figure 8: Routing Policy Evaluation**

## Categories of Routing Policy Match Conditions

A *match condition* defines the criteria that a route must match. You can define one or more match conditions. If a route matches all match conditions, one or more actions are applied to the route.

Match conditions fall into two categories: standard and extended. In general, the extended match conditions are more complex than standard match conditions. The extended match conditions provide many powerful capabilities. The standard match conditions include criteria that are defined within a routing policy and are less complex than the extended match conditions, also called named match conditions.

Extended match conditions are defined separately from the routing policy and are given names. You then reference the name of the match condition in the definition of the routing policy itself.

Named match conditions allow you to do the following:

- Reuse match conditions in other routing policies.

- Read configurations that include complex match conditions more easily.

Named match conditions include communities, prefix lists, and AS path regular expressions.

[Table 7 on page 39](#) describes each match condition, including its category, when you typically use it, and any relevant notes about it. For more information about match conditions, see [“Routing Policy Match Conditions” on page 40](#).

**Table 7: Match Condition Concepts**

Match Condition	Category	When to Use	Notes
AS path regular expression—A combination of AS numbers and regular expression operators.	Extended	(BGP only) Match a route based on its AS path. (An AS path consists of the AS numbers of all routers a packet must go through to reach a destination.) You can specify an exact match with a particular AS path or a less precise match.	You use regular expressions to match the AS path.
Community—A group of destinations that share a property. (Community information is included as a path attribute in BGP update messages.)	Extended	Match a group of destinations that share a property. Use a routing policy to define a community that specifies a group of destinations you want to match and one or more actions that you want taken on this community.	<p>Actions can be performed on the entire group.</p> <p>You can create multiple communities associated with a particular destination.</p> <p>You can create match conditions using regular expressions.</p>
Prefix list—A named list of IP addresses.	Extended	Match a route based on prefix information. You can specify an exact match of a particular route only.	You can specify a common action only for all prefixes in the list.
Route list—A list of destination prefixes.	Extended	Match a route based on prefix information. You can specify an exact match of a particular route or a less precise match.	You can specify an action for each prefix in the route list or a common action for all prefixes in the route list.
Standard—A collection of criteria that can match a route.	Standard	<p>Match a route based on one of the following criteria: area ID, color, external route, family, instance (routing), interface name, level number, local preference, metric, neighbor address, next-hop address, origin, preference, protocol, routing table name, or tag.</p> <p>You can specify a match condition for policies based on protocols by naming a protocol from which the route is learned or to which the route is being advertised.</p>	None.

Table 7: Match Condition Concepts (*continued*)

Match Condition	Category	When to Use	Notes
Subroutine—A routing policy that is called repeatedly from another routing policy.	Extended	Use an effective routing policy in other routing policies. You can create a subroutine that you can call over and over from other routing policies.	The subroutine action influences but does not necessarily determine the final action. For more information, see <a href="#">“How a Routing Policy Subroutine Is Evaluated”</a> on page 162.

Each term can consist of two statements, **from** and **to**, that define match conditions:

- In the **from** statement, you define the criteria that an *incoming* route must match. You can specify one or more match conditions. If you specify more than one, all conditions must match the route for a match to occur.
- In the **to** statement, you define the criteria that an *outgoing* route must match. You can specify one or more match conditions. If you specify more than one, all conditions must match the route for a match to occur.

The order of match conditions in a term is not important, because a route must match all match conditions in a term for an action to be taken.

#### Related Documentation

- [Routing Policy Match Conditions on page 40](#)

## Routing Policy Match Conditions

Each term in a routing policy can include two statements, **from** and **to**, to define the conditions that a route must match for the policy to apply:

```

from {
    family family-name;
    match-conditions;
    policy subroutine-policy-name;
    prefix-list name;
    route-filter destination-prefix match-type <actions>;
    source-address-filter source-prefix match-type <actions>;
}
to {
    match-conditions;
    policy subroutine-policy-name;
}

```

In the **from** statement, you define the criteria that an incoming route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur.

The **from** statement is optional. If you omit the **from**, all routes are considered to match. All routes then take the configured actions of the policy term.

In the **to** statement, you define the criteria that an outgoing route must match. You can specify one or more match conditions. If you specify more than one, they all must match the route for a match to occur. You can specify most of the same match conditions in the **to** statement that you can in the **from** statement. In most cases, specifying a match condition in the **to** statement produces the same result as specifying the same match condition in the **from** statement.

The **to** statement is optional. If you omit both the **to** and the **from** statements, all routes are considered to match.

Table 8 on page 41 summarizes key routing policy match conditions.

**Table 8: Summary of Key Routing Policy Match Conditions**

Match Condition	Description
<b>aggregate-contributor</b>	Matches routes that are contributing to a configured aggregate. This match condition can be used to suppress a contributor in an aggregate route.
<b>area <i>area-id</i></b>	Matches a route learned from the specified OSPF area during the exporting of OSPF routes into other protocols.
<b>as-path <i>name</i></b>	Matches the name of the path regular expression of an autonomous systems (AS). BGP routes whose AS path matches the regular expression are processed.
<b>color <i>preference</i></b>	Matches a color value. You can specify preference values that are finer-grained than those specified in the <b>preference</b> match conditions. The <b>color</b> value can be a number from 0 through 4,294,967,295 ( $2^{32} - 1$ ). A lower number indicates a more preferred route.
<b>community</b>	Matches the name of one or more communities. If you list more than one name, only one name needs to match for a match to occur. (The matching is effectively a logical OR operation.)
<b>external [<i>type metric-type</i>]</b>	Matches external OSPF routes, including routes exported from one level to another. In this match condition, <b>type</b> is an optional keyword. The <b>metric-type</b> value can be either 1 or 2. When you do not specify <b>type</b> , this condition matches all external routes.
<b>interface <i>interface-name</i></b>	Matches the name or IP address of one or more router interfaces. Use this condition with protocols that are interface-specific. For example, do not use this condition with internal BGP (IBGP).  Depending on where the policy is applied, this match condition matches routes learned from or advertised through the specified interface.
<b>internal</b>	Matches a routing policy against the internal flag for simplified next-hop self policies.
<b>level <i>level</i></b>	Matches the IS-IS level. Routes that are from the specified level or are being advertised to the specified level are processed.
<b>local-preference <i>value</i></b>	Matches a BGP local preference attribute. The preference value can be from 0 through 4,294,967,295 ( $2^{32} - 1$ ).

Table 8: Summary of Key Routing Policy Match Conditions (*continued*)

Match Condition	Description
<b>metric</b> <i>metric</i> <b>metric2</b> <i>metric</i>	Matches a metric value. The <b>metric</b> value corresponds to the multiple exit discriminator (MED), and <b>metric2</b> corresponds to the IGP metric if the BGP next hop runs back through another route.
<b>neighbor</b> <i>address</i>	Matches the address of one or more neighbors (peers).  For BGP export policies, the address can be for a directly connected or indirectly connected peer. For all other protocols, the address is for the neighbor from which the advertisement is received.
<b>next-hop</b> <i>address</i>	Matches the next-hop address or addresses specified in the routing information for a particular route. For BGP routes, matches are performed against each protocol next hop.
<b>origin</b> <i>value</i>	Matches the BGP origin attribute, which is the origin of the AS path information. The value can be one of the following: <ul style="list-style-type: none"> <li>• <b>egp</b>—Path information originated from another AS.</li> <li>• <b>igp</b>—Path information originated from within the local AS.</li> <li>• <b>incomplete</b>—Path information was learned by some other means.</li> </ul>
<b>preference</b> <i>preference</i> <b>preference2</b> <i>preference</i>	Matches the preference value. You can specify a primary preference value ( <b>preference</b> ) and a secondary preference value ( <b>preference2</b> ). The preference value can be a number from 0 through 4,294,967,295 ( $2^{32} - 1$ ). A lower number indicates a more preferred route.  <b>NOTE:</b> Do not set <b>preference2</b> for BGP route-policy.
<b>protocol</b> <i>protocol</i>	Matches the name of the protocol from which the route was learned or to which the route is being advertised. It can be one of the following: <b>aggregate</b> , <b>bgp</b> , <b>direct</b> , <b>dvmrp</b> , <b>isis</b> , <b>local</b> , <b>ospf</b> , <b>pim-dense</b> , <b>pim-sparse</b> , <b>rip</b> , <b>ripng</b> , or <b>static</b> .
<b>route-type</b> <i>value</i>	Matches the type of route. The value can be either <b>external</b> or <b>internal</b> .

All conditions in the **from** and **to** statements must match for the action to be taken. The match conditions defined in [Table 9 on page 43](#) are effectively a logical AND operation. Matching in prefix lists and route lists is handled differently. They are effectively a logical OR operation. If you configure a policy that includes some combination of route filters, prefix lists, and source address filters, they are evaluated according to a logical OR operation or a longest-route match lookup.

[Table 9 on page 43](#) describes the match conditions available for matching an incoming or outgoing route. The table indicates whether you can use the match condition in both **from** and **to** statements and whether the match condition functions the same or differently when used with both statements. If a match condition functions differently in a **from** statement than in a **to** statement, or if the condition cannot be used in one type of statement, there is a separate description for each type of statement. Otherwise, the same description applies to both types of statements.

Table 9 on page 43 also indicates whether the match condition is standard or extended. In general, the extended match conditions include criteria that are defined separately from the routing policy (autonomous system [AS] path regular expressions, communities, and prefix lists) and are more complex than standard match conditions. The extended match conditions provide many powerful capabilities. The standard match conditions include criteria that are defined within a routing policy and are less complex than the extended match conditions.

Table 9: Complete List of Routing Policy Match Conditions

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>aggregate-contributor</b>	Standard	Match routes that are contributing to a configured aggregate. This match condition can be used to suppress a contributor in an aggregate route.	
<b>area <i>area-id</i></b>	Standard	(Open Shortest Path First [OSPF] only) Area identifier.  In a <b>from</b> statement used with an <b>export</b> policy, match a route learned from the specified OSPF area when exporting OSPF routes into other protocols.	
<b>as-path <i>name</i></b>	Extended	(Border Gateway Protocol [BGP] only) Name of an AS path regular expression. For more information, see <a href="#">“Understanding AS Path Regular Expressions for Use as Routing Policy Match Conditions”</a> on page 249.	
<b>as-path-group <i>group-name</i></b>	Extended	(BGP only) Name of an AS path group regular expression. For more information, see <a href="#">“Understanding AS Path Regular Expressions for Use as Routing Policy Match Conditions”</a> on page 249.	
<b>color <i>preference</i></b> <b>color2 <i>preference</i></b>	Standard	Color value. You can specify preference values ( <b>color</b> and <b>color2</b> ) that are finer-grained than those specified in the <b>preference</b> and <b>preference2</b> match conditions. The color value can be a number in the range from 0 through 4,294,967,295 ( $2^{32} - 1$ ). A lower number indicates a more preferred route.	

Table 9: Complete List of Routing Policy Match Conditions (*continued*)

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>community-count value (equal   orhigher   orlower)</b>	Standard	<p>(BGP only) Number of community entries required for a route to match. The count value can be a number in the range of 0 through 1,024. Specify one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>equal</b>—The number of communities must equal this value to be considered a match.</li> <li>• <b>orhigher</b> —The number of communities must be greater than or equal to this value to be considered a match.</li> <li>• <b>orlower</b>—The number of communities must be less than or equal to this value to be considered a match.</li> </ul> <p><b>NOTE:</b> If you configure multiple <b>community-count</b> statements, the matching is effectively a logical AND operation.</p> <p><b>NOTE:</b> The <b>community-count</b> attribute only works with standard communities. It does not work with extended communities.</p>	You cannot specify this match condition.
<b>community [ names ]</b>	Extended	Name of one or more communities. If you list more than one name, only one name needs to match for a match to occur (the matching is effectively a logical OR operation). For more information, see " <a href="#">Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions</a> " on page 295.	
<b>external [ type metric-type ]</b>	Standard	<p>(OSPF and IS-IS only) Match IGP external routes. For IS-IS routes, the <b>external</b> condition also matches routes that are exported from one IS-IS level to another. The <b>type</b> keyword is optional and is applicable only to OSPF external routes. When you do not specify <b>type</b>, the <b>external</b> condition matches all IGP external (OSPF and IS-IS) routes. When you specify <b>type</b>, the <b>external</b> condition matches only OSPF external routes with the specified OSPF metric type. The metric type can either be 1 or 2.</p> <p>To match BGP external routes, use the <b>route-type</b> match condition.</p>	

Table 9: Complete List of Routing Policy Match Conditions (*continued*)

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>family</b> <i>family-name</i>	Standard	<p>Name of an address family. Match the address family of the route. Depending on your device and configuration, <b>family-name</b> can be one of the following:</p> <ul style="list-style-type: none"> <li><b>inet</b>—IP version 4 (IPv4) traffic</li> <li><b>inet-mdt</b>—IPv4 multicast distribution tree (MDT) traffic</li> <li><b>inet-mvpn</b>—IPv4 multicast virtual private network (MVPN) traffic</li> <li><b>inet-vpn</b>—IPv4 VPN traffic</li> <li><b>inet6</b>—IP version 6 (IPv6) traffic</li> <li><b>inet6-mvpn</b>—IPv6 MVPN traffic</li> <li><b>inet6-vpn</b>—IPv6 VPN traffic</li> <li><b>iso</b>—IS-IS traffic</li> <li><b>route-target</b>—BGP route target filtering routes for VPN traffic</li> </ul> <p>Default setting is <b>inet</b>.</p>	
<b>instance</b> <i>instance-name</i>	Standard	<p>Name of one or more routing instances.</p> <p>Match a route learned from one of the specified instances.</p>	<p>Name of one or more routing instances.</p> <p>Match a route to be advertised over one of the specified instances.</p>
<b>interface</b> <i>interface-name</i>	Standard	<p>Name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as IBGP.</p> <p>Match a route learned from one of the specified interfaces. Direct routes match routes configured on the specified interface.</p>	<p>Name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as IBGP.</p> <p>Match a route to be advertised from one of the specified interfaces.</p>
<b>level</b> <i>level</i>	Standard	<p>(Intermediate System-to-Intermediate System [IS-IS] only) IS-IS level.</p> <p>Match a route learned from a specified level.</p>	<p>(IS-IS only) IS-IS level.</p> <p>Match a route to be advertised to a specified level.</p>
<b>local-preference</b> <i>value</i>	Standard	(BGP only) BGP local preference (LOCAL_PREF <i>local-preference (add   subtract) number</i> ) attribute. The preference value can be a number in the range 0 through 4,294,967,295 ( $2^{32} - 1$ ).	
<b>metric</b> <i>metric metric2 metric3 metric4 metric</i>	Standard	<p>Metric value. You can specify up to four metric values, starting with <b>metric</b> (for the first metric value) and continuing with <b>metric2</b>, <b>metric3</b>, and <b>metric4</b>.</p> <p>(BGP only) <b>metric</b> corresponds to the multiple exit discriminator (MED), and <b>metric2</b> corresponds to the interior gateway protocol (IGP) metric if the BGP next hop runs back through another route.</p>	

Table 9: Complete List of Routing Policy Match Conditions (*continued*)

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>multicast-scoping</b> ( <i>scoping-name</i>   <i>number</i> ) < (orhigher   orlower) >	Standard	<p>Multicast scope value of IPv4 or IPv6 multicast group address. The multicast-scoping name corresponds to an IPv4 prefix. You can match on a specific multicast-scoping prefix or on a range of prefixes. Specify <b>orhigher</b> to match on a scope and numerically higher scopes, or <b>orlower</b> to match on a scope and numerically lower scopes. For more information, see the <i>Multicast Protocols Feature Guide for Routing Devices</i>.</p> <p>You can apply this scoping policy to the routing table by including the <b>scope-policy</b> statement at the [edit routing-options] hierarchy level.</p> <p>The <b>number</b> value can be any hexadecimal number from 0 through F. The multicast-scope value is a number from 0 through 15, or one of the following keywords with the associated meanings:</p> <ul style="list-style-type: none"> <li>• <b>node-local</b> (value=1)—No corresponding prefix</li> <li>• <b>link-local</b> (value=2)—Corresponding prefix 224.0.0.0/24</li> <li>• <b>site-local</b> (value=5)—No corresponding prefix</li> <li>• <b>global</b> (value=14)—Corresponding prefix 224.0.1.0 through 238.255.255.255</li> <li>• <b>organization-local</b> (value=8)—Corresponding prefix 239.192.0.0/14</li> </ul>	
<b>neighbor address</b>	Standard	<p>Address of one or more neighbors (peers).</p> <p>For BGP, the address can be a directly connected or indirectly connected peer.</p> <p>For all other protocols, the address is the neighbor from which the advertisement is received.</p> <p><b>NOTE:</b> The <b>neighbor address</b> match condition is not valid for the Routing Information Protocol (RIP).</p>	<p>Address of one or more neighbors (peers).</p> <p>For BGP import policies, specifying <b>to neighbor</b> produces the same result as specifying <b>from neighbor</b>.</p> <p>For BGP export policies, specifying the <b>neighbor</b> match condition has no effect and is ignored.</p> <p>For all other protocols, the <b>to</b> statement matches the neighbor to which the advertisement is sent.</p> <p><b>NOTE:</b> The <b>neighbor address</b> match condition is not valid for the Routing Information Protocol (RIP).</p>
<b>next-hop</b> [ <i>addresses</i> ]	Standard	One or more next-hop addresses specified in the routing information for a particular route. A next-hop address cannot include a netmask. For BGP routes, matches are performed against each protocol next hop.	
<b>next-hop-type merged</b>	Standard	LDP generates a next hop based on RSVP and IP next hops available to use, combined with forwarding-class mapping.	You cannot specify this match condition.
<b>nlri-route-type</b>	Standard	<p>Route type from NLRI 1 through NLRI 10.</p> <p>Multiple route types can be specified in a single policy.</p>	

Table 9: Complete List of Routing Policy Match Conditions (*continued*)

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>origin value</b>	Standard	<p>(BGP only) BGP origin attribute, which is the origin of the AS path information. The value can be one of the following:</p> <ul style="list-style-type: none"> <li><b>egp</b>—Path information originated in another AS.</li> <li><b>igp</b>—Path information originated within the local AS.</li> <li><b>incomplete</b>—Path information was learned by some other means.</li> </ul>	
<b>policy [ <i>policy-name</i> ]</b>	Extended	<p>Name of a policy to evaluate as a subroutine.</p> <p>For information about this extended match condition, see <a href="#">“Understanding Policy Subroutines in Routing Policy Match Conditions”</a> on page 159.</p>	
<b>preference preference preference2 preference</b>	Standard	<p>Preference value. You can specify a primary preference value (<b>preference</b>) and a secondary preference value (<b>preference2</b>). The preference value can be a number from 0 through 4,294,967,295 (<math>2^{32} - 1</math>). A lower number indicates a more preferred route.</p> <p>To specify even finer-grained preference values, see the <b>color</b> and <b>color2</b> match conditions in this table.</p>	
<b>prefix-list prefix-list-name ip-addresses</b>	Extended	<p>Named list of IP addresses. You can specify an exact match with incoming routes.</p> <p>For information about this extended match condition, see <a href="#">“Understanding Prefix Lists for Use in Routing Policy Match Conditions”</a> on page 233.</p>	You cannot specify this match condition.
<b>prefix-list-filter prefix-list-name match-type</b>	Extended	<p>Named prefix list. You can specify prefix length qualifiers for the list of prefixes in the prefix list.</p> <p>For information about this extended match condition, see <a href="#">“Understanding Prefix Lists for Use in Routing Policy Match Conditions”</a> on page 233.</p>	You cannot specify this match condition.
<b>protocol protocol</b>	Standard	<p>Name of the protocol from which the route was learned or to which the route is being advertised. It can be one of the following: <b>access</b>, <b>access-internal</b>, <b>aggregate</b>, <b>arp</b>, <b>bgp</b>, <b>direct</b>, <b>dvmrp</b>, <b>isis</b>, <b>fr</b>, <b>isis</b>, <b>l2circuit</b>, <b>l2vpn</b>, <b>ldp</b>, <b>local</b>, <b>msdp</b>, <b>ospf</b>, <b>ospf2</b>, <b>ospf3</b>, <b>pim</b>, <b>rip</b>, <b>ripng</b>, <b>route-target</b>, <b>rsvp</b>, or <b>static</b>.</p> <p><b>NOTE:</b> The <b>ospf2</b> statement matches on OSPFv2 routes. The <b>ospf3</b> statement matches on OSPFv3 routes. The <b>ospf</b> statement matches on both OSPFv2 and OSPFv3 routes.</p>	

Table 9: Complete List of Routing Policy Match Conditions (*continued*)

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>rib <i>routing-table</i></b>	Standard	<p>Name of a routing table. The value of <b><i>routing-table</i></b> can be one of the following:</p> <ul style="list-style-type: none"> <li>inet.0—Unicast IPv4 routes</li> <li><i>instance-name</i> inet.0—Unicast IPv4 routes for a particular routing instance</li> <li>inet.1—Multicast IPv4 routes</li> <li>inet.2—Unicast IPv4 routes for multicast reverse-path forwarding (RPF) lookup</li> <li>inet.3—MPLS routes</li> <li>mpls.0—MPLS routes for label-switched path (LSP) next hops</li> <li>inet6.0—Unicast IPv6 routes</li> </ul>	
<b>route-filter</b> <b><i>destination-prefix</i></b> <b><i>match-type</i></b> <b>&lt;<i>actions</i>&gt;</b>	Extended	<p>List of destination prefixes. When specifying a destination prefix, you can specify an exact match with a specific route or a less precise match using match types. You can configure either a common action that applies to the entire list or an action associated with each prefix. For more information, see <a href="#">“Understanding Route Filters for Use in Routing Policy Match Conditions”</a> on page 175.</p>	You cannot specify this match condition.
<b>route-type <i>value</i></b>	Standard	<p>Type of BGP route. The value can be one of the following:</p> <ul style="list-style-type: none"> <li><b>external</b>—External route.</li> <li><b>internal</b>—Internal route.</li> </ul> <p>To match IGP external routes, use the <b>external</b> match condition.</p>	
<b>rtf-prefix-list <i>name</i></b> <b><i>route-targets</i></b>	Extended	<p>(BGP only) Named list of route target prefixes for BGP route target filtering and proxy BGP route target filtering.</p> <p>For information about this extended match condition, see <i>Example: Configuring Proxy BGP Route Target Filtering</i>.</p>	You cannot specify this match condition.
<b>source-address-filter</b> <b><i>destination-prefix</i></b> <b><i>match-type</i></b> <b>&lt;<i>actions</i>&gt;</b>	Extended	<p>List of multicast source addresses. When specifying a source address, you can specify an exact match with a specific route or a less precise match using match types. You can configure either a common action that applies to the entire list or an action associated with each prefix. For more information, see <a href="#">“Understanding Route Filters for Use in Routing Policy Match Conditions”</a> on page 175.</p>	You cannot specify this match condition.

Table 9: Complete List of Routing Policy Match Conditions (*continued*)

Match Condition	Match Condition Category	from Statement Description	to Statement Description
<b>state (active   inactive)</b>	Standard	(BGP export only) Match on the following types of advertised routes: <ul style="list-style-type: none"> <li>• <b>active</b>—An active BGP route</li> <li>• <b>inactive</b>—A route advertised to internal BGP peers as the best external path even if the best path is an internal route</li> <li>• <b>inactive</b>—A route advertised by BGP as the best route even if the routing table did not select it to be an active route</li> </ul>	
<b>tag string tag2 string</b>	Standard	<p>Tag value. You can specify two tag strings: <b>tag</b> (for the first string) and <b>tag2</b>. These values are local to the router and can be set on configured routes or by using an import routing policy.</p> <p>You can specify multiple tags under one match condition by including the tags within a bracketed list. For example: <b>from tag [ tag1 tag2 tag3 ]</b>;</p> <p>For OSPF routes, the <b>tag</b> action sets the 32-bit tag field in OSPF external link-state advertisement (LSA) packets.</p> <p>For IS-IS routes, the <b>tag</b> action sets the 32-bit flag in the IS-IS IP prefix type length values. (TLV).</p> <p>OSPF stores the INTERNAL route's OSPF area ID in the <b>tag2</b> attribute. However, for EXTERNAL routes, OSPF does not store anything in the <b>tag2</b> attribute.</p> <p>You can configure a policy term to set the <b>tag2</b> value for a route. If the route, already has a <b>tag2</b> value (for example, an OSPF route that stores area id in tag2), then the original <b>tag2</b> value is overwritten by the new value.</p> <p>When the policy contains the "from area" match condition, for internal OSPF routes, where <b>tag2</b> is set, based on the OSPF area- ID, the evaluation is conducted to compare the <b>tag2</b> attribute with the area ID. For external OSPF routes that do not have the <b>tag2</b> attribute set, the match condition fails.</p>	
<b>validation-database</b>	Standard	<p>When BGP origin validation is configured, triggers a lookup in the route validation database to determine if the route prefix is valid, invalid, or unknown. The route validation database contains route origin authorization (ROA) records that map route prefixes to expected originating autonomous systems (ASs). This prevents the accidental advertisement of invalid routes.</p> <p><i>See Example: Configuring Origin Validation for BGP.</i></p>

## Route Filter Match Conditions

When specifying a destination prefix, you can specify an exact match with a specific route, or a less precise match by using match types. You can configure either a common reject action that applies to the entire list, or an action associated with each prefix.

You can specify known invalid (“bad”) routes to ignore by specifying matches on destination prefixes. Additionally, you can specify that “good” routes be processed in a particular way. For instance, you can group traffic from specific source or destination addresses into forwarding classes to be processed using the class of service (CoS) feature.

Table 10 on page 50 lists route list match types.

Table 10: Route List Match Types

Match Type	Match Conditions
<b>exact</b>	The route shares the same most-significant bits (described by <i>prefix-length</i> ), and <i>prefix-length</i> is equal to the route's prefix length.
<b>longer</b>	The route shares the same most-significant bits (described by <i>prefix-length</i> ), and <i>prefix-length</i> is greater than the route's prefix length.
<b>orlonger</b>	The route shares the same most-significant bits (described by <i>prefix-length</i> ), and <i>prefix-length</i> is equal to or greater than the route's prefix length.
<b>prefix-length-range <i>prefix-length2-prefix-length3</i></b>	The route shares the same most-significant bits (described by <i>prefix-length</i> ), and the route's prefix length falls between <i>prefix-length2</i> and <i>prefix-length3</i> , inclusive.
<b>through <i>destination-prefix</i></b>	<p>All the following are true:</p> <ul style="list-style-type: none"> <li>The route shares the same most-significant bits (described by <i>prefix-length</i>) of the first destination prefix.</li> <li>The route shares the same most-significant bits (described by <i>prefix-length</i>) of the second destination prefix for the number of bits in the prefix length.</li> <li>The number of bits in the route's prefix length is less than or equal to the number of bits in the second prefix.</li> </ul> <p>You do not use the <b>through</b> match type in most routing policy configurations.</p>
<b>upto <i>prefix-length2</i></b>	The route shares the same most-significant bits (described by <i>prefix-length</i> ) and the route's prefix length falls between <i>prefix-length</i> and <i>prefix-length2</i> .

- [Example: Grouping Source and Destination Prefixes into a Forwarding Class on page 401](#)

## Actions in Routing Policy Terms

Each term in a routing policy can include a **then** statement, which defines the actions to take if a route matches all the conditions in the **from** and **to** statements in the term:

```
then {
    actions;
}
```

You can include this statement at the following hierarchy levels:

- [edit policy-options **policy-statement** *policy-name* term *term-name*]
- [edit logical-systems *logical-system-name* policy-options **policy-statement** *policy-name* term *term-name*]

If a term does not have **from** and **to** statements, all routes are considered to match, and the actions apply to them all. For information about the **from** and **to** statements, see [“Routing Policy Match Conditions” on page 40](#).

You can specify one or more actions in the **then** statement. There are three types of actions:

- Flow control actions, which affect whether to accept or reject the route and whether to evaluate the next term or routing policy.
- Actions that manipulate route characteristics.
- Trace action, which logs route matches.

**NOTE:** When you specify an action that manipulates the route characteristics, the changes occur in a copy of the source route. The source route itself does not change. The effect of the action is visible only after the route is imported into or exported from the routing table. To view the source route before the routing policy has been applied, use the `show route receive-protocol` command. To view a route after an export policy has been applied, use the `show route advertised-protocol` command.

During policy evaluation, the characteristics in the copy of the source route always change immediately after the action is evaluated. However, the route is not copied to the routing table or a routing protocol until the completion of the policy evaluation is complete.

The **then** statement is optional. If you omit it, one of the following occurs:

- The next term in the routing policy, if one is present, is evaluated.
- If there are no more terms in the routing policy, the next routing policy, if one is present, is evaluated.

- If there are no more terms or routing policies, the accept or reject action specified by the default policy is taken. For more information, see [“Default Routing Policies” on page 27](#).

The following sections discuss the following actions:

- [Configuring Flow Control Actions on page 52](#)
- [Configuring Actions That Manipulate Route Characteristics on page 53](#)
- [Configuring the Default Action in Routing Policies on page 60](#)
- [Configuring a Final Action in Routing Policies on page 61](#)
- [Logging Matches to a Routing Policy Term on page 62](#)
- [Configuring Separate Actions for Routes in Route Lists on page 62](#)

## Configuring Flow Control Actions

[Table 11 on page 52](#) lists the flow control actions. You can specify one of these actions along with the trace action or one or more of the actions that manipulate route characteristics (see [“Configuring Actions That Manipulate Route Characteristics” on page 53](#)).

**Table 11: Flow Control Actions**

Flow Control Action	Description
<b>accept</b>	Accept the route and propagate it. After a route is accepted, no other terms in the routing policy and no other routing policies are evaluated.
<b>default-action accept</b>	Accept and override any action intrinsic to the protocol. This is a nonterminating policy action.
<b>reject</b>	Reject the route and do not propagate it. After a route is rejected, no other terms in the routing policy and no other routing policies are evaluated.
<b>default-action reject</b>	Reject and override any action intrinsic to the protocol. This is a nonterminating policy action.
<b>next term</b>	<p>Skip to and evaluate the next term in the same routing policy. Any accept or reject action specified in the <b>then</b> statement is skipped. Any actions in the <b>then</b> statement that manipulate route characteristics are applied to the route.</p> <p><b>next term</b> is the default control action if a match occurs and you do not specify a flow control action.</p>
<b>next policy</b>	<p>Skip to and evaluate the next routing policy. Any accept or reject action specified in the <b>then</b> statement is skipped. Any actions in the <b>then</b> statement that manipulate route characteristics are applied to the route.</p> <p><b>next policy</b> is the default control action if a match occurs, you do not specify a flow control action, and there are no further terms in the current routing policy.</p>

## Configuring Actions That Manipulate Route Characteristics

You can specify one or more of the actions listed in [Table 12 on page 53](#) to manipulate route characteristics.

**Table 12: Actions That Manipulate Route Characteristics**

Action	Description
<b>add-path send-count <i>path-count</i></b>	(BGP only) Enable sending up to 20 BGP paths to a destination for a subset of <b>add-path</b> advertised prefixes.
<b>as-path-prepend <i>as-path</i></b>	<p>(BGP only) Affix one or more AS numbers at the beginning of the AS path. If specifying more than one AS number, enclose the numbers in quotation marks (" "). The AS numbers are added after the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS numbers are placed within a confederation sequence. Otherwise, the affixed AS numbers are placed with a nonconfederation sequence. For more information, see <a href="#">"Understanding Prepending AS Numbers to BGP AS Paths" on page 264</a>.</p> <p>In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS.</p>
<b>as-path-expand last-as count <i>n</i></b>	(BGP only) Extract the last AS number in the existing AS path and affix that AS number to the beginning of the AS path <i>n</i> times, where <i>n</i> is a number from 1 through 32. The AS number is added before the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS numbers are placed within a confederation sequence. Otherwise, the affixed AS numbers are placed within a nonconfederation sequence. This option is typically used in non-IBGP export policies.
<b>class <i>class-name</i></b>	(Class of service [CoS] only) Apply the specified class-of-service parameters to routes installed into the routing table. For more information, see the <i>Class of Service Feature Guide for Routing Devices</i> .
<b>color <i>preference</i> color2 <i>preference</i></b>	<p>Set the preference value to the specified value. The <b>color</b> and <b>color2</b> preference values are even more fine-grained than those specified in the <b>preference</b> and <b>preference2</b> actions. The color value can be a number in the range from 0 through 4,294,967,295 (<math>2^{32} - 1</math>). A lower number indicates a more preferred route.</p> <p>If you set the preference with the <b>color</b> action, the value is internal to the Junos OS and is not transitive.</p>
<b>color (add   subtract) <i>number</i></b> <b>color2 (add   subtract) <i>number</i></b>	Change the color preference value by the specified amount. If an addition operation results in a value that is greater than 4,294,967,295 ( $2^{32} - 1$ ), the value is set to $2^{32} - 1$ . If a subtraction operation results in a value less than 0, the value is set to 0. If an attribute value is not already set at the time of the addition or subtraction operation, the attribute value defaults to a value of 0 regardless of the amount specified. If you perform an addition to an attribute with a value of 0, the number you add becomes the resulting attribute value.
<b>community (+   add) [ <i>names</i> ]</b>	(BGP only) Add the specified communities to the set of communities in the route. For more information, see <a href="#">"Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions" on page 295</a> .

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>community</b> (–   delete) [ <i>names</i> ]	(BGP only) Delete the specified communities from the set of communities in the route. For more information, see <a href="#">“Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions”</a> on page 295.
<b>community</b> (=   set) [ <i>names</i> ]	(BGP only) Replace any communities that were in the route in with the specified communities. For more information, see <a href="#">“Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions”</a> on page 295.
<b>cos-next-hop-map</b> <i>map-name</i>	Set CoS-based next-hop map in forwarding table.
<b>damping</b> <i>name</i>	<p>(BGP only) Apply the specified route-damping parameters to the route. These parameters override the default damping parameters. This action is useful only in an import policy, because the damping parameters affect the state of routes in the routing table.</p> <p>To apply damping parameters, you must enable BGP flap damping as described in the <i>Junos OS Routing Protocols Library for Routing Devices</i>, and you must create a named list of parameters as described in <a href="#">“Using Routing Policies to Damp BGP Route Flapping”</a> on page 348.</p>
<b>destination-class</b> <i>destination-class-name</i>	<p>Maintain packet counts for a route passing through your network, based on the destination address in the packet. You can do the following:</p> <ul style="list-style-type: none"> <li>• Configure group destination prefixes by configuring a routing policy.</li> <li>• Apply that routing policy to the forwarding table with the corresponding destination class.</li> <li>• Enable packet counting on one or more interfaces by including the <b>destination-class-usage</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet accounting] hierarchy level (see the <i>Class of Service Feature Guide for Routing Devices</i>).</li> <li>• View the output by using one of the following commands: <b>show interfaces destination-class</b> (all   <i>destination-class-name logical-interface-name</i>), <b>show interfaces interface-name extensive</b>, or <b>show interfaces interface-name statistics</b> (see the <a href="#">CLI Explorer</a>).</li> <li>• To configure a packet count based on the source address, use the <b>source-class</b> statement described in this table.</li> </ul>
<b>external type</b> <i>metric</i>	Set the external metric type for routes exported by OSPF. You must specify the keyword <b>type</b> .
<b>forwarding-class</b> <i>forwarding-class-name</i>	<p>Create the forwarding class that includes packets based on both the destination address and the source address in the packet. You can do the following:</p> <ul style="list-style-type: none"> <li>• Configure group prefixes by configuring a routing policy.</li> <li>• Apply that routing policy to the forwarding table with the corresponding forwarding class.</li> <li>• Enable packet counting on one or more interfaces by using the procedure described in either the <b>destination-class</b> or <b>source-class</b> actions defined in this table.</li> </ul>
<b>install-nexthop</b> <strict> <i>lsp</i> <i>lsp-name</i>	Choose which next hops, among a set of equal LSP next hops, are installed in the forwarding table. Use the export policy for the forwarding table to specify the LSP next hop to be used for the desired routes. Specify the <b>strict</b> option to enable strict mode, which checks to see if any of the LSP next hops specified in the policy are up. If none of the specified LSP next hops are up, the policy installs the discard next hop.

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>install-to-fib</b>	For PTX Series routers only, override the default BGP routing policy. For more information, see <i>Example: Overriding the Default BGP Routing Policy on PTX Series Packet Transport Routers</i> .
<b>load-balance consistent-hash</b>	(BGP only) For MX Series routers with modular port concentrators (MPCs) only, specify consistent load balancing for one or more IP addresses. This feature preserves the affinity of a flow to a path in an equal-cost multipath (ECMP) group when one or more next-hop paths fail. Only flows for paths that are inactive are redirected. Flows mapped to servers that remain active are maintained. For more information, see <i>Configuring Consistent Load Balancing for ECMP Groups</i> .
<b>load-balance per-packet</b>	(For export to the forwarding table only) Install all next-hop addresses in the forwarding table and have the forwarding table perform per-packet load balancing. This policy action allows you to optimize VPLS traffic flows across multiple paths. For more information, see <i>Configuring Per-Packet Load Balancing</i> .
<b>load-balance per-prefix</b>	For PTX Series routers only, override the default per-packet load balancing routing policy for BGP. For more information, see <i>Example: Overriding the Default BGP Routing Policy on PTX Series Packet Transport Routers</i> .
<b>local-preference value</b>	(BGP only) Set the BGP local preference (LOCAL_PREF) attribute. The preference value can be a number in the range from 0 through 4,294,967,295 ( $2^{32} - 1$ ).
<b>local-preference (add   subtract) number</b>	<p>Change the local preference value by the specified amount. If an addition operation results in a value that is greater than 4,294,967,295 (<math>2^{32} - 1</math>), the value is set to <math>2^{32} - 1</math>. If a subtraction operation results in a value less than 0, the value is set to 0. If an attribute value is not already set at the time of the addition or subtraction operation, the attribute value defaults to a value of 0 regardless of the amount specified. If you perform an addition to an attribute with a value of 0, the number you add becomes the resulting attribute value.</p> <p>For BGP, if the attribute value is not known, it is initialized to 100 before the routing policy is applied.</p>
<b>map-to-interface (interface-name   self)</b>	<p>Sets the <b>map-to-interface</b> value which is similar to existing metric or tag actions. The <b>map-to-interface</b> action requires you to specify one of the following:</p> <ul style="list-style-type: none"> <li>A logical interface (for example, ge-0/0/0.0). The logical interface can be any interface that multicast currently supports, including VLAN and aggregated Ethernet interfaces.</li> </ul> <p><b>NOTE:</b> If you specify a physical interface as the <b>map-to-interface</b> (for example, ge-0/0/0), a value of .0 is appended to physical interface to create a logical interface.</p> <ul style="list-style-type: none"> <li>The keyword <b>self</b>. The <b>self</b> keyword specifies that multicast data packets are sent on the same interface as the control packets and no mapping occurs.</li> </ul> <p>If no term matches, then no multicast data packets are sent.</p>
<b>metric metric metric2 metric metric3 metric metric4 metric</b>	<p>Set the metric. You can specify up to four metric values, starting with <b>metric</b> (for the first metric value) and continuing with <b>metric2</b>, <b>metric3</b>, and <b>metric4</b>.</p> <p>(BGP only) <b>metric</b> corresponds to the MED, and <b>metric2</b> corresponds to the IGP metric if the BGP next hop loops through another router.</p>

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>metric (add   subtract) <i>number</i></b> <b>metric2 (add   subtract) <i>number</i></b> <b>metric3 (add   subtract) <i>number</i></b> <b>metric4 (add   subtract) <i>number</i></b>	<p>Change the metric value by the specified amount. If an addition operation results in a value that is greater than 4,294,967,295 (<math>2^{32} - 1</math>), the value is set to <math>2^{32} - 1</math>. If a subtraction operation results in a value less than 0, the value is set to 0. If an attribute value is not already set at the time of the addition or subtraction operation, the attribute value defaults to a value of 0 regardless of the amount specified. If you perform an addition to an attribute with a value of 0, the number you add becomes the resulting attribute value.</p>
<b>metric expression (metric multiplier <i>x</i> offset <i>a</i>   metric2 multiplier <i>y</i> offset <i>b</i>)</b>	<p>Calculate a metric based on the current values of <b>metric</b> and <b>metric2</b>.</p> <p>This policy action overrides the current value of the metric attribute with the result of the expression</p> $((x * \text{metric}) + a) + ((y * \text{metric2}) + b)$ <p>where <b>metric</b> and <b>metric2</b> are the current input values. Metric multipliers are limited in range to eight significant digits.</p>
<b>metric (igp   minimum-igp) site-offset</b>	<p>(BGP only) Change the metric (MED) value by the specified negative or positive offset. This action is useful only in an external BGP (EBGP) export policy.</p>

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>next-hop</b> ( <i>address</i>   <b>discard</b>   <b>next-table</b> <i>table-name</i>   <b>peer-address</b>   <b>reject</b>   <b>self</b> )	<p>Set the next-hop address. When the advertising protocol is BGP, you can set the next hop only when any third-party next hop can be advertised; that is, when you are using IBGP or EBGp confederations.</p> <p>If you specify <b>self</b>, the next-hop address is replaced by one of the local routing device's addresses. The advertising protocol determines which address to use. When the advertising protocol is BGP, this address is set to the local IP address used for the BGP adjacency. A routing device cannot install routes with itself as the next hop.</p> <p>If you specify <b>peer-address</b>, the next-hop address is replaced by the peer's IP address. This option is valid only in import policies. Primarily used by BGP to enforce using the peer's IP address for advertised routes, this option is meaningful only when the next hop is the advertising routing device or another directly connected routing device.</p> <p>If you specify <b>discard</b>, the next-hop address is replaced by a discard next hop.</p> <p>If you specify <b>next-table</b>, the routing device performs a forwarding lookup in the specified table.</p> <p>If you use the <b>next-table</b> action, the configuration must include a term qualifier that specifies a different table than the one specified in the <b>next-table</b> action. In other words, the term qualifier in the <b>from</b> statement must exclude the table in the <b>next-table</b> action. In the following example, the first term contains <b>rib vrf-customer2.inet.0</b> as a matching condition. The action specifies a next-hop in a different routing table, <b>vrf-customer1.inet.0</b>. The second term does the opposite by using <b>rib vrf-customer1.inet.0</b> in the match condition and <b>vrf-customer2.inet.0</b> in the <b>next-table</b> action.</p> <pre> term 1 {   from {     protocol bgp;     rib vrf-customer2.inet.0;     community customer;   }   then {     next-hop next-table vrf-customer1.inet.0;   } } term 2 {   from {     protocol bgp;     rib vrf-customer1.inet.0;     community customer;   }   then {     next-hop next-table vrf-customer2.inet.0;   } } </pre> <p>If you specify <b>reject</b>, the next-hop address is replaced by a reject next hop.</p>
<b>origin value</b>	<p>(BGP only) Set the BGP origin attribute to one of the following values:</p> <ul style="list-style-type: none"> <li><b>igp</b>—Path information originated within the local AS.</li> <li><b>egp</b>—Path information originated in another AS.</li> <li><b>incomplete</b>—Path information learned by some other means.</li> </ul>

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>p2mp-lsp-root</b>	Set the ingress root node for a multipoint LDP (M-LDP)-based point-to-multipoint label-switched path (LSP). For more information, see <i>Example: Configuring Multipoint LDP In-Band Signaling for Point-to-Multipoint LSPs</i> .
<b>preference</b> <i>preference</i> <b>preference2</b> <i>preference</i>	<p>Set the preference value. You can specify a primary preference value (<b>preference</b>) and a secondary preference value (<b>preference2</b>). The preference value can be a number in the range from 0 through 4,294,967,295 (<math>2^{32} - 1</math>). A lower number indicates a more preferred route. When you use an import policy to set the value of <b>preference2</b> to the highest allowed value of 4,294,967,295, Junos OS resets this value to -1. If you set <b>preference2</b> to a number greater than (<math>2^{31} - 1</math>), it is reset to a negative value.</p> <p>To specify even finer-grained preference values, see the <b>color</b> and <b>color2</b> actions in this table.</p> <p>If you set the preference with the <b>preference</b> action, the new preference remains associated with the route. The new preference is internal to the Junos OS and is not transitive.</p>
<b>preference</b> (add   subtract) <i>number</i> <b>preference2</b> (add   subtract) <i>number</i>	Change the preference value by the specified amount. If an addition operation results in a value that is greater than 4,294,967,295 ( $2^{32} - 1$ ), the value is set to $2^{32} - 1$ . If a subtraction operation results in a value less than 0, the value is set to 0. If an attribute value is not already set at the time of the addition or subtraction operation, the attribute value defaults to a value of 0 regardless of the amount specified. If you perform an addition to an attribute with a value of 0, the number you add becomes the resulting attribute value.
<b>priority</b> (low   medium   high)	<p>(OSPF import only) Specify a priority for prefixes included in an OSPF import policy. Prefixes learned through OSPF are installed in the routing table based on the priority assigned to the prefixes. Prefixes assigned a priority of <b>high</b> are installed first, while prefixes assigned a priority of <b>low</b> are installed last.</p> <p><b>NOTE:</b> An OSPF import policy can only be used to set priority or to filter OSPF external routes. If an OSPF import policy is applied that results in a <b>reject</b> terminating action for a nonexternal route, then the <b>reject</b> action is ignored and the route is accepted anyway.</p>

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>source-class <i>source-class-name</i></b>	<p>Maintain packet counts for a route passing through your network, based on the source address. You can do the following:</p> <ul style="list-style-type: none"> <li>• Configure group source prefixes by configuring a routing policy.</li> <li>• Apply that routing policy to the forwarding table with the corresponding source class.</li> <li>• Enable packet counting on one or more interfaces by including the <b>source-class-usage <i>interface-name</i></b> statement at the <b>[edit interfaces <i>logical-unit-number</i> unit family inet accounting]</b> hierarchy level. Also, follow the <b>source-class-usage</b> statement with the <b>input</b> or <b>output</b> statement to define the inbound and outbound interfaces on which traffic monitored for source-class usage (SCU) is arriving and departing (or define one interface for both). The complete syntax is <b>[edit interfaces <i>interface-name</i> unit family inet accounting source-class-usage (input   output   input output) <i>unit-number</i>]</b>.</li> <li>• View the output by using one of the following commands: <b>show interfaces <i>interface-name</i> source-class <i>source-class-name</i></b>, <b>show interfaces <i>interface-name</i> extensive</b>, or <b>show interfaces <i>interface-name</i> statistics</b> (see the <a href="#">CLI Explorer</a>).</li> <li>• To configure a packet count based on the destination address, use the <b>destination-class</b> statement described in this table.</li> <li>• For a detailed source-class usage example configuration, see the “<a href="#">Example: Grouping Source and Destination Prefixes into a Forwarding Class</a>” on page 401.</li> </ul> <p><b>NOTE:</b> When configuring policy action statements, you can configure only one source class for each matching route. In other words, more than one source class cannot be applied to the same route.</p>
<b>ssm-source [ <i>addresses</i> ];</b>	Specify one or more IPv4 or IPv6 source addresses for the source-specific multicast (SSM) policy
<b>ssm-source [ <i>addresses</i> ];</b>	Specify one or more IPv4 or IPv6 source addresses for the source-specific multicast (SSM) policy.
<b>tag <i>tag tag2 tag</i></b>	<p>Set the tag value. You can specify two tag strings: <b>tag</b> (for the first string) and <b>tag2</b> (a second string). These values are local to the router.</p> <ul style="list-style-type: none"> <li>• For OSPF routes the <b>tag</b> action sets the 32-bit tag field in OSPF external link-state advertisement (LSA) packets.</li> <li>• For IS-IS routes, the <b>tag</b> action sets the 32-bit flag in the IS-IS IP prefix type length values (TLV).</li> <li>• For RIPv2 routes, the <b>tag</b> action sets the route-tag community. The <b>tag2</b> option is not supported.</li> </ul>
<b>tag (add   subtract) <i>number tag2</i> (add   subtract) <i>number</i></b>	Change the tag value by the specified amount. If an addition operation results in a value that is greater than 4,294,967,295 ( $2^{32} - 1$ ), the value is set to $2^{32} - 1$ . If a subtraction operation results in a value less than 0, the value is set to 0. If an attribute value is not already set at the time of the addition or subtraction operation, the attribute value defaults to a value of 0 regardless of the amount specified. If you perform an addition to an attribute with a value of 0, the number you add becomes the resulting attribute value.

Table 12: Actions That Manipulate Route Characteristics (*continued*)

Action	Description
<b>validation-state</b>	<p>When BGP origin validation is configured, set the validation state of a route prefix to valid, invalid, or unknown.</p> <p>The route validation database contains route origin authorization (ROA) records that map route prefixes to expected originating autonomous systems (ASs). This prevents the accidental advertisement of invalid routes.</p> <p>See <i>Example: Configuring Origin Validation for BGP</i>.</p>

## Configuring the Default Action in Routing Policies

The **default-action** statement overrides any action intrinsic to the protocol. This action is also nonterminating, so that various policy terms can be evaluated before the policy is terminated. You can specify a default action, either **accept** or **reject**, as follows:

```
[edit]
policy-options {
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list name;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then {
        actions;
        default-action (accept | reject);
      }
    }
  }
}
```

The resulting action is set either by the protocol or by the last policy term that is matched.

### Example: Configuring the Default Action in a Routing Policy

Configure a routing policy that matches routes based on three policy terms. If the route matches the first term, a certain community tag is attached. If the route matches two separate terms, then both community tags are attached. If the route does not match any terms, it is rejected (protocol's default action). Note that the terms **hub** and **spoke** are mutually exclusive.

```
[edit]
policy-options {
  policy-statement test {
```

```

term set-default {
    then default-action reject;
}
term hub {
    from interface ge-2/1/0.5;
    then {
        community add test-01-hub;
        default-action accept;
    }
}
term spoke {
    from interface [ ge-2/1/0.1 ge-2/1/0.2 ];
    then {
        community add test-01-spoke;
        default-action accept;
    }
}
term management {
    from protocol direct;
    then {
        community add management;
        default-action accept;
    }
}
}

```

## Configuring a Final Action in Routing Policies

In addition to specifying an action using the **then** statement in a named term, you can also specify an action using the **then** statement in an unnamed term, as follows:

```

[edit]
policy-options {
  policy-statement policy-name {
    term term-name {
      from {
        family family-name;
        match-conditions;
        policy subroutine-policy-name;
        prefix-list name;
        route-filter destination-prefix match-type <actions>;
        source-address-filter source-prefix match-type <actions>;
      }
      to {
        match-conditions;
        policy subroutine-policy-name;
      }
      then {
        actions;
      }
    }
    then action;
  }
}

```

## Logging Matches to a Routing Policy Term

If you specify the trace action, the match is logged to a trace file. To set up a trace file, you must specify the following elements in the global **traceoptions** statement:

- Trace filename
- **policy** option in the **flag** statement

The following example uses the trace filename of **policy-log**:

```
[edit]
routing-options {
  traceoptions {
    file "policy-log";
    flag policy;
  }
}
```

This action does not affect the flow control during routing policy evaluation.

If a term that specifies a trace action also specifies a flow control action, the name of the term is logged in the trace file. If a term specifies a trace action only, the word **<default>** is logged.

## Configuring Separate Actions for Routes in Route Lists

If you specify route lists in the **from** statement, for each route in the list, you can specify an action to take on that individual route directly, without including a **then** statement. For more information, see [“Understanding Route Filters for Use in Routing Policy Match Conditions” on page 175](#).

## Summary of Routing Policy Actions

An *action* is what the policy framework software does if a route matches all criteria defined in a match condition. You can configure one or more actions in a term.

The policy framework software supports the following types of actions:

- Flow control actions, which affect whether to accept or reject the route or whether to evaluate the next term or routing policy
- Actions that manipulate route characteristics
- Trace action, which logs route matches

Manipulating the route characteristics allows you to control which route is selected as the active route to reach a destination. In general, the active route is also advertised to a routing platform's neighbors. You can manipulate the following route characteristics:

AS path, class, color, community, damping parameters, destination class, external type, next hop, load balance, local preference, metric, origin, preference, and tag.

For the numeric information (color, local preference, metric, preference, and tag), you can set a specific value or change the value by adding or subtracting a specified amount. The addition and subtraction operations do not allow the value to exceed a maximum value and drop below a minimum value.

All policies have default actions in case one of the following situations arises during policy evaluation:

- A policy does not specify a match condition.
- A match occurs, but a policy does not specify an action.
- A match does not occur with a term in a policy and subsequent terms in the same policy exist.
- A match does not occur by the end of a policy.

An action defines what the router does with the route when the route matches all the match conditions in the **from** and **to** statements for a particular term. If a term does not have **from** and **to** statements, all routes are considered to match and the actions apply to all routes.

Each term can have one or more of the following types of actions. The actions are configured under the **then** statement.

- Flow control actions, which affect whether to accept or reject the route and whether to evaluate the next term or routing policy
- Actions that manipulate route characteristics
- Trace action, which logs route matches

If you do not specify an action, one of the following results occurs:

- The next term in the routing policy, if one exists, is evaluated.
- If the routing policy has no more terms, the next routing policy, if one exists, is evaluated.
- If there are no more terms or routing policies, the accept or reject action specified by the default policy is executed.

Table 13 on page 63 summarizes the routing policy actions.

**Table 13: Summary of Key Routing Policy Actions**

Action	Description
Flow Control Actions	These actions control the flow of routing information into and out of the routing table.
<b>accept</b>	Accepts the route and propagates it. After a route is accepted, no other terms in the routing policy and no other routing policies are evaluated.

Table 13: Summary of Key Routing Policy Actions (*continued*)

Action	Description
<b>reject</b>	Rejects the route and does not propagate it. After a route is rejected, no other terms in the routing policy and no other routing policies are evaluated.
<b>next term</b>	Skips to and evaluates the next term in the same routing policy. Any <b>accept</b> or <b>reject</b> action specified in the <b>then</b> statement is ignored. Any actions specified in the <b>then</b> statement that manipulate route characteristics are applied to the route.
<b>next policy</b>	Skips to and evaluates the next routing policy. Any <b>accept</b> or <b>reject</b> action specified in the <b>then</b> statement is ignored. Any actions specified in the <b>then</b> statement that manipulate route characteristics are applied to the route.
<b>Route Manipulation Actions</b>	These actions manipulate the route characteristics.
<b>as-path-prepend <i>as-path</i></b>	<p>Appends one or more AS numbers at the beginning of the AS path. If you are specifying more than one AS number, include the numbers in quotation marks.</p> <p>The AS numbers are added after the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the appended AS numbers are placed within a confederation sequence. Otherwise, the appended AS numbers are placed with a nonconfederation sequence.</p>
<b>as-path-expand last-as count <i>n</i></b>	<p>Extracts the last AS number in the existing AS path and appends that AS number to the beginning of the AS path <i>n</i> times. Replace <i>n</i> with a number from 1 through 32.</p> <p>The AS numbers are added after the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the appended AS numbers are placed within a confederation sequence. Otherwise, the appended AS numbers are placed with a nonconfederation sequence.</p>
<b>class <i>class-name</i></b>	Applies the specified class-of-service (CoS) parameters to routes installed into the routing table.
<b>color <i>preference</i></b> <b>color2 <i>preference</i></b>	Sets the preference value to the specified value. The <b>color</b> and <b>color2</b> preference values can be a number from 0 through 4,294,967,295 ( $2^{32} - 1$ ). A lower number indicates a more preferred route.
<b>damping <i>name</i></b>	<p>Applies the specified route-damping parameters to the route. These parameters override BGP's default damping parameters.</p> <p>This action is useful only in import policies.</p>
<b>local-preference <i>value</i></b>	Sets the BGP local preference attribute. The preference can be a number from 0 through 4,294,967,295 ( $2^{32} - 1$ ).
<b>metric <i>metric</i></b> <b>metric2 <i>metric</i></b> <b>metric3 <i>metric</i></b> <b>metric4 <i>metric</i></b>	<p>Sets the metric. You can specify up to four metric values, starting with <b>metric</b> (for the first metric value) and continuing with <b>metric2</b>, <b>metric3</b>, and <b>metric4</b>.</p> <p>For BGP routes, <b>metric</b> corresponds to the MED, and <b>metric2</b> corresponds to the IGP metric if the BGP next hop loops through another router.</p>

Table 13: Summary of Key Routing Policy Actions (*continued*)

Action	Description
<b>next-hop address</b>	<p>Sets the next hop.</p> <p>If you specify <b>address</b> as <b>self</b>, the next-hop address is replaced by one of the local router's addresses. The advertising protocol determines which address to use.</p>

### Example: Configuring a Routing Policy to Advertise the Best External Route to Internal Peers

The BGP protocol specification, as defined in RFC 1771, specifies that a BGP peer shall advertise to its internal peers the higher preference external path, even if this path is not the overall best (in other words, even if the best path is an internal path). In practice, deployed BGP implementations do not follow this rule. The reasons for deviating from the specification are as follows:

- Minimizing the amount of advertised information. BGP scales according to the number of available paths.
- Avoiding routing and forwarding loops.

There are, however, several scenarios in which the behavior, specified in RFC 1771, of advertising the best external route might be beneficial. Limiting path information is not always desirable as path diversity might help reduce restoration times. Advertising the best external path can also address internal BGP (IBGP) route oscillation issues as described in RFC 3345, *Border Gateway Protocol (BGP) Persistent Route Oscillation Condition*.

The **advertise-external** statement modifies the behavior of a BGP speaker to advertise the best external path to IBGP peers, even when the best overall path is an internal path.

**NOTE:** The **advertise-external** statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.

The **conditional** option limits the behavior of the **advertise-external** setting, such that the external route is advertised only if the route selection process reaches the point where the multiple exit discriminator (MED) metric is evaluated. Thus, an external route is not advertised if it has, for instance, an AS path that is worse (longer) than that of the active path. The **conditional** option restricts external path advertisement to when the best external path and the active path are equal until the MED step of the route selection process. Note that the criteria used for selecting the best external path is the same whether or not the **conditional** option is configured.

Junos OS also provides support for configuring a BGP export policy that matches the state of an advertised route. You can match either active or inactive routes, as follows:

```
policy-options {  
  policy-statement name{  
    from state (active|inactive);  
  }  
}
```

This qualifier only matches when used in the context of an export policy. When a route is being advertised by a protocol that can advertise inactive routes (such as BGP), **state inactive** matches routes advertised as a result of the **advertise-inactive** and **advertise-external** statements.

For example, the following configuration can be used as a BGP export policy toward internal peers to mark routes advertised due to the **advertise-external** setting with a user-defined community. That community can be later used by the receiving routers to filter out such routes from the forwarding table. Such a mechanism can be used to address concerns that advertising paths not used for forwarding by the sender might lead to forwarding loops.

```
user@host# show policy-options  
policy-statement mark-inactive {  
  term inactive {  
    from state inactive;  
    then {  
      community set comm-inactive;  
    }  
  }  
  term default {  
    from protocol bgp;  
    then accept;  
  }  
  then reject;  
}  
community comm-inactive members 65535:65284;
```

- [Verification on page 70](#)

## Requirements

Junos OS 9.3 or later is required.

## Overview

This example shows three routing devices. Device R2 has an external BGP (EBGP) connection to Device R1. Device R2 has an IBGP connection to Device R3.

Device R1 advertises 172.16.6.0/24. Device R2 does not set the local preference in an import policy for Device R1's routes, and thus 172.16.6.0/24 has the default local preference of 100.

Device R3 advertises 172.16.6.0/24 with a local preference of 200.

When the **advertise-external** statement is not configured on Device R2, 172.16.6.0/24 is not advertised by Device R2 toward Device R3.

When the **advertise-external** statement is configured on Device R2 on the session toward Device R3, 172.16.6.0/24 is advertised by Device R2 toward Device R3.

When **advertise-external conditional** is configured on Device R2 on the session toward Device R3, 172.16.6.0/24 is not advertised by Device R2 toward Device R3. If you remove the **then local-preference 200** setting on Device R3 and add the **path-selection as-path-ignore** setting on Device R2 (thus making the path selection criteria equal until the MED step of the route selection process), 172.16.6.0/24 is advertised by Device R2 toward Device R3.

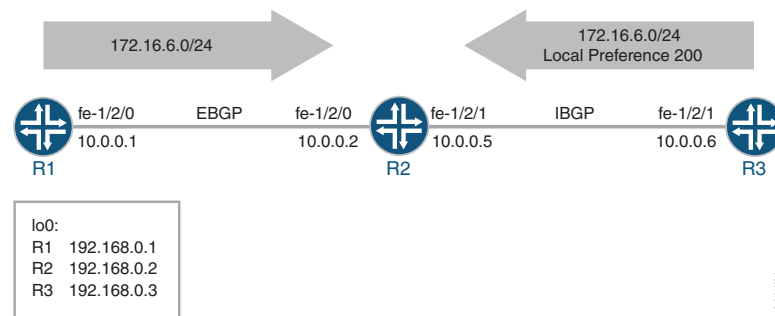

**NOTE:** To configure the **advertise-external** statement on a route reflector, you must disable intracluster reflection with the **no-client-reflect** statement, and the client cluster must be fully meshed to prevent the sending of redundant route advertisements.

When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.

## Topology

Figure 9 on page 67 shows the sample network.

Figure 9: BGP Topology for advertise-external

“CLI Quick Configuration” on page 68 shows the configuration for all of the devices in Figure 9 on page 67.

The section “Step-by-Step Procedure” on page 69 describes the steps on Device R2.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 0 description to-R2
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 from route-filter 172.16.6.0/24
  exact
set policy-options policy-statement send-static term 1 then accept
set policy-options policy-statement send-static term 2 then reject
set routing-options static route 172.16.6.0/24 reject
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 100
```

**Device R2**

```
set interfaces fe-1/2/0 unit 0 description to-R1
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 0 description to-R3
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.5/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 100
set protocols bgp group ext neighbor 10.0.0.1
set protocols bgp group int type internal
set protocols bgp group int local-address 192.168.0.2
set protocols bgp group int advertise-external
set protocols bgp group int neighbor 192.168.0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/1.0
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set routing-options router-id 192.168.0.2
set routing-options autonomous-system 200
```

**Device R3**

```
set interfaces fe-1/2/0 unit 6 family inet address 10.0.0.6/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set protocols bgp group int type internal
set protocols bgp group int local-address 192.168.0.3
set protocols bgp group int export send-static
set protocols bgp group int neighbor 192.168.0.2
set protocols ospf area 0.0.0.0 interface fe-1/2/0.6
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then local-preference 200
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 172.16.6.0/24 reject
set routing-options static route 0.0.0.0/0 next-hop 10.0.0.5
set routing-options autonomous-system 200
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 0 description to-R1
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30
```

```
user@R2# set fe-1/2/1 unit 0 description to-R3
user@R2# set fe-1/2/1 unit 0 family inet address 10.0.0.5/30
```

```
user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure OSPF or another interior gateway protocol (IGP).

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface fe-1/2/1.0
user@R2# set interface lo0.0 passive
```

3. Configure the EBGP connection to Device R1.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set peer-as 100
user@R2# set neighbor 10.0.0.1
```

4. Configure the IBGP connection to Device R3.

```
[edit protocols bgp group int]
user@R2# set type internal
user@R2# set local-address 192.168.0.2
user@R2# set neighbor 192.168.0.3
```

5. Add the **advertise-external** statement to the IBGP group peering session.

```
[edit protocols bgp group int]
user@R2# set advertise-external
```

6. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options ]
user@R2# set router-id 192.168.0.2
user@R2# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    description to-R1;
    family inet {
```

```
        address 10.0.0.2/30;
    }
}
fe-1/2/1 {
    unit 0 {
        description to-R3;
        family inet {
            address 10.0.0.5/30;
        }
    }
}
lo0 {
    unit 0 {
        family inet {
            address 192.168.0.2/32;
        }
    }
}
```

```
user@R2# show protocols
bgp {
    group ext {
        type external;
        peer-as 100;
        neighbor 10.0.0.1;
    }
    group int {
        type internal;
        local-address 192.168.0.2;
        advertise-external;
        neighbor 192.168.0.3;
    }
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/1.0;
        interface lo0.0 {
            passive;
        }
    }
}
```

```
user@R2# show routing-options
router-id 192.168.0.2;
autonomous-system 200;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the BGP Active Path on page 71](#)
- [Verifying the External Route Advertisement on page 71](#)

- [Verifying the Route on Device R3 on page 71](#)
- [Experimenting with the conditional Option on page 72](#)

---

### Verifying the BGP Active Path

---

**Purpose** On Device R2, make sure that the 172.16.6.0/24 prefix is in the routing table and has the expected active path.

**Action** user@R2> show route 172.16.6

```
inet.0: 8 destinations, 9 routes (8 active, 1 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.6.0/24    *[BGP/170] 00:00:07, localpref 200, from 192.168.0.3
                 AS path: I, validation-state: unverified
                 > to 10.0.0.6 via fe-1/2/1.0
                 [BGP/170] 03:23:03, localpref 100
                 AS path: 100 I, validation-state: unverified
                 > to 10.0.0.1 via fe-1/2/0.0
```

**Meaning** Device R2 receives the 172.16.6.0/24 route from both Device R1 and Device R3. The route from Device R3 is the active path, as designated by the asterisk (\*). The active path has the highest local preference. Even if the local preferences of the two routes were equal, the route from Device R3 would remain active because it has the shortest AS path.

---

### Verifying the External Route Advertisement

---

**Purpose** On Device R2, make sure that the 172.16.6.0/24 route is advertised toward Device R3.

**Action** user@R2> show route advertising-protocol bgp 192.168.0.3

```
inet.0: 8 destinations, 9 routes (8 active, 1 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref   AS path
  172.16.6.0/24      10.0.0.1          0         100       100 I
```

**Meaning** Device R2 is advertising the 172.16.6.0/24 route toward Device R3.

---

### Verifying the Route on Device R3

---

**Purpose** Make sure that the 172.16.6.0/24 prefix is in Device R3's routing table.

**Action** user@R3> show route 172.16.6.0/24

```
inet.0: 7 destinations, 8 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.6.0/24      *[Static/5] 03:34:14
                   Reject
                   [BGP/170] 06:34:43, localpref 100, from 192.168.0.2
                   AS path: 100 I, validation-state: unverified
                   > to 10.0.0.5 via fe-1/2/0.6
```

**Meaning** Device R3 has the static route and the BGP route for 172.16.6.0/24.

Note that the BGP route is hidden on Device R3 if the route is not reachable or if the next hop cannot be resolved. To fulfill this requirement, this example includes a static default route on Device R3 (**static route 0.0.0.0/0 next-hop 10.0.0.5**).

### Experimenting with the conditional Option

**Purpose** See how the **conditional** option works in the context of the BGP path selection algorithm.

**Action** 1. On Device R2, add the **conditional** option.

```
[edit protocols bgp group int]
user@R2# set advertise-external conditional
user@R2# commit
```

2. On Device R2, check to see if the 172.16.6.0/24 route is advertised toward Device R3.

```
user@R2> show route advertising-protocol bgp 192.168.0.3
```

As expected, the route is no longer advertised. You might need to wait a few seconds to see this result.

3. On Device R3, deactivate the **then local-preference** policy action.

```
[edit policy-options policy-statement send-static term 1]
user@R3# deactivate logical-systems R3 then local-preference
user@R3# commit
```

4. On Device R2, ensure that the local preferences of the two paths are equal.

```
user@R2> show route 172.16.6.0/24
```

```
inet.0: 8 destinations, 9 routes (8 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.6.0/24      *[BGP/170] 08:02:59, localpref 100
                   AS path: 100 I, validation-state: unverified
                   > to 10.0.0.1 via fe-1/2/0.0
                   [BGP/170] 00:07:51, localpref 100, from 192.168.0.3
                   AS path: I, validation-state: unverified
                   > to 10.0.0.6 via fe-1/2/1.0
```

5. On Device R2, add the **as-path-ignore** statement.

```
[edit protocols bgp]
user@R2# set path-selection as-path-ignore
```

```
user@R2# commit
```

6. On Device R2, check to see if the 172.16.6.0/24 route is advertised toward Device R3.

```
user@R2> show route advertising-protocol bgp 192.168.0.3
```

```
inet.0: 8 destinations, 9 routes (8 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
* 172.16.6.0/24      10.0.0.1          100        100        100 I
```

As expected, the route is now advertised because the AS path length is ignored and because the local preferences are equal.

- Related Documentation**
- [Example: Configuring BGP to Advertise Inactive Routes on page 73](#)
  - [Understanding BGP Path Selection](#)

## Example: Configuring BGP to Advertise Inactive Routes

By default, BGP readvertises only active routes. To have the routing table export to BGP the best route learned by BGP even if Junos OS did not select it to be an active route, include the **advertise-inactive** statement:

```
advertise-inactive;
```

In Junos OS, BGP advertises BGP routes that are installed or active, which are routes selected as the best based on the BGP path selection rules. The **advertise-inactive** statement allows nonactive BGP routes to be advertised to other peers.

**NOTE:** If the routing table has two BGP routes where one is active and the other is inactive, the **advertise-inactive** statement does not advertise the inactive BGP prefix. This statement does not advertise an inactive BGP route in the presence of another active BGP route. However, if the active route is a static route, the **advertise-inactive** statement advertises the inactive BGP route.

Junos OS also provides support for configuring a BGP export policy that matches the state of an advertised route. You can match either active or inactive routes, as follows:

```
policy-options {
  policy-statement name {
    from state (active|inactive);
  }
}
```

This qualifier only matches when used in the context of an export policy. When a route is being advertised by a protocol that can advertise inactive routes (such as BGP), **state inactive** matches routes advertised as a result of the **advertise-inactive** (or **advertise-external**) statement.

For example, the following configuration can be used as a BGP export policy to mark routes advertised due to the **advertise-inactive** setting with a user-defined community. That community can be later used by the receiving routers to filter out such routes from the forwarding table. Such a mechanism can be used to address concerns that advertising paths not used for forwarding by the sender might lead to forwarding loops.

```
user@host# show policy-options
policy-statement mark-inactive {
  term inactive {
    from state inactive;
    then {
      community set comm-inactive;
    }
  }
  term default {
    from protocol bgp;
    then accept;
  }
  then reject;
}
community comm-inactive members 65535:65284;
```

- [Configuration on page 75](#)
- [Verification on page 77](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, Device R2 has two external BGP (EBGP) peers, Device R1 and Device R3.

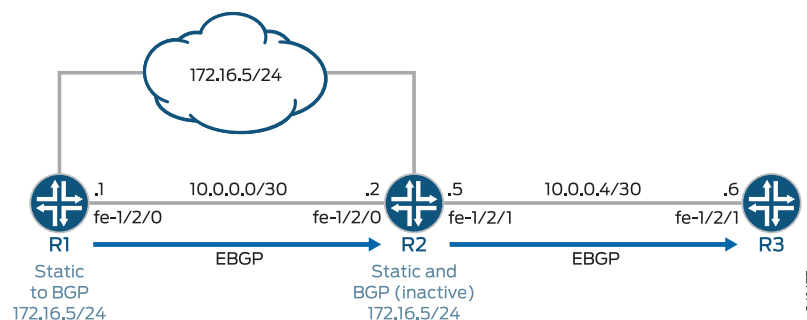

Device R1 has a static route to 172.16.5/24. Likewise, Device R2 also has a static route to 172.16.5/24. Through BGP, Device R1 sends information about its static route to Device R2. Device R2 now has information about 172.16.5/24 from two sources—its own static route and the BGP-learned route received from Device R1. Static routes are preferred over BGP-learned routes, so the BGP route is inactive on Device R2. Normally Device R2 would send the BGP-learned information to Device R3, but Device R2 does not do this because the BGP route is inactive. Device R3, therefore, has no information about 172.16.5/24 unless you enable the **advertise-inactive** command on Device R2, which causes Device R2 to send the BGP-learned to Device R3.

---

## Topology

[Figure 10 on page 75](#) shows the sample network.

Figure 10: BGP Topology for advertise-inactive

"CLI Quick Configuration" on page 75 shows the configuration for all of the devices in Figure 10 on page 75.

The section "Step-by-Step Procedure" on page 76 describes the steps on Device R2.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group to_R2 type external
set protocols bgp group to_R2 export send-static
set protocols bgp group to_R2 neighbor 10.0.0.2 peer-as 200
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 172.16.5.0/24 discard
set routing-options static route 172.16.5.0/24 install
set routing-options autonomous-system 100
```

**Device R2**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.5/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group to_R1 type external
set protocols bgp group to_R1 neighbor 10.0.0.1 peer-as 100
set protocols bgp group to_R3 type external
set protocols bgp group to_R3 advertise-inactive
set protocols bgp group to_R3 neighbor 10.0.0.6 peer-as 300
set routing-options static route 172.16.5.0/24 discard
set routing-options static route 172.16.5.0/24 install
set routing-options autonomous-system 200
```

**Device R3**

```
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.6/30
set interfaces fe-1/2/0 unit 9 family inet address 10.0.0.9/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.5
set routing-options autonomous-system 300
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30
```

```
user@R2# set fe-1/2/1 unit 0 family inet address 10.0.0.5/30
```

```
user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure the EBGP connection to Device R1.

```
[edit protocols bgp group to_R1]
user@R2# set type external
user@R2# set neighbor 10.0.0.1 peer-as 100
```

3. Configure the EBGP connection to Device R3.

```
[edit protocols bgp group to_R3]
user@R2# set type external
user@R2# set neighbor 10.0.0.6 peer-as 300
```

4. Add the **advertise-inactive** statement to the EBGP group peering session with Device R3.

```
[edit protocols bgp group to_R3]
user@R2# set advertise-inactive
```

5. Configure the static route to the 172.16.5.0/24 network.

```
[edit routing-options static]
user@R2# set route 172.16.5.0/24 discard
user@R2# set route 172.16.5.0/24 install
```

6. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
```

```
    unit 0 {
      family inet {
        address 10.0.0.5/30;
      }
    }
  }
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.2/32;
    }
  }
}

user@R2# show protocols
bgp {
  group to_R1 {
    type external;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
  }
  group to_R3 {
    type external;
    advertise-inactive;
    neighbor 10.0.0.6 {
      peer-as 300;
    }
  }
}

user@R2# show routing-options
static {
  route 172.16.5.0/24 {
    discard;
    install;
  }
}
autonomous-system 200;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the BGP Active Path on page 77](#)
- [Verifying the External Route Advertisement on page 78](#)
- [Verifying the Route on Device R3 on page 78](#)
- [Experimenting with the advertise-inactive Statement on page 78](#)

### Verifying the BGP Active Path

---

**Purpose** On Device R2, make sure that the 172.16.5.0/24 prefix is in the routing table and has the expected active path.

**Action** user@R2> show route 172.16.5

```
inet.0: 7 destinations, 8 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.5.0/24      *[Static/5] 21:24:38
                   Discard
                   [BGP/170] 21:21:41, localpref 100
                   AS path: 100 I, validation-state: unverified
                   > to 10.0.0.1 via fe-1/2/0.0
```

**Meaning** Device R2 receives the 172.16.5.0/24 route from both Device R1 and from its own statically configured route. The static route is the active path, as designated by the asterisk (\*). The static route path has the lowest route preference (5) as compared to the BGP preference (170). Therefore, the static route becomes active.

---

### Verifying the External Route Advertisement

**Purpose** On Device R2, make sure that the 172.16.5.0/24 route is advertised toward Device R3.

**Action** user@R2> show route advertising-protocol bgp 10.0.0.6

```
inet.0: 6 destinations, 7 routes (6 active, 0 holddown, 0 hidden)
  Prefix                Nexthop              MED      Lclpref   AS path
  172.16.5.0/24          Self                      0         0         100 I
```

**Meaning** Device R2 is advertising the 172.16.5.0/24 route toward Device R3

---

### Verifying the Route on Device R3

**Purpose** Make sure that the 172.16.6.0/24 prefix is in Device R3's routing table.

**Action** user@R3> show route 172.16.5.0/24

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.5.0/24      *[BGP/170] 00:01:19, localpref 100
                   AS path: 200 100 I, validation-state: unverified
                   > to 10.0.0.5 via fe-1/2/1.0
```

**Meaning** Device R3 has the BGP-learned route for 172.16.5.0/24.

---

### Experimenting with the advertise-inactive Statement

**Purpose** See what happens when the **advertise-inactive** statement is removed from the BGP configuration on Device R2.

**Action** 1. On Device R2, deactivate the **advertise-inactive** statement.

[edit protocols bgp group to\_R3]

```
user@R2# deactivate advertise-inactive
user@R2# commit
```

2. On Device R2, check to see if the 172.16.5.0/24 route is advertised toward Device R3.

```
user@R2> show route advertising-protocol bgp 10.0.0.6
```

As expected, the route is no longer advertised.

3. On Device R3, ensure that the 172.16.5/24 route is absent from the routing table.

```
user@R3> show route 172.16.5/24
```

**Meaning** Device R1 advertises route 172.16.5/24 to Device R2, but Device R2 has a manually configured static route for this prefix. Static routes are preferred over BGP routes, so Device R2 installs the BGP route as an inactive route. Because the BGP route is not active, Device R2 does not readvertise the BGP route to Device R3. This is the default behavior in Junos OS. If you add the **advertise-inactive** statement to the BGP configuration on Device R2, Device R2 readvertises nonactive routes.

## Example: Using Routing Policy to Set a Preference Value for BGP Routes

---

This example shows how to use routing policy to set the preference for routes learned from BGP. Routing information can be learned from multiple sources. To break ties among equally specific routes learned from multiple sources, each source has a preference value. Routes that are learned through explicit administrative action, such as static routes, are preferred over routes learned from a routing protocol, such as BGP or OSPF. This concept is called *administrative distance* by some vendors.

- [Requirements on page 79](#)
- [Overview on page 79](#)
- [Configuration on page 80](#)
- [Verification on page 84](#)

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

Routing information can be learned from multiple sources, such as through static configuration, BGP, or an interior gateway protocol (IGP). When Junos OS determines a route's preference to become the active route, it selects the route with the lowest preference as the active route and installs this route into the forwarding table. By default,

the routing software assigns a preference of 170 to routes that originated from BGP. Of all the routing protocols, BGP has the highest default preference value, which means that routes learned by BGP are the least likely to become the active route.

Some vendors have a preference (distance) of 20 for external BGP (EBGP) and a distance of 200 for internal BGP (IGBP). Junos OS uses the same value (170) for both EBGP and IGBP. However, this difference between vendors has no operational impact because Junos OS always prefers EBGP routes over IGBP routes.

Another area in which vendors differ is in regard to IGP distance compared to BGP distance. For example, some vendors assign a distance of 110 to OSPF routes. This is higher than the EBGP distance of 20, and results in the selection of an EBGP route over an equivalent OSPF route. In the same scenario, Junos OS chooses the OSPF route, because of the default preference 10 for an internal OSPF route and 150 for an external OSPF route, which are both lower than the 170 preference assigned to all BGP routes.

This example shows a routing policy that matches routes from specific next hops and sets a preference. If a route does not match the first term, it is evaluated by the second term.

## Topology

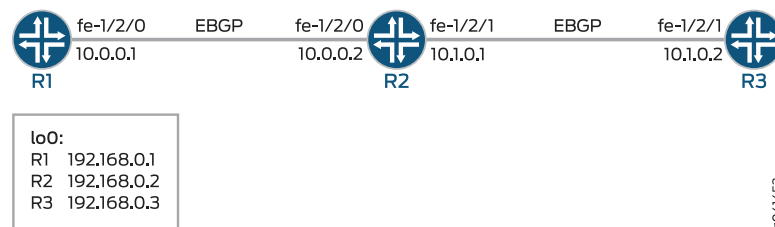

In the sample network, Device R1 and Device R3 have EBGP sessions with Device R2.

On Device R2, an import policy takes the following actions:

- For routes received through BGP from next-hop 10.0.0.1 (Device R1), set the route preference to 10.
- For routes received through BGP from next-hop 10.1.0.2 (Device R3), set the route preference to 15.

Figure 11 on page 80 shows the sample network.

**Figure 11: BGP Preference Value Topology**

"CLI Quick Configuration" on page 80 shows the configuration for all of the devices in Figure 11 on page 80.

The section "Step-by-Step Procedure" on page 81 describes the steps on Device R2.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 100
```

**Device R2**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group ext type external
set protocols bgp group ext import set-preference
set protocols bgp group ext export send-direct
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement set-preference term term1 from protocol bgp
set policy-options policy-statement set-preference term term1 from next-hop 10.0.0.1
set policy-options policy-statement set-preference term term1 then preference 10
set policy-options policy-statement set-preference term term2 from protocol bgp
set policy-options policy-statement set-preference term term2 from next-hop 10.1.0.2
set policy-options policy-statement set-preference term term2 then preference 15
set routing-options autonomous-system 200
```

**Device R3**

```
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 300
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.  

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure the local autonomous system.

```
[edit routing-options]
user@R2# set autonomous-system 200
```

3. Configure the routing policy that sends direct routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

4. Configure the routing policy that changes the preference of received routes.

```
[edit policy-options policy-statement set-preference]
user@R2# set term term1 from protocol bgp
user@R2# set term term1 from next-hop 10.0.0.1
user@R2# set term term1 then preference 10
```

```
user@R2# set term term2 from protocol bgp
user@R2# set term term2 from next-hop 10.1.0.2
user@R2# set term term2 then preference 15
```

5. Configure the external peering with Device R2.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300
```

6. Apply the **set-preference** policy as an import policy.

This affects Device R2's routing table and has no impact on Device R1 and Device R3.

```
[edit protocols bgp group ext]
user@R2# set import set-preference
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      address 10.1.0.1/30;
    }
  }
}
```

```
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.2/32;
    }
  }
}

user@R2# show protocols
bgp {
  group ext {
    type external;
    import set-preference;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
    neighbor 10.1.0.2 {
      peer-as 300;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
policy-statement set-preference {
  term term1 {
    from {
      protocol bgp;
      next-hop 10.0.0.1;
    }
    then {
      preference 10;
    }
  }
  term term2 {
    from {
      protocol bgp;
      next-hop 10.1.0.2;
    }
    then {
      preference 15;
    }
  }
}

user@R2# show routing-options
autonomous-system 200;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the Preference

**Purpose** Make sure that the routing tables on Device R1 and Device R2 reflect the fact that Device R1 is using the configured EBGp preference of 8, and Device R2 is using the default EBGp preference of 170.

**Action** From operational mode, enter the **show route protocols bgp** command.

```
user@R2> show route protocols bgp
inet.0: 7 destinations, 9 routes (7 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/30      [BGP/10] 04:42:23, localpref 100
                 AS path: 100 I, validation-state: unverified
                 > to 10.0.0.1 via fe-1/2/0.0
10.1.0.0/30      [BGP/15] 04:42:23, localpref 100
                 AS path: 300 I, validation-state: unverified
                 > to 10.1.0.2 via fe-1/2/1.0
192.168.0.1/32   *[BGP/10] 04:42:23, localpref 100
                 AS path: 100 I, validation-state: unverified
                 > to 10.0.0.1 via fe-1/2/0.0
192.168.0.3/32   *[BGP/15] 04:42:23, localpref 100
                 AS path: 300 I, validation-state: unverified
                 > to 10.1.0.2 via fe-1/2/1.0
```

**Meaning** The output shows that on Device R2, the preference values have been changed to 15 for routes learned from Device R3, and the preference values have been changed to 10 for routes learned from Device R1.

**Related Documentation**

- *Route Preferences Overview*
- *Understanding External BGP Peering Sessions*

## Example: Enabling BGP Route Advertisements

Junos OS does not advertise the routes learned from one EBGp peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGp peers that are in the same autonomous system (AS) as the originating peer, regardless of the routing instance. You can modify this behavior by including the **advertise-peer-as** statement in the configuration.

If you include the **advertise-peer-as** statement in the configuration, BGP advertises the route regardless of this check.

To restore the default behavior, include the **no-advertise-peer-as** statement in the configuration:

```
no-advertise-peer-as;
```

The route suppression default behavior is disabled if the **as-override** statement is included in the configuration. If you include both the **as-override** and **no-advertise-peer-as** statements in the configuration, the **no-advertise-peer-as** statement is ignored.

- [Configuration on page 86](#)
- [Verification on page 90](#)

## Requirements

No special configuration beyond device initialization is required before you configure this example.

## Overview

This example shows three routing devices with external BGP (EBGP) connections. Device R2 has an EBGP connection to Device R1 and another EBGP connection to Device R3. Although separated by Device R2 which is in AS 64511, Device R1 and Device R3 are in the same AS (AS 64512). Device R1 and Device R3 advertise into BGP direct routes to their own loopback interface addresses.

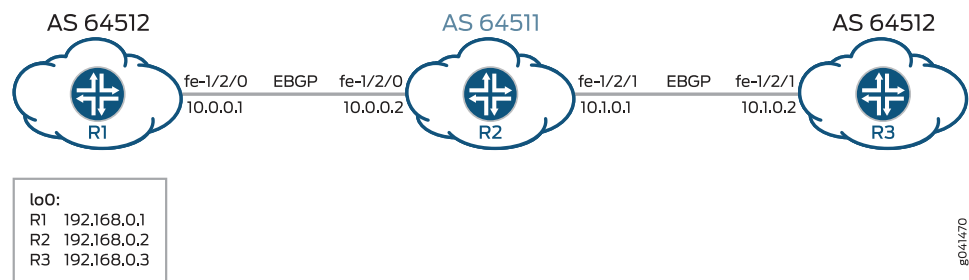

Device R2 receives these loopback interface routes, and the **advertise peer-as** statement allows Device R2 to advertise them. Specifically, Device R1 sends the 192.168.0.1 route to Device R2, and because Device R2 has the **advertise peer-as** configured, Device R2 can send the 192.168.0.1 route to Device R3. Likewise, Device R3 sends the 192.168.0.3 route to Device R2, and **advertise peer-as** enables Device R2 to forward the route to Device R1.

To enable Device R1 and Device R3 to accept routes that contain their own AS number in the AS path, the **loops 2** statement is required on Device R1 and Device R3.

## Topology

[Figure 12 on page 85](#) shows the sample network.

**Figure 12: BGP Topology for advertise-peer-as**

[“CLI Quick Configuration” on page 86](#) shows the configuration for all of the devices in [Figure 12 on page 85](#).

The section [“Step-by-Step Procedure” on page 86](#) describes the steps on Device R1 and Device R2.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp family inet unicast loops 2
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 300
```

**Device R2**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group ext type external
set protocols bgp group ext advertise-peer-as
set protocols bgp group ext export send-direct
set protocols bgp group ext neighbor 10.0.0.1 peer-as 300
set protocols bgp group ext neighbor 10.1.0.2 peer-as 300
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 200
```

**Device R3**

```
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set protocols bgp family inet unicast loops 2
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.1.0.1
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 300
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```
[edit interfaces]
```

```
user@R1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30
```

```
user@R1# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure BGP.

```
[edit protocols bgp group ext]
user@R1# set type external
user@R1# set peer-as 200
user@R1# set neighbor 10.0.0.2
```

3. Prevent routes from Device R3 from being hidden on Device R1 by including the **loops 2** statement.

The **loops 2** statement means that the local device's own AS number can appear in the AS path up to one time without causing the route to be hidden. The route is hidden if the local device's AS number is detected in the path two or more times.

```
[edit protocols bgp family inet unicast]
user@R1# set loops 2
```

4. Configure the routing policy that sends direct routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Apply the export policy to the BGP peering session with Device R2.

```
[edit protocols bgp group ext]
user@R1# set export send-direct
```

6. Configure the autonomous system (AS) number.

```
[edit routing-options ]
user@R1# set autonomous-system 300
```

#### **Step-by-Step Procedure**

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

user@R2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure BGP.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set neighbor 10.0.0.1 peer-as 300
user@R2# set neighbor 10.1.0.2 peer-as 300
```

3. Configure Device R2 to advertise routes learned from one EBGP peer to another EBGP peer in the same AS.

In other words, advertise to Device R1 routes learned from Device R3 (and the reverse), even though Device R1 and Device R3 are in the same AS.

```
[edit protocols bgp group ext]
user@R2# set advertise-peer-as
```

4. Configure a routing policy that sends direct routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Apply the export policy.

```
[edit protocols bgp group ext]
user@R2# set export send-direct
```

6. Configure the AS number.

```
[edit routing-options]
user@R2# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device R1 user@R1# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}

user@R1# show protocols
bgp {
  family inet {
    unicast {
      loops 2;
    }
  }
  group ext {
    type external;
    export send-direct;
    peer-as 200;
    neighbor 10.0.0.2;
  }
}
```

```

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show routing-options
autonomous-system 300;

Device R2 user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      address 10.1.0.1/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.2/32;
    }
  }
}

user@R2# show protocols
bgp {
  group ext {
    type external;
    advertise-peer-as;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 300;
    }
    neighbor 10.1.0.2 {
      peer-as 300;
    }
  }
}

user@R2# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

```

```
user@R2# show routing-options
autonomous-system 200;
```

If you are done configuring the devices, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the BGP Routes

**Purpose** Make sure that the routing tables on Device R1 and Device R3 contain the expected routes.

**Action** 1. On Device R2, deactivate the **advertise-peer-as** statement in the BGP configuration.

```
[edit protocols bgp group ext]
user@R2# deactivate advertise-peer-as
user@R2# commit
```

2. On Device R3, deactivate the **loops** statement in the BGP configuration.

```
[edit protocols bgp family inet unicast ]
user@R3# deactivate unicast loops
user@R3# commit
```

3. On Device R1, check to see what routes are advertised to Device R2.

```
user@R1> show route advertising-protocol bgp 10.0.0.2
inet.0: 5 destinations, 6 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref      AS path
* 10.0.0.0/30        Self              0
* 192.168.0.1/32     Self              0
```

4. On Device R2, check to see what routes are received from Device R1.

```
user@R2> show route receive-protocol bgp 10.0.0.1
inet.0: 7 destinations, 9 routes (7 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref      AS path
10.0.0.0/30         10.0.0.1         0
* 192.168.0.1/32     10.0.0.1         0
```

5. On Device R2, check to see what routes are advertised to Device R3.

```
user@R2> show route advertising-protocol bgp 10.1.0.2
inet.0: 7 destinations, 9 routes (7 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref      AS path
* 10.0.0.0/30        Self              0
* 10.1.0.0/30        Self              0
* 192.168.0.2/32     Self              0
```

6. On Device R2, activate the **advertise-peer-as** statement in the BGP configuration.

```
[edit protocols bgp group ext]
user@R2# activate advertise-peer-as
user@R2# commit
```

7. On Device R2, recheck the routes that are advertised to Device R3.

```
user@R2> show route advertising-protocol bgp 10.1.0.2
inet.0: 7 destinations, 9 routes (7 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref      AS path
* 10.0.0.0/30        Self              0
```

```

* 10.1.0.0/30          Self          I
* 192.168.0.1/32       Self          300 I
* 192.168.0.2/32       Self          I
* 192.168.0.3/32       10.1.0.2     300 I

```

8. On Device R3, check the routes that are received from Device R2.

```

user@R3> show route receive-protocol bgp 10.1.0.1
inet.0: 5 destinations, 6 routes (5 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref  AS path
* 10.0.0.0/30       10.1.0.1
  10.1.0.0/30       10.1.0.1
* 192.168.0.2/32    10.1.0.1          200 I

```

9. On Device R3, activate the **loops** statement in the BGP configuration.

```

[edit protocols bgp family inet unicast ]
user@R3# activate unicast loops
user@R3# commit

```

10. On Device R3, recheck the routes that are received from Device R2.

```

user@R3> show route receive-protocol bgp 10.1.0.1
inet.0: 6 destinations, 8 routes (6 active, 0 holddown, 1 hidden)
  Prefix            Nexthop          MED      Lclpref  AS path
* 10.0.0.0/30       10.1.0.1
  10.1.0.0/30       10.1.0.1
* 192.168.0.1/32    10.1.0.1          200 300 I
* 192.168.0.2/32    10.1.0.1          200 I

```

**Meaning** First the **advertise-peer-as** statement and the **loops** statement are deactivated so that the default behavior can be examined. Device R1 sends to Device R2 a route to Device R1's loopback interface address, 192.168.0.1/32. Device R2 does not advertise this route to Device R3. After activating the **advertise-peer-as** statement, Device R2 does advertise the 192.168.0.1/32 route to Device R3. Device R3 does not accept this route until after the **loops** statement is activated.

**Related Documentation**

- [Example: Configuring a Layer 3 VPN with Route Reflection and AS Override](#)

## Example: Rejecting Known Invalid Routes

This example shows how to create route-based match conditions for a routing policy.

- [Requirements on page 91](#)
- [Overview on page 92](#)
- [Configuration on page 92](#)
- [Verification on page 93](#)

## Requirements

Before you begin, configure router interfaces and configure routing protocols, as explained in *Routing Policies Configuration Overview*.

## Overview

In this example, you create a policy called `rejectpolicy1` that rejects routes with a mask of `/8` and greater (`/8`, `/9`, `/10`, and so on) that have the first 8 bits set to 0. This policy also accepts routes less than 8 bits in length by creating a mask of `0/0` up to `/7`.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement rejectpolicy1 term rejectterm1 from route-filter
  0.0.0.0/0 upto /7 accept
set policy-options policy-statement rejectpolicy1 term rejectterm1 from route-filter
  0.0.0.0/8 orlonger reject
set policy-options policy-statement test term 1 from protocol direct
```

**Step-by-Step Procedure** To create a policy that rejects known invalid routes:

1. Create the routing policy.  

```
[edit]
user@host# edit policy-options policy-statement rejectpolicy1
```
2. Create the policy term.  

```
[edit policy-options policy-statement rejectpolicy1]
user@host# edit term rejectterm1
```
3. Create a mask that specifies which routes to accept.  

```
[edit policy-options policy-statement rejectpolicy1 term rejectterm1]
user@host# set from route-filter 0/0 upto /7 accept
```
4. Create a mask that specifies which routes to reject.  

```
[edit policy-options policy-statement rejectpolicy1 term rejectterm1]
user@host# set from route-filter 0/8 orlonger reject
```

**Results** Confirm your configuration by entering the **show policy-options** command from configuration mode. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show policy-options
policy-statement rejectpolicy1 {
  term rejectterm1 {
    from {
      route-filter 0.0.0.0/0 upto /7 accept;
      route-filter 0.0.0.0/8 orlonger reject;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the Route-Based Match Conditions on page 93](#)

---

### Verifying the Route-Based Match Conditions

<b>Purpose</b>	Verify that the policy and term are configured on the device with the appropriate route-based match conditions.
<b>Action</b>	From operational mode, enter the <b>show policy-options</b> command.

## Example: Using Routing Policy in an ISP Network

This example is a case study in how routing policies might be used in a typical Internet service provider (ISP) network.

- [Requirements on page 93](#)
- [Overview on page 93](#)
- [Set Commands for All Devices in the Topology on page 95](#)
- [Configuring Device Customer-1 on page 101](#)
- [Configuring Device Customer-2 on page 103](#)
- [Configuring Devices ISP-1 and ISP-2 on page 107](#)
- [Configuring Device ISP-3 on page 112](#)
- [Configuring Device Exchange-2 on page 117](#)
- [Configuring Device Private-Peer-2 on page 119](#)
- [Verification on page 123](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this network example, the ISP's AS number is 64510. The ISP has two transit peers (AS 64514 and AS 64515) to which it connects at an exchange point. The ISP is also connected to two private peers (AS 64513 and AS 64516) with which it exchanges specific customer routes. The ISP has two customers (AS 64511 and AS 64512).

The ISP policies are configured in an outbound direction. That is, the example focuses on the routes that the ISP announces to its peers and customers, and includes the following:

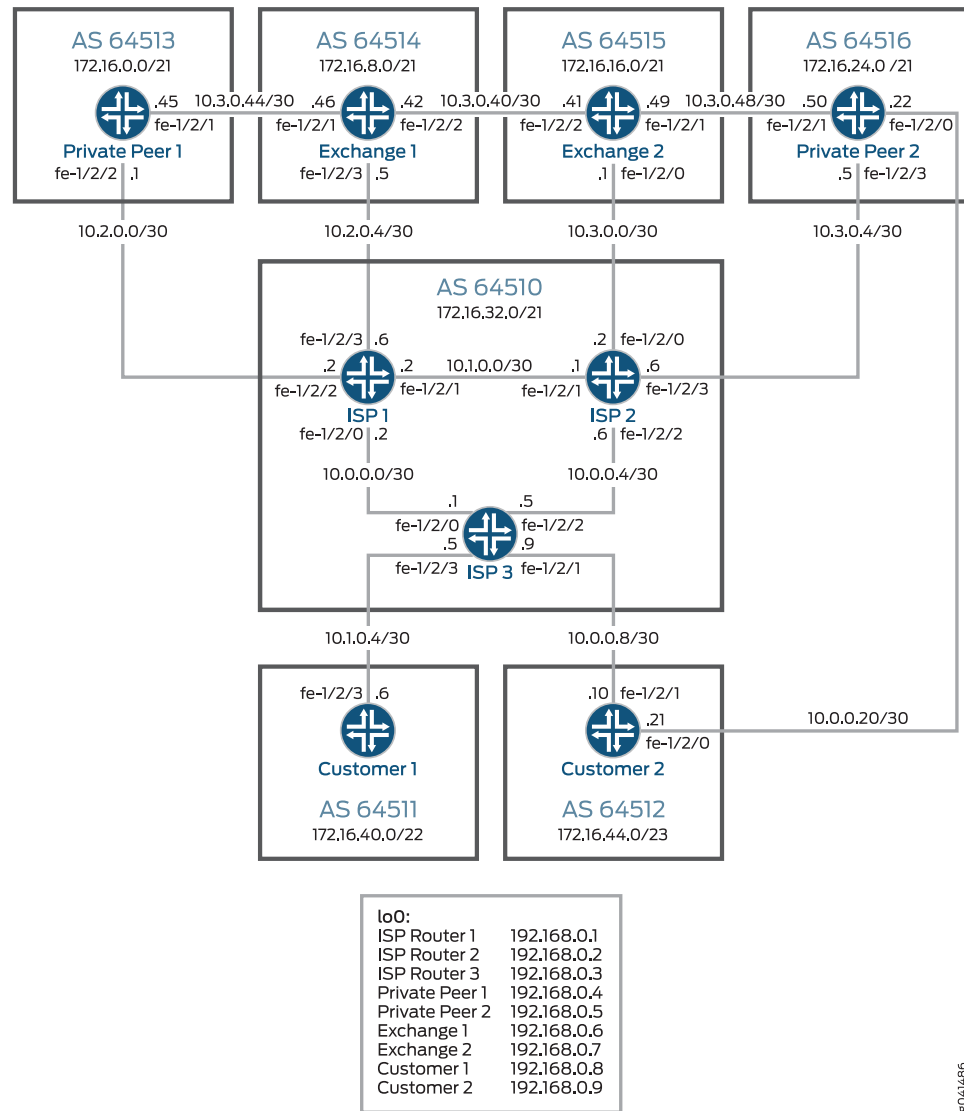

1. The ISP has been assigned AS 64510 and the routing space of 172.16.32.0/21. With the exception of the two customer networks, all other customer routes are simulated with static routes.
2. The exchange peers are used for transit service to other portions of the Internet. This means that the ISP is accepting all routes (the full Internet routing table) from those BGP peers. To help maintain an optimized Internet routing table, the ISP is configured to advertise only two aggregate routes to the transit peers.
3. The ISP administrators want all data to the private peers to use the direct links. As a result, all the customer routes from the ISP are advertised to those private peers. These peers then advertise all their customer routes to the ISP.
4. Finally, each customer has a different set of requirements. Customer-1 requires a single default route. Customer-2 requires specific routes.

---

### Topology

Figure 13 on page 95 shows the sample network.

Figure 13: ISP Network Example

### Set Commands for All Devices in the Topology

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device Customer-1**

```

set interfaces fe-1/2/3 unit 0 description to_ISP-3
set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.6/30
set interfaces lo0 unit 0 family inet address 192.168.0.8/32
set protocols bgp group ext type external
set protocols bgp group ext export send-statics
set protocols bgp group ext peer-as 64510
set protocols bgp group ext neighbor 10.1.0.5
set policy-options policy-statement send-statics term static-routes from protocol static

```

```

set policy-options policy-statement send-statics term static-routes then accept
set routing-options static route 172.16.40.0/25 reject
set routing-options static route 172.16.40.128/25 reject
set routing-options static route 172.16.41.0/25 reject
set routing-options static route 172.16.41.128/25 reject
set routing-options autonomous-system 64511

```

#### Device Customer-2

## Configuring Device Customer-1

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

Device Customer-1 has multiple static routes configured to simulate customer routes. These routes are sent to the ISP.

To configure Device Customer-1:

1. Configure the device interfaces.

```
[edit interfaces]
```

```
user@Customer-1# set fe-1/2/3 unit 0 description to_ISP-3
```

```
user@Customer-1# set fe-1/2/3 unit 0 family inet address 10.1.0.6/30
```

```
user@Customer-1# set lo0 unit 0 family inet address 192.168.0.8/32
```

2. Configure the static routes.  

```
[edit routing-options static]
user@Customer-1# set route 172.16.40.0/25 reject
user@Customer-1# set route 172.16.40.128/25 reject
user@Customer-1# set route 172.16.41.0/25 reject
user@Customer-1# set route 172.16.41.128/25 reject
```
3. Configure the policy to send static routes.  

```
[edit policy-options policy-statement send-statics term static-routes]
user@Customer-1# set from protocol static
user@Customer-1# set then accept
```
4. Configure the external BGP (EBGP) connection to the ISP.  

```
[edit protocols bgp group ext]
user@Customer-1# set type external
user@Customer-1# set export send-statics
user@Customer-1# set peer-as 64510
user@Customer-1# set neighbor 10.1.0.5
```
5. Configure the autonomous system (AS) number.  

```
[edit routing-options]
user@Customer-1# set autonomous-system 64511
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@Customer-1# show interfaces
fe-1/2/1 {
  unit 0 {
    description to_ISP-3;
    family inet {
      address 10.1.0.6/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.8/32;
    }
  }
}

user@Customer-1# show protocols
bgp {
  group ext {
    type external;
    export send-statics;
    peer-as 64510;
    neighbor 10.1.0.5;
  }
}
```

```

user@Customer-1# show policy-options
policy-statement send-statics {
    term static-routes {
        from protocol static;
        then accept;
    }
}

user@Customer-1# show routing-options
static {
    route 172.16.40.0/25 reject;
    route 172.16.40.128/25 reject;
    route 172.16.41.0/25 reject;
    route 172.16.41.128/25 reject;
}
autonomous-system 64511;

```

If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Device Customer-2

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

Device Customer-2 has two static routes configured to simulate customer routes. These routes are sent to the ISP. Customer-2 has a link to the ISP, as well as a link to AS 8000. This customer has requested specific customer routes from the ISP, as well as from AS 64516. Customer-2 wants to use the ISP for transit service to the Internet, and has requested a default route from the ISP.

To configure Device Customer-2:

1. Configure the device interfaces.

```

[edit interfaces]
user@Customer-2# set fe-1/2/1 unit 0 description to_ISP-3
user@Customer-2# set fe-1/2/1 unit 0 family inet address 10.0.0.10/30

user@Customer-2# set fe-1/2/0 unit 0 description to-Private-Peer-2
user@Customer-2# set fe-1/2/0 unit 0 family inet address 10.0.0.21/30

user@Customer-2# set lo0 unit 0 family inet address 192.168.0.9/32

```

2. Configure the static routes.

```

[edit routing-options static]
user@Customer-2# set route 172.16.44.0/26 reject
user@Customer-2# set route 172.16.44.64/26 reject
user@Customer-2# set route 172.16.44.128/26 reject
user@Customer-2# set route 172.16.44.192/26 reject

```

3. Configure the import routing policy.

The route with the highest local preference value is preferred. Routes from the ISP are preferred over the same routes from Device Private-Peer-2

```
[edit policy-options policy-statement inbound-routes]
user@Customer-2# set term AS64510-primary from protocol bgp
user@Customer-2# set term AS64510-primary from as-path AS64510-routes
user@Customer-2# set term AS64510-primary then local-preference 200
user@Customer-2# set term AS64510-primary then accept
```

```
[edit policy-options policy-statement inbound-routes]
user@Customer-2# set term AS64516-backup from protocol bgp
user@Customer-2# set term AS64516-backup from as-path AS64516-routes
user@Customer-2# set term AS64516-backup then local-preference 50
user@Customer-2# set term AS64516-backup then accept
```

```
[edit policy-options]
user@Customer-2# set as-path AS64510-routes "64510 .*"
user@Customer-2# set as-path AS64516-routes "64516 .*"
```

4. Configure the export routing policy.

```
[edit policy-options policy-statement outbound-routes]
user@Customer-2# set term statics from protocol static
user@Customer-2# set term statics then accept
```

```
user@Customer-2# set term internal-bgp-routes from protocol bgp
user@Customer-2# set term internal-bgp-routes from as-path my-own-routes
user@Customer-2# set term internal-bgp-routes then accept
user@Customer-2# set term no-transit then reject
```

```
[edit policy-options]
user@Customer-2# set as-path my-own-routes "()"
```

5. Configure the external BGP (EBGP) connection to the ISP and to Device Private-Peer-2.

```
[edit protocols bgp group ext]
user@Customer-2# set type external
user@Customer-2# set import inbound-routes
user@Customer-2# set export outbound-routes
user@Customer-2# set neighbor 10.0.0.9 peer-as 64510
user@Customer-2# set neighbor 10.0.0.22 peer-as 64516
```

6. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@Customer-2# set autonomous-system 64512
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@Customer-2# show interfaces
fe-1/2/1 {
  unit 0 {
    description to_ISP-3;
    family inet {
```

```
        address 10.0.0.10/30;
    }
}
}
fe-1/2/0 {
    unit 0 {
        description to-Private-Peer-2;
        family inet {
            address 10.0.0.21/30;
        }
    }
}
lo0 {
    unit 0 {
        family inet {
            address 192.168.0.9/32;
        }
    }
}

user@Customer-2# show protocols
bgp {
    group ext {
        type external;
        import inbound-routes;
        export outbound-routes;
        neighbor 10.0.0.9 {
            peer-as 64510;
        }
        neighbor 10.0.0.22 {
            peer-as 64516;
        }
    }
}

user@Customer-2# show policy-options
policy-statement inbound-routes {
    term AS64510-primary {
        from {
            protocol bgp;
            as-path AS64510-routes;
        }
        then {
            local-preference 200;
            accept;
        }
    }
    term AS64516-backup {
        from {
            protocol bgp;
            as-path AS64516-routes;
        }
        then {
            local-preference 50;
            accept;
        }
    }
}
```

```
}
policy-statement outbound-routes {
  term statics {
    from protocol static;
    then accept;
  }
  term internal-bgp-routes {
    from {
      protocol bgp;
      as-path my-own-routes;
    }
    then accept;
  }
  term no-transit {
    then reject;
  }
}
as-path my-own-routes "()";
as-path AS64510-routes "64510 .*";
as-path AS64516-routes "64516 .*";

user@Customer-2# show routing-options
static {
  route 172.16.44.0/26 reject;
  route 172.16.44.64/26 reject;
  route 172.16.44.128/26 reject;
  route 172.16.44.192/26 reject;
}
autonomous-system 64512;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Devices ISP-1 and ISP-2

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

Device ISP-1 and Device ISP-2 each have two policies configured: The **private-peer** policy and the **exchange-peer** policy. Because of their similar configurations, this example shows the step-by-step configuration only for Device ISP-2.

On Device ISP-2, the private-peer policy sends the ISP customer routes to Device Private-Peer-2. The policy accepts all local static routes (local Device ISP-2 customers) and all BGP routes in the 172.16.32.0/21 range (advertised by other ISP routers). These two policy terms represent the ISP customer routes. The final policy term rejects all other routes, which includes the entire Internet routing table sent by the exchange peers. These routes do not need to be sent to Device Private-Peer-2 for two reasons:

- The peer already maintains a connection to Device Exchange-2 in our example, so the routes are redundant.
- The private peer wants customer routes only. The **private-peer** policy accomplishes this goal. The **exchange-peer** policy sends routes to Device Exchange-2.

In the example, only two routes need to be sent to Device Exchange-2:

- The aggregate route that represents the AS 64510 routing space of 172.16.32.0/21. This route is configured as an aggregate route locally and is advertised by the **exchange-peer** policy.
- The address space assigned to Customer-2, 172.16.44.0/23. This smaller aggregate route needs to be sent to Device Exchange-2 because the customer is also attached to the AS 64516 peer (Device Private-Peer-2).

Sending these two routes to Device Exchange-2 allows other networks in the Internet to reach the customer through either the ISP or the private peer. If just the private peer were to advertise the /23 network while the ISP maintained only its /21 aggregate, all traffic destined for the customer would transit AS 64516 only. Because the customer also wants routes from the ISP, the 172.16.44.0/23 route is announced by Device ISP-2. Like the larger aggregate route, the 172.16.44.0/23 route is configured locally and is advertised by the exchange-peer policy. The final term in that policy rejects all routes, including the specific customer networks of the ISP, the customer routes from Device Private-Peer-1, the customer routes from Device Private-Peer-2, and the routing table from Device Exchange-1. In essence, this final term prevents the ISP from performing transit services for the Internet at large.

To configure Device ISP-2:

1. Configure the device interfaces.

```
[edit interfaces]
user@ISP-2# set fe-1/2/1 unit 0 description to_ISP-1
user@ISP-2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30
```

```
user@ISP-2# set fe-1/2/2 unit 0 description to_ISP-3
user@ISP-2# set fe-1/2/2 unit 0 family inet address 10.0.0.6/30
```

```
user@ISP-2# set fe-1/2/3 unit 0 description to_Private-Peer-2
user@ISP-2# set fe-1/2/3 unit 0 family inet address 10.3.0.6/30
```

```
user@ISP-2# set fe-1/2/0 unit 0 description to_Exchange-2
user@ISP-2# set fe-1/2/0 unit 0 family inet address 10.3.0.2/30
```

```
user@ISP-2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure the interior gateway protocol (IGP).

```
[edit protocols ospf area 0.0.0.0]
user@ISP-2# set interface fe-1/2/2.0
user@ISP-2# set interface fe-1/2/1.0
user@ISP-2# set interface lo0.0 passive
```

3. Configure the static and aggregate routes.

```
[edit routing-options static]
user@ISP-2# set route 172.16.34.0/24 reject
user@ISP-2# set route 172.16.35.0/24 reject
```

```
[edit routing-options aggregate]
user@ISP-2# set route 172.16.44.0/23
user@ISP-2# set route 172.16.32.0/21
```

4. Configure the routing policies for the exchange peers.

```
[edit policy-options policy-statement exchange-peer]
user@ISP-2# set term AS64510-Aggregate from protocol aggregate
user@ISP-2# set term AS64510-Aggregate from route-filter 172.16.32.0/21 exact
user@ISP-2# set term AS64510-Aggregate then accept
user@ISP-2# set term Customer-2-Aggregate from protocol aggregate
user@ISP-2# set term Customer-2-Aggregate from route-filter 172.16.44.0/23 exact
user@ISP-2# set term Customer-2-Aggregate then accept
user@ISP-2# set term reject-all-other-routes then reject
```

5. Configure the routing policies for the internal peers.

```
[edit policy-options policy-statement internal-peers]
user@ISP-2# set term statics from protocol static
user@ISP-2# set term statics then accept
user@ISP-2# set term next-hop-self then next-hop self
```

6. Configure the routing policies for the private peer.

```
[edit policy-options policy-statement private-peer]
user@ISP-2# set term statics from protocol static
user@ISP-2# set term statics then accept
user@ISP-2# set term isp-and-customer-routes from protocol bgp
user@ISP-2# set term isp-and-customer-routes from route-filter 172.16.32.0/21
    orlonger
user@ISP-2# set term isp-and-customer-routes then accept
user@ISP-2# set term reject-all then reject
```

7. Configure the internal BGP (IBGP) connections to the other ISP devices.

```
[edit protocols bgp group int]
user@ISP-2# set type internal
user@ISP-2# set local-address 192.168.0.2
user@ISP-2# set export internal-peers
user@ISP-2# set neighbor 192.168.0.1
user@ISP-2# set neighbor 192.168.0.3
```

8. Configure the EBGP connections to the exchange peer and the private peer.

```
[edit protocols bgp group AS-64516]
user@ISP-2# set type external
user@ISP-2# set export private-peer
user@ISP-2# set peer-as 64516
user@ISP-2# set neighbor 10.3.0.5
```

```
[edit protocols bgp group AS-64515]
user@ISP-2# set type external
user@ISP-2# set export exchange-peer
user@ISP-2# set peer-as 64515
user@ISP-2# set neighbor 10.3.0.1
```

9. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options]
user@ISP-2# set router-id 192.168.0.2
user@ISP-2# set autonomous-system 64510
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@ISP-2# show interfaces
fe-1/2/0 {
  unit 0 {
    description to_Exchange-2;
    family inet {
      address 10.3.0.2/30;
    }
  }
}

## Configuring Device ISP-3

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

On Device ISP-3, a separate policy is in place for each customer. The default route for Customer-1 is being sent by the **customer-1-peer** policy. This policy finds the 0.0.0.0/0 default route in inet.0 and accepts it. The policy also rejects all other routes, thereby not sending all BGP routes on the ISP router. The **customer-2-peer** policy is for Customer-2 and contains the same policy terms, which also send the default route and no other transit BGP routes. The additional terms in the **customer-2-peer** policy send the ISP customer routes to Customer-2. Because there are local static routes on Device ISP-3 that represent local customers, these routes are sent as well as all other internal routes announced to the local router by the other ISP routers.

If the upstream route from Device Exchange-1 (172.16.8.0/21) is present, Device ISP-3 generates a default route.

To configure Device ISP-3:

1. Configure the device interfaces.

```
[edit interfaces]
user@ISP-3# set fe-1/2/0 unit 0 description to_ISP-1
user@ISP-3# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30

user@ISP-3# set fe-1/2/2 unit 0 description to_ISP-2
user@ISP-3# set fe-1/2/2 unit 0 family inet address 10.0.0.5/30

user@ISP-3# set fe-1/2/3 unit 0 description to_Customer-1
user@ISP-3# set fe-1/2/3 unit 0 family inet address 10.1.0.5/30

user@ISP-3# set fe-1/2/1 unit 0 description to_Customer-2
user@ISP-3# set fe-1/2/1 unit 0 family inet address 10.0.0.9/30

user@ISP-3# set lo0 unit 0 family inet address 192.168.0.3/32
```

2. Configure the interior gateway protocol (IGP).

```
[edit protocols ospf area 0.0.0.0]
user@ISP-3# set interface fe-1/2/0.0
user@ISP-3# set interface fe-1/2/2.0
user@ISP-3# set interface lo0.0 passive
```

3. Configure the static routes.

```
[edit routing-options static]
user@ISP-3# set route 172.16.36.0/24 reject
user@ISP-3# set route 172.16.37.0/24 reject
user@ISP-3# set route 172.16.38.0/24 reject
user@ISP-3# set route 172.16.39.0/24 reject
```

4. Configure a routing policy that generates a default static route only if a certain upstream route exists.

```
[edit policy-options policy-statement if-upstream-routes-exist term  
  only-certain-contributing-routes]
```

```
user@ISP-3# set from route-filter 172.16.8.0/21 exact  
user@ISP-3# set then accept
```

```
[edit policy-options policy-statement if-upstream-routes-exist]  
user@ISP-3# set term reject-all-other-routes then reject
```

```
[edit routing-options generate route 0.0.0.0/0]  
user@ISP-3# set policy if-upstream-routes-exist
```

5. Configure the routing policy for Customer-1.

```
[edit policy-options policy-statement customer-1-peer]  
user@ISP-3# set term default-route from route-filter 0.0.0.0/0 exact  
user@ISP-3# set term default-route then accept  
user@ISP-3# set term reject-all-other-routes then reject
```

6. Configure the routing policy for Customer-2.

```
[edit policy-options policy-statement customer-2-peer]  
user@ISP-3# set term statics from protocol static  
user@ISP-3# set term statics then accept  
user@ISP-3# set term isp-and-customer-routes from protocol bgp  
user@ISP-3# set term isp-and-customer-routes from route-filter 172.16.32.0/21  
  orlonger  
user@ISP-3# set term isp-and-customer-routes then accept  
user@ISP-3# set term default-route from route-filter 0.0.0.0/0 exact  
user@ISP-3# set term default-route then accept  
user@ISP-3# set term reject-all-other-routes then reject
```

7. Configure the routing policies for the internal peers.

```
[edit policy-options policy-statement internal-peers]  
user@ISP-3# set term statics from protocol static  
user@ISP-3# set term statics then accept  
user@ISP-3# set term next then next-hop self
```

8. Configure the internal BGP (IBGP) connections to the other ISP devices.

```
[edit protocols bgp group int]  
user@ISP-3# set type internal  
user@ISP-3# set local-address 192.168.0.3  
user@ISP-3# set export internal-peers  
user@ISP-3# set neighbor 192.168.0.1  
user@ISP-3# set neighbor 192.168.0.2
```

9. Configure the EBGP connections to the customer peers.

```
[edit protocols bgp group to_64511]  
user@ISP-3# set type external  
user@ISP-3# set export customer-1-peer  
user@ISP-3# set neighbor 10.1.0.6 peer-as 64511
```

```
[edit protocols bgp group to_64512]
```

```
user@ISP-3# set type external
user@ISP-3# set export customer-2-peer
user@ISP-3# set neighbor 10.0.0.10 peer-as 64512
```

10. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options]
user@ISP-3# set router-id 192.168.0.3
user@ISP-3# set autonomous-system 64510
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@ISP-3# show interfaces
fe-1/2/0 {
  unit 0 {
    description to_ISP-1;
    family inet {
      address 10.0.0.1/30;
    }
  }
}

If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Device Exchange-2

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

Device Exchange-2 exchanges all BGP routes with all BGP peers. The outbound-routes policy for Device Exchange-2 advertises locally defined static routes using BGP. The exclusion of a final **then reject** term causes the default BGP export policy to take effect, which is to send all BGP routes to all external BGP peers.

To configure Device Exchange-2:

1. Configure the device interfaces.

```
[edit interfaces]
user@Exchange-2# set fe-1/2/0 unit 0 description to_ISP-2
user@Exchange-2# set fe-1/2/0 unit 0 family inet address 10.3.0.1/30

user@Exchange-2# set fe-1/2/2 unit 0 description to_Exchange-1
user@Exchange-2# set fe-1/2/2 unit 0 family inet address 10.3.0.41/30

user@Exchange-2# set fe-1/2/1 unit 0 description to_Private-Peer-2
user@Exchange-2# set fe-1/2/1 unit 0 family inet address 10.3.0.49/30

user@Exchange-2# set lo0 unit 0 family inet address 192.168.0.7/32
```

2. Configure the static routes.

```
[edit routing-options static]
set route 172.16.16.0/21 reject
```

3. Configure a routing policy that generates a default static route only if certain internal routes exist.

```
[edit policy-options policy-statement outbound-routes term statics]
user@Exchange-2# set from protocol static
user@Exchange-2# set then accept
```

4. Configure the EBGP connections to the customer peers.

```
[edit protocols bgp group ext]
user@Exchange-2# set type external
user@Exchange-2# set export outbound-routes
user@Exchange-2# set neighbor 10.3.0.2 peer-as 64510
user@Exchange-2# set neighbor 10.3.0.50 peer-as 64516
user@Exchange-2# set neighbor 10.3.0.42 peer-as 64514
```

5. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@Exchange-2# set autonomous-system 64515
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@Exchange-2 show interfaces
fe-1/2/0 {
  unit 0 {
    description to_ISP-2;
    family inet {
      address 10.3.0.1/30;
    }
  }
}
fe-1/2/1 {
  unit 0 {
    description to_Private-Peer-2;
    family inet {
      address 10.3.0.49/30;
    }
  }
}
fe-1/2/2 {

```

```

        from protocol static;
        then accept;
    }
}

user@Exchange-2# show routing-options
static {
    route 172.16.16.0/21 reject;
}
autonomous-system 64515;

```

If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Device Private-Peer-2

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

Device Private-Peer-2 performs two main functions:

- Advertises routes local to AS 64516 to both the exchange peers and the ISP routers. The **outbound-routes** policy advertises the local static routes (that is, customers) on the router, and also advertises all routes learned by BGP that originated in either AS 64516 or AS 64512. These routes include other AS 64516 customer routes in addition to the AS 64512 customer. The AS routes are identified by an AS path regular expression match criteria in the policy.
- Advertises the 0.0.0.0/0 default route to the AS 64512 customer router. To accomplish this, the private peer creates a generated route for 0.0.0.0/0 locally on the router. This generated route is further assigned a policy called **if-upstream-routes-exist**, which allows only certain routes to contribute to the generated route, making it an active route in the routing table. Once the route is active, it can be sent to the AS 64512 router using BGP and the configured policies. The **if-upstream-routes-exist** policy accepts only the 172.16.32.0/21 route from Device Exchange-2, and rejects all other routes. If the 172.16.32.0/21 route is withdrawn by the exchange peer, the private peer loses the 0.0.0.0/0 default route and withdraws the default route from the AS 64512 customer router.

To configure Device Private-Peer-2:

1. Configure the device interfaces.

```

[edit interfaces]
user@Private-Peer-2# set fe-1/2/3 unit 0 description to_ISP-2
user@Private-Peer-2# set fe-1/2/3 unit 0 family inet address 10.3.0.5/30

user@Private-Peer-2# set fe-1/2/0 unit 0 description to_Customer-1
user@Private-Peer-2# set fe-1/2/0 unit 0 family inet address 10.0.0.22/30

user@Private-Peer-2# set fe-1/2/1 unit 0 description to_Exchange-2
user@Private-Peer-2# set fe-1/2/1 unit 0 family inet address 10.3.0.50/30

```

```
user@Private-Peer-2# set lo0 unit 0 family inet address 192.168.0.5/32
```

2. Configure the static routes.

```
[edit routing-options static]
user@Private-Peer-2# set route 172.16.24.0/25 reject
user@Private-Peer-2# set route 172.16.24.128/25 reject
user@Private-Peer-2# set route 172.16.25.0/26 reject
user@Private-Peer-2# set route 172.16.25.64/26 reject
```

3. Configure a routing policy that generates a default static route only if certain internal routes exist.

```
[edit policy-options policy-statement if-upstream-routes-exist]
user@Private-Peer-2# set term as-64515-routes from route-filter 172.16.16.0/21
exact
user@Private-Peer-2# set term as-64515-routes then accept
user@Private-Peer-2# set term reject-all-other-routes then reject
```

```
[edit routing-options generate route 0.0.0.0/0]
user@Private-Peer-2# set policy if-upstream-routes-exist
```

4. Configure the routing policy that advertises local static routes and the default route.

```
[edit policy-options policy-statement internal-routes]
user@Private-Peer-2# set term statics from protocol static
user@Private-Peer-2# set term statics then accept
user@Private-Peer-2# set term default-route from route-filter 0.0.0.0/0 exact
user@Private-Peer-2# set term default-route then accept
user@Private-Peer-2# set term reject-all-other-routes then reject
```

5. Configure the routing policy that advertises local customer routes.

```
[edit policy-options policy-statement outbound-routes]
user@Private-Peer-2# set term statics from protocol static
user@Private-Peer-2# set term statics then accept
user@Private-Peer-2# set term allowed-bgp-routes from as-path my-own-routes
user@Private-Peer-2# set term allowed-bgp-routes from as-path AS64512-routes
user@Private-Peer-2# set term allowed-bgp-routes then accept
user@Private-Peer-2# set term no-transit then reject
```

```
[edit policy-options]
user@Private-Peer-2# set as-path my-own-routes "()"
user@Private-Peer-2# set as-path AS64512-routes 64512
```

6. Configure the EBGP connection to Customer-2.

```
[edit protocols bgp group to-64512]
user@Private-Peer-2# set type external
user@Private-Peer-2# set export internal-routes
user@Private-Peer-2# set peer-as 64512
user@Private-Peer-2# set neighbor 10.0.0.21
```

7. Configure the EBGP connection to Device Exchange-2.

```
[edit protocols bgp group to-64515]
user@Private-Peer-2# set type external
user@Private-Peer-2# set export outbound-routes
user@Private-Peer-2# set peer-as 64515
```

```
user@Private-Peer-2# set neighbor 10.3.0.49
```

8. Configure the EBGP connections to the ISP.

```
[edit protocols bgp group ext]
user@Private-Peer-2# set type external
user@Private-Peer-2# set export outbound-routes
user@Private-Peer-2# set peer-as 64510
user@Private-Peer-2# set neighbor 10.3.0.6
```

9. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@Private-Peer-2# set autonomous-system 64516
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@Private-Peer-2# show interfaces
fe-1/2/0 {

```

**Meaning** Device Customer-1 has its four static routes, and it has learned the default route through BGP.

---

### Verifying the Routes on Device Customer-2

---

**Purpose** On Device Customer-2, check the routes in the routing table.

```

Action user@Customer-2> show route
inet.0: 22 destinations, 23 routes (22 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0          *[BGP/170] 00:10:35, localpref 200
                   AS path: 64510 I, validation-state: unverified
                   > to 10.0.0.9 via fe-1/2/0.10
                   [BGP/170] 04:58:09, localpref 50
                   AS path: 64516 I, validation-state: unverified
                   > to 10.0.0.22 via fe-1/2/0.0
10.0.0.8/30        *[Direct/0] 23:51:29
                   > via fe-1/2/0.10
10.0.0.10/32       *[Local/0] 23:52:49
                   Local via fe-1/2/0.10
10.0.0.20/30       *[Direct/0] 23:52:49
                   > via fe-1/2/0.0

                   > via lo0.0
    
```

**Meaning** Device Customer-2 has learned the default route through its session with the ISP and also through its session with the private peer. The route learned from the ISP is preferred because it has a higher local preference.

#### Verifying the Routes on Device ISP-1

**Purpose** On Device ISP-1, check the routes in the routing table.

**Action** user@ISP-1> show route

```

inet.0: 42 destinations, 53 routes (42 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0          *[BGP/170] 22:44:26, localpref 100, from 192.168.0.2
                   AS path: 64516 I, validation-state: unverified

                   *[BGP/170] 23:00:54, localpref 100
                   AS path: 64516 64512 I, validation-state: unverified
                   > to 10.3.0.50 via fe-1/2/1.0
192.168.0.5/32      > to 10.3.0.50 via fe-1/2/1.0
                   *[BGP/170] 23:54:44, localpref 100
                   AS path: 64516 I, validation-state: unverified
                   > to 10.3.0.50 via fe-1/2/1.0
192.168.0.7/32      > to 10.3.0.50 via fe-1/2/1.0
                   *[Direct/0] 23:54:57
                   > via lo0.0
```

**Meaning** On Device Exchange-2, the default route 0/0 is hidden because the next hop for the route is its own interface to Device Private-Peer-2, from which the route was received. The route is hidden to avoid a loop.

---

#### Verifying the Routes on Device Private-Peer-1

---

**Purpose** On Device Private-Peer-1, check the routes in the routing table.

**Action** user@Private-Peer-1> show route

```
inet.0: 13 destinations, 13 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.2.0.0/30      *[Direct/0] 23:58:57
                 > via fe-1/2/2.0
10.2.0.1/32     *[Local/0] 5d 21:34:22
                 Local via fe-1/2/2.0
10.3.0.44/30    *[Direct/0] 23:59:02
                 > via fe-1/2/1.0
10.3.0.46/32    *[Local/0] 1d 03:19:52
                 Local via fe-1/2/1.0
172.16.32.0/24  *[BGP/170] 22:51:22, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.33.0/24  *[BGP/170] 22:51:22, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.34.0/24  *[BGP/170] 22:46:16, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.35.0/24  *[BGP/170] 22:46:16, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.36.0/24  *[BGP/170] 22:46:16, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.37.0/24  *[BGP/170] 22:46:16, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.38.0/24  *[BGP/170] 22:46:16, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
172.16.39.0/24  *[BGP/170] 22:46:16, localpref 100
                 AS path: 64510 I, validation-state: unverified
                 > to 10.2.0.2 via fe-1/2/2.0
192.168.0.4/32  *[Direct/0] 5d 21:34:22
                 > via lo0.0
```

### Verifying the Routes on Device Private-Peer-2

**Purpose** On Device Private-Peer-2, check the routes in the routing table.

**Action** user@Private-Peer-2> show route

```
inet.0: 29 destinations, 29 routes (29 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0          *[Aggregate/130] 1d 02:13:28
                   > to 10.3.0.49 via fe-1/2/1.0
10.0.0.20/30       *[Direct/0] 1d 00:00:53
                   > via fe-1/2/0.0
10.0.0.22/32       *[Local/0] 4d 23:51:14
                   Local via fe-1/2/0.0
10.3.0.4/30        *[Direct/0] 23:59:36
                   > via fe-1/2/3.0
10.3.0.5/32        *[Local/0] 5d 21:34:57
                   Local via fe-1/2/3.0
10.3.0.48/30       *[Direct/0] 23:59:35
                   > via fe-1/2/1.0
10.3.0.50/32       *[Local/0] 1d 03:20:27
                   Local via fe-1/2/1.0

## Understanding Policy Expressions

Policy expressions give the policy framework software a different way to evaluate routing policies. A *policy expression* uses Boolean logical operators with policies. The logical operators establish rules by which the policies are evaluated.

During evaluation of a routing policy in a policy expression, the policy action of accept, reject, or next policy is converted to the value of TRUE or FALSE. This value is then evaluated against the specified logical operator to produce output of either TRUE or FALSE. The output is then converted back to a flow control action of accept, reject, or next policy. The result of the policy expression is applied as it would be applied to a single policy; the route is accepted or rejected and the evaluation ends, or the next policy is evaluated.

[Table 14 on page 141](#) summarizes the policy actions and their corresponding TRUE and FALSE values and flow control action values. [Table 15 on page 142](#) describes the logical operators. For complete information about policy expression evaluation, see [“Policy Expression Evaluation” on page 144](#).

You must enclose a policy expression in parentheses. You can place a policy expression anywhere in the **import** or **export** statements and in the **from policy** statement.

**Table 14: Policy Action Conversion Values**

Policy Action	Conversion Value	Flow Control Action Conversion Value
Accept	TRUE	Accept

Table 14: Policy Action Conversion Values (*continued*)

Policy Action	Conversion Value	Flow Control Action Conversion Value
Reject	FALSE	Reject
Next policy	TRUE	Next policy

Table 15: Policy Expression Logical Operators

Logical Operator	Policy Expression Logic	How Logical Operator Affects Policy Expression Evaluation
&& (Logical AND)	<p>Logical AND requires that all values must be TRUE to produce output of TRUE.</p> <p>Routing policy value of TRUE and TRUE produces output of TRUE. Value of TRUE and FALSE produces output of FALSE. Value of FALSE and FALSE produces output of FALSE.</p>	<p>If the first routing policy returns the value of TRUE, the next policy is evaluated. If the first policy returns the value of FALSE, the evaluation of the expression ends and subsequent policies in the expression are not evaluated.</p>
(Logical OR)	<p>Logical OR requires that at least one value must be TRUE to produce output of TRUE.</p> <p>Routing policy value of TRUE and FALSE produces output of TRUE. Value of TRUE and TRUE produces output of TRUE. Value of FALSE and FALSE produces output of FALSE.</p>	<p>If the first routing policy returns the value of TRUE, the evaluation of the expression ends and subsequent policies in the expression are not evaluated. If the first policy returns the value of FALSE, the next policy is evaluated.</p>
! (Logical NOT)	<p>Logical NOT reverses value of TRUE to FALSE and of FALSE to TRUE. It also reverses the actions of accept and next policy to reject, and reject to accept.</p>	<p>If used with the logical AND operator and the first routing policy value of FALSE is reversed to TRUE, the next policy is evaluated. If the value of TRUE is reversed to FALSE, the evaluation of the expression ends and subsequent policies in the expression are not evaluated.</p> <p>If used with the logical OR operator and the first routing policy value of FALSE is reversed to TRUE, the evaluation of the expression ends and subsequent policies in the expression are not evaluated. If the value of TRUE is reversed to FALSE, the next policy is evaluated.</p> <p>If used with a policy and the flow control action is accept or next policy, these actions are reversed to reject. If the flow control action is reject, this action is reversed to accept.</p>

- [Policy Expression Evaluation on page 144](#)
- [Evaluating Policy Expressions on page 145](#)

## Policy Expression Examples

The following examples show how to use the logical operators to create policy expressions:

- **Logical AND**—In the following example, **policy1** is evaluated first. If after **policy1** is evaluated, a value of TRUE is returned, **policy2** is evaluated. If a value of FALSE is returned, **policy2** is not evaluated.

```
export (policy1 && policy2)
```

- **Logical OR**—In the following example, **policy1** is evaluated first. If after **policy1** is evaluated, a value of TRUE is returned, **policy2** is not evaluated. If a value of FALSE is returned, **policy2** is evaluated.

```
export (policy1 || policy2)
```

- **Logical OR and logical AND**—In the following example, **policy1** is evaluated first. If after **policy1** is evaluated, a value of TRUE is returned, **policy2** is skipped and **policy3** is evaluated. If after **policy1** is evaluated, a value of FALSE is returned, **policy2** is evaluated. If **policy2** returns a value of TRUE, **policy3** is evaluated. If **policy2** returns a value of FALSE, **policy3** is not evaluated.

```
export [(policy1 || policy2) && policy3]
```

- **Logical NOT**—In the following example, **policy1** is evaluated first. If after **policy1** is evaluated, a value of TRUE is returned, the value is reversed to FALSE and **policy2** is not evaluated. If a value of FALSE is returned, the value is reversed to TRUE and **policy2** is evaluated.

```
export (!policy1 && policy2)
```

The sequential list [**policy1 policy2 policy3**] is not the same as the policy expression (**policy1 && policy2 && policy3**).

The sequential list is evaluated on the basis of a route matching a routing policy. For example, if **policy1** matches and the action is **accept** or **reject**, **policy2** and **policy3** are not evaluated. If **policy1** does not match, **policy2** is evaluated and so on until a match occurs and the action is **accept** or **reject**.

The policy expressions are evaluated on the basis of the action in a routing policy that is converted to the value of TRUE or FALSE and the logic of the specified logical operator. (For complete information about policy expression evaluation, see [“Policy Expression Evaluation” on page 144](#).) For example, if **policy1** returns a value of FALSE, **policy2** and **policy3** are not evaluated. If **policy1** returns a value of TRUE, **policy2** is evaluated. If **policy2** returns a value of FALSE, **policy3** is not evaluated. If **policy2** returns a value of TRUE, **policy3** is evaluated.

You can also combine policy expressions and sequential lists. In the following example, if **policy1** returns a value of FALSE, **policy2** is evaluated. If **policy2** returns a value of TRUE and contains a **next policy** action, **policy3** is evaluated. If **policy2** returns a value of TRUE but does not contain an action, including a **next policy** action, **policy3** is still evaluated (because if you do not specify an action, next term or next policy are the default actions). If **policy2** returns a value of TRUE and contains an **accept** action, **policy3** is not evaluated.

```
export [(policy1 || policy2) policy3]
```

## Policy Expression Evaluation

During evaluation, the policy framework software converts policy actions to values of TRUE or FALSE, which are factors in determining the flow control action that is performed upon a route. However, the software does not actually perform a flow control action on a route until it evaluates an entire policy expression.

The policy framework software evaluates a policy expression as follows:

1. The software evaluates a route against the first routing policy in a policy expression and converts the specified or default action to a value of TRUE or FALSE. (For information about the policy action conversion values, see [Table 14 on page 141](#).)
2. The software takes the value of TRUE or FALSE and evaluates it against the logical operator used in the policy expression (see [Table 15 on page 142](#)). Based upon the logical operator used, the software determines whether or not to evaluate the next policy, if one is present.

The policy framework software uses a shortcut method of evaluation: if the result of evaluating a policy predetermines the value of the entire policy expression, the software does not evaluate the subsequent policies in the expression. For example, if the policy expression uses the logical AND operator and the evaluation of a policy returns the value of FALSE, the software does not evaluate subsequent policies in the expression because the final value of the expression is guaranteed to be FALSE no matter what the values of the unevaluated policies.

3. The software performs Step 1 and Step 2 for each subsequent routing policy in the policy expression, if they are present and it is necessary to evaluate them.
4. After evaluating the last routing policy, if it is appropriate, the software evaluates the value of TRUE or FALSE obtained from each routing policy evaluation. Based upon the logical operator used, it calculates an output of TRUE or FALSE.
5. The software converts the output of TRUE or FALSE back to an action. (For information about the policy action conversion values, see [Table 14 on page 141](#).) The action is performed.

If each policy in the expression returned a value of TRUE, the software converts the output of TRUE back to the flow control action specified in the last policy. For example, if the policy expression (**policy1 && policy2**) is specified and **policy1** specifies **accept** and **policy2** specifies **next term**, the **next term** action is performed.

If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a policy expression sets a route's metric to 500, this route matches the criteria of **metric 500** defined in the next policy. However, if a route characteristic manipulation action is specified in a policy located in the middle or the end of a policy expression, it is possible, because of the shortcut evaluation, that the policy is never evaluated and the manipulation of the route characteristic never occurs.

## Evaluating Policy Expressions

The following sample routing policy uses three policy expressions:

```
[edit]
policy-options {
  policy-statement policy-A {
    from {
      route-filter 10.10.0.0/16 orlonger;
    }
    then reject;
  }
}
policy-options {
  policy-statement policy-B {
    from {
      route-filter 10.20.0.0/16 orlonger;
    }
    then accept;
  }
}
protocols {
  bgp {
    neighbor 192.168.1.1 {
      export (policy-A && policy-B);
    }
    neighbor 192.168.2.1 {
      export (policy-A || policy-B);
    }
    neighbor 192.168.3.1 {
      export (!policy-A);
    }
  }
}
```

The policy framework software evaluates the transit BGP route 10.10.1.0/24 against the three policy expressions specified in the sample routing policy as follows:

- (policy-A && policy-B)—10.10.1.0/24 is evaluated against **policy-A**. 10.10.1.0/24 matches the route list specified in **policy-A**, so the specified action of **reject** is returned. **reject** is converted to a value of FALSE, and FALSE is evaluated against the specified logical AND. Because the result of FALSE is certain no matter what the results of the evaluation of **policy-B** are (in policy expression logic, any result AND a value of FALSE produces the output of FALSE), **policy-B** is not evaluated and the output of FALSE is produced. The FALSE output is converted to **reject**, and 10.10.1.0/24 is rejected.
- (policy-A || policy-B)—10.10.1.0/24 is evaluated against **policy-A**. 10.10.1.0/24 matches the route list specified in **policy-A**, so the specified action of **reject** is returned. **reject** is converted to a value of FALSE, then FALSE is evaluated against the specified logical OR. Because logical OR requires at least one value of TRUE to produce an output of TRUE, 10.10.1.0/24 is evaluated against **policy-B**. 10.10.1.0/24 does not match **policy-B**, so the default action of **next-policy** is returned. The **next-policy** is converted to a value of TRUE, then the value of FALSE (for **policy-A** evaluation) and TRUE (for **policy-B** evaluation) are evaluated against the specified logical OR. In policy expression logic,

FALSE OR TRUE produce an output of TRUE. The output of TRUE is converted to **next-policy**. (TRUE is converted to **next-policy** because **next-policy** was the last action retained by the policy framework software.) **policy-B** is the last routing policy in the policy expression, so the action specified by the default export policy for BGP is taken.

- (!policy-A)—10.10.1.0/24 is evaluated against **policy-A**. 10.10.1.0/24 matches the route list specified in **policy-A**, so the specified action of **reject** is returned. **reject** is converted to a value of FALSE, and FALSE is evaluated against the specified logical NOT. The value of FALSE is reversed to an output of TRUE based on the rules of logical NOT. The output of TRUE is converted to **accept**, and route 10.10.1.0/24 is accepted.

## Understanding How a Routing Policy Chain Is Evaluated

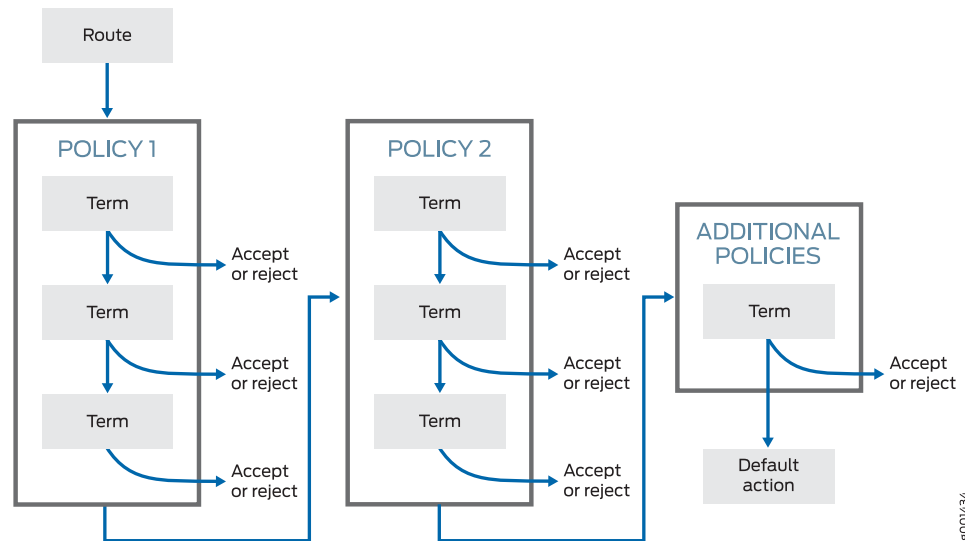

---

[Figure 14 on page 148](#) shows how a chain of routing policies is evaluated. These routing policies consist of multiple terms. Each term consists of match conditions and actions to apply to matching routes. Each route is evaluated against the policies as follows:

1. The route is evaluated against the first term in the first routing policy. If it matches, the specified action is taken. If the action is to accept or reject the route, that action is taken and the evaluation of the route ends. If the **next term** action is specified, if no action is specified, or if the route does not match, the evaluation continues as described in Step 2. If the **next policy** action is specified, any accept or reject action specified in this term is skipped, all remaining terms in this policy are skipped, all other actions are taken, and the evaluation continues as described in Step 3.
2. The route is evaluated against the second term in the first routing policy. If it matches, the specified action is taken. If the action is to accept or reject the route, that action is taken and the evaluation of the route ends. If the **next term** action is specified, if no action is specified, or if the route does not match, the evaluation continues in a similar manner against the last term in the first routing policy. If the **next policy** action is specified, any accept or reject action specified in this term is skipped, all remaining terms in this policy are skipped, all other actions are taken, and the evaluation continues as described in Step 3.
3. If the route does not match a term or matches a term with a **next policy** action in the first routing policy, it is evaluated against the first term in the second routing policy.
4. The evaluation continues until the route matches a term with an accept or reject action defined or until there are no more routing policies to evaluate. If there are no

more routing policies, then the accept or reject action specified by the default policy is taken.

## Example: Configuring Policy Chains and Route Filters

A *policy chain* is the application of multiple policies within a specific section of the configuration. A *route filter* is a collection of match prefixes.

- [Requirements on page 148](#)
- [Overview on page 148](#)
- [Configuration on page 150](#)
- [Verification on page 156](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

An example of a policy chain applied to BGP is as follows:

```

user@R1# show protocols bgp
group int {
  type internal;
  local-address 192.168.0.1;
  export [ adv-statics adv-large-aggregates adv-small-aggregates ];
  neighbor 192.168.0.2;
}
  
```

```
neighbor 192.168.0.3;
}
```

The **adv-statics**, **adv-large-aggregates**, and **adv-small-aggregates** policies, in addition to the default BGP policy, make up the policy chain applied to the BGP peers of Device R1. Two of the policies demonstrate route filters with different match types. The other policy matches all static routes, so no route filter is needed.

```
user@R1# show policy-options
policy-statement adv-large-aggregates {
  term between-16-and-18 {
    from {
      protocol aggregate;
      route-filter 172.16.0.0/16 upto /18;
    }
    then accept;
  }
}
policy-statement adv-small-aggregates {
  term between-19-and-24 {
    from {
      protocol aggregate;
      route-filter 172.16.0.0/16 prefix-length-range /19-/24;
    }
    then accept;
  }
}
policy-statement adv-statics {
  term statics {
    from protocol static;
    then accept;
  }
}
```

Optionally, you can convert this policy chain into a single multiterm policy for the internal BGP (IBGP) peers. If you do this, one of the advantages of a policy chain is lost—the ability to reuse policies for different purposes.

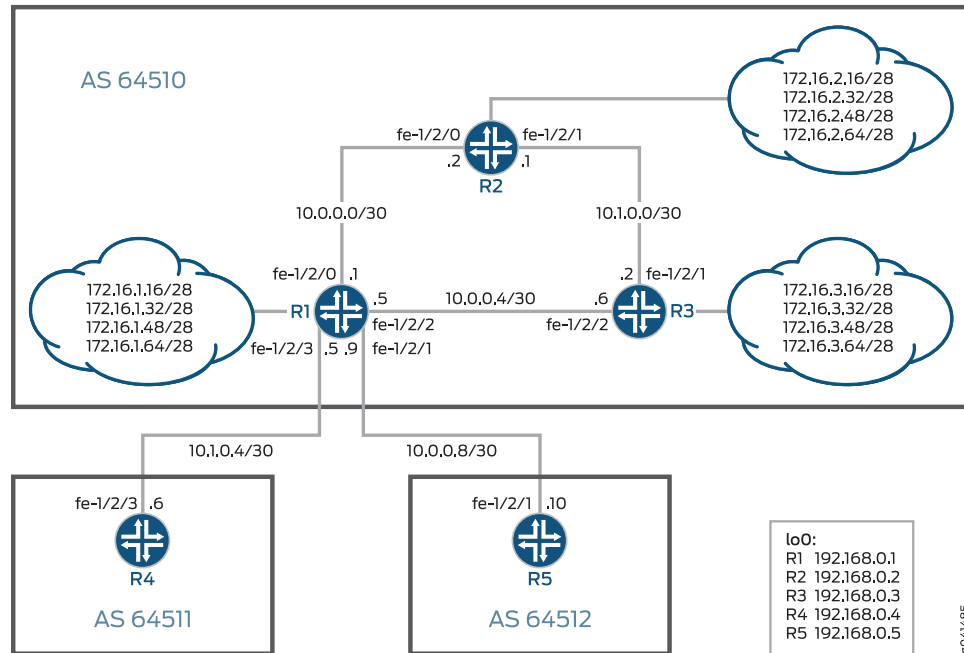

[Figure 15 on page 150](#) displays Device R1 in AS 64510 with its IBGP peers, Device R2 and Device R3. Device R1 also has external BGP (EBGP) connections to Device R4 in AS 64511 and Device R5 in AS 64512. The current administrative policy within AS 64510 is to send the customer static routes only to other IBGP peers. Any EBGP peer providing transit service only receives aggregate routes with mask lengths smaller than 18 bits. Any EBGP peer providing peering services receives all customer routes and all aggregates whose mask length is larger than 19 bits. Each portion of these administrative policies is configured in a separate routing policy within the **[edit policy-options]** configuration hierarchy. These policies provide the administrators of AS 64510 with multiple configuration options for advertising routes to peers.

Device R4 is providing transit service to AS 64510, which allows the AS to advertise its assigned routing space to the Internet. On the other hand, the peering service provided by Device R5 allows AS 64510 to route traffic directly between the autonomous systems (ASs) for all customer routes.

## Topology

Figure 15 on page 150 shows the sample network.

Figure 15: BGP Topology for Policy Chains

"CLI Quick Configuration" on page 150 shows the configuration for all of the devices in Figure 15 on page 150.

The section "Step-by-Step Procedure" on page 152 describes the steps on Device R1.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1
set interfaces fe-1/2/0 unit 0 description to_R2
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces fe-1/2/2 unit 0 description to_R3
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.5/30
set interfaces fe-1/2/3 unit 0 description to_R4
set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.5/30
set interfaces fe-1/2/1 unit 0 description to_R5
set interfaces fe-1/2/1 unit 0 family inet address 10.0.0.10/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group int type internal
set protocols bgp group int local-address 192.168.0.1
set protocols bgp group int export adv-statics
set protocols bgp group int export adv-large-aggregates
set protocols bgp group int export adv-small-aggregates
set protocols bgp group int neighbor 192.168.0.2
  
```

```

set protocols bgp group int neighbor 192.168.0.3

set protocols bgp group ext type external
set protocols bgp group ext neighbor 10.0.0.10 peer-as 64510
set routing-options autonomous-system 64512

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 0 description to_R2
user@R1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30

user@R1# set fe-1/2/2 unit 0 description to_R3
user@R1# set fe-1/2/2 unit 0 family inet address 10.0.0.5/30

```

```
user@R1# set fe-1/2/3 unit 0 description to_R4
user@R1# set fe-1/2/3 unit 0 family inet address 10.1.0.5/30
```

```
user@R1# set fe-1/2/1 unit 0 description to_R5
user@R1# set fe-1/2/1 unit 0 family inet address 10.0.0.10/30
```

```
user@R1# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure the IBGP connections to Device R2 and Device R3.

```
[edit protocols bgp group int]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set neighbor 192.168.0.2
user@R1# set neighbor 192.168.0.3
```

3. Apply the export policies for the internal peers.

```
[edit protocols bgp group int]
user@R1# set export adv-statics
user@R1# set export adv-large-aggregates
user@R1# set export adv-small-aggregates
```

4. Configure the EBGP connection to Device R4.

```
[edit protocols bgp group to_64511]
user@R1# set type external
user@R1# set neighbor 10.1.0.6 peer-as 64511
```

5. Apply the export policy for Device R4.

```
[edit protocols bgp group to_64511]
user@R1# set export adv-large-aggregates
```

6. Configure the EBGP connection to Device R5.

```
[edit protocols bgp group to_64512]
user@R1# set type external
user@R1# set neighbor 10.0.0.9 peer-as 64512
```

7. Apply the export policies for Device R5.

```
[edit protocols bgp group to_64512]
user@R1# set export adv-small-aggregates
user@R1# set export adv-statics
```

8. Configure OSPF connections to Device R2 and Device R3.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.0
user@R1# set interface fe-1/2/2.0
user@R1# set interface lo0.0 passive
```

9. Configure the routing policies.

```
[edit policy-options policy-statement adv-large-aggregates term between-16-and-18]
user@R1# set from protocol aggregate
user@R1# set from route-filter 172.16.0.0/16 upto /18
user@R1# set then accept
```

```
[edit policy-options policy-statement adv-small-aggregates term
  between-19-and-24]
user@R1# set from protocol aggregate
user@R1# set from route-filter 172.16.0.0/16 prefix-length-range /19-/24
user@R1# set then accept
```

```
[edit policy-options policy-statement adv-statics term statics]
user@R1# set from protocol static
user@R1# set then accept
```

10. Configure the static and aggregate routes.

```
[edit routing-options static]
user@R1# set route 172.16.1.16/28 discard
user@R1# set route 172.16.1.32/28 discard
user@R1# set route 172.16.1.48/28 discard
user@R1# set route 172.16.1.64/28 discard
```

```
[edit routing-options aggregate]
user@R1# set route 172.16.0.0/16
user@R1# set route 172.16.1.0/24
```

11. Configure the autonomous system (AS) number and router ID.

```
[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 64510
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 0 {
    description to_R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
fe-1/2/2 {
  unit 0 {
    description to_R3;
    family inet {
      address 10.0.0.5/30;
    }
  }
}
fe-1/2/3 {
  unit 0 {
    description to_R4;
    family inet {
      address 10.1.0.5/30;
    }
  }
}
```

```

    }
  }
  fe-1/2/1 {
    unit 0 {
      description to_R5;
      family inet {
        address 10.0.0.10/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 192.168.0.1/32;
      }
    }
  }
}

user@R1# show protocols
bgp {
  group int {
    type internal;
    local-address 192.168.0.1;
    export [ adv-statics adv-large-aggregates adv-small-aggregates ];
    neighbor 192.168.0.2;
    neighbor 192.168.0.3;
  }
  group to_64511 {
    type external;
    export adv-large-aggregates;
    neighbor 10.1.0.6 {
      peer-as 64511;
    }
  }
  group to_64512 {
    type external;
    export [ adv-small-aggregates adv-statics ];
    neighbor 10.0.0.9 {
      peer-as 64512;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.0;
    interface fe-1/2/2.0;
    interface lo0.0 {
      passive;
    }
  }
}

user@R1# show policy-options
policy-statement adv-large-aggregates {

    }
    then accept;
}
}
policy-statement adv-small-aggregates {
    term between-19-and-24 {
        from {
            protocol aggregate;
            route-filter 172.16.0.0/16 prefix-length-range /19-/24;
        }
        then accept;
    }
}
policy-statement adv-statics {
    term statics {
        from protocol static;
        then accept;
    }
}

user@R1# show routing-options
static {
    route 172.16.1.16/28 discard;
    route 172.16.1.32/28 discard;
    route 172.16.1.48/28 discard;
    route 172.16.1.64/28 discard;
}
aggregate {
    route 172.16.0.0/16;
    route 172.16.1.0/24;
}
router-id 192.168.0.1;
autonomous-system 64510;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Route Advertisement to Device R4 on page 156](#)
- [Checking Where the Longer Routes Are Originating on page 157](#)
- [Blocking the More Specific Routes on page 157](#)
- [Verifying the Route Advertisement to Device R5 on page 158](#)

---

### Verifying the Route Advertisement to Device R4

**Purpose** On Device R1, make sure that the customer routes are advertised to Device R4.

**Action** user@R1> show route advertising-protocol bgp 10.1.0.6

```
inet.0: 29 destinations, 31 routes (29 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref    AS path
* 172.16.0.0/16          Self              0
* 172.16.2.0/24          Self              0
* 172.16.2.16/28         Self              0
* 172.16.2.32/28         Self              0
* 172.16.2.48/28         Self              0
* 172.16.2.64/28         Self              0
* 172.16.3.0/24          Self              0
* 172.16.3.16/28         Self              0
* 172.16.3.32/28         Self              0
* 172.16.3.48/28         Self              0
* 172.16.3.64/28         Self              0
```

**Meaning** The **adv-large-aggregates** policy is applied to the peering session with Device R4 to advertise the aggregate routes with a subnet mask length between 16 and 18 bits. The 172.16.0.0/16 aggregate route is being sent as defined by the administrative policy, but a number of other routes with larger subnet masks are also being sent to Device R4.

### Checking Where the Longer Routes Are Originating

**Purpose** On Device R1, find where the other routes are coming from.

**Action** user@R1> show route 172.16.3.16/28

```
inet.0: 29 destinations, 31 routes (29 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

172.16.3.16/28      *[BGP/170] 20:16:00, localpref 100, from 192.168.0.3
                    AS path: I, validation-state: unverified
                    > to 10.0.0.6 via fe-1/2/2.0
```

**Meaning** Device R1 has learned this route through its BGP session with Device R3. Because it is an active BGP route, it is automatically advertised by the BGP default policy. Remember that the default policy is always applied to the end of every policy chain. What is needed is a policy to block the more specific routes from being advertised.

### Blocking the More Specific Routes

**Purpose** Create a policy called **not-larger-than-18** that rejects all routes within the 172.16.0.0 /16 address space that have a subnet mask length greater than or equal to 19 bits. This ensures that all aggregates with a mask between 16 and 18 bits are advertised, thus accomplishing the goal of the administrative policy.

**Action** 1. On Device R1, configure the **not-larger-than-18** policy.

```
[edit policy-options policy-statement not-larger-than-18 term
  reject-greater-than-18-bits]
user@R1# set from route-filter 172.16.0.0/16 prefix-length-range /19-/32
user@R1# set then reject
```

2. On Device R1, apply the policy to the peering session with Device R4.

```
[edit protocols bgp group to_64511]
user@R1# set export not-larger-than-18
user@R1# commit
```

3. On Device R1, check which routes are advertised to Device R4.

```
user@R1> show route advertising-protocol bgp 10.1.0.6

inet.0: 29 destinations, 31 routes (29 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref  AS path
* 172.16.0.0/16      Self              0         0         I
```

**Meaning** The policy chain is working correctly. Only the 172.16.0.0 /16 route is advertised to Device R4.

### Verifying the Route Advertisement to Device R5

**Purpose** On Device R1, make sure that the customer routes are advertised to Device R5.

Device R5 is Device R1's EBGP peer in AS 64512. The administrative policy states that this peer receives only aggregate routes larger than 18 bits in length and all customer routes. In anticipation of encountering a problem similar to the problem on Device R4, you can create a policy called **not-smaller-than-18** that rejects all aggregates with mask lengths between 16 and 18 bits.

- Action** 1. On Device R2, configure an aggregate route for 172.16.128.0/17.

```
[edit routing-options aggregate]
user@R2# set route 172.16.128.0/17 discard
user@R2# commit
```

2. On Device R1, check which routes are advertised to Device R5.

```
user@R1> show route advertising-protocol bgp 10.0.0.9

inet.0: 30 destinations, 32 routes (30 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref  AS path
* 172.16.1.0/24      Self              0         0         I
* 172.16.1.16/28     Self              0         0         I
* 172.16.1.32/28     Self              0         0         I
* 172.16.1.48/28     Self              0         0         I
* 172.16.1.64/28     Self              0         0         I
* 172.16.2.0/24      Self              0         0         I
* 172.16.2.16/28     Self              0         0         I
* 172.16.2.32/28     Self              0         0         I
* 172.16.2.48/28     Self              0         0         I
* 172.16.2.64/28     Self              0         0         I
* 172.16.3.0/24      Self              0         0         I
* 172.16.3.16/28     Self              0         0         I
* 172.16.3.32/28     Self              0         0         I
* 172.16.3.48/28     Self              0         0         I
* 172.16.3.64/28     Self              0         0         I
* 172.16.128.0/17    Self              0         0         I
```

The aggregate route 172.16.128.0/17 is advertised, in violation of the administrative policy

3. On Device R1, configure the **not-smaller-than-18** policy.

```
[edit policy-options policy-statement not-smaller-than-18 term reject-less-than-18-bits]
user@R1# set from protocol aggregate
user@R1# set from route-filter 172.16.0.0/16 upto /18
user@R1# set then reject
```

4. On Device R1, apply the policy to the peering session with Device R5.

```
[edit protocols bgp group to_64512]
user@R1# set export not-smaller-than-18
user@R1# commit
```

5. On Device R1, check which routes are advertised to Device R5.

```
user@R1> show route advertising-protocol bgp 10.0.0.9

inet.0: 29 destinations, 31 routes (29 active, 0 holddown, 0 hidden)
  Prefix                Nexthop              MED      Lc1pref  AS path
* 172.16.1.0/24          Self                  0         0         I
* 172.16.1.16/28         Self                  0         0         I
* 172.16.1.32/28         Self                  0         0         I
* 172.16.1.48/28         Self                  0         0         I
* 172.16.1.64/28         Self                  0         0         I
* 172.16.2.0/24          Self                  0         0         I
* 172.16.2.16/28         Self                  0         0         I
* 172.16.2.32/28         Self                  0         0         I
* 172.16.2.48/28         Self                  0         0         I
* 172.16.2.64/28         Self                  0         0         I
* 172.16.3.0/24          Self                  0         0         I
* 172.16.3.16/28         Self                  0         0         I
* 172.16.3.32/28         Self                  0         0         I
* 172.16.3.48/28         Self                  0         0         I
* 172.16.3.64/28         Self                  0         0         I
```

**Meaning** The policy chain is working correctly. Only aggregate routes larger than 18 bits in length and all customer routes are advertised to Device R5.

## Understanding Policy Subroutines in Routing Policy Match Conditions

You can use a routing policy called from another routing policy as a match condition. This process makes the called policy a *subroutine*.

In some ways, the Junos OS policy framework is similar to a programming language. This similarity includes the concept of nesting policies into a policy subroutine. A subroutine in a software program is a section of code that you reference on a regular basis. A policy

subroutine works in the same fashion—you reference an existing policy as a match criterion in another policy. The routing device first evaluates the subroutine and then evaluates the main policy. The evaluation of the subroutine returns a true or false Boolean result to the main policy. Because you are referencing the subroutine as a match criterion, a true result means that the main policy has a match and can perform any configured actions. A false result from the subroutine, however, means that the main policy does not have a match.

## Configuring Subroutines

To configure a subroutine in a routing policy to be called from another routing policy, create the subroutine and specify its name using the **policy** match condition in the **from** or **to** statement of another routing policy.

**NOTE:** Do not evaluate a routing policy within itself. The result is that no prefixes ever match the routing policy.

The action specified in a subroutine is used to provide a match condition to the calling policy. If the subroutine specifies an action of accept, the calling policy considers the route to be a match. If the subroutine specifies an action of reject, the calling policy considers the route not to match. If the subroutine specifies an action that is meant to manipulate the route characteristics, the changes are made.

### Possible Consequences of Termination Actions in Subroutines

A subroutine with particular statements can behave differently from a routing policy that contains the same statements. With a subroutine, you must remember that the possible termination actions of accept or reject specified by the subroutine or the default policy can greatly affect the expected results.

In particular, you must consider what happens if a match does not occur with routes specified in a subroutine and if the default policy action that is taken is the action that you expect and want.

For example, imagine that you are a network administrator at an Internet service provider (ISP) that provides service to Customer A. You have configured several routing policies for the different classes of neighbors that Customer A presents on various links. To save time maintaining the routing policies for Customer A, you have configured a subroutine that identifies their routes and various routing policies that call the subroutine, as shown below:

```
[edit]
policy-options {
  policy-statement customer-a-subroutine {
    from {
      route-filter 10.1/16 exact;
      route-filter 10.5/16 exact;
      route-filter 192.168.10/24 exact;
    }
    then accept;
  }
}
```

```

}
policy-options {
  policy-statement send-customer-a-default {
    from {
      policy customer-a-subroutine;
    }
    then {
      set metric 500;
      accept;
    }
  }
}
policy-options {
  policy-statement send-customer-a-primary {
    from {
      policy customer-a-subroutine;
    }
    then {
      set metric 100;
      accept;
    }
  }
}
policy-options {
  policy-statement send-customer-a-secondary {
    from {
      policy customer-a-subroutine;
    }
    then {
      set metric 200;
      accept;
    }
  }
}
protocols {
  bgp {
    group customer-a {
      export send-customer-a-default;
      neighbor 10.1.1.1;
      neighbor 10.1.2.1;
      neighbor 10.1.3.1 {
        export send-customer-a-primary;
      }
      neighbor 10.1.4.1 {
        export send-customer-a-secondary;
      }
    }
  }
}
}

```

The following results occur with this configuration:

- The group-level **export** statement resets the metric to 500 when advertising all BGP routes to neighbors 10.1.1.1 and 10.1.2.1 rather than just the routes that match the subroutine route filters.

- The neighbor-level **export** statements reset the metric to 100 and 200 when advertising all BGP routes to neighbors 10.1.3.1 and 10.1.4.1, respectively, rather than just the BGP routes that match the subroutine route filters.

These unexpected results occur because the subroutine policy does not specify a termination action for routes that do not match the route filter and therefore, the default BGP export policy of accepting all BGP routes is taken.

If the statements included in this particular subroutine had been contained within the calling policies themselves, only the desired routes would have their metrics reset.

This example illustrates the differences between routing policies and subroutines and the importance of the termination action in a subroutine. Here, the default BGP export policy action for the subroutine was not carefully considered. A solution to this particular example is to add one more term to the subroutine that rejects all other routes that do not match the route filters:

```
[edit]
policy-options {
  policy-statement customer-a-subroutine {
    term accept-exact {
      from {
        route-filter 10.1/16 exact;
        route-filter 10.5/16 exact;
        route-filter 192.168.10/24 exact;
      }
      then accept;
    }
    term reject-others {
      then reject;
    }
  }
}
```

Termination action strategies for subroutines in general include the following:

- Depend upon the default policy action to handle all other routes.
- Add a term that accepts all other routes.
- Add a term that rejects all other routes.

The option that you choose depends upon what you want to achieve with your subroutine. Plan your subroutines carefully.

## How a Routing Policy Subroutine Is Evaluated

Figure 16 on page 164 shows how a subroutine is evaluated. The subroutine is included in the first term of the first routing policy in a chain. Each route is evaluated against the subroutine as follows:

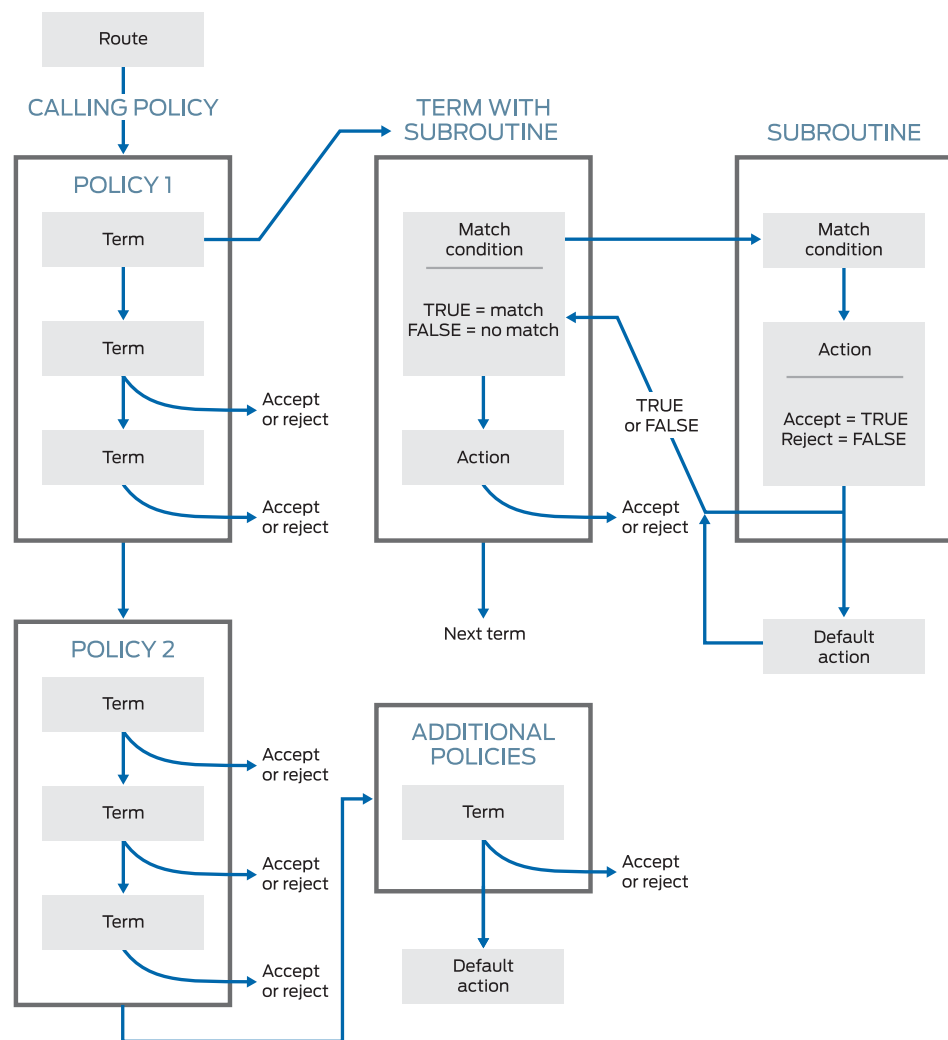

1. The route is evaluated against the first term in the first routing policy. If the route does not match all match conditions specified before the subroutine, the subroutine is skipped and the next term in the routing policy is evaluated (see Step 2). If the route matches all match conditions specified before the subroutine, the route is evaluated against the subroutine. If the route matches the match conditions in any of the subroutine terms, two levels of evaluation occur in the following order:
  - a. The actions in the subroutine term are evaluated. If one of the actions is **accept**, evaluation of the subroutine ends and a Boolean value of **TRUE** is returned to the calling policy. If one of the actions is **reject**, evaluation of the subroutine ends and **FALSE** is returned to the calling policy.

If the subroutine does not specify the **accept**, **reject** or **next-policy** action, it uses the **accept** or **reject** action specified by the default policy, and the values of **TRUE** or **FALSE** are returned to the calling policy as described in the previous paragraph.
  - b. The calling policy's subroutine match condition is evaluated. During this part of the evaluation, **TRUE** equals a match and **FALSE** equals no match. If the subroutine returns **TRUE** to the calling policy, then the evaluation of the calling policy continues. If the subroutine returns **FALSE** to the calling policy, then the evaluation of the current term ends and the next term is evaluated.
2. The route is evaluated against the second term in the first routing policy.

If you specify a policy chain as a subroutine, the entire chain acts as a single subroutine. As with other chains, the action specified by the default policy is taken only when the entire chain does not accept or reject a route.

If a term defines multiple match conditions, including a subroutine, and a route does not match a condition specified before the subroutine, the evaluation of the term ends and the subroutine is not called and evaluated. In this situation, an action specified in the subroutine that manipulates a route's characteristics is not implemented.

- [Configuration on page 166](#)
- [Verification on page 171](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

On Device R1, a policy called **main** is configured.

```
user@R1# show policy-options
policy-statement main {
  term subroutine-as-a-match {
    from policy subroutine;
    then accept;
  }
  term nothing-else {
    then reject;
  }
}
```

This main policy calls a subroutine called **subroutine**.

```
user@R1# show policy-options
policy-statement subroutine {
  term get-routes {
    from protocol static;
    then accept;
  }
  term nothing-else {
    then reject;
  }
}
```

The router evaluates the logic of **main** in a defined manner. The match criterion of **from policy subroutine** allows the routing device to locate the subroutine. All terms of the subroutine are evaluated, in order, following the normal policy processing rules. In this example, all static routes in the routing table match the subroutine with an action of accept. This returns a true result to the original, or calling, policy which informs the device that a positive match has occurred. The actions in the calling policy are executed and the route is accepted. All other routes in the routing table do not match the subroutine and return a false result to the calling policy. The device evaluates the second term of **main** and rejects the routes.

The actions in the subroutine do not actually accept or reject a specific route. The subroutine actions are only translated into a true or a false result. Actions that modify a route's attributes, however, are applied to the route regardless of the outcome of the subroutine.

Device R1 in AS 64510 has multiple customer routes, some of which are static routes configured locally, and some of which are received from Device R2 and Device R3 through internal BGP (IBGP). AS 64510 is connected to Device R4 in AS 64511. The policy **main**

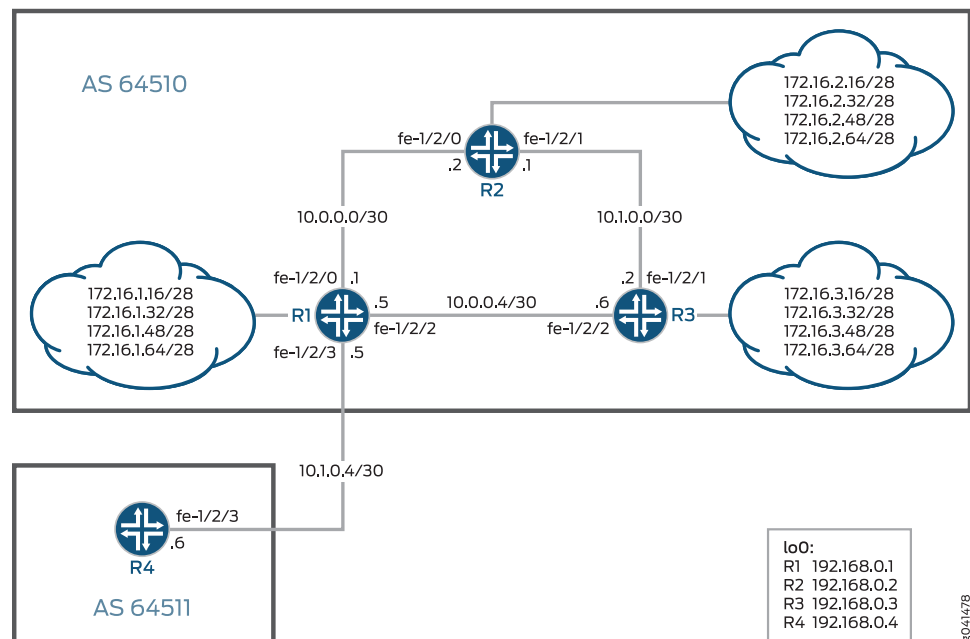

is applied as an export policy in Device R1's BGP peering session with Device R4. This causes Device R1 to send only its own static routes to Device R4. Because of the policy **main**, Device R1 does not send the routes received from its internal peers, Device R2 and Device R3.

When you are working with policy subroutines, it is important to remember that the default EBGp export policy is to advertise all learned BGP routes to all EBGp peers. This default policy is in effect in the main policy and also in the subroutine. Therefore, as shown in this example, if you do not want the default EBGp export policy to take effect, you must configure a **then reject** terminating action as the final term in both the main policy and in the policy subroutine. This example demonstrates what happens when the final **then reject** term is missing either from the main policy or from the policy subroutine.

### Topology

Figure 17 on page 166 shows the sample network.

Figure 17: BGP Topology for Policy Subroutine

"CLI Quick Configuration" on page 166 shows the configuration for all of the devices in Figure 17 on page 166.

The section "Step-by-Step Procedure" on page 168 describes the steps on Device R1.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**      **set interfaces fe-1/2/0 unit 0 description to\_R2**  
                   **set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30**

```

set interfaces fe-1/2/2 unit 0 description to_R3
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.5/30
set interfaces fe-1/2/3 unit 0 description to_R4
set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.5/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group int type internal
set protocols bgp group int local-address 192.168.0.1
set protocols bgp group int neighbor 192.168.0.2
set protocols bgp group int neighbor 192.168.0.3
set protocols bgp group to_64511 type external
set protocols bgp group to_64511 export main
set protocols bgp group to_64511 neighbor 10.1.0.6 peer-as 64511
set protocols ospf area 0.0.0.0 interface fe-1/2/0.0
set protocols ospf area 0.0.0.0 interface fe-1/2/2.0
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set policy-options policy-statement main term subroutine-as-a-match from policy
subroutine
set policy-options policy-statement main term subroutine-as-a-match then accept
set policy-options policy-statement main term nothing-else then reject
set policy-options policy-statement subroutine term get-routes from protocol static
set policy-options policy-statement subroutine term get-routes then accept
set policy-options policy-statement subroutine term nothing-else then reject
set routing-options static route 172.16.1.16/28 discard
set routing-options static route 172.16.1.32/28 discard
set routing-options static route 172.16.1.48/28 discard
set routing-options static route 172.16.1.64/28 discard
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 64510

```

**Device R2**

```

set interfaces fe-1/2/0 unit 0 description to_R1
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces fe-1/2/1 unit 0 description to_R3
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32

set routing-options static route 172.16.2.48/28 discard
set routing-options static route 172.16.2.64/28 discard
set routing-options router-id 192.168.0.2
set routing-options autonomous-system 64510

```

**Device R3**

```

set interfaces fe-1/2/1 unit 0 description to_R2
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.2/30
set interfaces fe-1/2/2 unit 0 description to_R1
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.6/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32

```

```
set protocols bgp group int type internal
set protocols bgp group int local-address 192.168.0.3
set protocols bgp group int neighbor 192.168.0.1 export send-static
set protocols bgp group int neighbor 192.168.0.2
set protocols ospf area 0.0.0.0 interface fe-1/2/2.6
set protocols ospf area 0.0.0.0 interface fe-1/2/0.4
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set policy-options policy-statement send-static from protocol static
set policy-options policy-statement send-static then accept
set routing-options static route 172.16.3.16/28 discard
set routing-options static route 172.16.3.32/28 discard
set routing-options static route 172.16.3.48/28 discard
set routing-options static route 172.16.3.64/28 discard
set routing-options router-id 192.168.0.3
set routing-options autonomous-system 64510
```

**Device R4**

```
set interfaces fe-1/2/3 unit 0 description to_R1
set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.6/30
set interfaces lo0 unit 0 family inet address 192.168.0.4/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 64510
set protocols bgp group ext neighbor 10.1.0.5
set routing-options autonomous-system 64511
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 0 description to_R2
user@R1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30

user@R1# set fe-1/2/2 unit 0 description to_R3
user@R1# set fe-1/2/2 unit 0 family inet address 10.0.0.5/30

user@R1# set fe-1/2/3 unit 0 description to_R4
user@R1# set fe-1/2/3 unit 0 family inet address 10.1.0.5/30

user@R1# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure the internal BGP (IBGP) connections to Device R2 and Device R3.

```
[edit protocols bgp group int]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set neighbor 192.168.0.2
user@R1# set neighbor 192.168.0.3
```

3. Configure the EBGP connection to Device R4.

```
[edit protocols bgp group to_64511]
user@R1# set type external
```

- ```

user@R1# set export main
user@R1# set neighbor 10.1.0.6 peer-as 64511

```
4. Configure OSPF connections to Device R2 and Device R3.
 

```

[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.0
user@R1# set interface fe-1/2/2.0
user@R1# set interface lo0.0 passive

```
  5. Configure the policy **main**.
 

```

[edit policy-options policy-statement main term subroutine-as-a-match]
user@R1# set from policy subroutine
user@R1# set then accept

[edit policy-options policy-statement main term nothing-else]
user@R1# set then reject

```
  6. Configure the policy **subroutine**.
 

```

[edit policy-options policy-statement subroutine term get-routes]
user@R1# set from protocol static
user@R1# set then accept

[edit policy-options policy-statement subroutine term nothing-else]
user@R1# set then reject

```
  7. Configure the static route to the 172.16.5.0/24 network.
 

```

[edit routing-options static]
user@R1# set route 172.16.1.16/28 discard
user@R1# set route 172.16.1.32/28 discard
user@R1# set route 172.16.1.48/28 discard
user@R1# set route 172.16.1.64/28 discard

```
  8. Configure the autonomous system (AS) number and router ID.
 

```

[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 64510

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 0 {
    description to_R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
fe-1/2/2 {
  unit 0 {

```

```
        description to_R3;
        family inet {
            address 10.0.0.5/30;
        }
    }
}
fe-1/2/3 {
    unit 0 {
        description to_R4;
        family inet {
            address 10.1.0.5/30;
        }
    }
}
lo0 {
    unit 0 {
        family inet {
            address 192.168.0.1/32;
        }
    }
}

user@R1# show protocols
bgp {
    group int {
        type internal;
        local-address 192.168.0.1;
        neighbor 192.168.0.2;
        neighbor 192.168.0.3;
    }
    group to_64511 {
        type external;
        export main;
        neighbor 10.1.0.6 {
            peer-as 64511;
        }
    }
}
ospf {
    area 0.0.0.0 {
        interface fe-1/2/0.0;
        interface fe-1/2/2.0;
        interface lo0.0 {
            passive;
        }
    }
}

user@R1# show policy-options
policy-statement main {
    term subroutine-as-a-match {
        from policy subroutine;
        then accept;
    }
    term nothing-else {
        then reject;
    }
}
```

```

}
policy-statement subroutine {
  term get-routes {
    from protocol static;
    then accept;
  }
  term nothing-else {
    then reject;
  }
}

user@R1# show routing-options
static {
  route 172.6.1.16/28 discard;
  route 172.6.1.32/28 discard;
  route 172.6.1.48/28 discard;
  route 172.6.1.64/28 discard;
}
router-id 192.168.0.1;
autonomous-system 64510;

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Routes on Device R1 on page 171](#)
- [Verifying the Route Advertisement to Device R4 on page 171](#)
- [Experimenting with the Default BGP Export Policy on page 172](#)

### Verifying the Routes on Device R1

**Purpose** On Device R1, check the static routes in the routing table.

**Action** user@R1> show route protocol static

```
inet.0: 23 destinations, 23 routes (23 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```

172.16.1.16/28    *[Static/5] 1d 02:02:13
                  Discard
172.16.1.32/28    *[Static/5] 1d 02:02:13
                  Discard
172.16.1.48/28    *[Static/5] 1d 02:02:13
                  Discard
172.16.1.64/28    *[Static/5] 1d 02:02:13
                  Discard

```

**Meaning** Device R1 has four static routes.

### Verifying the Route Advertisement to Device R4

**Purpose** On Device R1, make sure that the static routes are advertised to Device R4.

**Action** user@R1> show route advertising-protocol bgp 10.1.0.6

```
inet.0: 23 destinations, 23 routes (23 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref  AS path
* 172.16.1.16/28    Self              0         0         I
* 172.16.1.32/28    Self              0         0         I
* 172.16.1.48/28    Self              0         0         I
* 172.16.1.64/28    Self              0         0         I
```

**Meaning** As expected, Device R1 only advertises its static routes to Device R4.

### Experimenting with the Default BGP Export Policy

**Purpose** See what can happen when you remove the final **then reject** term from the policy **main** or the policy **subroutine**.

**Action** 1. On Device R1, deactivate the final term in the policy **main**.

```
[edit policy-options policy-statement main]
user@R1# deactivate term nothing-else
user@R1# commit
```

2. On Device R1, check to see which routes are advertised to Device R4.

user@R1> show route advertising-protocol bgp 10.1.0.6

```
inet.0: 23 destinations, 23 routes (23 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref  AS path
* 172.16.1.16/28    Self              0         0         I
* 172.16.1.32/28    Self              0         0         I
* 172.16.1.48/28    Self              0         0         I
* 172.16.1.64/28    Self              0         0         I
* 172.16.2.16/28    Self              0         0         I
* 172.16.2.32/28    Self              0         0         I
* 172.16.2.48/28    Self              0         0         I
* 172.16.2.64/28    Self              0         0         I
* 172.16.3.16/28    Self              0         0         I
* 172.16.3.32/28    Self              0         0         I
* 172.16.3.48/28    Self              0         0         I
* 172.16.3.64/28    Self              0         0         I
```

Now, all the BGP routes from Device R1 are sent to Device R4. This is because after the processing is returned to policy **main**, the default BGP export policy takes effect.

3. On Device R1, reactivate the final term in the policy **main**, and deactivate the final term in the policy **subroutine**.

```
[edit policy-options policy-statement main]
user@R1# activate term nothing-else
```

```
[edit policy-options policy-statement subroutine]
user@R1# deactivate term nothing-else
user@R1# commit
```

4. On Device R1, check to see which routes are advertised to Device R4.

user@R1> show route advertising-protocol bgp 10.1.0.6

```

inet.0: 23 destinations, 23 routes (23 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref  AS path
* 172.16.1.16/28    Self              0         0         I
* 172.16.1.32/28    Self              0         0         I
* 172.16.1.48/28    Self              0         0         I
* 172.16.1.64/28    Self              0         0         I
* 172.16.2.16/28    Self              0         0         I
* 172.16.2.32/28    Self              0         0         I
* 172.16.2.48/28    Self              0         0         I
* 172.16.2.64/28    Self              0         0         I
* 172.16.3.16/28    Self              0         0         I
* 172.16.3.32/28    Self              0         0         I
* 172.16.3.48/28    Self              0         0         I
* 172.16.3.64/28    Self              0         0         I

```

Now, all the BGP routes from Device R1 are sent to Device R4. This is because before the processing is returned to policy **main**, the default BGP export policy takes effect in the policy **subroutine**.

**Meaning** To prevent the default BGP export policy from taking effect, you must include a final **then reject** term in the main policy and in all referenced subroutines.

## Understanding Route Filters for Use in Routing Policy Match Conditions

---

A *route filter* is a collection of match prefixes. When specifying a match prefix, you can specify an exact match with a particular route or a less precise match. You can configure either a common action that applies to the entire list or an action associated with each prefix.

**NOTE:** Because the configuration of route filters includes setting up prefixes and prefix lengths, we strongly recommend that you have a thorough understanding of IP addressing, including supernetting, before proceeding with the configuration.

It is also important to understand how a route filter is evaluated, particularly if the route filter includes multiple route-filter options in a from statement. We strongly recommend that you read [“How Route Filters Are Evaluated in Routing Policy Match Conditions” on page 183](#) before proceeding with the configuration. Not fully understanding the evaluation process can result in faulty configuration and unexpected results.

This section discusses the following topics:

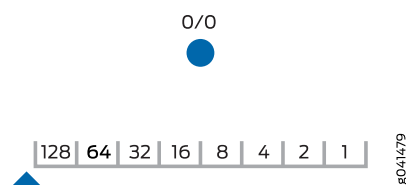

- [Radix Trees on page 176](#)
- [Configuring Route Filters on page 178](#)
- [How Route Filters Are Evaluated in Routing Policy Match Conditions on page 183](#)
- [Route Filter Examples on page 186](#)

## Radix Trees

To understand the operation of a route filter, you need to be familiar with a device used for binary number matching known as a radix tree (sometimes called a patricia trie or radix trie). A radix tree uses binary lookups to identify IP addresses (routes). Remember that an IP address is a 32-bit number represented in a dotted decimal format for easy comprehension by humans. These 8-bit groupings can each have a value between 0 and 255. A radix tree can be a graphical representation of these binary numbers.

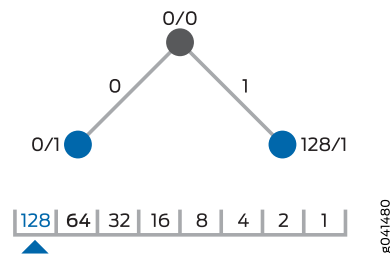

In [Figure 18 on page 176](#), the radix tree starts with no configured value (starts at 0) and is at the leftmost position of the binary IP address. This is shown as 0/0, which is often referred to as the default route.

**Figure 18: Beginning of a Radix Tree**

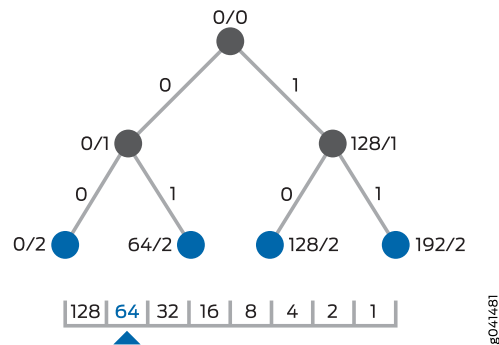

Because this is binary, each bit can have only one of two possible values—a 0 or a 1. Moving down the left branch represents a value of 0, while moving to the right represents a value of 1. The first step is shown in [Figure 19 on page 177](#). At the first position, the first octet of the IP address has a value of 00000000 or 10000000—a 0 or 128, respectively. This is represented in [Figure 19 on page 177](#) by the values 1/1 and 128/1.

Figure 19: First Step of a Radix Tree

The second step is shown in [Figure 20 on page 177](#). This second level of the tree has four possible binary values for the first octet: 00000000, 01000000, 10000000, and 11000000. These decimal values of 0, 64, 128, and 192 are represented by the IP addresses of 0/2, 64/2, 128/2, and 192/2 on the radix tree.

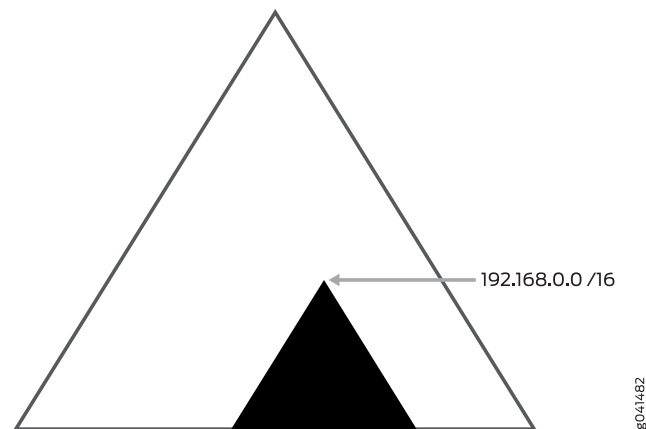

Figure 20: Second Step of a Radix Tree

This step-by-step process continues for 33 total levels to represent every possible IP address.

The radix tree structure is helpful when locating a group of routes that all share the same most significant bits. [Figure 21 on page 177](#) shows the point in the radix tree that represents the 192.168.0.0/16 network. All of the routes that are more specific than 192.168.0.0/16 are shown in the highlighted section.

Figure 21: Locating a Group of Routes

## Configuring Route Filters

**NOTE:** The topic, [Configuring Route Filters](#), describes default Junos OS behavior. The walkup feature, which is not covered in this topic, alters the evaluation results discussed in this topic by allowing the router to consider shorter match conditions configured within the same term. See [“Walkup for Route Filters Overview” on page 194](#) for details.

To configure a route filter, include one or more **route-filter** or **source-address-filter** statements:

```
[edit policy-options policy-statement policy-name term term-name from]
route-filter destination-prefix match-type {
  actions;
}
```

The **route-filter** option is typically used to match an incoming route address to destination match prefixes of any type except for unicast source addresses.

The **destination-prefix** address is the IP version 4 (IPv4) or IP version 6 (IPv6) address prefix specified as **prefix/prefix-length**. If you omit **prefix-length** for an IPv4 prefix, the default is /32. If you omit **prefix-length** for an IPv6 prefix, the default is /128. Prefixes specified in a **from** statement must be either all IPv4 addresses or all IPv6 addresses.

The **source-address-filter** option is typically used to match an incoming route address to unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments.

```
source-address-filter source-prefix match-type {
  actions;
}
```

**source-prefix** address is the IPv4 or IPv6 address prefix specified as **prefix/prefix-length**. If you omit **prefix-length** for an IPv4 prefix, the default is /32. If you omit **prefix-length** for an IPv6 prefix, the default is /128. Prefixes specified in a **from** statement must be either all IPv4 addresses or all IPv6 addresses.

**match-type** is the type of match to apply to the source or destination prefix. It can be one of the match types listed in [Table 16 on page 179](#). For examples of the match types and the results when presented with various routes, see [Table 17 on page 182](#).

**actions** are the actions to take if a route address matches the criteria specified for a destination match prefix (specified as part of a **route-filter** option) or for a source match prefix (specified as part of a **destination-address-filter** option). The actions can consist of one or more of the actions described in [“Actions in Routing Policy Terms” on page 51](#).

In a route filter you can specify actions in two ways:

- In the **route-filter** or **source-address-filter** option—These actions are taken immediately after a match occurs, and the **then** statement is not evaluated.

- In the **then** statement—These actions are taken after a match occurs but no actions are specified for the **route-filter** or **source-address-filter** option.

The **upto** and **prefix-length-range** match types are similar in that both specify the most-significant bits and provide a range of prefix lengths that can match. The difference is that **upto** allows you to specify an upper limit only for the prefix length range, whereas **prefix-length-range** allows you to specify both lower and upper limits.

For more examples of these route filter match types, see [“Route Filter Examples” on page 186](#).

**Table 16: Route Filter Match Types for a Prefix List**

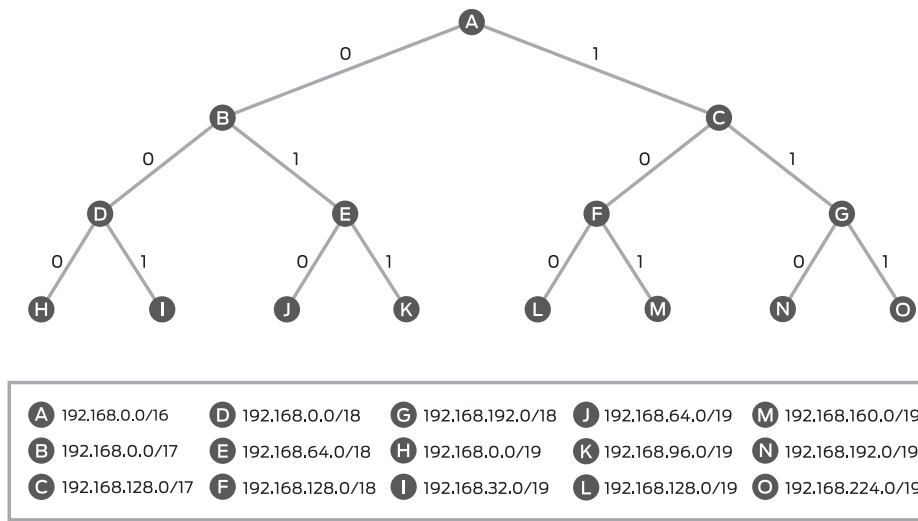

| Match Type                                  | Match Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address-mask</b><br><i>netmask-value</i> | <p>All of the following are true:</p> <ul style="list-style-type: none"> <li>• The bit-wise logical AND of the <i>netmask-value</i> pattern and the incoming IPv4 or IPv6 route address and the bit-wise logical AND of the <i>netmask-value</i> pattern and the <i>destination-prefix</i> address are the same. The bits set in the <i>netmask-value</i> pattern do not need to be contiguous.</li> <li>• The <i>prefix-length</i> component of the incoming IPv4 or IPv6 route address and the <i>prefix-length</i> component of the <i>destination-prefix</i> address are the same.</li> </ul> <p><b>NOTE:</b> The <b>address-mask</b> routing policy match type is valid only for matching an incoming IPv4 (<b>family inet</b>) or IPv6 (<b>family inet6</b>) route address to a list of destination match prefixes specified in a <b>route-filter</b> statement.</p> <p>The <b>address-mask</b> routing policy match type enables you to match an incoming IPv4 or IPv6 route address on a configured netmask address in addition to the length of a configured destination match prefix. The length of the route address must match exactly with the length of the configured destination match prefix, as the <b>address-mask</b> match type does not support prefix length variations for a range of prefix lengths.</p> <p>When the longest-match lookup is performed on a route filter, the lookup evaluates an <b>address-mask</b> match type differently from other routing policy match types. The lookup does not consider the length of the destination match prefix. Instead, the lookup considers the number of contiguous high-order bits set in the netmask value.</p> <p>For more information about this route filter match type, see <a href="#">“How an Address Mask Match Type Is Evaluated” on page 185</a>.</p> <p>For example configurations showing route filters that contain the <b>address-mask</b> match type, see the following topics:</p> <ul style="list-style-type: none"> <li>• <a href="#">“Accepting Incoming IPv4 Routes by Applying an Address Mask to the Route Address and the Destination Match Prefix” on page 190</a>.</li> <li>• <a href="#">“Accepting Incoming IPv4 Routes with Similar Patterns But Different Prefix Lengths” on page 192</a>.</li> <li>• <a href="#">“Evaluation of an Address Mask Match Type with Longest-Match Lookup” on page 192</a>.</li> </ul> |
| <b>exact</b>                                | <p>All of the following are true:</p> <ul style="list-style-type: none"> <li>• The route address shares the same most-significant bits as the match prefix (<i>destination-prefix</i> or <i>source-prefix</i>). The number of significant bits is described by the <i>prefix-length</i> component of the match prefix.</li> <li>• The <i>prefix-length</i> component of the match prefix is equal to the route's prefix length.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 16: Route Filter Match Types for a Prefix List (*continued*)

| Match Type                                                         | Match Criteria                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## How Route Filters Are Evaluated in Routing Policy Match Conditions

During route filter evaluation, the policy framework software compares each route's source address with the destination prefixes in the route filter. The evaluation occurs in two steps:

1. The policy framework software performs a *longest-match lookup*, which means that the software searches for the prefix in the list with the longest length.

The longest-match lookup considers the *prefix* and *prefix-length* components of the configured match prefix only, and not the *match-type* component. The following sample route filter illustrates this point:

```
from {
  route-filter 192.168.0.0/14 upto /24 reject;
  route-filter 192.168.0.0/15 exact;
}
then accept;
```

The longest match for the candidate route 192.168.1.0/24 is the second route-filter, 192.168.0.0/15, which is based on prefix and prefix length only.

2. When an incoming route matches a prefix (longest first), the following actions occur:
  1. The route filter stops evaluating other prefixes, even if the match type fails.
  2. The software examines the match type and action associated with that prefix.

**NOTE:** When a route source address is evaluated against a match criteria that uses the *address-mask* match type, both steps of the evaluation include the configured netmask value. For more information, see [“How an Address Mask Match Type Is Evaluated” on page 185](#).

In Step 1, if route 192.168.1.0/24 were evaluated, it would fail to match. It matches the longest prefix of 192.168.0.0/15, but it does not match **exact**. The route filter is finished because it matched a prefix, but the result is a failed match because the match type failed.

If a match occurs, the action specified with the prefix is taken. If an action is not specified with the prefix, the action in the **then** statement is taken. If neither action is specified, the software evaluates the next term or routing policy, if present, or takes the **accept** or **reject** action specified by the default policy. For more information about the default routing policies, see [“Default Routing Policies” on page 27](#).

**NOTE:** If you specify multiple prefixes in the route filter, only one prefix needs to match for a match to occur. The route filter matching is effectively a logical OR operation.

If a match does not occur, the software evaluates the next term or routing policy, if present, or takes the **accept** or **reject** action specified by the default policy.

For example, compare the prefix 192.168.254.0/24 against the following route filter:

```
route-filter 192.168.0.0/16 orlonger;  
route-filter 192.168.254.0/23 exact;
```

The prefix 192.168.254.0/23 is determined to be the longest prefix. When the software evaluates 192.168.254.0/24 against the longest prefix, a match occurs (192.168.254.0/24 is a subset of 192.168.254.0/23). Because of the match between 192.168.254.0/24 and the longest prefix, the evaluation continues. However, when the software evaluates the match type, a match does not occur between 192.168.254.0/24 and 192.168.254.0/23 **exact**. The software concludes that the term does not match and goes on to the next term or routing policy, if present, or takes the **accept** or **reject** action specified by the default policy.

**NOTE:** The walkup feature allows terms with multiple route filters to “walk-up” the evaluation process to include less-specific routes as well as the longest match. In other words, enabling walkup changes the default behavior from “if one fails, then the term fails” to “if one matches, then the term matches.” For more information about the [walkup](#) feature, see [“Walkup for Route Filters Overview” on page 194](#).

---

### How Prefix Order Affects Route Filter Evaluation

The order in which the prefixes are specified (from top to bottom) typically does not matter, because the policy framework software scans the route filter looking for the longest prefix during evaluation. An exception to this rule is when you use the same destination prefix multiple times in a list. In this case, the order of the prefixes is important, because the list of identical prefixes is scanned from top to bottom, and the first match type that matches the route applies.

**NOTE:** The walkup feature allows terms with multiple route filters to “walk-up” the evaluation process to include less-specific routes as well as the longest match. In other words, enabling walkup changes the default behavior from “if one fails, then the term fails” to “if one matches, then the term matches.” For more information about the [walkup](#) feature, see “[Walkup for Route Filters Overview](#)” on page 194.

In the following example, different match types are specified for the same prefix. The route 0.0.0.0/0 would be rejected, the route 0.0.0.0/8 would be marked with **next-hop self**, and the route 0.0.0.0/25 would be rejected.

```
route-filter 0.0.0.0/0 upto /7 reject;
route-filter 0.0.0.0/0 upto /24 next-hop self;
route-filter 0.0.0.0/0 orlonger reject;
```

### How an Address Mask Match Type Is Evaluated

The **address-mask** routing policy match type enables you to match incoming IPv4 or IPv6 route addresses on a configured netmask value in addition to the length of a configured destination match prefix. During route filter evaluation, an **address-mask** match type is processed differently from other routing policy match types, taking into consideration the configured netmask value:

- When a longest-match lookup evaluates an **address-mask** routing policy match type, the **prefix-length** component of the configured match prefix is not considered. Instead, the lookup considers the number of contiguous high-order bits set in the configured netmask value.
- When an incoming IPv4 or IPv6 route address is evaluated against a route filter match criteria that uses the **address-mask** routing policy match type, the match succeeds if the following values are identical:
  - The bit-wise logical AND of the configured netmask value and the incoming IPv4 or IPv6 route address
  - The bit-wise logical AND of the configured netmask value and the configured destination match prefix

For an example configuration of a route filter that contains two **address-mask** match types, see “[Evaluation of an Address Mask Match Type with Longest-Match Lookup](#)” on page 192.

### Common Configuration Problem with the Longest-Match Lookup

A common problem when defining a route filter is including a shorter prefix that you want to match with a longer, similar prefix in the same list. For example, imagine that the prefix 192.168.254.0/24 is compared against the following route filter:

```
route-filter 192.168.0.0/16 orlonger;
route-filter 192.168.254.0/23 exact;
```

Because the policy framework software performs longest-match lookup, the prefix 192.168.254.0/23 is determined to be the longest prefix. An exact match does not occur between 192.168.254.0/24 and 192.168.254.0/23 exact. The software determines that the term does not match and goes on to the next term or routing policy, if present, or takes the **accept** or **reject** action specified by the default policy. (For more information about the default routing policies, see [“Default Routing Policies” on page 27](#).) The shorter prefix 192.168.0.0/16 or longer that you wanted to match is inadvertently ignored.

One solution to this problem is to remove the prefix 192.168.0.0/16 or longer from the route filter in this term and move it to another term where it is the only prefix or the longest prefix in the list.

Another solution is to enable the **walkup** feature. See [“Walkup for Route Filters Overview” on page 194](#) for details.

## Route Filter Examples

The examples in this section show only fragments of routing policies. Normally, you would combine these fragments with other terms or routing policies.

In all examples, remember that the following actions apply to nonmatching routes:

- Evaluate next term, if present.
- Evaluate next policy, if present.
- Take the **accept** or **reject** action specified by the default policy. For more information about the default routing policies, see [“Default Routing Policies” on page 27](#).

The following examples show how to configure route filters for various purposes:

- [Rejecting Routes with Specific Destination Prefixes and Mask Lengths on page 187](#)
- [Rejecting Routes with a Mask Length Greater than Eight on page 187](#)
- [Rejecting Routes with Mask Length Between 26 and 29 on page 187](#)
- [Rejecting Routes from Specific Hosts on page 187](#)
- [Accepting Routes with a Defined Set of Prefixes on page 188](#)
- [Rejecting Routes with a Defined Set of Prefixes on page 188](#)
- [Rejecting Routes with Prefixes Longer than 24 Bits on page 189](#)
- [Rejecting PIM Multicast Traffic Joins on page 189](#)
- [Rejecting PIM Traffic on page 190](#)
- [Accepting Incoming IPv4 Routes by Applying an Address Mask to the Route Address and the Destination Match Prefix on page 190](#)
- [Accepting Incoming IPv4 Routes with Similar Patterns But Different Prefix Lengths on page 192](#)
- [Evaluation of an Address Mask Match Type with Longest-Match Lookup on page 192](#)

### Rejecting Routes with Specific Destination Prefixes and Mask Lengths

Reject routes with a destination prefix of 0.0.0.0 and a mask length from 0 through 8, and accept all other routes:

```
[edit]
policy-options {
  policy-statement from-hall2 {
    term 1 {
      from {
        route-filter 0.0.0.0/0 upto /8 reject;
      }
    }
    then accept;
  }
}
```

### Rejecting Routes with a Mask Length Greater than Eight

Reject routes with a mask of /8 and greater (that is, /8, /9, /10, and so on) that have the first 8 bits set to 0 and accept routes less than 8 bits in length:

```
[edit]
policy-options {
  policy-statement from-hall3 {
    term term1 {
      from {
        route-filter 0/0 upto /7 accept;
        route-filter 0/8 orlonger;
      }
      then reject;
    }
  }
}
```

### Rejecting Routes with Mask Length Between 26 and 29

Reject routes with the destination prefix of 192.168.10/24 and a mask between /26 and /29 and accept all other routes:

```
[edit]
policy-options {
  policy-statement from-customer-a {
    term term1 {
      from {
        route-filter 192.168.10/24 prefix-length-range /26-/29 reject;
      }
      then accept;
    }
  }
}
```

### Rejecting Routes from Specific Hosts

Reject a range of routes from specific hosts, and accept all other routes:

```
[edit]
policy-options {
  policy-statement hosts-only {
    from {
      route-filter 10.125.0.0/16 upto /31 reject;
      route-filter 0/0;
    }
    then accept;
  }
}
```

You do not use the **through** match type in most routing policy configurations. You should think of **through** as a tool to group a contiguous set of exact matches. For example, instead of specifying four exact matches:

```
from route-filter 0.0.0.0/1 exact
from route-filter 0.0.0.0/2 exact
from route-filter 0.0.0.0/3 exact
from route-filter 0.0.0.0/4 exact
```

You could represent them with the following single match:

```
from route-filter 0.0.0.0/1 through 0.0.0.0/4
```

---

### Accepting Routes with a Defined Set of Prefixes

Explicitly accept a limited set of prefixes (in the first term) and reject all others (in the second term):

```
policy-options {
  policy-statement internet-in {
    term 1 {
      from {
        route-filter 192.168.231.0/24 exact accept;
        route-filter 192.168.244.0/24 exact accept;
        route-filter 192.168.198.0/24 exact accept;
        route-filter 192.168.160.0/24 exact accept;
        route-filter 192.168.59.0/24 exact accept;
      }
    }
    term 2 {
      then {
        reject;
      }
    }
  }
}
```

---

### Rejecting Routes with a Defined Set of Prefixes

Reject a few groups of prefixes, and accept the remaining prefixes:

```
[edit policy-options]
policy-statement drop-routes {
  term 1 {
    from { # first, reject a number of prefixes:
      route-filter default exact reject; # reject 0.0.0.0/0 exact
      route-filter 0.0.0.0/8 orlonger reject; # reject prefix 0, mask /8 or longer
    }
  }
}
```

```

route-filter 10.0.0.0/8 orlonger reject; # reject loopback addresses
}
route-filter 10.105.0.0/16 exact { # accept 10.105.0.0/16
  as-path-prepend "1 2 3";
  accept;
}
route-filter 192.0.2.0/24 orlonger reject; # reject test network packets
route-filter 224.0.0.0/3 orlonger reject; # reject multicast and higher
route-filter 0.0.0.0/0 upto /24 accept; # accept everything up to /24
route-filter 0.0.0.0/0 orlonger accept; # accept everything else
}
}
}

```

### Rejecting Routes with Prefixes Longer than 24 Bits

Reject all prefixes longer than 24 bits. You would install this routing policy in a sequence of routing policies in an **export** statement. The first term in this filter passes on all routes with a prefix length of up to 24 bits. The second, unnamed term rejects everything else.

```

[edit policy-options]
policy-statement 24bit-filter {
  term acl20 {
    from {
      route-filter 0.0.0.0/0 upto /24;
    }
    then next policy;
  }
  then reject;
}

```

If, in this example, you were to specify **route-filter 0.0.0.0/0 upto /24 accept**, matching prefixes would be accepted immediately and the next routing policy in the **export** statement would never get evaluated.

If you were to include the **then reject** statement in the term **acl20**, prefixes greater than 24 bits would never get rejected because the policy framework software, when evaluating the term, would move on to evaluating the next statement before reaching the **then reject** statement.

### Rejecting PIM Multicast Traffic Joins

Configure a routing policy for rejecting Protocol Independent Multicast (PIM) multicast traffic joins for a source destination prefix from a neighbor:

```

[edit]
policy-options {
  policy-statement join-filter {
    from {
      neighbor 10.14.12.20;
      source-address-filter 10.83.0.0/16 orlonger;
    }
    then reject;
  }
}

```

## Rejecting PIM Traffic

---

Configure a routing policy for rejecting PIM traffic for a source destination prefix from an interface:

```
[edit]
policy-options {
  policy-statement join-filter {
    from {
      interface so-1/0/0.0;
      source-address-filter 10.83.0.0/16 orlonger;
    }
    then reject;
  }
}
```

The following routing policy qualifiers apply to PIM:

- **interface**—Interface over which a join is received
- **neighbor**—Source from which a join originates
- **route-filter**—Group address
- **source-address-filter**—Source address for which to reject a join

For more information about importing a PIM join filter in a PIM protocol definition, see the *Multicast Protocols Feature Guide for Routing Devices*.

## Accepting Incoming IPv4 Routes by Applying an Address Mask to the Route Address and the Destination Match Prefix

---

Accept incoming IPv4 routes with a destination prefix of 10.1.0/24 and the third byte an even number from 0 to 14, inclusive:

```
[edit]
policy-options {
  policy-statement from_customer_a {
    term term_1 {
      from {
        route-filter 10.1.0.0/24 address-mask 255.255.241.0;
      }
      then {
        ...
        reject;
      }
    }
  }
}
```

The route filter in routing policy term **term\_1** matches the following incoming IPv4 route addresses:

- 10.1.0.0/24
- 10.1.2.0/24

- 10.1.4.0/24
- 10.1.6.0/24
- 10.1.8.0/24
- 10.1.10.0/24
- 10.1.12.0/24
- 10.1.14.0/24

The bit-wise logical AND of the netmask value and the candidate route address must match the bit-wise logical AND of the netmask value and the match prefix address. That is, where the netmask bit pattern 255.255.241.0 contains a set bit, the incoming IPv4 route address being evaluated must match the value of the corresponding bit in the destination prefix address 10.1.0.0/24.

- The first two bytes of the netmask value are binary 1111 1111 1111 1111, which means that a candidate route address will fail the match if the first two bytes are not 10.1.
- The third byte of the netmask value is binary 1111 0001, which means that a candidate route address will fail the match if the third byte is greater than 15 (decimal), an odd number, or both.
- The prefix length of the match prefix address is 24 (decimal), which means that a candidate route address will fail the match if its prefix length is not exactly 24.

As an example, suppose that the candidate route address being tested in the policy is 10.1.8.0/24 (binary 0000 1010 0000 0001 0000 1000).

- When the netmask value is applied to this candidate route address, the result is binary 0000 1010 0000 0001 0000 0000.
- When the netmask value is applied to the configured destination prefix address, the result is also binary 0000 1010 0000 0001 0000 0000.
- Because the results of both AND operations are the same, the match continues to the second match criteria.
- Because the prefix lengths of the candidate address and the configured destination prefix address are the same (24 bits), the match succeeds.

As another example, suppose that the candidate route address being tested in the policy is 10.1.3.0/24 (binary 0000 1010 0000 0001 0000 0011).

- When the netmask value is applied to this candidate route address, the result is binary 0000 1010 0000 0001 0000 0001.
- However, when the netmask value is applied to the configured destination prefix address, the result is binary 0000 1010 0000 0001 0000 0000.
- Because the results of the two AND operations are different (in the third byte), the match fails.

### Accepting Incoming IPv4 Routes with Similar Patterns But Different Prefix Lengths

Accept incoming IPv4 route addresses of the form 10.\*1/24 or 10.\*1./32:

```
[edit]
policy-options {
  policy-statement from_customer_b {
    term term_2 {
      from {
        route-filter 10.0.1.0/24 address-mask 255.0.255.0;
        route-filter 10.0.1.0/32 address-mask 255.0.255.0;
      }
      then {
        ...
        reject;
      }
    }
  }
}
```

The route filter match criteria **10.0.1.0/24 address-mask 255.0.255.0** matches an incoming IPv4 route address of the form 10.\*1/24. The route's prefix length must be exactly 24 bits long, and any value is acceptable in the second byte.

The route filter match criteria **10.0.1.0/32 address-mask 255.0.255.0** matches an incoming IPv4 route address of the form 10.\*1./32. The route's prefix length must be exactly 32 bits long, and any value is acceptable in the second byte and the fourth byte.

### Evaluation of an Address Mask Match Type with Longest-Match Lookup

This example illustrates how a longest-match lookup evaluates a route filter that contains two **address-mask** match types. Consider the route filter configured in the routing policy term **term\_3** below:

```
[edit]
policy-options {
  policy-statement from_customer_c {
    term term_3 {
      from {
        route-filter 10.0.1.0/24 address-mask 255.0.255.0;
        route-filter 10.0.2.0/24 address-mask 255.240.255.0;
      }
      then {
        ...
      }
    }
  }
}
```

Suppose that the incoming IPv4 route source address 10.1.1.0/24 is tested against the route filter configured in the policy term **term\_3**:

1. The longest-match lookup tree for routing policy term **term\_3** contains two match prefixes: one prefix for **10.0.1.0/24 address-mask 255.0.255.0** and one prefix for **10.0.2.0/24 address-mask 255.240.255.0**. When searching the tree for the longest-prefix match for a candidate, the longest-match lookup considers the number of contiguous high-order bits in the configured **netmask-value** instead of the length of the configured **destination-prefix**:

- For the first route filter match criteria, the longest-match lookup entry is 10.0.0.0/8 because the netmask value contains 8 contiguous high-order bits.
- For second route filter match criteria, the longest-match lookup entry is 10.0.0.0/12 because the netmask value contains 12 contiguous high-order bits.

For the candidate route address 10.1.1.0/24, the longest-match lookup returns the tree entry 10.0.0.0/12, which corresponds to the route filter match criteria **10.0.2.0/24 address-mask 255.240.255.0**.

2. Now that the longest-match prefix in **term\_3** has been identified for the candidate route address, the candidate route address is evaluated against the route filter match criteria **10.0.2.0/24 address-mask 255.240.255.0**:
  - a. To test the incoming IPv4 route address 10.1.1.0/24, the netmask value 255.240.255.0 is applied to 10.1.1.0/24. The result is 10.0.1.0.
  - b. To test the configured destination prefix address 10.0.2.0/24, the netmask value 255.240.255.0 is applied to 10.0.2.0/24. The result is 10.0.2.0.
  - c. Because the results are different, the route filter match fails. No actions, whether specified with the match criteria or with the **then** statement, are taken. The incoming IPv4 route address is not evaluated against any other match criteria.

## Walkup for Route Filters Overview

---

Use the walkup feature if you have concerns about policy performance because of split route filters across multiple policy terms. The walkup feature enables the consolidation of route filters under one policy term.

By default, Junos evaluates multiple route filters in a policy statement term by first finding the longest match prefix and then evaluating the conditions attached to the route filter, such as prefix range. If the route filter condition is false (for example, the prefix is not in the specified range), then the whole term is false, even if there are potentially true shorter route filter prefixes. Due to this behavior, there can be performance issues if route filters are split into individual policy statement terms. The walkup feature changes the default route filter behavior.

Some automated policy tools — for example, those used for autonomous system border routers in the Border Gateway Protocol (BGP) — break up route filters into multiple terms because of the default route filter behavior. Route filters are also used in routing protocols other than BGP; the walkup feature is not limited to BGP route filters.

**NOTE:** Technically, BGP does not deal with routes in the same way as OSPF or IS-IS. BGP “routes” are more properly called network layer reachability information (NLRI) updates. However, the term “route” is used in most documentation and is used here.

Route filters consist of three major parts:

1. A prefix and prefix length (for example, **10.0.0.0/8**)
2. A match condition (for example, **exact**)
3. An action that is carried out if both previous parts — the prefix and match condition — both evaluate to true (for example, **accept**)

So the **10.0.0.0/8 exact accept** route filter succeeds if and only if the prefix considered is **10.0.0.0/8** exactly. This route filter rejects routes with all other longer prefixes, such as **10.0.0.0/10**, although there might be other route filter terms in the policy chain that accept the **10.0.0.0/10** route.

**NOTE:** Although the **10.0.0.0/8** route and variations are not specifically reserved for documentation, the private RFC 1918 **10.0.0.0/8** address space is used in this topic because of the flexibility and realistic scenarios that this address spaces provides.

Route filters can be combined in a single policy statement term. In that case, evaluation becomes more complex. Consider the following routing policy:

```
[edit policy-options]
policy-statement RouteFilter-A {
```

```

term RouteFilter-1 {
  from {
    route-filter 10.0.0.0/16 prefix-length-range /22-/24;
    route-filter 10.0.0.0/8 orlonger;
  }
  then accept;
}
term default {
  then reject;
}
}

```

Note that the **10.0.0.0/8 orlonger** filter includes the **10.0.0.0/16 prefix-length-range /22-/24** filter in its scope. That is, any **10.0.0.0** route with a prefix of 8 bits or longer could also be a route with a prefix in the range between 22 and 24 bits.

By default, evaluation of a policy statement term with multiple route filters is a two-step process:

1. The policy framework software performs a longest-match lookup on the list based on prefix and prefix-length values.
2. The software considers the route filter condition (**orlonger**, **exact**, and so on). The route either fulfills the route filter condition (success) or does not match the route filter condition (failure).

Based on the results of these two steps, the action determined by the match or failure is applied to the route. In **Route-Filter-A**, this means that any route that is “true” is accepted and any route that is “false” in the **RouteFilter-1** term is rejected. This route becomes a hidden (filtered) route.

For example, consider what happens when the route **10.0.0.0/18** is evaluated by the policy statement **RouteFilter-A**:

First, the **10.0.0.0/18** route is evaluated by the **RouteFilter-1** term. Because **10.0.0.0/16** is longer than **10.0.0.0/8**, the **10.0.0.0/18** route matches the longer and more specific route prefix. Next, the match fails because the **10.0.0.0/18** route does not match the **prefix-length-range /22-/24** condition. So the route match fails in the **RouteFilter-1** term, and the policy examines the next term, the default term. The **10.0.0.0/18** route is rejected by the default term.

As a result, the **10.0.0.0/18** route is hidden (filtered). (The **10.0.0.0/18** route can still be found with the **show route hidden** command.)

The issue is that the user might actually want the **10.0.0.0/18** route to be accepted, not rejected. Naturally, a route filter with a **10.0.0.0/18 exact** configuration could be added. But in a backbone routing table with 100,000 or more entries, it is not possible to configure a route filter tuned to every possible route or every possible new route added to the network.

The default workaround to achieve the proper behavior from the example routing policy is to configure a separate term for each route filter. This is frequently done, as follows:

```
[edit policy-options]
```

```
policy-statement RouteFilter-A {
  term RouteFilter-1 {
    from {
      route-filter 10.0.0.0/16 prefix-length-range /22-/24;
    }
    then accept;
  }
  term RouteFilter-2 {
    from {
      route-filter 10.0.0.0/8 orlonger;
    }
    then accept;
  }
  term default {
    then reject;
  }
}
```

Now the **10.0.0.0/18** route is accepted because, although it still fails the **RouteFilter-1** match condition, it matches the new **RouteFilter-2** term (**10.0.0.0/8** is the longest match, and the **orlonger** condition is true). The problem with this approach is that the complete routing policy now takes more time to evaluate than when multiple route filters are grouped. This method also makes maintenance more complex.

The issues with the one-term-per-route-filters approach are solved with the walkup statement and feature. Walkup alters the default behavior of route filter evaluation globally or on a per-policy basis.

The walkup feature allows terms with multiple route filters to “walk-up” the evaluation process to include less-specific routes as well as the longest match. In other words, the walkup knob changes the default behavior from “if one fails, then the term fails” to if “one matches, then the term matches.”

Consider the application of the walkup feature to the example policy statement (you can also apply walk-up globally to all policies configured):

```
[edit policy-options]
policy-statement RouteFilter-A {
  defaults {
    route-filter walkup;
  }
  term RouteFilter-1 {
    from {
      route-filter 10.0.0.0/16 prefix-length-range /22-/24;
      route-filter 10.0.0.0/8 orlonger;
    }
    then accept;
  }
  term default {
    then reject;
  }
}
```

This is what happens when the route prefix **10.0.0.0/18** is evaluated by the policy statement **RouteFilter-A**:

The default behavior is altered by the walkup knob. As before, the **10.0.0.0/18** route matches the longer and more specific route prefix because **10.0.0.0/16** is longer than **10.0.0.0/8**. As before, this match fails because the **10.0.0.0/18** route does not match the **prefix-length-range /22-/24** condition. However, this time the process continues by a “walk up” and examines the less specific **10.0.0.0/8** route filter. The route condition of **orlonger** matches this filter and therefore the route is accepted by the **RouteFilter-1** term.

This can be verified (for a BGP route) by the **show route protocol bgp 10.0.0.0/18** command. This time, the route is not hidden.

If you enable the walkup feature globally, you can override it locally on a per-policy basis with the **[edit policy-options policy-statements policy-statement-name defaults route-filter no-walkup]** statement.

## Configuring Walkup for Route Filters to Improve Operational Efficiency

Use the walkup feature if you have concerns about policy performance because of split route filters across multiple policy terms. The walkup feature enables the consolidation of route filters under one policy term.

If policy statements have been split into multiple terms because of the default route filter behavior, the route filter walkup feature allows you to consolidate multiple route filters into one policy statement term. By default, Junos OS evaluates multiple route filters in a policy statement term by first finding the longest match prefix and then evaluating the conditions attached to the route filter, such as the prefix range. If the route filter condition is false (for example, the prefix is not in the specified range), then the whole term is false, even if there are potentially true shorter route filter prefixes. The walkup feature alters this default behavior, locally or globally.

The route filter walkup feature is used anywhere multiple route filters are used in a policy statement. The walkup option is supported in the main routing instance at the **[edit policy-options]** hierarchy level and in logical systems at the **[edit logical-systems policy-options]** hierarchy level.

Before you begin configuring route filter walkup, be sure you have:

- A properly configured routing policy or set of routing policies

- A need to consolidate multiple route filter terms into fewer routing policy terms

Route filter walkup can be configured in two different ways. You can configure the **walkup** option globally at the **[edit policy-options default route-filter]** hierarchy level or in logical systems at the **[edit logical-systems policy-options default route-filter]** hierarchy level. When you configure the **walkup** option globally, you alter the policy route filter behavior in every policy statement. Instead of the default policy statement behavior (if the longest match route filter is false, then the term is false), the **walkup** option changes this behavior globally (to “walk up” from the longest match route filter to less specific, and if any is true, then the term is true).

If you configure the **walkup** option globally, you can still override it locally on a per-routing-policy basis. So if you have enabled **walkup** globally, you can override it in a routing policy by configuring the **no-walkup** option statement at the **[edit policy-options policy-statement default route-filter]** hierarchy level. The **no-walkup** option restores the default route filter behavior locally for this policy statement.

**NOTE:** At the **[edit policy-options default route-filter]** global level, the only option is the **walkup** statement because the default behavior globally is “no walkup.” However, for an individual policy statement at the **[edit policy-options policy-statement default route-filter]** hierarchy level, you can configure either the **walkup** or **no-walkup** option statement. In this way, at the local level, you can control whether the policy statement performs a walkup (with the **walkup** statement configured) or no walkup (with the **no-walkup** statement configured). This gives the user maximum control over the walkup option

You configure the walkup feature globally with:

```
user@host> set policy-options defaults route-filter walkup
```

Alternatively, configure the walkup feature globally in a logical system with:

```
user@host> set logical-systems logical-system-name policy-options defaults  
route-filter walkup
```

You configure the walkup or no-walkup feature locally in a policy statement with:

```
user@host> set policy-options policy-statement policy-statement-name defaults  
route-filter [ no-walkup | walkup ]
```

Alternatively, configure the walkup feature locally in a logical system with:

```
user@host> set logical-systems logical-system-name policy-options policy-statement  
policy-statement-name defaults route-filter [ no-walkup | walkup ]
```

Route filter walkup behavior can be complex when the statements are configured at the global and local level at the same time. [Table 18 on page 199](#) shows the behavior of a policy statement with all six possible combinations of the walkup option when you configure the feature both globally and locally.

Table 18: Route Filter Walkup and Policy Statements

| Case: | Global Configuration | Local Configuration | Result                                                                   |
|-------|----------------------|---------------------|--------------------------------------------------------------------------|
| 1     | (none)               | (none)              | The device does not perform a walkup for any policy (default operation). |
| 2     | (none)               | <b>walkup</b>       | The device performs a walkup for this policy.                            |
| 3     | (none)               | <b>no-walkup</b>    | The device does not perform a walkup for any policy (default operation). |
| 4     | <b>walkup</b>        | (none)              | The device performs a walkup for all policies.                           |
| 5     | <b>walkup</b>        | <b>walkup</b>       | The device performs a walkup for all policies.                           |
| 6     | <b>walkup</b>        | <b>no-walkup</b>    | The device does not perform a walkup for this policy only.               |

Each row forms a possible use case numbered 1 through 6. Each walkup case is configured as follows:

- Case #1: This is a trivial configuration for backward compatibility. No route filter walkup is enabled either globally or locally. The device behaves exactly as it did before the feature was introduced. No route filter walkup occurs in any policy.
- Case #2: Route filter walkup is not enabled globally, but is enabled locally for a specific policy named **RouteFilter-Case2**. Route filter walkup occurs in this policy.

To configure the route filter walkup locally for a specific policy:

1. Enable the walkup feature locally for this policy statement.

[edit policy-options]

user@host# set policy-statement RouteFilter-Case2 defaults route-filter walkup

2. Configure policy terms locally (walkup applies to all terms in this policy).

[edit policy-options]

user@host# set policy-statement RouteFilter-Case2 term ...

3. Apply the policy statement to a routing protocol.

- Case #3: Route filter **walkup** is not enabled globally, but **no-walkup** is enabled locally for a specific policy named **RouteFilter-Case3**. (This case is not particularly helpful, because no walkup takes place in all policies by default, but does make local behavior explicit, even if walkup is enabled globally in the future.)

To configure the route filter no-walkup locally for a specific policy:

1. Enable the **no-walkup** feature locally for this policy statement.

[edit policy-options]

```
user@host# set policy-statement RouteFilter-Case3 defaults route-filter no-walkup
```

2. Configure policy terms locally (**no-walkup** applies to this policy).

```
[edit policy-options]
```

```
user@host# set policy-statement RouteFilter-Case3 term ...
```

3. Apply the policy statement to a routing protocol.

- Case #4: Route filter **walkup** is enabled globally, but not enabled locally for a specific policy named **RouteFilter-Case4**. Because of the global configuration, route filter **walkup** occurs in this policy.

To configure the route filter walkup globally for a device:

1. Enable the walkup feature globally for this device.

```
[edit policy-options]
```

```
user@host# set defaults route-filter walkup
```

**NOTE:** Global **walkup**, in contrast to the **walkup** or **no-walkup** statements configured locally in a policy statement, is configured at the [edit policy-options defaults] or [edit logical-systems *logical-system-name* policy-options defaults] hierarchy level and applies to all policies.

2. Configure policy statement **RouteFilter-Case4** and terms locally (**walkup** applies to this policy).

```
[edit policy-options]
```

```
user@host# set policy-statement RouteFilter-Case4 term ...
```

3. Apply the policy statement to a routing protocol.

- Case #5: Route filter **walkup** is enabled globally, and enabled locally for a specific policy named **RouteFilter-Case5**. Although this configuration might appear redundant (**walkup** enabled globally as well as locally), this ensures that route filter **walkup** occurs in this policy even if route filter **walkup** is deleted at the global level.

To configure the route filter walkup globally for a device and locally for a specific policy:

1. Enable the **walkup** feature globally for this device.

```
[edit policy-options]
```

```
user@host# set defaults route-filter walkup
```

**NOTE:** Global **walkup** is configured at the [edit policy-options defaults] or [edit logical-systems *logical-system-name* policy-options defaults] hierarchy level and applies to all policies.

2. Configure policy statement **RouteFilter-Case5** and enable **walkup** locally (**walkup** applies to this policy).

```
[edit policy-options]
```

```
user@host# set policy-statement Route-Filter-Case5 defaults route-filter walkup
```

3. Configure policy statement **RouteFilter-Case5** and terms locally (walkup applies to this policy).

```
[edit policy-options]
```

```
user@host# set policy-statement RouteFilter-Case5 term ...
```

4. Apply the policy statement to a routing protocol.

- Case #6: Route filter **walkup** is enabled globally, but overridden locally with **no-walkup** for a specific policy named **RouteFilter-Case6**. Because of the local configuration, no route filter walkup occurs in this policy. This case is useful to make sure that a local policy still functions exactly as before global walkup was enabled.

To configure the route filter walkup globally for a device and the no-walkup feature locally for a specific policy:

1. Enable the walkup feature globally for this device.

```
[edit policy-options]
```

```
user@host# set defaults route-filter walkup
```

**NOTE:** Global walkup is configured at the [edit policy-options defaults] or [edit logical-systems *logical-system-name* policy-options defaults] hierarchy level and applies to all policies.

2. Configure policy statement **RouteFilter-Case6** and disable walkup locally with the **no-walkup** statement (no walkup is performed in this policy).

```
[edit policy-options]
```

```
user@host# set policy-statement Route-Filter-Case6 defaults route-filter walkup
```

3. Configure policy statement **RouteFilter-Case6** and terms locally.

```
[edit policy-options]
```

```
user@host# set policy-statement RouteFilter-Case6 term ...
```

4. Apply the policy statement to a routing protocol.

**NOTE:** Keep in mind that a policy statement does nothing until it is applied as an import or export policy for the routing protocol itself. For BGP, this can be done at the global, group or neighbor level.

## Example: Configuring Walkup for Route Filters Globally to Improve Operational Efficiency

---

Use the walkup feature if you have concerns about policy performance because of split route filters across multiple policy terms. The walkup feature enables the consolidation of route filters under one policy term.

This example shows how to configure the route filter walkup feature globally for policy statements with route filters. When configured at the global level, the route filter walkup option applies to all policy statements. This example changes the default behavior of policy terms with multiple route filters globally, so that any reversion to the default “no walkup” behavior must be established locally.

- [Requirements on page 202](#)
- [Overview on page 202](#)
- [Configuring Route Filter Walkup Globally on page 203](#)
- [Verification on page 206](#)
- [Troubleshooting on page 206](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks router
- A Junos operating system from 13.3 or above

Before you configure route filter walkup locally, be sure you have:

- A properly configured routing policy or set of routing policies
- A need to consolidate multiple route filter terms into fewer routing policy terms

### Overview

Routing protocols exchange information with other routers running the same routing protocols. In many cases, route filters are used in routing policy statements to filter prefixes for import or export. In some cases, when route filters are split into many separate terms, performance is impacted. The route filter walkup feature allows consolidation of policy statement terms for operational efficiency.

This example uses BGP, but the same walkup feature applies to any routing protocol that supports route filtering of input or output.

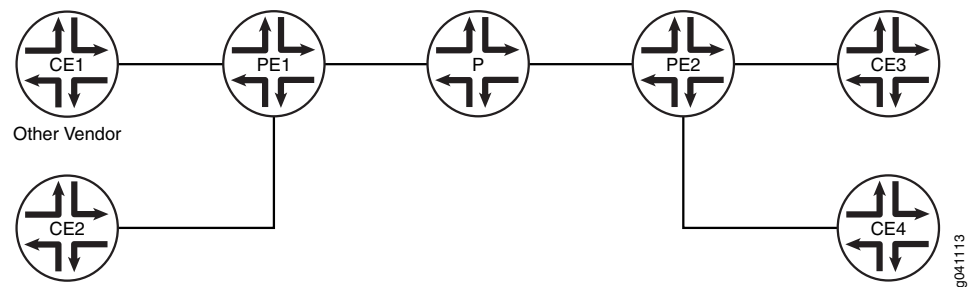

You can configure a Juniper Networks router to change the default operation of a term in a policy statement with route filters. By default, only a single longest match attempt is made for all route filters in a term. The walkup feature allows the router to “walk up” the route filters in a term from longest match to less specific in search of a true condition. This allows consolidation of multiple terms in a policy statement and corresponding operational efficiency.

This example changes the default behavior globally, for all policy statements. You can still configure **no-walkup** for an individual policy.

### Topology

In the sample network in [Figure 24 on page 203](#), the router CE1 is a router from another vendor. The rest are Juniper Networks routers. The walkup feature can be configured on any router in the figure, except for router CE1. The vendor of router CE1 might or not might support a similar feature.

Figure 24: Topology for the Global Walkup Example

In the example, the following addresses are used:

- 10.0.0.0/16
- 10.0.0.0/8

**NOTE:** Although the 10.0.0.0/8 address space is not specifically reserved for documentation, the private RFC 1918 10.0.0.0/8 address space is used in this topic because of the flexibility and realistic scenarios that this address spaces provides.

### Configuring Route Filter Walkup Globally

|                                |                                                                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CLI Quick Configuration</b> | To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details such as addresses and interfaces to match your network configuration, and then copy and paste the commands into the CLI at the <b>[edit]</b> hierarchy level.    |
| <b>Device PE1</b>              | <pre> set policy-options defaults route-filter walkup set policy-options policy-statement routeset1-import term prefixes1 from route-filter   10.0.0.0/16 prefix-length-range /22-/24 set policy-options policy-statement routeset1-import term prefixes1 from route-filter   10.0.0.0/8 orlonger </pre> |

```

set policy-options policy-statement routeset1-import term prefixes1 then accept
set policy-options policy-statement routeset1-import term reject-the-rest then reject
set policy-options policy-statement import-route-filter-a term import-routes from protocol
  bgp
set policy-options policy-statement import-route-filter-a term import-routes from policy
  routeset1-import
set policy-options policy-statement import-route-filter-a term import-routes then next
  policy
set policy-options policy-statement import-route-filter-a term all-others then reject
set policy-options policy-statement route-filter-a-export term all then reject
set protocols bgp group routeset1 type external
set protocols bgp group routeset1 neighbor 10.0.10.13 import import-route-filter-a
set protocols bgp group routeset1 neighbor 10.0.10.13 family inet unicast
set protocols bgp group routeset1 neighbor 10.0.10.13 export route-filter-a-export
set protocols bgp group routeset1 neighbor 10.0.10.13 peer-as 65536

```

### Step-by-Step Procedure

The following example requires that you navigate to various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure router PE1 to perform walkup globally and combine multiple route filters in one term:

1. Configure the walkup feature globally.

```

[edit policy-options defaults]
user@PE1# set route-filter walkup

```

2. Configure the policy statements for an import policy named **routeset1-import**.

```

[edit policy-options]
user@PE1# set policy-statement routeset1-import term prefixes1 from route-filter
  10.0.0.0/16 prefix-length-range /22-/24
user@PE1# set policy-statement routeset1-import term prefixes1 from route-filter
  10.0.0.0/8 orlonger
user@PE1# set policy-statement routeset1-import term prefixes1 then accept
user@PE1# set policy-statement routeset1-import term reject-the-rest then reject

```

3. Configure the policy options for the import and export policy statements.

```

[edit policy-options]
user@PE1# set policy-statement import-route-filter-a term import-routes from
  protocol bgp
user@PE1# set policy-statement import-route-filter-a term import-routes from
  policy routeset1-import
user@PE1# set policy-statement import-route-filter-a term import-routes then next
  policy
user@PE1# set policy-statement route-filter-a-export term all-others then reject

```

4. Apply the import and export policies to a BGP neighbor.

```

[edit protocols bgp]
user@PE1# set group routeset1 type external
user@PE1# set group routeset1 neighbor 10.0.10.13 import import-route-filter-a
user@PE1# set group routeset1 neighbor 10.0.10.13 family inet unicast
user@PE1# set group routeset1 neighbor 10.0.10.13 export route-filter-a-export
user@PE1# set group routeset1 neighbor 10.0.10.13 peer-as 65536

```

## Results

From configuration mode, confirm your configuration by entering the **show protocols** and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE1# show policy-options
defaults {
    route-filter walkup;
}
policy-statement routeset1-import {
term prefixes1 {
    from {
        route-filter 10.0.0.0/16 prefix-length-range /22-/24;
        route-filter 10.0.0.0/8 orlonger;
    }
    then accept;
}
term reject-the-rest {
    then reject;
}
}

policy-statement import-route-filter-a {
term import-routes {
    from {
        protocol bgp;
        policy routeset1-import;
    }
    then next policy;
}
term all-others {
    then reject;
}
}
policy-statement route-filter-a-export {
term all {
    then reject;
}
}

user@PE1# show protocols bgp
group routeset1 {
type external;
neighbor 10.0.10.13 {
    import import-route-filter-a;
    family inet {
        unicast;
    }
    export route-filter-a-export;
    peer-as 65536;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying Route Filter Operation

---

**Purpose** Display expected information about the routes to confirm the route filters are working as expected.

Notice that the **10.0.0.0/8 orlonger** filter includes the **10.0.0.0/16 prefix-length-range /22-/24** filter in its scope. That is, any **10.0.0.0** route with a prefix of 8 bits or longer could also be a route with a prefix in the range between 22 and 24 bits. Without the walkup feature enabled, a route such as **10.0.0.0/16** would be rejected and become a hidden route. If the walkup feature is working as expected, then a route such as **10.0.0.0/16** would be accepted by the policy.

**Action** From operational mode, enter the **show route protocol bgp 10.0.0.0/16** command. Make sure that **10.0.0.0/16** is not a hidden route.

```
user@PE1>show route protocol bgp 10.0.0.0/16
inet.0: 520762 destinations, 520764 routes (520760 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/16      *[BGP/170] 01:07:37, localpref 100
                  AS path: 65536, I, validation-state: unverified
                  > to 10.0.100.13 via xe-0/2/0.0
```

As a further check, make sure that no routes that should be accepted are hidden routes. From operational mode, enter the **show route protocol bgp ip-address-prefix hidden** command to verify this.

**Meaning** The presence of routes that are not the longest match in the configured policy route filter term shows that the walkup feature is functioning globally.

## Troubleshooting

To troubleshoot route filter walkup globally:

- [Troubleshooting BGP on page 206](#)
- [Troubleshooting Policy Statements on page 206](#)
- [Troubleshooting Route Filters on page 207](#)

### Troubleshooting BGP

---

**Problem** BGP is not functioning as expected.

**Solution** See the *BGP Configuration Overview* topic, examples, and troubleshooting.

### Troubleshooting Policy Statements

---

**Problem** The policy statements are not functioning as expected.

**Solution** See the *Verify That a Particular BGP Route Is Received on Your Router* and *Example: Configuring BGP Route Advertisement* topics, related examples, and troubleshooting.

### [Troubleshooting Route Filters](#)

---

**Problem** The route filters are not functioning as expected.

**Solution** See the “[Route Filter Match Conditions](#)” on [page 49](#) topic, examples, and troubleshooting.

## [Example: Configuring Walkup for Route Filters Locally to Improve Operational Efficiency](#)

---

Use the walkup feature if you have concerns about policy performance because of split route filters across multiple policy terms. The walkup feature enables the consolidation of route filters under one policy term.

This example shows how to configure the route filter walkup feature locally for policy statements with route filters. When configured at the local level, the route filter walkup option applies only to the policy statement in which it is configured. This example does *not* change the default behavior of policy terms with route filters globally. This example establishes route filter walkup locally.

- [Requirements on page 207](#)
- [Overview on page 208](#)
- [Configuring Route Filter Walkup Locally on page 209](#)
- [Verification on page 211](#)
- [Troubleshooting on page 212](#)

### Requirements

This example uses the following hardware and software components:

- A Juniper Networks router
- A Junos operating system from 13.3 or above

Before you configure route filter walkup globally, be sure you have:

- A properly configured routing policy or set of routing policies
- A need to consolidate multiple route filter terms into fewer routing policy terms

## Overview

Routing protocols exchange information with other routers running the same routing protocols. In many cases, route filters are used in routing policy statements to filter prefixes for import or export. In some cases, when route filters are split into many separate terms, performance is impacted. The route filter walkup feature allows consolidation of policy statement terms for operational efficiency.

This example uses BGP, but the same walkup feature applies to any routing protocol that supports route filtering of input or output.

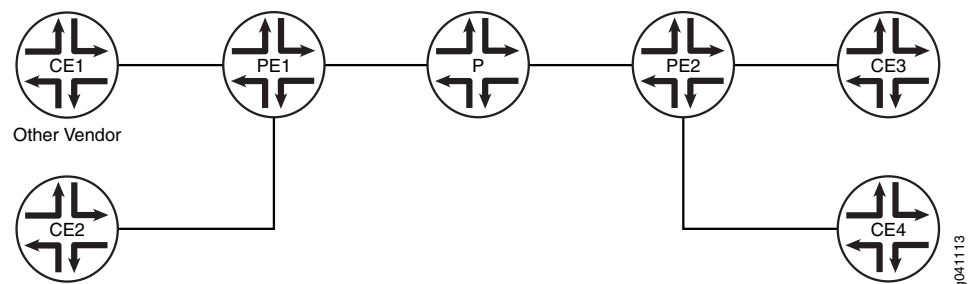

You can configure a Juniper Networks router to change the default operation of a term in a policy statement with route filters. By default, only a single longest match attempt is made for all route filters in a term. The walkup feature allows the router to “walk up” the route filters in a term from longest match to less specific in search of a true condition. This allows consolidation of multiple terms in a policy statement and corresponding operational efficiency.

This example changes the default behavior locally in a single policy statement. It does not affect the behavior of other policy statements.

## Topology

In the sample network in [Figure 24 on page 203](#), the router CE1 is a router from another vendor. The rest are Juniper Networks routers. The walkup feature can be configured on any router in the figure, except for router CE1. The vendor of router CE1 might or might not support a similar feature.

**Figure 25: Topology for the Local Walkup Example**

In the example, the following addresses are used:

- 10.0.0.0/16
- 10.0.0.0/8

**NOTE:** Although the 10.0.0.0/8 address space is not specifically reserved for documentation, the private RFC 1918 10.0.0.0/8 address space is used in this topic because of the flexibility and realistic scenarios that this address spaces provides.

## Configuring Route Filter Walkup Locally

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details such as addresses and interfaces to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device PE1**

```

set policy-options policy-statement routeset1-import defaults route-filter walkup
set policy-options policy-statement routeset1-import term prefixes1 from route-filter
  10.0.0.0/16 prefix-length-range /22-/24
set policy-options policy-statement routeset1-import term prefixes1 from route-filter
  10.0.0.0/8 orlonger
set policy-options policy-statement routeset1-import term prefixes1 then accept
set policy-options policy-statement routeset1-import term reject-the-rest then reject
set policy-options policy-statement import-route-filter-a term import-routes from protocol
  bgp
set policy-options policy-statement import-route-filter-a term import-routes from policy
  routeset1-import
set policy-options policy-statement import-route-filter-a term import-routes then next
  policy
set policy-options policy-statement import-route-filter-a term all-others then reject
set policy-options policy-statement route-filter-a-export term all then reject
set protocols bgp group routeset1 type external
set protocols bgp group routeset1 neighbor 10.0.10.13 import import-route-filter-a
set protocols bgp group routeset1 neighbor 10.0.10.13 family inet unicast
set protocols bgp group routeset1 neighbor 10.0.10.13 export route-filter-a-export
set protocols bgp group routeset1 neighbor 10.0.10.13 peer-as 65536

```

**Step-by-Step Procedure** The following example requires that you navigate to various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure router PE1 to perform walkup locally for multiple route filters in one term:

1. Configure the walkup feature locally in a policy named **routeset1-import**.

```

[edit policy-options policy-statement routeset1-import defaults]
user@PE1# set route-filter walkup

```

2. Configure the policy statements for an import policy named **routeset1-import**.

```

[edit policy-options ]
user@PE1# set policy-statement routeset1-import term prefixes1 from route-filter
  10.0.0.0/16 prefix-length-range /22-/24
user@PE1# set policy-statement routeset1-import term prefixes1 from route-filter
  10.0.0.0/8 orlonger
user@PE1# set policy-statement routeset1-import term prefixes1 then accept
user@PE1# set policy-statement routeset1-import term reject-the-rest then reject

```

3. Configure the policy options for the import and export policy statements.

```
[edit policy-options]
user@PE1# set policy-statement import-route-filter-a term import-routes from
protocol bgp
user@PE1# set policy-statement import-route-filter-a term import-routes from
policy routeset1-import
user@PE1# set policy-statement import-route-filter-a term import-routes then next
policy
user@PE1# set policy-statement route-filter-a-export term all-others then reject
```

4. Apply the import and export policies to a BGP neighbor.

```
[edit protocols bgp]
user@PE1# set group routeset1 type external
user@PE1# set group routeset1 neighbor 10.0.10.13 import import-route-filter-a
user@PE1# set group routeset1 neighbor 10.0.10.13 family inet unicast
user@PE1# set group routeset1 neighbor 10.0.10.13 export route-filter-a-export
user@PE1# set group routeset1 neighbor 10.0.10.13 peer-as 65536
```

## Results

From configuration mode, confirm your configuration by entering the **show protocols** and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE1# show policy-options
policy-statement routeset1-import {
  defaults {
    route-filter walkup;
  }
  term prefixes1 {
    from {
      route-filter 10.0.0.0/16 prefix-length-range /22-/24;
      route-filter 10.0.0.0/8 orlonger;
    }
    then accept;
  }
  term reject-the-rest {
    then reject;
  }
}

policy-statement import-route-filter-a {
  term import-routes {
    from {
      protocol bgp;
      policy routeset1-import;
    }
    then next policy;
  }
  term all-others {
    then reject;
  }
}

policy-statement route-filter-a-export {
```

```

    term all {
        then reject;
    }
}

user@PE1# show protocols bgp
group routeset1 {
    type external;
    neighbor 10.0.10.13 {
        import import-route-filter-a;
        family inet {
            unicast;
        }
        export router-filter-a-export;
        peer-as 65536;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying Route Filter Operation

**Purpose** Display expected information about the routes to confirm the route filters are working as expected.

Notice that the **10.0.0.0/8 orlonger** filter includes the **10.0.0.0/16 prefix-length-range /22-/24** filter in its scope. That is, any **10.0.0.0** route with a prefix of 8 bits or longer could also be a route with a prefix in the range between 22 and 24 bits. Without the walkup feature enabled in the policy example given, a route such as **10.0.0.0/16** would be rejected and become a hidden route. If the walkup feature is working as expected, then a route such as **10.0.0.0/16** would be accepted by the policy.

**Action** From operational mode, enter the **show route protocol bgp 10.0.0.0/16** command. Make sure that **10.0.0.0/16** is not a hidden route.

```

user@PE1>show route protocol bgp 10.0.0.0/16
inet.0: 520762 destinations, 520764 routes (520760 active, 0 holddown, 2 hidden)
+ = Active Route, - = Last Active, * = Both

10.0.0.0/16      *[BGP/170] 01:07:37, localpref 100
                  AS path: 65536, I, validation-state:  unverified
                  > to 10.0.100.13 via xe-0/2/0.0

```

As a further check, make sure that no routes that should be accepted are hidden routes. From operational mode, enter the **show route protocol bgp ip-address-prefix hidden** command to verify this.

**Meaning** The presence of routes that are not the longest match in the configured policy route filter term shows that the walkup feature is functioning locally.

## Troubleshooting

To troubleshoot route filter walkup locally:

## Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF

This example shows how to create an OSPF import policy that prioritizes specific prefixes learned through OSPF.

- [Requirements on page 213](#)
- [Overview on page 213](#)

- [Configuration on page 214](#)
- [Verification on page 216](#)

## Requirements

Before you begin:

- Configure the device interfaces. See the *Interfaces Feature Guide for Security Devices*.
- Configure the router identifiers for the devices in your OSPF network. See *Example: Configuring an OSPF Router Identifier*.
- Control OSPF designated router election. See *Example: Controlling OSPF Designated Router Election*.
- Configure a single-area OSPF network. See *Example: Configuring a Single-Area OSPF Network*.
- Configure a multiarea OSPF network. See *Example: Configuring a Multiarea OSPF Network*.

## Overview

In a network with a large number of OSPF routes, it can be useful to control the order in which routes are updated in response to a network topology change. In Junos OS Release 9.3 and later, you can specify a priority of high, medium, or low for prefixes included in an OSPF import policy. In the event of an OSPF topology change, high priority prefixes are updated in the routing table first, followed by medium and then low priority prefixes.

OSPF import policy can only be used to set priority or to filter OSPF external routes. If an OSPF import policy is applied that results in a **reject** terminating action for a nonexternal route, then the **reject** action is ignored and the route is accepted anyway. By default, such a route is now installed in the routing table with a priority of low. This behavior prevents traffic black holes, that is, silently discarded traffic, by ensuring consistent routing within the OSPF domain.

In general, OSPF routes that are not explicitly assigned a priority are treated as priority medium, except for the following:

- Summary discard routes have a default priority of low.
- Local routes that are not added to the routing table are assigned a priority of low.
- External routes that are rejected by import policy and thus not added to the routing table are assigned a priority of low.

Any available match criteria applicable to OSPF routes can be used to determine the priority. Two of the most commonly used match criteria for OSPF are the **route-filter** and **tag** statements.

In this example, the routing device is in area 0.0.0.0, with interfaces **fe-0/1/0** and **fe-1/1/0** connecting to neighboring devices. You configure an import routing policy named **ospf-import** to specify a priority for prefixes learned through OSPF. Routes associated

with these prefixes are installed in the routing table in the order of the prefixes' specified priority. Routes matching **200.3.0.0/16 orlonger** are installed first because they have a priority of **high**. Routes matching **200.2.0.0/16 orlonger** are installed next because they have a priority of **medium**. Routes matching **200.1.0.0/16 orlonger** are installed last because they have a priority of **low**. You then apply the import policy to OSPF.

**NOTE:** The priority value takes effect when a new route is installed, or when there is a change to an existing route.

## Configuration

### CLI Quick Configuration

To quickly configure an OSPF import policy that prioritizes specific prefixes learned through OSPF, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the [edit] hierarchy level, and then enter **commit** from configuration mode.

```
[edit]
set interfaces fe-0/1/0 unit 0 family inet address 192.168.8.4/30
set interfaces fe-0/1/0 unit 0 family inet address 192.168.8.5/30
set policy-options policy-statement ospf-import term t1 from route-filter 200.1.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t1 then priority low
set policy-options policy-statement ospf-import term t1 then accept
set policy-options policy-statement ospf-import term t2 from route-filter 200.2.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t2 then priority medium
set policy-options policy-statement ospf-import term t2 then accept
set policy-options policy-statement ospf-import term t3 from route-filter 200.3.0.0/16
  orlonger
set policy-options policy-statement ospf-import term t3 then priority high
set policy-options policy-statement ospf-import term t3 then accept
set protocols ospf import ospf-import
set protocols ospf area 0.0.0.0 interface fe-0/1/0
set protocols ospf area 0.0.0.0 interface fe-1/1/0
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Modifying the Junos OS Configuration* in the *CLI User Guide*.

To configure an OSPF import policy that prioritizes specific prefixes:

1. Configure the interfaces.

```
[edit]
user@host# set interfaces fe-0/1/0 unit 0 family inet address 192.168.8.4/30
user@host# set interfaces fe-0/2/0 unit 0 family inet address 192.168.8.5/30
```

2. Enable OSPF on the interfaces.

**NOTE:** For OSPFv3, include the `ospf3` statement at the `[edit protocols]` hierarchy level.

```
[edit]
user@host# set protocols ospf area 0.0.0.0 interface fe-0/1/0
user@host# set protocols ospf area 0.0.0.0 interface fe-0/2/0
```

3. Configure the policy to specify the priority for prefixes learned through OSPF.

```
[edit ]
user@host# set policy-options policy-statement ospf-import term t1 from route-filter
200.1.0.0/16 orlonger
user@host# set policy-options policy-statement ospf-import term t1 then priority
low
user@host# set policy-options policy-statement ospf-import term t1 then accept
user@host# set policy-options policy-statement ospf-import term t2 from route-filter
200.2.0.0/16 orlonger
user@host# set policy-options policy-statement ospf-import term t2 then priority
medium
user@host# set policy-options policy-statement ospf-import term t2 then accept
user@host# set policy-options policy-statement ospf-import term t3 from route-filter
200.3.0.0/16 orlonger
user@host# set policy-options policy-statement ospf-import term t3 then priority
high
user@host# set policy-options policy-statement ospf-import term t3 then accept
```

4. Apply the policy to OSPF.

```
[edit]
user@host# set protocols ospf import ospf-import
```

5. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm your configuration by entering the `show interfaces`, `show policy-options`, and the `show protocols ospf` commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show interfaces
fe-0/1/0 {
  unit 0 {
    family inet {
      address 192.168.8.4/30;
    }
  }
}
fe-0/2/0 {
  unit 0 {
    family inet {
      address 192.168.8.5/30;
    }
  }
}
```

```
}

user@host# show protocols ospf
import ospf-import;
area 0.0.0.0 {
    interface fe-0/1/0.0;
    interface fe-0/2/0.0;
}

user@host# show policy-options
policy-statement ospf-import {
    term t1 {
        from {
            route-filter 200.1.0.0/16 orlonger;
        }
        then {
            priority low;
            accept;
        }
    }
    term t2 {
        from {
            route-filter 200.2.0.0/16 orlonger;
        }
        then {
            priority medium;
            accept;
        }
    }
    term t3 {
        from {
            route-filter 200.3.0.0/16 orlonger;
        }
        then {
            priority high;
            accept;
        }
    }
}

user@host# show protocols ospf
import ospf-import;
area 0.0.0.0 {
    interface fe-0/1/0.0;
    interface fe-0/2/0.0;
}
```

To confirm your OSPFv3 configuration, enter the **show interfaces**, **show policy-options**, and **show protocols ospf3** commands.

## Verification

Confirm that the configuration is working properly.

### [Verifying the Prefix Priority in the OSPF Routing Table](#)

---

**Purpose** Verify the priority assigned to the prefix in the OSPF routing table.

**Action** From operational mode, enter the **show ospf route detail** for OSPFv2, and enter the **show ospf3 route detail** command for OSPFv3.

**Related Documentation**

- [Understanding Route Filters for Use in Routing Policy Match Conditions on page 175](#)
- *OSPF Routing Policy Overview*

---

## Example: Configuring the MED Using Route Filters

---

This example shows how to configure a policy that uses route filters to modify the multiple exit discriminator (MED) metric to advertise in BGP update messages.

- [Requirements on page 217](#)
- [Overview on page 217](#)
- [Configuration on page 218](#)
- [Verification on page 228](#)

### Requirements

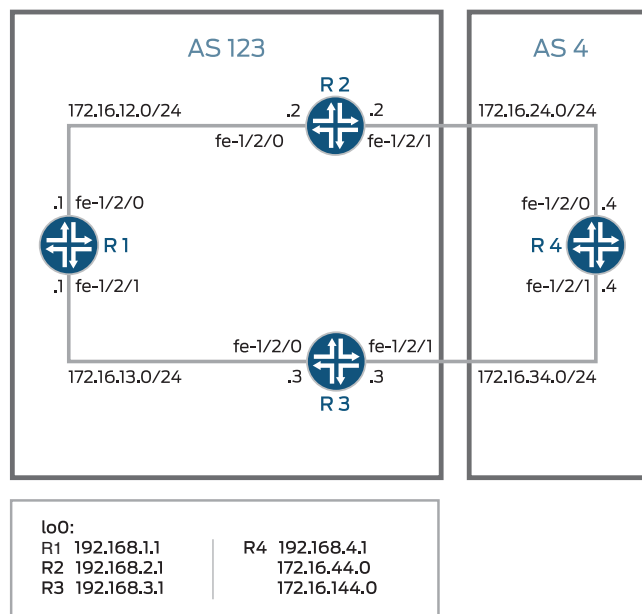

No special configuration beyond device initialization is required before you configure this example.

### Overview

To configure a route-filter policy that modifies the advertised MED metric in BGP update messages, include the **metric** statement in the policy action.

[Figure 26 on page 218](#) shows a typical network with internal peer sessions and multiple exit points to a neighboring autonomous system (AS).

Figure 26: Typical Network with IBGP Sessions and Multiple Exit Points

Device R4 has multiple loopback interfaces configured to simulate advertised prefixes. The extra loopback interface addresses are 44.44.44.44/32 and 144.144.144.144/32. This example shows how to configure Device R4 to advertise a MED value of 30 to Device R3 for all routes except 144.144.144.144. For 144.144.144.144, a MED value of 10 is advertised to Device 3. A MED value of 20 is advertised to Device R2, regardless of the route prefix.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 1 family inet address 12.12.12.1/24
set interfaces fe-1/2/1 unit 2 family inet address 13.13.13.1/24
set interfaces lo0 unit 1 family inet address 192.168.1.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.1.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols ospf area 0.0.0.0 interface lo0.1 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.1
set protocols ospf area 0.0.0.0 interface fe-1/2/1.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.1.1

```

**Device R2**

```

set interfaces fe-1/2/0 unit 3 family inet address 12.12.12.2/24
set interfaces fe-1/2/1 unit 4 family inet address 24.24.24.2/24
set interfaces lo0 unit 2 family inet address 192.168.2.1/32

```

```

set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.2.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.3.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 24.24.24.4
set protocols ospf area 0.0.0.0 interface lo0.2 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.3
set protocols ospf area 0.0.0.0 interface fe-1/2/1.4
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.2.1

```

Device R3

```

set interfaces fe-1/2/0 unit 5 family inet address 13.13.13.3/24
set interfaces fe-1/2/1 unit 6 family inet address 34.34.34.3/24
set interfaces lo0 unit 3 family inet address 192.168.3.1/32
set protocols bgp group internal type internal
set protocols bgp group internal local-address 192.168.3.1
set protocols bgp group internal export send-direct
set protocols bgp group internal neighbor 192.168.1.1
set protocols bgp group internal neighbor 192.168.2.1
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 4
set protocols bgp group external neighbor 34.34.34.4
set protocols ospf area 0.0.0.0 interface lo0.3 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.5
set protocols ospf area 0.0.0.0 interface fe-1/2/1.6
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 123
set routing-options router-id 192.168.3.1

```

Device R4

```

set interfaces fe-1/2/0 unit 7 family inet address 24.24.24.4/24
set interfaces fe-1/2/1 unit 8 family inet address 34.34.34.4/24
set interfaces lo0 unit 4 family inet address 192.168.4.1/32
set interfaces lo0 unit 4 family inet address 44.44.44.44/32
set interfaces lo0 unit 4 family inet address 144.144.144.144/32
set protocols bgp group external type external
set protocols bgp group external export send-direct
set protocols bgp group external peer-as 123
set protocols bgp group external neighbor 34.34.34.3 export med-10
set protocols bgp group external neighbor 34.34.34.3 export med-30
set protocols bgp group external neighbor 24.24.24.2 metric-out 20
set policy-options policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-options policy-statement med-10 then metric 10
set policy-options policy-statement med-10 then accept
set policy-options policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-options policy-statement med-30 then metric 30
set policy-options policy-statement med-30 then accept
set policy-options policy-statement send-direct term 1 from protocol direct

```

```
set policy-options policy-statement send-direct term 1 then accept
set routing-options autonomous-system 4
set routing-options router-id 192.168.4.1
```

### Configuring Device R1

---

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 1]
user@R1# set family inet address 12.12.12.1/24
```

```
[edit interfaces fe-1/2/1 unit 2]
user@R1# set family inet address 13.13.13.1/24
```

```
[edit interfaces lo0 unit 1]
user@R1# set family inet address 192.168.1.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R1# set type internal
user@R1# set local-address 192.168.1.1
user@R1# set export send-direct
user@R1# set neighbor 192.168.2.1
user@R1# set neighbor 192.168.3.1
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface lo0.1 passive
user@R1# set interface fe-1/2/0.1
user@R1# set interface fe-1/2/1.2
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R1# set autonomous-system 123
user@R1# set router-id 192.168.1.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show interfaces
fe-1/2/0 {
  unit 1 {
    family inet {
      address 12.12.12.1/24;
    }
  }
}
fe-1/2/1 {
  unit 2 {
    family inet {
      address 13.13.13.1/24;
    }
  }
}
lo0 {
  unit 1 {
    family inet {
      address 192.168.1.1/32;
    }
  }
}

user@R1# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.1.1;
    export send-direct;
    neighbor 192.168.2.1;
    neighbor 192.168.3.1;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.1 {
      passive;
    }
    interface fe-1/2/0.1;
    interface fe-1/2/1.2;
  }
}

user@R1# show policy-options
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R1# show routing-options
autonomous-system 123;
router-id 192.168.1.1;

```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring Device R2

---

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 3]
user@R2# set family inet address 12.12.12.21/24
```

```
[edit interfaces fe-1/2/1 unit 4]
user@R2# set family inet address 24.24.24.2/24
```

```
[edit interfaces lo0 unit 2]
user@R2# set family inet address 192.168.2.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]
user@R2# set type internal
user@R2# set local-address 192.168.2.1
user@R2# set export send-direct
user@R2# set neighbor 192.168.1.1
user@R2# set neighbor 192.168.3.1
```

```
[edit protocols bgp group external]
user@R2# set type external
user@R2# set export send-direct
user@R2# set peer-as 4
user@R2# set neighbor 24.24.24.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.2 passive
user@R2# set interface fe-1/2/0.3
user@R2# set interface fe-1/2/1.4
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R2# set autonomous-system 123
user@R2# set router-id 192.168.2.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R2# show interfaces
fe-1/2/0 {
  unit 3 {
    family inet {
      address 12.12.12.2/24;
    }
  }
}
fe-1/2/1 {
  unit 4 {
    family inet {
      address 24.24.24.2/24;
    }
  }
}
lo0 {
  unit 2 {
    family inet {
      address 192.168.2.1/32;
    }
  }
}
}

user@R2# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.2.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.3.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 24.24.24.4;
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.2 {
      passive;
    }
    interface fe-1/2/0.3;
    interface fe-1/2/1.4;
  }
}

user@R2# show policy-options
policy-statement send-direct {

```

```
term 1 {  
    from protocol direct;  
    then accept;  
}  
}  
  
user@R2# show routing-options  
autonomous-system 123;  
router-id 192.168.2.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Configuring Device R3

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 5]  
user@R3# set family inet address 13.13.13.3/24
```

```
[edit interfaces fe-1/2/1 unit 6]  
user@R3# set family inet address 34.34.34.3/24
```

```
[edit interfaces lo0 unit 3]  
user@R3# set family inet address 192.168.3.1/32
```

2. Configure BGP.

```
[edit protocols bgp group internal]  
user@R3# set type internal  
user@R3# set local-address 192.168.3.1  
user@R3# set export send-direct  
user@R3# set neighbor 192.168.1.1  
user@R3# set neighbor 192.168.2.1
```

```
[edit protocols bgp group external]  
user@R3# set type external  
user@R3# set export send-direct  
user@R3# set peer-as 4  
user@R3# set neighbor 34.34.34.4
```

3. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]  
user@R3# set interface lo0.3 passive  
user@R3# set interface fe-1/2/0.5  
user@R3# set interface fe-1/2/1.6
```

4. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R3# set from protocol direct
user@R3# set then accept
```

5. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R3# set autonomous-system 123
user@R3# set router-id 192.168.3.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/0 {
  unit 5 {
    family inet {
      address 13.13.13.3/24;
    }
  }
}
fe-1/2/1 {
  unit 6 {
    family inet {
      address 34.34.34.3/24;
    }
  }
}
lo0 {
  unit 3 {
    family inet {
      address 192.168.3.1/32;
    }
  }
}

user@R3# show protocols
bgp {
  group internal {
    type internal;
    local-address 192.168.3.1;
    export send-direct;
    neighbor 192.168.1.1;
    neighbor 192.168.2.1;
  }
  group external {
    type external;
    export send-direct;
    peer-as 4;
    neighbor 34.34.34.4;
  }
}
ospf {
  area 0.0.0.0 {
```

```
interface lo0.3 {
    passive;
}
interface fe-1/2/0.5;
interface fe-1/2/1.6;
}
}

user@R3# show policy-options
policy-statement send-direct {
    term 1 {
        from protocol direct;
        then accept;
    }
}

user@R3# show routing-options
autonomous-system 123;
router-id 192.168.3.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 7]
user@R4# set family inet address 24.24.24.4/24
```

```
[edit interfaces fe-1/2/1 unit 8]
user@R4# set family inet address 34.34.34.4/24
```

```
[edit interfaces lo0 unit 4]
user@R4# set family inet address 192.168.4.1/32
user@R4# set family inet address 44.44.44.44/32
user@R4# set family inet address 144.144.144.144/32
```

Device R4 has multiple loopback interface addresses to simulate advertised prefixes.

2. Configure a policy that accepts direct routes.

Other useful options for this scenario might be to accept routes learned through OSPF or local routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R4# set from protocol direct
user@R4# set then accept
```

3. Configure BGP.

```
[edit protocols bgp group external]
user@R4# set type external
```

```
user@R4# set export send-direct
user@R4# set peer-as 123
```

4. Configure the two MED policies.

```
[edit policy-options]
set policy-statement med-10 from route-filter 144.144.144.144/32 exact
set policy-statement med-10 then metric 10
set policy-statement med-10 then accept
```

```
set policy-statement med-30 from route-filter 0.0.0.0/0 longer
set policy-statement med-30 then metric 30
set policy-statement med-30 then accept
```

5. Configure the two EBGP neighbors, applying the two MED policies to Device R3, and a MED value of 20 to Device R2.

```
[edit protocols bgp group external]
user@R4# set neighbor 34.34.34.3 export med-10
user@R4# set neighbor 34.34.34.3 export med-30
user@R4# set neighbor 24.24.24.2 metric-out 20
```

6. Configure the router ID and autonomous system (AS) number.

```
[edit routing-options]
user@R4# set autonomous-system 4
user@R4# set router-id 192.168.4.1
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
fe-1/2/0 {
  unit 7 {
    family inet {
      address 24.24.24.4/24;
    }
  }
}
fe-1/2/1 {
  unit 8 {
    family inet {
      address 34.34.34.4/24;
    }
  }
}
lo0 {
  unit 4 {
    family inet {
      address 192.168.4.1/32;
      address 44.44.44.44/32;
      address 144.144.144.144/32;
    }
  }
}
```

```
user@R4# show protocols
bgp {
  group external {
    type external;
    export send-direct;
    peer-as 123;
    neighbor 24.24.24.2 {
      metric-out 20;
    }
    neighbor 34.34.34.3 {
      export [ med-10 med-30 ];
    }
  }
}

user@R4# show policy-options
policy-statement med-10 {
  from {
    route-filter 144.144.144.144/32 exact;
  }
  then {
    metric 10;
    accept;
  }
}
policy-statement med-30 {
  from {
    route-filter 0.0.0.0/0 longer;
  }
  then {
    metric 30;
    accept;
  }
}
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R4# show routing-options
autonomous-system 4;
router-id 192.168.4.1;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Checking the Active Path from Device R1 to Device R4 on page 229](#)
- [Verifying That Device R4 Is Sending Its Routes Correctly on page 229](#)

### Checking the Active Path from Device R1 to Device R4

**Purpose** Verify that the active path goes through Device R2.

**Action** From operational mode, enter the **show route protocol bgp** command.

```
user@R1> show route protocol bgp
inet.0: 13 destinations, 19 routes (13 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

12.12.12.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
13.13.13.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
24.24.24.0/24      [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
34.34.34.0/24      [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
44.44.44.44/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
144.144.144.144/32 *[BGP/170] 00:06:03, MED 10, localpref 100, from 192.168.3.1
                  AS path: 4 I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.2.1/32     [BGP/170] 4d 01:13:32, localpref 100, from 192.168.2.1
                  AS path: I
                  > to 12.12.12.2 via fe-1/2/0.1
192.168.3.1/32     [BGP/170] 3d 05:36:10, localpref 100, from 192.168.3.1
                  AS path: I
                  > to 13.13.13.3 via fe-1/2/1.2
192.168.4.1/32     *[BGP/170] 00:06:03, MED 20, localpref 100, from 192.168.2.1
                  AS path: 4 I
                  > to 12.12.12.2 via fe-1/2/0.1
```

**Meaning** The output shows that the preferred path to the routes advertised by Device R4 is through Device R2 for all routes except 144.144.144.144/32. For 144.144.144.144/32, the preferred path is through Device R3.

### Verifying That Device R4 Is Sending Its Routes Correctly

**Purpose** Make sure that Device R4 is sending update messages with a value of 20 to Device R2 and a value of 30 to Device R3.

**Action** From operational mode, enter the **show route advertising-protocol bgp** command.

```
user@R4> show route advertising-protocol bgp 24.24.24.2
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop      MED      Lcl1pref      AS path
* 24.24.24.0/24         Self         20              I
* 34.34.34.0/24         Self         20              I
* 44.44.44.44/32        Self         20              I
* 144.144.144.144/32    Self         20              I
* 192.168.4.1/32        Self         20              I
```

```

user@R4> show route advertising-protocol bgp 34.34.34.3
inet.0: 11 destinations, 13 routes (11 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
* 24.24.24.0/24         Self             30                I
* 34.34.34.0/24         Self             30                I
* 44.44.44.44/32        Self             30                I
* 144.144.144.144/32    Self             10                I
* 192.168.4.1/32        Self             30                I

```

**Meaning** The MED column shows that Device R4 is sending the correct MED values to its two EBGp neighbors.

## Example: Configuring Layer 3 VPN Protocol Family Qualifiers for Route Filters

This example shows how to control the scope of BGP import policies by configuring a family qualifier for the BGP import policy. The family qualifier specifies routes of type **inet**, **inet6**, **inet-vpn**, or **inet6-vpn**.

- [Requirements on page 230](#)
- [Overview on page 230](#)
- [Configuration on page 231](#)
- [Verification on page 233](#)

### Requirements

This example uses Junos OS Release 10.0 or later.

Before you begin:

- Configure the device interfaces.
- Configure an interior gateway protocol. See the *Junos OS Routing Protocols Library for Routing Devices*.
- Configure a BGP session for multiple route types. For example, configure the session for both family **inet** routes and family **inet-vpn** routes. See *Configuring IBGP Sessions Between PE Routers in VPNs* and *Configuring Layer 3 VPNs to Carry IPv6 Traffic*.

### Overview

Family qualifiers cause a route filter to match only one specific family. When you configure an IPv4 route filter without a family qualifier, as shown here, the route filter matches **inet** and **inet-vpn** routes.

```
route-filter ipv4-address/mask;
```

Likewise, when you configure an IPv6 route filter without a family qualifier, as shown here, the route filter matches **inet6** and **inet6-vpn** routes.

```
route-filter ipv6-address/mask;
```

Consider the case in which a BGP session has been configured for both family **inet** routes and family **inet-vpn** routes, and an import policy has been configured for this BGP session. This means that both family **inet** and family **inet-vpn** routes, when received, share the same import policy. The policy term might look as follows:

```
from {
  route-filter 0.0.0.0/0 exact;
}
then {
  next-hop self;
  accept;
}
```

This route-filter logic matches an **inet** route of 0.0.0.0 and an **inet-vpn** route whose IPv4 address portion is 0.0.0.0. The 8-byte route distinguisher portion of the **inet-vpn** route is not considered in the route-filter matching. This is a change in Junos OS behavior that was introduced in Junos OS Release 10.0.

If you do not want your policy to match both types of routes, add a family qualifier to your policy. To have the route-filter match only **inet** routes, add the family **inet** policy qualifier. To have the route-filter match only **inet-vpn** routes, add the family **inet-vpn** policy qualifier.

The family qualifier is evaluated before the route-filter is evaluated. Thus, the route-filter is not evaluated if the family match fails. The same logic applies to family **inet6** and family **inet6-vpn**. The route-filter used in the **inet6** example must use an IPv6 address. There is a potential efficiency gain in using a family qualifier because the family qualifier is tested before most other qualifiers, quickly eliminating routes from undesired families.

## Configuration

|                                |                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CLI Quick Configuration</b> | To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the <b>[edit]</b> hierarchy level.                                                                            |
| <b>inet Example</b>            | <pre>set policy-options policy-statement specific-family from family inet set policy-options policy-statement specific-family from route-filter 0.0.0.0/0 exact set policy-options policy-statement specific-family then next-hop self set policy-options policy-statement specific-family then accept set protocols bgp import specific-family</pre>     |
| <b>Inet-vpn Example</b>        | <pre>set policy-options policy-statement specific-family from family inet-vpn set policy-options policy-statement specific-family from route-filter 0.0.0.0/0 exact set policy-options policy-statement specific-family then next-hop self set policy-options policy-statement specific-family then accept set protocols bgp import specific-family</pre> |

**inet6 Example**

```
set policy-options policy-statement specific-family from family inet6
set policy-options policy-statement specific-family from route-filter 0::0/0 exact
set policy-options policy-statement specific-family then next-hop self
set policy-options policy-statement specific-family then accept
set protocols bgp import specific-family
```

**Inet6-vpn Example**

```
set policy-options policy-statement specific-family from family inet6-vpn
set policy-options policy-statement specific-family from route-filter 0::0/0 exact
set policy-options policy-statement specific-family then next-hop self
set policy-options policy-statement specific-family then accept
set protocols bgp import specific-family
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a flow map:

1. Configure the family qualifier.

```
[edit policy-options]
user@host# set policy-statement specific-family from family inet
```

2. Configure the route filter.

```
[edit policy-options]
user@host# set policy-statement specific-family from route-filter 0.0.0.0/0 exact
```

3. Configure the policy actions.

```
[edit policy-options]
user@host# set policy-statement specific-family then next-hop self
user@host# set policy-statement specific-family then accept
```

4. Apply the policy.

```
[edit protocols bgp]
user@host# set import specific-family
```

---

## Results

From configuration mode, confirm your configuration by issuing the **show protocols** and **show policy-options** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show protocols
bgp {
  import specific-family;
}
user@host# show policy-options
policy-statement specific-family {
  from {
    family inet;
    route-filter 0.0.0.0/0 exact;
  }
  then {
```

```

        next-hop self;
        accept;
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

Repeat the procedure for every protocol family for which you need a specific route-filter policy.

## Verification

To verify the configuration, run the following commands:

- **show route advertising-protocol *bgp neighbor* detail**
- **show route instance *instance-name* detail**

## Understanding Prefix Lists for Use in Routing Policy Match Conditions

A *prefix list* is a named list of IP addresses. You can specify an exact match with incoming routes and apply a common action to all matching prefixes in the list.

Suppose, for example, that you configure the following prefix list:

```

prefix-list bgp179 {
  apply-path "protocols bgp group <*> neighbor <*>";
}

```

This works well when all neighbors on the device are in the same address family.

When the neighbors are in different address families, for example when both IPv4 and IPv6 neighbors are configured, you can use a prefix list as follows:

```

prefix-list IPV4-BGP-NEIGHBORS {
  apply-path "protocols bgp group <*> neighbor <*.***>";
}
prefix-list IPV6-BGP-NEIGHBORS {
  apply-path "protocols bgp group <*> neighbor <*:.*>";
}

```

One prefix list matches IPv4 addresses. The other matches IPv6 addresses. You can run the **show configuration policy-options prefix-list prefix-list name | display inheritance** command to verify the configuration.

A prefix list functions like a route list that contains multiple instances of the **exact** match type only. The differences between these two extended match conditions are summarized in [Table 19 on page 234](#).

**Table 19: Prefix List and Route List Differences**

| Feature | Prefix List                                                                                                        | Route Lists                                                                                                                                                                                  |
|---------|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | Can specify action in a <b>then</b> statement only. These actions are applied to all prefixes that match the term. | Can specify action that is applied to a particular prefix in a <b>route-filter</b> match condition in a <b>from</b> statement, or to all prefixes in the list using a <b>then</b> statement. |

For information about configuring route lists, see “[Understanding Route Filters for Use in Routing Policy Match Conditions](#)” on page 175.

This section includes the following information:

- [Configuring Prefix Lists on page 234](#)
- [How Prefix Lists Are Evaluated in Routing Policy Match Conditions on page 235](#)
- [Configuring Prefix List Filters on page 236](#)

## Configuring Prefix Lists

You can create a named prefix list and include it in a routing policy with the **prefix-list** match condition (described in “[Routing Policy Match Conditions](#)” on page 40).

To define a prefix list, include the **prefix-list** statement:

```
[edit policy-options]
prefix-list prefix-list-name {
  apply-path path;
  ip-addresses;
}
```

You can use the **apply-path** statement to include all prefixes (and their associated network mask) pointed to by a defined path, or you can specify one or more addresses, or both.

To include a prefix list in a routing policy, specify the **prefix-list** match condition in the **from** statement at the **[edit policy-options policy-statement policy-name term term-name]** hierarchy level:

```
[edit policy-options policy-statement policy-name term term-name]
from {
  prefix-list prefix-list-name;
}
then actions;
```

**name** identifies the prefix list. It can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in quotation marks (“ ”).

*ip-addresses* are the IPv4 or IP version 6 (IPv6) prefixes specified as *prefix/prefix-length*. If you omit *prefix-length* for an IPv4 prefix, the default is /32*prefix-length*. If you omit *prefix-length* for an IPv6 prefix, the default is /128. Prefixes specified in a **from** statement must be either all IPv4 addresses or all IPv6 addresses.

**NOTE:** You cannot apply actions to individual prefixes in the list.

You can specify the same prefix list in the **from** statement of multiple routing policies or firewall filters. For information about firewall filters, see “[Guidelines for Configuring Firewall Filters](#)” on page 492 and “[Guidelines for Applying Standard Firewall Filters](#)” on page 498.

Use the **apply-path** statement to configure a prefix list comprising all IP prefixes pointed to by a defined path. This eliminates most of the effort required to maintain a group prefix list.

The path consists of elements separated by spaces. Each element matches a configuration keyword or an identifier, and you can use wildcards to match more than one identifier. Wildcards must be enclosed in angle brackets, for example, <\*>.

**NOTE:** You cannot add a path element, including wildcards, after a leaf statement in the **apply-path** statement. Path elements, including wildcards, can only be used after a container statement.

**NOTE:** When you use **apply-path** to define a prefix list, you can also use the same prefix list in a policy statement.

For examples of configuring a prefix list, see “[Example: Configuring Routing Policy Prefix Lists](#)” on page 236.

## How Prefix Lists Are Evaluated in Routing Policy Match Conditions

During prefix list evaluation, the policy framework software performs a *longest-match lookup*, which means that the software searches for the prefix in the list with the longest length. The order in which you specify the prefixes, from top to bottom, does not matter. The software then compares a route’s source address to the longest prefix.

You can use prefix list qualifiers for prefixes contained in a prefix list by configuring a prefix list filter. For more information, see *Configuring Prefix Lists for Use in Routing Policy Match Conditions*.

If a match occurs, the evaluation of the current term continues. If a match does not occur, the evaluation of the current term ends.

**NOTE:** If you specify multiple prefixes in the prefix list, only one prefix must match for a match to occur. The prefix list matching is effectively a logical OR operation.

## Configuring Prefix List Filters

A prefix list filter allows you to apply prefix list qualifiers to a list of prefixes within a prefix list. The prefixes within the list are evaluated using the specified qualifiers. You can configure multiple prefix list filters under the same policy term.

To configure a prefix list filter, include the **prefix-list-filter** statement at the **[edit policy-options policy-statement *policy-name* from]** hierarchy level:

```
[edit policy-options policy-statement policy-name
from {
  prefix-list-filter prefix-list-name match-type actions;
}
```

The ***prefix-list-name*** option is the name of the prefix list to be used for evaluation. You can specify only one prefix list.

The ***match-type*** option is the type of match to apply to the prefixes in the prefix list. It can be one of the match types listed in [Table 20 on page 236](#).

The ***actions*** option is the action to take if the prefix list matches. It can be one or more of the actions listed in ["Configuring Flow Control Actions" on page 52](#) and ["Configuring Actions That Manipulate Route Characteristics" on page 53](#).

**Table 20: Route List Match Types for a Prefix List Filter**

| Match Type | Match Condition                                                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exact      | The route shares the same most-significant bits (described by <b><i>prefix-length</i></b> ), and <b><i>prefix-length</i></b> is equal to the route's prefix length.                 |
| longer     | The route shares the same most-significant bits (described by <b><i>prefix-length</i></b> ), and <b><i>prefix-length</i></b> is greater than the route's prefix length.             |
| orlonger   | The route shares the same most-significant bits (described by <b><i>prefix-length</i></b> ), and <b><i>prefix-length</i></b> is equal to or greater than the route's prefix length. |

## Example: Configuring Routing Policy Prefix Lists

In Junos OS, prefix lists provide one method of defining a set of routes. Junos OS provides other methods of accomplishing the same task, such as route filters. A prefix list is a

listing of IP prefixes that represent a set of routes that are used as match criteria in an applied policy. Such a list might be useful for representing a list of customer routes in your autonomous system (AS). A prefix list is given a name and is configured within the **[edit policy-options]** configuration hierarchy.

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

Prefix lists are similar to a list of route filters. The functional difference between route filters and prefix lists is that you cannot specify a range using a prefix list. You can simulate a range using a prefix list by including additional prefixes in the list, or by using two prefix lists, one shorter and one longer, setting one to accept and the other to reject. You can also filter a prefix list using the **prefix-list-filter** match condition. Your choices are **exact**, **longer**, and **orlonger**.

The benefit of a prefix list over a list of route filters is seen when the prefixes are referenced in several different locations. For instance, a prefix list can be referenced in a BGP import policy, an export policy, an RPF policy, in firewall filters, in loopback filters, in setting a multicast scope, and so on.

When your list of prefixes changes, rather than trying to remember the many different locations prefixes are configured, you can instead update the prefix list, changing the prefix one time instead of multiple times. This helps to reduce the likelihood of configuration errors, such as mistyping the address in a location or forgetting to update one or more locations.

Prefix lists also help when managing a large number of devices. You can write the various filters and policies as generically as possible, referencing prefix lists instead of specific IP addresses. The more complex logic in the filters and policies has to be written only one time, with minimal per-device and per-site customizations.

As shown in [Figure 27 on page 239](#), each router in AS 64510 has customer routes. Device R1 assigns customer routes within the 172.16.1.0/24 subnet. Device R2 and Device R3 assign customer routes within the 172.16.2.0/24 and 172.16.3.0/24 subnets, respectively. Device R1 has been designated the central point in AS 64510 to maintain a complete list of customer routes. Device R1 has a prefix list called **customers**, as follows:

```
user@R1# show policy-options
prefix-list customers {
  172.16.1.16/28;
  172.16.1.32/28;
  172.16.1.48/28;
```

```
172.16.1.64/28;  
172.16.2.16/28;  
172.16.2.32/28;  
172.16.2.48/28;  
172.16.2.64/28;  
172.16.3.16/28;  
172.16.3.32/28;  
172.16.3.48/28;  
172.16.3.64/28;  
}
```

As you can see, the prefix list does not contain a match type for each route (as you would see with a route filter). This is an important point when using a prefix list in a policy. Routes match only if they exactly match one of the prefixes in the list. In other words, each route in the list must appear in the routing table exactly as it is configured in the prefix list.

You reference the prefix list as a match criterion within a policy like this:

```
user@R1# show policy-options  
policy-statement customer-routes {  
  term get-routes {  
    from {  
      prefix-list customers;  
    }  
    then accept;  
  }  
  term others {  
    then reject;  
  }  
}
```

In this example, all the routes in the **customers** prefix list appear in the routing table on Device R1. Device R2 and Device R3 export to Device R1 static routes to their customers.

As previously mentioned, you can use the **prefix-list-filter** match condition with the **exact**, **longer**, or **orlonger** match type. This provides a way to avoid the prefix list exact-match limitation of prefix lists. For example:

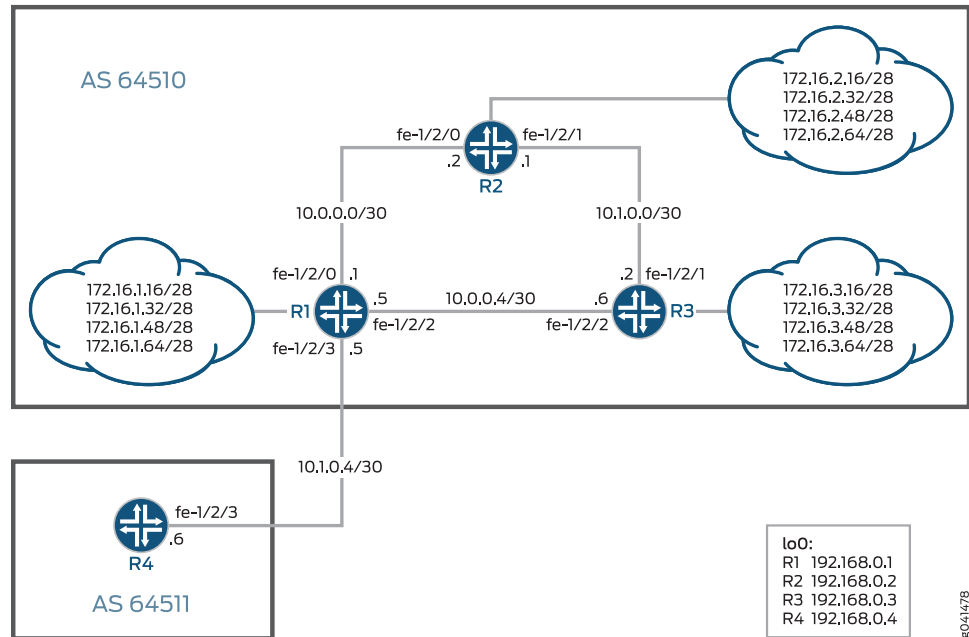

```
user@R1# show policy-options  
policy-statement customer-routes {  
  term get-routes {  
    from {  
      prefix-list-filter customers orlonger;  
    }  
    then accept;  
  }  
  term others {  
    then reject;  
  }  
}
```

The example demonstrates the effects of both the **prefix-list** match condition and the **prefix-list-filter** match condition.

## Topology

Figure 27 on page 239 shows the sample network.

Figure 27: BGP Topology for Policy Prefix Lists

“CLI Quick Configuration” on page 239 shows the configuration for all of the devices in Figure 27 on page 239.

The section “Step-by-Step Procedure” on page 241 describes the steps on Device R1.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 0 description to_R2
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces fe-1/2/2 unit 0 description to_R3
set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.5/30
set interfaces fe-1/2/3 unit 0 description to_R4
set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.5/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32

set routing-options router-id 192.168.0.3
set routing-options autonomous-system 64510

```

**Device R4**

```

set interfaces fe-1/2/3 unit 0 description to_R1
set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.6/30
set interfaces lo0 unit 0 family inet address 192.168.0.4/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 64510
set protocols bgp group ext neighbor 10.1.0.5
set routing-options autonomous-system 64511

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```

[edit interfaces]
user@R1# set interfaces fe-1/2/0 unit 0 description to_R2
user@R1# set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30

user@R1# set interfaces fe-1/2/2 unit 0 description to_R3
user@R1# set interfaces fe-1/2/2 unit 0 family inet address 10.0.0.5/30

user@R1# set interfaces fe-1/2/3 unit 0 description to_R4
user@R1# set interfaces fe-1/2/3 unit 0 family inet address 10.1.0.5/30

user@R1# set interfaces lo0 unit 0 family inet address 192.168.0.1/32

```

2. Configure the internal BGP (IBGP) connections to Device R2 and Device R3.

```

[edit protocols bgp group int]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set neighbor 192.168.0.2
user@R1# set neighbor 192.168.0.3

```

3. Configure the EBGP connection to Device R4.

```

[edit protocols bgp group to_64511]
user@R1# set type external
user@R1# set neighbor 10.1.0.6 peer-as 64511
user@R1# set export customer-routes

```

4. Configure OSPF connections to Device R2 and Device R3.  

```
[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.0
user@R1# set interface fe-1/2/2.0
user@R1# set interface lo0.0 passive
```
5. Configure the prefix list.  

```
[edit policy-options prefix-list 64510-customers]
user@R1# set 172.16.1.16/28
user@R1# set 172.16.1.32/28
user@R1# set 172.16.1.48/28
user@R1# set 172.16.1.64/28
user@R1# set 172.16.2.16/28
user@R1# set 172.16.2.32/28
user@R1# set 172.16.2.48/28
user@R1# set 172.16.2.64/28
user@R1# set 172.16.3.16/28
user@R1# set 172.16.3.32/28
user@R1# set 172.16.3.48/28
user@R1# set 172.16.3.64/28
```
6. Configure the routing policy that references the prefix list as a match criterion.  

```
[edit policy-options policy-statement customer-routes term get-routes]
user@R1# set from prefix-list 64510-customers
user@R1# set then accept

[edit policy-options policy-statement customer-routes term others]
user@R1# set then reject
```
7. Configure the static route to the 172.16.5.0/24 network.  

```
[edit routing-options static]
user@R1# set route 172.16.1.16/28 discard
user@R1# set route 172.16.1.32/28 discard
user@R1# set route 172.16.1.48/28 discard
user@R1# set route 172.16.1.64/28 discard
```
8. Configure the autonomous system (AS) number and router ID.  

```
[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 64510
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-1/2/0 {
  unit 0 {
    description to_R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
```

```

    }
  }
  fe-1/2/2 {
    unit 0 {
      description to_R3;
      family inet {
        address 10.0.0.5/30;
      }
    }
  }
  fe-1/2/3 {
    unit 0 {
      description to_R4;
      family inet {
        address 10.1.0.5/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 192.168.0.1/32;
      }
    }
  }
}

user@R1# show protocols
bgp {
  group int {
    type internal;
    local-address 192.168.0.1;
    neighbor 192.168.0.2;
    neighbor 192.168.0.3;
  }
  group to_64511 {
    type external;
    export customer-routes;
    neighbor 10.1.0.6 {
      peer-as 64511;
    }
  }
}

ospf {
  area 0.0.0.0 {
    interface fe-1/2/0.0;
    interface fe-1/2/2.0;
    interface lo0.0 {
      passive;
    }
  }
}

user@R1# show policy-options
prefix-list 64510-customers {
  172.16.1.16/28;
  172.16.1.32/28;
  172.16.1.48/28;
}

```

```
172.16.1.64/28;
172.16.2.16/28;
172.16.2.32/28;
172.16.2.48/28;
172.16.2.64/28;
172.16.3.16/28;
172.16.3.32/28;
172.16.3.48/28;
172.16.3.64/28;
}
policy-statement customer-routes {
  term get-routes {
    from {
      prefix-list 64510-customers;
    }
    then accept;
  }
  term others {
    then reject;
  }
}

user@R1# show routing-options
static {
  route 172.16.1.16/28 discard;
  route 172.16.1.32/28 discard;
  route 172.16.1.48/28 discard;
  route 172.16.1.64/28 discard;
}
router-id 192.168.0.1;
autonomous-system 64510;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Routes on Device R1 on page 244](#)
- [Verifying the Route Advertisement to Device R4 on page 245](#)
- [Experimenting with the prefix-list-filter Statement on page 246](#)

### Verifying the Routes on Device R1

---

**Purpose** On Device R1, check the routes in the routing table.

**Action** user@R1> `show route terse 172.16/16`

inet.0: 26 destinations, 26 routes (26 active, 0 holddown, 0 hidden)  
 + = Active Route, - = Last Active, \* = Both

| A | V | Destination    | P | Prf | Metric 1 | Metric 2 | Next hop  | AS path |
|---|---|----------------|---|-----|----------|----------|-----------|---------|
| * | ? | 172.16.1.16/28 | S | 5   |          |          | Discard   |         |
| * | ? | 172.16.1.32/28 | S | 5   |          |          | Discard   |         |
| * | ? | 172.16.1.48/28 | S | 5   |          |          | Discard   |         |
| * | ? | 172.16.1.64/28 | S | 5   |          |          | Discard   |         |
| * | ? | 172.16.2.1/32  | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.2 |         |
| * | ? | 172.16.2.16/28 | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.2 |         |
| * | ? | 172.16.2.32/28 | B | 170 | 100      |          |           | I       |

| * | ? | 172.16.3.1/32  | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.6 |         |
| * | ? | 172.16.3.16/28 | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.6 |         |
| * | ? | 172.16.3.32/28 | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.6 |         |
| * | ? | 172.16.3.48/28 | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.6 |         |
| * | ? | 172.16.3.64/28 | B | 170 | 100      |          |           | I       |
|   |   | unverified     |   |     |          |          | >10.0.0.6 |         |

**Meaning** Device R1 has learned its own static routes (S) and the BGP routes from Devices R2 and R3 (B).

#### Verifying the Route Advertisement to Device R4

**Purpose** On Device R1, make sure that the customer routes are advertised to Device R4.

**Action** user@R1> show route advertising-protocol bgp 10.1.0.6

```
inet.0: 26 destinations, 26 routes (26 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 172.16.1.16/28    Self              I
* 172.16.1.32/28    Self              I
* 172.16.1.48/28    Self              I
* 172.16.1.64/28    Self              I
* 172.16.2.16/28    Self              I
* 172.16.2.32/28    Self              I
* 172.16.2.48/28    Self              I
* 172.16.2.64/28    Self              I
* 172.16.3.16/28    Self              I
* 172.16.3.32/28    Self              I
* 172.16.3.48/28    Self              I
* 172.16.3.64/28    Self              I
```

**Meaning** As expected, only the routes from the customer prefix list are advertised to Device R4.

### Experimenting with the prefix-list-filter Statement

**Purpose** See what can happen when you use **prefix-list-filter** instead of **prefix-list**.

**Action** 1. On Device R2, add a static route that is longer than one of the existing static routes.

```
[edit routing-options static route]
user@R2# set 172.16.2.65/32 discard
user@R2# commit
```

2. On Device R1, deactivate the prefix list and configure a prefix list filter with the **orlonger** match type.

```
[edit policy-options policy-statement customer-routes term get-routes]
user@R1# deactivate from prefix-list 64510-customers
user@R1# set from prefix-list-filter 64510-customers orlonger
user@R1# commit
```

3. On Device R1, check which routes are advertised to Device R4.

```
user@R1> show route advertising-protocol bgp 10.1.0.6

inet.0: 27 destinations, 27 routes (27 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 172.16.1.16/28    Self              I
* 172.16.1.32/28    Self              I
* 172.16.1.48/28    Self              I
* 172.16.1.64/28    Self              I
* 172.16.2.16/28    Self              I
* 172.16.2.32/28    Self              I
* 172.16.2.48/28    Self              I
* 172.16.2.64/28    Self              I
* 172.16.2.65/32    Self              I
* 172.16.3.16/28    Self              I
* 172.16.3.32/28    Self              I
* 172.16.3.48/28    Self              I
* 172.16.3.64/28    Self              I
```

**Meaning** As expected, Device R1 is now advertising the 172.16.2.65/32 route to Device R4, even though 172.16.2.65/32 is not in the prefix list.

## Understanding AS Path Regular Expressions for Use as Routing Policy Match Conditions

A BGP AS *path* is a path to a destination. It is a route attribute used by BGP for both for route selection and to prevent potential routing loops. You can define regular expressions and use those expressions to locate a set of routes. An AS path consists of the AS numbers of networks that a packet traverses if it takes the associated route to a destination. The AS numbers are assembled in a sequence, or path, that is read from right to left. For example, for a packet to reach a destination using a route with an AS path 5 4 3 2 1, the packet first traverses AS 1 and so on until it reaches AS 5, which is the last AS before its destination.

You can define a match condition based on all or portions of the AS path. To do this, you create a named AS path regular expression and then include it in a routing policy.

The following sections discuss the following tasks for configuring AS path regular expressions and provides the following examples:

- [Configuration of AS Path Regular Expressions on page 249](#)
- [How AS Path Regular Expressions Are Evaluated on page 254](#)
- [Examples: Configuring AS Path Regular Expressions on page 254](#)

## Configuration of AS Path Regular Expressions

You can create a named AS path regular expression and then include it in a routing policy with the **as-path** match condition (described in [“Routing Policy Match Conditions” on page 40](#)). To create a named AS path regular expression, include the **as-path** statement:

[edit policy-options]

**as-path** *name regular-expression*;

To include the AS path regular expression in a routing policy, include the **as-path** match condition in the **from** statement.

Additionally, you can create a named AS path group made up of AS path regular expressions and then include it in a routing policy with the **as-path-group** match condition. To create a named AS path group, include the **as-path-group** statement.

```
[edit policy-options]
  as-path-group group-name {
    name [ regular-expressions ];
  }
```

To include the AS path regular expressions within the AS path group in a routing policy, include the **as-path-group** match condition in the **from** statement.

**NOTE:** You cannot include both of the **as-path** and **as-path-group** statements in the same policy term.

**NOTE:** You can include the names of multiple AS path regular expressions in the **as-path** match condition in the **from** statement. If you do this, only one AS path regular expression needs to match for a match to occur. The AS path regular expression matching is effectively a logical OR operation.

The AS path name identifies the regular expression. It can contain letters, numbers, and hyphens (-), and can be up to 65,536 characters. To include spaces in the name, enclose the entire name in quotation marks (" ").

The regular expression is used to match all or portions of the AS path. It consists of two components, which you specify in the following format:

**term** <operator>

- **term**—Identifies an AS. You can specify it in one of the following ways:
  - AS number—The entire AS number composes one term. You cannot reference individual characters within an AS number, which differs from regular expressions as defined in POSIX 1003.2.
  - Wildcard character—Matches any single AS number. The wildcard character is a period (.). You can specify multiple wildcard characters.
  - AS path—A single AS number or a group of AS numbers enclosed in parentheses. Grouping the regular expression in this way allows you to perform a common operation on the group as a whole and to give the group precedence. The grouped path can itself include operators.

In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS

numbers that are supported in earlier releases of the Junos OS. You can configure a value in the range from 1 through 4,294,967,295.

- **operator**—(Optional) An operator specifying how the term must match. Most operators describe how many times the term must be found to be considered a match (for example, any number of occurrences, or zero, or one occurrence). [Table 21 on page 251](#) lists the regular expression operators supported for AS paths. You place operators immediately after **term** with no intervening space, except for the pipe ( | ) and dash (–) operators, which you place between two terms, and parentheses, with which you enclose terms.

You can specify one or more term–operator pairs in a single regular expression.

[Table 22 on page 252](#) shows examples of how to define regular expressions to match AS paths.

**Table 21: AS Path Regular Expression Operators**

| Operator     | Match Definition                                                                                                                                                                                                                                |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>{m,n}</b> | At least <i>m</i> and at most <i>n</i> repetitions of <b>term</b> . Both <i>m</i> and <i>n</i> must be positive integers, and <i>m</i> must be smaller than <i>n</i> .                                                                          |
| <b>{m}</b>   | Exactly <i>m</i> repetitions of <b>term</b> . <i>m</i> must be a positive integer.                                                                                                                                                              |
| <b>{m,}</b>  | <i>m</i> or more repetitions of <b>term</b> . <i>m</i> must be a positive integer.                                                                                                                                                              |
| <b>*</b>     | Zero or more repetitions of <b>term</b> . This is equivalent to {0,}.                                                                                                                                                                           |
| <b>+</b>     | One or more repetitions of <b>term</b> . This is equivalent to {1,}.                                                                                                                                                                            |
| <b>?</b>     | Zero or one repetition of <b>term</b> . This is equivalent to {0,1}.                                                                                                                                                                            |
| <b> </b>     | One of two terms on either side of the pipe.                                                                                                                                                                                                    |
| <b>–</b>     | Between a starting and ending range, inclusive.                                                                                                                                                                                                 |
| <b>^</b>     | A character at the beginning of a community attribute regular expression. This character is added implicitly; therefore, the use of it is optional.                                                                                             |
| <b>\$</b>    | A character at the end of a community attribute regular expression. This character is added implicitly; therefore, the use of it is optional.                                                                                                   |
| <b>( )</b>   | A group of terms that are enclosed in the parentheses. Intervening space between the parentheses and the terms is ignored. If a set of parentheses is enclosed in quotation marks with no intervening space "()", it is treated as a null path. |
| <b>[ ]</b>   | Set of AS numbers. One AS number from the set must match. To specify the start and end of a range, use a hyphen (-). A caret (^) may be used to indicate that it does not match a particular AS number in the set. For example, [ ^123].        |

Table 22: Examples of AS Path Regular Expressions

| AS Path to Match                                                                         |
|------------------------------------------------------------------------------------------|
| AS path is 1234                                                                          |
| Zero or more occurrences of AS number 1234                                               |
| Zero or one occurrence of AS number 1234                                                 |
| One through four occurrences of AS number 1234                                           |
| One through four occurrences of AS number 12, followed by one occurrence of AS number 34 |
| Range of AS numbers to match a single AS number                                          |
| Path whose second AS number must be 56 or 78                                             |

Table 22: Examples of AS Path Regular Expressions (*continued*)

| AS Path to Match                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------|
| Path whose second AS number might be 56 or 78                                                                                                  |
| Path whose first AS number is 123 and second AS number is either 56 or 78                                                                      |
| Path of any length, except nonexistent, whose second AS number can be anything, including nonexistent                                          |
| AS path is 1 2 3                                                                                                                               |
| One occurrence of the AS numbers 1 and 2, followed by one or more occurrences of the AS number 3                                               |
| One or more occurrences of AS number 1, followed by one or more occurrences of AS number 2, followed by one or more occurrences of AS number 3 |
| Path of any length that begins with AS numbers 4, 5, 6                                                                                         |
| Path of any length that ends with AS numbers 4, 5, 6                                                                                           |
| AS path 5, 12, or 18                                                                                                                           |

### Configuring a Null AS Path

You can use AS path regular expressions to create a null AS path that matches routes (prefixes) that have originated in your AS. These routes have not been advertised to your AS by any external peers. To create a null AS path, use the parentheses operator enclosed in quotation marks with no intervening spaces:

"()"

In the following example, locally administered AS 2 is connected to AS 1 (10.2.2.6) and AS 3. AS 3 advertises its routes to AS 2, but the administrator for AS 2 does not want to advertise AS 3 routes to AS 1 and thereby allow transit traffic from AS 1 to AS 3 through AS 2. To prevent transit traffic, the export policy **only-my-routes** is applied to AS 1. It permits advertisement of routes from AS 2 to AS 1 but prevents advertisement of routes for AS 3 (or routes for any other connected AS) to AS 1:

```
[edit policy-options]
null-as "()";
policy-statement only-my-routes {
  term just-my-as {
    from {
      protocol bgp;
      as-path null-as;
    }
    then accept;
  }
  term nothing-else {
    then reject;
  }
}
protocol {
  bgp {
    neighbor 10.2.2.6 {
      export only-my-routes;
    }
  }
}
```

## How AS Path Regular Expressions Are Evaluated

AS path regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2. They are identical to the UNIX regular expressions with the following exceptions:

- The basic unit of matching in an AS path regular expression is the AS number and not an individual character.
- A regular expression matches a route only if the AS path in the route exactly matches **regular-expression**. The equivalent UNIX regular expression is **^regular-expression\$**. For example, the AS path regular expression **1234** is equivalent to the UNIX regular expression **^1234\$**.
- You can specify a regular expression using wildcard operators.

## Examples: Configuring AS Path Regular Expressions

Exactly match routes with the AS path 1234 56 78 9 and accept them:

```
[edit]
policy-options {
  as-path wellington "1234 56 78 9";
  policy-statement from-wellington {
    term term1 {
```

```

        from as-path wellington;
    }
    then {
        preference 200;
        accept;
    }
    term term2 {
        then reject;
    }
}

```

Match alternate paths to an AS and accept them after modifying the preference:

```

[edit]
policy-options {
    as-path wellington-alternate "1234{1,6} (56|47)? (78|101|112)* 9+";
    policy-statement from-wellington {
        from as-path wellington-alternate;
    }
    then {
        preference 200;
        accept;
    }
}

```

Match routes with an AS path of 123, 124, or 125 and accept them after modifying the preference:

```

[edit]
policy-options {
    as-path addison "123-125";
    policy-statement from-addison {
        from as-path addison;
    }
    then {
        preference 200;
        accept;
    }
}

```

#### Related Documentation

- [Configuration on page 257](#)
- [Verification on page 262](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

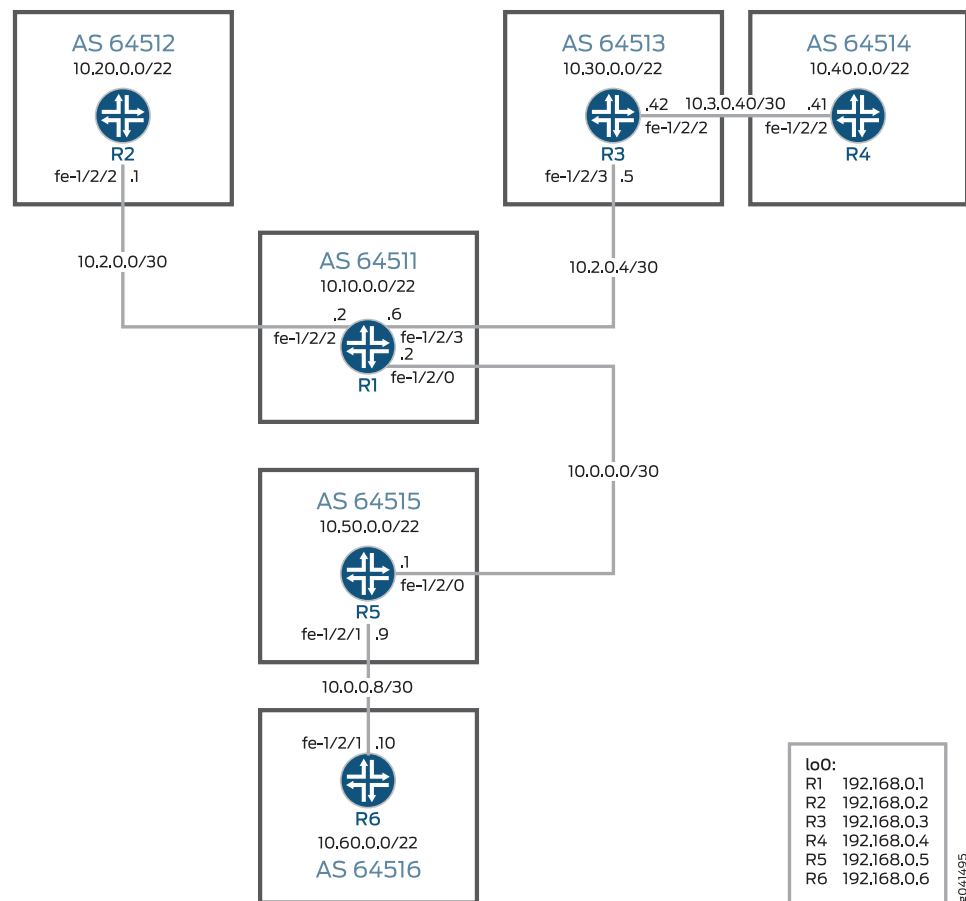

## Overview

Figure 28 on page 256 shows several ASs connected through external BGP (EBGP) peering sessions. Each device is generating customer routes within its assigned address space.

### Topology

Figure 28 on page 256 shows the sample network.

Figure 28: BGP Topology AS Regular Expressions

The administrators of AS 64516 want to reject all routes originating in AS 64513 and AS 64514. Two AS path regular expressions called **orig-in-64513** and **orig-in-64514** are created and referenced in a policy called **reject-some-routes**. The routing policy is then applied as an import policy on Device R6.

[“CLI Quick Configuration” on page 257](#) shows the configuration for all of the devices in [Figure 28 on page 256](#).

The section [“Step-by-Step Procedure” on page 259](#) describes the steps on Device R2 and Device R6. [“Verification” on page 262](#) shows how to use the **aspath-regex** option with the **show route** command on Device R2 to locate routes using regular expressions.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set routing-options static route 10.60.3.0/24 reject
set routing-options autonomous-system 64516

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the device interfaces.

```

[edit interfaces]
user@R2# set fe-1/2/2 unit 0 description to-R1
user@R2# set fe-1/2/2 unit 0 family inet address 10.2.0.1/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32

```

2. Configure the EBGP connection to Device R1.

```

[edit protocols bgp]
user@R2# set export send-static
user@R2# set group 64511 type external
user@R2# set group 64511 peer-as 64511
user@R2# set group 64511 neighbor 10.2.0.2

```

3. Configure the routing policy.

```

[edit policy-options policy-statement send-static term 1]
user@R2# set from protocol static
user@R2# set then accept

```

4. Configure the static routes.

```

[edit routing-options static]
user@R2# set route 10.20.1.0/24 reject
user@R2# set route 10.20.2.0/24 reject
user@R2# set route 10.20.3.0/24 reject

```

5. Configure the AS number.

```

[edit routing-options]
user@R2# set autonomous-system 64512

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R6:

1. Configure the device interfaces.

```
[edit interfaces]
user@R6# set fe-1/2/1 unit 0 description to-R5
user@R6# set fe-1/2/1 unit 0 family inet address 10.0.0.10/30

user@R6# set lo0 unit 0 family inet address 192.168.0.6/32
```

2. Configure the EBGP connection to Device R5.

```
[edit protocols bgp]
user@R6# set export send-static
user@R6# set group 64515 type external
user@R6# set group 64515 import reject-some-routes
user@R6# set group 64515 peer-as 64515
user@R6# set group 64515 neighbor 10.0.0.9
```

3. Configure the routing policy that sends static routes.

```
[edit policy-options policy-statement send-static term 1]
user@R6# set from protocol static
user@R6# set then accept
```

4. Configure the routing policy that rejects certain routes.

```
[edit policy-options policy-statement reject-some-routes term find-routes]
user@R6# set from as-path orig-in-64513
user@R6# set from as-path orig-in-64514
user@R6# set then reject
```

```
[edit policy-options]
user@R6# set as-path orig-in-64513 ".* 64513"
user@R6# set as-path orig-in-64514 ".* 64514"
```

5. Configure the static routes.

```
[edit routing-options static]
user@R6# set route 10.60.1.0/24 reject
user@R6# set route 10.60.2.0/24 reject
user@R6# set route 10.60.3.0/24 reject
```

6. Configure the AS number.

```
[edit routing-options]
user@R6# set autonomous-system 64516
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Device R2** user@R2# show interfaces

```

- [Making Sure That Routes Are Excluded on Device R6 on page 264](#)

---

### Finding Routes on Device R2

**Purpose** On Device R2, use the [show route aspath-regex](#) command to locate routes using regular expressions.

**Action** Look for routes that are originated by Device R6 in AS 64516.

```
user@R2> show route terse aspath-regex ".* 64516"
```

```
inet.0: 21 destinations, 21 routes (21 active, 0 holddown, 0 hidden)
```

+ = Active Route, - = Last Active, \* = Both

| A     | V | Destination  | P | Prf | Metric 1 | Metric 2 | Next hop  | AS path     |
|-------|---|--------------|---|-----|----------|----------|-----------|-------------|
| *     | ? | 10.60.1.0/24 | B | 170 | 100      |          |           | 64511 64515 |
| 64516 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.60.2.0/24 | B | 170 | 100      |          |           | 64511 64515 |
| 64516 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.60.3.0/24 | B | 170 | 100      |          |           | 64511 64515 |
| 64516 | I | unverified   |   |     |          |          | >10.2.0.2 |             |

Look for routes that are originated in either AS 64514 or AS 64516.

```
user@R2> show route terse aspath-regex ".*(64514|64516)"
```

inet.0: 21 destinations, 21 routes (21 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

| A     | V | Destination  | P | Prf | Metric 1 | Metric 2 | Next hop  | AS path     |
|-------|---|--------------|---|-----|----------|----------|-----------|-------------|
| *     | ? | 10.40.1.0/24 | B | 170 | 100      |          |           | 64511 64513 |
| 64514 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.40.2.0/24 | B | 170 | 100      |          |           | 64511 64513 |
| 64514 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.40.3.0/24 | B | 170 | 100      |          |           | 64511 64513 |
| 64514 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.60.1.0/24 | B | 170 | 100      |          |           | 64511 64515 |
| 64516 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.60.2.0/24 | B | 170 | 100      |          |           | 64511 64515 |
| 64516 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.60.3.0/24 | B | 170 | 100      |          |           | 64511 64515 |
| 64516 | I | unverified   |   |     |          |          | >10.2.0.2 |             |

Look for routes that use AS 64513 as a transit network.

```
user@R2> show route terse aspath-regex ".*64513.+"
```

inet.0: 21 destinations, 21 routes (21 active, 0 holddown, 0 hidden)  
+ = Active Route, - = Last Active, \* = Both

| A     | V | Destination  | P | Prf | Metric 1 | Metric 2 | Next hop  | AS path     |
|-------|---|--------------|---|-----|----------|----------|-----------|-------------|
| *     | ? | 10.40.1.0/24 | B | 170 | 100      |          |           | 64511 64513 |
| 64514 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.40.2.0/24 | B | 170 | 100      |          |           | 64511 64513 |
| 64514 | I | unverified   |   |     |          |          | >10.2.0.2 |             |
| *     | ? | 10.40.3.0/24 | B | 170 | 100      |          |           | 64511 64513 |
| 64514 | I | unverified   |   |     |          |          |           |             |

**Meaning** The output shows the routing table entries that match the specified AS path regular expressions.

### Making Sure That Routes Are Excluded on Device R6

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Purpose</b>               | On Device R6, use the <a href="#">show route</a> and <a href="#">show route hidden</a> commands to make sure that routes originating from AS 64513 and AS 64514 are excluded from Device R6's routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Understanding Prepending AS Numbers to BGP AS Paths

You can *prepend* one or more autonomous system (AS) numbers at the beginning of an AS path. The AS numbers are added at the beginning of the path after the actual AS

number from which the route originates has been added to the path. Prepending an AS path makes a shorter AS path look longer and therefore less preferable to BGP.

The BGP best path algorithm determines how the best path to an autonomous system (AS) is selected. The AS path length determines the best path when all of the following conditions are met:

- There are multiple potential routes to an AS.
- BGP has the lowest preference value (sometimes referred to as administrative distance) of the available routes.
- The local preferences of the available routes are equal.

When these conditions are met, the AS path length is used as the tie breaker in the best path algorithm. When two or more routes exist to reach a particular prefix, BGP prefers the route with the shortest AS Path length.

If you are an enterprise that has multihoming to one or more service providers, you might prefer that incoming traffic take a particular path to reach your network. Perhaps you have two connections, but one costs less than the other. Or you might have one fast connection and another, much slower connection that you only want to use as a backup if your primary connection is down. AS path prepending is an easy method that you can use to influence inbound routing to your AS.

In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295.

If you have a router that does not support 4-byte AS numbers in the AS path, the prepended AS number displayed in the AS path is the AS\_TRANS number, AS 23456. To display the route details, use the *show route* command.

## Example: Configuring a Routing Policy to Prepend the AS Path

---

This example shows how to configure a routing policy to prepend the AS path.

- [Requirements on page 266](#)
- [Overview on page 266](#)
- [Configuration on page 266](#)
- [Verification on page 267](#)

## Requirements

Before you begin, configure router interfaces and configure routing protocols, as explained in *Routing Policies Configuration Overview*.

## Overview

In this example, you create a routing policy called `prependpolicy1` and a term called `prependterm1`. The routing policy prepends the AS numbers 1111 to routes that are greater than or equal to 172.16.0.0/12, 192.168.0.0/16, and 10.0.0.0/8. The policy is applied as an import policy to all BGP routes and is evaluated when routes are imported to the routing table.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options policy-statement prependpolicy1 term prependterm1 from route-filter
  172.16.0.0/12 orlonger
set policy-options policy-statement prependpolicy1 term prependterm1 from route-filter
  192.168.0.0/16 orlonger
set policy-options policy-statement prependpolicy1 term prependterm1 from route-filter
  10.0.0.0/8 orlonger
set policy-options policy-statement prependpolicy1 term prependterm1 then
  as-path-prepend "1111"
set policy-options policy-statement test term 1 from protocol direct
set protocols bgp import prependpolicy1
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To create a routing policy that prepends AS numbers to multiple routes:

1. Create the routing policy.

```
[edit]
user@host# edit policy-options policy-statement prependpolicy1
```

2. Create the routing term.

```
[edit policy-options policy-statement prependpolicy1]
user@host# edit term prependterm1
```

3. Specify the routes to prepend with AS numbers.

```
[edit policy-options policy-statement prependpolicy1 term prependterm1]
user@host# set from route-filter 172.16.0.0/12 orlonger
user@host# set from route-filter 192.168.0.0/16 orlonger
user@host# set from route-filter 10.0.0.0/8 orlonger
```

4. Specify the AS numbers to prepend.

```
[edit policy-options policy-statement prependpolicy1 term prependterm1]
user@host# set then as-path-prepend "1111"
```

**NOTE:** If you enter multiple numbers, you must separate each number with a space. Enclose the numbers in double quotation marks.

5. Apply the policy as an import policy for all BGP routes.

```
[edit]
user@host# set protocols bgp import prependpolicy1
```

**NOTE:** You can refer to the same routing policy one or more times in the same or different import statement.

**Results** Confirm your configuration by entering the **show policy-options** and **show protocols bgp** commands from configuration mode. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@host# show policy-options
policy-statement prependpolicy1 {
  term prependterm1 {
    from {
      route-filter 172.16.0.0/12 orlonger;
      route-filter 192.168.0.0/16 orlonger;
      route-filter 10.0.0.0/8 orlonger;
    }
    then as-path-prepend "1111";
  }
}
```

```
user@host# show protocols bgp
import prependpolicy1;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the AS Numbers to Prepend on page 267](#)
- [Verifying the Routing Policy on page 268](#)

### Verifying the AS Numbers to Prepend

**Purpose** Verify that the policy and term are configured on the device and that the appropriate routes are specified to prepend with AS numbers.

**Action** From operational mode, enter the **show policy-options** command.

### Verifying the Routing Policy

---

**Purpose** Verify that the routing policy is applied to the routing protocol.

**Action** From operational mode, enter the **show protocols bgp** command.

- *Routing Policies Configuration Overview*

## Understanding Adding AS Numbers to BGP AS Paths

---

You can expand or add one or more AS numbers to an AS sequence. The AS numbers are added before the local AS number has been added to the path. Expanding an AS path makes a shorter AS path look longer and therefore less preferable to BGP. The last AS number in the existing path is extracted and prepended  $n$  times, where  $n$  is a number from 1 through 32. This is similar to the AS path prepend action, except that the AS path expand action adds an arbitrary sequence of AS numbers.

For example, from AS 1 there are two equal paths (through AS 2 and AS 3) to reach AS 4. You might want packets from certain sources to use the path through AS 2. Therefore, you must make the path through AS 3 less preferable so that BGP chooses the path through AS 2. In AS 1, you can expand multiple AS numbers.

```
[edit]
policy-options {
  policy-statement as-path-expand {
    term expand {
      from {
        route-filter 192.168.0.0/16 orlonger;
        route-filter 172.16.0.0/12 orlonger;
        route-filter 10.0.0.0/8 orlonger;
      }
      then as-path-expand last-as count 4;
    }
  }
}
```

For routes from AS 2, this makes the route look like 1 2 2 2 2 2 when advertised, where 1 is from AS 1, the 2 from AS 2 is prepended four times, and the final 2 is the original 2 received from the neighbor router.

## Example: Advertising Multiple Paths in BGP

In this example, BGP routers are configured to advertise multiple paths instead of advertising only the active path. Advertising multiple paths in BGP is specified in Internet draft draft-ietf-idr-add-paths-04, *Advertisement of Multiple Paths in BGP*.

- [Requirements on page 269](#)
- [Overview on page 269](#)
- [Configuration on page 270](#)
- [Verification on page 289](#)

### Requirements

This example uses the following hardware and software components:

- Eight BGP-enabled devices.
- Five of the BGP-enabled devices do not necessarily need to be routers. For example, they can be EX Series Ethernet Switches.
- Three of the BGP-enabled devices are configured to send multiple paths or receive multiple paths (or both send and receive multiple paths). These three BGP-enabled devices must be M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers.
- The three routers must be running Junos OS Release 11.4 or later.

### Overview

The following statements are used for configuring multiple paths to a destination:

```
[edit protocols bgp group group-name family family]
add-path {
  receive;
  send {
    path-count number;
    prefix-policy [ policy-names ];
  }
}
```

In this example, Router R5, Router R6, and Router R7 redistribute static routes into BGP. Router R1 and Router R4 are route reflectors. Router R2 and Router R3 are clients to Route Reflector R1. Router R8 is a client to Route Reflector R4.

Route reflection is optional when multiple-path advertisement is enabled in BGP.

With the **add-path send path-count 6** configuration, Router R1 is configured to send up to six paths (per destination) to Router R4.

With the **add-path receive** configuration, Router R4 is configured to receive multiple paths from Router R1.

With the **add-path send path-count 6** configuration, Router R4 is configured to send up to six paths to Router R8.

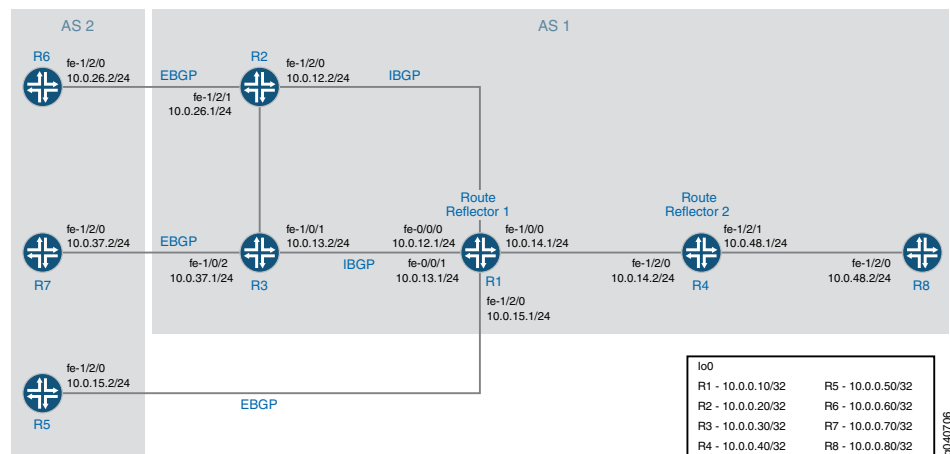

With the **add-path receive** configuration, Router R8 is configured to receive multiple paths from Router R4.

The **add-path send prefix-policy allow\_199** policy configuration (along with the corresponding route filter) limits Router R4 to sending multiple paths for only the 199.1.1.1/32 route.

### Topology Diagram

Figure 29 on page 270 shows the topology used in this example.

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Router R1**     **set interfaces fe-0/0/0 unit 12 family inet address 10.0.12.1/24**

```

set interfaces fe-0/0/1 unit 13 family inet address 10.0.13.1/24
set interfaces fe-1/0/0 unit 14 family inet address 10.0.14.1/24
set interfaces fe-1/2/0 unit 15 family inet address 10.0.15.1/24
set interfaces lo0 unit 10 family inet address 10.0.0.10/32
set protocols bgp group rr type internal
set protocols bgp group rr local-address 10.0.0.10
set protocols bgp group rr cluster 10.0.0.10
set protocols bgp group rr neighbor 10.0.0.20
set protocols bgp group rr neighbor 10.0.0.30
set protocols bgp group e1 type external
set protocols bgp group e1 neighbor 10.0.15.2 local-address 10.0.15.1
set protocols bgp group e1 neighbor 10.0.15.2 peer-as 2
set protocols bgp group rr_rr type internal
set protocols bgp group rr_rr local-address 10.0.0.10
set protocols bgp group rr_rr neighbor 10.0.0.40 family inet unicast add-path send

set routing-options autonomous-system 1

```

### Configuring Router R1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1:

1. Configure the interfaces to Router R2, Router R3, Router R4, and Router R5, and configure the loopback (lo0) interface.

```

[edit interfaces]
user@R1# set fe-0/0/0 unit 12 family inet address 10.0.12.1/24

user@R1# set fe-0/0/1 unit 13 family inet address 10.0.13.1/24

user@R1# set fe-1/0/0 unit 14 family inet address 10.0.14.1/24

user@R1# set fe-1/2/0 unit 15 family inet address 10.0.15.1/24

user@R1# set lo0 unit 10 family inet address 10.0.0.10/32

```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```

[edit protocols bgp]
user@R1# set group rr type internal
user@R1# set group rr local-address 10.0.0.10
user@R1# set group rr cluster 10.0.0.10
user@R1# set group rr neighbor 10.0.0.20
user@R1# set group rr neighbor 10.0.0.30

user@R1# set group rr_rr type internal
user@R1# set group rr_rr local-address 10.0.0.10

user@R1# set group e1 type external
user@R1# set group e1 neighbor 10.0.15.2 local-address 10.0.15.1
user@R1# set group e1 neighbor 10.0.15.2 peer-as 2

```

3. Configure Router R1 to send up to six paths to its neighbor, Router R4.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```

[edit protocols bgp]
user@R1# set group rr_rr neighbor 10.0.0.40 family inet unicast add-path send
path-count 6

```

4. Configure OSPF on the interfaces.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface lo0.10 passive
user@R1# set area 0.0.0.0 interface fe-0/0/0.12
user@R1# set area 0.0.0.0 interface fe-0/0/1.13
user@R1# set area 0.0.0.0 interface fe-1/0/0.14
user@R1# set area 0.0.0.0 interface fe-1/2/0.15
```

5. Configure the router ID and the autonomous system number.

```
[edit routing-options]
user@R1# set router-id 10.0.0.10
user@R1# set autonomous-system 1
```

6. If you are done configuring the device, commit the configuration.

```
user@R1# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
fe-0/0/0 {
  unit 12 {
    family inet {
      address 10.0.12.1/24;
    }
  }
}
fe-0/0/1 {
  unit 13 {
    family inet {
      address 10.0.13.1/24;
    }
  }
}
fe-1/0/0 {
  unit 14 {
    family inet {
      address 10.0.14.1/24;
    }
  }
}
fe-1/2/0 {
  unit 15 {
    family inet {
      address 10.0.15.1/24;
    }
  }
}
lo0 {
  unit 10 {
    family inet {
```

```

        address 10.0.0.10/32;
    }
}
}

user@R1# show protocols
bgp {
    group rr {
        type internal;
        local-address 10.0.0.10;
        cluster 10.0.0.10;
        neighbor 10.0.0.20;
        neighbor 10.0.0.30;
    }
    group e1 {
        type external;
        neighbor 10.0.15.2 {
            local-address 10.0.15.1;
            peer-as 2;
        }
    }
    group rr_rr {
        type internal;
        local-address 10.0.0.10;
        neighbor 10.0.0.40 {
            family inet {
                unicast {
                    add-path {
                        send {
                            path-count 6;
                        }
                    }
                }
            }
        }
    }
}
}

ospf {
    area 0.0.0.0 {
        interface lo0.10 {
            passive;
        }
        interface fe-0/0/0.12;
        interface fe-0/0/1.13;
        interface fe-1/0/0.14;
        interface fe-1/2/0.15;
    }
}

user@R1# show routing-options
router-id 10.0.0.10;
autonomous-system 1;

```

## Configuring Router R2

### Step-by-Step Procedure

To configure Router R2:

1. Configure the loopback (lo0) interface and the interfaces to Router R6 and Router R1.

```
[edit interfaces]
```

```
user@R2# set fe-1/2/0 unit 21 family inet address 10.0.12.2/24
```

```
user@R2# set fe-1/2/1 unit 26 family inet address 10.0.26.1/24
```

```
user@R2# set lo0 unit 20 family inet address 10.0.0.20/32
```

2. Configure BGP and OSPF on Router R2's interfaces.

```
[edit protocols]
```

```
user@R2# set bgp group rr type internal
```

```
user@R2# set bgp group rr local-address 10.0.0.20
```

```
user@R2# set bgp group e1 type external
```

```
user@R2# set bgp group e1 neighbor 10.0.26.2 peer-as 2
```

```
user@R2# set ospf area 0.0.0.0 interface lo0.20 passive
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/0.21
```

```
user@R2# set ospf area 0.0.0.0 interface fe-1/2/1.28
```

3. For routes sent from Router R2 to Router R1, advertise Router R2 as the next hop, because Router R1 does not have a route to Router R6's address on the 10.0.26.0/24 network.

```
[edit]
```

```
user@R2# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R2# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R2# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
```

```
fe-1/2/0 {
```

```
  unit 21 {
```

```
    family inet {
```

```
      address 10.0.12.2/24;
```

```

    }
  }
}
fe-1/2/1 {
  unit 26 {
    family inet {
      address 10.0.26.1/24;
    }
  }
}
lo0 {
  unit 20 {
    family inet {
      address 10.0.0.20/32;
    }
  }
}
}

user@R2# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.20;
    neighbor 10.0.0.10 {
      export set_nh_self;
    }
  }
  group e1 {
    type external;
    neighbor 10.0.26.2 {
      peer-as 2;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.20 {
      passive;
    }
    interface fe-1/2/0.21;
    interface fe-1/2/1.28;
  }
}

user@R2# show policy-options
policy-statement set_nh_self {
  then {
    next-hop self;
  }
}

user@R2# show routing-options
autonomous-system 1;

```

### Configuring Router R3

#### Step-by-Step Procedure

To configure Router R3:

1. Configure the loopback (lo0) interface and the interfaces to Router R7 and Router R1.

```
[edit interfaces]
```

```
user@R3# set fe-1/0/1 unit 31 family inet address 10.0.13.2/24
```

```
user@R3# set fe-1/0/2 unit 37 family inet address 10.0.37.1/24
```

```
user@R3# set lo0 unit 30 family inet address 10.0.0.30/32
```

2. Configure BGP and OSPF on Router R3's interfaces.

```
[edit protocols]
```

```
user@R3# set bgp group rr type internal
```

```
user@R3# set bgp group rr local-address 10.0.0.30
```

```
user@R3# set bgp group e1 type external
```

```
user@R3# set bgp group e1 neighbor 10.0.37.2 peer-as 2
```

```
user@R3# set ospf area 0.0.0.0 interface lo0.30 passive
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/1.31
```

```
user@R3# set ospf area 0.0.0.0 interface fe-1/0/2.37
```

3. For routes sent from Router R3 to Router R1, advertise Router R3 as the next hop, because Router R1 does not have a route to Router R7's address on the 10.0.37.0/24 network.

```
[edit]
```

```
user@R3# set policy-options policy-statement set_nh_self then next-hop self
```

```
user@R3# set protocols bgp group rr neighbor 10.0.0.10 export set_nh_self
```

4. Configure the autonomous system number.

```
[edit]
```

```
user@R3# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R3# commit
```

#### Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
```

```
fe-1/0/1 {
```

```
  unit 31 {
```

```
    family inet {
```

```
      address 10.0.13.2/24;
```

```
    }  
  }  
}  
fe-1/0/2 {  
  unit 37 {  
    family inet {  
      address 10.0.37.1/24;  
    }  
  }  
}  
lo0 {  
  unit 30 {  
    family inet {  
      address 10.0.0.30/32;  
    }  
  }  
}  
}

    next-hop self;  
  }  
}  
user@R3# show routing-options  
autonomous-system 1;
```

## Configuring Router R4

### Step-by-Step Procedure

To configure Router R4:

1. Configure the interfaces to Router R1 and Router R8, and configure the loopback (lo0) interface.

```
[edit interfaces]
```

```
user@R4# set fe-1/2/0 unit 41 family inet address 10.0.14.2/24
```

```
user@R4# set fe-1/2/1 unit 48 family inet address 10.0.48.1/24
```

```
user@R4# set lo0 unit 40 family inet address 10.0.0.40/32
```

2. Configure BGP on the interfaces, and configure IBGP route reflection.

```
[edit protocols bgp]
```

```
user@R4# set group rr type internal
```

```
user@R4# set group rr local-address 10.0.0.40
```

```
user@R4# set group rr neighbor 10.0.0.10
```

```
user@R4# set group rr_client type internal
```

```
user@R4# set group rr_client local-address 10.0.0.40
```

```
user@R4# set group rr_client cluster 10.0.0.40
```

3. Configure Router R4 to send up to six paths to its neighbor, Router R8.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```
[edit protocols bgp]
```

```
user@R4# set group rr_client neighbor 10.0.0.80 family inet unicast add-path send path-count 6
```

4. Configure Router R4 to receive multiple paths from its neighbor, Router R1.

The destination of the paths can be any destination that Router R1 can reach through multiple paths.

```
[edit protocols bgp group rr family inet unicast]
```

```
user@R4# set add-path receive
```

5. Configure OSPF on the interfaces.

```
[edit protocols ospf area 0.0.0.0]
```

```
user@R4# set interface fe-1/2/0.41
```

```
user@R4# set interface lo0.40 passive
```

```
user@R4# set interface fe-1/2/1.48
```

6. Configure a policy that allows Router R4 to send Router R8 multiple paths to the 199.1.1.1/32 route.

- Router R4 receives multiple paths for the 198.1.1.1/32 route and the 199.1.1.1/32 route. However, because of this policy, Router R4 only sends multiple paths for the 199.1.1.1/32 route.

```
[edit protocols bgp group rr_client neighbor 10.0.0.80 family inet unicast]
```

```

user@R4# set add-path send prefix-policy allow_199
[edit policy-options policy-statement allow_199]
user@R4# set from route-filter 199.1.1.1/32 exact
user@R4# set then accept

```

- Router R4 can also be configured to send up-to 20 BGP **add-path** routes for a subset of *add-path advertised prefixes*.

```

[edit policy-options policy-statement allow_199]
user@R4# set term match_199 from prefix-list match_199
user@R4# set then add-path send-count 20

```

7. Configure the autonomous system number.

```

[edit routing-options]
user@R4# set autonomous-system 1

```

8. If you are done configuring the device, commit the configuration.

```

user@R4# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

        prefix-list match_199;
    }
    then add-path send-count 20;
    then accept;
}

user@R4# show routing-options
autonomous-system 1;

```

### Configuring Router R5

#### Step-by-Step Procedure

To configure Router R5:

1. Configure the loopback (lo0) interface and the interface to Router R1.

[edit interfaces]

```
user@R5# set fe-1/2/0 unit 51 family inet address 10.0.15.2/24
```

```
user@R5# set lo0 unit 50 family inet address 10.0.0.50/32
```

2. Configure BGP on Router R5's interface.

```
[edit protocols bgp group e1]
user@R5# set type external
user@R5# set neighbor 10.0.15.1 peer-as 1
```

3. Create static routes for redistribution into BGP.

```
[edit routing-options]
user@R5# set static route 199.1.1.1/32 reject
user@R5# set static route 198.1.1.1/32 reject
```

4. Redistribute static and direct routes into BGP.

```
[edit protocols bgp group e1 neighbor 10.0.15.1]
user@R5# set export s2b
```

```
[edit policy-options policy-statement s2b]
user@R5# set from protocol static
user@R5# set from protocol direct
user@R5# set then as-path-expand 2
user@R5# set then accept
```

5. Configure the autonomous system number.

```
[edit routing-options]
user@R5# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R5# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R5# show interfaces
fe-1/2/0 {
  unit 51 {
    family inet {
      address 10.0.15.2/24;
    }
  }
}
lo0 {
  unit 50 {
    family inet {
      address 10.0.0.50/32;
    }
  }
}

user@R5# show protocols

    route 198.1.1.1/32 reject;
    route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

---

### Configuring Router R6

#### Step-by-Step Procedure

To configure Router R6:

1. Configure the loopback (lo0) interface and the interface to Router R2.  
  
[edit interfaces]  
user@R6# set fe-1/2/0 unit 62 family inet address 10.0.26.2/24  
  
user@R6# set lo0 unit 60 family inet address 10.0.0.60/32
2. Configure BGP on Router R6's interface.  
  
[edit protocols]  
user@R6# set bgp group e1 type external  
user@R6# set bgp group e1 neighbor 10.0.26.1 peer-as 1
3. Create static routes for redistribution into BGP.  
  
[edit]  
user@R6# set routing-options static route 199.1.1.1/32 reject  
user@R6# set routing-options static route 198.1.1.1/32 reject
4. Redistribute static and direct routes from Router R6's routing table into BGP.  
  
[edit protocols bgp group e1 neighbor 10.0.26.1]  
user@R6# set export s2b  
  
[edit policy-options policy-statement s2b]  
user@R6# set from protocol static  
user@R6# set from protocol direct  
user@R6# set then accept

5. Configure the autonomous system number.

```
[edit routing-options]
user@R6# set autonomous-system 2
```

6. If you are done configuring the device, commit the configuration.

```
user@R6# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R6# show interfaces
fe-1/2/0 {
  unit 62 {
    family inet {
      address 10.0.26.2/24;
    }
  }
}
lo0 {
  unit 60 {
    family inet {
      address 10.0.0.60/32;
    }
  }
}

user@R6# show protocols
bgp {
  group e1 {
    type external;
    neighbor 10.0.26.1 {
      export s2b;
      peer-as 1;
    }
  }
}

user@R6# show policy-options
policy-statement s2b {
  from protocol [ static direct ];
  then accept;
}

user@R6# show routing-options
static {
  route 198.1.1.1/32 reject;
  route 199.1.1.1/32 reject;
}
autonomous-system 2;
```

## Configuring Router R7

### Step-by-Step Procedure

To configure Router R7:

1. Configure the loopback (lo0) interface and the interface to Router R3.  
  

```
[edit interfaces]
user@R7# set fe-1/2/0 unit 73 family inet address 10.0.37.2/24

user@R7# set lo0 unit 70 family inet address 10.0.0.70/32
```
2. Configure BGP on Router R7's interface.  
  

```
[edit protocols bgp group e1]
user@R7# set type external
user@R7# set neighbor 10.0.37.1 peer-as 1
```
3. Create a static route for redistribution into BGP.  
  

```
[edit]
user@R7# set routing-options static route 199.1.1.1/32 reject
```
4. Redistribute static and direct routes from Router R7's routing table into BGP.  
  

```
[edit protocols bgp group e1 neighbor 10.0.37.1]
user@R7# set export s2b

[edit policy-options policy-statement s2b]
user@R7# set from protocol static
user@R7# set from protocol direct
user@R7# set then accept
```
5. Configure the autonomous system number.  
  

```
[edit routing-options]
user@R7# set autonomous-system 2
```
6. If you are done configuring the device, commit the configuration.  
  

```
user@R7# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R7# show interfaces
fe-1/2/0 {
  unit 73 {
    family inet {
      address 10.0.37.2/24;
    }
  }
}
lo0 {
  unit 70 {
```

```

        family inet {
            address 10.0.0.70/32;
        }
    }
}

user@R7# show protocols
bgp {
    group e1 {
        type external;
        neighbor 10.0.37.1 {
            export s2b;
            peer-as 1;
        }
    }
}

user@R7# show policy-options
policy-statement s2b {
    from protocol [ static direct ];
    then accept;
}

user@R7# show routing-options
static {
    route 199.1.1.1/32 reject;
}
autonomous-system 2;

```

### Configuring Router R8

#### Step-by-Step Procedure

To configure Router R8:

1. Configure the loopback (lo0) interface and the interface to Router R4.

```

[edit interfaces]
user@R8# set fe-1/2/0 unit 84 family inet address 10.0.48.2/24

user@R8# set lo0 unit 80 family inet address 10.0.0.80/32

```

2. Configure BGP and OSPF on Router R8's interface.

```

[edit protocols]
user@R8# set bgp group rr type internal
user@R8# set bgp group rr local-address 10.0.0.80

user@R8# set ospf area 0.0.0.0 interface lo0.80 passive
user@R8# set ospf area 0.0.0.0 interface fe-1/2/0.84

```

3. Configure Router R8 to receive multiple paths from its neighbor, Router R4.

The destination of the paths can be any destination that Router R4 can reach through multiple paths.

```

[edit protocols]
user@R8# set bgp group rr neighbor 10.0.0.40 family inet unicast add-path receive

```

4. Configure the autonomous system number.

```
[edit]
user@R8# set routing-options autonomous-system 1
```

5. If you are done configuring the device, commit the configuration.

```
user@R8# commit
```

---

## Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R8# show interfaces
fe-1/2/0 {
  unit 84 {
    family inet {
      address 10.0.48.2/24;
    }
  }
}
lo0 {
  unit 80 {
    family inet {
      address 10.0.0.80/32;
    }
  }
}

user@R8# show protocols
bgp {
  group rr {
    type internal;
    local-address 10.0.0.80;
    neighbor 10.0.0.40 {
      family inet {
        unicast {
          add-path {
            receive;
          }
        }
      }
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.80 {
      passive;
    }
    interface fe-1/2/0.84;
  }
}
```

```
user@R8# show routing-options
autonomous-system 1;
```

## Verification

Confirm that the configuration is working properly.

- [Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths on page 289](#)
- [Verifying That Router R1 Is Advertising Multiple Paths on page 289](#)
- [Verifying That Router R4 Is Receiving and Advertising Multiple Paths on page 290](#)
- [Verifying That Router R8 Is Receiving Multiple Paths on page 291](#)
- [Checking the Path ID on page 291](#)

### Verifying That the BGP Peers Have the Ability to Send and Receive Multiple Paths

**Purpose** Make sure that one or both of the following strings appear in the output of the **show bgp neighbor** command:

- NLRI's for which peer can receive multiple paths: inet-unicast
- NLRI's for which peer can send multiple paths: inet-unicast

**Action**

```
user@R1> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.10+65237 AS 1
  Type: Internal    State: Established    Flags: <Sync>
... NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.10
Peer: 10.0.0.10+65237 AS 1      Local: 10.0.0.40+179 AS 1
  Type: Internal    State: Established    Flags: <Sync>
...
  NLRI's for which peer can send multiple paths: inet-unicast
...

user@R4> show bgp neighbor 10.0.0.80
Peer: 10.0.0.80+55416 AS 1      Local: 10.0.0.40+179 AS 1
  Type: Internal    State: Established (route reflector client)Flags: <Sync>
...
  NLRI's for which peer can receive multiple paths: inet-unicast
...

user@R8> show bgp neighbor 10.0.0.40
Peer: 10.0.0.40+179 AS 1      Local: 10.0.0.80+55416 AS 1
  Type: Internal    State: Established    Flags: <Sync>
...
  NLRI's for which peer can send multiple paths: inet-unicast
...
```

### Verifying That Router R1 Is Advertising Multiple Paths

**Purpose** Make sure that multiple paths to the 198.1.1.1/32 destination and multiple paths to the 199.1.1.1/32 destination are advertised to Router R4.

**Action** user@R1> **show route advertising-protocol bgp 10.0.0.40**  
 inet.0: 21 destinations, 25 routes (21 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** When you see one prefix and more than one next hop, it means that multiple paths are advertised to Router R4.

### Verifying That Router R4 Is Receiving and Advertising Multiple Paths

**Purpose** Make sure that multiple paths to the 199.1.1.1/32 destination are received from Router R1 and advertised to Router R8. Make sure that multiple paths to the 198.1.1.1/32 destination are received from Router R1, but only one path to this destination is advertised to Router R8.

**Action** user@R4> **show route receive-protocol bgp 10.0.0.10**  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

user@R4> **show route advertising-protocol bgp 10.0.0.80**  
 inet.0: 19 destinations, 22 routes (19 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

**Meaning** The **show route receive-protocol** command shows that Router R4 receives two paths to the 198.1.1.1/32 destination and three paths to the 199.1.1.1/32 destination. The **show route advertising-protocol** command shows that Router R4 advertises only one path to the 198.1.1.1/32 destination and advertises all three paths to the 199.1.1.1/32 destination.

Because of the prefix policy that is applied to Router R4, Router R4 does not advertise multiple paths to the 198.1.1.1/32 destination. Router R4 advertises only one path to the 198.1.1.1/32 destination even though it receives multiple paths to this destination.

### Verifying That Router R8 Is Receiving Multiple Paths

**Purpose** Make sure that Router R8 receives multiple paths to the 199.1.1.1/32 destination through Router R4. Make sure that Router R8 receives only one path to the 198.1.1.1/32 destination through Router R4.

**Action** user@R8> show route receive-protocol bgp 10.0.0.40  
 inet.0: 18 destinations, 20 routes (18 active, 0 holddown, 0 hidden)

| Prefix         | Nexthop   | MED | Lc1pref | AS path |
|----------------|-----------|-----|---------|---------|
| * 10.0.0.50/32 | 10.0.15.2 |     | 100     | 2 2 I   |
| * 10.0.0.60/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 10.0.0.70/32 | 10.0.0.30 |     | 100     | 2 I     |
| * 198.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
| * 199.1.1.1/32 | 10.0.0.20 |     | 100     | 2 I     |
|                | 10.0.0.30 |     | 100     | 2 I     |
|                | 10.0.15.2 |     | 100     | 2 2 I   |
| * 200.1.1.0/30 | 10.0.0.20 |     | 100     | 2 I     |

### Checking the Path ID

**Purpose** On the downstream devices, Router R4 and Router R8, verify that a path ID uniquely identifies the path. Look for the **Addpath Path ID:** string.

**Action** user@R4> show route 199.1.1.1/32 detail

## Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions

---

A *BGP community* is a group of destinations that share a common property. Community information is included as a path attribute in BGP update messages. This information identifies community members and enables you to perform actions on a group without having to elaborate upon each member. You can use community and extended communities attributes to trigger routing decisions, such as acceptance, rejection, preference, or redistribution.

You can assign community tags to non-BGP routes through configuration (for static, aggregate, or generated routes) or an import routing policy. These tags can then be matched when BGP exports the routes.

A community value is a 32-bit field that is divided into two main sections. The first 16 bits of the value encode the AS number of the network that originated the community, while the last 16 bits carry a unique number assigned by the AS. This system attempts to guarantee a globally unique set of community values for each AS in the Internet. Junos OS uses a notation of ***as-number:community-value***, where each value is a decimal number. The AS values of 0 and 65,535 are reserved, as are all of the community values within those AS numbers. Each community, or set of communities, is given a name within the **[edit policy-options]** configuration hierarchy. The name of the community uniquely

identifies it to the routing device and serves as the method by which routes are categorized. For example, a route with a community value of 64510:1111 might belong to the community named **AS64510-routes**. The community name is also used within a routing policy as a match criterion or as an action. The command syntax for creating a community is: `policy-options community name members [community-ids]`. The *community-ids* are either a single community value or multiple community values. When more than one value is assigned to a community name, the routing device interprets this as a logical AND of the community values. In other words, a route must have all of the configured values before being assigned the community name.

The regular community attribute is four octets. Networking enhancements, such as VPNs, have functionality requirements that can be satisfied by an attribute such as a community. However, the 4-octet community value does not provide enough expansion and flexibility to accommodate VPN requirements. This leads to the creation of extended communities. An extended community is an 8-octet value that is also divided into two main sections. The first 2 octets of the community encode a type field while the last 6 octets carry a unique set of data in a format defined by the type field. Extended communities provide a larger range for grouping or categorizing communities.

The BGP extended communities attribute format has three fields: **type:administrator:assigned-number**. The routing device expects you to use the words **target** or **origin** to represent the type field. The administrator field uses a decimal number for the AS or an IPv4 address, while the assigned number field expects a decimal number no larger than the size of the field (65,535 for 2 octets or 4,294,967,295 for 4 octets).

When specifying community IDs for standard and extended community attributes, you can use UNIX-style regular expressions. The only exception is for VPN import policies (**vrf-import**), which do not support regular expressions for the extended communities attribute.

## Understanding How to Define BGP Communities and Extended Communities

To use a BGP community or extended community as a routing policy match condition, you define the community as described in the following sections:

- [Defining BGP Communities for Use in Routing Policy Match Conditions on page 297](#)
- [Defining BGP Extended Communities for Use in Routing Policy Match Conditions on page 300](#)

## Defining BGP Communities for Use in Routing Policy Match Conditions

To create a named BGP community and define the community members, include the **community** statement:

```
[edit policy-options]
community name {
  invert-match;
  members [ community-ids ];
}
```

*name* identifies the community. It can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

*community-ids* identifies one or more members of the community. Each community ID consists of two components, which you specify in the following format:

*as-number:community-value;*

- *as-number*—AS number of the community member. It can be a value from 0 through 65,535. You can use the following notation in specifying the AS number:
  - String of digits.
  - Asterisk (\*)—A wildcard character that matches all AS numbers. (In the definition of the community attribute, the asterisk also functions as described in [Table 23 on page 298](#).)
  - Period (.)—A wildcard character that matches any single digit in an AS number.
  - Group of AS numbers—A single AS number or a group of AS numbers enclosed in parentheses. Grouping the numbers in this way allows you to perform a common operation on the group as a whole and to give the group precedence. The grouped numbers can themselves include regular expression operators. For more information about regular expressions, see [“Using UNIX Regular Expressions in Community Names” on page 298](#).
- *community-value*—Identifier of the community member. It can be a number from 0 through 65,535. You can use the following notation in specifying the community ID:
  - String of digits.
  - Asterisk (\*)—A wildcard character that matches all community values. (In the definition of the community attribute, the asterisk also functions as described in [Table 23 on page 298](#).)
  - Period (.)—A wildcard character that matches any single digit in a community value number.
  - Group of community value numbers—A single community value number or a group of community value numbers enclosed in parentheses. Grouping the regular expression in this way allows you to perform a common operation on the group as a whole and to give the group precedence. The grouped path can itself include regular expression operators.

You can also include one of the following well-known community names (defined in RFC 1997, *BGP Communities Attribute*) in the *community-ids* option for the **members** statement:

- no-advertise—Routes in this community name must not be advertised to other BGP peers.
- no-export—Routes in this community must not be advertised outside a BGP confederation boundary. A stand alone autonomous system that is not part of a confederation should be considered a confederation itself.
- no-export-subconfed—Routes in this community must not be advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.

### Using UNIX Regular Expressions in Community Names

When specifying the members of a named BGP community (in the **members [ *community-ids* ]** statement), you can use UNIX-style regular expressions to specify the AS number and the member identifier. A regular expression consists of two components, which you specify in the following format:

*term operator*;

*term* identifies the string to match.

*operator* specifies how the term must match. [Table 23 on page 298](#) lists the regular expression operators supported in community IDs. You place an operator immediately after *term* with no intervening space, except for the pipe ( | ) and dash ( - ) operators, which you place between two terms, and parentheses, with which you enclose terms. [Table 24 on page 299](#) shows examples of how to define **community-ids** using community regular expressions. The operator is optional.

Community regular expressions are identical to the UNIX regular expressions. Both implement the extended (or modern) regular expressions as defined in POSIX 1003.2.

Community regular expressions evaluate the string specified in **term** on a character-by-character basis. For example, if you specify **1234:5678** as **term**, the regular expressions see nine discrete characters, including the colon (:), instead of two sets of numbers (1234 and 5678) separated by a colon.

**NOTE:** In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS.

**Table 23: Community Attribute Regular Expression Operators**

| Operator                   | Match Definition                                                                                                                                                       |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>{<i>m</i>,<i>n</i>}</b> | At least <i>m</i> and at most <i>n</i> repetitions of <b>term</b> . Both <i>m</i> and <i>n</i> must be positive integers, and <i>m</i> must be smaller than <i>n</i> . |

Table 23: Community Attribute Regular Expression Operators (*continued*)

| Operator      | Match Definition                                                                                                                                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| { <i>m</i> }  | Exactly <i>m</i> repetitions of <i>term</i> . <i>m</i> must be a positive integer.                                                                                                                                                                   |
| { <i>m</i> ,} | <i>m</i> or more repetitions of <i>term</i> . <i>m</i> must be a positive integer.                                                                                                                                                                   |
| *             | Zero or more repetitions of <i>term</i> . This is equivalent to {0,}.                                                                                                                                                                                |
| +             | One or more repetitions of <i>term</i> . This is equivalent to {1,}.                                                                                                                                                                                 |
| ?             | Zero or one repetition of <i>term</i> . This is equivalent to {0,1}.                                                                                                                                                                                 |
|               | One of the two terms on either side of the pipe.                                                                                                                                                                                                     |
| –             | Between a starting and ending range, inclusive.                                                                                                                                                                                                      |
| ^             | Character at the beginning of a community attribute regular expression.<br><br>If you omit the ^ character, it is implicitly added.<br><br>We recommend explicit use of this operator for the clearest interpretation of your configuration.         |
| \$            | Character at the end of a community attribute regular expression.<br><br>If you omit the \$ character, it is implicitly added.<br><br>We recommend explicit use of this operator for the clearest interpretation of your configuration.              |
| [ ]           | Set of characters. One character from the set can match. To specify the start and end of a range, use a hyphen (-). To specify a set of characters that do not match, use the caret (^) as the first character after the opening square bracket ([]. |
| ( )           | Group of terms that are enclosed in parentheses. If enclosed in quotation marks with no intervening space ("()"), indicates a null. Intervening space between the parentheses and the terms is ignored.                                              |
| " "           | Characters (such as space, tab, question mark, and bracket) that are enclosed within quotation marks in a community attribute regular expression indicate special characters.                                                                        |

| AS number is 56 or 78. Community value is any number that starts with 2 and ends with 2 through 8. | <br> | <br><br> |

## Defining BGP Extended Communities for Use in Routing Policy Match Conditions

To create a named BGP community and define the community members, include the **community** statement:

```
[edit policy-options]
community name {
  members [ community-ids ];
}
```

**name** identifies the community. It can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

**community-ids** identifies one or more members of the community. Each community ID consists of three components, which you specify in the following format:

*type:administrator:assigned-number*

**type** is the type of extended community and can be either the 16-bit numerical identifier of a specific BGP extended community or one of these types:

- **bandwidth**—Sets up the bandwidth extended community. Specifying link bandwidth allows you to distribute traffic unequally among different BGP paths.

**NOTE:** The link bandwidth attribute does not work concurrently with per-prefix load balancing.

- **domain-id**—Identifies the OSPF domain from which the route originated.
- **origin**—Identifies where the route originated.

- **rt-import**—Identifies the route to install in the routing table.

**NOTE:** You must identify the route by an IP address, not an AS number.

- **src-as**—Identifies the AS from which the route originated. You must specify an AS number, not an IP address.

**NOTE:** You must identify the AS by an AS number, not an IP address.

- **target**—Identifies the destination to which the route is going.

**NOTE:** For an import policy for a VPN routing and forwarding (VRF) instance, you must include at least one route target. Additionally, you cannot use wildcard characters or regular expressions in the route target for a VRF import policy. Each value you configure for a route target for a VRF import policy must be a single value.

**administrator** is the administrator. It is either an AS number or an IP version 4 (IPv4) address prefix, depending on the type of extended community.

**assigned-number** identifies the local provider.

In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a **target** or **origin** extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as **target:334324L:132**.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the **target** and **origin** extended communities. Specify two integers joined by a period: *16-bit high-order value in decimal.16-bit low-order value in decimal*. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

### Examples: Defining BGP Extended Communities

Configure a target community with an administrative field of **10458** and an assigned number of **20**:

```
[edit policy-options]
community test-a members [ target:10458:20 ];
```

Configure a target community with an administrative field of 10.1.1.1 and an assigned number of 20:

```
[edit policy-options]
community test-a members [ target:10.1.1.1:20 ];
```

Configure an origin community with an administrative field of 10.1.1.1 and an assigned number of 20:

```
[edit policy-options]
community test-a members [ origin:10.1.1.1:20 ];
```

Configure a target community with a 4-byte AS number in the administrative field of 100000 and an assigned number of 130:

```
[edit policy-options]
community test-b members [ target:100000L:130 ];
```

## How BGP Communities and Extended Communities Are Evaluated in Routing Policy Match Conditions

---

When you use BGP communities and extended communities as match conditions in a routing policy, the policy framework software evaluates them as follows:

- Each route is evaluated against each named community in a routing policy **from** statement. If a route matches one of the named communities in the **from** statement, the evaluation of the current term continues. If a route does not match, the evaluation of the current term ends.
- The route is evaluated against each member of a named community. The evaluation of all members must be successful for the named community evaluation to be successful.
- Each member in a named community is identified by either a literal community value or a regular expression. Each member is evaluated against each community associated with the route. (Communities are an unordered property of a route. For example, 1:2 3:4 is the same as 3:4 1:2.) Only one community from the route is required to match for the member evaluation to be successful.
- Community regular expressions are evaluated on a character-by-character basis. For example, if a route contains community 1234:5678, the regular expressions see nine discrete characters, including the colon (:), instead of two sets of numbers (1234 and 5678) separated by a colon. For example:

```
[edit]
policy-options {
  policy-statement one {
    from {
      community [comm-one comm-two];
    }
  }
  community comm-one members [ 1:2 "^4:(5|6)$" ];
  community comm-two members [ 7:8 9:10 ];
}
```

If a community member is a regular expression, a string match is made rather than a numeric match.

For example:

```
community example1 members 100:100
community example2 members 100:1..
```

Given a route with a community value of 1100:100, this route matches **community example2** but not **example1**.

- To match routing policy **one**, the route must match either **comm-one** or **comm-two**.
- To match **comm-one**, the route must have a community that matches 1:2 and a community that matches 4:5 or 4:6.
- To match **comm-two**, the route must have a community that matches 7:8 and a community that matches 9:10.

## Multiple Matches

When multiple matches are found, label aggregation does not happen. Consider the following configuration:

```
family inet-vpn {
  unicast {
    aggregate-label {
      community community-name;
    }
  }
}

family inet-vpn {
  labeled-unicast {
    aggregate-label {
      community community-name;
    }
  }
}
```

Suppose, for instance, that two routes are received with community attributes **target:65000:1000 origin:65200:2000** and that the community name is **"5.....\*"**. In this case, both the extended community attributes, **target:65000:1000** and **origin:65200:2000** match the regular expression of the community name. In this case, label aggregation does not occur. In the following example, the **Label operation** field shows that the labels are not aggregated.

```
user@host> show route table VPN detail | match "^10 | Communities | Push"
10.1.1.0/30 (1 entry, 1 announced)
  Label operation: Push 101040
  Push 101040
  Communities: target:65000:1000 origin:65200:2000
10.1.1.4/30 (1 entry, 1 announced)
  Label operation: Push 101056
  Push 101056
  Communities: target:65000:1000 origin:65200:2000
```

You can resolve this issue in either of the following ways:

- Be more specific in the regular expression if the site-of-origin extended community attribute does not overlap with the target one.
- Specify the site of origin in the community name.

Both methods are shown in the following examples.

#### Be More Specific in the Regular Expression

```
user@host# set policy-options community community-name members "52...:*"
user@host# commit
```

```
user@host> show route table VPN detail | match "^10 | Communities | Push"
10.1.1.0/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: target:65000:1000 origin:65200:2000
10.1.1.4/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: target:65000:1000 origin:65200:2000
```

#### Specify the Site of Origin in the Community Name

```
user@host# set policy-options community community-name members "origin:65....:*"
user@host# commit
```

```
user@host> show route table VPN detail | match "^10 | Communities | Push"
10.1.1.0/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: target:65000:1000 origin:65200:2000
10.1.1.4/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: target:65000:1000 origin:65200:2000
```

## Inverting Community Matches

The **community** match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The **invert-match** statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result. To invert the results of the community expression matching, include the **invert-match** statement in the community configuration.

```
[edit policy-options community name]
invert-match;
```

## Extended Community Type

The extended community type is not taken into account by regular expressions. Consider, for instance, the following community attributes and community name.

Communities:

- 5200:1000
- **target:65000:1000**

- **origin:65200:2000**

Community attribute:

- community-name members "5....:"

In this case, both extended community attribute, **5200:1000** and the extended community attribute, **origin:65200:2000**, match the regular expression of the community name. Therefore, the label aggregation does not occur, as shown here:

```
user@host> show route table VPN detail | match "^10 | Communities | Push"
10.1.1.0/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: 5200:1000 target:65000:1000 origin:65200:2000
10.1.1.4/30 (1 entry, 1 announced)
    Label operation: Push 101056
    Push 101056
    Communities: 5200:1000 target:65000:1000 origin:65200:2000
```

You can resolve this issue by using a more specific regular expression. For example, you can use the anchor character (^) to bind the location of the digits, as shown here:

```
user@host# set policy-options community community-name members "^5....:"
user@host# commit

user@host> show route table VPN detail | match "^10 | Communities | Push"
10.1.1.0/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: 5200:1000 target:65000:1000 origin:65200:2000
10.1.1.4/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: 5200:1000 target:65000:1000 origin:65200:2000
```

## Multiple Communities Are Matched with Ex-OR Logic

This differs from the AND matching logic used for non-extended communities in BGP.

If, for instance, four routes are received with two sets of community attributes, the regular expression might match both community attributes. Consider the following example:

- Communities—5200:1000 target:65000:1000
- Communities—target:65000:1000 origin:65200:2000
- Community attribute—community community-name member [ "^5....:" origin:65.\*.\* ]

Both labels are aggregated, as shown here:

```
user@host> show route table VPN detail | match "^10 | Communities | Push"
10.1.1.0/30 (1 entry, 1 announced)
    Label operation: Push 101040
    Push 101040
    Communities: target:65000:1000 origin:65200:2000
10.1.1.4/30 (1 entry, 1 announced)
    Label operation: Push 101040
```

```
Push 101040
Communities: target:65000:1000 origin:65200:2000

10.1.1.16/30 (1 entry, 1 announced)
Label operation: Push 121104
Push 101104
Communities: 5200:1000 target:65000:1000

10.1.1.20/30 (1 entry, 1 announced)
Label operation: Push 121104
Push 101104
Communities: 5200:1000 target:65000:1000
```

A more complete example of community values is shown here:

```
user@host> show policy-options community community-name
members [ "(^1...:*)" | (^3...:*)" | (^4...:*)" origin:2.*:* origin:3.*:* origin:6.*:*
]
```

This regular expression matches community values starting with 1, 3, or 4, and matches extended community values of type origin whose administrative value starts with 2, 3, or 6.

## Including BGP Communities and Extended Communities in Routing Policy Match Conditions

To include a BGP community or extended community in a routing policy match condition, include the **community** condition in the **from** statement of a policy term:

```
from {
    community [ names ];
}
```

Additionally, you can explicitly exclude BGP community information with a static route by using the **none** option. Include this option when configuring an individual route in the **route** portion to override a community option specified in the **defaults** portion.

You can include the names of multiple communities in the **community** match condition. If you do this, only one community needs to match for a match to occur (matching is effectively a logical OR operation).

## Example: Configuring Communities in a Routing Policy

A community is a route attribute used by BGP to administratively group routes with similar properties.

- [Requirements on page 307](#)
- [Overview on page 307](#)
- [Configuration on page 308](#)
- [Verification on page 317](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

One main role of the community attribute is to be an administrative tag value used to associate routes together. Generally, these routes share some common properties, but that is not required. Communities are a flexible tool within BGP. An individual community value can be assigned to a single route or multiple routes. A route can be assigned a single community value or multiple values. Networks use the community attribute to assist in implementing administrative routing policies. A route's assigned value can allow it to be accepted into the network, or rejected from the network, or allow it to modify attributes.

[Figure 30 on page 308](#) shows Device R1, Device R2, and Device R3 as internal BGP (IBGP) peers in autonomous system (AS) 64510. Device R4 is advertising the 172.16.0.0/21 address space from AS 64511. The specific routes received by Device R1 from Device R4 are as follows:

```
user@R1> show route receive-protocol bgp 10.0.0.13
inet.0: 20 destinations, 28 routes (20 active, 0 holddown, 8 hidden)
  Prefix                Nexthop          MED      Lc1pref   AS path
* 172.16.0.0/24         10.0.0.13              MED      Lc1pref   64511 I
* 172.16.1.0/24         10.0.0.13              64511 I
* 172.16.2.0/24         10.0.0.13              64511 I
* 172.16.3.0/24         10.0.0.13              64511 I
* 172.16.4.0/24         10.0.0.13              64511 I
* 172.16.5.0/24         10.0.0.13              64511 I
* 172.16.6.0/24         10.0.0.13              64511 I
* 172.16.7.0/24         10.0.0.13              64511 I
```

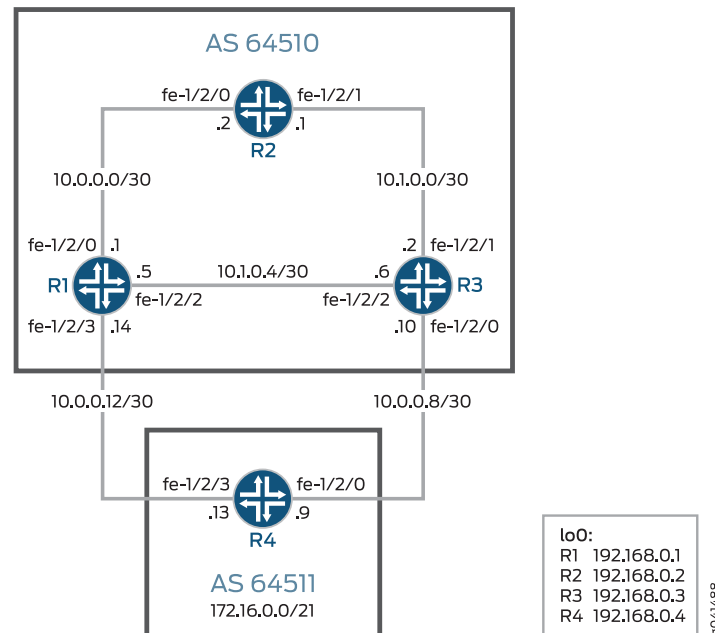

The administrators of AS 64511 want to receive certain user traffic from Device R1, and other user traffic from Device R3. To accomplish this administrative goal, Device R4 attaches the community value of 64511:1 to some routes that it sends and attaches the community value 64511:3 to other routes that it sends. Routing policies within AS 64510 are configured using a community match criterion to change the local preference of the received routes to new values that alter the BGP route selection algorithm. The route with the highest local preference value is preferred.

On Device R1, routes with the 64511:1 community value are assigned a local preference of 200, and routes with the 64511:3 community value are assigned a local preference of 50. On Device R3, the reverse is done so that routes with the 64511:3 community value are assigned a local preference of 200, and routes with the 64511:1 community value are assigned a local preference of 50. This information is then communicated through IBGP by both Device R1 and Device R3 to Device R2.

### Topology

Figure 30 on page 308 shows the sample network.

Figure 30: Topology for Regular BGP Communities

"CLI Quick Configuration" on page 308 shows the configuration for all of the devices in Figure 30 on page 308.

The section "Step-by-Step Procedure" on page 311 describes the steps on Device R1 and R4.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

#### Device R1

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces fe-1/2/2 unit 0 family inet address 10.1.0.5/30

```

### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```

[edit interfaces]
user@R1# set fe-1/2/0 unit 0 family inet address 10.0.0.1/30

user@R1# set fe-1/2/2 unit 0 family inet address 10.1.0.5/30

user@R1# set fe-1/2/3 unit 0 family inet address 10.0.0.14/30

user@R1# set lo0 unit 0 family inet address 192.168.0.1/32

```

2. Configure internal gateway protocol (IGP) connections to Device R2 and Device R3.

```

[edit protocols ospf area 0.0.0.0]
user@R1# set interface fe-1/2/0.0
user@R1# set interface fe-1/2/2.0
user@R1# set interface lo0.0 passive

```

3. Configure the IBGP connections to Device R2 and Device R3.

```

[edit protocols bgp group int]
user@R1# set type internal
user@R1# set local-address 192.168.0.1
user@R1# set neighbor 192.168.0.2 export send-direct
user@R1# set neighbor 192.168.0.3

```

4. Configure the EBGP connection to Device R4.

```

[edit protocols bgp group ext]
user@R1# set type external
user@R1# set import change-local-preference
user@R1# set peer-as 64511
user@R1# set neighbor 10.0.0.13

```

5. Configure the policy **send-direct**.

This policy is referenced in the IBGP connection to Device R2 and enables Device R2 to have external reachability. An alternative is to configure a **next-hop self** policy on Device R1 and Device R3.

```

[edit policy-options policy-statement send-direct term 1]
user@R1# set from protocol direct
user@R1# set from route-filter 10.0.0.12/30 exact
user@R1# set then accept

```

6. Configure the policy that changes the local preference for routes with specified community tags.

```
[edit policy-options policy-statement change-local-preference]
user@R1# set term find-R1-routes from community from-R1
user@R1# set term find-R1-routes then local-preference 200
user@R1# set term find-R3-routes from community from-R3
user@R1# set term find-R3-routes then local-preference 50
```

```
[edit policy-options ]
user@R1# set community from-R1 members 64511:1
user@R1# set community from-R3 members 64511:3
```

7. Configure the autonomous system (AS) number and router ID.

```
[edit routing-options]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 64510
```

### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```
[edit interfaces]
user@R4# set fe-1/2/0 unit 0 family inet address 10.0.0.9/30

user@R4# set fe-1/2/3 unit 0 family inet address 10.0.0.13/30

user@R4# set lo0 unit 0 family inet address 192.168.0.4/32
```

2. Configure the EBGP connection to Device R1 and Device R3.

```
[edit protocols bgp]
user@R4# set group to-R1 type external
user@R4# set group to-R1 export send-static
user@R4# set group to-R1 peer-as 64510
user@R4# set group to-R1 neighbor 10.0.0.14

user@R4# set group to-R3 type external
user@R4# set group to-R3 export send-static
user@R4# set group to-R3 peer-as 64510
user@R4# set group to-R3 neighbor 10.0.0.10
```

3. Configure the community tags.

```
[edit policy-options ]
user@R4# set community from-R1 members 64511:1
user@R4# set community from-R3 members 64511:3
```

4. Configure the policy **send-static**.

This policy is referenced in the EBGP connections to Device R1 and Device R3. The policy attaches the 64511:1 (from-R1) community to some routes and the 64511:3 (from-R3) community to other routes.

```
[edit policy-options policy-statement send-static term 1]
```

```

user@R4# set from protocol static
user@R4# set from route-filter 172.16.0.0/24 exact
user@R4# set from route-filter 172.16.1.0/24 exact
user@R4# set from route-filter 172.16.2.0/24 exact
user@R4# set from route-filter 172.16.3.0/24 exact
user@R4# set then community add from-R1
user@R4# set then accept

```

```

[edit policy-options policy-statement send-static term 2]
user@R4# set from protocol static
user@R4# set from route-filter 172.16.4.0/24 exact
user@R4# set from route-filter 172.16.5.0/24 exact
user@R4# set from route-filter 172.16.6.0/24 exact
user@R4# set from route-filter 172.16.7.0/24 exact
user@R4# set then community add from-R3
user@R4# set then accept

```

```

[edit policy-options policy-statement send-static term 3]
user@R4# set then reject

```

5. Configure the static routes.

```

[edit routing-options static]
user@R4# set route 172.16.0.0/24 reject
user@R4# set route 172.16.1.0/24 reject
user@R4# set route 172.16.2.0/24 reject
user@R4# set route 172.16.3.0/24 reject
user@R4# set route 172.16.4.0/24 reject
user@R4# set route 172.16.5.0/24 reject
user@R4# set route 172.16.6.0/24 reject
user@R4# set route 172.16.7.0/24 reject

```

6. Configure the autonomous system (AS) number and router ID.

```

[edit routing-options]
user@R4# set router-id 192.168.0.4
user@R4# set autonomous-system 64511

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

```

If you are done configuring the devices, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Routes Sent on Device R4 on page 317](#)
- [Verifying the Routes Received on Device R2 on page 319](#)

### Verifying the Routes Sent on Device R4

---

**Purpose** On Device R4, check the routes sent to Device R1 and Device R3.

**Action** user@R4> show route advertising-protocol bgp 10.0.0.14

```
inet.0: 13 destinations, 13 routes (13 active, 0 holddown, 0 hidden)
* 172.16.0.0/24 (1 entry, 1 announced)
  BGP group to-R1 type External
  Nexthop: Self
  AS path: [64511] I
  Communities: 64511:1

* 172.16.1.0/24 (1 entry, 1 announced)
  BGP group to-R1 type External
  Nexthop: Self
  AS path: [64511] I
  Communities: 64511:1

* 172.16.2.0/24 (1 entry, 1 announced)
  BGP group to-R1 type External
  Nexthop: Self
  AS path: [64511] I
  Communities: 64511:1

* 172.16.3.0/24 (1 entry, 1 announced)
  BGP group to-R1 type External
  Nexthop: Self
  AS path: [64511] I
  Communities: 64511:1

* 172.16.4.0/24 (1 entry, 1 announced)
  BGP group to-R1 type External
  Nexthop: Self
  AS path: [64511] I
  Communities: 64511:3

* 172.16.5.0/24 (1 entry, 1 announced)

## Example: Configuring Extended Communities in a Routing Policy

An extended community is similar in most ways to a regular community. Some networking implementations, such as virtual private networks (VPNs), use extended communities because the 4-octet regular community value does not provide enough expansion and flexibility. An extended community is an eight-octet value divided into two main sections.

### Requirements

No special configuration beyond device initialization is required before configuring this example.

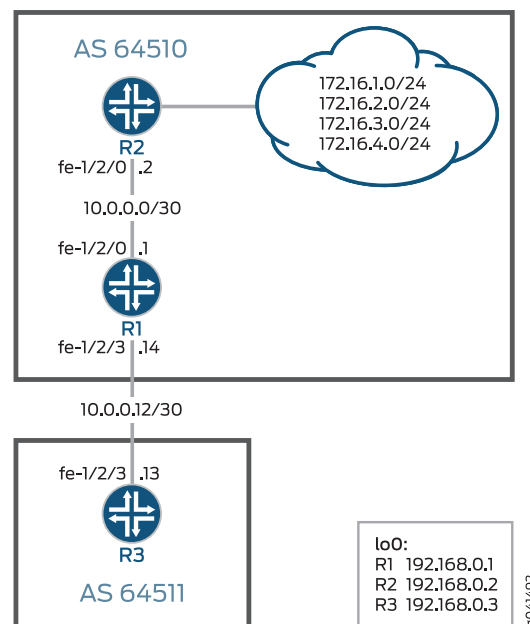

## Overview

In this example, Device R1 and Device R2 are OSPF neighbors in autonomous system (AS) 64510. Device R3 has an external BGP (EBGP) connection to Device R1. Device R2 has customer networks in the 172.16/16 address space, simulated with addresses on its loopback interface (lo0). Device R1 has static routes to several 172.16.x/24 networks, and attaches regular community values to these routes. Device R1 then uses an export policy to advertise the routes to Device R3. Device R3 receives these routes and uses an import policy to add extended community values to the routes.

### Topology

Figure 31 on page 322 shows the sample network.

Figure 31: Topology for Extended BGP Communities

“CLI Quick Configuration” on page 322 shows the configuration for all of the devices in Figure 31 on page 322.

The section “Step-by-Step Procedure” on page 324 describes the steps on Device R3.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces fe-1/2/3 unit 0 family inet address 10.0.0.14/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32 primary
set protocols bgp group ext type external
set protocols bgp group ext export send-static
```

```

set protocols bgp group ext peer-as 64511
set protocols bgp group ext neighbor 10.0.0.13
set protocols ospf area 0.0.0.0 interface fe-1/2/0.0
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 172.16.1.0/24 next-hop 10.0.0.2
set routing-options static route 172.16.1.0/24 community 64510:1
set routing-options static route 172.16.2.0/24 next-hop 10.0.0.2
set routing-options static route 172.16.2.0/24 community 64510:2
set routing-options static route 172.16.3.0/24 next-hop 10.0.0.2
set routing-options static route 172.16.3.0/24 community 64510:3
set routing-options static route 172.16.4.0/24 next-hop 10.0.0.2
set routing-options static route 172.16.4.0/24 community 64510:4
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 64510

```

**Device R2**

```

  origin-as
set policy-options policy-statement set-ext-comms term route-3 then accept
set policy-options policy-statement set-ext-comms term route-4 from route-filter
  172.16.4.0/24 exact
set policy-options policy-statement set-ext-comms term route-4 then community add
  origin-ip
set policy-options policy-statement set-ext-comms term route-4 then accept
set policy-options community origin-as members origin:64511:3

```

```
set policy-options community origin-ip members origin:172.16.7.7:4
set policy-options community target-as members target:64511:1
set policy-options community target-ip members target:172.16.7.7:2
set routing-options router-id 192.168.0.3
set routing-options autonomous-system 64511
```

**Step-by-Step  
Procedure**

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R3:

1. Configure the interfaces.

```
[edit interfaces]
user@R3# set fe-1/2/3 unit 0 family inet address 10.0.0.13/30

user@R3# set lo0 unit 0 family inet address 192.168.0.3/32
```

2. Configure the EBGP connection to Device R1.

```
[edit protocols bgp group to-R1]
user@R3# set type external
user@R3# set import set-ext-comms
user@R3# set peer-as 64510
user@R3# set neighbor 10.0.0.14
```

3. Configure the policy that adds extended community values to the routes received from Device R1.

An extended community uses a notation of *type:administrator:assigned-number*.

The specific community values can be anything that accomplishes your administrative goals, within certain parameters, as explained in [community](#).

```
[edit policy-options policy-statement set-ext-comms]
user@R3# set term route-1 from route-filter 172.16.1.0/24 exact
user@R3# set term route-1 then community add target-as
user@R3# set term route-1 then accept

user@R3# set term route-2 from route-filter 172.16.2.0/24 exact
user@R3# set term route-2 then community add target-ip
user@R3# set term route-2 then accept

user@R3# set term route-3 from route-filter 172.16.3.0/24 exact
user@R3# set term route-3 then community add origin-as
user@R3# set term route-3 then accept

user@R3# set term route-4 from route-filter 172.16.4.0/24 exact
user@R3# set term route-4 then community add origin-ip
user@R3# set term route-4 then accept

[edit policy-options]
user@R3# set community origin-as members origin:64511:3
user@R3# set community origin-ip members origin:172.16.7.7:4
user@R3# set community target-as members target:64511:1
```

```
user@R3# set community target-ip members target:172.16.7.7:2
```

4. Configure the autonomous system (AS) number and router ID.

```
[edit routing-options]
user@R3# set router-id 192.168.0.3
user@R3# set autonomous-system 64511
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R3# show interfaces
fe-1/2/3 {
  unit 0 {
    family inet {
      address 10.0.0.13/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.3/32;
    }
  }
}

user@R3# show protocols
bgp {
  group to-R1 {
    type external;
    import set-ext-comms;
    peer-as 64510;
    neighbor 10.0.0.14;
  }
}

user@R3# show policy-options
policy-statement set-ext-comms {
  term route-1 {
    from {
      route-filter 172.16.1.0/24 exact;
    }
    then {
      community add target-as;
      accept;
    }
  }
  term route-2 {
    from {
      route-filter 172.16.2.0/24 exact;
    }
    then {
      community add target-ip;
    }
  }
}
```

```
        accept;
    }
}
term route-3 {
    from {
        route-filter 172.16.3.0/24 exact;
    }
    then {
        community add origin-as;
        accept;
    }
}
term route-4 {
    from {
        route-filter 172.16.4.0/24 exact;
    }
    then {
        community add origin-ip;
        accept;
    }
}
}
community origin-as members origin:64511:3;
community origin-ip members origin:172.16.7.7:4;
community target-as members target:64511:1;
community target-ip members target:172.16.7.7:2;

user@R3# show routing-options
router-id 192.168.0.3;
autonomous-system 64511;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Routes on Device R1 on page 326](#)
- [Verifying the Routes on Device R3 on page 328](#)

---

### Verifying the Routes on Device R1

**Purpose** On Device R1, check the 172.16. routes in the routing table.

**Action** user@R1> show route protocol static match-prefix 172.16.\* detail

```
inet.0: 15 destinations, 15 routes (15 active, 0 holddown, 0 hidden)
172.16.1.0/24 (1 entry, 1 announced)
  *Static Preference: 5
    Next hop type: Router, Next hop index: 835
    Address: 0x9260250
    Next-hop reference count: 19
    Next hop: 10.0.0.2 via fe-1/2/0.0, selected
    State: <Active Int Ext>
    Local AS: 64510
    Age: 2:06:08
    Task: RT
    Announcement bits (2): 2-KRT 3-BGP_RT_Background
    AS path: I
    Communities: 64510:1

172.16.2.0/24 (1 entry, 1 announced)
  *Static Preference: 5
    Next hop type: Router, Next hop index: 835
    Address: 0x9260250
    Next-hop reference count: 19
    Next hop: 10.0.0.2 via fe-1/2/0.0, selected
    State: <Active Int Ext>
    Local AS: 64510
    Age: 2:06:08
    Task: RT
    Announcement bits (2): 2-KRT 3-BGP_RT_Background
    AS path: I
    Communities: 64510:2

172.16.3.0/24 (1 entry, 1 announced)
  *Static Preference: 5
    Next hop type: Router, Next hop index: 835
    Address: 0x9260250
    Next-hop reference count: 19
    Next hop: 10.0.0.2 via fe-1/2/0.0, selected
    State: <Active Int Ext>
    Local AS: 64510
    Age: 2:06:08
    Task: RT
    Announcement bits (2): 2-KRT 3-BGP_RT_Background
    AS path: I
    Communities: 64510:3

172.16.4.0/24 (1 entry, 1 announced)
  *Static Preference: 5
    Next hop type: Router, Next hop index: 835
    Address: 0x9260250
    Next-hop reference count: 19
    Next hop: 10.0.0.2 via fe-1/2/0.0, selected
    State: <Active Int Ext>
    Local AS: 64510
    Age: 2:06:08
    Task: RT
    Announcement bits (2): 2-KRT 3-BGP_RT_Background
    AS path: I
    Communities: 64510:4
```

**Meaning** The output shows that the regular community values are attached to the routes.

NOTE: The communities are attached to static routes, thus demonstrating that communities can be attached to non-BGP routes.

---

## Example: Configuring a Routing Policy Based on the Number of BGP Communities

This example shows how to create a policy that accepts BGP routes based on the number of BGP communities.

- [Requirements on page 330](#)
- [Overview on page 330](#)
- [Configuration on page 331](#)
- [Verification on page 335](#)

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

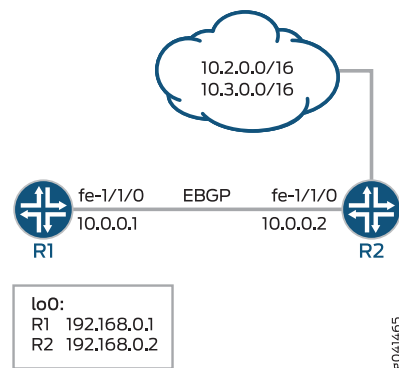

This example shows two routing devices with an external BGP (EBGP) connection between them. Device R2 uses the BGP session to send two static routes to Device R1. On Device R1, an import policy specifies that the BGP-received routes can contain up to five communities to be considered a match. For example, if a route contains three communities, it is considered a match and is accepted. If a route contains six or more communities, it is considered a nonmatch and is rejected.

It is important to remember that the default policy for EBGP is to accept all routes. To ensure that the nonmatching routes are rejected, you must include a **then reject** action at the end of the policy definition.

### Topology

Figure 32 on page 331 shows the sample network.

**Figure 32: BGP Policy with a Limit on the Number of Communities Accepted**

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/1/0 unit 0 description to-R2
set interfaces fe-1/1/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 2
set protocols bgp group external-peers neighbor 10.0.0.2 import import-communities
set policy-options policy-statement import-communities term 1 from protocol bgp
set policy-options policy-statement import-communities term 1 from community-count
  5 orlower
set policy-options policy-statement import-communities term 1 then accept
set policy-options policy-statement import-communities term 2 then reject
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 1

```

**Device R2**

```

set interfaces fe-1/1/0 unit 0 description to-R1
set interfaces fe-1/1/0 unit 0 family inet address 10.0.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers export statics
set protocols bgp group external-peers peer-as 1
set protocols bgp group external-peers neighbor 10.0.0.1
set policy-options policy-statement statics from protocol static
set policy-options policy-statement statics then community add 1
set policy-options policy-statement statics then accept
set policy-options community 1 members 2:1

```

```
set policy-options community 1 members 2:2
set policy-options community 1 members 2:3
set policy-options community 1 members 2:4
set policy-options community 1 members 2:5
set policy-options community 1 members 2:6
set policy-options community 1 members 2:7
set policy-options community 1 members 2:8
set policy-options community 1 members 2:9
set policy-options community 1 members 2:10
set routing-options static route 10.2.0.0/16 reject
set routing-options static route 10.2.0.0/16 install
set routing-options static route 10.3.0.0/16 reject
set routing-options static route 10.3.0.0/16 install
set routing-options router-id 192.168.0.3
set routing-options autonomous-system 2
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces]
user@R1# set fe-1/1/0 unit 0 description to-R2
user@R1# set fe-1/1/0 unit 0 family inet address 10.0.0.1/30

user@R1# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure BGP.

Apply the import policy to the BGP peering session with Device R2.

```
[edit protocols bgp group external-peers]
user@R1# set type external
user@R1# set peer-as 2
user@R1# set neighbor 10.0.0.2 import import-communities
```

3. Configure the routing policy that sends direct routes.

```
[edit policy-options policy-statement import-communities]
user@R1# set term 1 from protocol bgp
user@R1# set term 1 from community-count 5 orlower
user@R1# set term 1 then accept
user@R1# set term 2 then reject
```

4. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options ]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 1
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set fe-1/1/0 unit 0 description to-R1
user@R2# set fe-1/1/0 unit 0 family inet address 10.0.0.2/30
```

```
user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@R2# set router-id 192.168.0.3
user@R2# set autonomous-system 2
```

3. Configure BGP.

```
[edit protocols bgp group external-peers]
user@R2# set type external
user@R2# set peer-as 1
user@R2# set neighbor 10.0.0.1
```

4. Configure multiple communities, or configure a single community with multiple members.

```
[edit policy-options community 1]
user@R2# set members 2:1
user@R2# set members 2:2
user@R2# set members 2:3
user@R2# set members 2:4
user@R2# set members 2:5
user@R2# set members 2:6
user@R2# set members 2:7
user@R2# set members 2:8
user@R2# set members 2:9
user@R2# set members 2:10
```

5. Configure the static routes.

```
[edit routing-options static]
user@R2# set route 10.2.0.0/16 reject
user@R2# set route 10.2.0.0/16 install
```

```
user@R2# set route 10.3.0.0/16 reject
user@R2# set route 10.3.0.0/16 install
```

6. Configure a routing policy that advertises static routes into BGP and adds the BGP community to the routes.

```
[edit policy-options policy-statement statics]
user@R2# set from protocol static
user@R2# set then community add 1
user@R2# set then accept
```

7. Apply the export policy.

```
[edit protocols bgp group external-peers]
user@R2# set export statics
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device R1 user@R1# show interfaces
fe-1/1/0 {
  unit 0 {
    description to-R2;
    family inet {
      address 10.0.0.1/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.1/32;
    }
  }
}
}

user@R1# show protocols
bgp {
  group external-peers {
    type external;
    peer-as 2;
    neighbor 10.0.0.2 {
      import import-communities;
    }
  }
}

user@R1# show policy-options
policy-statement import-communities {
  term 1 {
    from {
      protocol bgp;
      community-count 5 orlower;
    }
    then accept;
  }
  term 2 {
    then reject;
  }
}

user@R1# show routing-options
router-id 192.168.0.1;
autonomous-system 1;
```

```

Device R2    user@R2# show interfaces

                  description to-R1;
                  family inet {
                    address 10.0.0.2/30;
                  }
                }
              }
              lo0 {
                unit 0 {
                  family inet {
                    address 192.168.0.2/32;
                  }
                }
              }

              user@R2# show protocols
              bgp {
                group external-peers {
                  type external;
                  export statics;
                  peer-as 1;
                  neighbor 10.0.0.1;
                }
              }

              user@R2# show policy-options
              policy-statement statics {
                from protocol static;
                then {
                  community add 1;
                  accept;
                }
              }
              community 1 members [ 2:1 2:2 2:3 2:4 2:5 2:6 2:7 2:8 2:9 2:10 ];

              user@R2# show routing-options
              static {
                route 10.2.0.0/16 {
                  reject;
                  install;
                }
                route 10.3.0.0/16 {
                  reject;
                  install;
                }
              }
              router-id 192.168.0.3;
              autonomous-system 2;

```

If you are done configuring the devices, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

## Verifying the BGP Routes

**Purpose** Make sure that the routing table on Device R1 contains the expected BGP routes.

**Action** 1. On Device R1, run the **show route protocols bgp** command.

```
user@R1> show route protocols bgp
```

```
inet.0: 5 destinations, 5 routes (3 active, 0 holddown, 2 hidden)
```

2. On Device R1, change the **community-count** configuration in the import policy.

```
[edit policy-options policy-statement import-communities term 1]
```

```
user@R1# set from community-count 5 orhigher
```

```
user@R1# commit
```

3. On Device R1, run the **show route protocols bgp** command.

```
user@R1> show route protocols bgp
```

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
10.2.0.0/16      *[BGP/170] 18:29:53, localpref 100
                  AS path: 2 I, validation-state: unverified
                  > to 10.0.0.2 via fe-1/1/0.0
```

```
10.3.0.0/16      *[BGP/170] 18:29:53, localpref 100
                  AS path: 2 I, validation-state: unverified
                  > to 10.0.0.2 via fe-1/1/0.0
```

4. On Device R1, run the **show route protocols bgp extensive** command to view the advertised communities.

```
user@R1> show route protocols bgp extensive
```

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
```

```

## Example: Configuring a Routing Policy That Removes BGP Communities

This example shows how to create a policy that accepts BGP routes, but removes BGP communities from the routes.

- [Requirements on page 337](#)
- [Overview on page 337](#)
- [Configuration on page 338](#)
- [Verification on page 343](#)

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

This example shows two routing devices with an external BGP (EBGP) connection between them. Device R2 uses the BGP session to send two static routes to Device R1. On Device R1, an import policy specifies that all BGP communities must be removed from the routes.

By default, when communities are configured on EBGP peers, they are sent and accepted. To suppress the acceptance of communities received from a neighbor, you can remove

all communities or a specified set of communities. When the result of a policy is an empty set of communities, the community attribute is not included. To remove all communities, first define a wildcard set of communities (here, the community is named **wild**):

```
[edit policy-options]
community wild members "*" : "*";
```

Then, in the routing policy statement, specify the **community delete** action:

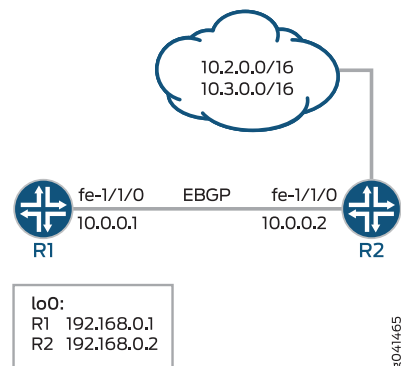

```
[edit policy-options]
policy-statement policy-name {
  term term-name {
    then community delete wild;
  }
}
```

To suppress a particular community from any autonomous system (AS), define the community as **community wild members "\*:community-value"**.

## Topology

Figure 33 on page 338 shows the sample network.

Figure 33: BGP Policy That Removes Communities

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R1

```

set interfaces fe-1/1/0 unit 0 description to-R2
set interfaces fe-1/1/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 2
set protocols bgp group external-peers neighbor 10.0.0.2 import remove-communities
set policy-options policy-statement remove-communities term 1 from protocol bgp
set policy-options policy-statement remove-communities term 1 then community delete wild
set policy-options policy-statement remove-communities term 1 then accept
set policy-options policy-statement remove-communities term 2 then reject
set policy-options community wild members "*" : "*"
```

```
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 1
```

**Device R2**

```
set interfaces fe-1/1/0 unit 0 description to-R1
set interfaces fe-1/1/0 unit 0 family inet address 10.0.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers export statics
set protocols bgp group external-peers peer-as 1
set protocols bgp group external-peers neighbor 10.0.0.1
set policy-options policy-statement statics from protocol static
set policy-options policy-statement statics then community add 1
set policy-options policy-statement statics then accept
set policy-options community 1 members 2:1
set policy-options community 1 members 2:2
set policy-options community 1 members 2:3
set policy-options community 1 members 2:4
set policy-options community 1 members 2:5
set policy-options community 1 members 2:6
set policy-options community 1 members 2:7
set policy-options community 1 members 2:8
set policy-options community 1 members 2:9
set policy-options community 1 members 2:10
set routing-options static route 10.2.0.0/16 reject
set routing-options static route 10.2.0.0/16 install
set routing-options static route 10.3.0.0/16 reject
set routing-options static route 10.3.0.0/16 install
set routing-options router-id 192.168.0.3
set routing-options autonomous-system 2
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the interfaces.

```
[edit interfaces]
user@R1# set fe-1/1/0 unit 0 description to-R2
user@R1# set fe-1/1/0 unit 0 family inet address 10.0.0.1/30

user@R1# set lo0 unit 0 family inet address 192.168.0.1/32
```

2. Configure BGP.

Apply the import policy to the BGP peering session with Device R2.

```
[edit protocols bgp group external-peers]
user@R1# set type external
user@R1# set peer-as 2
user@R1# set neighbor 10.0.0.2 import remove-communities
```

3. Configure the routing policy that deletes communities.

```
[edit policy-options policy-statement remove-communities]
user@R1# set term 1 from protocol bgp
```

```
user@R1# set term 1 then community delete wild
user@R1# set term 1 then accept
user@R1# set term 2 then reject
```

4. Configure the autonomous system (AS) number and the router ID.

```
[edit routing-options ]
user@R1# set router-id 192.168.0.1
user@R1# set autonomous-system 1
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set fe-1/1/0 unit 0 description to-R1
user@R2# set fe-1/1/0 unit 0 family inet address 10.0.0.2/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
user@R2# set router-id 192.168.0.3
user@R2# set autonomous-system 2
```

3. Configure BGP.

```
[edit protocols bgp group external-peers]
user@R2# set type external
user@R2# set peer-as 1
user@R2# set neighbor 10.0.0.1
```

4. Configure multiple communities, or configure a single community with multiple members.

```
[edit policy-options community 1]
user@R2# set members 2:1
user@R2# set members 2:2
user@R2# set members 2:3
user@R2# set members 2:4
user@R2# set members 2:5
user@R2# set members 2:6
user@R2# set members 2:7
user@R2# set members 2:8
user@R2# set members 2:9
user@R2# set members 2:10
```

5. Configure the static routes.

```
[edit routing-options static]
user@R2# set route 10.2.0.0/16 reject
user@R2# set route 10.2.0.0/16 install
user@R2# set route 10.3.0.0/16 reject
user@R2# set route 10.3.0.0/16 install
```

6. Configure a routing policy that advertises static routes into BGP and adds the BGP community to the routes.

```
[edit policy-options policy-statement statics]
user@R2# set from protocol static
user@R2# set then community add 1
user@R2# set then accept
```

7. Apply the export policy.

```
[edit protocols bgp group external-peers]
user@R2# set export statics
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device R1 user@R1# show interfaces

If you are done configuring the devices, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Verifying the BGP Routes

**Purpose** Make sure that the routing table on Device R1 does not contain BGP communities.

**Action** 1. On Device R1, run the **show route protocols bgp extensive** command.

```
user@R1> show route protocols bgp extensive

inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)

## Understanding Damping Parameters

---

BGP *route flapping* describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. BGP *flap damping* is a method of reducing the number of update messages sent between BGP peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route. Marking routes in this way leads to some delay, or *suppression*, in the propagation of route information, but the result is increased network stability. You typically apply flap damping to external BGP (EBGP) routes (routes in different ASs). You can also apply flap damping within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level, which is supported in Junos OS Release 12.2 and later. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

By default, route flap damping is not enabled. Damping is applied to external peers and to peers at confederation boundaries.

When you enable damping, default parameters are applied, as summarized in [Table 25 on page 348](#).

Table 25: Damping Parameters

| Damping Parameter                  | Description                                                                                                             | Default Value | Possible Values  |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------|---------------|------------------|
| <b>half-life <i>minutes</i></b>    | Decay half-life—Number of minutes after which an arbitrary value is halved if a route stays stable.                     | 15 (minutes)  | 1 through 45     |
| <b>max-suppress <i>minutes</i></b> | Maximum hold-down time for a route, in minutes.                                                                         | 60 (minutes)  | 1 through 720    |
| <b>reuse</b>                       | Reuse threshold—Arbitrary value below which a suppressed route can be used again.                                       | 750           | 1 through 20,000 |
| <b>suppress</b>                    | Cutoff (suppression) threshold—Arbitrary value above which a route can no longer be used or included in advertisements. | 3000          | 1 through 20,000 |

To change the default BGP flap damping values, you define actions by creating a named set of damping parameters and including it in a routing policy with the damping action. For the damping routing policy to work, you also must enable BGP route flap damping.

## Using Routing Policies to Damp BGP Route Flapping

BGP *route flapping* describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. BGP *flap damping* is a way to reduce the number of update messages sent between BGP peers, thereby reducing the load on these peers without adversely affecting the route convergence time.

Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route. Doing this leads to some delay, or *suppression*, in the propagation of route information, but the result is increased network stability. You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to IBGP routes. (If you do, it is ignored.)

BGP flap damping is defined in RFC 2439, *BGP Route Flap Damping*.

To effect changes to the default BGP flap damping values, you define actions by creating a named set of damping parameters and including it in a routing policy with the **damping** action (described in [“Configuring Actions That Manipulate Route Characteristics” on page 53](#)). For the damping routing policy to work, you also must enable BGP route flap damping.

The following sections discuss the following topics:

- [Configuring BGP Flap Damping Parameters on page 349](#)
- [Specifying BGP Flap Damping as the Action in Routing Policy Terms on page 351](#)
- [Disabling Damping for Specific Address Prefixes on page 351](#)
- [Configuring BGP Flap Damping on page 352](#)

## Configuring BGP Flap Damping Parameters

To define damping parameters, include the **damping** statement:

```
[edit policy-options]
damping name {
  disable;
  half-life minutes;
  max-suppress minutes;
  reuse number;
  suppress number;
}
```

The name identifies the group of damping parameters. It can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose the entire name in quotation marks (" ").

You can specify one or more of the damping parameters described in [Table 26 on page 349](#).

**Table 26: Damping Parameters**

| Damping Parameter           | Description                        | Default         | Possible Values             |
|-----------------------------|------------------------------------|-----------------|-----------------------------|
| <b>half-life minutes</b>    | Decay half-life, in minutes        | 15 minutes      | 1 through 45 minutes        |
| <b>max-suppress minutes</b> | Maximum hold-down time, in minutes | 60 minutes      | 1 through 720 minutes       |
| <b>reuse</b>                | Reuse threshold                    | 750 (unitless)  | 1 through 20,000 (unitless) |
| <b>suppress</b>             | Cutoff (suppression) threshold     | 3000 (unitless) | 1 through 20,000 (unitless) |

If you do not specify one or more of the damping parameters, the default value of the parameter is used.

To understand how to configure these parameters, you need to understand how damping suppresses routes. How long a route can be suppressed is based on a *figure of merit*, which is a value that correlates to the probability of future instability of a route. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time.

A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes. With each incident of instability, the value increases as follows:

- Route is withdrawn—1000
- Route is readvertised—1000
- Route's path attributes change—500

**NOTE:** Other vendors' implementations for figure-of-merit increase the value only when a route is withdrawn. The Junos OS implementation for figure-of-merit increases the value for both route withdrawal and route readvertisement. To accommodate other implementations for figure-of-merit, multiply the **reuse** and **suppress** threshold values by 2.

When a route's figure-of-merit value reaches a particular level, called the *cutoff* or *suppression threshold*, the route is suppressed. If a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols. By default, a route is suppressed when its figure-of-merit value reaches 3000. To modify this default, include the **suppress** option at the **[edit policy-options damping name]** hierarchy level.

If a route has flapped, but then becomes stable so that none of the incidents listed previously occur within a configurable amount of time, the figure-of-merit value for the route decays exponentially. The default half-life is 15 minutes. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes. To modify the default half-life, include the **half-life** option at the **[edit policy-options damping name]** hierarchy level.

**NOTE:** For the half-life, configure a value that is less than the max-suppress. If you do not, the configuration is rejected.

A suppressed route becomes reusable when its figure-of-merit value decays to a value below a *reuse threshold*, thus allowing routes that experience transient instability to once again be considered valid. The default reuse threshold is 750. When the figure-of-merit value passes below the reuse threshold, the route once again is considered usable and can be installed in the forwarding table and exported from the routing table. To modify the default reuse threshold, include the **reuse** option at the **[edit policy-options damping name]** hierarchy level.

The maximum suppression time provides an upper bound on the time that a route can remain suppressed. The default maximum suppression time is 60 minutes. To modify the default, include the **max-suppress** option at the **[edit policy-options damping name]** hierarchy level.

**NOTE:** For the max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.

A route's figure-of-merit value stops increasing when it reaches a maximum suppression threshold, which is determined based on the route's suppression threshold level, half-life, reuse threshold, and maximum hold-down time.

The merit ceiling,  $\epsilon_c$ , which is the maximum merit that a flapping route can collect, is calculated using the following formula:

$$\epsilon_c \leq \epsilon_r e^{(t/\lambda) (\ln 2)}$$

$\epsilon_r$  is the figure-of-merit reuse threshold,  $t$  is the maximum hold-down time in minutes, and  $\lambda$  is the half-life in minutes. For example, if you use the default figure-of-merit values in this formula, but use a half-life of 30 minutes, the calculation is as follows:

$$\epsilon_c \leq 750 e^{(60/30) (\ln 2)}$$

$$\epsilon_c \leq 3000$$

**NOTE:** The cutoff threshold, which you configure using the **suppress** option, must be less than or equal to the merit ceiling,  $\epsilon_c$ . If the configured cutoff threshold or the default cutoff threshold is greater than the merit ceiling, the route is never suppressed and damping never occurs.

To display figure-of-merit information, use the **show policy damping** command.

A route that has been assigned a figure of merit is considered to have a damping state. To display the current damping information on the routing device, use the **show route detail** command.

## Specifying BGP Flap Damping as the Action in Routing Policy Terms

To BGP flap damping as the action in a routing policy term, include the **damping** statement and the name of the configured damping parameters either as an option of the **route-filter** statement at the **[edit policy-options policy-statement *policy-name* term *term-name* from]** hierarchy level:

```
[edit policy-options policy-statement policy-name term term-name from]
route-filter destination-prefix match-type {
  damping damping-parameters;
}
```

or at the **[edit policy-options policy-statement *policy-name* term *term-name* then]** hierarchy level:

```
[edit policy-options policy-statement policy-name term term-name then]
damping damping-parameters;
```

## Disabling Damping for Specific Address Prefixes

Normally, you enable or disable damping on a per-peer basis. However, you can disable damping for a specific prefix received from a peer by including the **disable** option:

```
[edit policy-options damping name]
```

```
disable;
```

### Disabling Damping for a Specific Address Prefix

---

In this routing policy example, although damping is enabled for the peer, the **damping none** statement specifies that damping be disabled for prefix 10.0.0.0/8 in **Policy-A**. This route is not damped because the routing policy statement named **Policy-A** filters on the prefix 10.0.0.0/8 and the action points to the **damping** statement named **none**. The remaining prefixes are damped using the default parameters.

```
[edit]
policy-options {
  policy-statement Policy-A {
    from {
      route-filter 10.0.0.0/8 exact;
    }
    then damping none;
  }
  damping none {
    disable;
  }
}
```

### Configuring BGP Flap Damping

Enable BGP flap damping and configure damping parameters:

```
[edit]
routing-options {
  autonomous-system 666;
}
protocols {
  bgp {
    damping;
    group group1 {
      traceoptions {
        file bgp-log size 1m files 10;
        flag damping;
      }
      import damp;
      type external;
      peer-as 10458;
      neighbor 192.168.2.30;
    }
  }
}
policy-options {
  policy-statement damp {
    from {
      route-filter 192.168.0.0/32 exact {
        damping high;
        accept;
      }
      route-filter 172.16.0.0/32 exact {
        damping medium;
        accept;
      }
    }
  }
}
```

```

    }
    route-filter 10.0.0.0/8 exact {
        damping none;
        accept;
    }
}
damping high {
    half-life 30;
    suppress 3000;
    reuse 750;
    max-suppress 60;
}
damping medium {
    half-life 15;
    suppress 3000;
    reuse 750;
    max-suppress 45;
}
damping none {
    disable;
}
}

```

To display damping parameters for this configuration, use the **show policy damping** command:

```

user@host> show policy damping
Damping information for "high":
  Halflife: 30 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 3008
    Maximum decay: 24933
Damping information for "medium":
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 45 minutes
  Computed values:
    Merit ceiling: 6024
    Maximum decay: 12449
Damping information for "none":
Damping disabled

```

## Example: Configuring BGP Route Flap Damping Parameters

This example shows how to configure damping parameters.

- [Requirements on page 354](#)
- [Overview on page 354](#)
- [Configuration on page 355](#)
- [Verification on page 358](#)

### Requirements

Before you begin, configure router interfaces and configure routing protocols.

### Overview

This example has three routing devices. Device R2 has external BGP (EBGP) connections with Device R1 and Device R3.

Device R1 and Device R3 have some static routes configured for testing purposes, and these static routes are advertised through BGP to Device R2.

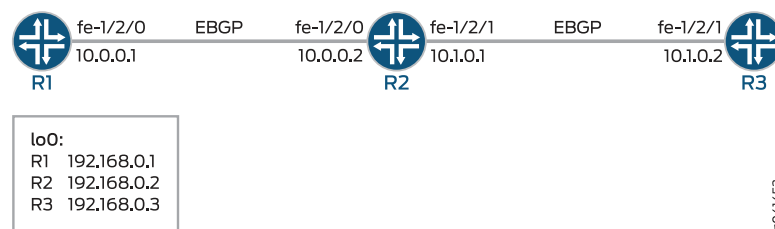

Device R2 damps routes received from Device R1 and Device R3 according to these criteria:

- Damp all prefixes with a mask length equal to or greater than 17 more aggressively than routes with a mask length between 9 and 16.
- Damp routes with a mask length between 0 and 8, inclusive, less than routes with a mask length greater than 8.
- Do not damp the 10.128.0.0/9 prefix at all.

The routing policy is evaluated when routes are being exported from the routing table into the forwarding table. Only the active routes are exported from the routing table.

[Figure 34 on page 354](#) shows the sample network.

**Figure 34: BGP Flap Damping Topology**

[“CLI Quick Configuration” on page 355](#) shows the configuration for all of the devices in [Figure 34 on page 354](#).

The section [“Step-by-Step Procedure” on page 356](#) describes the steps on Device R2.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device R1**

```

set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct-and-static
set protocols bgp group ext peer-as 200

set routing-options autonomous-system 300

```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure damping parameters:

1. Configure the interfaces.

```

[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

```

```

user@R2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30

```

```

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32

```

2. Configure the BGP neighbors.

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set neighbor 10.0.0.1 peer-as 100
user@R2# set neighbor 10.1.0.2 peer-as 300

```

3. Create and configure the damping parameter groups.

```

[edit policy-options]
user@R2# set damping aggressive half-life 30
user@R2# set damping aggressive suppress 2500
user@R2# set damping timid half-life 5
user@R2# set damping dry disable

```

4. Configure the damping policy.

```

[edit policy-options policy-statement damp term 1]
user@R2# set from route-filter 10.128.0.0/9 exact damping dry
user@R2# set from route-filter 0.0.0.0/0 prefix-length-range /0-/8 damping timid
user@R2# set from route-filter 0.0.0.0/0 prefix-length-range /17-/32 damping aggressive

```

5. Enable damping for BGP.

```

[edit protocols bgp]
user@R2# set damping

```

6. Apply the policy as an import policy for the BGP neighbor.

```

[edit protocols bgp group ext]
user@R2# set import damp

```

**NOTE:** You can refer to the same routing policy one or more times in the same or different import statements.

7. Configure an export policy.  

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```
8. Apply the export policy.  

```
[edit protocols bgp group ext]
user@R2# set export send-direct
```
9. Configure the autonomous system (AS) number.  

```
[edit routing-options]
user@R2# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      address 10.1.0.1/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.2/32;
    }
  }
}
```

```
user@R2# show protocols
bgp {
  damping;
  group ext {
    type external;
    import damp;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
    neighbor 10.1.0.2 {
      peer-as 300;
    }
  }
}
```

```
    }  
  }  
  user@R2# show policy-options  
  policy-statement damp {  
    term 1 {  
      from {  
        route-filter 10.128.0.0/9 exact damping dry;  
        route-filter 0.0.0.0/0 prefix-length-range /0-/8 damping timid;  
        route-filter 0.0.0.0/0 prefix-length-range /17-/32 damping aggressive;  
      }  
    }  
  }  
  policy-statement send-direct {  
    term 1 {  
      from protocol direct;  
      then accept;  
    }  
  }  
  damping aggressive {  
    half-life 30;  
    suppress 2500;  
  }  
  damping timid {  
    half-life 5;  
  }  
  damping dry {  
    disable;  
  }  
  
  user@R2# show routing-options  
  autonomous-system 200;
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

---

### Causing Some Routes to Flap

**Purpose** To verify your route flap damping policy, some routes must flap. Having a live Internet feed almost guarantees that a certain number of route flaps will be present. If you have control over a remote system that is advertising the routes, you can modify the advertising router's policy to effect the advertisement and withdrawal of all routes or of a given

prefix. In a test environment, you can cause routes to flap by clearing the BGP neighbors or by restarting the routing process on the BGP neighbors, as shown here.

**Action** From operational mode on Device R1 and Device R3, enter the **restart routing** command.

**CAUTION:** Use this command cautiously in a production network.

```
user@R1> restart routing
```

```
R1 started, pid 10474
```

```
user@R3> restart routing
```

```
R3 started, pid 10478
```

**Meaning** On Device R2, all of the routes from the neighbors are withdrawn and re-advertised.

### Checking the Route Flaps

**Purpose** View the number of neighbor flaps.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@R2> show bgp summary
```

```
Groups: 1 Peers: 2 Down peers: 0
Table          Tot Paths  Act Paths Suppressed    History  Damp State   Pending
inet.0
Peer           AS         InPkt   OutPkt   OutQ   Flaps  Last Up/Dwn
State|#Active/Received/Accepted/Damped...
10.0.0.1        100         10       10       0       4      2:50
0/9/0/9        0/0/0/0
10.1.0.2        300         10       10       0       4      2:53
1/3/1/2        0/0/0/0
```

**Meaning** This output was captured after the routing process was restarted on Device R2's neighbors four times.

### Verifying Route Flap Damping

**Purpose** Verify that routes are being hidden due to damping.

**Action** From operational mode, enter the **show route damping suppressed** command.

```
user@R2> show route damping suppressed
```

```
inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
0.0.0.0/0      [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
```

```

10.0.0.0/9      > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
10.0.0.0/30     > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
10.1.0.0/30     > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:15, localpref 100
                AS path: 300 I, validation-state: unverified

                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
172.16.0.0/16   > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
172.16.128.0/17 > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
172.16.192.0/20 > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
192.168.0.1/32  > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
192.168.0.3/32  > to 10.0.0.1 via fe-1/2/0.0
                [BGP ] 00:00:15, localpref 100
                AS path: 300 I, validation-state: unverified
224.0.0.0/7     > to 10.1.0.2 via fe-1/2/1.0
                [BGP ] 00:00:12, localpref 100
                AS path: 100 I, validation-state: unverified
                > to 10.0.0.1 via fe-1/2/0.0

```

**Meaning** The output shows some routing instability. Eleven routes are hidden due to damping.

### Displaying the Details of a Damped Route

**Purpose** Display the details of damped routes.

**Action** From operational mode, enter the **show route damping suppressed 172.16.192.0/20 detail** command.

```

user@R2> show route damping suppressed 172.16.192.0/20 detail

inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
172.16.192.0/20 (1 entry, 0 announced)
    BGP /-101
        Next hop type: Router, Next hop index: 758
        Address: 0x9414484
        Next-hop reference count: 9
        Source: 10.0.0.1
        Next hop: 10.0.0.1 via fe-1/2/0.0, selected
        Session Id: 0x100201
        State: <Hidden Ext>
        Local AS: 200 Peer AS: 100
        Age: 52
        Validation State: unverified
        Task: BGP_100.10.0.0.1+55922
        AS path: 100 I
        Localpref: 100

```

```

Router ID: 192.168.0.1
Merit (last update/now): 4278/4196
damping-parameters: aggressive
Last update:      00:00:52 First update:      01:01:55
Flaps: 8
Suppressed. Reusable in:      01:14:40
Preference will be: 170

```

**Meaning** This output indicates that the displayed route has a mask length that is equal to or greater than /17, and confirms that it has been correctly mapped to the aggressive damping profile. You can also see the route's current (and last) figure of merit value, and when the route is expected to become active if it remains stable.

### Verifying That Default Damping Parameters Are in Effect

**Purpose** Locating a damped route with a /16 mask confirms that the default parameters are in effect.

**Action** From operational mode, enter the **show route damping suppressed detail | match 0/16** command.

```
user@R2> show route damping suppressed detail | match 0/16
```

```
172.16.0.0/16 (1 entry, 0 announced)
```

```
user@R2> show route damping suppressed 172.16.0.0/16 detail
```

```

inet.0: 15 destinations, 17 routes (6 active, 0 holddown, 11 hidden)
172.16.0.0/16 (1 entry, 0 announced)
   BGP          /-101
     Next hop type: Router, Next hop index: 758
     Address: 0x9414484
     Next-hop reference count: 9
     Source: 10.0.0.1
     Next hop: 10.0.0.1 via fe-1/2/0.0, selected
     Session Id: 0x100201
     State: <Hidden Ext>
     Local AS: 200 Peer AS: 100
     Age: 1:58
     Validation State: unverified
     Task: BGP_100.10.0.0.1+55922
     AS path: 100 I
     Localpref: 100
     Router ID: 192.168.0.1
     Merit (last update/now): 3486/3202
     Default damping parameters used
     Last update:      00:01:58 First update:      01:03:01
     Flaps: 8
     Suppressed. Reusable in:      00:31:40
     Preference will be: 170

```

**Meaning** Routes with a /16 mask are not impacted by the custom damping rules. Therefore, the default damping rules are in effect.

To repeat, the custom rules are as follows:

- Damp all prefixes with a mask length equal to or greater than 17 more aggressively than routes with a mask length between 9 and 16.
- Damp routes with a mask length between 0 and 8, inclusive, less than routes with a mask length greater than 8.
- Do not damp the 10.128.0.0/9 prefix at all.

### Filtering the Damping Information

---

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b>               | Use OR groupings or cascaded piping to simplify the determination of what damping profile is being used for routes with a given mask length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Meaning</b>               | When you are satisfied that your EBGp routes are correctly associated with a damping profile, you can issue the <b>clear bgp damping</b> operational mode command to restore an active status to your damped routes, which will return your connectivity to normal operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family

This example shows how to configure an multiprotocol BGP multicast VPN (also called Next-Generation MVPN) with BGP route flap damping.

- [Requirements on page 363](#)
- [Overview on page 363](#)
- [Configuration on page 364](#)
- [Verification on page 371](#)

### Requirements

This example uses Junos OS Release 12.2. BGP route flap damping support for MBGP MVPN, specifically, and on an address family basis, in general, is introduced in Junos OS Release 12.2.

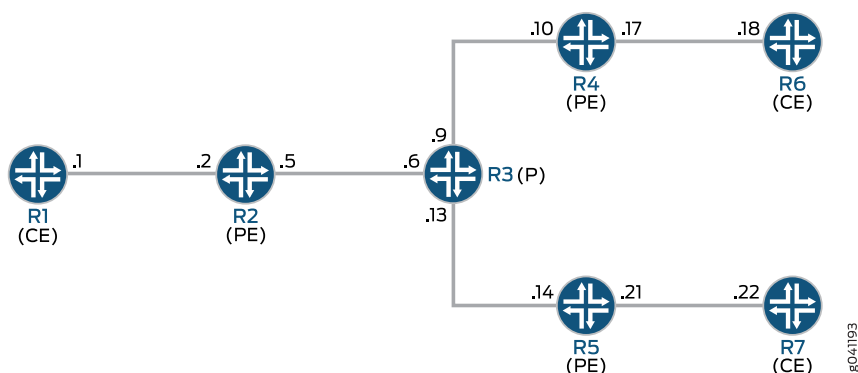

### Overview

BGP route flap damping helps to diminish route instability caused by routes being repeatedly withdrawn and readvertised when a link is intermittently failing.

This example uses the default damping parameters and demonstrates an MBGP MVPN scenario with three provider edge (PE) routing devices, three customer edge (CE) routing devices, and one provider (P) routing device.

[Figure 35 on page 363](#) shows the topology used in this example.

**Figure 35: MBGP MVPN with BGP Route Flap Damping**

On PE Device R4, BGP route flap damping is configured for address family `inet-mvpn`. A routing policy called `dampPolicy` uses the `nlri-route-type` match condition to damp only MVPN route types 3, 4, and 5. All other MVPN route types are not damped.

This example shows the full configuration on all devices in the “[CLI Quick Configuration](#)” on [page 364](#) section. The “[Configuring Device R4](#)” on [page 367](#) section shows the step-by-step configuration for PE Device R4.

## Configuration

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Configuring Device R4

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R4:

1. Configure the interfaces.

```

[edit interfaces]
user@R4# set ge-1/2/0 unit 10 family inet address 10.1.1.10/30
user@R4# set ge-1/2/0 unit 10 family mpls

user@R4# set ge-1/2/1 unit 17 family inet address 10.1.1.17/30
user@R4# set ge-1/2/1 unit 17 family mpls

user@R4# set vt-1/2/0 unit 4 family inet

user@R4# set lo0 unit 4 family inet address 1.1.1.4/32
user@R4# set lo0 unit 104 family inet address 100.1.1.4/32

```

2. Configure MPLS and the signaling protocols on the interfaces.

```

[edit protocols]
user@R4# set mpls interface all
user@R4# set mpls interface ge-1/2/0.10
user@R4# set rsvp interface all aggregate
user@R4# set ldp interface ge-1/2/0.10
user@R4# set ldp p2mp

```

3. Configure BGP.

The BGP configuration enables BGP route flap damping for the **inet-mvpn** address family. The BGP configuration also imports into the routing table the routing policy called **dampPolicy**. This policy is applied to neighbor PE Device R2.

```

[edit protocols bgp group ibgp]
user@R4# set type internal
user@R4# set local-address 1.1.1.4
user@R4# set family inet-vpn unicast
user@R4# set family inet-vpn any
user@R4# set family inet-mvpn signaling damping
user@R4# set neighbor 1.1.1.2 import dampPolicy
user@R4# set neighbor 1.1.1.5

```

4. Configure an interior gateway protocol.

```
[edit protocols ospf]
user@R4# set traffic-engineering

[edit protocols ospf area 0.0.0.0]
user@R4# set interface all
user@R4# set interface lo0.4 passive
user@R4# set interface ge-1/2/0.10
```

5. Configure a damping policy that uses the **nlri-route-type** match condition to damp only MVPN route types 3, 4, and 5.

```
[edit policy-options policy-statement dampPolicy term term1]
user@R4# set from family inet-mvpn
user@R4# set from nlri-route-type 3
user@R4# set from nlri-route-type 4
user@R4# set from nlri-route-type 5
user@R4# set then accept
```

6. Configure the **damping** policy to disable BGP route flap damping.

The **no-damp** policy (**damping no-damp disable**) causes any damping state that is present in the routing table to be deleted. The **then damping no-damp** statement applies the **no-damp** policy as an action and has no **from** match conditions. Therefore, all routes that are not matched by **term1** are matched by this term, with the result that all other MVPN route types are not damped.

```
[edit policy-options policy-statement dampPolicy]
user@R4# set then damping no-damp
user@R4# set then accept
```

```
[edit policy-options]
user@R4# set damping no-damp disable
```

7. Configure the **parent\_vpn\_routes** to accept all other BGP routes that are not from the **inet-mvpn** address family.

This policy is applied as an OSPF export policy in the routing instance.

```
[edit policy-options policy-statement parent_vpn_routes]
user@R4# set from protocol bgp
user@R4# set then accept
```

8. Configure the VPN routing and forwarding (VRF) instance.

```
[edit routing-instances vpn-1]
user@R4# set instance-type vrf
user@R4# set interface vt-1/2/0.4
user@R4# set interface ge-1/2/1.17
user@R4# set interface lo0.104
user@R4# set route-distinguisher 100:100
user@R4# set vrf-target target:1:1
user@R4# set protocols ospf export parent_vpn_routes
user@R4# set protocols ospf area 0.0.0.0 interface lo0.104 passive
user@R4# set protocols ospf area 0.0.0.0 interface ge-1/2/1.17
user@R4# set protocols pim rp static address 100.1.1.2
user@R4# set protocols pim interface ge-1/2/1.17 mode sparse
```

```
user@R4# set protocols mvpn
```

9. Configure the router ID and the autonomous system (AS) number.

```
[edit routing-options]
```

```
user@R4# set router-id 1.1.1.4
```

```
user@R4# set autonomous-system 1001
```

10. If you are done configuring the device, commit the configuration.

```
user@R4# commit
```

## Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-instances**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R4# show interfaces
```

```
ge-1/2/0 {
  unit 10 {
    family inet {
      address 10.1.1.10/30;
    }
    family mpls;
  }
}
ge-1/2/1 {
  unit 17 {
    family inet {
      address 10.1.1.17/30;
    }
    family mpls;
  }
}
vt-1/2/0 {
  unit 4 {
    family inet;
  }
}
lo0 {
  unit 4 {
    family inet {
      address 1.1.1.4/32;
    }
  }
  unit 104 {
    family inet {
      address 100.1.1.4/32;
    }
  }
}
}
```

```
user@R4# show protocols
```

```

## Verification

Confirm that the configuration is working properly.

- [Verifying That Route Flap Damping Is Disabled on page 371](#)
- [Verifying Route Flap Damping on page 372](#)

### Verifying That Route Flap Damping Is Disabled

**Purpose** Verify the presence of the **no-damp** policy, which disables damping for MVPN route types other than 3, 4, and 5.

**Action** From operational mode, enter the **show policy damping** command.

```
user@R4> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "no-damp":
  Damping disabled
```

**Meaning** The output shows that the default damping parameters are in effect and that the **no-damp** policy is also in effect for the specified route types.

### Verifying Route Flap Damping

**Purpose** Check whether BGP routes have been damped.

**Action** From operational mode, enter the **show bgp summary** command.

```
user@R4> show bgp summary
Groups: 1 Peers: 2 Down peers: 0
Table Tot Paths Act Paths Suppressed History Damp State Pending
bgp.l3vpn.0
      6      6      0      0      0      0
bgp.l3vpn.2
      0      0      0      0      0      0
bgp.mvpn.0
      2      2      0      0      0      0
Peer AS InPkt OutPkt OutQ Flaps Last Up/Dwn
State|#Active/Received/Accepted/Damped...
1.1.1.2 1001 3159 3155 0 0 23:43:47
Establ
  bgp.l3vpn.0: 3/3/3/0
  bgp.l3vpn.2: 0/0/0/0
  bgp.mvpn.0: 1/1/1/0
  vpn-1.inet.0: 3/3/3/0
  vpn-1.mvpn.0: 1/1/1/0
1.1.1.5 1001 3157 3154 0 0 23:43:40
Establ
  bgp.l3vpn.0: 3/3/3/0
  bgp.l3vpn.2: 0/0/0/0
  bgp.mvpn.0: 1/1/1/0
  vpn-1.inet.0: 3/3/3/0
  vpn-1.mvpn.0: 1/1/1/0
```

**Meaning** The Damp State field shows that zero routes in the bgp.mvpn.0 routing table have been damped. Further down, the last number in the State field shows that zero routes have been damped for BGP peer 1.1.1.2.

### Understanding Source Class Usage and Destination Class Usage Options

You can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into disjoint sets defined as source classes and *destination classes*. You can define classes based on a variety of parameters, such as routing neighbors, autonomous systems, and route filters.

Source class usage (SCU) counts packets sent to customers by performing lookups on the IP source address and the IP destination address. SCU makes it possible to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge. You must enable SCU accounting on both the inbound and outbound physical interfaces.

Destination class usage (DCU) counts packets from customers by performing lookups of the IP destination address. DCU makes it possible to track traffic originating from the customer edge and destined for specific prefixes on the provider core router.

On T Series Core Routers and M320 Multiservice Edge Routers, the source class and destination classes are not carried across the platform fabric. The implications of this are as follows:

- On T Series and M320 routers, SCU and DCU accounting is performed before the packet enters the fabric.
- On T Series and M320 routers, DCU is performed before output filters are evaluated.
- On M Series platforms, DCU is performed after output filters are evaluated.
- If an output filter drops traffic on M Series devices, the dropped packets are excluded from DCU statistics.
- If an output filter drops traffic on T Series and M320 routers, the dropped packets are included in DCU statistics.

**NOTE:** SCU and DCU is supported on PTX series routers only when third-generation FPCs are installed on the router and *enhanced-mode* is configured on the chassis.

---

On MX Series platforms with MPC/MIC interfaces, SCU and DCU are performed after output filters are evaluated. Packets dropped by output filters are not included in SCU or DCU statistics.

On MX Series platforms with non-MPC/MIC interfaces, SCU and DCU are performed before output filters are evaluated. Packets dropped by output filters are included in SCU and DCU statistics.

On Enhanced Scaling FPCs (T640-FPC1-ES, T640-FPC2-ES, T640-FPC3-ES, T640-FPC4-1P-ES, and T1600-FPC4-ES), the source class accounting is performed at ingress. Starting with Junos OS Release 14.2, the SCU accounting is performed at ingress on a T4000 Type 5 FPC. The implications of this are as follows:

- SCU accounting is performed when packets traverse from T4000 Type 5 FPC (ingress FPC) to Enhanced Scaling FPCs (egress FPC).
- SCU accounting is performed when packets traverse from Enhanced Scaling FPCs (ingress FPC) to T4000 Type 5 FPC (egress FPC).

**NOTE:** When the interface statistics are cleared and then the routing engine is replaced, the SCU and DCU statistics will not match the statistics of the previous routing engine.

For more information about source class usage, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*, the *Junos OS Network Interfaces Library for Routing Devices*, and the *Junos OS, Release 15.1*.

## Source Class Usage Overview

Source class usage (SCU) is a logical extension of the destination class usage (DCU) concept. DCU was created so that Juniper Networks customers could count on a per-interface basis how much traffic was sent to specified prefixes. [Figure 36 on page 375](#) shows a service provider edge (PE) router diagram.

**Figure 36: DCU/SCU Concept**

The Fast Ethernet interfaces contain inbound traffic from customers, and the SONET/SDH interfaces are connected to outbound public network prefixes. With DCU configured on the Fast Ethernet interfaces, you can track how much traffic is sent to a specific prefix in the core of the network originating from one of the specified interfaces (in this case, the Fast Ethernet interfaces).

However, DCU limits your ability to keep track of traffic moving in the reverse direction. It can account for all traffic that arrives on a core interface and heads toward a specific customer, but it cannot count traffic that arrives on a core interface from a specific prefix. For example, DCU can process cumulative traffic headed toward interface **fe-0/0/0**, but cannot differentiate between traffic coming only from **10.3.0.0/16** and traffic coming from all prefixes.

You can track source-based traffic by using SCU, which allows you to monitor the amount of traffic originating from a specific prefix. With this feature, usage can be tracked and customers can be billed for the traffic they receive.

## Guidelines for Configuring SCU

---

When you enable SCU or DCU, keep the following information in mind:

- In Junos OS Release 5.6 and later for M Series routers only, you can use a source class or a destination class as a match condition in a firewall filter. To configure, include the **destination-class** or **source-class** statement at the **[edit firewall filter *firewall-name* term *term-name* from]** hierarchy level. For more information about firewall filters, see the *Junos Policy Framework Configuration Guide*.
- You can assign up to 126 source classes and 126 destination classes.
- When configuring policy action statements, you can configure only one source class for each matching route. In other words, more than one source class cannot be applied to the same route.
- A source or destination class is applied to a packet only once during the routing table lookup. When a network prefix matches a class-usage policy, SCU is assigned to packets first; DCU is assigned only if SCU has not been assigned. Be careful when using both class types, since misconfiguration can result in uncounted packets. The following example explores one potential mishap:

A packet arrives on a router interface configured for both SCU and DCU. The packet's source address matches an SCU class, and its destination matches a DCU class. Consequently, the packet is subjected to a source lookup and is marked with the SCU class. The DCU class is ignored. As a result, the packet is forwarded to the outbound interface with only the SCU class still intact.

However, the outbound interface lacks an SCU configuration. When the packet is ready to leave the router, the router detects that the output interface is not configured for SCU and the packet is not counted by SCU. Likewise, even though the prefix matched the DCU prefix, the DCU counters do not increment because DCU was superseded by SCU at the inbound interface.

To solve this problem, make sure you configure both the inbound and outbound interfaces completely or configure only one class type per interface per direction.

- Classes cannot be mapped to directly connected prefixes configured on local interfaces. This is true for DCU and SCU classes.
- If you use multiple terms within a single policy, you only need to configure the policy name and apply it to the forwarding table once. This makes it easier to change options within your terms without having to reconfigure the main policy.
- Execute command line interface (CLI) **show** commands and accounting profiles at the desired outbound interface to track SCU traffic. SCU counters increment at the SCU **output** interface.
- Apply your classes to the inbound and outbound interfaces by means of the **input** and **output** SCU interface parameters.
- On M320 and T Series routers, the source and destination classes are not carried across the platform fabric. For these routers, SCU and DCU accounting is performed before the packet enters the fabric and DCU is performed before output filters are evaluated.
- If an output filter drops traffic on M Series routers other than the M120 router and M320 router, the dropped packets are excluded from DCU statistics. If an output filter drops traffic on M320 and T Series routers, the dropped packets are included in DCU statistics.

## System Requirements for SCU

To implement SCU, your system must meet these requirements:

- Junos OS Release 8.2 or later for M120 and MX Series router support
- Junos OS Release 6.2 or later for IPv6 SCU
- Junos OS Release 5.6 or later to use a source class or a destination class as a match condition in a firewall filter
- Junos OS Release 5.4 or later for IPv4 SCU
- Three Juniper Networks M Series, MX Series, or T Series routers for basic SCU and five routers for SCU with Layer 3 VPNs. One router acts as a source class usage transit router, and the other routers are used to generate traffic or participate in the Layer 3 VPN.
- For M Series and T Series routers, a Tunnel Services PIC for SCU with Layer 3 VPNs

## Terms and Acronyms for SCU

### D

- destination address (DA)** The IP address of a device intended as the receiver for a packet. This address is included in the IP header and is the main address analyzed by the router during routing table lookups and DCU.
- destination class usage (DCU)** A method of grouping certain types of traffic and monitoring these groups through CLI **show** commands, accounting profiles, or SNMP. DCU uses a destination address lookup when determining group membership. For more information about DCU, see the *Junos Policy Framework Configuration Guide*.

### S

- source address (SA)** The IP address of a device sending a packet. This address is included in the IP header and is analyzed by the router for a variety of services, including source-based filtering, policing, class of service (CoS), and SCU.
- source class usage (SCU)** A method of grouping certain types of traffic and monitoring these groups through CLI **show** commands, accounting profiles, or SNMP. SCU uses a source address lookup when determining group membership. For more information about SCU, see the *Junos Policy Framework Configuration Guide*.

---

## Roadmap for Configuring SCU

To configure source class usage (SCU), you must:

1. Create a routing policy that includes prefix route filters that indicate the IPv4 or IPv6 source addresses to monitor. See [“Configuring Route Filters and Source Classes in a Routing Policy” on page 380](#).

2. Apply the filters to the forwarding table. See [“Applying the Policy to the Forwarding Table” on page 380](#).
3. Enable accounting on the inbound and outbound interfaces. See [“Enabling Accounting on Inbound and Outbound Interfaces” on page 381](#).

---

## Roadmap for Configuring SCU with Layer 3 VPNs

---

SCU can be implemented over regular interfaces; it is also used in combination with Layer 3 VPNs. When you view SCU traffic on an ingress provider edge (PE) router, use the standard procedure outlined in [“Roadmap for Configuring SCU” on page 378](#). However, when you enable packet counting for Layer 3 VPNs at the egress point of the MPLS tunnel, you need to take some additional steps, as follows:

1. Configure SCU on the virtual loopback tunnel (vt) interface of the egress PE router. See [“Configuring Input SCU on the vt Interface of the Egress PE Router” on page 382](#).
2. Map the SCU-enabled input interface of that router to the virtual routing and forwarding (VRF) instance. See [“Mapping the SCU-Enabled vt Interface to the VRF Instance” on page 382](#).
3. Configure SCU on the output interface of the egress router. See [“Configuring SCU on the Output Interface” on page 383](#).
4. Configure an accounting profile and associate the source class with that accounting profile. You can also specify the filename for the data capture, a class usage profile name, and an interval indicating how often you want the SCU information to be saved. See [“Associating an Accounting Profile with SCU Classes” on page 384](#).

**NOTE:** SCU is not supported over Layer 2 VPNs.

---

## Configuring Route Filters and Source Classes in a Routing Policy

Begin configuring SCU by creating prefix route filters in a policy statement. These prefixes indicate the IPv4 or IPv6 source addresses to monitor. Within the policy statement, you must define and name the source classes attached to the filters.

```
[edit policy-options]
policy-statement policy-name {
  term term-name {
    from {
      route-filter address/prefix;
    }
    then source-class class-name;
  }
}
```

**NOTE:** When configuring policy action statements, you can configure only one source class for each matching route. In other words, more than one source class cannot be applied to the same route.

An alternate configuration method, using the **forwarding-class** policy action, is even more flexible. It allows your IPv4 or IPv6 route filters to apply to an SCU profile, a DCU profile, or both simultaneously. Additionally, if you have only one term, you can implement the **from** and **then** statements at the **[edit policy-options policy-statement *policy-name*]** hierarchy level.

```
[edit policy-options]
policy-statement policy-name {
  from {
    route-filter 105.15.0.0/16 orlonger;
  }
  then forwarding-class class-name;
}
```

A third option is the existing DCU parameter of **destination-class**. For more information on DCU, see the *Junos Policy Framework Configuration Guide*.

- [System Requirements for SCU on page 377](#)
- [Roadmap for Configuring SCU on page 378](#)
- [SCU Configuration on page 385](#)

## Applying the Policy to the Forwarding Table

Next, apply the policy you created to the forwarding table. When you apply the policy, the network prefixes you defined are marked with the appropriate source class.

```
[edit routing-options]
forwarding-table {
  export policy-name;
}
```

## Enabling Accounting on Inbound and Outbound Interfaces

Unlike DCU, which only requires implementation on a single interface, accounting for SCU must be enabled on two interfaces: the inbound and outbound physical or logical interfaces traversed by the source class. You must define explicitly the two interfaces on which SCU monitored traffic is expected to arrive and depart. This is because SCU performs two lookups in the routing table: a source address (SA) and a destination address (DA) lookup. In contrast, DCU only has a single destination address lookup. By specifying the addresses involved in the additional SCU SA lookup, you minimize the performance impact on your router.

An individual SCU interface can be configured as an input interface, an output interface, or both. SCU can be enabled in an IPv4 (**family inet**) or IPv6 (**family inet6**) network. To configure SCU accounting, include the **source-class-usage** statement at the **[edit interfaces interface-name unit logical-unit-number family (inet | inet6) accounting]** hierarchy level:

```
[edit]
interfaces {
  interface-name {
    unit unit-number {
      family (inet | inet6) {
        accounting {
          source-class-usage {
            (input | output | input output);
          }
          destination-class-usage;
        }
      }
    }
  }
}
```

After the full SCU configuration is enabled, every packet arriving on an SCU input interface is subjected to an SA-based lookup and then a DA-based lookup. In addition, an individual set of counters for every configured SCU class is maintained by the router on a per-interface and per-protocol family basis.

## Configuring Input SCU on the vt Interface of the Egress PE Router

To enable SCU in a Layer 3 VPN, configure source class usage on the virtual loopback tunnel (**vt**) interface of the egress PE router that is either configured for or equipped with a Tunnel PIC. The interface is equivalent to the inbound SCU interface, so use the **input** statement at the **[edit interfaces vt-interface-number unit 0 family inet accounting source-class-usage]** hierarchy level:

```
[edit]
interfaces {
  vt-0/3/0 {
    unit 0 {
      family inet {
        accounting {
          source-class-usage {
            input;
          }
        }
      }
    }
  }
}
```

## Mapping the SCU-Enabled vt Interface to the VRF Instance

Next, include the VPN loopback tunnel interface in the desired VRF instance at the **[edit routing-instances routing-instance-name]** hierarchy level:

```
[edit]
routing-instances {
  routing-instance-name {
    instance-type vrf;
    interface at-2/1/1.0;
    interface vt-0/3/0.0;
    route-distinguisher 10.250.14.225:100;
    vrf-import import-policy-name;
```

```

vrf-export export-policy-name;
protocols {
  bgp {
    group to-r4 {
      local-address 10.20.253.1;
      peer-as 400;
      neighbor 10.20.253.2;
    }
  }
}

```

## Configuring SCU on the Output Interface

Since VPN traffic enters the egress router through the VPN loopback tunnel interface, you still need to determine the exit interface for this traffic. To complete your SCU configuration, configure the output version of source class usage on the exit interface of your egress router:

```

[edit interfaces]
at-1/1/0 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          output;
        }
      }
    }
  }
}

```

## Associating an Accounting Profile with SCU Classes

Once your source classes are defined, implemented on the inbound and outbound interfaces, and applied to the forwarding table, you are ready to associate the source class with an accounting profile. Configure the accounting profile at the **[edit accounting-options class-usage-profile]** hierarchy level. You can associate either an SCU source class or a DCU destination class with the accounting profile. You can also specify the filename for the data capture, a class usage profile name, and an interval (in minutes) indicating how often you want the SCU information to be saved to the file.

```
[edit]
accounting-options {
  file filename;
  class-usage-profile profile-name {
    file filename;
    interval minutes;
    source-classes {
      source-class-name;
    }
    destination-classes {
      destination-class-name;
    }
  }
}
```

**NOTE:** SCU accounting occurs on the outbound interface before output filter processing. If an SCU-marked packet is discarded in the router, the SCU counters can indicate more traffic than actually exists. You must use filter counters or traceoptions logs to ensure that all packets dropped by the SCU filter are recorded. If logged, you can subtract the discarded packets from the SCU counter tallies and calculate the true traffic profile.

Because DCU accounting occurs after the filtering process, DCU is unaffected by this disclaimer.

## Verifying Your SCU Accounting Profile

**Purpose** To view the results of the SCU accounting profile you created.

**Action** Navigate to the `/var/log` directory of your router. It should contain the designated class usage profile log. The layout of an SCU profile looks like this:

```
profile_name,epoch-timestamp,interface-name,source-class-name,packet-count,
byte-count
```

An example of the actual output from a profile looks like this:

```
scu_profile,980313078,ge-1/0/0.0,gold,82,6888
scu_profile,980313078,ge-1/0/0.0,silver,164,13776
scu_profile,980313078,ge-1/0/0.0,bronze,0,0
scu_profile,980313678,ge-1/0/0.0,gold,82,6888
scu_profile,980313678,ge-1/0/0.0,silver,246,20664
scu_profile,980313678,ge-1/0/0.0,bronze,0,0
```

To view the parameters of your SCU accounting profile, you can use the **show accounting-options class-usage-profile scu-profile-name** command.

## SCU Configuration

- [Configuring SCU on page 385](#)
- [Verifying Your Work on page 388](#)

### Configuring SCU

**Figure 37: SCU Topology Diagram**

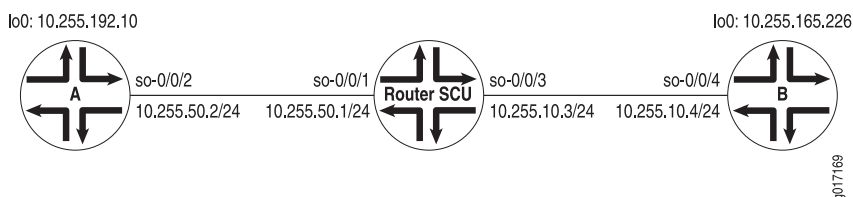

Figure 37 on page 385 shows a basic SCU configuration with three routers. Source routers A and B use loopback addresses as the prefixes to be monitored. Most of the configuration tasks and actual monitoring occurs on transit Router SCU.

Begin your configuration on Router A. The loopback address on Router A contains the origin of the prefix that is to be assigned to source class A on Router SCU. However, no SCU processing happens on this router. Therefore, configure Router A for basic OSPF routing and include your loopback interface and interface `so-0/0/2` in the OSPF process.

```
Router A: [edit]
          interfaces {
            so-0/0/2 {
              unit 0 {
```

```

        family inet {
            address 10.255.50.2/24;
        }
    }
}
lo0 {
    unit 0 {
        family inet {
            address 10.255.192.10/32;
        }
    }
}
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/2.0;
            interface lo0.0;
        }
    }
}
}

```

Router SCU handles the bulk of the activity in this example. On Router SCU, enable source class usage on the inbound and outbound interfaces at the **[edit interfaces *interface-name* unit *unit-number* family inet accounting]** hierarchy level. Make sure you specify the expected traffic: input, output, or, in this case, both.

Next, configure a route filter policy statement that matches the prefixes of the loopback addresses from routers A and B. Include statements in the policy that classify packets from Router A in one group named **scu-class-a** and packets from Router B in a second class named **scu-class-b**. Notice the efficient use of a single policy containing multiple terms.

Last, apply the policy to the forwarding table.

```

Router SCU [edit]
interfaces {
    so-0/0/1 {
        unit 0 {
            family inet {
                accounting {
                    source-class-usage {
                        input;
                        output;
                    }
                }
            }
            address 10.255.50.1/24;
        }
    }
}
so-0/0/3 {
    unit 0 {
        family inet {
            accounting {
                source-class-usage {

```

```

        input;
        output;
    }
}
address 10.255.10.3/24;
}
}
lo0 {
    unit 0 {
        family inet {
            address 10.255.6.111/32;
        }
    }
}
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/1.0;
            interface so-0/0/3.0;
        }
    }
}
routing-options {
    forwarding-table {
        export scu-policy;
    }
}
policy-options {
    policy-statement scu-policy {
        term 0 {
            from {
                route-filter 10.255.192.0/24 orlonger;
            }
            then source-class scu-class-a;
        }
        term 1 {
            from {
                route-filter 10.255.165.0/24 orlonger;
            }
            then source-class scu-class-b;
        }
    }
}
}

```

Complete the configuration tasks on Router B. Just as Router A provides a source prefix, Router B's loopback address matches the prefix assigned to **scu-class-b** on Router SCU. Again, no SCU processing happens on this router, so configure Router B for basic OSPF routing and include your loopback interface and interface **so-0/0/4** in the OSPF process.

**Router B:** [edit]  
 interfaces {  
   so-0/0/4 {  
     unit 0 {  
       family inet {

```

        address 10.255.10.4/24;
    }
}
lo0 {
    unit 0 {
        family inet {
            address 10.255.165.226/32;
        }
    }
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/4.0;
            interface lo0.0;
        }
    }
}

```

## Verifying Your Work

To verify that SCU is functioning properly, use the following commands:

- **show interfaces *interface-name* statistics**
- **show interfaces *interface-name* (extensive | detail)**
- **show route (extensive | detail)**
- **show interfaces source-class *source-class-name* *interface-name***
- **clear interface *interface-name* statistics**

You should always verify SCU statistics at the outbound SCU interface on which you configured the **output** statement. You can perform the following three steps to check the functionality of SCU:

1. Clear all counters on your SCU-enabled router and verify that they are empty.
2. Send a ping from one edge router to another edge router to generate SCU traffic across the SCU-enabled router.
3. Verify that the counters are incrementing correctly on the outbound interface.

The following section shows the output of these commands as used with the configuration example.

```
user@scu> clear interfaces statistics all
```

```
user@scu> show interfaces so-0/0/1.0 statistics
```

```
Logical interface so-0/0/1.0 (Index 4) (SNMP ifIndex 119)

### Configuring SCU in a Layer 3 VPN

Figure 38: SCU in a Layer 3 VPN Topology Diagram

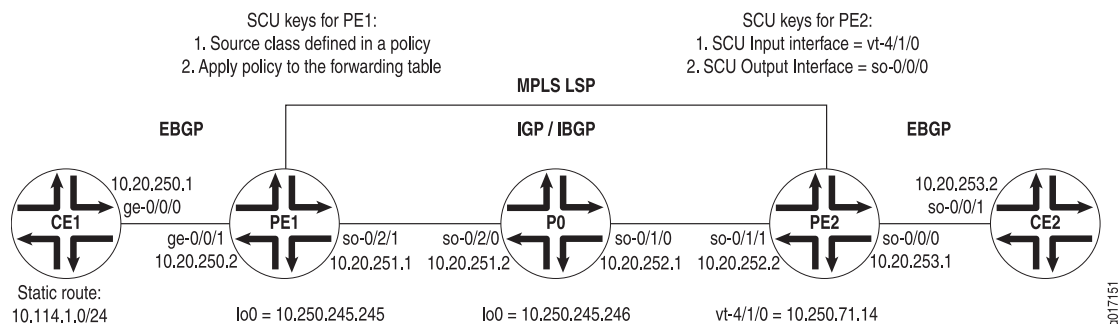

Figure 38 on page 393 displays a Layer 3 VPN topology. CE1 and CE2 are customer edge (CE) routers connected by a VPN through provider routers PE1, P0, and PE2. EBGP is established between routers CE1 and PE1, IBGP connects routers PE1 and PE2 over an IS-IS/MPLS/LDP core, and a second EBGP connection flows between routers PE2 and CE2.

On Router CE1, begin your VPN by setting up an EBGP connection to PE1. Install a static route of 10.114.1.0/24 and advertise this route to your EBGP neighbor.

```
Router CE1 [edit]
interfaces {
  ge-0/0/0 {
    unit 0 {
      family inet {
        address 10.20.250.1/30;
      }
    }
  }
}
routing-options {
  static {
    route 10.114.1.0/24 reject;
  }
  autonomous-system 100;
}
protocols {
  bgp {
    group to-pe1 {
      local-address 10.20.250.1;
      export inject-direct;
      peer-as 300;
      neighbor 10.20.250.2;
    }
  }
}
policy-options {
  policy-statement inject-direct {
    term 1 {
      from {
        protocol static;
        route-filter 10.114.1.0/24 exact;
      }
      then accept;
    }
    term 2 {
      from protocol direct;
      then accept;
    }
  }
}
```

On PE1, complete the EBGP connection to CE1 through a VRF routing instance. Set an export policy for your VRF instance that puts BGP traffic into a community, and an import policy that accepts like community traffic from your VPN neighbor. Lastly, configure an IBGP relationship to Router PE2 that runs over an IS-IS, MPLS, and LDP core.

```
Router PE1 [edit]
interfaces {
  ge-0/0/1 {
    unit 0 {
      family inet {
        address 10.20.250.2/30;
      }
    }
  }
}
```

```
    }  
  }  
}  
so-0/2/1 {  
  unit 0 {  
    family inet {  
      address 10.20.251.1/30;  
    }  
    family iso;  
    family mpls;  
  }  
}  
lo0 {  
  unit 0 {  
    family inet {  
      address 10.250.245.245/32;  
    }  
    family iso;  
    family mpls;  
  }  
}  
}  
routing-options {  
  autonomous-system 300;  
}  
protocols {  
  mpls {  
    interface so-0/2/1;  
  }  
  bgp {  
    group ibgp {  
      type internal;  
      local-address 10.250.245.245;  
      family inet-vpn {  
        unicast;  
      }  
      neighbor 10.250.71.14;  
    }  
  }  
  isis {  
    interface so-0/2/1;  
  }  
  ldp {  
    interface so-0/2/1;  
  }  
}  
policy-options {  
  policy-statement red-import {  
    from {  
      protocol bgp;  
      community red-com;  
    }  
    then accept;  
  }  
  policy-statement red-export {  
    from protocol bgp;  
  }  
}
```

```

    then {
        community add red-com;
        accept;
    }
}
community red-com members target:20:20;
}
routing-instances {
    red {
        instance-type vrf;
        interface ge-0/0/1.0;
        route-distinguisher 10.250.245.245:100;
        vrf-import red-import;
        vrf-export red-export;
        protocols {
            bgp {
                group to-ce1 {
                    local-address 10.20.250.2;
                    peer-as 100;
                    neighbor 10.20.250.1;
                }
            }
        }
    }
}
}

```

On P0, connect the IBGP neighbors located at PE1 and PE2. Remember to include VPN-related protocols (MPLS, LDP, and IGP) on all interfaces.

```

Router P0 [edit]
interfaces {
    so-0/1/0 {
        unit 0 {
            family inet {
                address 10.20.252.1/30;
            }
            family iso;
            family mpls;
        }
    }
    so-0/2/0 {
        unit 0 {
            family inet {
                address 10.20.251.2/30;
            }
            family iso;
            family mpls;
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 10.250.245.246/32;
            }
            family iso;
            family mpls;
        }
    }
}

```

```

    }
  }
}
routing-options {
  autonomous-system 300;
}
protocols {
  mpls {
    interface so-0/1/0;
    interface so-0/2/0;
  }
  isis {
    interface all;
  }
  ldp {
    interface all;
  }
}
}

```

On PE2, complete the IBGP relationship to Router PE1. Establish an EBGP connection to CE2 through a VRF routing instance. Set an export policy for the VRF instance that places BGP traffic into a community, and an import policy that accepts like community traffic from the VPN neighbor. Next, establish a policy that adds the static route from CE1 to a source class called **GOLD1**. Also, export this SCU policy into the forwarding table. Finally, set your **vt** interface as the SCU input interface and establish the CE-facing interface **so-0/0/0** as the SCU output interface.

```

Router PE2 [edit]
interfaces {
  so-0/1/1 {
    unit 0 {
      family inet {
        address 10.20.252.2/30;
      }
      family iso;
      family mpls;
    }
  }
  so-0/0/0 {
    unit 0 {

      neighbor 10.20.253.1;
    }
  }
}
policy-options {
  policy-statement inject-direct {
    from {
      protocol direct;
    }
  }
}

```

```

    }
    then accept;
  }
}

```

## Verifying Your Work

To verify that SCU is functioning properly in the Layer 3 VPN, use the following commands:

- **show interfaces *interface-name* statistics**
- **show interfaces source-class *source-class-name* *interface-name***
- **show interfaces *interface-name* (extensive | detail)**
- **show route (extensive | detail)**
- **clear interface *interface-name* statistics**

You should always verify SCU statistics at the outbound SCU interface on which you configured the **output** statement. To check SCU functionality, follow these steps:

1. Clear all counters on your SCU-enabled router and verify they are empty.
2. Send a ping from the ingress CE router to the second CE router to generate SCU traffic across the SCU-enabled VPN route.
3. Verify that the counters are incrementing correctly on the outbound interface.

The following section shows the output of these commands used with the configuration example.

```
user@pe2> clear interfaces statistics all
```

```
user@pe2> show interfaces so-0/0/0.0 statistics
```

```
Logical interface so-0/0/0.0 (Index 6) (SNMP ifIndex 113)
```

```
Flags: Point-To-Point SNMP-Traps Encapsulation: PPP
```

```

## Example: Grouping Source and Destination Prefixes into a Forwarding Class

This example shows how to group source and destination prefixes into a forwarding class.

- [Requirements on page 401](#)
- [Overview on page 401](#)
- [Configuration on page 403](#)
- [Verification on page 408](#)

### Requirements

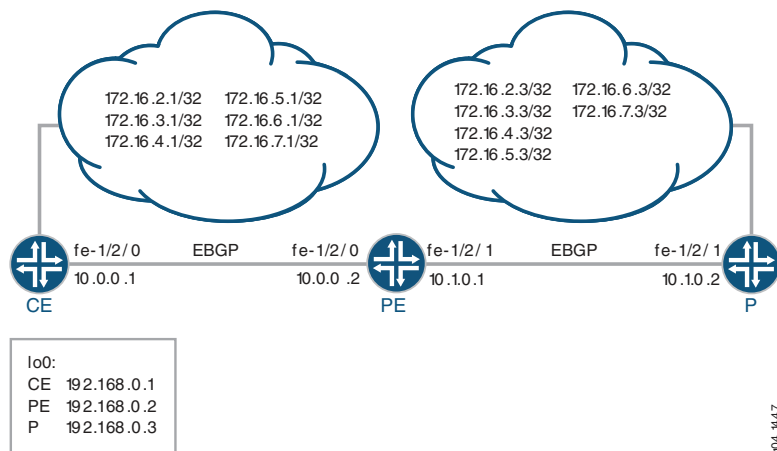

No special configuration beyond device initialization is required before configuring this example.

### Overview

This example uses three routing devices: a customer edge (CE) device, a provider edge (PE) device, and a provider core (P) device.

[Figure 39 on page 401](#) shows the sample network.

**Figure 39: SCU and DCU Sample Network**

Source class usage (SCU) counts packets sent to the customer edge by performing lookup on the IP source address and the IP destination address. SCU makes it possible

to track traffic originating from specific prefixes on the provider core and destined for specific prefixes on the customer edge.

DCU counts packets from customers by performing a lookup of the IP destination address. DCU makes it possible to track traffic originating from the customer edge and destined for specific prefixes on the provider core router.

On Device PE's fe-1/2/1 interface, facing the provider core (represented by Device P), SCU input is configured with the **source-class-usage input** statement to track traffic originating at Device P and destined to Device CE. On this same interface, the **destination-class-usage input** statement is configured to track traffic originating at Device CE destined to the provider core.

```
user@PE# show interfaces fe-1/2/1 unit 0 family inet
accounting {
  source-class-usage {
    input; # tracks traffic destined to customer edge
  }
  destination-class-usage; # tracks traffic destined to provider core
}
address 10.1.0.1/30;
```

Unlike destination class usage (DCU), which only requires implementation on a single interface, accounting for SCU must be enabled on two interfaces: the inbound and outbound interfaces traversed by the source class. You must define explicitly the two interfaces on which SCU monitored traffic is expected to arrive and depart. This is because SCU performs two lookups in the routing table: a source address (SA) and a destination address (DA) lookup. In contrast, DCU only has a single destination address lookup.

On Device PE's fe-1/2/0 interface, facing Device CE, SCU output is configured with the **source-class-usage output** statement.

```
user@PE# show interfaces fe-1/2/0 unit 0 family inet
accounting {
  source-class-usage {
    output;
  }
}
address 10.0.0.2/30;
```

To account for traffic destined to the customer, the policy called scu\_class uses route filters to place traffic into the gold1, gold2, and gold3 classes.

```
user@PE# show policy-options
policy-statement scu_class {
  term gold1 {
    from {
      route-filter 2.0.0.0/24 orlonger;
    }
    then source-class gold1;
  }
  term gold2 {
    from {
      route-filter 3.0.0.0/24 orlonger;
    }
  }
}
```

```

        then source-class gold2;
    }
    term gold3 {
        from {
            route-filter 4.0.0.0/24 orlonger;
        }
        then source-class gold3;
    }
}

```

To account for traffic destined to the provider, the policy called `dcu_class` uses route filters to place traffic into the `silver1`, `silver2`, and `silver3` classes.

```

user@PE# show policy-options
policy-statement dcu_class {
    term silver1 {
        from {
            route-filter 5.0.0.0/24 orlonger;
        }
        then destination-class silver1;
    }
    term silver2 {
        from {
            route-filter 6.0.0.0/24 orlonger;
        }
        then destination-class silver2;
    }
    term silver3 {
        from {
            route-filter 7.0.0.0/24 orlonger;
        }
        then destination-class silver3;
    }
}

```

The policies are then applied to the forwarding table.

```

forwarding-table {
    export [ dcu_class scu_class ];
}

```

The example uses static routes to provide connectivity and loopback interface addresses for testing the operation.

[“CLI Quick Configuration” on page 403](#) shows the configuration for all of the devices in [Figure 39 on page 401](#).

The section [“Step-by-Step Procedure” on page 405](#) describes the steps on Device PE.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device CE**      **set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30**

```

set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set interfaces lo0 unit 0 family inet address 2.0.0.1/32
set interfaces lo0 unit 0 family inet address 3.0.0.1/32
set interfaces lo0 unit 0 family inet address 4.0.0.1/32
set interfaces lo0 unit 0 family inet address 5.0.0.1/32
set interfaces lo0 unit 0 family inet address 6.0.0.1/32
set interfaces lo0 unit 0 family inet address 7.0.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext export send-static
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.2
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set routing-options static route 10.1.0.0/30 next-hop 10.0.0.2
set routing-options autonomous-system 100

```

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

set routing-options static route 7.0.0.0/24 discard
set routing-options autonomous-system 300

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To group source and destination prefixes in a forwarding class:

1. Create the router interfaces.

```

[edit interfaces]
user@PE# set fe-1/2/0 unit 0 family inet accounting source-class-usage output
user@PE# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

```

```

user@PE# set fe-1/2/1 unit 0 family inet accounting source-class-usage input
user@PE# set fe-1/2/1 unit 0 family inet accounting destination-class-usage
user@PE# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30

```

```

user@PE# set lo0 unit 0 family inet address 192.168.0.2/32

```

2. Configure BGP.

```

[edit protocols bgp group ext]
user@PE# set type external
user@PE# set export send-direct
user@PE# set neighbor 10.0.0.1 peer-as 100
user@PE# set neighbor 10.1.0.2 peer-as 300

```

3. Configure the DCU policy.

```

[edit policy-options policy-statement dcu_class]
user@PE# set term silver1 from route-filter 5.0.0.0/24 orlonger
user@PE# set term silver1 then destination-class silver1

```

```
user@PE# set term silver2 from route-filter 6.0.0.0/24 orlonger
user@PE# set term silver2 then destination-class silver2
```

```
user@PE# set term silver3 from route-filter 7.0.0.0/24 orlonger
user@PE# set term silver3 then destination-class silver3
```

4. Configure the SCU policy.

```
[edit policy-options policy-statement scu_class]
user@PE# set term gold1 from route-filter 2.0.0.0/24 orlonger
user@PE# set term gold1 then source-class gold1
```

```
user@PE# set term gold2 from route-filter 3.0.0.0/24 orlonger
user@PE# set term gold2 then source-class gold2
```

```
user@PE# set term gold3 from route-filter 4.0.0.0/24 orlonger
user@PE# set term gold3 then source-class gold3
```

5. Apply the policies to the forwarding table.

```
[edit routing-options forwarding-table]
user@PE# set export dcu_class
user@PE# set export scu_class
```

**NOTE:** You can refer to the same routing policy one or more times in the same or different export statement.

6. (Optional) Configure a routing policy that advertises direct routes.

```
[edit policy-options policy-statement send-direct term 1]
user@PE# set from protocol direct
user@PE# set then accept
```

7. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@PE# set autonomous-system 200
```

**Results** From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@PE# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          output;
        }
      }
    }
    address 10.0.0.2/30;
  }
}
```

```

    }
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          input;
        }
        destination-class-usage;
      }
      address 10.1.0.1/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 192.168.0.2/32;
    }
  }
}
}

user@PE# show protocols
bgp {
  group ext {
    type external;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
    neighbor 10.1.0.2 {
      peer-as 300;
    }
  }
}

user@PE# show policy-options
policy-statement dcu_class {
  term silver1 {
    from {
      route-filter 5.0.0.0/24 orlonger;
    }
    then destination-class silver1;
  }
  term silver2 {
    from {
      route-filter 6.0.0.0/24 orlonger;
    }
    then destination-class silver2;
  }
  term silver3 {
    from {
      route-filter 7.0.0.0/24 orlonger;
    }
    then destination-class silver3;
  }
}

```

```
    }  
  }  
  policy-statement scu_class {  
    term gold1 {  
      from {  
        route-filter 2.0.0.0/24 orlonger;  
      }  
      then source-class gold1;  
    }  
    term gold2 {  
      from {  
        route-filter 3.0.0.0/24 orlonger;  
      }  
      then source-class gold2;  
    }  
    term gold3 {  
      from {  
        route-filter 4.0.0.0/24 orlonger;  
      }  
      then source-class gold3;  
    }  
  }  
}  
policy-statement send-direct {  
  term 1 {  
    from protocol direct;  
    then accept;  
  }  
}  
  
user@PE# show routing-options  
autonomous-system 200;  
forwarding-table {  
  export [ dcu_class scu_class ];  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Making Sure That the DCU Policy Is Working on page 408](#)
- [Making Sure That the SCU Policy Is Working on page 409](#)

---

### Making Sure That the DCU Policy Is Working

**Purpose** Verify that traffic sent from the provider core into the customer network is causing the DCU policy counters to increment.

**Action** 1. From Device P, ping an address in the customer network.

```
user@P> ping rapid count 10000000 6.0.0.1
```

```
PING 6.0.0.1 (6.0.0.1): 56 data bytes
```

---

2. On Device PE, check the interface statistics on the interface facing the provider core.

```
user@PE> show interfaces statistics fe-1/2/1.0
```

```
Logical interface fe-1/2/1.0 (Index 108) (SNMP ifIndex 546)
Flags: SNMP-Traps 0x4000 Encapsulation: ENET2
Input packets : 251956
Output packets: 251961
Protocol inet, MTU: 1500
Flags: Sendbcst-pkt-to-re, DCU, SCU-in
```

| Destination class | Packets<br>(packet-per-second) | Bytes<br>(bits-per-second) |
|-------------------|--------------------------------|----------------------------|
| silver1           | 7460                           | 626640                     |
| (                 | 0)                             | 0)                         |
| silver2           | 22440                          | 2401416                    |
| (                 | 256)                           | 171963)                    |
| silver3           | 9004                           | 756336                     |
| (                 | 0)                             | 0)                         |

```
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.1.0.0/30, Local: 10.1.0.1, Broadcast: 10.1.0.3
```

**Meaning** Packet and bit rates are displayed with packet and byte counters.

Alternatively, you can use the `show interfaces destination-class all` command to display the same information.

### Making Sure That the SCU Policy Is Working

**Purpose** Verify that traffic sent from the customer network into the provider core is causing the SCU policy counters to increment.

- Action** 1. From Device CE, ping an address in the customer network.

```
user@CE> ping rapid count 10000000 2.0.0.1
```

```
PING 6.0.0.1 (6.0.0.1): 56 data bytes
```

2. On Device PE, check the interface statistics on the interface facing the customer network.

```
user@PE> show interfaces statistics fe-1/2/0.0
```

```
Logical interface fe-1/2/0.0 (Index 93) (SNMP ifIndex 554)
Flags: SNMP-Traps 0x4000 Encapsulation: ENET2
Input packets : 32246
Output packets: 32245
Protocol inet, MTU: 1500
Flags: Sendbcst-pkt-to-re, Is-Primary, SCU-out
```

| Source class | Packets<br>(packet-per-second) | Bytes<br>(bits-per-second) |
|--------------|--------------------------------|----------------------------|

- [Example: Configuring a Routing Policy for Conditional Advertisement Enabling Conditional Installation of Prefixes in a Routing Table on page 415](#)

## Conditional Advertisement Enabling Conditional Installation of Prefixes in a Routing Table

BGP accepts all non-looped routes learned from neighbors and imports them into the RIB-In table. If these routes are accepted by the BGP import policy, they are then imported into the inet.0 routing table. In cases where only certain routes are required to be imported, provisions can be made such that the peer routing device exports routes based on a condition or a set of conditions.

The condition for exporting a route can be based on:

- The peer the route was learned from
- The interface the route was learned on
- Some other required attribute

For example:

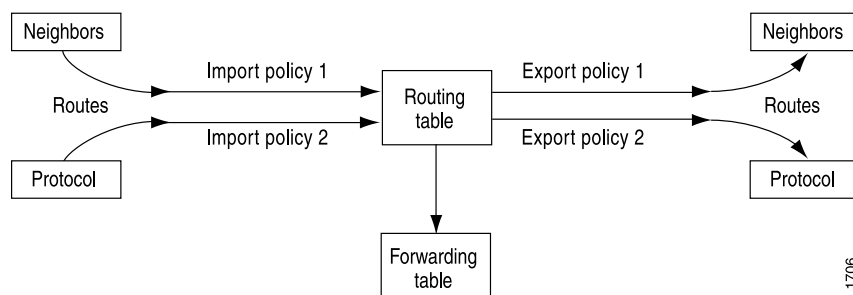

```
[edit]
policy-options {
  condition condition-name {
    if-route-exists address table table-name;
  }
}
```

This is known as conditional installation of prefixes and is described in [“Example: Configuring a Routing Policy for Conditional Advertisement of Prefixes in a Routing Table” on page 415](#).

The Juniper Networks® Junos® Operating System (Junos OS) supports conditional export of routes based on the existence of another route in the routing table. Junos OS does not, however, support policy conditions for import policy.

[Figure 40 on page 412](#) illustrates where BGP import and export policies are applied. An import policy is applied to inbound routes that are visible in the output of the **show route receive-protocol bgp neighbor-address** command. An export policy is applied to outbound routes that are visible in the output of the **show route advertising-protocol bgp neighbor-address** command.

**Figure 40: BGP Import and Export Policies**

To enable conditional installation of prefixes, an export policy must be configured on the

device where the prefix export has to take place. The export policy evaluates each route to verify that it satisfies all the match conditions under the **from** statement. It also searches for the existence of the route defined under the **condition** statement (also configured under the **from** statement).

If the route does not match the entire set of required conditions defined in the policy, or if the route defined under the **condition** statement does not exist in the routing table, the route is not exported to its BGP peers. Thus, a conditional export policy matches the routes for the desired route or prefix you want installed in the peers' routing table.

To configure the conditional installation of prefixes with the help of an export policy:

1. Create a **condition** statement to check prefixes.

```
[edit]
policy-options {
  condition condition-name {
    if-route-exists address table table-name;
  }
}
```

2. Create an export policy with the newly created condition using the **condition** statement.

```
[edit]
policy-options {
  policy-statement policy-name {
    term 1 {
      from {
        protocols bgp;
        condition condition-name;
      }
      then {
        accept;
      }
    }
  }
}
```

3. Apply the export policy to the device that requires only selected prefixes to be exported from the routing table.

```
[edit]
protocols bgp {
  group group-name {
    export policy-name;
  }
}
```

## Conditional Advertisement Enabling Conditional Installation of Prefixes Use Cases

---

Networks are usually subdivided into smaller, more-manageable units called autonomous systems (ASs). When BGP is used by routers to form peer relationships in the same AS, it is referred to as internal BGP (IBGP). When BGP is used by routers to form peer relationships in different ASs, it is referred to as external BGP (EBGP).

After performing route sanity checks, a BGP router accepts the routes received from its peers and installs them into the routing table. By default, all routers in IBGP and EBGP sessions follow the standard BGP advertisement rules. While a router in an IBGP session advertises only the routes learned from its direct peers, a router in an EBGP session advertises all routes learned from its direct and indirect peers (peers of peers). Hence, in a typical network configured with EBGP, a router adds all routes received from an EBGP peer into its routing table and advertises nearly all routes to all EBGP peers.

A service provider exchanging BGP routes with both customers and peers on the Internet is at risk of malicious and unintended threats that can compromise the proper routing of traffic, as well as the operation of the routers.

This has several disadvantages:

- **Non-aggregated route advertisements**—A customer could erroneously advertise all its prefixes to the ISP rather than an aggregate of its address space. Given the size of the Internet routing table, this must be carefully controlled. An edge router might also need only a default route out toward the Internet and instead be receiving the entire BGP routing table from its upstream peer.
- **BGP route manipulation**—If a malicious administrator alters the contents of the BGP routing table, it could prevent traffic from reaching its intended destination.
- **BGP route hijacking**—A rogue administrator of a BGP peer could maliciously announce a network's prefixes in an attempt to reroute the traffic intended for the victim network to the administrator's network to either gain access to the contents of traffic or to block the victim's online services.
- **BGP denial of service (DoS)**—If a malicious administrator sends unexpected or undesirable BGP traffic to a router in an attempt to use all of the router's available BGP resources, it might result in impairing the router's ability to process valid BGP route information.

Conditional installation of prefixes can be used to address all the problems previously mentioned. If a customer requires access to remote networks, it is possible to install a specific route in the routing table of the router that is connected with the remote network. This does not happen in a typical EBGP network and hence, conditional installation of prefixes becomes essential.

ASs are not only bound by physical relationships but by business or other organizational relationships. An AS can provide services to another organization, or act as a transit AS between two other ASs. These transit ASs are bound by contractual agreements between the parties that include parameters on how to connect to each other and most importantly, the type and quantity of traffic they carry for each other. Therefore, for both

legal and financial reasons, service providers must implement policies that control how BGP routes are exchanged with neighbors, which routes are accepted from those neighbors, and how those routes affect the traffic between the ASs.

There are many different options available to filter routes received from a BGP peer to both enforce inter-AS policies and mitigate the risks of receiving potentially harmful routes. Conventional route filtering examines the attributes of a route and accepts or rejects the route based on such attributes. A policy or filter can examine the contents of the AS-Path, the next-hop value, a community value, a list of prefixes, the address family of the route, and so on.

In some cases, the standard “acceptance condition” of matching a particular attribute value is not enough. The service provider might need to use another condition outside of the route itself, for example, another route in the routing table. As an example, it might be desirable to install a default route received from an upstream peer, only if it can be verified that this peer has reachability to other networks further upstream. This conditional route installation avoids installing a default route that is used to send traffic toward this peer, when the peer might have lost its routes upstream, leading to black-holed traffic. To achieve this, the router can be configured to search for the presence of a particular route in the routing table, and based on this knowledge accept or reject another prefix.

[“Example: Configuring a Routing Policy for Conditional Advertisement of Prefixes in a Routing Table” on page 415](#) explains how the conditional installation of prefixes can be configured and verified.

## Example: Configuring a Routing Policy for Conditional Advertisement Enabling Conditional Installation of Prefixes in a Routing Table

---

This example shows how to configure conditional installation of prefixes in a routing table using BGP export policy.

- [Requirements on page 415](#)
- [Overview on page 416](#)
- [Configuration on page 418](#)
- [Verification on page 425](#)

### Requirements

This example uses the following hardware and software components:

- M Series Multiservice Edge Routers, MX Series 3D Universal Edge Routers, or T Series Core Routers
- Junos OS Release 9.0 or later

## Overview

In this example, three routers in three different autonomous systems (ASs) are connected and configured with the BGP protocol. Router Internet, which is the upstream router, has five addresses configured on its lo0.0 loopback interface (11.1.1.1/32, 12.1.1.1/32, 13.1.1.1, 14.1.1.1/32, and 15.1.1.1/32), and an extra loopback address (192.168.9.1/32) to be configured as the router ID. These six addresses are exported into BGP to emulate the contents of a BGP routing table of a router connected to the Internet, and advertised to Router North.

Router North exports a default route into BGP, and advertises the default route and the five BGP routes to Router South, which is the downstream router. Router South receives the default route and only one other route (11.1.1.1/32), and installs this route and the default route in its routing table.

To summarize, the example meets the following requirements:

- On Device North, send 0/0 to Device South only if a particular route is also sent (in the example 11.1.1.1/32).
- On Device South, accept the default route and the 11.1.1.1/32 route. Drop all other routes. Consider that Device South might be receiving the entire Internet table, while the operator only wants Device South to have the default and one other specific prefix.

The first requirement is met with an export policy on Device North:

```
user@North# show policy-options
policy-statement conditional-export-bgp {
  term prefix_11 {
    from {
      protocol bgp;
      route-filter 11.0.0.0/5 orlonger;
    }
    then accept;
  }
  term conditional-default {
    from {
      route-filter 0.0.0.0/0 exact;
      condition prefix_11;
    }
    then accept;
  }
  term others {
    then reject;
  }
}
condition prefix_11 {
  if-route-exists {
    11.1.1.1/32;
    table inet.0;
  }
}
```

The logic of the conditional export policy can be summarized as follows: If 0/0 is present, and if 11.1.1.1/32 is present, then send the 0/0 prefix. This implies that if 11.1.1.1/32 is not present, then do not send 0/0.

The second requirement is met with an import policy on Device South:

```
user@South# show policy-options
policy-statement import-selected-routes {
  term 1 {
    from {
      rib inet.0;
      neighbor 10.0.78.14;
      route-filter 0.0.0.0/0 exact;
      route-filter 11.0.0.0/8 orlonger;
    }
    then accept;
  }
  term 2 {
    then reject;
  }
}
```

In this example, four routes are dropped as a result of the import policy on Device South. This is because the export policy on Device North leaks all of the routes received from Device Internet, and the import policy on Device South excludes some of these routes.

It is important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.

Hidden routes can be viewed by using the **show route receive-protocol bgp neighbor-address hidden** command. The hidden routes can then be retained or dropped from the routing table by configuring the **keep all | none** statement at the **[edit protocols bgp]** or **[edit protocols bgp group group-name]** hierarchy level.

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, BGP discards routes that were received from a peer and that were rejected by import policy or other sanity checking. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

When you configure **keep all** or **keep none** and the peers support route refresh, the local speaker sends a refresh message and performs an import evaluation. For these peers,

the sessions do not restart. To determine if a peer supports refresh, check for **Peer supports Refresh capability** in the output of the **show bgp neighbor** command.

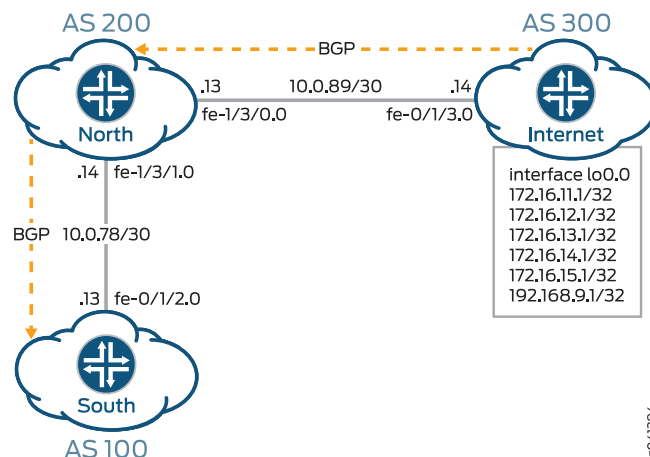

**CAUTION:** If you configure **keep all** or **keep none** and the peer does not support session restart, the associated BGP sessions are restarted (flapped).

## Topology

Figure 41 on page 418 shows the topology used in this example.

Figure 41: Conditional Installation of Prefixes

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Router Internet

```
set interfaces lo0 unit 0 family inet address 11.1.1/32
set interfaces lo0 unit 0 family inet address 12.1.1/32
set interfaces lo0 unit 0 family inet address 13.1.1/32
set interfaces lo0 unit 0 family inet address 14.1.1/32
set interfaces lo0 unit 0 family inet address 15.1.1/32
set interfaces lo0 unit 0 family inet address 192.168.9.1/32
set interfaces fe-0/1/3 unit 0 family inet address 10.0.89.14/30
set protocols bgp group toNorth local-address 10.0.89.14
set protocols bgp group toNorth peer-as 200
set protocols bgp group toNorth neighbor 10.0.89.13
set protocols bgp group toNorth export into-bgp
set policy-options policy-statement into-bgp term 1 from interface lo0.0
set policy-options policy-statement into-bgp term 1 then accept
set routing-options router-id 192.168.9.1
set routing-options autonomous-system 300
```

#### Router North

```
set interfaces fe-1/3/1 unit 0 family inet address 10.0.78.14/30
```

```

set interfaces fe-1/3/0 unit 0 family inet address 10.0.89.13/30
set interfaces lo0 unit 0 family inet address 192.168.8.1/32
set protocols bgp group toInternet local-address 10.0.89.13
set protocols bgp group toInternet peer-as 300
set protocols bgp group toInternet neighbor 10.0.89.14
set protocols bgp group toSouth local-address 10.0.78.14
set protocols bgp group toSouth export conditional-export-bgp
set protocols bgp group toSouth peer-as 100
set protocols bgp group toSouth neighbor 10.0.78.13
set policy-options policy-statement conditional-export-bgp term prefix_11 from protocol
  bgp
set policy-options policy-statement conditional-export-bgp term prefix_11 from route-filter
  11.0.0.0/5 orlonger
set policy-options policy-statement conditional-export-bgp term prefix_11 then accept
set policy-options policy-statement conditional-export-bgp term conditional-default
  from route-filter 0.0.0.0/0 exact
set policy-options policy-statement conditional-export-bgp term conditional-default
  from condition prefix_11
set policy-options policy-statement conditional-export-bgp term conditional-default
  then accept
set policy-options policy-statement conditional-export-bgp term others then reject
set policy-options condition prefix_11 if-route-exists 11.1.1.1/32
set policy-options condition prefix_11 if-route-exists table inet.0
set routing-options static route 0/0 reject
set routing-options router-id 192.168.8.1
set routing-options autonomous-system 200

```

**Router South**

```

set interfaces fe-0/1/2 unit 0 family inet address 10.0.78.13/30
set interfaces lo0 unit 0 family inet address 192.168.7.1/32
set protocols bgp group toNorth local-address 10.0.78.13
set protocols bgp group toNorth import import-selected-routes
set protocols bgp group toNorth peer-as 200
set protocols bgp group toNorth neighbor 10.0.78.14
set policy-options policy-statement import-selected-routes term 1 from neighbor 10.0.78.14
set policy-options policy-statement import-selected-routes term 1 from route-filter
  11.0.0.0/8 orlonger
set policy-options policy-statement import-selected-routes term 1 from route-filter
  0.0.0.0/0 exact
set policy-options policy-statement import-selected-routes term 1 then accept
set policy-options policy-statement import-selected-routes term 2 then reject
set routing-options router-id 192.168.7.1
set routing-options autonomous-system 100

```

### Configuring Conditional Installation of Prefixes

---

**Step-by-Step Procedure**

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the Junos OS CLI User Guide.

To configure conditional installation of prefixes:

1. Configure the router interfaces forming the links between the three routers.

```

Router Internet
[edit interfaces]

```

```
user@Internet# set fe-0/1/3 unit 0 family inet address 10.0.89.14/30
```

#### Router North

```
[edit interfaces]
```

```
user@North# set fe-1/3/1 unit 0 family inet address 10.0.78.14/30
```

```
user@North# set fe-1/3/0 unit 0 family inet address 10.0.89.13/30
```

#### Router South

```
[edit interfaces]
```

```
user@South# set fe-0/1/2 unit 0 family inet address 10.0.78.13/30
```

2. Configure five loopback interface addresses on Router Internet to emulate BGP routes learned from the Internet that are to be imported into the routing table of Router South, and configure an additional address (192.168.9.1/32) that will be configured as the router ID.

#### Router Internet

```
[edit interfaces lo0 unit 0 family inet]
```

```
user@Internet# set address 11.1.1.1/32
```

```
user@Internet# set address 12.1.1.1/32
```

```
user@Internet# set address 13.1.1.1/32
```

```
user@Internet# set address 14.1.1.1/32
```

```
user@Internet# set address 15.1.1.1/32
```

```
user@Internet# set address 192.168.9.1/32
```

Also, configure the loopback interface addresses on Routers North and South.

#### Router North

```
[edit interfaces lo0 unit 0 family inet]
```

```
user@North# set address 192.168.8.1/32
```

#### Router South

```
[edit interfaces lo0 unit 0 family inet]
```

```
user@South# set address 192.168.7.1/32
```

3. Configure the static default route on Router North to be advertised to Router South.  

```
[edit routing-options]
user@North# set static route 0/0 reject
```
4. Define the condition for exporting prefixes from the routing table on Router North.  

```
[edit policy-options condition prefix_11]
user@North# set if-route-exists 11.1.1.1/32
user@North# set if-route-exists table inet.0
```
5. Define export policies (**into-bgp** and **conditional-export-bgp**) on Routers Internet and North respectively, to advertise routes to BGP.

**NOTE:** Ensure that you reference the condition, **prefix\_11** (configured in Step 4), in the export policy.

#### Router Internet

```
[edit policy-options policy-statement into-bgp]
```

```
user@Internet# set term 1 from interface lo0.0
```

```
user@Internet# set term 1 then accept
```

#### Router North

```
[edit policy-options policy-statement conditional-export-bgp]
user@North# set term prefix_11 from protocol bgp
user@North# set term prefix_11 from route-filter 11.0.0.0/5 orlonger
user@North# set term prefix_11 then accept
user@North# set term conditional-default from route-filter 0.0.0.0/0 exact
user@North# set term conditional-default from condition prefix_11
user@North# set term conditional-default then accept
user@North# set term others then reject
```

6. Define an import policy (**import-selected-routes**) on Router South to import some of the routes advertised by Router North into its routing table.

```
[edit policy-options policy-statement import-selected-routes ]
user@South# set term 1 from neighbor 10.0.78.14
user@South# set term 1 from route-filter 11.0.0.0/8 orlonger
user@South# set term 1 from route-filter 0.0.0.0/0 exact
user@South# set term 1 then accept
user@South# set term 2 then reject
```

7. Configure BGP on all three routers to enable the flow of prefixes between the autonomous systems.

**NOTE:** Ensure that you apply the defined import and export policies to the respective BGP groups for prefix advertisement to take place.

#### Router Internet

```
[edit protocols bgp group toNorth]
user@Internet# set local-address 10.0.89.14
user@Internet# set peer-as 200
user@Internet# set neighbor 10.0.89.13
user@Internet# set export into-bgp
```

#### Router North

```
[edit protocols bgp group toInternet]
user@North# set local-address 10.0.89.13
user@North# set peer-as 300
user@North# set neighbor 10.0.89.14

[edit protocols bgp group toSouth]
user@North# set local-address 10.0.78.14
user@North# set peer-as 100
user@North# set neighbor 10.0.78.13
user@North# set export conditional-export-bgp
```

#### Router South

```
[edit protocols bgp group toNorth]
user@South# set local-address 10.0.78.13
user@South# set peer-as 200
user@South# set neighbor 10.0.78.14
user@South# set import import-selected-routes
```

8. Configure the router ID and autonomous system number for all three routers.

**NOTE:** In this example, the router ID is configured based on the IP address configured on the lo0.0 interface of the router.

#### Router Internet

[edit routing options]

user@Internet# set router-id 192.168.9.1

user@Internet# set autonomous-system 300

#### Router North

[edit routing options]

user@North# set router-id 192.168.8.1

user@North# set autonomous-system 200

#### Router South

[edit routing options]

user@South# set router-id 192.168.7.1

user@South# set autonomous-system 100

## Results

From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols bgp**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device Internet  user@Internet# show interfaces
                  fe-0/1/3 {
                    unit 0 {
                      family inet {
                        address 10.0.89.14/30;
                      }
                    }
                  }
                  lo0 {
                    unit 0 {
                      family inet {
                        address 11.1.1.1/32;
                        address 12.1.1.1/32;
                        address 13.1.1.1/32;
                        address 14.1.1.1/32;
                        address 15.1.1.1/32;
                        address 192.168.9.1/32;
                      }

If you are done configuring the routers, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying BGP on page 425](#)
- [Verifying Prefix Advertisement from Router Internet to Router North on page 427](#)
- [Verifying Prefix Advertisement from Router North to Router South on page 427](#)
- [Verifying BGP Import Policy for Installation of Prefixes on page 428](#)
- [Verifying Conditional Export from Router North to Router South on page 428](#)
- [Verifying the Presence of Routes Hidden by Policy \(Optional\) on page 429](#)

### Verifying BGP

**Purpose** Verify that BGP sessions have been established between the three routers.

**Action** From operational mode, run the **show bgp neighbor *neighbor-address*** command.

1. Check the BGP session on Router Internet to verify that Router North is a neighbor.

```

user@Internet> show bgp neighbor 10.0.89.13
Peer: 10.0.89.13+179 AS 200 Local: 10.0.89.14+56187 AS 300
  Type: External   State: Established   Flags: [ImportEval Sync]
  Last State: OpenConfirm   Last Event: RecvKeepAlive
  Last Error: None
  Export: [ into-bgp ]
  Options: [Preference LocalAddress PeerAS Refresh]
  Local Address: 10.0.89.14 Holdtime: 90 Preference: 170
  Number of flaps: 0
  Peer ID: 192.168.8.1      Local ID: 192.168.9.1      Active Holdtime: 90
  Keepalive Interval: 30      Group index: 0      Peer index: 0
  BFD: disabled, down
  Local Interface: fe-0/1/3.0
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Stale routes from peer are kept for: 300
  Peer does not support Restarter functionality
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast

```

```

NLRI of all end-of-rib markers sent: inet-unicast
Peer supports 4 byte AS extension (peer-as 200)
Peer does not support Addpath
Table inet.0 Bit: 10000
  RIB State: BGP restart is complete
  Send state: in sync
    Active prefixes:          0
    Received prefixes:        0
    Accepted prefixes:        0
    Suppressed due to damping: 0
    Advertised prefixes:      6
Last traffic (seconds): Received 9    Sent 18    Checked 28
Input messages: Total 12    Updates 1    Refreshes 0    Octets 232
Output messages: Total 14    Updates 1    Refreshes 0    Octets 383
Output Queue[0]: 0

```

2. Check the BGP session on Router North to verify that Router Internet is a neighbor.

```

user@North> show bgp neighbor 10.0.89.14
Peer: 10.0.89.14+56187 AS 300 Local: 10.0.89.13+179 AS 200
  Type: External    State: Established    Flags: [ImportEval Sync]
  Last State: OpenConfirm    Last Event: RecvKeepAlive
  Last Error: None
  Options: [Preference LocalAddress PeerAS Refresh]
  Local Address: 10.0.89.13 Holdtime: 90 Preference: 170
  Number of flaps: 0
  Peer ID: 192.168.9.1    Local ID: 192.168.8.1    Active Holdtime: 90
  Keepalive Interval: 30    Group index: 0    Peer index: 0
  BFD: disabled, down
  Local Interface: fe-1/3/0.0
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Stale routes from peer are kept for: 300
  Peer does not support Restarter functionality
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Peer supports 4 byte AS extension (peer-as 300)
  Peer does not support Addpath
  Table inet.0 Bit: 10001
    RIB State: BGP restart is complete
    Send state: in sync
      Active prefixes:          6
      Received prefixes:        6
      Accepted prefixes:        6
      Suppressed due to damping: 0
      Advertised prefixes:      0
Last traffic (seconds): Received 14    Sent 3    Checked 3
Input messages: Total 16    Updates 2    Refreshes 0    Octets 402
Output messages: Total 15    Updates 0    Refreshes 0    Octets 348
Output Queue[0]: 0

```

Check the following fields in these outputs to verify that BGP sessions have been established:

- **Peer**—Check if the peer AS number is listed.
- **Local**—Check if the local AS number is listed.

- **State**—Ensure that the value is **Established**. If not, check the configuration again and see **show bgp neighbor** for more details on the output fields.

Similarly, verify that Routers North and South form peer relationships with each other.

**Meaning** BGP sessions are established between the three routers.

### Verifying Prefix Advertisement from Router Internet to Router North

**Purpose** Verify that the routes sent from Router Internet are received by Router North.

- Action** 1. From operational mode on Router Internet, run the **show route advertising-protocol bgp 10.0.89.13** command.

```
user@Internet> show route advertising-protocol bgp 10.0.89.13
inet.0: 8 destinations, 8 routes (8 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
* 11.1.1.1/32       Self              I
* 12.1.1.1/32       Self              I
* 13.1.1.1/32       Self              I
* 14.1.1.1/32       Self              I
* 15.1.1.1/32       Self              I
* 192.168.9.1/32    Self              I
```

The output verifies that Router Internet advertises the routes 11.1.1.1/32, 12.1.1.1/32, 13.1.1.1/32, 14.1.1.1/32, 15.1.1.1/32, and 192.168.9.1/32 (the loopback address used as router ID) to Router North.

2. From operational mode on Router North, run the **show route receive-protocol bgp neighbor-address** command.

```
user@North> show route receive-protocol bgp 10.0.89.14
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
* 11.1.1.1/32       10.0.89.14       300 I
* 12.1.1.1/32       10.0.89.14       300 I
* 13.1.1.1/32       10.0.89.14       300 I
* 14.1.1.1/32       10.0.89.14       300 I
* 15.1.1.1/32       10.0.89.14       300 I
* 192.168.9.1/32    10.0.89.14       300 I
```

The output verifies that Router North has received all the routes advertised by Router Internet.

**Meaning** Prefixes sent by Router Internet have been successfully installed into the routing table on Router North.

### Verifying Prefix Advertisement from Router North to Router South

**Purpose** Verify that the routes received from Router Internet and the static default route are advertised by Router North to Router South.

- Action** 1. From operational mode on Router North, run the **show route 0/0 exact** command.

```

user@North> show route 0/0 exact
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

0.0.0.0/0          *[Static/5] 00:10:22
                   Reject

```

The output verifies the presence of the static default route (0.0.0.0/0) in the routing table on Router North.

- From operational mode on Router North, run the **show route advertising-protocol bgp neighbor-address** command.

```

user@North> show route advertising-protocol bgp 10.0.78.13
inet.0: 12 destinations, 12 routes (12 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lclpref  AS path
* 0.0.0.0/0             Self                    0
* 11.1.1.1/32           Self                    0      300 I
* 12.1.1.1/32           Self                    0      300 I
* 13.1.1.1/32           Self                    0      300 I
* 14.1.1.1/32           Self                    0      300 I
* 15.1.1.1/32           Self                    0      300 I

```

The output verifies that Router North is advertising the static route and the 11.1.1.1/32 route received from Router Internet, as well as many other routes, to Router South.

### Verifying BGP Import Policy for Installation of Prefixes

**Purpose** Verify that the BGP import policy successfully installs the required prefixes.

**Action** See if the import policy on Router South is operational by checking if only the static default route from Router North and the 11.1.1.1/32 route from Router South are installed in the routing table.

From operational mode, run the **show route receive-protocol bgp neighbor-address** command.

```

user@South> show route receive-protocol bgp 10.0.78.14
inet.0: 10 destinations, 11 routes (6 active, 0 holddown, 4 hidden)
  Prefix                Nexthop          MED      Lclpref  AS path
* 0.0.0.0/0             10.0.78.14        0      200 I
* 11.1.1.1/32           10.0.78.14        0      200 300 I

```

The output verifies that the BGP import policy is operational on Router South, and only the static default route of 0.0.0.0/0 from Router North and the 11.1.1.1/32 route from Router Internet have leaked into the routing table on Router South.

**Meaning** The installation of prefixes is successful because of the configured BGP import policy.

### Verifying Conditional Export from Router North to Router South

**Purpose** Verify that when Device Internet stops sending the 11.1.1.1/32 route, Device North stops sending the default 0/0 route.

- Action** 1. Cause Device Internet to stop sending the 11.1.1.1/32 route by deactivating the 11.1.1.1/32 address on the loopback interface.

```
[edit interfaces lo0 unit 0 family inet]
user@Internet# deactivate address 11.1.1.1/32
user@Internet# commit
```

2. From operational mode on Router North, run the **show route advertising-protocol bgp neighbor-address** command.

```
user@North> show route advertising-protocol bgp 10.0.78.13
inet.0: 11 destinations, 11 routes (11 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref    AS path
* 12.1.1.1/32       Self              300      I          300 I
* 13.1.1.1/32       Self              300      I          300 I
* 14.1.1.1/32       Self              300      I          300 I
* 15.1.1.1/32       Self              300      I          300 I
```

The output verifies that Router North is not advertising the default route to Router South. This is the expected behavior when the 11.1.1.1/32 route is not present.

3. Reactivate the 11.1.1.1/32 address on Device Internet's loopback interface.

```
[edit interfaces lo0 unit 0 family inet]
user@Internet# activate address 11.1.1.1/32
user@Internet# commit
```

### Verifying the Presence of Routes Hidden by Policy (Optional)

**Purpose** Verify the presence of routes hidden by the import policy configured on Router South.

**NOTE:** This section demonstrates the effects of various changes you can make to the configuration depending on your needs.

**Action** View routes hidden from the routing table of Router South by:

- Using the **hidden** option for the **show route receive-protocol bgp neighbor-address** command.
- Deactivating the import policy.

1. From operational mode, run the **show route receive-protocol bgp neighbor-address hidden** command to view hidden routes.

```
user@South> show route receive-protocol bgp 10.0.78.14 hidden
inet.0: 10 destinations, 11 routes (6 active, 0 holddown, 4 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
  12.1.1.1/32           10.0.78.14             200 300 I
  13.1.1.1/32           10.0.78.14             200 300 I
  14.1.1.1/32           10.0.78.14             200 300 I
  15.1.1.1/32           10.0.78.14             200 300 I
```

The output verifies the presence of routes hidden by the import policy (12.1.1.1/32, 13.1.1.1/32, 14.1.1.1/32, and 15.1.1.1/32) on Router South.

2. Deactivate the BGP import policy by configuring the **deactivate import** statement at the **[edit protocols bgp group group-name]** hierarchy level.

```
[edit protocols bgp group toNorth]
user@South# deactivate import
user@South# commit
```

3. Run the **show route receive-protocol bgp neighbor-address** operational mode command to check the routes after deactivating the import policy.

```
user@South> show route receive-protocol bgp 10.0.78.14
inet.0: 10 destinations, 11 routes (10 active, 0 holddown, 0 hidden)
  Prefix                Nexthop          MED      Lc1pref    AS path
* 0.0.0.0/0             10.0.78.14             200 I
* 11.1.1.1/32           10.0.78.14             200 300 I
* 12.1.1.1/32           10.0.78.14             200 300 I
* 13.1.1.1/32           10.0.78.14             200 300 I
* 14.1.1.1/32           10.0.78.14             200 300 I
* 15.1.1.1/32           10.0.78.14             200 300 I
```

The output verifies the presence of previously hidden routes (12.1.1.1/32, 13.1.1.1/32, 14.1.1.1/32, and 15.1.1.1/32).

4. Activate the BGP import policy and remove the hidden routes from the routing table by configuring the **activate import** and **keep none** statements respectively at the **[edit protocols bgp group group-name]** hierarchy level.

```
[edit protocols bgp group toNorth]
user@South# activate import
user@South# set keep none
user@South# commit
```

5. From operational mode, run the **show route receive-protocol bgp neighbor-address hidden** command to check the routes after activating the import policy and configuring the **keep none** statement.

```
user@South> show route receive-protocol bgp 10.0.78.14 hidden

inet.0: 6 destinations, 7 routes (6 active, 0 holddown, 0 hidden)
```

The output verifies that the hidden routes are not maintained in the routing table because of the configured **keep none** statement.

# Protecting Against DoS Attacks by Forwarding Traffic to the Discard Interface

- [Understanding Forwarding Packets to the Discard Interface on page 433](#)
- [Example: Forwarding Packets to the Discard Interface on page 434](#)

## Understanding Forwarding Packets to the Discard Interface

---

The discard (**dsc**) interface is not a physical interface, but a virtual interface that discards packets. You can configure one discard interface. This interface allows you to identify the ingress point of a denial-of-service (DoS) attack. When your network is under attack, the target host IP address is identified, and the local policy forwards attacking packets to the discard interface. Traffic routed out of the discard interface is silently discarded.

The discard interface allows you to protect a network from DoS attacks by identifying the target IP address that is being attacked and configuring a policy to forward all packets to a discard interface. All packets forwarded to the discard interface are dropped.

To configure the discard interface, include the **dsc** statement:

```
[edit interfaces interface-name]  
dsc {  
  unit 0 {  
    family inet {  
      filter {  
        input filter-name;  
        output filter-name;  
      }  
    }  
  }  
}
```

The **dsc** interface name denotes the discard interface. The discard interface supports only unit 0.

The following two configurations are required to configure a policy to forward all packets to the discard interface.

Configure an input policy to associate a community with the discard interface:

```
[edit]
```

```
policy-options {  
  community community-name members [ community-id ];  
  policy-statement statement-name {  
    term term-name {  
      from community community-name;  
      then {  
        next-hop address; # Remote end of the point-to-point interface  
        accept;  
      }  
    }  
  }  
}
```

Configure an output policy to set up the community on the routes injected into the network:

```
[edit]  
policy-options {  
  policy-statement statement-name {  
    term term-name {  
      from prefix-list name;  
      then community (set | add | delete) community-name;  
    }  
  }  
}
```

- [Overview on page 434](#)
- [Configuration on page 437](#)
- [Verification on page 441](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In discard routing, routers are configured with rules that disallow millions of requests in a short period of time from being sent to the same address. If too many requests are received in a short period of time, the router simply discards the requests without forwarding them. The requests are sent to a router that does not forward the packets. The problematic routes are sometimes referred to as discard routes or black-holed routes. The types of routes that should be discarded are identified as attacks to customers from

peers or other customers, attacks from customers to peers or other customers, attack controllers, which are hosts providing attack instructions, and unallocated address spaces, known as bogons or invalid IP addresses.

After the attack attempt is identified, operators can put a configuration in place to mitigate the attack. One way to configure discard routing in Junos OS is to create a discard static route for each next hop used for discard routes. A discard static route uses the **discard** option.

For example:

```
user@host# show routing-options
static {
  route 192.0.2.101/32 discard;
  route 192.0.2.103/32 discard;
  route 192.0.2.105/32 discard;
}

user@host> show route protocol static terse
inet.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

| A | V | Destination    | P | Prf | Metric 1 | Metric 2 | Next hop | AS path |
|---|---|----------------|---|-----|----------|----------|----------|---------|
| * | ? | 192.0.2.101/32 | S | 5   |          |          | Discard  |         |
| * | ? | 192.0.2.103/32 | S | 5   |          |          | Discard  |         |
| * | ? | 192.0.2.105/32 | S | 5   |          |          | Discard  |         |

Another strategy, which is the main focus of this example, is to use routing policy and the discard interface. In this approach, the discard interface contains the next hop you are assigning to the black-hole routes. A discard interface can have only one logical unit (unit 0), but you can configure multiple IP addresses on unit 0.

For example:

```
user@host# show interfaces dsc
unit 0 {
  family inet {
    address 192.0.2.102/32 {
      destination 192.0.2.101;
    }
    address 192.0.2.104/32 {
      destination 192.0.2.103;
    }
    address 192.0.2.106/32 {
      destination 192.0.2.105;
    }
  }
}

user@host> show interfaces terse dsc
b
```

| Interface | Admin | Link | Proto | Local       | Remote          |
|-----------|-------|------|-------|-------------|-----------------|
| dsc       | up    | up   |       |             |                 |
| dsc.0     | up    | up   | inet  | 192.0.2.102 | --> 192.0.2.101 |
|           |       |      |       | 192.0.2.104 | --> 192.0.2.103 |
|           |       |      |       | 192.0.2.106 | --> 192.0.2.105 |

The advantage of using a discard interface instead of using discard static routes is that the discard interface allows you to configure and assign filters to the interface for counting, logging, and sampling the traffic. This is demonstrated in this example.

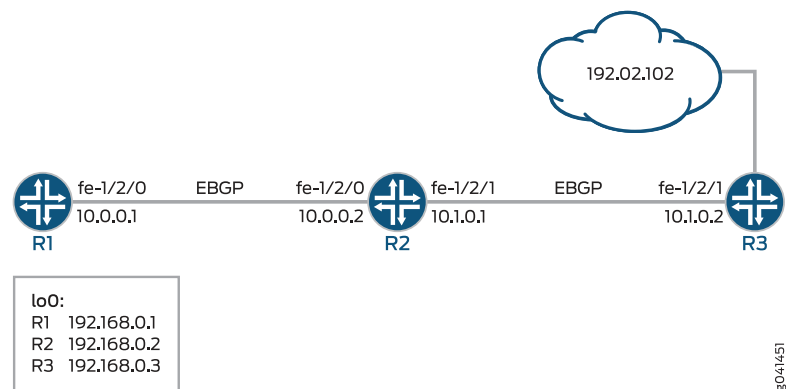

To actually discard packets requires a routing policy attached to the BGP sessions. To locate discard-eligible routes, you can use a route filter, an access list, or a BGP community value.

For example, here is how you would use a route filter:

```
Route Filter
protocols {
  bgp {
    import blackhole-by-route;
  }
}
policy-options {
  policy-statement blackhole-by-route {
    term specific-routes {
      from {
        route-filter 10.10.10.1/32 exact;
        route-filter 10.20.20.2/32 exact;
        route-filter 10.30.30.3/32 exact;
        route-filter 10.40.40.4/32 exact;
      }
      then {
        next-hop 192.0.2.101
      }
    }
  }
}
```

Figure 42 on page 436 shows the sample network.

**Figure 42: Discard Interface Sample Network**

The example includes three routers with external BGP (EBGP) sessions established.

Device R1 represents the attacking device. Device R3 represents the router closest to the device that is being attacked. Device R2 mitigates the attack by forwarding packets to the discard interface.

The example shows an outbound filter applied to the discard interface.

**NOTE:** An issue with using a single black-hole filter is visibility. All discard packets increment the same counter. To see which categories of packets are being discarded, use destination class usage (DCU), and associate a user-defined class with each black-hole community. Then reference the DCU classes in a firewall filter. For related examples, see [“Example: Grouping Source and Destination Prefixes into a Forwarding Class” on page 401](#) and [“Example: Configuring a Rate-Limiting Filter Based on Destination Class” on page 676](#).

Compared to using route filters and access lists, using a community value is the least administratively difficult and the most scalable approach. Therefore, this is the approach shown in this example.

By default, the next hop must be equal the external BGP (EBGP) peer address. Altering the next hop for black-hole services requires the multihop feature to be configured on the EBGP sessions.

[“CLI Quick Configuration” on page 437](#) shows the configuration for all of the devices in [Figure 42 on page 436](#).

The section [“Step-by-Step Procedure” on page 438](#) describes the steps on Device R2.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

```
set policy-options policy-statement dsc-export from route-filter 192.0.2.102/32 exact
set policy-options policy-statement dsc-export then community set blackhole-all-routers
set policy-options policy-statement dsc-export then accept
set policy-options community blackhole-all-routers members 100:5555
set routing-options static route 192.0.2.102/32 next-hop 192.0.2.101
set routing-options autonomous-system 200
set firewall filter log-discard term one then count counter
set firewall filter log-discard term one then log
```

**Device R3**

```
set interfaces fe-1/2/1 unit 0 family inet address 10.1.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.3/32
set interfaces lo0 unit 0 family inet address 192.0.2.102/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.1.0.1
set routing-options autonomous-system 300
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Create the router interfaces.

```
[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30
```

```
user@R2# set fe-1/2/1 unit 0 family inet address 10.1.0.1/30
```

```
user@R2# set lo0 unit 0 family inet address 192.168.0.2/32
```

2. Configure a firewall filter that matches all packets and counts and logs the packets.

```
[edit firewall filter log-discard term one]
user@R2# set then count counter
user@R2# set then log
```

3. Create a discard interface and apply the output firewall filter.

Input firewall filters have no impact in this context.

```
[edit interfaces dsc unit 0 family inet]
user@R2# set filter output log-discard
user@R2# set address 192.0.2.102/32 destination 192.0.2.101
```

4. Configure a static route that sends the next hop to the destination address that is specified in the discard interface.

```
[edit routing-options static]
user@R2# set route 192.0.2.102/32 next-hop 192.0.2.101
```

5. Configure BGP peering.

```
[edit protocols bgp ]
user@R2# set group ext type external
user@R2# set group ext multihop
```

```

user@R2# set group ext neighbor 10.0.0.1 peer-as 100
user@R2# set group ext neighbor 10.1.0.2 peer-as 300

```

6. Configure the routing policies.

```

[edit policy-options policy-statement blackhole-policy term blackhole-communities]
user@R2# set from community blackhole-all-routers
user@R2# set then next-hop 192.0.2.101

```

```

[edit policy-options policy-statement dsc-export]
user@R2# set from route-filter 192.0.2.101/32 exact
user@R2# set from route-filter 192.0.2.102/32 exact
user@R2# set then community set blackhole-all-routers
user@R2# set then accept

```

```

[edit policy-options community blackhole-all-routers]
user@R2# set members 100:5555

```

7. Apply the routing policies.

```

[edit protocols bgp ]
user@R2# set import blackhole-policy
user@R2# set group ext export dsc-export

```

8. Configure the autonomous system (AS) number.

```

[edit routing-options]
user@R2# set autonomous-system 200

```

**Results** From configuration mode, confirm your configuration by issuing the **show interfaces**, **show protocols**, **show policy-options**, **show routing-options**, and **show firewall** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      address 10.1.0.1/30;
    }
  }
}
dsc {
  unit 0 {
    family inet {
      filter {
        output log-discard;
      }
    }
  }
}

```

```
        address 192.0.2.102/32 {
            destination 192.0.2.101;
        }
    }
}
lo0 {
    unit 0 {
        family inet {
            address 192.168.0.2/32;
        }
    }
}

user@R2# show protocols
bgp {
    import blackhole-policy;
    group ext {
        type external;
        multihop;
        export dsc-export;
        neighbor 10.0.0.1 {
            peer-as 100;
        }
        neighbor 10.1.0.2 {
            peer-as 300;
        }
    }
}

user@R2# show policy-options
policy-statement blackhole-policy {
    term blackhole-communities {
        from community blackhole-all-routers;
        then {
            next-hop 192.0.2.101;
        }
    }
}
policy-statement dsc-export {
    from {
        route-filter 192.0.2.101/32 exact;
        route-filter 192.0.2.102/32 exact;
    }
    then {
        community set blackhole-all-routers;
        accept;
    }
}
community blackhole-all-routers members 100:5555;

user@R2# show routing-options
static {
    route 192.0.2.102/32 next-hop 192.0.2.101;
}
autonomous-system 200;
```

```

user@R2# show firewall
filter log-discard {
  term one {
    then {
      count counter;
      log;
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Clearing the Firewall Counters on page 441](#)
- [Pinging the 192.0.2.101 Address on page 441](#)
- [Checking the Output Filter on page 442](#)
- [Checking the Community Attribute on page 442](#)

### Clearing the Firewall Counters

**Purpose** Clear the counters to make sure you are starting from a known zero (0) state.

- Action**
1. From Device R2, run the **clear firewall** command.
  2. From Device R2, run the **show firewall** command.

```

user@R2> clear firewall filter log-discard

user@R2> show firewall filter log-discard
Filter: /log-discard
Counters:
Name                               Bytes      Packets
counter                             0
0

```

### Pinging the 192.0.2.101 Address

**Purpose** Send packets to the destination address.

- Action** From Device R1, run the **ping** command.

```

user@R1> ping 192.0.2.101
PING 192.0.2.101 (192.0.2.101): 56 data bytes
^C
--- 192.0.2.101 ping statistics ---
4 packets transmitted, 0 packets received, 100% packet loss

```

**Meaning** As expected, the ping request fails, and no response is sent. The packets are being discarded.

### Checking the Output Filter

**Purpose** Verify that Device R2's firewall filter is functioning properly.

**Action** From Device R2, enter the **show firewall filter log-discard** command.

```
user@R2> show firewall filter log-discard
```

```
Filter: log-discard
```

```
Counters:
```

| Name    | Bytes | Packets |
|---------|-------|---------|
| counter | 336   | 4       |

**Meaning** As expected, the counter is being incremented.

**NOTE:** The ping packet carries an additional 20 bytes of IP overhead as well as 8 bytes of ICMP header.

### Checking the Community Attribute

**Purpose** Verify that the route is being tagged with the community attribute.

**Action** From Device R1, enter the **show route extensive** command, using the neighbor address for Device R2, 192.0.2.101.

```
user@R1> show route 192.0.2.101 extensive
```

```
inet.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
```

```
192.0.2.101/32 (1 entry, 1 announced)
```

```
TSI:
```

```
KRT in-kernel 192.0.2.101/32 -> {10.0.0.2}
```

```
*BGP Preference: 170/-101
```

```
Next hop type: Router, Next hop index: 684
```

```
Address: 0x94141d8
```

```
Next-hop reference count: 2
```

```
Source: 10.0.0.2
```

```
Next hop: 10.0.0.2 via fe-1/2/0.0, selected
```

```
Session Id: 0x8000a
```

```
State: <Active Ext>
```

```
Local AS: 100 Peer AS: 200
```

```
Age: 53:03
```

```
Validation State: unverified
```

```
Task: BGP_200.10.0.0.2+63097
```

```
Announcement bits (1): 2-KRT
```

```
AS path: 200 I
```

```
Communities: 100:5555
```

```
Accepted
```

```
Localpref: 100
```

```
Router ID: 192.168.0.2
```

**Meaning** As expected, when Device R2 advertises the 192.0.2.101 route to Device R1, Device R2 adds the 100:5555 community tag.

## Understanding Dynamic Routing Policies

---

The verification process required to commit configuration changes can entail a significant amount of overhead and time. For example, changing a prefix in one line of a routing policy that is 20,000 lines long can take up to 20 seconds to commit. It can be useful to be able to commit routing policy changes much more quickly.

In Junos OS Release 9.5 and later, you can configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database. As a result, the time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can then reference these policies and policy objects in routing policies you configure in the standard database. BGP is the only protocol to which you can apply routing policies that reference policies and policy objects configured in the dynamic database. After you configure and commit a routing policy based on the objects configured in the dynamic database, you can quickly update any existing routing policy by making changes to the dynamic database configuration.

**CAUTION:** Because the Junos OS does not validate configuration changes to the dynamic database, when you use this feature, you should test and verify all configuration changes before committing them.

- [Configuring Routing Policies and Policy Objects in the Dynamic Database on page 446](#)
- [Configuring Routing Policies Based on Dynamic Database Configuration on page 446](#)
- [Applying Dynamic Routing Policies to BGP on page 448](#)
- [Preventing Reestablishment of BGP Peering Sessions After NSR Routing Engine Switchover on page 448](#)

## Configuring Routing Policies and Policy Objects in the Dynamic Database

Junos OS Release 9.5 and later support a configuration database, the *dynamic database*, which can be edited in a similar way to the standard configuration database but which is not subject to the same verification process to commit configuration changes. As a result, the time it takes to commit a configuration change is much faster. The policies and policy objects defined in the dynamic database can then be referenced in routing policies configured in the standard configuration. The dynamic database is stored in the `/var/run/db/juniper.dyn` directory.

To configure the dynamic database, enter the **configure dynamic** command to enter the configuration mode for the dynamic database:

```
user@host> configure dynamic
Entering configuration mode
```

```
[edit dynamic]
user@host#
```

In this dynamic configuration database, you can configure the following statements at the **[edit policy-options]** hierarchy level:

- **as-path** *name*
- **as-path-group** *group-name*
- **community** *community-name*
- **condition** *condition-name*
- **prefix-list** *prefix-list-name*
- **policy-statement** *policy-statement-name*

**NOTE:** No other configuration is supported at the **[edit dynamic]** hierarchy level.

---

Use the **policy-statement** *policy-statement-name* statement to configure routing policies as you would in the standard configuration database.

To exit configuration mode for the dynamic database, issue the **exit configuration-mode** command from any level within the **[edit dynamic]** hierarchy, or use the **exit** command from the top level.

## Configuring Routing Policies Based on Dynamic Database Configuration

In the standard configuration mode, you can configure routing policies that reference policies and policy objects configured at the **[edit dynamic]** hierarchy level in the dynamic database. To define a routing policy that references the dynamic database configuration, include the **dynamic-db** statement at the **[edit policy-options policy-statement** *policy-statement-name* **]** hierarchy level:

```
[edit policy-options]
```

```

policy-statement policy-statement-name {
  dynamic-db;
}

```

You can also define specific policy objects based on the configuration of these objects in the dynamic database. To define a policy object based on the dynamic database, include the **dynamic-db** statement with the following statements at the **[edit policy-options]** hierarchy level:

- **as-path** *name*
- **as-path-group** *group-name*
- **community** *community-name*
- **condition** *condition-name*
- **prefix-list** *prefix-list-name*

In the standard configuration, you can also define a routing policy that references any policy object you have configured in the standard configuration that references an object configured in the dynamic database.

For example, in standard configuration mode, you configure a prefix list **prefix-list pl2** that references a prefix list, also named **prefix-list pl2**, that has been configured in the dynamic database:

```

[edit policy-options]
prefix-list pl2 {
  dynamic-db; # Reference a prefix list configured in the dynamic database.
}

```

You then configure a routing policy in the standard configuration that includes **prefix-list pl2**:

```

[edit policy-options]
policy-statement one {
  term term1 {
    from {
      prefix-list pl2; # Include the prefix list configured in the standard configuration
                       # database, but which references a prefix list configured in the dynamic database.
    }
    then accept;
  }
  then reject;
}

```

If you need to update the configuration of **prefix-list pl2**, you do so in the dynamic database configuration using the **[edit dynamic]** hierarchy level. This enables you to make commit configuration changes to the prefix list more quickly than you can in the standard configuration database.

**NOTE:** If you are downgrading the Junos OS to Junos OS Release 9.4 or earlier, you must first delete any routing policies that reference the dynamic database. That is, you must delete any routing policies or policy objects configured with the `dynamic-db` statement.

## Applying Dynamic Routing Policies to BGP

BGP is the only routing protocol to which you can apply routing policies that reference the dynamic database configuration. You must apply these policies in the standard configuration. Dynamic policies can be applied to BGP export or import policy. They can also be applied at the global, group, or neighbor hierarchy level.

To apply a BGP export policy, include the `export [ policy-names ]` statement at the `[edit protocols bgp]`, `[edit protocols bgp group group-name]`, or `[edit protocols bgp group group-name neighbor address]` hierarchy level.

```
[edit]
protocols
  bgp {
    export [ policy-names ];
  }
}
```

To apply a BGP import policy, include the `import [ policy-names ]` statement at the `[edit protocols bgp]`, `[edit protocols bgp group group-name]`, or `[edit protocols bgp group group-name neighbor address]` hierarchy level.

```
[edit]
protocols
  bgp {
    import [ policy-names ];
  }
}
```

Include one or more policy names configured in that standard configuration at the `[edit policy-options policy-statement]` hierarchy level that reference policies configured in the dynamic database.

## Preventing Reestablishment of BGP Peering Sessions After NSR Routing Engine Switchover

If you have active nonstop routing (NSR) enabled, the dynamic database is not synchronized with the backup Routing Engine. As a result, if a switchover to a backup Routing Engine occurs, import and export policies running on the master Routing Engine at the time of the switchover might no longer be available. Therefore, you might want to prevent a BGP peering session from automatically being reestablished as soon as a switchover occurs.

You can configure the router not to reestablish a BGP peering session after an active nonstop routing switchover either for a specified period or until you manually reestablish the session. Include the `idle-after-switch-over (seconds | forever)` statement at the `[edit`

`protocols bgp`], `[edit protocols bgp group group-name]`, or `[edit protocols bgp group group-name neighbor address]` hierarchy level:

```
[edit]
bgp {
  protocols {
    idle-after-switch-over (seconds | never);
  }
}
```

For ***seconds***, specify a value from 1 through 4,294,967,295 ( $2^{32} - 1$ ). The BGP peering session is not reestablished until after the specified period. If you specify the **forever** option, the BGP peering session is not established until you issue the **clear bgp neighbor** command.

## Example: Configuring Dynamic Routing Policies

This example shows how to configure routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database.

- [Requirements on page 449](#)
- [Overview on page 449](#)
- [Configuration on page 450](#)
- [Verification on page 458](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

The verification process required to commit configuration changes can entail a significant amount of overhead and time.

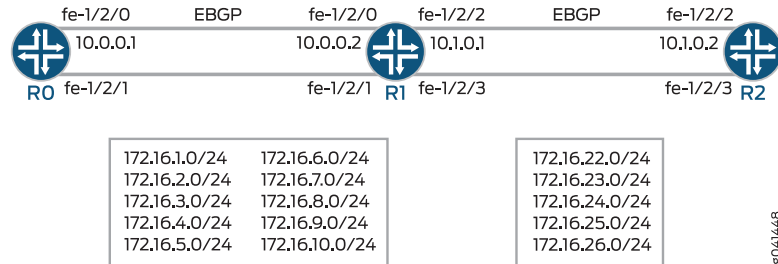

The time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can reference these policies and policy objects in routing policies you configure in the standard database. BGP is the only protocol to which you can apply routing policies that reference policies and policy objects configured in the dynamic database. After you configure and commit a routing policy based on the objects configured in the dynamic database, you can quickly update any existing routing policy by making changes to the dynamic database configuration.

**CAUTION:** Because Junos OS does not validate configuration changes to the dynamic database, when you use this feature, you should test and verify all configuration changes before committing them.

Figure 43 on page 450 shows the sample network.

Figure 43: Dynamic Routing Policy Sample Network

The example includes three routers with external BGP (EBGP) sessions established. Only Device R1 makes use of the dynamic database.

On Device R0's fe-1/2/1 interface, multiple IPv4 interfaces are configured, and a routing policy injects these prefixes into BGP, using the **from interface fe-1/2/1.0** policy condition as a shorthand method for specifying all of the IP addresses configured on Device R0's fe-1/2/1 interface.

Likewise, on Device R2's fe-1/2/3 interface, multiple IPv4 addresses are configured, and a routing policy injects these prefixes into BGP. Device R2's configuration is slightly different from Device R0's in that Device R2's configuration demonstrates the use of a prefix list.

On Device R1, in the dynamic database, two prefix lists are defined, one for the interface addresses learned from Device R0 and another for the interface addresses learned from Device R2. Device R1's standard database contains routing policies with prefix lists that are similar to those defined in the dynamic database.

In its peer session with Device R0, Device R1 has the static-database policies applied. In contrast, in its peer session with Device R2, Device R1's configuration references the dynamic database.

The results of these different configurations are analyzed in the ["Verification" on page 458](#) section.

["CLI Quick Configuration" on page 450](#) shows the configuration for all of the devices in [Figure 43 on page 450](#).

The section ["Step-by-Step Procedure" on page 453](#) describes the steps on Device R1's dynamic database.

The section ["Step-by-Step Procedure" on page 453](#) describes the steps on Device R1's standard database.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1's dynamic database:

1. Enter configuration mode for the dynamic database.

```
user@R1> configure dynamic
Entering configuration mode
[edit dynamic]
```

2. Create a prefix list for the interface addresses learned from Device R0.

```
[edit dynamic policy-options prefix-list dyn_prfx1]
user@R1# set 1.1.1.0/24
user@R1# set 1.1.2.0/24
user@R1# set 1.1.3.0/24
user@R1# set 1.1.4.0/24
user@R1# set 1.1.5.0/24
user@R1# set 1.1.6.0/24
user@R1# set 1.1.7.0/24
user@R1# set 1.1.8.0/24
```

3. Create a prefix list for the interface addresses learned from Device R2.

```
[edit dynamic policy-options prefix-list dyn_prfx2]
user@R1# set 2.2.2.0/24
user@R1# set 2.2.3.0/24
user@R1# set 2.2.4.0/24
user@R1# set 2.2.5.0/24
user@R1# set 2.2.6.0/24
```

4. Configure the routing policies.

```
[edit dynamic policy-options policy-statement dyn_policy1]
user@R1# set term t1 from prefix-list dyn_prfx1
user@R1# set term t1 then accept
user@R1# set term t2 then reject
```

```
user@R1# set term t1 from prefix-list dyn_prfx2
user@R1# set term t1 then accept
user@R1# set term t2 then reject
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1's standard database:

1. Create the router interfaces.

```
[edit interfaces]
user@R1# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

user@R1# set fe-1/2/2 unit 0 family inet address 10.1.0.1/30
```

```

user@R1# set fe-1/2/1 unit 0 family inet address 1.1.4.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.3.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.2.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.1.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.5.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.6.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.7.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.8.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.9.2/24
user@R1# set fe-1/2/1 unit 0 family inet address 1.1.10.2/24

```

```

user@R1# set fe-1/2/3 unit 0 family inet address 2.2.2.2/24
user@R1# set fe-1/2/3 unit 0 family inet address 2.2.3.2/24
user@R1# set fe-1/2/3 unit 0 family inet address 2.2.4.2/24
user@R1# set fe-1/2/3 unit 0 family inet address 2.2.5.2/24
user@R1# set fe-1/2/3 unit 0 family inet address 2.2.6.2/24

```

```

user@R1# set lo0 unit 0 family inet address 192.168.0.2/32

```

2. Create routing policies that reference the policies in the dynamic database.

```

[edit policy-options]
user@R1# set policy-statement dyn_policy1 dynamic-db
user@R1# set policy-statement dyn_policy2 dynamic-db

```

3. Configure BGP peering with Device R0.

```

[edit protocols bgp group to_r0]
user@R1# set neighbor 10.0.0.1 peer-as 100

```

4. Apply the dynamic database policies to the BGP peering with Device R0.

```

[edit protocols bgp group to_r0]
user@R1# set neighbor 10.0.0.1 import dyn_policy1
user@R1# set neighbor 10.0.0.1 export dyn_policy2

```

5. Configure a prefix list for prefixes learned from Device R0.

```

[edit policy-options prefix-list static_prfx2]
user@R1# set 1.1.1.0/24
user@R1# set 1.1.2.0/24
user@R1# set 1.1.3.0/24
user@R1# set 1.1.4.0/24

```

6. Configure a prefix list for prefixes learned from Device R2.

```

[edit policy-options prefix-list static_prfx1]
user@R1# set 2.2.2.0/24
user@R1# set 2.2.3.0/24
user@R1# set 2.2.4.0/24
user@R1# set 2.2.5.0/24

```

7. Configure the static database policies.

```

[edit policy-options policy-statement static_policy1]
user@R1# set term t1 from prefix-list static_prfx1
user@R1# set term t1 then accept
user@R1# set term t2 then reject

```

```
[edit policy-options policy-statement static_policy2]
user@R1# set term t1 from prefix-list static_prfx2
user@R1# set term t1 then accept
user@R1# set term t2 then reject
```

8. Configure BGP peering with Device R2.

```
[edit protocols bgp group to_R2]
user@R1# set neighbor 10.1.0.2 peer-as 300
```

9. Apply the static database policies to the BGP peering with Device R2.

```
[edit protocols bgp group to_R2]
user@R1# set import static_policy1
user@R1# set export static_policy2
```

10. (Optional) Configure the router not to reestablish the BGP peering sessions after an active nonstop routing switchover either for a specified period or until you manually reestablish the session.

This statement is particularly useful with dynamic routing policies because the dynamic database is not synchronized with the backup Routing Engine when nonstop active routing (NSR) is enabled. As a result, if a switchover to a backup Routing Engine occurs, import and export policies running on the master Routing Engine at the time of the switchover might no longer be available. Therefore, you might want to prevent a BGP peering session from automatically being reestablished as soon as a switchover occurs.

```
[edit protocols bgp]
user@R1# set group to_r0 idle-after-switch-over 300
user@R1# set group to_R2 idle-after-switch-over 300
```

11. Configure the autonomous system (AS) number.

```
[edit routing-options]
user@R1# set routing-options autonomous-system 200
```

**Results** Confirm your configuration by entering the **show** command from configuration mode in the dynamic database, and the **show interfaces**, **show protocols**, **show policy-options** and **show routing-options** commands from configuration mode in the standard database. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

#### Device R1 Dynamic

```
[edit dynamic]
user@R1# show
policy-options {
  prefix-list dyn_prfx1 {
    1.1.1.0/24;
    1.1.2.0/24;
    1.1.3.0/24;
    1.1.4.0/24;
    1.1.5.0/24;
    1.1.6.0/24;
    1.1.7.0/24;
    1.1.8.0/24;
  }
  prefix-list dyn_prfx2 {
```

```

2.2.2.0/24;
2.2.3.0/24;
2.2.4.0/24;
2.2.5.0/24;
2.2.6.0/24;
}
policy-statement dyn_policy1 {
  term t1 {
    from {
      prefix-list dyn_prfx1;
    }
    then accept;
  }
  term t2 {
    then reject;
  }
}
policy-statement dyn_policy2 {
  term t1 {
    from {
      prefix-list dyn_prfx2;
    }
    then accept;
  }
  term t2 {
    then reject;
  }
}
}
}

```

**Device R1 Standard**

```

[edit]
user@R1# show interfaces
fe-1/2/0 {
  unit 0 {

---

### Checking the Configured Policies on Device R1

**Purpose** Verify that Device R1 has the dynamic and static policies in effect.

**Action** From Device R1, enter the **show policy** command.

```
user@R1> show policy
Configured policies:
dyn_policy1
dyn_policy2
static_policy1
static_policy2
dyn_policy1
dyn_policy2
```

**Meaning** The dynamic policies are listed two times because they are configured two times, the first and central configuration in the dynamic database. The secondary configuration is in the static database, where the dynamic database is referenced, as shown here:

**Configured in the Dynamic Database**

```
policy-statement dyn_policy1 {
  term t1 {
    from {
      prefix-list dyn_prfx1;
    }
    then accept;
  }
  term t2 {
    then reject;
  }
}
policy-statement dyn_policy2 {
  term t1 {
    from {
      prefix-list dyn_prfx2;
    }
    then accept;
  }
  term t2 {
    then reject;
  }
}
```

**Referenced from the Static Database**

```
policy-statement dyn_policy1 {
  dynamic-db;
}
policy-statement dyn_policy2 {
  dynamic-db;
}
```

### Checking the Routes Advertised from Device R0 to Device R1

**Purpose** Verify that Device R0's routing policy is working.

**Action** From Device R0, enter the **show route advertising-protocol bgp** command, using the neighbor address for Device R1.

```
user@R0> show route advertising-protocol bgp 10.0.0.2
inet.0: 28 destinations, 28 routes (28 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lclpref  AS path
* 1.1.1.0/24        Self              0         0         I
```

|               |      |   |
|---------------|------|---|
| * 1.1.2.0/24  | Self | I |
| * 1.1.3.0/24  | Self | I |
| * 1.1.4.0/24  | Self | I |
| * 1.1.5.0/24  | Self | I |
| * 1.1.6.0/24  | Self | I |
| * 1.1.7.0/24  | Self | I |
| * 1.1.8.0/24  | Self | I |
| * 1.1.9.0/24  | Self | I |
| * 1.1.10.0/24 | Self | I |
| * 10.0.0.0/30 | Self | I |

**Meaning** Device R0 is sending the expected routes to Device R1.

### Checking the Routes That Device R1 Is Receiving from Device R0

**Purpose** Verify that Device R1's import routing policy is working.

**Action** From Device R1, enter the **show route receive-protocol bgp 10.0.0.1** command, using the neighbor address for Device R0.

```
user@R1> show route receive-protocol bgp 10.0.0.1
inet.0: 35 destinations, 51 routes (35 active, 0 holddown, 4 hidden)
  Prefix            Nexthop          MED      Lclpref   AS path
  1.1.1.0/24         10.0.0.1         100      I         100 I
  1.1.2.0/24         10.0.0.1         100      I         100 I
  1.1.3.0/24         10.0.0.1         100      I         100 I
  1.1.4.0/24         10.0.0.1         100      I         100 I
  1.1.5.0/24         10.0.0.1         100      I         100 I
  1.1.6.0/24         10.0.0.1         100      I         100 I
  1.1.7.0/24         10.0.0.1         100      I         100 I
  1.1.8.0/24         10.0.0.1         100      I         100 I
```

**Meaning** Some of the routes that are sent by Device R0 are not received by Device R1. The routes 1.1.9.0/24, 1.1.10.0/24, and 10.0.0.0/30 are missing. This is because Device R1's import policy, applied to the BGP peering session with Device R0 using the **import dyn\_policy1** statement, specifically defines a prefix list limited to the following routes:

```
prefix-list dyn_prfx1 {
  1.1.1.0/24;
  1.1.2.0/24;
  1.1.3.0/24;
  1.1.4.0/24;
  1.1.5.0/24;
  1.1.6.0/24;
  1.1.7.0/24;
  1.1.8.0/24;
}
```

### Checking the Routes Advertised from Device R2 to Device R1

**Purpose** Verify that Device R2's routing policy is working.

**Action** From Device R2, enter the **show route advertising-protocol bgp** command, using the neighbor address for Device R1.

```
user@R2> show route advertising-protocol bgp 10.1.0.1
inet.0: 17 destinations, 17 routes (17 active, 0 holddown, 0 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
* 2.2.2.0/24        Self              I
* 2.2.3.0/24        Self              I
* 2.2.4.0/24        Self              I
* 2.2.5.0/24        Self              I
* 2.2.6.0/24        Self              I
```

**Meaning** Device R2 is sending the expected routes to Device R1.

### Checking the Routes That Device R1 Is Receiving from Device R2

**Purpose** Verify that Device R1's import routing policy is working.

**Action** From Device R1, enter the **show route receive-protocol bgp** command, using the neighbor address for Device R0.

```
user@R1> show route receive-protocol bgp 10.1.0.2
inet.0: 35 destinations, 51 routes (35 active, 0 holddown, 4 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
2.2.2.0/24         10.1.0.2          I
2.2.3.0/24         10.1.0.2          I
2.2.4.0/24         10.1.0.2          I
2.2.5.0/24         10.1.0.2          I
```

**Meaning** One of the routes that is sent by Device R2 is not received by Device R1. The route 2.2.6.0/24 is missing. This is because Device R1's import policy, applied to the BGP peering session with Device R2 using the **import static\_policy1** statement, specifically defines a prefix list limited to the following routes:

```
prefix-list static_prfx1 {
  2.2.2.0/24;
  2.2.3.0/24;
  2.2.4.0/24;
  2.2.5.0/24;
}
```

### Checking the Routes That Device R1 Is Advertising to Device R0

**Purpose** Verify that Device R1's export routing policy is working.

**Action** From Device R1, enter the **show route advertising-protocol bgp** command, using the neighbor address for Device R0.

```
user@R1> show route advertising-protocol bgp 10.0.0.1
inet.0: 35 destinations, 51 routes (35 active, 0 holddown, 4 hidden)
  Prefix            Nexthop          MED      Lc1pref    AS path
* 2.2.2.0/24        Self              I
* 2.2.3.0/24        Self              I
* 2.2.4.0/24        Self              I
* 2.2.5.0/24        Self              I
* 2.2.6.0/24        Self              I
```

**Meaning** Perhaps unexpectedly, the route that Device R1 did not receive through BGP from Device R2 (2.2.6.0/24) is nonetheless being advertised by Device R1 through BGP to Device R0. This is happening for two reasons. The first reason is that route 2.2.6.0/24 is in Device R1's routing table, albeit as a direct route, as shown here:

```
user@R1> show route 2.2.6.0/24 protocol direct
inet.0: 35 destinations, 51 routes (35 active, 0 holddown, 4 hidden)
+ = Active Route, - = Last Active, * = Both

2.2.6.0/24          *[Direct/0] 2d 22:51:41
                    > via fe-1/2/3.0
```

The second reason is that Device R1's export policy, applied to the BGP peering session with Device R0 using the **export dyn\_policy2** statement, specifically defines a prefix list limited to the following routes:

```
prefix-list dyn_prfx2 {
  2.2.2.0/24;
  2.2.3.0/24;
  2.2.4.0/24;
  2.2.5.0/24;
  2.2.6.0/24;
}
```

Note the inclusion of 2.2.6.0/24.

### Checking the Routes That Device R1 Is Advertising to Device R2

**Purpose** Verify that Device R1's export routing policy is working.

**Action** From Device R1, enter the **show route advertising-protocol bgp** command, using the neighbor address for Device R2.

```
user@R1> show route advertising-protocol bgp 10.1.0.2
inet.0: 35 destinations, 51 routes (35 active, 0 holddown, 4 hidden)
  Prefix                Nexthop          MED      Lc1pref  AS path
* 1.1.1.0/24            Self              0         0         I
* 1.1.2.0/24            Self              0         0         I
* 1.1.3.0/24            Self              0         0         I
* 1.1.4.0/24            Self              0         0         I
```

**Meaning** Device R1 is sending the expected routes to Device R2. Device R1's export policy, applied to the BGP peering session with Device R2 using the **export static\_policy2** statement, specifically defines a prefix list limited to the following routes:

```
prefix-list static_prfx2 {
  1.1.1.0/24;
  1.1.2.0/24;
  1.1.3.0/24;
  1.1.4.0/24;
}
```

## Understanding Routing Policy Tests

---

Routing policy tests provide a method for verifying the effectiveness of your policies before applying them on the routing device. Before applying a routing policy, you can issue the **test policy** command to ensure that the policy produces the results that you expect:

```
user@host> test policy policy-name prefix
```

Keep in mind that different protocols have different default policies that get applied if the prefix does not match the configured policy. For BGP this is accept, but for RIP it is reject. The **test policy** command always uses accept as the default policy, so unless you explicitly reject all routes that you do not want to match you might see more routes matching than you want.

The default policy of the **test policy** command accepts all routes from all protocols. Test output can be misleading when you are evaluating protocol-specific conditions. For example, if you define a policy for BGP that accepts routes of a specified prefix and apply it to BGP as an export policy, BGP routes that match the prefix are advertised to BGP peers. However, if you test the same policy using the **test policy** command, the test output might indicate that non-BGP routes have been accepted.

### Example: Testing a Routing Policy

Test the following policy, which looks for unwanted routes and rejects them:

```
[edit policy-options]
policy-statement reject-unwanted-routes {
  term drop-these-routes {
    from {
      route-filter 0/0 exact;
      route-filter 10/8 orlonger;
      route-filter 172.16/12 orlonger;
      route-filter 192.168/16 orlonger;
      route-filter 224/3 orlonger;
    }
    then reject;
  }
}
```

```
}
}
```

Test this policy against all routes in the routing table:

```
user@host> test policy reject-unwanted-routes 0/0
```

Test this policy against a specific set of routes:

```
user@host> test policy reject-unwanted-routes 10.49.0.0/16
```

- [Example: Testing a Routing Policy with Complex Regular Expressions on page 464](#)

## Example: Testing a Routing Policy with Complex Regular Expressions

This example shows how to test a routing policy using the **test policy** command to ensure that the policy produces the results that you expect before you apply it in a production environment. Regular expressions, especially complex ones, can be tricky to get right. This example shows how to use the **test policy** command to make sure that your regular expressions have the intended effect.

### Requirements

No special configuration beyond device initialization is required before you configure this example.

### Overview

This example shows two routing devices with an external BGP (EBGP) connection between them. Device R2 uses the BGP session to send customer routes to Device R1. These static routes have multiple community values attached.

```
user@R2> show route match-prefix 172.16.* detail
```

```

    Communities: 64510:4 64510:40 64510:44 64510:400 64510:444

```

To test a complex regular expression, Device R2 has a policy called **test-regex** that locates routes. The policy is configured like this:

```

policy-statement test-regex {
  term find-routes {
    from community complex-regex;
    then accept;
  }
  term reject-the-rest {
    then reject;
  }
}
community complex-regex members "^64510:[13].*$";

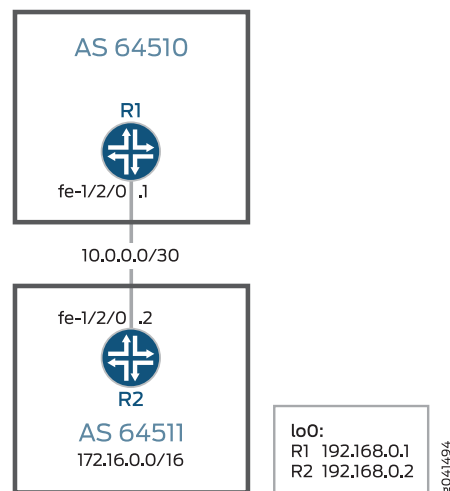

```

This regular expression matches community values beginning with either 1 or 3.

## Topology

Figure 44 on page 466 shows the sample network.

Figure 44: Routing Policy Test for Complex Regular Expressions

"CLI Quick Configuration" on page 466 shows the configuration for all of the devices in Figure 44 on page 466.

The section "Step-by-Step Procedure" on page 467 describes the steps on Device R2.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Device R1
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 64511
set protocols bgp group ext neighbor 10.0.0.2
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 64510

Device R2
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces lo0 unit 0 family inet address 192.168.0.2/32
set protocols bgp group ext type external
set protocols bgp group ext peer-as 64510
set protocols bgp group ext neighbor 10.0.0.1
set policy-options policy-statement send-static term 1 from protocol static
set policy-options policy-statement send-static term 1 then accept
set policy-options policy-statement send-static term 2 then reject
set policy-options policy-statement test-regex term find-routes from community
  complex-regex
set policy-options policy-statement test-regex term find-routes then accept
set policy-options policy-statement test-regex term reject-the-rest then reject
set policy-options community complex-regex members "^64510:[13].*$"
set routing-options static route 172.16.1.0/24 reject
set routing-options static route 172.16.1.0/24 community 64510:1
set routing-options static route 172.16.1.0/24 community 64510:10

```

```

set routing-options static route 172.16.1.0/24 community 64510:11
set routing-options static route 172.16.1.0/24 community 64510:100
set routing-options static route 172.16.1.0/24 community 64510:111
set routing-options static route 172.16.2.0/24 reject
set routing-options static route 172.16.2.0/24 community 64510:2
set routing-options static route 172.16.2.0/24 community 64510:20
set routing-options static route 172.16.2.0/24 community 64510:22
set routing-options static route 172.16.2.0/24 community 64510:200
set routing-options static route 172.16.2.0/24 community 64510:222
set routing-options static route 172.16.3.0/24 reject
set routing-options static route 172.16.3.0/24 community 64510:3
set routing-options static route 172.16.3.0/24 community 64510:30
set routing-options static route 172.16.3.0/24 community 64510:33
set routing-options static route 172.16.3.0/24 community 64510:300
set routing-options static route 172.16.3.0/24 community 64510:333
set routing-options static route 172.16.4.0/24 reject
set routing-options static route 172.16.4.0/24 community 64510:4
set routing-options static route 172.16.4.0/24 community 64510:40
set routing-options static route 172.16.4.0/24 community 64510:44
set routing-options static route 172.16.4.0/24 community 64510:400
set routing-options static route 172.16.4.0/24 community 64510:444
set routing-options router-id 192.168.0.2
set routing-options autonomous-system 64511

```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```

[edit interfaces]
user@R2# set fe-1/2/0 unit 0 family inet address 10.0.0.2/30

user@R2# set lo0 unit 0 family inet address 192.168.0.2/32

```

2. Configure BGP.

Apply the import policy to the BGP peering session with Device R2.

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set peer-as 64510
user@R2# set neighbor 10.0.0.1

```

3. Configure the routing policy that sends static routes.

```

[edit policy-options policy-statement send-static]
user@R2# set term 1 from protocol static
user@R2# set term 1 then accept
user@R2# set term 2 then reject

```

4. Configure the routing policy that tests a regular expression.

```

[edit policy-options policy-statement test-regex]
user@R2# set term find-routes from community complex-regex
user@R2# set term find-routes then accept

```

```
user@R2# set term reject-the-rest then reject
```

```
[edit policy-options community]
```

```
user@R2# set complex-regex members "^64510:[13].*$"
```

5. Configure the static routes and attaches community values.

```
[edit routing-options static route 172.16.1.0/24]
```

```
user@R2# set reject
```

```
user@R2# set community [ 64510:1 64510:10 64510:11 64510:100 64510:111 ]
```

```
[edit routing-options static route 172.16.2.0/24]
```

```
user@R2# set reject
```

```
user@R2# set community [ 64510:2 64510:20 64510:22 64510:200 64510:222 ]
```

```
[edit routing-options static route 172.16.3.0/24]
```

```
user@R2# set reject
```

```
user@R2# set community [ 64510:3 64510:30 64510:33 64510:300 64510:333 ]
```

```
[edit routing-options static route 172.16.4.0/24]
```

```
user@R2# set reject
```

```
user@R2# set community [ 64510:4 64510:40 64510:44 64510:400 64510:444 ]
```

6. Configure the autonomous system (AS) number and the router ID.

This affects Device R2's routing table, and as no impact on Device R1 and Device R3.

```
[edit routing-options ]
```

```
user@R2# set router-id 192.168.0.2
```

```
user@R2# set autonomous-system 64511
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
```

```
fe-1/2/0 {
```

```
  unit 0 {
```

```
    family inet {
```

```
      address 10.0.0.2/30;
```

```
    }
```

```
  }
```

```
}
```

```
lo0 {
```

```
  unit 0 {
```

```
    family inet {
```

```
      address 192.168.0.2/32;
```

```
    }
```

```
  }
```

```
}
```

```
user@R2# show protocols
```

```
bgp {
```

```

group ext {
    type external;
    peer-as 64510;
    neighbor 10.0.0.1;
}
}

user@R2# show policy-options
policy-statement send-static {
    term 1 {
        from protocol static;
        then accept;
    }
    term 2 {
        then reject;
    }
}
policy-statement test-regex {
    term find-routes {
        from community complex-regex;
        then accept;
    }
    term reject-the-rest {
        then reject;
    }
}
community complex-regex members "^64510:[13].*$";

user@R2# show routing-options
static {
    route 172.16.1.0/24 {
        reject;
        community [ 64510:1 64510:10 64510:11 64510:100 64510:111 ];
    }
    route 172.16.2.0/24 {
        reject;
        community [ 64510:2 64510:20 64510:22 64510:200 64510:222 ];
    }
    route 172.16.3.0/24 {
        reject;
        community [ 64510:3 64510:30 64510:33 64510:300 64510:333 ];
    }
    route 172.16.4.0/24 {
        reject;
        community [ 64510:4 64510:40 64510:44 64510:400 64510:444 ];
    }
}
router-id 192.168.0.2;
autonomous-system 64511;

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Test to See Which Communities Match the Regular Expression

**Purpose** You can test the regular expression and its policy by using the `test policy policy-name` command.

**Action** 1. On Device R2, run the `test policy test-regex 0/0` command.

```
user@R2> test policy test-regex 0/0
```

```
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
```

```
+ = Active Route, - = Last Active, * = Both
```

```
172.16.1.0/24      *[Static/5] 1d 00:32:50
                  Reject
```

```
172.16.3.0/24      *[Static/5] 1d 00:32:50
                  Reject
```

```
Policy test-regex: 2 prefix accepted, 5 prefix rejected
```

2. On Device R2, change the regular expression to match a community value containing any number of instances of the digit 2.

```
[edit policy-options community complex-regex]
```

```
user@R2# delete members "^64510:[13].*$"
```

```
user@R2# set members "^65020:2+*$"
```

```
user@R2# commit
```

3. On Device R2, rerun the `test policy test-regex 0/0` command.

```
user@R2> test policy test-regex 0/0
```

```
inet.0: 7 destinations, 7 routes (7 active, 0 holddown, 0 hidden)
```

```
+ = Active Route, - = Last Active, * = Both
```

```
172.16.2.0/24      *[Static/5] 1d 00:31:36
                  Reject
```

```
Policy test-regex: 1 prefix accepted, 6 prefix rejected
```

**Meaning** The 172.16.1.0 /24 and 172.16.3.0/24 routes both have communities attached that match the `^64510:[13].*$` expression. The 172.16.2.0/24 route has communities that match the `^65020:2+*$` expression.

## Firewall Filters Overview

---

Firewall filters provide a means of protecting your router (and switch) from excessive traffic transiting the router (and switch) to a network destination or destined for the Routing Engine. Firewall filters that control local packets can also protect your router (and switch) from external incidents.

You can configure a firewall filter to do the following:

- Restrict traffic destined for the Routing Engine based on its source, protocol, and application.
- Limit the traffic rate of packets destined for the Routing Engine to protect against flood, or denial-of-service (DoS) attacks.
- Address special circumstances associated with fragmented packets destined for the Routing Engine. Because the device evaluates every packet against a firewall filter

(including fragments), you must configure the filter to accommodate fragments that do not contain packet header information. Otherwise, the filter discards all but the first fragment of a fragmented packet.

## Router Data Flow Overview

The Junos<sup>®</sup> operating system (Junos OS) provides a *policy framework*, which is a collection of Junos OS policies that enable you to control flows of routing information and packets within the router.

- [Flow of Routing Information on page 474](#)
- [Flow of Data Packets on page 474](#)
- [Flow of Local Packets on page 475](#)
- [Interdependent Flows of Routing Information and Packets on page 475](#)

### Flow of Routing Information

*Routing information* is the information about routes learned by the routing protocols from a router's neighbors. This information is stored in routing tables. The routing protocols advertise active routes only from the routing tables. An *active route* is a route that is chosen from all routes in the routing table to reach a destination.

To control which routes the routing protocols place in the routing tables and which routes the routing protocols advertise from the routing tables, you can configure *routing policies*, which are sets of rules that the policy framework uses to preempt default routing policies.

The Routing Engine, which runs the router's control plane software, handles the flow of routing information between the routing protocols and the routing tables and between the routing tables and the forwarding table. The Routing Engine runs the Junos OS and routing policies and stores the active router configuration, the master routing table, and the master forwarding table,

### Flow of Data Packets

*Data packets* are chunks of data that transit the router as they are being forwarded from a source to a destination. When a router receives a data packet on an interface, it determines where to forward the packet by looking in the forwarding table for the best route to a destination. The router then forwards the data packet toward its destination through the appropriate interface.

The Packet Forwarding Engine, which is the central processing element of the router's forwarding plane, handles the flow of data packets in and out of the router's physical

interfaces. Although the Packet Forwarding Engine contains Layer 3 and Layer 4 header information, it does not contain the packet data itself (the packet's payload).

## Flow of Local Packets

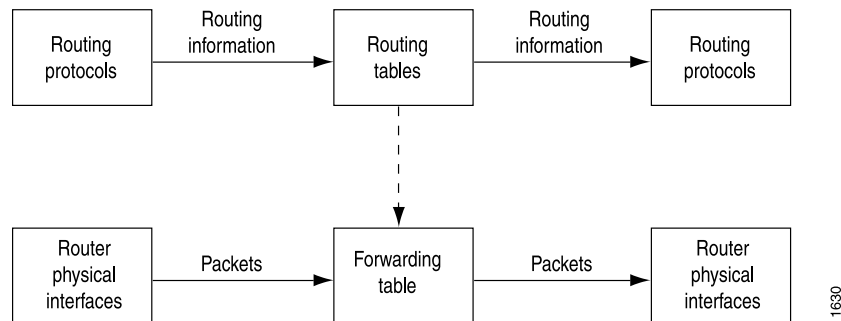

*Local packets* are chunks of data that are destined for or sent by the router. Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP). When the Routing Engine receives a local packet, it forwards the packet to the appropriate process or to the kernel, which are both part of the Routing Engine, or to the Packet Forwarding Engine.

The Routing Engine handles the flow of local packets from the router's physical interfaces and to the Routing Engine.

## Interdependent Flows of Routing Information and Packets

Figure 45 on page 475 illustrates the flow of data through a router. Although routing information flows and packet flows are very different from one another, they are also interdependent.

**Figure 45: Flows of Routing Information and Packets**

Routing policies determine which routes the Routing Engine places in the forwarding table. The forwarding table, in turn, has an integral role in determining the appropriate physical interface through which to forward a packet.

## Stateless Firewall Filter Overview

---

This topic covers the following information:

- [Packet Flow Control on page 476](#)
- [Stateless and Stateful Firewall Filters on page 476](#)
- [Purpose of Stateless Firewall Filters on page 477](#)

### Packet Flow Control

To influence which packets are allowed to transit the system and to apply special actions to packets as necessary, you can configure *stateless firewall filters*. A stateless firewall specifies a sequence of one or more packet-filtering rules, called *filter terms*. A filter term specifies *match conditions* to use to determine a match and *actions* to take on a matched packet. A stateless firewall filter enables you to manipulate any packet of a particular protocol family, including fragmented packets, based on evaluation of Layer 3 and Layer 4 header fields. You typically apply a stateless firewall filter to one or more interfaces that have been configured with protocol family features. You can apply a stateless firewall filter to an ingress interface, an egress interface, or both.

#### Data Packet Flow Control

---

To control the flow of data packets transiting the device as the packets are being forwarded from a source to a destination, you can apply stateless firewall filters to the input or output of the router's or switch's physical interfaces.

To enforce a specified bandwidth and maximum burst size for traffic sent or received on an interface, you can configure *policers*. Policers are a specialized type of stateless firewall filter and a primary component of the Junos OS *class-of-service* (CoS).

#### Local Packet Flow Control

---

To control the flow of local packets between the physical interfaces and the Routing Engine, you can apply stateless firewall filters to the input or output of the *loopback interface*. The loopback interface (**lo0**) is the interface to the Routing Engine and carries no data packets.

### Stateless and Stateful Firewall Filters

A stateless firewall filter, also known as an *access control list* (ACL), does not statefully inspect traffic. Instead, it evaluates packet contents statically and does not keep track of the state of network connections. In contrast, a *stateful firewall filter* uses connection state information derived from other applications and past communications in the data flow to make dynamic control decisions.

The *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices* describes *stateless firewall filters*.

## Purpose of Stateless Firewall Filters

The basic purpose of a stateless firewall filter is to enhance security through the use of packet filtering. Packet filtering enables you to inspect the components of incoming or outgoing packets and then perform the actions you specify on packets that match the criteria you specify. The typical use of a stateless firewall filter is to protect the Routing Engine processes and resources from malicious or untrusted packets.

## Understanding How to Use Standard Firewall Filters

---

This topic covers the following information:

- [Using Standard Firewall Filters to Affect Local Packets on page 477](#)
- [Using Standard Firewall Filters to Affect Data Packets on page 478](#)

### Using Standard Firewall Filters to Affect Local Packets

On a router, you can configure one physical loopback interface, **lo0**, and one or more addresses on the interface. The loopback interface is the interface to the Routing Engine, which runs and monitors all the control protocols. The loopback interface carries local packets only. Standard firewall filters applied to the loopback interface affect the local packets destined for or transmitted from the Routing Engine.

**NOTE:** When you create an additional loopback interface, it is important to apply a filter to it so the Routing Engine is protected. We recommend that when you apply a filter to the loopback interface, you include the **apply-groups** statement. Doing so ensures that the filter is automatically inherited on every loopback interface, including **lo0** and other loopback interfaces.

---

### Trusted Sources

The typical use of a standard stateless firewall filter is to protect the Routing Engine processes and resources from malicious or untrusted packets. To protect the processes and resources owned by the Routing Engine, you can use a standard stateless firewall filter that specifies which protocols and services, or applications, are allowed to reach the Routing Engine. Applying this type of filter to the loopback interface ensures that the local packets are from a trusted source and protects the processes running on the Routing Engine from an external attack.

## Flood Prevention

---

You can create standard stateless firewall filters that limit certain TCP and ICMP traffic destined for the Routing Engine. A router without this kind of protection is vulnerable to TCP and ICMP flood attacks, which are also called denial-of-service (DoS) attacks. For example:

- A TCP flood attack of SYN packets initiating connection requests can overwhelm the device until it can no longer process legitimate connection requests, resulting in denial of service.
- An ICMP flood can overload the device with so many echo requests (ping requests) that it expends all its resources responding and can no longer process valid network traffic, also resulting in denial of service.

Applying the appropriate firewall filters to the Routing Engine protects against these types of attacks.

## Using Standard Firewall Filters to Affect Data Packets

Standard firewall filters that you apply to your router's transit interfaces evaluate only the user data packets that transit the router from one interface directly to another as they are being forwarded from a source to a destination. To protect the network as a whole from unauthorized access and other threats at specific interfaces, you can apply firewall filters router transit interfaces .

## Stateless Firewall Filter Types

---

This topic covers the following information:

- [Firewall Filters on page 478](#)
- [Service Filters on page 479](#)
- [Simple Filters on page 479](#)

## Firewall Filters

The Junos OS standard stateless firewall filters support a rich set of packet-matching criteria that you can use to match on specific traffic and perform specific actions, such as forwarding or dropping packets that match the criteria you specify. You can configure firewall filters to protect the local router or to protect another device that is either directly or indirectly connected to the local router. For example, you can use the filters to restrict the local packets that pass from the router's physical interfaces to the Routing Engine. Such filters are useful in protecting the IP services that run on the Routing Engine, such as Telnet, SSH, and BGP, from denial-of-service attacks.

**NOTE:** If you configured targeted broadcast for virtual routing and forwarding (VRF) by including the `forward-and-send-to-re` statement, any firewall filter that is configured on the Routing Engine loopback interface (lo0) cannot be applied to the targeted broadcast packets that are forwarded to the Routing Engine. This is because broadcast packets are forwarded as flood next hop traffic and not as local next hop traffic, and you can only apply a firewall filter to local next hop routes for traffic directed toward the Routing Engine.

## Service Filters

A service filter defines packet-filtering (a set of match conditions and a set of actions) for IPv4 or IPv6 traffic. You can apply a service filter to the inbound or outbound traffic at an adaptive services interface to perform packet filtering on traffic before it is accepted for service processing. You can also apply a service filter to the traffic that is returning to the services interface after service processing to perform postservice processing.

Service filters filter IPv4 and IPv6 traffic only and can be applied to logical interfaces on Adaptive Services PICs, MultiServices PICs, and MultiServices DPCs only. Service filters are not supported on Branch SRX devices.

## Simple Filters

Simple filters are supported on Gigabit Ethernet intelligent queuing (IQ2) and Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only. Unlike standard filters, simple filters support IPv4 traffic only and have a number of restrictions. For example, you cannot configure a terminating action for a simple filter. Simple filters always accept packets. Also, simple filters can be applied only as input filters. They are not supported on outbound traffic. Simple filters are recommended for metropolitan Ethernet applications.

| Internet Protocol version 4 (IPv4) | <b>family inet</b>                                                                                         | The <b>family inet</b> statement is optional for IPv4.                       |
| Internet Protocol version 6 (IPv6) | <b>family inet6</b>                                                                                        |                                                                              |
| MPLS                               | <b>family mpls</b>                                                                                         |                                                                              |
| MPLS-tagged IPv4                   | <b>family mpls</b>                                                                                         | Supports matching on IP addresses and ports, up to five MPLS stacked labels. |
| MPLS-tagged IPv6                   | <b>family mpls</b>                                                                                         | Supports matching on IP addresses and ports, up to five MPLS stacked labels. |
| Virtual private LAN service (VPLS) | <b>family vpls</b>                                                                                         |                                                                              |
| Layer 2 Circuit Cross-Connection   | <b>family ccc</b>                                                                                          |                                                                              |
| Layer 2 Bridging                   | <b>family bridge</b> (for MX Series routers) and <b>family ethernet-switching</b> (for EX Series switches) | MX Series routers and EX Series switches only.                               |

## Filter Type

Under the **family *family-name*** statement, you can specify the type and name of the filter you want to configure.

Table 28 on page 480 describes the firewall filter types.

**Table 28: Filter Types**

| Filter Type              | Configuration Statement          | Description                                                                                                                                                                                                                                                                                                                                     |

## Terms

Under the **filter**, **service-filter**, or **simple-filter** statement, you must configure at least one firewall filter *term*. A term is a named structure in which match conditions and actions are defined. Within a firewall filter, you must configure a unique name for each term.

**TIP:** For each protocol family on an interface, you can apply no more than one filter in each direction. If you try to apply additional filters for the same protocol family in the same direction, the last filter overwrites the previous filter. You can, however, apply filters from the same protocol family to the input and output direction of the same interface.

All stateless firewall filters contain one or more terms, and each term consists of two components—match conditions and actions. The match conditions define the values or fields that the packet must contain to be considered a match. If a packet is a match, the corresponding action is taken. By default, a packet that does not match a firewall filter is discarded.

If a packet arrives on an interface for which no firewall filter is applied for the incoming traffic on that interface, the packet is accepted by default.

**NOTE:** A firewall filter with a large number of terms can adversely affect both the configuration commit time and the performance of the Routing Engine.

Additionally, you can configure a stateless firewall filter within the term of another filter. This method enables you to add common terms to multiple filters without having to modify all filter definitions. You can configure one filter with the desired common terms, and configure this filter as a term in other filters. Consequently, to make a change in these common terms, you need to modify only one filter that contains the common terms, instead of multiple filters.

## Match Conditions

A firewall filter term must contain at least one packet-filtering criteria, called a *match condition*, to specify the field or value that a packet must contain in order to be considered a match for the firewall filter term. For a match to occur, the packet must match all the conditions in the term. If a packet matches a firewall filter term, the router (or switch) takes the configured action on the packet.

If a firewall filter term contains multiple match conditions, a packet must meet *all* match conditions to be considered a match for the firewall filter term.

If a single match condition is configured with multiple values, such as a range of values, a packet must match only *one* of the values to be considered a match for the firewall filter term.

The scope of match conditions you can specify in a firewall filter term depends on the protocol family under which the firewall filter is configured. You can define various match conditions, including the IP source address field, IP destination address field, TCP or UDP source port field, IP protocol field, Internet Control Message Protocol (ICMP) packet type, IP options, TCP flags, incoming logical or physical interface, and outgoing logical or physical interface. These are pre-defined, or fixed, match conditions.

On MX Series 3D Universal Edge Routers with MPCs or MICs, it is possible to build flexible match conditions for IPv4, IPv6, Layer 2 bridge, CCC, and VPLS protocol families. These flexible match conditions allow a user to specify start location, byte offset, match length, and other parameters within the packet.

Each protocol family supports a different set of match conditions, and some match conditions are supported only on certain routing devices. For example, a number of match conditions for VPLS traffic are supported only on the MX Series 3D Universal Edge Routers.

In the **from** statement in a firewall filter term, you specify characteristics that the packet must have for the action in the subsequent **then** statement to be performed. The characteristics are referred to as *match conditions*. The packet must match all conditions in the **from** statement for the action to be performed, which also means that the order of the conditions in the **from** statement is not important.

If an individual match condition can specify a list of values (such as multiple source and destination addresses) or a range of numeric values, a match occurs if any of the values matches the packet.

If a filter term does not specify match conditions, the term accepts all packets and the actions specified in the term's **then** statement are optional.

**NOTE:**

Some of the numeric range and bit-field match conditions allow you to specify a text synonym. For a complete list of synonyms:

- If you are using the J-Web interface, select the synonym from the appropriate list.
- If you are using the CLI, type a question mark (?) after the **from** statement.

## Actions

The actions specified in a firewall filter term define the actions to take for any packet that matches the conditions specified in the term.

Actions that are configured within a single term are all taken on traffic that matches the conditions configured.

**BEST PRACTICE:** We strongly recommend that you explicitly configure one or more actions per firewall filter term. Any packet that matches all the conditions of the term is automatically accepted unless the term specifies other or additional actions.

Firewall filter actions fall into the following categories:

### Filter-Terminating Actions

A filter-terminating action halts all evaluation of a firewall filter for a specific packet. The router (or switch) performs the specified action, and no additional terms are examined.

### Nonterminating Actions

Nonterminating actions are used to perform other functions on a packet, such as incrementing a counter, logging information about the packet header, sampling the packet data, or sending information to a remote host using the system log functionality.

The presence of a nonterminating action, such as **count**, **log**, or **syslog**, without an explicit terminating action, such as **accept**, **discard**, or **reject**, results in a default terminating action of **accept**. If you do not want the firewall filter action to terminate, use the **next term** action after the nonterminating action.

In this example, term 2 is never evaluated, because term 1 has the implicit default **accept** terminating action.

```
[edit firewall filter test]
term 1 {
  from {
    source-address {
```

```
        0.0.0.0/0;  
    }  
}  
then {  
    log;  
    <accept> #By default if not specified  
}  
}  
term 2 {  
    then {  
        reject;  
    }  
}
```

In this example, term 2 is evaluated, because term 1 has the explicit **next term** flow control action.

```
[edit firewall filter test]  
term 1 {  
    from {  
        source-address {  
            0.0.0.0/0;  
        }  
    }  
    then {  
        log;  
        next term;  
    }  
}  
term 2 {  
    then {  
        reject;  
    }  
}
```

---

### Flow Control Action

For standard stateless firewall filters only, the action **next term** enables the router (or switch) to perform configured actions on the packet and then evaluate the following term in the filter, rather than terminating the filter.

A maximum of 1024 **next term** actions are supported per standard stateless firewall filter configuration. If you configure a standard filter that exceeds this limit, your candidate configuration results in a commit error.

## Stateless Firewall Filter Application Points

---

After you define the firewall filter, you must apply it to an application point. These application points include logical interfaces, physical interfaces, routing interfaces, and routing instances.

In most cases, you can apply a firewall filter as an *input* filter or an *output* filter, or both at the same time. Input filters take action on packets being received on the specified interface, whereas output filters take action on packets that are transmitted through the specified interface.

You typically apply one filter with multiple terms to a single logical interface, to incoming traffic, outbound traffic, or both. However, there are times when you might want to chain together multiple firewall filters (with single or multiple terms) and apply them to an interface. You use an *input list* to apply multiple firewall filters to the incoming traffic on an interface. You use an *output list* to apply multiple firewall filters to the outbound traffic on an interface. You can include up to 16 filters in an input list or an output list.

There is no limit to the number of filters and counters you can set, but there are some practical considerations. More counters require more terms, and a large number of terms can take a long time to process during a commit operation. However, filters with more than 4000 terms and counters have been implemented successfully.

[Table 29 on page 486](#) describes each point to which you can apply a firewall filter. For each application point, the table describes the types of firewall filters supported at that point, the router (or switch) hierarchy level at which the filter can be applied, and any platform-specific limitations.

Table 29: Stateless Firewall Filter Configuration and Application Summary

| Filter Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Application Point                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Restrictions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Firewall Filter Packet Evaluation Overview

The following sequence describes how the device evaluates a packet entering or exiting an interface if the input or output traffic at a device interface is associated with a firewall filter. Packet evaluation proceeds as follows:

1. The device evaluates the packet against the terms in the firewall filter sequentially, beginning with the first term in the filter.
  - If the packet matches all the conditions specified in a term, the device performs all the actions specified in that term.
  - If the packet does not match all the conditions specified in a term, the device proceeds to the next term in the filter (if a subsequent term exists) and evaluates the packet against that term.

- If the packet does not match any term in the firewall filter, the device implicitly discards the packet.
2. Unlike service filters and simple filters, firewall filters support the **next term** action, which is neither a terminating action nor a nonterminating action but a flow control action.
    - If the matched term includes the **next term** action, the device continues evaluation of the packet at the next term within the firewall filter.
    - If the matched term does not include the **next term** action, evaluation of the packet against the given firewall filter ends at this term. The device does not evaluate the packet against any subsequent terms in this filter.

A maximum of 1024 **next term** actions are supported per firewall filter configuration. If you configure a firewall filter that exceeds this limit, your candidate configuration results in a commit error.

3. The device stops evaluating a packet against a given firewall filter when either the packet matches a term without the **next term** action or the packet fails to match the last term in the firewall filter.
4. If a local packet arrives at a router interface that is associated with an ingress firewall filter, the filter evaluates the packet twice. The first evaluation occurs in the Packet Forwarding Engine, which is the central processing element of the router's forwarding plane, and the second evaluation occurs in the Routing Engine, which runs the router's control plane software.

**NOTE:** Local packets--chunks of data that are destined for or sent by the router itself--usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP).

If the first evaluation of the firewall filter modifies the incoming local packet or packet context values, the second evaluation of the firewall filter is based on the updated packet or packet context values.

For example, suppose that the filter includes a match condition based on the forwarding class or loss priority value associated with the packet and that the filter includes an action that modifies the forwarding class or loss priority value associated with the packet. If an ingress local packet arrives at an associated interface and the filter evaluation in the Packet Forwarding Engine modifies (rather than drops) the packet, then the filter evaluation in the Routing Engine is based on the modified packet context (rather than the original packet context).

## Packet Evaluation at a Single Firewall Filter

Table 30 on page 490 describes packet-filtering behaviors at a device interface associated with a single firewall filter.

Table 30: Packet Evaluation at a Single Firewall Filter

| Firewall Filter Event                                                                                               | Action                                                                                                                                                                                                                                                                                                                                                                               | Subsequent Action                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The firewall filter term does not specify any match conditions.                                                     | The term matches all packets by default, and so the device performs the actions specified by that term.                                                                                                                                                                                                                                                                              | If the term actions include the <b>next term</b> action, the device continues evaluation of the packet against the next term within the firewall filter (if a subsequent term exists). |
| The packet matches all conditions specified by the firewall filter term.                                            | The device performs the actions specified by that term.                                                                                                                                                                                                                                                                                                                              | If the term actions include the <b>next term</b> action, the device continues evaluation of the packet against the next term within the firewall filter (if a subsequent term exists). |
| The packet matches all conditions specified by the firewall filter term, but the term does not specify any actions. | The device implicitly accepts the packet.                                                                                                                                                                                                                                                                                                                                            | If the term actions include the <b>next term</b> action, the device continues evaluation of the packet against the next term within the firewall filter (if a subsequent term exists). |
| The packet does not match all conditions specified by the firewall filter term.                                     | The device does not perform the actions specified by that term.                                                                                                                                                                                                                                                                                                                      | The device continues evaluation of the packet against the next term within the filter (if a subsequent term exists).                                                                   |
| The packet does not match any term in the filter                                                                    | <p>The device implicitly discards the packet</p> <p>Every firewall filter configuration includes an implicit <b>discard</b> action at the end of the filter. This implicit terminating action is equivalent to including the following example term <b>t_explicit_discard</b> as the final term in the firewall filter:</p> <pre>term t_explicit_discard {     then discard; }</pre> |                                                                                                                                                                                        |

### Best Practice: Explicitly Accept Any Traffic That Is Not Specifically Discarded

You might want a firewall filter to accept any traffic that the filter does not specifically discard. In this case, we recommend that you configure the firewall filter with a final term that specifies the **accept** terminating action.

In the following example snippet, configuring the **t\_allow\_all\_else** term as the final term in the firewall filter explicitly configures the firewall filter to accept any traffic that the filter did not specifically discard :

```
term t_allow_all_else {
    then accept;
}
```

Following this best practice can simplify troubleshooting of the firewall filter.

## Best Practice: Explicitly Reject Any Traffic That Is Not Specifically Accepted

On the other hand, you might want a firewall filter to reject any traffic that the firewall filter does not specifically accept. In this case, we recommend that you configure the firewall filter with a final term that specifies the **reject** terminating action.

In the following example snippet, configuring the **t\_deny\_all\_else** term as the final term in the firewall filter explicitly configures the firewall filter to reject any traffic that the filter did not specifically accept:

```
term t_deny_all_else {
    then reject;
}
```

Following this best practice can simplify troubleshooting of the firewall filter.

## Multiple Firewall Filters Attached to a Single Interface

On supported device interfaces, you can attach multiple firewall filters to a single interface. For more information, see [“Understanding Multiple Firewall Filters Applied as a List” on page 732](#).

**NOTE:** On supported interfaces, you can attach a protocol-independent (family any) firewall filter and a protocol-specific (family inet or family inet6) firewall filter to the same interface. The protocol-independent firewall filter executes first. For more information, see [“Guidelines for Applying Standard Firewall Filters” on page 498](#).

## Single Firewall Filter Attached to Multiple Interfaces

On supported interfaces, you can associate a single firewall filter with multiple interfaces, and Junos OS creates an *interface-specific instance* of that firewall filter for each associated interface.

- Junos OS associates each interface-specific instantiation of a firewall filter with a system-generated, interface-specific name.
- For any **count** actions in the filter terms, the Packet Forwarding Engine maintains separate, interface-specific counters, and Junos OS associates each counter with a system-generated, interface-specific name.
- For any **policer** actions in the filter terms, Junos OS creates separate, interface-specific instances of the policer actions.

For more information, see [“Interface-Specific Firewall Filter Instances Overview” on page 747](#).

## Understanding Firewall Filter Fast Lookup Filter

---

In order to enhance the speed at which specific firewall filters are processed, starting in Junos OS Release 15.1, you can use the filter block hardware available on the MPC5E, MPC5EQ, and MPC6E modular port concentrators. This hardware allows for an increase in the number of firewall filter operations per second that can be accomplished.

Using the **fast-lookup-filter** option in environments with hundreds or thousands of terms per filter can increase performance of those filters by utilizing the filter block hardware.

There are 4096 hardware filters available per MPC. The number of firewall filters that can be installed in hardware depends on the number of terms in each filter. One hardware filter is needed for every group of 255 terms in a firewall filter. The total number of terms supported per firewall filter is 8000. However, attaching a given firewall filter with less than 256 terms to multiple interfaces will only result in one instance of that firewall filter being installed in the filter block. This is true for interface-specific filters as well as for filter lists.

You designate specific firewall filters to be processed in the filter block hardware by including the **fast-lookup-filter** option when configuring the firewall.

When this option is used, firewall parameters are stored in the filter block hardware which accelerates the lookup process. **fast-lookup-filter** is only available for the inet and inet6 protocol families. The match conditions are limited to 5-tuples: **protocol**, **source-address**, **destination-address**, **source-port**, and **destination-port**.

Ranges, prefix lists, and the except keyword are supported within the firewall filters and terms when using this option.

**NOTE:** Firewall filters that are configured using the **fast-lookup-filter** option are not optimized by the firewall compiler.

## Guidelines for Configuring Firewall Filters

---

This topic covers the following information:

- [Statement Hierarchy for Configuring Firewall Filters on page 493](#)
- [Firewall Filter Protocol Families on page 494](#)
- [Firewall Filter Names and Options on page 494](#)

- [Firewall Filter Terms on page 495](#)
- [Firewall Filter Match Conditions on page 495](#)
- [Firewall Filter Actions on page 497](#)

## Statement Hierarchy for Configuring Firewall Filters

To configure a firewall filter, you can include the following statements. For an IPv4 firewall filter, the **family inet** statement is optional.

```
firewall {
  family family-name {
    filter filter-name {
      accounting-profile name;
      instance-shared;
      interface-specific;
      physical-interface-filter;
    }
    term term-name {
      filter filter-name;
    }
    term term-name {
      from {
        match-conditions;
        ip-version ip-version {
          match-conditions;
        }
        protocol (tcp | udp) {
          match conditions;
        }
      }
    }
    then {
      actions;
    }
  }
}
```

You can include the firewall configuration at one of the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

**NOTE:** For stateless firewall filtering, you must allow the output tunnel traffic through the firewall filter applied to input traffic on the interface that is the next-hop interface toward the tunnel destination. The firewall filter affects only the packets exiting the router (or switch) by way of the tunnel.

## Firewall Filter Protocol Families

A firewall filter configuration is specific to a particular protocol family. Under the **firewall** statement, include one of the following statements to specify the protocol family for which you want to filter traffic:

- **family any**—To filter protocol-independent traffic.
- **family inet**—To filter Internet Protocol version 4 (IPv4) traffic.
- **family inet6**—To filter Internet Protocol version 6 (IPv6) traffic.
- **family mpls**—To filter MPLS traffic.
- **family vpls**—To filter virtual private LAN service (VPLS) traffic.
- **family ccc**—To filter Layer 2 circuit cross-connection (CCC) traffic.
- **family bridge**—To filter Layer 2 bridging traffic for MX Series 3D Universal Edge Routers only.
- **family ethernet-switching**—To filter Layer 2 (Ethernet) traffic.

The **family *family-name*** statement is required only to specify a protocol family other than IPv4. To configure an IPv4 firewall filter, you can configure the filter at the **[edit firewall]** hierarchy level without including the **family inet** statement, because the **[edit firewall]** and **[edit firewall family inet]** hierarchy levels are equivalent.

**NOTE:** For bridge family filter, the *ip-protocol* match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset such as the MX 3D MPC line cards.

---

## Firewall Filter Names and Options

Under the **family *family-name*** statement, you can include **filter *filter-name*** statements to create and name firewall filters. The filter name can contain letters, numbers, and hyphens (-) and be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

At the **[edit firewall family *family-name* filter *filter-name*]** hierarchy level, the following statements are optional:

- **accounting-profile**
- **instance-shared** (MX Series routers with Modular Port Concentrators (MPCS) only)
- **interface-specific**
- **physical-interface-filter**

## Firewall Filter Terms

Under the **filter *filter-name*** statement, you can include **term *term-name*** statements to create and name filter terms.

- You must configure at least one term in a firewall filter.
- You must specify a unique name for each term within a firewall filter. The term name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").
- The order in which you specify terms within a firewall filter configuration is important. Firewall filter terms are evaluated in the order in which they are configured. By default, new terms are always added to the end of the existing filter. You can use the **insert** configuration mode command to reorder the terms of a firewall filter.

At the **[edit firewall family *family-name* filter *filter-name* term *term-name*]** hierarchy level, the **filter *filter-name*** statement is not valid in the same term as **from** or **then** statements. When included at this hierarchy level, the **filter *filter-name*** statement is used to *nest* firewall filters.

## Firewall Filter Match Conditions

Firewall filter match conditions are specific to the type of traffic being filtered.

With the exception of MPLS-tagged IPv4 or IPv6 traffic, you specify the term's match conditions under the **from** statement. For MPLS-tagged IPv4 traffic, you specify the term's IPv4 address-specific match conditions under the **ip-version *ipv4*** statement and the term's IPv4 port-specific match conditions under the **protocol (*tcp* | *udp*)** statement.

For MPLS-tagged IPv6 traffic, you specify the term's IPv6 address-specific match conditions under the **ip-version *ipv6*** statement and the term's IPv6 port-specific match conditions under the **protocol (*tcp* | *udp*)** statement.

[Table 31 on page 495](#) describes the types of traffic for which you can configure firewall filters.

**Table 31: Firewall Filter Match Conditions by Protocol Family**

| Traffic Type         | Hierarchy Level at Which Match Conditions Are Specified                                                                                                                                                                                   |

| (MX Series routers and EX Series switches only) | <p><b>[edit firewall family ethernet-switching filter <i>filter-name</i> term <i>term-name</i>]</b> (for EX Series switches only)</p> <p>For the complete list of match conditions, see “Firewall Filter Match Conditions for Layer 2 Bridging Traffic” on page 569.</p>  |

If you specify an IPv6 address in a match condition (the **address**, **destination-address**, or **source-address** match conditions), use the syntax for text representations described in RFC 4291, *IP Version 6 Addressing Architecture*. For more information about IPv6 addresses, see *IPv6 Overview* and *Supported IPv6 Standards*.

## Firewall Filter Actions

Under the **then** statement for a firewall filter term, you can specify the actions to be taken on a packet that matches the term.

Table 32 on page 497 summarizes the types of actions you can specify in a firewall filter term.

**Table 32: Firewall Filter Action Categories**

| Type of Action | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Terminating    | <p>Halts all evaluation of a firewall filter for a specific packet. The router (or switch) performs the specified action, and no additional terms are used to examine the packet.</p> <p>You can specify only one <i>terminating action</i> in a firewall filter term. You can, however, specify one terminating action with one or more <i>nonterminating actions</i> in a single term. For example, within a term, you can specify <b>accept</b> with <b>count</b> and <b>syslog</b>. Regardless of the number of terms that contain terminating actions, once the system processes a terminating action within a term, processing of the entire firewall filter halts.</p>                                                                            | See “ <a href="#">Firewall Filter Terminating Actions</a> ” on page 587.                                                                                                                                                                                                                                                                                                                                                                                        |
| Nonterminating | <p>Performs other functions on a packet (such as incrementing a counter, logging information about the packet header, sampling the packet data, or sending information to a remote host using the system log functionality), but any additional terms are used to examine the packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>All nonterminating actions include an implicit accept action. This accept action is carried out if no other terminating action is configured in the same term.</p> <p>See “<a href="#">Firewall Filter Nonterminating Actions</a>” on page 578.</p>                                                                                                                                                                                                          |
| Flow control   | <p>For standard firewall filters only, the <b>next term</b> action directs the router (or switch) to perform configured actions on the packet and then, rather than terminate the filter, use the next term in the filter to evaluate the packet. If the <b>next term</b> action is included, the matching packet is evaluated against the next term in the firewall filter. Otherwise, the matching packet is not evaluated against subsequent terms in the firewall filter.</p> <p>For example, when you configure a term with the nonterminating action <b>count</b>, the term's action changes from an implicit <b>discard</b> to an implicit <b>accept</b>. The <b>next term</b> action forces the continued evaluation of the firewall filter.</p> | <p>You cannot configure the <b>next term</b> action with a terminating action in the same filter term. However, you can configure the next term action with another nonterminating action in the same filter term.</p> <p>A maximum of 1024 <b>next term</b> actions are supported per standard firewall filter configuration. If you configure a standard firewall filter that exceeds this limit, your candidate configuration results in a commit error.</p> |

## Guidelines for Applying Standard Firewall Filters

This topic covers the following information:

- [Applying Firewall Filters Overview on page 498](#)
- [Statement Hierarchy for Applying Firewall Filters on page 499](#)
- [Restrictions on Applying Firewall Filters on page 500](#)

### Applying Firewall Filters Overview

You can apply a standard firewall filter to a loopback interface on the router or to a physical or logical interface on the router. [Table 33 on page 498](#) summarizes the behavior of firewall filters based on the point to which you attach the filter.

**Table 33: Firewall Filter Behavior by Filter Attachment Point**

| Filter Attachment Point                 | Filter Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loopback interface                      | The router's loopback interface, <b>lo0</b> , is the interface to the Routing Engine and carries no data packets. When you apply a firewall filter to the loopback interface, the filter evaluates the local packets received or transmitted by the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Physical interface or logical interface | When you apply a filter to a physical interface on the router or to a logical interface (or member of an aggregated Ethernet bundle defined on the interface), the filter evaluates all data packet that pass through that interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Multiple interfaces                     | <p>You can use the same firewall filter one or more times.</p> <p>On M Series routers, except the M120 and M320 routers, if you apply a firewall filter to multiple interfaces, the filter acts on the sum of traffic entering or exiting those interfaces.</p> <p>On T Series, M120, M320, and MX Series routers, interfaces are distributed among multiple packet-forwarding components. On these routers, you can configure firewall filters and service filters that, when applied to multiple interfaces, act on the individual traffic streams entering or exiting each interface, regardless of the sum of traffic on the multiple interfaces.</p> <p>For more information, see <a href="#">"Interface-Specific Firewall Filter Instances Overview" on page 747</a>.</p> |

Table 33: Firewall Filter Behavior by Filter Attachment Point (*continued*)

| Filter Attachment Point                                                                    | Filter Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Statement Hierarchy for Applying Firewall Filters

To apply a standard firewall filter to a logical interface, configure the **filter** statement for the logical interface defined under either the **[edit]** or **[edit logical-systems logical-system-name]** hierarchy level. Under the **filter** statement, you can include one or more of the following statements: **group group-number**, **input filter-name**, **input-list filter-name**, **output filter-name**, or **output-list filter-name**. The hierarchy level at which you attach the **filter** statement depends on the filter type and device type you are configuring.

### Protocol-Independent Firewall Filters on MX Series Routers

To apply a protocol-independent firewall filter to a logical interface on an MX Series router, configure the **filter** statement *directly* under the logical unit:

```

interfaces {
  interface-name {
    unit logical-unit-number {
      filter {
        group group-number;
        input filter-name;
        input-list [ filter-names ];
        output filter-name;
        output-list [ filter-names ];
      }
    }
  }
}

```

### All Other Firewall Filters on Logical Interfaces

---

To apply a standard firewall filter to a logical interface for all cases *other than* a protocol-independent filter on an MX Series router, configure the **filter** statement under the protocol family:

```
interfaces {
  interface-name {
    unit logical-unit-number {
      family family-name {
        ...
        filter {
          group group-number;
          input filter-name;
          input-list [ filter-names ];
          output filter-name;
          output-list [ filter-names ];
        }
      }
    }
  }
}
```

### Restrictions on Applying Firewall Filters

- [Number of Input and Output Filters Per Logical Interface on page 500](#)
- [MPLS and Layer 2 CCC Firewall Filters in Lists on page 501](#)
- [Layer 2 CCC Firewall Filters on MX Series Routers and EX Series Switches on page 501](#)

#### Number of Input and Output Filters Per Logical Interface

---

**Input filters**—Although you can use the same filter multiple times, you can apply only one input filter or one input filter list to an interface.

- To specify a single firewall filter to be used to evaluate packets received on the interface, include the **input *filter-name*** statement in the **filter** stanza.
- To specify an ordered list of firewall filters to be used to evaluate packets received on the interface, include the **input-list [ *filter-names* ]** statement in the **filter** stanza. You can specify up to 16 firewall filters for the filter input list.

**Output filters**—Although you can use the same filter multiple times, you can apply only one output filter or one output filter list to an interface.

- To specify a single firewall filter to be used to evaluate packets transmitted on the interface, include the **output *filter-name*** statement in the **filter** stanza.
- To specify an ordered list of firewall filters to be used to evaluate packets transmitted on the interface, include the **output-list [ *filter-names* ]** statement in the **filter** stanza. You can specify up to 16 firewall filters in a filter output list.

### MPLS and Layer 2 CCC Firewall Filters in Lists

The **input-list *filter-names*** and **output-list *filter-names*** statements for firewall filters for the **ccc** and **mpls** protocol families are supported on all interfaces with the exception of the following:

- Management interfaces and internal Ethernet interfaces (**fxp** or **em0**)
- Loopback interfaces (**lo0**)
- USB modem interfaces (**umd**)

### Layer 2 CCC Firewall Filters on MX Series Routers and EX Series Switches

Only on MX Series routers and EX Series switches, you cannot apply a Layer 2 CCC stateless firewall filter (a firewall filter configured at the **[edit firewall filter family ccc]** hierarchy level) as an output filter. On MX Series routers and EX Series switches, firewall filters configured for the **family ccc** statement can be applied only as input filters.

## Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers

This topic provides a list of firewall and policier features available on PTX Packet Transport Routers and compares them with firewall and policing features on T Series routers.

### Firewall Filters

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers do not support:
  - Egress Forwarding Table Filters
  - Forwarding Table Filters for MPLS/CCC
  - Family VPLS
- PTX Series Packet Transport Routers do not support nested firewall filters. The **filter** statement at the **[edit firewall family *family-name* filter *filter-name* term *term-name*]** hierarchy level is disabled.

- Because no service PICs are present in PTX Series Packet Transport Routers, service filters are not supported for both IPv4 and IPv6 traffic. The **service-filter** statement at the **[edit firewall family (inet | inet6)]** hierarchy level is disabled.
- The PTX Series Packet Transport Routers exclude simple filters. These filters are supported on Gigabit Ethernet intelligent queuing (IQ2) and Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only. The **simple-filter** statement at the **[edit firewall family inet]** hierarchy level is disabled.
- Physical interface filtering is not supported. The **physical-interface-filter** statement at the **[edit firewall family family-name filter filter-name]** hierarchy level is disabled.
- The prefix action feature is not supported on PTX Series Packet Transport Routers. The **prefix-action** statement at **[edit firewall family inet]** hierarchy level is disabled.
- On T Series routers, you can collect a variety of information about traffic passing through the device by setting up one or more accounting profiles that specify some common characteristics of the data. The PTX Series Packet Transport Routers do not support accounting configurations for firewall filters. The **accounting-profile** statement at the **[edit firewall family family-name filter filter-name]** hierarchy level is disabled.
- The **reject** action is not supported on the loopback (**lo0**) interface. If you apply a filter to the **lo0** interface and the filter includes a **reject** action, an error message appears.
- PTX Series Packet Transport Routers do not support aggregated ethernet logical interface match conditions. However, child link interface matching is supported.
- PTX Series Packet Transport Routers displays both counts if two different terms in a filter have the same match condition but they have different counts. T Series routers display one count only.
- PTX Series Packet Transport Routers do not have separate policer instances when a filter is bound to multiple interfaces. Use the **interface-specific** configuration statement to create the configuration.
- On PTX Series Packet Transport Routers, when an ingress interface has CCC encapsulation, packets coming in through the ingress CCC interface will not be processed by the egress filters.
- For CCC encapsulation, the PTX Series Packet Transport Routers append an extra 8 bytes for egress Layer 2 filtering. The T Series routers do not. Therefore, egress counters on PTX Series Packet Transport Routers show an extra eight bytes for each packet which impacts policer accuracy.
- On PTX Series Packet Transport Routers, output for the **show pfe statistics traffic** CLI command includes the packets discarded by DMAC and SMAC filtering. On T Series routers, the command output does not include these discarded packets because MAC filters are implemented in the PIC and not in the FPC.
- The last-fragment packet that goes through a PTX firewall cannot be matched by the **is-fragment** matching condition. This feature is supported on T Series routers.

A possible workaround on PTX Series Packet Transport Routers is to configure two separate terms with same the actions: one term contains a match to **is-fragment** and the other term contains a match to **fragment-offset -except 0**.

- On PTX Series Packet Transport Routers, MAC pause frames are generated when packet discards exceed 100 Mbps. This occurs only for frame sizes that are less than 105 bytes.

#### Traffic Policers

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers support ARP policing. T Series routers do not.
- PTX Series Packet Transport Routers do not support LSP policing.
- PTX Series Packet Transport Routers do not support the **hierarchical-policer** configuration statement. .
- PTX Series Packet Transport Routers do not support the **interface-set** configuration statement. This statement groups a number of interfaces into a single, named interface set.
- PTX Series Packet Transport Routers do not support the following policer types for both normal policers and three-color policers:
  - **logical-bandwidth-policer** — Policer uses logical interface bandwidth.
  - **physical-interface-policer** — Policer is a physical interface policer.
  - **shared-bandwidth-policer** — Share policer bandwidth among bundle links.
- When a policer action and forwarding-class, loss-priority actions are configured within the same rule (a *Multifield Classification*), the PTX Series Packet Transport Routers work differently than T Series routers. As shown below, you can configure two rules in the filter to make the PTX filter behave the same as the T Series filter:

PTX Series configuration:

```
rule-1 {
  match: {x, y, z}
  action: {forwarding-class, loss-prio, next}
}
rule-2 {
  match: {x, y, z}
  action: {policer}
}
```

T Series configuration:

```
rule-1 {
  match: {x, y, z}
  action: {forwarding-class, loss-prio, policer}
}
```

## Supported Standards for Filtering

---

The Junos OS supports the following RFCs related to filtering:

- RFC 792, *Internet Control Message Protocol*
- RFC 2460, *Internet Protocol, Version 6 (IPv6)*
- RFC 2474, *Definition of the Differentiated Services (DS) Field*
- RFC 2475, *An Architecture for Differentiated Services*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 3246, *An Expedited Forwarding PHB (Per-Hop Behavior)*
- RFC 4291, *IP Version 6 Addressing Architecture*
- RFC 4443, *Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification*

## Standard Firewall Filter Match Conditions and Actions on ACX Series Routers Overview

On ACX Series Universal Access Routers, you can configure firewall filters to filter packets and to perform an action on packets that match the filter. The match conditions specified to filter the packets are specific to the type of traffic being filtered.

**NOTE:** On ACX Series routers, the filter for the exiting traffic (egress filter) can be applied only for interface-specific instances of the firewall filter.

Table 34 on page 506 describes the types of traffic for which you can configure standard stateless firewall filters.

**Table 34: Standard Firewall Filter Match Conditions by Protocol Family for ACX Series Routers**

| Traffic Type         | Hierarchy Level at Which Match Conditions Are Specified                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol-independent | <p><b>[edit firewall family any filter <i>filter-name</i> term <i>term-name</i>]</b></p> <p>No match conditions are supported for this traffic type on ACX Series routers.</p>                                                                                  |
| IPv4                 | <p><b>[edit firewall family inet filter <i>filter-name</i> term <i>term-name</i>]</b></p> <p>For the complete list of match conditions, see “<a href="#">Standard Firewall Filter Match Conditions for IPv4 Traffic on ACX Series Routers</a>” on page 537.</p> |
| MPLS                 | <p><b>[edit firewall family mpls filter <i>filter-name</i> term <i>term-name</i>]</b></p> <p>For the complete list of match conditions, see “<a href="#">Standard Firewall Filter Match Conditions for MPLS Traffic on ACX Series Routers</a>” on page 551.</p> |
| Layer 2 CCC          | <p><b>[edit firewall family ccc filter <i>filter-name</i> term <i>term-name</i>]</b></p> <p>No match conditions are supported for this traffic type on ACX Series routers.</p>                                                                                  |

Under the **then** statement for a standard stateless firewall filter term, you can specify the actions to be taken on a packet that matches the term.

Table 35 on page 507 summarizes the types of actions you can specify in a standard stateless firewall filter term.

Table 35: Standard Firewall Filter Action Categories for ACX Series Routers

| Type of Action | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Comment                                                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Terminating    | <p>Halts all evaluation of a firewall filter for a specific packet. The router performs the specified action, and no additional terms are used to examine the packet.</p> <p>You can specify only one <i>terminating action</i> in a standard firewall filter. You can, however, specify one terminating action with one or more <i>nonterminating actions</i> in a single term. For example, within a term, you can specify <b>accept</b> with <b>count</b> and <b>syslog</b>.</p> | See “Standard Firewall Filter Terminating Actions on ACX Series Routers” on page 592.    |
| Nonterminating | <p>Performs other functions on a packet (such as incrementing a counter, logging information about the packet header, sampling the packet data, or sending information to a remote host using the system log functionality), but any additional terms are used to examine the packet.</p>                                                                                                                                                                                           | See “Standard Firewall Filter Nonterminating Actions on ACX Series Routers” on page 585. |

**Related Documentation**

- [Guidelines for Configuring Firewall Filters on page 492](#)

## Firewall Filter Flexible Match Conditions

Standard firewall filter match conditions vary based on the protocol family of the traffic being matched. For example, the terms available for bridge protocol traffic are different from those available for the inet or inet6 protocol families. The fields available for matching within each protocol family are, however, fixed or pre-defined. This means that filters can match on patterns within those pre-defined fields only.

Using flexible match conditions, firewall filters can be constructed that start the match at layer-2, layer-3, layer-4, ethernet-switching or payload locations. From there, additional offset criteria can be specified thereby enabling pattern matches at custom, user-defined locations within a packet.

Flexible match filter terms are applied to MPC or MIC interfaces as either input or output filters just as any other firewall filter terms. Flexible match filter terms can also be created as templates at the **[edit firewall]** hierarchy level. These templates can then be referenced within a flexible match term.

**NOTE:** Flexible match conditions are only supported on MX Series routers with MPCs or MICs. For environments in which FPCs, PICs, and or DPCs are installed along with MPCs or MICs, care must be taken to ensure that flexible match firewall filter criteria are applied only to the MPC or MIC interfaces.

- [Statement Hierarchy on page 508](#)
- [Flexible Filter Match Types on page 509](#)
- [Flexible Filter Match Start Locations on page 510](#)

## Statement Hierarchy

Flexible match filter terms are available in three variations as shown in [Table 36 on page 509](#). The **flexible-match** variation is configured at the **[edit firewall]** hierarchy level. It is used to define flexible match templates. The **flexible-filter-match-mask** and **flexible-match-range** are configured at the **[edit firewall family [inet|inet6|bridge|ethernet-switching|vcc|vpls] filter <filter-name> term <term-name> from]** hierarchy.

**NOTE:** On the EX9200 switches, you configure firewall filter flexible match conditions under **[edit firewall family ethernet-switching]**. For example: **flexible-filter-match-mask** and **flexible-match-range** are configured at the **[edit firewall family ethernet-switching filter <filter-name> term <term-name> from]** hierarchy.

## Flexible Filter Match Types

Table 36: Flexible Filter Match Types

| Flexible Filter Match Type | Available Attributes       | Description                                                                                                 |
|----------------------------|----------------------------|-------------------------------------------------------------------------------------------------------------|
| flexible-match             | <b>&lt;name&gt;</b>        | Create a flexible-match template named as the <b>&lt;name&gt;</b> attribute.                                |
|                            | <b>bit-length</b>          | Length of the data to be matched in bits, not needed for string input (0..32)                               |
|                            | <b>bit-offset</b>          | Bit offset after the (match-start + byte) offset (0..7)                                                     |
|                            | <b>byte-offset</b>         | Byte offset after the match start point                                                                     |
|                            | <b>match-start</b>         | Start point to match in packet                                                                              |
| flexible-match-mask        | <b>bit-length</b>          | Length of the data to be matched in bits, not needed for string input (0..128)                              |
|                            | <b>bit-offset</b>          | Bit offset after the (match-start + byte) offset (0..7)                                                     |
|                            | <b>byte-offset</b>         | Byte offset after the match start point                                                                     |
|                            | <b>flexible-mask-name</b>  | Select a flexible match from predefined template field. Required unless <b>match-start</b> is configured.   |
|                            | <b>mask-in-hex</b>         | Mask out bits in the packet data to be matched.                                                             |
|                            | <b>match-start</b>         | Start point to match in packet. Required unless <b>flexible-mask-name</b> is configured.                    |
|                            | <b>prefix</b>              | Value data/string to be matched.                                                                            |
| flexible-match-range       | <b>bit-length</b>          | Length of the data to be matched in bits. (0..32) Required unless <b>flexible-range-name</b> is configured. |
|                            | <b>bit-offset</b>          | Bit offset after the (match-start + byte) offset. (0..7)                                                    |
|                            | <b>byte-offset</b>         | Byte offset after the match start point                                                                     |
|                            | <b>flexible-range-name</b> | Select a flexible match from predefined template.                                                           |
|                            | <b>match-start</b>         | Start point to match in packet. Required unless <b>flexible-range-name</b> is configured.                   |
|                            | <b>range</b>               | Range of values to be matched.                                                                              |
|                            | <b>range-except</b>        | Range of values to be not matched.                                                                          |

## Flexible Filter Match Start Locations

Flexible match filter terms are constructed by giving a start location or anchor point within the packet. The start locations can be any of: layer-2, layer-3, layer-4 or payload, depending on the protocol family in use. [Table 37 on page 510](#) shows available flexible filter match start locations by protocol family. You use these available start locations as the **match-start** locations for the flexible match filter terms.

From these start locations, specific byte and bit offsets can be utilized to allow the filter to match patterns at very specific locations within the packet.

**Table 37: Flexible Filter Match Start Locations**

| Protocol Family                           | Available Start Locations             |
|-------------------------------------------|---------------------------------------|
| inet                                      | layer-3, layer-4 and payload          |
| inet6                                     | layer-3, layer-4 and payload          |
| bridge                                    | layer-2, layer-3, layer-4 and payload |
| ccc                                       | layer-2, layer-3, layer-4 and payload |
| vpls                                      | layer-2, layer-3, layer-4 and payload |
| ethernet-switching (EX9200 switches only) | layer-2 and payload                   |

## Firewall Filter Match Conditions Based on Numbers or Text Aliases

This topic covers the following information:

- [Matching on a Single Numeric Value on page 511](#)
- [Matching on a Range of Numeric Values on page 511](#)
- [Matching on a Text Alias for a Numeric Value on page 511](#)
- [Matching on a List of Numeric Values or Text Aliases on page 511](#)

## Matching on a Single Numeric Value

You can specify a firewall filter match condition based on whether a particular packet field value is a specified numeric value. In the following example, a match occurs if the packet source port number is **25**:

```
[edit firewall family inet filter filter1 term term1 from]
user@host# set source-port 25
```

## Matching on a Range of Numeric Values

You can specify a firewall filter match condition based on whether a particular packet field value falls within a specified range of numeric values. In the following example, a match occurs for source ports values from **1024** through **65,535**, inclusive:

```
[edit firewall family inet filter filter2 term term1 from]
user@host# set source-port 1024-65535
```

## Matching on a Text Alias for a Numeric Value

You can specify a firewall filter match condition based on whether a particular packet field value is a numeric value that you specify by using a text string as an *alias* for the numeric value. In the following example, a match occurs if the packet source port number is **25**. For the **source-port** and **destination-port** match conditions, the text alias **smtp** corresponds to the numeric value **25**.

```
[edit firewall family inet filter filter3 term term1 from]
user@host# set source-port smtp
```

## Matching on a List of Numeric Values or Text Aliases

You can specify a firewall filter match condition based on whether a particular packet field value matches any one of multiple numeric values or text aliases that you specify within square brackets and delimited by spaces. In the following example, a match occurs if the packet source port number is any of the following values: **20** (which corresponds to the text aliases **ftp-data**), **25**, or any value from **1024** through **65535**.

```
[edit firewall family inet filter filter3 term term1 from]
user@host# set source-port [ smtp ftp-data 25 1024-65535 ]
```

## Match Conditions for Bit-Field Values

Table 38 on page 512 lists the firewall filter match conditions that are based on whether certain bit fields in a packet are set or not set. The second and third columns list the types of traffic for which the match condition is supported.

Table 38: Binary and Bit-Field Match Conditions for Firewall Filters

| Bit-Field Match Condition                                                                                                                                                                                              | Match Values                                                                                                | Protocol Families for Standard Stateless Firewall Filters                               | Protocol Families for Service Filters     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|-------------------------------------------|
| <b>fragment-flags <i>flags</i></b>                                                                                                                                                                                     | Hexadecimal values or text aliases for the three-bit IP fragmentation flags field in the IP header.         | <b>family inet</b>                                                                      | <b>family inet</b>                        |
| <b>fragment-offset <i>value</i></b>                                                                                                                                                                                    | Hexadecimal values or text aliases for the 13-bit fragment offset field in the IP header.                   | <b>family inet</b>                                                                      | <b>family inet</b>                        |
| <b>tcp-flags <i>value</i></b> <sup>†</sup>                                                                                                                                                                             | Hexadecimal values or text aliases for the low-order 6 bits of the 8-bit TCP flags field in the TCP header. | <b>family inet</b><br><b>family inet6</b><br><b>family vpls</b><br><b>family bridge</b> | <b>family inet</b><br><b>family inet6</b> |
| <sup>†</sup> The Junos OS does not automatically check the first fragment bit when matching TCP flags for IPv4 traffic. To check the first fragment bit for IPv4 traffic only, use the first-fragment match condition. |                                                                                                             |                                                                                         |                                           |

## Match Conditions for Common Bit-Field Values or Combinations

Table 39 on page 513 describes firewall filter match conditions that are based on whether certain commonly used values or *combinations* of bit fields in a packet are set or not set.

You can use text synonyms to specify some common bit-field matches. In the previous example, you can specify **tcp-initial** as the same match condition.

**NOTE:**

Some of the numeric range and bit-field match conditions allow you to specify a text synonym. For a complete list of synonyms:

- If you are using the J-Web interface, select the synonym from the appropriate list.
- If you are using the CLI, type a question mark (?) after the from statement.

**Table 39: Bit-Field Match Conditions for Common Combinations**

| Match Condition        | Description                                                                                                                                                             | Protocol Families for Standard Stateless Firewall Filters | Protocol Families for Service Filters |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|---------------------------------------|
| <b>first-fragment</b>  | Text alias for the bit-field match condition <b>fragment-offset 0</b> , which indicates the first fragment of a fragmented packet.                                      | <b>family inet</b>                                        | <b>family inet</b>                    |
| <b>is-fragment</b>     | Text alias for the bit-field match condition <b>fragment-offset 0 except</b> , which indicates a trailing fragment of a fragmented packet.                              | <b>family inet</b>                                        | <b>family inet</b>                    |
| <b>tcp-established</b> | Alias for the bit-field match condition <b>tcp-flags "(ack   rst)"</b> , which indicates an established TCP session, but not the first packet of a TCP connection.      | <b>family inet</b><br><b>family inet6</b>                 | —                                     |
| <b>tcp-initial</b>     | Alias for the bit-field match condition <b>tcp-flags "(!ack &amp; syn)"</b> , which indicates the first packet of a TCP connection, but not an established TCP session. | <b>family inet</b><br><b>family inet6</b>                 | —                                     |

## Logical Operators for Bit-Field Values

Table 40 on page 514 lists the logical operators you can apply to *single* bit-field values when specifying stateless firewall filter match conditions. The operators are listed in order, from highest precedence to lowest precedence. Operations are left-associative, meaning that the operations are processed from left to right.

Table 40: Bit-Field Logical Operators

| Precedence Order | Bit-Field Logical Operator                                                                             | Description                                                                                                 |
|------------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| 1                | <i>(complex-match-condition)</i>                                                                       | Grouping—The complex match condition is evaluated before any operators outside the parentheses are applied. |
| 2                | <i>! match-condition</i>                                                                               | Negation—A match occurs if the match condition is false.                                                    |
| 3                | <i>match-condition-1 &amp; match-condition-2</i><br>or<br><i>match-condition-1 + match-condition-2</i> | Logical AND—A match occurs if both match conditions are true.                                               |
| 4                | <i>match-condition-1   match-condition-2</i><br>or<br><i>match-condition-1 , match-condition-2</i>     | Logical OR—A match occurs if either match condition is true.                                                |

### Matching on a Single Bit-Field Value or Text Alias

For the **fragment-flags** and **tcp-flags** bit-match conditions, you can specify firewall filter match conditions based on whether a particular bit in the packet field is set or not set.

- Numeric value to specify a single bit—You can specify a single bit-field match condition by using a numeric value that has one bit set. Depending on the match condition, you can specify a decimal value, a binary value, or a hexadecimal value. To specify a binary value, specify the number with the prefix **b**. To specify a hexadecimal value, specify the number with the prefix **0x**.

In the following example, a match occurs if the **RST** bit in the TCP flags field is set:

```
[edit firewall family inet filter filter_tcp_rst_number term term1 from]
user@host# set tcp-flags 0x04
```

- Text alias to specify a single bit—You generally specify a single bit-field match condition by using a text alias enclosed in double-quotation marks (" ").

In the following example, a match occurs if the **RST** bit in the TCP flags field is set:

```
[edit firewall family inet filter filter_tcp_rst_alias term term1 from]
user@host# set tcp-flags "rst"
```

## Matching on Multiple Bit-Field Values or Text Aliases

You can specify a firewall filter match condition based on whether a particular set of bits in a packet field are set.

- Numeric values to specify multiple set bits—When you specify a numeric value whose binary representation has more than one set bit, the value is treated as a logical AND of the set bits.

In the following example, the two match conditions are the same. A match occurs if either bit **0x01** or **0x02** is not set:

```
[edit firewall family inet filter reset_or_not_initial_packet term term5 from]
user@host# set tcp-flags "0x3"
user@host# set tcp-flags "!(0x01 & 0x02)"
```

- Text aliases that specify common bit-field matches—You can use text aliases to specify some common bit-field matches. You specify these matches as a single keyword.

In the following example, the **tcp-established** condition, which is an alias for **"(ack | rst)"**, specifies that a match occurs on TCP packets other than the first packet of a connection:

```
[edit firewall family inet filter reset_or_not_initial_packet term term6 from]
user@host# set tcp-established
```

## Matching on a Negated Bit-Field Value

To negate a match, precede the value with an exclamation point.

In the following example, a match occurs if the **RST** bit in the TCP flags field is *not* set:

```
[edit firewall family inet filter filter_tcp_rst term term1 from]
user@host# set tcp-flags "!rst"
```

## Matching on the Logical OR of Two Bit-Field Values

You can use the *logical OR operator* (**|** or **,**) to specify that a match occurs if a bit field matches either of two bit-field values specified.

In the following example, a match occurs if the packet is *not* the initial packet in a TCP session:

```
[edit firewall family inet filter not_initial_packet term term3 from]
user@host# set tcp-flags "!syn | ack"
```

In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet. In a packet that is not the initial packet in a TCP session, either the SYN flag is not set or the ACK flag is set.

## Matching on the Logical AND of Two Bit-Field Values

You can use the *logical AND operator* (& or +) to specify that a match occurs if a bit field matches both of two bit-field values specified.

In the following example, a match occurs if the packet is the initial packet in a TCP session:

```
[edit firewall family inet filter initial_packet term term2 from]
user@host# set tcp-flags "syn & !ack"
```

In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet. In a packet that is an initial packet in a TCP session, the SYN flag is set and the ACK flag is not set.

## Grouping Bit-Field Match Conditions

You can use the *logical grouping notation* to specify that the complex match condition inside the parentheses is evaluated before any operators outside the parentheses are applied.

In the following example, a match occurs if the packet is a TCP reset or if the packet is not the initial packet in the TCP session:

```
[edit firewall family inet filter reset_or_not_initial_packet term term4 from]
user@host# set tcp-flags "!(syn & !ack) | rst"
```

In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet. In a packet that is *not* the initial packet in a TCP session, the SYN flag is not set and the ACK field is set.

## Implied Match on the '0/0 except' Address for Firewall Filter Match Conditions Based on Address Fields

Every firewall filter match condition based on a set of addresses or address prefixes is associated with an implicit match on the address **0.0.0.0/0 except** (for IPv4 or VPLS traffic) or **0:0:0:0:0:0:0:0/0 except** (for IPv6 traffic). As a result, any packet whose specified address field does not match any of the specified addresses or address prefixes fails to match the entire term.

### Matching an Address Field to a Subnet Mask or Prefix

You can specify a single match condition to match a source address or destination address that falls within a specified address prefix.

#### IPv4 Subnet Mask Notation

For an IPv4 address, you can specify a subnet mask value rather than a prefix length. For example:

```
[edit firewall family inet filter filter_on_dst_addr term term3 from]
user@host# set address 10.0.0.10/255.0.0.255
```

#### Prefix Notation

To specify the address prefix, use the notation *prefix/prefix-length*. In the following example, a match occurs if a destination address matches the prefix **10.0.0.0/8**:

```
[edit firewall family inet filter filter_on_dst_addr term term1 from]
user@host# set destination-address 10.0.0.0/8
```

#### Default Prefix Length for IPv4 Addresses

If you do not specify */prefix-length* for an IPv4 address, the prefix length defaults to **/32**. The following example illustrates the default prefix value:

```
[edit firewall family inet filter filter_on_dst_addr term term2 from]
user@host# set destination-address 10
user@host# show
destination-address {
  10.0.0.0/32;
}
```

#### Default Prefix Length for IPv6 Addresses

If you do not specify */prefix-length* for an IPv6 address, the prefix length defaults to **/128**. The following example illustrates the default prefix value:

```
[edit firewall family inet6 filter filter_on_dst_addr term term1 from]
user@host# set destination-address ::10
user@host# show
destination-address {
  ::10/128;
}
```

### Default Prefix Length for MAC Addresses

---

If you do not specify */prefix-length* for a media access control (MAC) address of a VPLS, Layer 2 CCC, or Layer 2 bridging packet, the prefix length defaults to */48*. The following example illustrates the default prefix value:

```
[edit firewall family vpls filter filter_on_dst_mac_addr term term1 from]
user@host# set destination-mac-address 01:00:0c:cc:cc:cd
user@host# show
destination-address {
    01:00:0c:cc:cc:cd/48;
}
```

### Matching an Address Field to an Excluded Value

For the address-field match conditions, you can include the **except** keyword to specify that a match occurs for an address field that does not match the specified address or prefix.

#### Excluding IP Addresses in IPv4 or IPv6 Traffic

---

For the following IPv4 and IPv6 match conditions, you can include the **except** keyword to specify that a match occurs for an IP address field that does not match the specified IP address or prefix:

- **address address except**—A match occurs if either the source IP address or the destination IP address does not match the specified address or prefix.
- **source-address address except**—A match occurs if the source IP address does not match the specified address or prefix.
- **destination-address address except**—A match occurs if the destination IP address does not match the specified address or prefix.

In the following example, a match occurs for any IPv4 destination addresses that fall under the **192.168.10.0/8** prefix, except for addresses that fall under **192.168.0.0/16**. All other addresses implicitly do not match this condition.

```
[edit firewall family inet filter filter_on_dst_addr term term1 from]
user@host# set 192.168.0.0/16 except
user@host# set 192.168.10.0/8
user@host# show
destination-address {
    192.168.0.0/16 except;
    192.168.10.0/8;
}
```

In the following example, a match occurs for any IPv4 destination address that does not fall within the prefix **10.1.1.0/24**:

```
[edit firewall family inet filter filter_on_dst_addr term term24 from]
user@host# set destination-address 0.0.0.0/0
user@host# set destination-address 10.1.1.0/24 except
user@host# show
destination-address {
    0.0.0.0/0;
}
```

```

10.1.1.0/24 except;
}

```

### Excluding IP Addresses in VPLS or Layer 2 Bridging Traffic

For the following VPLS and Layer 2 bridging match conditions on MX Series routers only, you can include the **except** keyword to specify that a match occurs for an IP address field that does not match the specified IP address or prefix:

- **ip-address *address* except**—A match occurs if either the source IP address or the destination IP address does not match the specified address or prefix.
- **source-ip-address *address* except**—A match occurs if the source IP address does not match the specified address or prefix.
- **destination-ip-address *address* except**—A match occurs if the destination IP address does not match the specified address or prefix.

In the following example for filtering VPLS traffic on an MX Series router, a match occurs if the source IP address falls within the exception range of **55.0.1.0/255.0.255.0** and the destination IP address matches **55.0.0.0/8**:

```

[edit]
firewall {
  family vpls {
    filter fvpls {
      term 1 {
        from {
          ip-address {
            55.0.0.0/8;
            55.0.1.0/255.0.255.0 except;
          }
        }
        then {
          count from-55/8;
          discard;
        }
      }
    }
  }
}

```

### Excluding MAC Addresses in VPLS or Layer 2 Bridging Traffic

For the following VPLS or Layer 2 bridging traffic match conditions, you can include the **except** keyword to specify that a match occurs for a MAC address field that does not match the specified MAC address or prefix:

- **source-mac-address *address* except**—A match occurs if the source MAC address does not match the specified address or prefix.
- **destination-mac-address *address* except**—A match occurs if either the destination MAC address does not match the specified address or prefix.

### Excluding All Addresses Requires an Explicit Match on the '0/0' Address

If you specify a firewall filter match condition that consists of one or more address-*exception* match conditions (address match conditions that use the **except** keyword) but no *matchable* address match conditions, packets that do not match any of the configured prefixes fails the overall match operation. To configure a firewall filter term of address-exception match conditions to match any address that is not in the prefix list, include an explicit match of **0/0** so that the term contain a matchable address.

For the following example firewall filter for IPv4 traffic, the **from-trusted-addresses** term fails to discard matching traffic, and the **INTRUDERS-COUNT** counter is missing from the output of the **show firewall** operational mode command:

```
[edit]
user@host# show policy-options
prefix-list TRUSTED-ADDRESSES {
    10.2.1.0/24;
    192.168.122.0/24;
}

[edit firewall family inet filter protect-RE]
user@host# show
term from-trusted-addresses {
    from {
        source-prefix-list {
            TRUSTED-ADDRESSES except;
        }
        protocol icmp;
    }
    then {
        count INTRUDERS-COUNT;
        discard;
    }
}
term other-icmp {
    from {
        protocol icmp;
    }
    then {
        count VALID-COUNT;
        accept;
    }
}
term all {
    then accept;
}
}
```

```
[edit]
user@host# run show firewall
Filter: protect-RE
Counters:
Name                                     Bytes      Packets
VALID-COUNT                             2770        70
Filter: __default_bpdu_filter__
```

To cause a filter term of address-exception match conditions to match any address that is not in the prefix list, include an explicit match of 0/0 in the set of match conditions:

```
[edit firewall family inet filter protect-RE]
user@host# show term from-trusted-addresses
from {
  source-prefix-list {
    0.0.0.0/0;
    TRUSTED-ADDRESSES except;
  }
  protocol icmp;
}
```

With the addition of the 0.0.0.0/0 source prefix address to the match condition, the **from-trusted-addresses** term discards matching traffic, and the INTRUDERS-COUNT counter displays in the output of the **show firewall** operational mode command:

```
[edit]
user@host# run show firewall
Filter: protect-RE
Counters:
Name                               Bytes          Packets
VALID-COUNT                        2770           70
INTRUDERS-COUNT                    420            5
Filter: __default_bpdu_filter__
```

## Matching Either IP Address Field to a Single Value

For IPv4 and IPv6 traffic and for VPLS and Layer 2 bridging traffic on MX Series routers only, you can use a single match condition to match a single address or prefix value to either the source or destination IP address field.

### Matching Either IP Address Field in IPv4 or IPv6 Traffic

For IPv4 or IPv6 traffic, you can use a single match condition to specify the same address or prefix value as the match for either the source or destination IP address field. Instead of creating separate filter terms that specify the same address for the **source-address** and **destination-address** match conditions, you use only the **address** match condition. A match occurs if *either* the source IP address *or* the destination IP address matches the specified address or prefix.

If you use the **except** keyword with the **address** match condition, a match occurs if *both* the source IP address and the destination IP address match the specified value *before* the exception applies.

In a firewall filter term that specifies either the **source-address** or the **destination-address** match condition, you cannot also specify the **address** match condition.

### Matching Either IP Address Field in VPLS or Layer 2 Bridging Traffic

For VPLS or Layer 2 bridging traffic on MX Series routers only, you can use a single match condition to specify the same address or prefix value as the match for either the source or destination IP address field. Instead of creating separate filter terms that specify the same address for the **source-ip-address** and **destination-ip-address** match conditions,

you use only the **ip-address** match condition. A match occurs if *either* the source IP address or the destination IP address matches the specified address or prefix.

If you use the **except** keyword with the **ip-address** match condition, a match occurs if *both* the source IP address and the destination IP address match the specified value *before* the exception applies.

In a firewall filter term that specifies either the **source-ip-address** or the **destination-ip-address** match condition, you cannot also specify the **ip-address** match condition.

## Matching an Address Field to Noncontiguous Prefixes

For IPv4 traffic only, specify a single match condition to match the IP source or destination address field to any prefix specified. The prefixes do not need to be contiguous. That is, the prefixes under the **source-address** or **destination-address** match condition do not need to be adjacent or neighboring to one another.

In the following example, a match occurs if a destination address matches either the **10.0.0.0/8** prefix or the **192.168.0.0/32** prefix:

```
[edit firewall family inet filter filter_on_dst_addr term term5 from]
user@host# set destination-address 10.0.0.0/8
user@host# set destination-address 192.168.0.0/32
user@host# show
destination-address {
    destination-address 10.0.0.0/8;
    destination-address 192.168.0.0/32;
}
```

The order in which you specify the prefixes within the match condition is not significant. Packets are evaluated against all the prefixes in the match condition to determine whether a match occurs. If prefixes overlap, longest-match rules are used to determine whether a match occurs. A match condition of noncontiguous prefixes includes an implicit **0/0 except** statement, which means that any prefix that does not match any prefix included in the match condition is explicitly considered not to match.

Because the prefixes are order-independent and use longest-match rules, longer prefixes subsume shorter ones as long as they are the same type (whether you specify **except** or not). This is because anything that would match the longer prefix would also match the shorter one.

Consider the following example:

```
[edit firewall family inet filter filter_on_src_addr term term1 from]
source-address {
    172.16.0.0/10;
    172.16.2.0/24 except;
    192.168.1.0;
    192.168.1.192/26 except;
    192.168.1.254;
    172.16.3.0/24; # ignored
    10.2.2.2 except; # ignored
}
```

Within the **source-address** match condition, two addresses are ignored. The **172.16.3.0/16** value is ignored because it falls under the address **172.16.0.0/10**, which is the same type. The **10.2.2.2 except** value is ignored because it is subsumed by the implicit **0.0.0.0/0 except** match value.

Suppose the following source IP address are evaluated by this firewall filter:

- Source IP address **172.16.1.2**—This address matches the **172.16.0.0/10** prefix, and thus the action in the **then** statement is taken.
- Source IP address **172.16.2.2**—This address matches the **172.16.2.0/24** prefix. Because this prefix is negated (that is, includes the **except** keyword), an explicit *mismatch* occurs. The next term in the filter is evaluated, if there is one. If there are no more terms, the packet is discarded.
- Source IP address **10.1.2.3**—This address does not match any of the prefixes included in the **source-address** condition. Instead, it matches the implicit **0.0.0.0/0 except** at the end of the list of prefixes configured under the **source-address** match condition, and is considered to be a mismatch.

The **172.16.3.0/24** statement is ignored because it falls under the address **172.16.0.0/10**—both are the same type.

The **10.2.2.2 except** statement is ignored because it is subsumed by the implicit **0.0.0.0/0 except** statement at the end of the list of prefixes configured under the **source-address** match condition.

**BEST PRACTICE:** When a firewall filter term includes the **from address address** match condition and a subsequent term includes the **from source-address address** match condition for the same address, packets might be processed by the latter term before they are evaluated by any intervening terms. As a result, packets that should be rejected by the intervening terms might be accepted instead, or packets that should be accepted might be rejected instead.

To prevent this from occurring, we recommend that you do the following. For every firewall filter term that contains the **from address address** match condition, replace that term with two separate terms: one that contains the **from source-address address** match condition, and another that contains the **from destination-address address** match condition.

## Matching an Address Field to a Prefix List

You can define a list of IPv4 or IPv6 address prefixes for use in a routing policy statement or in a stateless firewall filter match condition that evaluates packet address fields.

To define a list of IPv4 or IPv6 address prefixes, include the **prefix-list prefix-list** statement.

```
prefix-list name {
  ip-addresses;
  apply-path path;
```

```
}
```

You can include the statement at the following hierarchy levels:

- **[edit policy-options]**
- **[edit logical-systems *logical-system-name* policy-options]**

After you have defined a prefix list, you can use it when specifying a firewall filter match condition based on an IPv4 or IPv6 address prefix.

```
[edit firewall family family-name filter filter-name term term-name]  
from {  
  source-prefix-list {  
    prefix-lists;  
  }  
  destination-prefix-list {  
    prefix-lists;  
  }  
}
```

## Firewall Filter Match Conditions Based on Address Classes

For IPv4 and IPv6 traffic only, you can use class-based firewall filter conditions to match packet fields based on source class or destination class.

- [Source-Class Usage on page 524](#)
- [Destination-Class Usage on page 524](#)
- [Guidelines for Applying SCU or DCU Firewall Filters to Output Interfaces on page 525](#)

### Source-Class Usage

A *source class* is a set of source prefixes grouped together and given a class name. To configure a firewall filter term that matches an IP source address field to one or more source classes, use the **source-class *class-name*** match condition under the **[edit firewall family (inet | inet6) filter *filter-name* term *term-name* from]** hierarchy level.

*Source-class usage* (SCU) enables you to monitor the amount of traffic originating from a specific prefix. With this feature, usage can be tracked and customers can be billed for the traffic they receive.

### Destination-Class Usage

A *destination class* is a set of destination prefixes grouped together and given a class name. To configure a firewall filter term that matches an IP destination address field to one or more destination classes, use the **destination-class *class-name*** match condition

at the `[edit firewall family (inet | inet6) filter filter-name term term-name from]` hierarchy level.

*Destination-class usage* (DCU) enables you can track how much traffic is sent to a specific prefix in the core of the network originating from one of the specified interfaces.

Note, however, that DCU limits your ability to keep track of traffic moving in the reverse direction. It can account for all traffic that arrives on a core interface and heads toward a specific customer, but it cannot count traffic that arrives on a core interface from a specific prefix.

## Guidelines for Applying SCU or DCU Firewall Filters to Output Interfaces

When applying a SCU or DCU firewall filter to an interface, keep the following guidelines in mind:

- Output interfaces—Class-based firewall filter match conditions work only for firewall filters that you apply to output interfaces. This is because the SCU and DCU are determined after route lookup occurs.
- Input interfaces—Although you can specify a source class and destination class for an input firewall filter, the counters are incremented only if the firewall filter is applied on the output interface.
- Output interfaces for tunnel traffic—SCU and DCU are not supported on the interfaces you configure as the output interface for tunnel traffic for transit packets exiting the router through the tunnel.

## Firewall Filter Match Conditions for Protocol-Independent Traffic

You can configure a firewall filter with match conditions for protocol-independent traffic (**family any**).

To apply a protocol-independent firewall filter to a logical interface, configure the **filter** statement under the logical unit.

**NOTE:**

On MX Series routers, attach a protocol-independent firewall filter to a logical interface by configuring the filter statement *directly* under the logical unit:

- [edit interfaces *name* unit *number* filter]
- [edit logical-systems *name* interfaces *name* unit *number* filter]

On all other supported devices, attach a protocol-independent firewall filter to a logical interface by configuring the filter statement under the protocol family (*family any*):

- [edit interfaces *name* unit *number* family *any* filter]
- [edit logical-systems *name* interfaces *name* unit *number* family *any* filter]

Table 41 on page 526 describes the *match-conditions* you can configure at the [edit firewall family *any* filter *filter-name* term *term-name* from] hierarchy level.

**Table 41: Firewall Filter Match Conditions for Protocol-Independent Traffic**

| Match Condition                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>interface</b> <i>interface-name</i>         | <p>Match the interface on which the packet was received.</p> <p><b>NOTE:</b> If you configure this match condition with an interface that does not exist, the term does not match any packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>interface-set</b> <i>interface-set-name</i> | <p>Match the interface on which the packet was received to the specified interface set.</p> <p>To define an interface set, include the <b>interface-set</b> statement at the [edit firewall] hierarchy level. For more information, see “<a href="#">Filtering Packets Received on an Interface Set Overview</a>” on page 750.</p>                                                                                                                                                                                                                                                                        |

Table 41: Firewall Filter Match Conditions for Protocol-Independent Traffic (*continued*)

| Match Condition                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loss-priority level</b>        | <p>Match the packet loss priority (PLP) level.</p> <p>Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers.</p> <p>For IP traffic on M320, MX Series, and T Series routers with Enhanced II Flexible PIC Concentrators (FPCs), you must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For information about the <b>tri-color</b> statement, see <i>Configuring Tricolor Marking</i>. For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Forwarding Classes Overview</i>.</p> |
| <b>loss-priority-except level</b> | <p>Do not match the PLP level. For details, see the <b>loss-priority</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>packet-length bytes</b>        | <p>Match the length of the received packet, in bytes. The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>packet-length-except bytes</b> | <p>Do not match on the received packet length, in bytes. For details, see the <b>packet-length</b> match type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Firewall Filter Match Conditions for IPv4 Traffic

You can configure a firewall filter with match conditions for Internet Protocol version 4 (IPv4) traffic (**family inet**). [Table 42 on page 527](#) describes the **match-conditions** you can configure at the **[edit firewall family inet filter *filter-name* term *term-name* from]** hierarchy level.

Table 42: Firewall Filter Match Conditions for IPv4 Traffic

| Match Condition                          | Description                                                                                                                                                                                                                                                                |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address <i>address</i> [ except ]</b> | <p>Match the IPv4 source or destination address field unless the <b>except</b> option is included. If the option is included, do not match the IPv4 source or destination address field.</p> <p><b>NOTE:</b> This match condition is not supported on PTX1000 routers.</p> |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>fragment-flags <i>number</i></b>         | <p>(Ingress only) Match the three-bit IP fragmentation flags field in the IP header.</p> <p>In place of the numeric field value, you can specify one of the following keywords (the field values are also listed): <b>dont-fragment</b> (0x4), <b>more-fragments</b> (0x2), or <b>reserved</b> (0x8).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>fragment-offset <i>value</i></b>         | <p>Match the 13-bit fragment offset field in the IP header. The value is the offset, in 8-byte units, in the overall datagram message to the data fragment. Specify a numeric value, a range of values, or a set of values. An offset value of 0 indicates the first fragment of a fragmented packet.</p> <p>The <b>first-fragment</b> match condition is an alias for the <b>fragment-offset 0</b> match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions (<b>first-fragment</b> and <b>is-fragment</b>).</p> <p><b>NOTE:</b> This match condition is not supported on PTX1000 routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>fragment-offset-except <i>number</i></b> | <p>Do not match the 13-bit fragment offset field.</p> <p><b>NOTE:</b> This match condition is not supported on PTX1000 routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>gre-key <i>range</i></b>                 | <p>Match the gre-key field. The GRE key field is a 4 octet number inserted by the GRE encapsulator. It is an optional field for use in GRE encapsulation. The <i>range</i> can be a single GRE key number or a range of key numbers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>icmp-code <i>number</i></b>              | <p>Match the ICMP message code field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol icmp</b> match condition in the same term.</p> <p>If you configure this match condition, you must also configure the <b>icmp-type <i>message-type</i></b> match condition in the same term. An ICMP message code provides more specific information than an ICMP message type, but the meaning of an ICMP message code is dependent on the associated ICMP message type.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>parameter-problem: <b>ip-header-bad</b> (0), <b>required-option-missing</b> (1)</li> <li>redirect: <b>redirect-for-host</b> (1), <b>redirect-for-network</b> (0), <b>redirect-for-tos-and-host</b> (3), <b>redirect-for-tos-and-net</b> (2)</li> <li>time-exceeded: <b>ttl-eq-zero-during-reassembly</b> (1), <b>ttl-eq-zero-during-transit</b> (0)</li> <li>unreachable: <b>communication-prohibited-by-filtering</b> (13), <b>destination-host-prohibited</b> (10), <b>destination-host-unknown</b> (7), <b>destination-network-prohibited</b> (9), <b>destination-network-unknown</b> (6), <b>fragmentation-needed</b> (4), <b>host-precedence-violation</b> (14), <b>host-unreachable</b> (1), <b>host-unreachable-for-TOS</b> (12), <b>network-unreachable</b> (0), <b>network-unreachable-for-TOS</b> (11), <b>port-unreachable</b> (3), <b>precedence-cutoff-in-effect</b> (15), <b>protocol-unreachable</b> (2), <b>source-host-isolated</b> (8), <b>source-route-failed</b> (5)</li> </ul> |
| <b>icmp-code-except <i>message-code</i></b> | <p>Do not match the ICMP message code field. For details, see the <b>icmp-code</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-type</b> <i>number</i>                    | <p>Match the ICMP message type field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol icmp</b> match condition in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>echo-reply</b> (0), <b>echo-request</b> (8), <b>info-reply</b> (16), <b>info-request</b> (15), <b>mask-request</b> (17), <b>mask-reply</b> (18), <b>parameter-problem</b> (12), <b>redirect</b> (5), <b>router-advertisement</b> (9), <b>router-solicit</b> (10), <b>source-quench</b> (4), <b>time-exceeded</b> (11), <b>timestamp</b> (13), <b>timestamp-reply</b> (14), or <b>unreachable</b> (3).</p> |
| <b>icmp-type-except</b> <i>message-type</i>       | Do not match the ICMP message type field. For details, see the <b>icmp-type</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interface</b> <i>interface-name</i>            | <p>Match the interface on which the packet was received.</p> <p><b>NOTE:</b> If you configure this match condition with an interface that does not exist, the term does not match any packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>interface-group</b> <i>group-number</i>        | <p>Match the logical interface on which the packet was received to the specified interface group or set of interface groups. For <i>group-number</i>, specify a single value or a range of values from 0 through 255.</p> <p>To assign a logical interface to an interface group <i>group-number</i>, specify the <i>group-number</i> at the [interfaces <i>interface-name</i> unit <i>number</i> family <i>family</i> filter group] hierarchy level.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For more information, see <a href="#">“Filtering Packets Received on a Set of Interface Groups Overview” on page 749</a>.</p>                                  |
| <b>interface-group-except</b> <i>group-number</i> | <p>Do not match the logical interface on which the packet was received to the specified interface group or set of interface groups. For details, see the <b>interface-group</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>interface-set</b> <i>interface-set-name</i>    | <p>Match the interface on which the packet was received to the specified interface set.</p> <p>To define an interface set, include the <b>interface-set</b> statement at the [edit firewall] hierarchy level.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For more information, see <a href="#">“Filtering Packets Received on an Interface Set Overview” on page 750</a>.</p>                                                                                                                                                                                                                                                                                   |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-options <i>values</i></b>        | <p>Match the 8-bit IP option field, if present, to the specified value or list of values.</p> <p>In place of a numeric value, you can specify one of the following text synonyms (the option values are also listed): <b>loose-source-route</b> (131), <b>record-route</b> (7), <b>router-alert</b> (148), <b>security</b> (130), <b>stream-id</b> (136), <b>strict-source-route</b> (137), or <b>timestamp</b> (68).</p> <p>To match <i>any</i> value for the IP option, use the text synonym <b>any</b>. To match on <i>multiple</i> values, specify the list of values within square brackets ('[' and ']'). To match a <i>range</i> of values, use the value specification [ <i>value1-value2</i> ].</p> <p>For example, the match condition <b>ip-options [ 0-147 ]</b> matches on an IP options field that contains the <b>loose-source-route</b>, <b>record-route</b>, or <b>security</b> values, or any other value from 0 through 147. However, this match condition does not match on an IP options field that contains only the <b>router-alert</b> value (148).</p> <p>For most interfaces, a filter term that specifies an <b>ip-option</b> match on one or more <i>specific</i> IP option values (a value other than <b>any</b>) causes packets to be sent to the Routing Engine so that the kernel can parse the IP option field in the packet header.</p> <ul style="list-style-type: none"> <li>For a firewall filter term that specifies an <b>ip-option</b> match on one or more specific IP option values, you cannot specify the <b>count</b>, <b>log</b>, or <b>syslog</b> nonterminating actions <i>unless</i> you also specify the <b>discard</b> terminating action in the same term. This behavior prevents double-counting of packets for a filter applied to a transit interface on the router.</li> <li>Packets processed on the kernel might be dropped in case of a system bottleneck. To ensure that matched packets are instead sent to the Packet Forwarding Engine (where packet processing is implemented in hardware), use the <b>ip-options any</b> match condition.</li> </ul> <p>The 10-Gigabit Ethernet Modular Port Concentrator (MPC), 100-Gigabit Ethernet MPC, 60-Gigabit Ethernet MPC, 60-Gigabit Queuing Ethernet MPC, and 60-Gigabit Ethernet Enhanced Queuing MPC on MX Series routers are capable of parsing the IP option field of the IPv4 packet header. For interfaces configured on those MPCs, <i>all</i> packets that are matched using the <b>ip-options</b> match condition are sent to the Packet Forwarding Engine for processing.</p> <p><b>NOTE:</b> On M and T series routers, firewall filters cannot count <b>ip-options</b> packets on a per option type and per interface basis. A limited work around is to use the <b>show pfe statistics ip options</b> command to see <b>ip-options</b> statistics on a per PFE basis. See <i>show pfe statistics ip</i> for sample output.</p> |
| <b>ip-options-except <i>values</i></b> | <p>Do not match the IP option field to the specified value or list of values. For details about specifying the <b>values</b>, see the <b>ip-options</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>is-fragment</b>                     | <p>Match if the packet is a trailing fragment of a fragmented packet. Do not match the first fragment of a fragmented packet.</p> <p><b>NOTE:</b> To match both first and trailing fragments, you can use two terms that specify different match conditions (<b>first-fragment</b> and <b>is-fragment</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loss-priority level</b>                      | <p>Match the packet loss priority (PLP) level.</p> <p>Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers.</p> <p>For IP traffic on M320, MX Series, and T Series routers with Enhanced II Flexible PIC Concentrators (FPCs), you must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For information about the <b>tri-color</b> statement, see <i>Configuring Tricolor Marking</i>. For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Understanding How Behavior Aggregate Classifiers Prioritize Trusted Traffic</i>.</p> |
| <b>loss-priority-except level</b>               | <p>Do not match the PLP level. For details, see the <b>loss-priority</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>packet-length bytes</b>                      | <p>Match the length of the received packet, in bytes. The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>packet-length-except bytes</b>               | <p>Do not match the length of the received packet, in bytes. For details, see the <b>packet-length</b> match type.</p> <p><b>NOTE:</b> This match condition is not supported on PTX1000 routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>port number</b>                              | <p>Match the UDP or TCP source or destination port field.</p> <p>If you configure this match condition, you cannot configure the <b>destination-port</b> match condition or the <b>source-port</b> match condition in the same term.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol udp</b> or <b>protocol tcp</b> match statement in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed under <b>destination-port</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>port-except number</b>                       | <p>Do not match the UDP or TCP source AND destination port field. For details, see the <b>port</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>precedence</b><br><b>ip-precedence-value</b> | <p>Match the IP precedence field.</p> <p>In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00). You can specify precedence in hexadecimal, binary, or decimal form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source-address</b> <i>address</i><br>[ <b>except</b> ]  | <p>Match the IPv4 address of the source node sending the packet unless the <b>except</b> option is included. If the option is included, do not match the IPv4 address of the source node sending the packet.</p> <p>You cannot specify both the <b>address</b> and <b>source-address</b> match conditions in the same term.</p> <p><b>NOTE:</b> The <b>except</b> option is not supported on PTX1000 routers.</p>                                                                                                                                 |
| <b>source-class</b> <i>class-names</i>                     | <p>Match one or more specified source class names (sets of source prefixes grouped together and given a class name). For more information, see <a href="#">“Firewall Filter Match Conditions Based on Address Classes” on page 524</a>.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                     |
| <b>source-class-except</b> <i>class-names</i>              | <p>Do not match one or more specified source class names. For details, see the <b>source-class</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                         |
| <b>source-port</b> <i>number</i>                           | <p>Match the UDP or TCP source port field.</p> <p>You cannot specify the <b>port</b> and <b>source-port</b> match conditions in the same term.</p> <p>If you configure this match condition for IPv4 traffic, we recommend that you also configure the <b>protocol udp</b> or <b>protocol tcp</b> match statement in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed with the <b>destination-port</b> <i>number</i> match condition.</p> |
| <b>source-port-except</b> <i>number</i>                    | <p>Do not match the UDP or TCP source port field. For details, see the <b>source-port</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>source-prefix-list</b> <i>name</i><br>[ <b>except</b> ] | <p>Match source prefixes in the specified list unless the <b>except</b> option is included. If the option is included, do not match the source prefixes in the specified list.</p> <p>Specify the name of a prefix list defined at the <b>[edit policy-options prefix-list <i>prefix-list-name</i>]</b> hierarchy level.</p>                                                                                                                                                                                                                      |
| <b>tcp-established</b>                                     | <p>Match TCP packets of an established TCP session (packets other than the first packet of a connection). This is an alias for <b>tcp-flags "(ack   rst)"</b>.</p> <p>This match condition does not implicitly check that the protocol is TCP. To check this, specify the <b>protocol tcp</b> match condition.</p>                                                                                                                                                                                                                                |

Table 42: Firewall Filter Match Conditions for IPv4 Traffic (*continued*)

| Match Condition                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tcp-flags <i>value</i></b>   | <p>Match one or more of the low-order 6 bits in the 8-bit TCP flags field in the TCP header.</p> <p>To specify individual bit fields, you can specify the following text synonyms or hexadecimal values:</p> <ul style="list-style-type: none"> <li>• <b>fin</b> (0x01)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>ack</b> (0x10)</li> <li>• <b>urgent</b> (0x20)</li> </ul> <p>In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet.</p> <p>You can string together multiple flags using the bit-field logical operators.</p> <p>For combined bit-field match conditions, see the <b>tcp-established</b> and <b>tcp-initial</b> match conditions.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol tcp</b> match statement in the same term to specify that the TCP protocol is being used on the port.</p> <p>For IPv4 traffic only, this match condition does not implicitly check whether the datagram contains the first fragment of a fragmented packet. To check for this condition for IPv4 traffic only, use the <b>first-fragment</b> match condition.</p> |
| <b>tcp-initial</b>              | <p>Match the initial packet of a TCP connection. This is an alias for <b>tcp-flags "(lack &amp; syn)"</b>.</p> <p>This condition does not implicitly check that the protocol is TCP. If you configure this match condition, we recommend that you also configure the <b>protocol tcp</b> match condition in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ttl <i>number</i></b>        | <p>Match the IPv4 time-to-live number. Specify a TTL value or a range of TTL values. For <b><i>number</i></b>, you can specify one or more values from <b>0</b> through <b>255</b>. This match condition is supported only on M120, M320, MX Series, and T Series routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ttl-except <i>number</i></b> | <p>Do not match on the IPv4 TTL number. For details, see the <b>ttl</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Standard Firewall Filter Match Conditions for IPv4 Traffic on ACX Series Routers

On ACX Series routers, you can configure a standard stateless firewall filter with match conditions for IP version 4 (IPv4) traffic (**family inet**). [Table 43 on page 538](#) describes the match conditions you can configure at the **[edit firewall family inet filter *filter-name* term *term-name* from]** hierarchy level.

Table 43: Standard Firewall Filter Match Conditions for IPv4 Traffic on ACX Series Routers

| Match Condition                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>destination-address</b> <i>address</i> | <p>Match the IPv4 destination address field.</p> <p><b>NOTE:</b> On ACX Series routers, you can specify only one destination address. A list of IPv4 destination addresses is not supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>destination-port</b> <i>number</i>     | <p>Match the UDP or TCP destination port field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol udp</b> or <b>protocol tcp</b> match statement in the same term to specify which protocol is being used on the port.</p> <p><b>NOTE:</b> On ACX Series routers, you can specify only one destination port number. A list of port numbers is not supported.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cmd</b> (514), <b>cvspserver</b> (2401), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>ldp</b> (646), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>tacacs</b> (49), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), or <b>xdmcp</b> (177).</p> |
| <b>dscp</b> <i>number</i>                 | <p>Match the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant 6 bits of this byte form the DSCP. For more information, see <i>Understanding How Behavior Aggregate Classifiers Prioritize Trusted Traffic</i>.</p> <p>You can specify a numeric value from 0 through 63. To specify the value in hexadecimal form, include 0x as a prefix. To specify the value in binary form, include b as a prefix.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• RFC 3246, <i>An Expedited Forwarding PHB (Per-Hop Behavior)</i>, defines one code point: <b>ef</b> (46).</li> <li>• RFC 2597, <i>Assured Forwarding PHB Group</i>, defines 4 classes, with 3 drop precedences in each class, for a total of 12 code points: <ul style="list-style-type: none"> <li>• <b>af11</b> (10), <b>af12</b> (12), <b>af13</b> (14)</li> <li>• <b>af21</b> (18), <b>af22</b> (20), <b>af23</b> (22)</li> <li>• <b>af31</b> (26), <b>af32</b> (28), <b>af33</b> (30)</li> <li>• <b>af41</b> (34), <b>af42</b> (36), <b>af43</b> (38)</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>fragment-flags</b> <i>number</i>       | <p>(Ingress only) Match the three-bit IP fragmentation flags field in the IP header.</p> <p>In place of the numeric field value, you can specify one of the following keywords (the field values are also listed): <b>dont-fragment</b> (0x4), <b>more-fragments</b> (0x2), or <b>reserved</b> (0x8).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 43: Standard Firewall Filter Match Conditions for IPv4 Traffic on ACX Series Routers (*continued*)

| Match Condition                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-code <i>number</i></b>                  | <p>Match the ICMP message code field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol icmp</b> match condition in the same term.</p> <p>If you configure this match condition, you must also configure the <b>icmp-type <i>message-type</i></b> match condition in the same term. An ICMP message code provides more specific information than an ICMP message type, but the meaning of an ICMP message code is dependent on the associated ICMP message type.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>parameter-problem: <b>ip-header-bad</b> (0), <b>required-option-missing</b> (1)</li> <li>redirect: <b>redirect-for-host</b> (1), <b>redirect-for-network</b> (0), <b>redirect-for-tos-and-host</b> (3), <b>redirect-for-tos-and-net</b> (2)</li> <li>time-exceeded: <b>ttl-eq-zero-during-reassembly</b> (1), <b>ttl-eq-zero-during-transit</b> (0)</li> <li>unreachable: <b>communication-prohibited-by-filtering</b> (13), <b>destination-host-prohibited</b> (10), <b>destination-host-unknown</b> (7), <b>destination-network-prohibited</b> (9), <b>destination-network-unknown</b> (6), <b>fragmentation-needed</b> (4), <b>host-precedence-violation</b> (14), <b>host-unreachable</b> (1), <b>host-unreachable-for-TOS</b> (12), <b>network-unreachable</b> (0), <b>network-unreachable-for-TOS</b> (11), <b>port-unreachable</b> (3), <b>precedence-cutoff-in-effect</b> (15), <b>protocol-unreachable</b> (2), <b>source-host-isolated</b> (8), <b>source-route-failed</b> (5)</li> </ul> |
| <b>icmp-type <i>number</i></b>                  | <p>Match the ICMP message type field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol icmp</b> match condition in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>echo-reply</b> (0), <b>echo-request</b> (8), <b>info-reply</b> (16), <b>info-request</b> (15), <b>mask-request</b> (17), <b>mask-reply</b> (18), <b>parameter-problem</b> (12), <b>redirect</b> (5), <b>router-advertisement</b> (9), <b>router-solicit</b> (10), <b>source-quench</b> (4), <b>time-exceeded</b> (11), <b>timestamp</b> (13), <b>timestamp-reply</b> (14), or <b>unreachable</b> (3).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ip-options <i>values</i></b>                 | <p>Match the 8-bit IP option field, if present, to the specified value.</p> <p>ACX Series routers support only the <b>ip-options_any</b> match condition, which ensures that the packets are sent to the Packet Forwarding Engine for processing.</p> <p><b>NOTE:</b> On ACX Series routers, you can specify only one IP option value. Configuring multiple values is not supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>precedence</b><br><b>ip-precedence-field</b> | <p>Match the IP precedence field.</p> <p>In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00). You can specify precedence in hexadecimal, binary, or decimal form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 43: Standard Firewall Filter Match Conditions for IPv4 Traffic on ACX Series Routers (*continued*)

| Match Condition                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>protocol <i>number</i></b>        | Match the IP protocol type field. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>ah</b> (51), <b>dstopts</b> (60), <b>egp</b> (8), <b>esp</b> (50), <b>fragment</b> (44), <b>gre</b> (47), <b>hop-by-hop</b> (0), <b>icmp</b> (1), <b>icmp6</b> (58), <b>icmpv6</b> (58), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>sctp</b> (132), <b>tcp</b> (6), <b>udp</b> (17), or <b>vrrp</b> (112).                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>source-address <i>address</i></b> | Match the IPv4 address of the source node sending the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>source-port <i>number</i></b>     | Match the UDP or TCP source port field.<br><br>If you configure this match condition for IPv4 traffic, we recommend that you also configure the <b>protocol udp</b> or <b>protocol tcp</b> match statement in the same term to specify which protocol is being used on the port.<br><br>In place of the numeric value, you can specify one of the text synonyms listed with the <b>destination-port <i>number</i></b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>tcp-flags <i>value</i></b>        | Match one or more of the low-order 6 bits in the 8-bit TCP flags field in the TCP header.<br><br>To specify individual bit fields, you can specify the following text synonyms or hexadecimal values: <ul style="list-style-type: none"> <li>• <b>fin</b> (0x01)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>ack</b> (0x10)</li> <li>• <b>urgent</b> (0x20)</li> </ul> In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet.<br><br>You can string together multiple flags using the bit-field logical operators.<br><br>For combined bit-field match conditions, see the <b>tcp-initial</b> match conditions.<br><br>If you configure this match condition, we recommend that you also configure the <b>protocol tcp</b> match statement in the same term to specify that the TCP protocol is being used on the port. |
| <b>tcp-initial</b>                   | Match the initial packet of a TCP connection. This is an alias for <b>tcp-flags "(ack &amp; syn)"</b> .<br><br>This condition does not implicitly check that the protocol is TCP. If you configure this match condition, we recommend that you also configure the <b>protocol tcp</b> match condition in the same term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ttl <i>number</i></b>             | Match the IPv4 time-to-live number. Specify a TTL value or a range of TTL values. For <b><i>number</i></b> , you can specify one or more values from 2 through 255.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Firewall Filter Match Conditions for IPv6 Traffic

You can configure a firewall filter with match conditions for Internet Protocol version 6 (IPv6) traffic (**family inet6**). [Table 44 on page 541](#) describes the match conditions you can configure at the `[edit firewall family inet6 filter filter-name term term-name from]` hierarchy level.

**Table 44: Firewall Filter Match Conditions for IPv6 Traffic**

| Match Condition                                             | Description                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address</b> <i>address</i> [ <b>except</b> ]             | Match the IPv6 source or destination address field unless the <b>except</b> option is included. If the option is included, do not match the IPv6 source or destination address field.                                                                                                                                                                    |
| <b>apply-groups</b>                                         | Specify which groups to inherit configuration data from. You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups.                                                                                                     |
| <b>apply-groups-except</b>                                  | Specify which groups not to inherit configuration data from. You can specify more than one group name.                                                                                                                                                                                                                                                   |
| <b>destination-address</b> <i>address</i> [ <b>except</b> ] | Match the IPv6 destination address field unless the <b>except</b> option is included. If the option is included, do not match the IPv6 destination address field.<br><br>You cannot specify both the <b>address</b> and <b>destination-address</b> match conditions in the same term.                                                                    |
| <b>destination-class</b> <i>class-names</i>                 | Match one or more specified destination class names (sets of destination prefixes grouped together and given a class name).<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.<br><br>For more information, see <a href="#">"Firewall Filter Match Conditions Based on Address Classes" on page 524</a> . |
| <b>destination-class-except</b> <i>class-names</i>          | Do not match one or more specified destination class names. For details, see the <b>destination-class</b> match condition.<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.                                                                                                                             |

Table 44: Firewall Filter Match Conditions for IPv6 Traffic (*continued*)

| Match Condition                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port <i>number</i></b>                                    | <p>Match the UDP or TCP destination port field.</p> <p>You cannot specify both the <b>port</b> and <b>destination-port</b> match conditions in the same term.</p> <p>If you configure this match condition, we recommend that you also configure the <b>next-header udp</b> or <b>next-header tcp</b> match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cmd</b> (514), <b>cvspserver</b> (2401), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>ldp</b> (646), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>tacacs</b> (49), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), or <b>xmcp</b> (177).</p> |
| <b>destination-port-except <i>number</i></b>                             | <p>Do not match the UDP or TCP destination port field. For details, see the <b>destination-port</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>destination-prefix-list <i>prefix-list-name</i> [ <i>except</i> ]</b> | <p>Match the IPv6 destination prefix to the specified list unless the <b>except</b> option is included. If the option is included, do not match the IPv6 destination prefix to the specified list.</p> <p>The prefix list is defined at the <b>[edit policy-options prefix-list <i>prefix-list-name</i>]</b> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>extension-headers <i>header-type</i></b>                              | <p>Match an extension header type that is contained in the packet by identifying a Next Header value.</p> <p><b>NOTE:</b> This match condition is only supported on MPCs in MX Series routers.</p> <p>In the first fragment of a packet, the filter searches for a match in any of the extension header types. When a packet with a fragment header is found (a subsequent fragment), the filter only searches for a match of the next extension header type because the location of other extension headers is unpredictable.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>ah</b> (51), <b>destination</b> (60), <b>esp</b> (50), <b>fragment</b> (44), <b>hop-by-hop</b> (0), <b>mobility</b> (135), or <b>routing</b> (43).</p> <p>To match <i>any</i> value for the extension header option, use the text synonym <b>any</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>interface-group</b><br><i>group-number</i>        | <p>Match the logical interface on which the packet was received to the specified interface group or set of interface groups. For <i>group-number</i>, specify a single value or a range of values from 0 through 255.</p> <p>To assign a logical interface to an interface group <i>group-number</i>, specify the <i>group-number</i> at the [interfaces <i>interface-name</i> unit <i>number</i> family <i>family</i> filter group] hierarchy level.</p> <p>For more information, see <a href="#">“Filtering Packets Received on a Set of Interface Groups Overview” on page 749</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>interface-group-except</b><br><i>group-number</i> | <p>Do not match the logical interface on which the packet was received to the specified interface group or set of interface groups. For details, see the <b>interface-group</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interface-set</b><br><i>interface-set-name</i>    | <p>Match the interface on which the packet was received to the specified interface set.</p> <p>To define an interface set, include the <b>interface-set</b> statement at the [edit firewall] hierarchy level.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For more information, see <a href="#">“Filtering Packets Received on an Interface Set Overview” on page 750</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ip-options values</b>                             | <p>Match the 8-bit IP option field, if present, to the specified value or list of values.</p> <p>In place of a numeric value, you can specify one of the following text synonyms (the option values are also listed): <b>loose-source-route</b> (131), <b>record-route</b> (7), <b>router-alert</b> (148), <b>security</b> (130), <b>stream-id</b> (136), <b>strict-source-route</b> (137), or <b>timestamp</b> (68).</p> <p>To match <i>any</i> value for the IP option, use the text synonym <b>any</b>. To match on <i>multiple</i> values, specify the list of values within square brackets ('[' and ']'). To match a <i>range</i> of values, use the value specification [ <i>value1-value2</i> ].</p> <p>For example, the match condition <b>ip-options [ 0-147 ]</b> matches on an IP options field that contains the <b>loose-source-route</b>, <b>record-route</b>, or <b>security</b> values, or any other value from 0 through 147. However, this match condition does not match on an IP options field that contains only the <b>router-alert</b> value (148).</p> <p>For most interfaces, a filter term that specifies an <b>ip-option</b> match on one or more <i>specific</i> IP option values (a value other than <b>any</b>) causes packets to be sent to the Routing Engine so that the kernel can parse the IP option field in the packet header.</p> <ul style="list-style-type: none"> <li>For a firewall filter term that specifies an <b>ip-option</b> match on one or more specific IP option values, you cannot specify the <b>count</b>, <b>log</b>, or <b>syslog</b> nonterminating actions <i>unless</i> you also specify the <b>discard</b> terminating action in the same term. This behavior prevents double-counting of packets for a filter applied to a transit interface on the router.</li> <li>Packets processed on the kernel might be dropped in case of a system bottleneck. To ensure that matched packets are instead sent to the Packet Forwarding Engine (where packet processing is implemented in hardware), use the <b>ip-options any</b> match condition.</li> </ul> <p>The 10-Gigabit Ethernet Modular Port Concentrator (MPC), 100-Gigabit Ethernet MPC, 60-Gigabit Ethernet MPC, 60-Gigabit Queuing Ethernet MPC, and 60-Gigabit Ethernet Enhanced Queuing MPC on MX Series routers are capable of parsing the IP option field of the IPv4 packet header. For interfaces configured on those MPCs, <i>all</i> packets that are matched using the <b>ip-options</b> match condition are sent to the Packet Forwarding Engine for processing.</p> |

Table 44: Firewall Filter Match Conditions for IPv6 Traffic (*continued*)

| Match Condition                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-options-except values</b>       | Do not match the IP option field to the specified value or list of values. For details about specifying the <b>values</b> , see the <b>ip-options</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>loss-priority level</b>            | <p>Match the packet loss priority (PLP) level.</p> <p>Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers and EX Series switches.</p> <p>For IP traffic on M320, MX Series, T Series routers and EX Series switches with Enhanced II Flexible PIC Concentrators (FPCs), you must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For information about the <b>tri-color</b> statement, see <i>Configuring Tricolor Marking</i>. For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Forwarding Classes Overview</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>loss-priority-except level</b>     | <p>Do not match the PLP level. For details, see the <b>loss-priority</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>next-header header-type</b>        | <p>Match the first 8-bit Next Header field in the packet. Support for the <b>next-header</b> firewall match condition is available in Junos OS Release 13.3R6 and later.</p> <p>For IPv6, we recommend that you use the <b>payload-protocol</b> term rather than the <b>next-header</b> term when configuring a firewall filter with match conditions. Although either can be used, <b>payload-protocol</b> provides the more reliable match condition because it uses the actual payload protocol to find a match, whereas <b>next-header</b> simply takes whatever appears in the first header following the IPv6 header, which may or may not be the actual protocol. In addition, if <b>next-header</b> is used with IPv6, the accelerated filter block lookup process is bypassed and the standard filter used instead.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>ah</b> (51), <b>dstops</b> (60), <b>egp</b> (8), <b>esp</b> (50), <b>fragment</b> (44), <b>gre</b> (47), <b>hop-by-hop</b> (0), <b>icmp</b> (1), <b>icmp6</b> (58), <b>icmpv6</b> (58), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>mobility</b> (135), <b>no-next-header</b> (59), <b>ospf</b> (89), <b>pim</b> (103), <b>routing</b> (43), <b>rsvp</b> (46), <b>sctp</b> (132), <b>tcp</b> (6), <b>udp</b> (17), or <b>vrpp</b> (112).</p> <p><b>NOTE:</b> <b>next-header icmp6</b> and <b>next-header icmpv6</b> match conditions perform the same function. <b>next-header icmp6</b> is the preferred option. <b>next-header icmpv6</b> is hidden in the Junos OS CLI.</p> |
| <b>next-header-except header-type</b> | Do not match the 8-bit Next Header field that identifies the type of header between the IPv6 header and payload. For details, see the <b>next-header</b> match type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>packet-length bytes</b>            | Match the length of the received packet, in bytes. The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>packet-length-except bytes</b>     | Do not match the length of the received packet, in bytes. For details, see the <b>packet-length</b> match type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 44: Firewall Filter Match Conditions for IPv6 Traffic (*continued*)

| Match Condition                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>payload-protocol</b><br><i>protocol-type</i>                 | <p>Match the payload protocol type.</p> <p>In place of the <b>protocol-type</b> numeric value, you can specify one of the following text synonyms (the field values are also listed): specify one or a set of of the following: <b>ah</b> (51), <b>dstopts</b> (60), <b>egp</b> (8), <b>esp</b> (50), <b>fragment</b> (44), <b>gre</b> (47), <b>hop-by-hop</b> (0), <b>icmp</b> (1), <b>icmp6</b> (58), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>no-next-header</b>, <b>ospf</b> (89), <b>pim</b> (103), <b>routing</b>, <b>rsvp</b> (46), <b>sctp</b> (132), <b>tcp</b> (6), <b>udp</b> (17), or <b>vrp</b> (112).</p> <p>You can also use the <b>payload-protocol</b> condition to match an extension header type that the Juniper Networks firmware cannot interpret. You can specify a range of extension header values within square brackets. When the firmware finds the first extension header type that it cannot interpret in a packet, the <b>payload-protocol</b> value is set to that extension header type. The firewall filter only examines the first extension header type that the firmware cannot interpret in the packet.</p> <p><b>NOTE:</b> This match condition is only supported on MPCs on MX Series Routers</p> |
| <b>payload-protocol-except</b><br><i>protocol-type</i>          | <p>Do not match the payload protocol type. For details, see the <b>payload-protocol</b> match type.</p> <p><b>NOTE:</b> This match condition is only supported on MPCs on MX Series Routers</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>port number</b>                                              | <p>Match the UDP or TCP source or destination port field.</p> <p>If you configure this match condition, you cannot configure the <b>destination-port</b> match condition or the <b>source-port</b> match condition in the same term.</p> <p>If you configure this match condition, we recommend that you also configure the <b>next-header udp</b> or <b>next-header tcp</b> match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed under <b>destination-port</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>port-except number</b>                                       | <p>Do not match the UDP or TCP source or destination port field. For details, see the <b>port</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>prefix-list</b> <i>prefix-list-name</i><br>[ <b>except</b> ] | <p>Match the prefixes of the source or destination address fields to the prefixes in the specified list unless the <b>except</b> option is included. If the option is included, do not match the prefixes of the source or destination address fields to the prefixes in the specified list.</p> <p>The prefix list is defined at the [edit policy-options prefix-list <i>prefix-list-name</i>] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>service-filter-hit</b>                                       | <p>Match a packet received from a filter where a <b>service-filter-hit</b> action was applied.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>source-address</b> <i>address</i><br>[ <b>except</b> ]       | <p>Match the IPv6 address of the source node sending the packet unless the <b>except</b> option is included. If the option is included, do not match the IPv6 address of the source node sending the packet.</p> <p>You cannot specify both the <b>address</b> and <b>source-address</b> match conditions in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 44: Firewall Filter Match Conditions for IPv6 Traffic (*continued*)

| Match Condition                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>source-class</b> <i>class-names</i>                     | <p>Match one or more specified source class names (sets of source prefixes grouped together and given a class name).</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For more information, see <a href="#">“Firewall Filter Match Conditions Based on Address Classes” on page 524</a>.</p>                                                                                                                                                                                   |
| <b>source-class-except</b> <i>class-names</i>              | <p>Do not match one or more specified source class names. For details, see the <b>source-class</b> match condition.</p> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p>                                                                                                                                                                                                                                                                                                              |
| <b>source-port</b> <i>number</i>                           | <p>Match the UDP or TCP source port field.</p> <p>You cannot specify the <b>port</b> and <b>source-port</b> match conditions in the same term.</p> <p>If you configure this match condition, we recommend that you also configure the <b>next-header udp</b> or <b>next-header tcp</b> match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed with the <b>destination-port</b> <i>number</i> match condition.</p> |
| <b>source-port-except</b> <i>number</i>                    | <p>Do not match the UDP or TCP source port field. For details, see the <b>source-port</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>source-prefix-list</b> <i>name</i><br>[ <b>except</b> ] | <p>Match the IPv6 address prefix of the packet source field unless the <b>except</b> option is included. If the option is included, do not match the IPv6 address prefix of the packet source field.</p> <p>Specify a prefix list name defined at the <b>[edit policy-options prefix-list <i>prefix-list-name</i>]</b> hierarchy level.</p>                                                                                                                                                                                            |
| <b>tcp-established</b>                                     | <p>Match TCP packets other than the first packet of a connection. This is a text synonym for <b>tcp-flags "(ack   rst)" (0x14)</b>.</p> <p><b>NOTE:</b> This condition does not implicitly check that the protocol is TCP. To check this, specify the <b>protocol tcp</b> match condition.</p> <p>If you configure this match condition, we recommend that you also configure the <b>next-header tcp</b> match condition in the same term.</p>                                                                                         |

Table 44: Firewall Filter Match Conditions for IPv6 Traffic (*continued*)

| Match Condition                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tcp-flags <i>flags</i></b>             | <p>Match one or more of the low-order 6 bits in the 8-bit TCP flags field in the TCP header.</p> <p>To specify individual bit fields, you can specify the following text synonyms or hexadecimal values:</p> <ul style="list-style-type: none"> <li>• <b>fin</b> (0x01)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>ack</b> (0x10)</li> <li>• <b>urgent</b> (0x20)</li> </ul> <p>In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet.</p> <p>You can string together multiple flags using the bit-field logical operators.</p> <p>For combined bit-field match conditions, see the <b>tcp-established</b> and <b>tcp-initial</b> match conditions.</p> <p>If you configure this match condition, we recommend that you also configure the <b>next-header tcp</b> match condition in the same term to specify that the TCP protocol is being used on the port.</p>                                                                                                                                       |
| <b>tcp-initial</b>                        | <p>Match the initial packet of a TCP connection. This is a text synonym for <b>tcp-flags "(!ack &amp; syn)"</b>.</p> <p>This condition does not implicitly check that the protocol is TCP. If you configure this match condition, we recommend that you also configure the <b>next-header tcp</b> match condition in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>traffic-class <i>number</i></b>        | <p>Match the 8-bit field that specifies the class-of-service (CoS) priority of the packet.</p> <p>This field was previously used as the type-of-service (ToS) field in IPv4.</p> <p>You can specify a numeric value from <b>0</b> through <b>63</b>. To specify the value in hexadecimal form, include <b>0x</b> as a prefix. To specify the value in binary form, include <b>b</b> as a prefix.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• RFC 3246, <i>An Expedited Forwarding PHB (Per-Hop Behavior)</i>, defines one code point: <b>ef</b> (46).</li> <li>• RFC 2597, <i>Assured Forwarding PHB Group</i>, defines 4 classes, with 3 drop precedences in each class, for a total of 12 code points: <ul style="list-style-type: none"> <li>• <b>af11</b> (10), <b>af12</b> (12), <b>af13</b> (14)</li> <li>• <b>af21</b> (18), <b>af22</b> (20), <b>af23</b> (22)</li> <li>• <b>af31</b> (26), <b>af32</b> (28), <b>af33</b> (30)</li> <li>• <b>af41</b> (34), <b>af42</b> (36), <b>af43</b> (38)</li> </ul> </li> </ul> |
| <b>traffic-class-except <i>number</i></b> | <p>Do not match the 8-bit field that specifies the CoS priority of the packet. For details, see the <b>traffic-class</b> match description.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**NOTE:** If you specify an IPv6 address in a match condition (the address, destination-address, or source-address match conditions), use the syntax for text representations described in RFC 4291, *IP Version 6 Addressing Architecture*. For more information about IPv6 addresses, see *IPv6 Overview* and *Supported IPv6 Standards*.

## Firewall Filter Match Conditions for MPLS Traffic

You can configure a firewall filter with match conditions for MPLS traffic (**family mpls**).

**NOTE:** The input-list *filter-names* and output-list *filter-names* statements for firewall filters for the mpls protocol family are supported on all interfaces with the exception of management interfaces and internal Ethernet interfaces (fxp or em0), loopback interfaces (lo0), and USB modem interfaces (umd).

Table 45 on page 550 describes the *match-conditions* you can configure at the [edit firewall family mpls filter *filter-name* term *term-name* from] hierarchy level.

Table 45: Firewall Filter Match Conditions for MPLS Traffic

| Match Condition                      | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>apply-groups</b>                  | Specify which groups to inherit configuration data from. You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups.                                           |
| <b>apply-groups-except</b>           | Specify which groups not to inherit configuration data from. You can specify more than one group name.                                                                                                                                                                                         |
| <b>exp number</b>                    | Experimental (EXP) bit number or range of bit numbers in the MPLS header. For <i>number</i> , you can specify one or more values from 0 through 7 in decimal, binary, or hexadecimal format.<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers. |
| <b>exp-except number</b>             | Do not match on the EXP bit number or range of bit numbers in the MPLS header. For <i>number</i> , you can specify one or more values from 0 through 7.<br><br><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.                                      |
| <b>forwarding-class class</b>        | Forwarding class. Specify <b>assured-forwarding</b> , <b>best-effort</b> , <b>expedited-forwarding</b> , or <b>network-control</b> .                                                                                                                                                           |
| <b>forwarding-class-except class</b> | Do not match on the forwarding class. Specify <b>assured-forwarding</b> , <b>best-effort</b> , <b>expedited-forwarding</b> , or <b>network-control</b> .                                                                                                                                       |

Table 45: Firewall Filter Match Conditions for MPLS Traffic (*continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b> <i>interface-name</i>            | <p>Interface on which the packet was received. You can configure a match condition that matches packets based on the interface on which they were received.</p> <p><b>NOTE:</b> If you configure this match condition with an interface that does not exist, the term does not match any packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Standard Firewall Filter Match Conditions for MPLS Traffic on ACX Series Routers

On ACX Series routers, you can configure a standard stateless firewall filter with match conditions for MPLS traffic (**family mpls**).

**NOTE:** The input-list *filter-names* and output-list *filter-names* statements for firewall filters for the mpls protocol family are supported on all interfaces with the exception of management interfaces and internal Ethernet interfaces (fxp or em0), loopback interfaces (lo0), and USB modem interfaces (umd).

Table 46 on page 552 describes the match conditions you can configure at the [edit firewall family mpls filter *filter-name* term *term-name* from] hierarchy level.

**Table 46: Standard Firewall Filter Match Conditions for MPLS Traffic on ACX Series Routers**

| Match Condition              | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>exp number</i>            | Experimental (EXP) bit number or range of bit numbers in the MPLS header. For <i>number</i> , you can specify one or more values from 0 through 7 in decimal, binary, or hexadecimal format.                                                                                                                                                                                                           |

## Firewall Filter Match Conditions for MPLS-Tagged IPv4 or IPv6 Traffic

This topic covers the following information:

- Matching on IPv4 or IPv6 Packet Header Address or Port Fields in MPLS Flows on page 552
- IP Address Match Conditions for MPLS Traffic on page 553
- IP Port Match Conditions for MPLS Traffic on page 554

### Matching on IPv4 or IPv6 Packet Header Address or Port Fields in MPLS Flows

To support network-based service in a core network, you can configure a firewall filter that matches Internet Protocol version 4 (IPv4) or version 6 (IPv6) packet header fields in MPLS traffic (**family mpls**). The firewall filter can match IPv4 or IPv6 packets as an inner payload of an MPLS packet that has a single MPLS label or up to five MPLS labels stacked together. You can configure match conditions based on IPv4 addresses and IPv4 port numbers or IPv6 addresses and IPv6 port numbers in the header.

Firewall filters based on MPLS-tagged IPv4 headers are supported for interfaces on Enhanced Scaling flexible PIC concentrators (FPCs) on T320, T640, T1600, TX Matrix, and TX Matrix Plus routers and switches only. However, the firewall filters based on MPLS-tagged IPv6 headers are supported for interfaces on the Type 5 FPC on T4000 Core Routers only. The feature is not supported for the router or switch loopback interface (lo0), the router or switch management interface (fxp0 or em0), or USB modem interfaces (umd).

To configure a firewall filter term that matches an address or port fields in the Layer 4 header of packets in an MPLS flow, you use the **ip-version ipv4** match condition to specify that the term is to match packets based on inner IP fields:

- To match an MPLS-tagged IPv4 packet on the source or destination address field in the IPv4 header, specify the match condition at the **[edit firewall family mpls filter filter-name term term-name from ip-version ipv4]** hierarchy level.
- To match an MPLS-tagged IPv4 packet on the source or destination port field in the Layer 4 header, specify the match condition at the **[edit firewall family mpls filter filter-name term term-name from ip-version ipv4 protocol (udp | tcp)]** hierarchy level.

To configure a firewall filter term that matches an address or port fields in the IPv6 header of packets in an MPLS flow, you use the **ip-version ipv6** match condition to specify that the term is to match packets based on inner IP fields:

- To match an MPLS-tagged IPv6 packet on the source or destination address field in the IPv6 header, specify the match condition at the **[edit firewall family mpls filter filter-name term term-name from ip-version ipv6]** hierarchy level.
- To match an MPLS-tagged IPv6 packet on the source or destination port field in the Layer 4 header, specify the match condition at the **[edit firewall family mpls filter filter-name term term-name from ip-version ipv6 protocol (udp | tcp)]** hierarchy level.

## IP Address Match Conditions for MPLS Traffic

Table 47 on page 553 describes the IP address-specific match conditions you can configure at the **[edit firewall family mpls filter filter-name term term-name from ip-version ip-version]** hierarchy level.

**Table 47: IP Address-Specific Firewall Filter Match Conditions for MPLS Traffic**

| Match Condition                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-address</b> <i>address</i>               | Match the address of the destination node to receive the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>destination-address</b> <i>address</i> <b>except</b> | Do not match the address of the destination node to receive the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>protocol</b> <i>number</i>                           | Match the IP protocol type field. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>ah</b> (51), <b>dstop</b> (60), <b>egp</b> (8), <b>esp</b> (50), <b>fragment</b> (44), <b>gre</b> (47), <b>hop-by-hop</b> (0), <b>icmp</b> (1), <b>icmp6</b> (58), <b>icmpv6</b> (58), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>sctp</b> (132), <b>tcp</b> (6), <b>udp</b> (17), or <b>vrp</b> (112). |
| <b>source-address</b> <i>address</i>                    | Match the address of the source node sending the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>source-address</b> <i>address</i> <b>except</b>      | Do not match the address of the source node sending the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## IP Port Match Conditions for MPLS Traffic

Table 48 on page 554 describes the IP port-specific *match-conditions* you can configure at the `[edit firewall family mpls filter filter-name term term-name from ip-version ip-version protocol (udp | tcp )]` hierarchy level.

**Table 48: IP Port-Specific Firewall Filter Match Conditions for MPLS Traffic**

| Match Condition                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port <i>number</i></b>        | <p>Match on the UDP or TCP destination port field.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cmd</b> (514), <b>cvspserver</b> (2401), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>ldp</b> (646), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobilip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>tacacs</b> (49), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), or <b>xmcp</b> (177).</p> |
| <b>destination-port-except <i>number</i></b> | <p>Do not match on the UDP or TCP destination port field.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed with the <b>destination-port</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>source-port <i>number</i></b>             | <p>Match on the TCP or UDP source port field.</p> <p>In place of the numeric field, you can specify one of the text synonyms listed under <b>destination-port</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>source-port-except <i>number</i></b>      | Do not match on the TCP or UDP source port field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Firewall Filter Match Conditions for VPLS Traffic

In the **from** statement in the VPLS filter term, you specify conditions that the packet must match for the action in the **then** statement to be taken. All conditions in the **from** statement must match for the action to be taken. The order in which you specify match

conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify no match conditions in a term, that term matches all packets.

An individual condition in a **from** statement can contain a list of values. For example, you can specify numeric ranges. You can also specify multiple source addresses or destination addresses. When a condition defines a list of values, a match occurs if one of the values in the list matches the packet.

Individual conditions in a **from** statement can be negated. When you negate a condition, you are defining an explicit mismatch. For example, the negated match condition for **forwarding-class** is **forwarding-class-except**. If a packet matches a negated condition, it is immediately considered not to match the **from** statement, and the next term in the filter is evaluated, if there is one. If there are no more terms, the packet is discarded.

You can configure a firewall filter with match conditions for Virtual Private LAN Service (VPLS) traffic (**family vpls**). [Table 49 on page 555](#) describes the **match-conditions** you can configure at the `[edit firewall family vpls filter filter-name term term-name from]` hierarchy level.

**NOTE:** Not all match conditions for VPLS traffic are supported on all routing platforms or switching platforms. A number of match conditions for VPLS traffic are supported only on MX Series 3D Universal Edge Routers.

In the VPLS documentation, the word *router* in terms such as *PE router* is used to refer to any device that provides routing functions.

**Table 49: Firewall Filter Match Conditions for VPLS Traffic**

| Match Condition                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-mac-address</b><br><i>address</i> | Match the destination media access control (MAC) address of a VPLS packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>destination-port</b> <i>number</i>            | <p>(MX Series routers and EX Series switches only) Match the UDP or TCP destination port field.</p> <p>You cannot specify both the <b>port</b> and <b>destination-port</b> match conditions in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cmd</b> (514), <b>cvspserver</b> (2401), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>ldp</b> (646), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>tacacs</b> (49), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), or <b>xmcp</b> (177).</p> |
| <b>destination-port-except</b><br><i>number</i>  | <p>(MX Series routers and EX Series switches only) Do not match on the TCP or UDP destination port field. You cannot specify both the <b>port</b> and <b>destination-port</b> match conditions in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 49: Firewall Filter Match Conditions for VPLS Traffic (*continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-type-except</b> <i>number</i>                     | (MX Series routers and EX Series switches only) Do not match the ICMP message type field. For details, see the <b>icmp-type</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>interface</b> <i>interface-name</i>                    | Interface on which the packet was received. You can configure a match condition that matches packets based on the interface on which they were received.<br><br><b>NOTE:</b> If you configure this match condition with an interface that does not exist, the term does not match any packet.                                                                                                                                                                                                                                                                                                                                                         |
| <b>interface-group</b><br><i>group-number</i>             | Match the logical interface on which the packet was received to the specified interface group or set of interface groups. For <i>group-number</i> , specify a single value or a range of values from 0 through 255.<br><br>To assign a logical interface to an interface group <i>group-number</i> , specify the <i>group-number</i> at the [interfaces <i>interface-name</i> unit <i>number</i> family <i>family</i> filter group] hierarchy level.<br><br>For more information, see “Filtering Packets Received on a Set of Interface Groups Overview” on page 749.<br><br><b>NOTE:</b> This match condition is not supported on T4000 Type 5 FPCs. |
| <b>interface-group-except</b><br><i>group-name</i>        | Do not match the logical interface on which the packet was received to the specified interface group or set of interface groups. For details, see the <b>interface-group</b> match condition.<br><br><b>NOTE:</b> This match condition is not supported on T4000 Type 5 FPCs.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>interface-set</b><br><i>interface-set-name</i>         | Match the interface on which the packet was received to the specified interface set.<br><br>To define an interface set, include the <b>interface-set</b> statement at the [edit firewall] hierarchy level. For more information, see “Filtering Packets Received on an Interface Set Overview” on page 750.                                                                                                                                                                                                                                                                                                                                           |
| <b>ip-address</b> <i>address</i>                          | (MX Series routers and EX Series switches only) 32-bit address that supports the standard syntax for IPv4 addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ip-destination-address</b><br><i>address</i>           | (MX Series routers and EX Series switches only) 32-bit address that is the final destination node address for the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ip-precedence</b><br><i>ip-precedence-field</i>        | (MX Series routers and EX Series switches only) IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00).                                                                                                                                                                                                                                 |
| <b>ip-precedence-except</b><br><i>ip-precedence-field</i> | (MX Series routers and EX Series switches only) Do not match on the IP precedence field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ip-protocol</b> <i>number</i>                          | (MX Series routers and EX Series switches only) IP protocol field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ipv6-address</b> <i>address</i>                        | (MX Series only) 128-bit address that supports the standard syntax for IPv6 addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ip-protocol-except</b> <i>number</i>                   | (MX Series routers and EX Series switches only) Do not match on the IP protocol field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 49: Firewall Filter Match Conditions for VPLS Traffic (*continued*)

| Match Condition                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 49: Firewall Filter Match Conditions for VPLS Traffic (*continued*)

| Match Condition                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loss-priority level</b>        | <p>Packet loss priority (PLP) level. Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers.</p> <p>For IP traffic on M320, MX Series, and T Series routers with Enhanced II Flexible PIC Concentrators (FPCs) and EX Series switches, you must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p>For information about the <b>tri-color</b> statement and about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Forwarding Classes Overview</i>.</p> |
| <b>loss-priority-except level</b> | <p>Do not match on the packet loss priority level. Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Understanding How Behavior Aggregate Classifiers Prioritize Trusted Traffic</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>port number</b>                | <p>(MX Series routers and EX Series switches only) TCP or UDP source or destination port. You cannot specify both the <b>port</b> match condition and either the <b>destination-port</b> or <b>source-port</b> match condition in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>port-except number</b>         | <p>(MX Series routers and EX Series switches only) Do not match on the TCP or UDP source or destination port. You cannot specify both the <b>port</b> match condition and either the <b>destination-port</b> or <b>source-port</b> match condition in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>prefix-list name</b>           | <p>(MX Series routers and EX Series switches only) Match the destination or source prefixes in the specified list. Specify the name of a prefix list defined at the <b>[edit policy-options prefix-list prefix-list-name]</b> hierarchy level.</p> <p><b>NOTE:</b> VPLS prefix lists support only IPv4 addresses. IPv6 addresses included in a VPLS prefix list will be discarded.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>prefix-list name except</b>    | <p>(MX Series routers and EX Series switches only) Do not match the destination or source prefixes in the specified list. For more information, see the <b>destination-prefix-list</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>source-mac-address address</b> | <p>Source MAC address of a VPLS packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Firewall Filter Match Conditions for Layer 2 CCC Traffic

You can configure a firewall filter with match conditions for Layer 2 circuit cross-connect (CCC) traffic (**family ccc**).

The following restrictions apply to firewall filters for Layer 2 CCC traffic:

- The **input-list *filter-names*** and **output-list *filter-names*** statements for firewall filters for the **ccc** protocol family are supported on all interfaces with the exception of management interfaces and internal Ethernet interfaces (**fxp** or **em0**), loopback interfaces (**lo0**), and USB modem interfaces (**umd**).
- Only on MX Series routers and EX Series switches, you cannot apply a Layer 2 CCC stateless firewall filter (a firewall filter configured at the **[edit firewall filter family ccc]** hierarchy level) as an output filter. On MX Series routers and EX Series switches, firewall filters configured for the **family ccc** statement can be applied only as input filters.

[Table 50 on page 565](#) describes the **match-conditions** you can configure at the **[edit firewall family ccc filter *filter-name* term *term-name* from]** hierarchy level.

Table 50: Firewall Filter Match Conditions for Layer 2 CCC Traffic

| Match Condition            | Description                                                                                                                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>apply-groups</b>        | Specify which groups to inherit configuration data from. You can specify more than one group name. You must list them in order of inheritance priority. The configuration data in the first group takes priority over the data in subsequent groups. |
| <b>apply-groups-except</b> | Specify which groups not to inherit configuration data from. You can specify more than one group name.                                                                                                                                               |

Table 50: Firewall Filter Match Conditions for Layer 2 CCC Traffic (*continued*)

| Match Condition                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>destination-mac-address address</b> | <p>(MX Series routers and EX Series switches only) Match the destination media access control (MAC) address of a virtual private LAN service (VPLS) packet.</p> <p>To have packets correctly evaluated by this match condition when applied to egress traffic flowing over a CCC circuit from a logical interface on an I-chip DPC in a Layer 2 virtual private network (VPN) routing instance, you must make a configuration change to the Layer 2 VPN routing instance. You must explicitly disable the use of a control word for traffic flowing out over a Layer 2 circuit. The use of a control word is enabled by default for Layer 2 VPN routing instances to support the emulated virtual circuit (VC) encapsulation for Layer 2 circuits.</p> <p>To explicitly disable the use of a control word for Layer 2 VPNs, include the <b>no-control-word</b> statement at either of the following hierarchy levels:</p> <ul style="list-style-type: none"><li>• [edit routing-instances <i>routing-instance-name</i> protocols l2vpn]</li><li>• [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn]</li></ul> <p><b>NOTE:</b> This match condition is not supported on PTX series packet transport routers.</p> <p>For more information, see <i>Disabling the Control Word for Layer 2 VPNs</i>.</p> |                                                                                |

## Firewall Filter Match Conditions for Layer 2 Bridging Traffic

Only on MX Series routers and EX Series switches, you can configure a standard stateless firewall filter with match conditions for Layer 2 bridging traffic (**family bridge**).

[Table 51 on page 569](#) describes the *match-conditions* you can configure at the **[edit firewall family bridge filter *filter-name* term *term-name* from]** hierarchy level.

**Table 51: Standard Firewall Filter Match Conditions for Layer 2 Bridging (MX Series Routers and EX Series Switches Only)**

| Match Condition                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-mac-address</b><br><i>address</i>    | Destination media access control (MAC) address of a Layer 2 packet in a bridging environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>destination-port</b> <i>number</i>               | TCP or UDP destination port field. You cannot specify both the <b>port</b> and <b>destination-port</b> match conditions in the same term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>destination-port-except</b>                      | Do not match the TCP/UDP destination port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>destination-prefix-list</b><br><i>named-list</i> | Match the IP destination prefixes in a <i>named-list</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>dscp</b> <i>number</i>                           | <p>Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant 6 bits of this byte form the DSCP. For more information, see <i>Understanding How Behavior Aggregate Classifiers Prioritize Trusted Traffic</i>.</p> <p>You can specify a numeric value from <b>0</b> through <b>63</b>. To specify the value in hexadecimal form, include <b>0x</b> as a prefix. To specify the value in binary form, include <b>b</b> as a prefix.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• RFC 3246, <i>An Expedited Forwarding PHB (Per-Hop Behavior)</i>, defines one code point: <b>ef</b> (46).</li> <li>• RFC 2597, <i>Assured Forwarding PHB Group</i>, defines 4 classes, with 3 drop precedences in each class, for a total of 12 code points:</li> </ul> <p><b>af11</b> (10), <b>af12</b> (12), <b>af13</b> (14),</p> <p><b>af21</b> (18), <b>af22</b> (20), <b>af23</b> (22),</p> <p><b>af31</b> (26), <b>af32</b> (28), <b>af33</b> (30),</p> <p><b>af41</b> (34), <b>af42</b> (36), <b>af43</b> (38)</p> |
| <b>dscp-except</b> <i>number</i>                    | Do not match on the DSCP number. For more information, see the <b>dscp-except</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 51: Standard Firewall Filter Match Conditions for Layer 2 Bridging (MX Series Routers and EX Series Switches Only) (continued)**

| Match Condition                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>forwarding-class-except</b> <i>class</i> | Ethernet type field of a Layer 2 packet environment. Specify <b>assured-forwarding</b> , <b>best-effort</b> , <b>expedited-forwarding</b> , or <b>network-control</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>icmp-code</b> <i>message-code</i>        | <p>Match the ICMP message code field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>ip-protocol icmp</b>, <b>ip-protocol icmp6</b>, or <b>ip-protocol icmpv6</b> match condition in the same term.</p> <p>If you configure this match condition, you must also configure the <b>icmp-type</b> <i>message-type</i> match condition in the same term. An ICMP message code provides more specific information than an ICMP message type, but the meaning of an ICMP message code is dependent on the associated ICMP message type.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed). The keywords are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>parameter-problem: <b>ip6-header-bad</b> (0), <b>unrecognized-next-header</b> (1), <b>unrecognized-option</b> (2)</li> <li>time-exceeded: <b>ttl-eq-zero-during-reassembly</b> (1), <b>ttl-eq-zero-during-transit</b> (0)</li> <li>destination-unreachable: <b>address-unreachable</b> (3), <b>administratively-prohibited</b> (1), <b>no-route-to-destination</b> (0), <b>port-unreachable</b> (4)</li> </ul> |
| <b>icmp-code-except</b> <i>message-code</i> | Do not match the ICMP message code field. For details, see the <b>icmp-code</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 51: Standard Firewall Filter Match Conditions for Layer 2 Bridging (MX Series Routers and EX Series Switches Only) (*continued*)

| Match Condition                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-type</b> <i>message-type</i>                   | <p>Match the ICMP message type field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>ip-protocol</b> <b>icmp</b>, <b>ip-protocol icmp6</b>, or <b>ip-protocol icmpv6</b> match condition in the same term.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>destination-unreachable</b> (1), <b>echo-reply</b> (129), <b>echo-request</b> (128), <b>membership-query</b> (130), <b>membership-report</b> (131), <b>membership-termination</b> (132), <b>neighbor-advertisement</b> (136), <b>neighbor-solicit</b> (135), <b>node-information-reply</b> (140), <b>node-information-request</b> (139), <b>packet-too-big</b> (2), <b>parameter-problem</b> (4), <b>redirect</b> (137), <b>router-advertisement</b> (134), <b>router-renumbering</b> (138), <b>router-solicit</b> (133), or <b>time-exceeded</b> (3).</p> |
| <b>icmp-type-except</b> <i>message-type</i>            | Do not match the ICMP message type field. For details, see the <b>icmp-type</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>interface</b> <i>interface-name</i>                 | <p>Interface on which the packet was received. You can configure a match condition that matches packets based on the interface on which they were received.</p> <p><b>NOTE:</b> If you configure this match condition with an interface that does not exist, the term does not match any packet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>interface-group</b> <i>group-number</i>             | <p>Match the logical interface on which the packet was received to the specified interface group or set of interface groups. For <b>group-number</b>, specify a single value or a range of values from 0 through 255.</p> <p>To assign a logical interface to an interface group <b>group-number</b>, specify the <b>group-number</b> at the [interfaces <i>interface-name</i> unit <i>number</i> family <i>family</i> filter <i>group</i>] hierarchy level.</p> <p>For more information, see “<a href="#">Filtering Packets Received on a Set of Interface Groups Overview</a>” on page 749.</p>                                                                                                                                                                                                                                                                                                                                                |
| <b>interface-group-except</b> <i>number</i>            | Do not match the logical interface on which the packet was received to the specified interface group or set of interface groups. For details, see the <b>interface-group</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>interface-set</b> <i>interface-set-name</i>         | <p>Match the interface on which the packet was received to the specified interface set.</p> <p>To define an interface set, include the <b>interface-set</b> statement at the [edit firewall] hierarchy level. For more information, see “<a href="#">Filtering Packets Received on an Interface Set Overview</a>” on page 750.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ip-address</b> <i>address</i>                       | 32-bit address that supports the standard syntax for IPv4 addresses. Note that when using this term, the match condition <b>ether-type IPv4</b> must be defined on the same term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ip-destination-address</b> <i>address</i>           | 32-bit address that is the final destination node address for the packet. Note that when using this term, the match condition <b>ether-type IPv4</b> must be defined on the same term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ip-precedence</b> <i>ip-precedence-field</i>        | IP precedence field. In place of the numeric field value, you can specify one of the following text synonyms (the field values are also listed): <b>critical-ecp</b> (0xa0), <b>flash</b> (0x60), <b>flash-override</b> (0x80), <b>immediate</b> (0x40), <b>internet-control</b> (0xc0), <b>net-control</b> (0xe0), <b>priority</b> (0x20), or <b>routine</b> (0x00).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ip-precedence-except</b> <i>ip-precedence-field</i> | Do not match on the IP precedence field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 51: Standard Firewall Filter Match Conditions for Layer 2 Bridging (MX Series Routers and EX Series Switches Only) (*continued*)

| Match Condition                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>learn-vlan-id</b> <i>number</i>        | VLAN identifier used for MAC learning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>learn-vlan-id-except</b> <i>number</i> | Do not match on the VLAN identifier used for MAC learning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>loss-priority</b> <i>level</i>         | <p>Packet loss priority (PLP) level. Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers and EX Series switches.</p> <p>For IP traffic on M320, MX Series, and T Series routers with Enhanced II Flexible PIC Concentrators (FPCs), and EX Series switches, you must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p>For information about the <b>tri-color</b> statement, see <i>Configuring Tricolor Marking</i>. For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Forwarding Classes Overview</i>.</p> |
| <b>loss-priority-except</b> <i>level</i>  | <p>Do not match on the packet loss priority level. Specify a single level or multiple levels: <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</p> <p>For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see the <i>Understanding How Behavior Aggregate Classifiers Prioritize Trusted Traffic</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>port</b> <i>number</i>                 | TCP or UDP source or destination port. You cannot specify both the <b>port</b> match condition and either the <b>destination-port</b> or <b>source-port</b> match conditions in the same term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>source-mac-address</b> <i>address</i>  | Source MAC address of a Layer 2 packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>source-port</b> <i>number</i>          | TCP or UDP source port field. You cannot specify the <b>port</b> and <b>source-port</b> match conditions in the same term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>source-port-except</b>                 | Do not match the TCP/UDP source port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 51: Standard Firewall Filter Match Conditions for Layer 2 Bridging (MX Series Routers and EX Series Switches Only) (*continued*)

| Match Condition                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tcp-flags</b> <i>flags</i>                    | <p>Match one or more of the low-order 6 bits in the 8-bit TCP flags field in the TCP header.</p> <p>To specify individual bit fields, you can specify the following text synonyms or hexadecimal values:</p> <ul style="list-style-type: none"> <li>• <b>fin</b> (0x01)</li> <li>• <b>syn</b> (0x02)</li> <li>• <b>rst</b> (0x04)</li> <li>• <b>push</b> (0x08)</li> <li>• <b>ack</b> (0x10)</li> <li>• <b>urgent</b> (0x20)</li> </ul> <p>In a TCP session, the SYN flag is set only in the initial packet sent, while the ACK flag is set in all packets sent after the initial packet.</p> <p>You can string together multiple flags using the bit-field logical operators.</p> <p>Configuring the <b>tcp-flags</b> match condition requires that you configure the <b>next-header-tcp</b> match condition.</p> |
| <b>traffic-type</b> <i>type</i>                  | Traffic type. Specify <b>broadcast</b> , <b>multicast</b> , <b>unknown-unicast</b> , or <b>known-unicast</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>traffic-type-except</b> <i>type</i>           | Do not match on the traffic type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>user-vlan-1p-priority</b> <i>value</i>        | <p>(MX Series routers and EX Series switches only) Match on the IEEE 802.1p user priority bits in the customer VLAN tag (the inner tag in a dual-tag frame with 802.1Q VLAN tags). Specify a single value or multiple values from 0 through 7.</p> <p>Compare with the <b>learn-vlan-1p-priority</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>user-vlan-1p-priority-except</b> <i>value</i> | (MX Series routers and EX Series switches only) Do not match on the IEEE 802.1p user priority bits. For details, see the <b>user-vlan-1p-priority</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>user-vlan-id</b> <i>number</i>                | (MX Series routers and EX Series switches only) Match the first VLAN identifier that is part of the payload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Firewall Filter Nonterminating Actions

Firewall filters support different sets of nonterminating actions for each protocol family.

**NOTE:** You cannot configure the next term action with a *terminating* action in the same filter term. However, you can configure the next term action with another *nonterminating* action in the same filter term.

*Nonterminating* actions carry with them an implicit accept action. In this context, *nonterminating* means that other actions can follow these actions whereas no other actions can follow a *terminating* action.

Table 52 on page 578 describes the nonterminating actions you can configure for a firewall filter term.

Table 52: Nonterminating Actions for Firewall Filters

| Nonterminating Action                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                 | Protocol Families                                                                                                                                                                            |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>count</b> <i>counter-name</i>      | Count the packet in the named counter.                                                                                                                                                                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li>family any</li> <li>family bridge</li> <li>family ccc</li> <li>family inet</li> <li>family inet6</li> <li>family mpls</li> <li>family vpls</li> </ul> |
| <b>dont-fragment</b><br>(set   clear) | Configure the value of the Don't Fragment bit (flag) in the IPv4 header to specify whether the datagram can be fragmented: <ul style="list-style-type: none"> <li><b>set</b>—Change the flag value to one, preventing fragmentation.</li> <li><b>clear</b>—Change the flag value to zero, allowing fragmentation.</li> </ul> <p><b>NOTE:</b> The <b>dont-fragment (set   clear)</b> actions are supported only on MPCs.</p> | family inet                                                                                                                                                                                  |

Table 52: Nonterminating Actions for Firewall Filters (*continued*)

| Nonterminating Action | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Protocol Families  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>dscp value</b>     | <p>Set the IPv4 Differentiated Services code point (DSCP) bit. You can specify a numerical value from <b>0</b> through <b>63</b>. To specify the value in hexadecimal form, include <b>0x</b> as a prefix. To specify the value in binary form, include <b>b</b> as a prefix.</p> <p>The default DSCP value is best effort, that is, <b>be</b> or <b>0</b>.</p> <p>You can also specify one of the following text synonyms:</p> <ul style="list-style-type: none"> <li>• <b>af11</b>—Assured forwarding class 1, low drop precedence</li> <li>• <b>af12</b>—Assured forwarding class 1, medium drop precedence</li> <li>• <b>af13</b>—Assured forwarding class 1, high drop precedence</li> <li>• <b>af21</b>—Assured forwarding class 2, low drop precedence</li> <li>• <b>af22</b>—Assured forwarding class 2, medium drop precedence</li> <li>• <b>af23</b>—Assured forwarding class 2, high drop precedence</li> <li>• <b>af31</b>—Assured forwarding class 3, low drop precedence</li> <li>• <b>af32</b>—Assured forwarding class 3, medium drop precedence</li> <li>• <b>af33</b>—Assured forwarding class 3, high drop precedence</li> <li>• <b>af41</b>—Assured forwarding class 4, low drop precedence</li> <li>• <b>af42</b>—Assured forwarding class 4, medium drop precedence</li> <li>• <b>af43</b>—Assured forwarding class 4, high drop precedence</li> <li>• <b>be</b>—Best effort</li> <li>• <b>cs0</b>—Class selector 0</li> <li>• <b>cs1</b>—Class selector 1</li> <li>• <b>cs2</b>—Class selector 2</li> <li>• <b>cs3</b>—Class selector 3</li> <li>• <b>cs4</b>—Class selector 4</li> <li>• <b>cs5</b>—Class selector 5</li> <li>• <b>cs6</b>—Class selector 6</li> <li>• <b>cs7</b>—Class selector 7</li> <li>• <b>ef</b>—Expedited forwarding</li> </ul> <p><b>NOTE:</b> This action is not supported on PTX Series Packet Transport Routers.</p> <p><b>NOTE:</b> The actions <b>dscp 0</b> and <b>dscp be</b> are supported only on T320, T640, T1600, TX Matrix, TX Matrix Plus, and M320 routers and on the 10-Gigabit Ethernet Modular Port Concentrators (MPC), 60-Gigabit Ethernet MPC, 60-Gigabit Ethernet Queuing MPC, and 60-Gigabit Ethernet Enhanced Queuing MPC on MX Series routers. However, these actions are not supported on Enhanced III Flexible PIC Concentrators (FPCs) on M320 routers.</p> <p><b>NOTE:</b> On T4000 routers, the <b>dscp 0</b> action is not supported during the interoperation between a T1600 Enhanced Scaling Type 4 FPC and a T4000 Type 5 FPC.</p> | <b>family inet</b> |

Table 52: Nonterminating Actions for Firewall Filters (*continued*)

| Nonterminating Action                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Protocol Families                                                                                                                                                                                          |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>force-premium</b>                                | <p>By default, a hierarchical policer processes the traffic it receives according to the traffic's forwarding class. Premium, expedited-forwarding traffic has priority for bandwidth over aggregate, best-effort traffic. <b>force-premium</b> ensures that traffic matching the term is treated as premium traffic by a subsequent hierarchical policer, regardless of its forwarding class. This traffic is given preference over any aggregate traffic received by that policer.</p> <p><b>NOTE:</b> The <b>force-premium</b> filter option is supported only on MPCs.</p> | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul>                                                                                                                    |
| <b>forwarding-class</b><br><i>class-name</i>        | <p>Classify the packet to the named forwarding class:</p> <ul style="list-style-type: none"> <li>• <i>forwarding-class-name</i></li> <li>• assured-forwarding</li> <li>• best-effort</li> <li>• expedited-forwarding</li> <li>• network-control</li> </ul>                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>• family any</li> <li>• family bridge</li> <li>• family ccc</li> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> <li>• family vpls</li> </ul> |
| hierarchical-policer                                | Police the packet using the specified hierarchical policer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>• family any</li> <li>• family bridge</li> <li>• family ccc</li> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> <li>• family vpls</li> </ul> |
| <b>ipsec-sa</b> <i>ipsec-sa</i>                     | <p>Use the specified IPsec security association.</p> <p><b>NOTE:</b> This action is not supported on MX Series routers, Type 5 FPCs on T4000 routers, and PTX Series Packet Transport Routers.</p>                                                                                                                                                                                                                                                                                                                                                                             | family inet                                                                                                                                                                                                |
| <b>load-balance</b><br><i>group-name</i>            | <p>Use the specified load-balancing group.</p> <p><b>NOTE:</b> This action is not supported on MX Series routers or PTX Series Packet Transport Routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   | family inet                                                                                                                                                                                                |
| <b>log</b>                                          | Log the packet header information in a buffer within the Packet Forwarding Engine. You can access this information by issuing the <b>show firewall log</b> command at the command-line interface (CLI).                                                                                                                                                                                                                                                                                                                                                                        | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul>                                                                                                                    |
| <b>logical-system</b><br><i>logical-system-name</i> | Direct packets to a specific logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul>                                                                                                                    |

Table 52: Nonterminating Actions for Firewall Filters (*continued*)

| Nonterminating Action                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Protocol Families                                                                                                                                                                                          |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loss-priority</b> (high   medium-high   medium-low   low) | <p>Set the packet loss priority (PLP) level.</p> <p>You cannot also configure the <b>three-color-policer</b> nonterminating action for the same firewall filter term. These two nonterminating actions are mutually exclusive.</p> <p>Supported on M120 and M320 routers; M7i and M10i routers with the Enhanced CFEB (CFEB-E); and MX Series routers.</p> <p>For IP traffic on M320, MX Series, and T Series routers with Enhanced II Flexible PIC Concentrators (FPCs), you must include the <b>tri-color</b> statement at the [edit <b>class-of-service</b>] hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can only configure the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p>For information about the <b>tri-color</b> statement and using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Understanding How Behavior Aggregate Classifiers Prioritize Trusted Traffic</i>.</p> | <ul style="list-style-type: none"> <li>• family any</li> <li>• family bridge</li> <li>• family ccc</li> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> <li>• family vpls</li> </ul> |
| <b>next-hop-group</b> <i>group-name</i>                      | Use the specified next-hop group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>• family any</li> <li>• family inet</li> </ul>                                                                                                                      |
| <b>next-interface</b> <i>interface-name</i>                  | (MX Series) Direct packets to the specified outgoing interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul>                                                                                                                    |
| <b>next-ip</b> <i>ip-address</i>                             | (MX Series) Direct packets to the specified destination IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | family inet                                                                                                                                                                                                |
| <b>next-ip6</b> <i>ipv6-address</i>                          | (MX Series) Direct packets to the specified destination IPv6 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | family inet6                                                                                                                                                                                               |
| <b>packet-mode</b>                                           | Updates a bit field in the packet key buffer, which specifies traffic that will bypass flow-based forwarding. Packets with the <b>packet-mode</b> action modifier follow the packet-based forwarding path and bypass flow-based forwarding completely. For more information about selective stateless packet-based services, see the <i>Junos OS Security Configuration Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | family any                                                                                                                                                                                                 |
| <b>policer</b> <i>policer-name</i>                           | Name of policer to use to rate-limit traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <ul style="list-style-type: none"> <li>• family any</li> <li>• family bridge</li> <li>• family ccc</li> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> <li>• family vpls</li> </ul> |

Table 52: Nonterminating Actions for Firewall Filters (*continued*)

| Nonterminating Action                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Protocol Families                                                                                                                                                                                          |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>port-mirror</b><br><i>instance-name</i>              | Port-mirror the packet based on the specified family. Supported on M120 routers, M320 routers configured with Enhanced III FPCs, MX Series routers, and PTX Series Packet Transport Routers only.                                                                                                                                                                                                                                                                                                                 | <ul style="list-style-type: none"> <li>• family any</li> <li>• family bridge</li> <li>• family ccc</li> <li>• family inet</li> <li>• family inet6</li> <li>• family vpls</li> <li>• family mpls</li> </ul> |
| <b>port-mirror-instance</b><br><i>instance-name</i>     | Port mirror a packet for an instance. This action is only supported on the MX series routers.                                                                                                                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>• family any</li> <li>• family bridge</li> <li>• family ccc</li> <li>• family inet</li> <li>• family inet6</li> <li>• family vpls</li> <li>• family mpls</li> </ul> |
| <b>prefix-action</b><br><i>action-name</i>              | Count or police packets based on the specified action name.<br><br><b>NOTE:</b> This action is not supported on PTX Series Packet Transport Routers.                                                                                                                                                                                                                                                                                                                                                              | family inet                                                                                                                                                                                                |
| <b>routing-instance</b><br><i>routing-instance-name</i> | Direct packets to the specified routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul>                                                                                                                    |
| <b>sample</b>                                           | Sample the packet.<br><br><b>NOTE:</b> Junos OS does not sample packets originating from the router. If you configure a filter and apply it to the output side of an interface, then only the transit packets going through that interface are sampled. Packets that are sent from the Routing Engine to the Packet Forwarding Engine are not sampled.                                                                                                                                                            | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> </ul>                                                                                             |
| <b>service-accounting</b>                               | <p>Use the inline counting mechanism when capturing subscriber per-service statistics.</p> <p>Count the packet for service accounting. The count is applied to a specific named counter (<b>_junos-dyn-service-counter</b>) that RADIUS can obtain.</p> <p>The <b>service-accounting</b> and <b>service-accounting-deferred</b> keywords are mutually exclusive, both per-term and per-filter.</p> <p><b>NOTE:</b> This action is not supported on T4000 Type 5 FPCs and PTX Series Packet Transport Routers.</p> | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul>                                                                                                                    |

Table 52: Nonterminating Actions for Firewall Filters (*continued*)

| Nonterminating Action                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Protocol Families                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>service-accounting-deferred</b>                                                            | <p>Use the deferred counting mechanism when capturing subscriber per-service statistics. The count is applied to a specific named counter (<code>_junos-dyn-service-counter</code>) that RADIUS can obtain.</p> <p>The <b>service-accounting</b> and <b>service-accounting-deferred</b> keywords are mutually exclusive, both per-term and per-filter.</p> <p><b>NOTE:</b> This action is not supported on T4000 Type 5 FPCs and PTX Series Packet Transport Routers.</p>                                              |                                                                                                                                                                                                                                |
| <b>service-filter-hit</b>                                                                     | <p>(Only if the <b>service-filter-hit</b> flag is marked by a previous filter in the current type of chained filters) Direct the packet to the next type of filters.</p> <p>Indicate to subsequent filters in the chain that the packet was already processed. This action, coupled with the <b>service-filter-hit</b> match condition in receiving filters, helps to streamline filter processing.</p> <p><b>NOTE:</b> This action is not supported on T4000 Type 5 FPCs and PTX Series Packet Transport Routers.</p> | <ul style="list-style-type: none"> <li>• <b>family inet</b></li> <li>• <b>family inet6</b></li> </ul>                                                                                                                          |

## Standard Firewall Filter Nonterminating Actions on ACX Series Routers

Standard stateless firewall filters support different sets of nonterminating actions for each protocol family.

**NOTE:** ACX Series routers do not support the next term action.

Table 53 on page 585 describes the nonterminating actions you can configure for a standard firewall filter term.

**Table 53: Nonterminating Actions for Standard Firewall Filters on ACX Series Routers**

| Nonterminating Action                    | Description                                                                                                                                                                                                                                                                 | Protocol Families                                                                                                          |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <code>count counter-name</code>          | Count the packet in the named counter.                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li>family any</li> <li>family inet</li> <li>family mpls</li> <li>family ccc</li> </ul> |
| <code>forwarding-class class-name</code> | Classify the packet based on the specified forwarding class: <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> </ul> <p><b>NOTE:</b> This action is supported on ingress only.</p> | <ul style="list-style-type: none"> <li>family inet</li> <li>family any</li> <li>family mpls</li> <li>family ccc</li> </ul> |
| <code>log</code>                         | Log the packet header information in a buffer within the Packet Forwarding Engine. You can access this information by issuing the <b>show firewall log</b> command at the command-line interface (CLI). <p><b>NOTE:</b> This action is supported on ingress only.</p>       | family inet                                                                                                                |

Table 53: Nonterminating Actions for Standard Firewall Filters on ACX Series Routers (*continued*)

| Nonterminating Action                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Protocol Families                                                                                                                                              |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>loss-priority (high   medium-high   low)</b> | <p>Set the packet loss priority (PLP) level.</p> <p>You cannot also configure the <b>three-color-policer</b> nonterminating action for the same firewall filter term. These two nonterminating actions are mutually exclusive.</p> <p>You must include the <b>tri-color</b> statement at the <b>[edit class-of-service]</b> hierarchy level to commit a PLP configuration with any of the four levels specified. If the <b>tri-color</b> statement is not enabled, you can configure only the <b>high</b> and <b>low</b> levels. This applies to all protocol families.</p> <p>For information about the <b>tri-color</b> statement, see <i>Configuring Tricolor Marking</i>. For information about using behavior aggregate (BA) classifiers to set the PLP level of incoming packets, see <i>Forwarding Classes Overview</i>.</p> <p><b>NOTE:</b> This action is supported on ingress only.</p> | <ul style="list-style-type: none"> <li>• <b>family any</b></li> <li>• <b>family inet</b></li> <li>• <b>family mpls</b></li> <li>• <b>family ccc</b></li> </ul> |
| <b>policer <i>policer-name</i></b>              | Name of policer to use to rate-limit traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>• <b>family any</b></li> <li>• <b>family inet</b></li> <li>• <b>family mpls</b></li> <li>• <b>family ccc</b></li> </ul> |

## Firewall Filter Terminating Actions

Firewall filters support a set of terminating actions for each protocol family. A filter-terminating action halts all evaluation of a firewall filter for a specific packet. The router performs the specified action, and no additional terms are examined.

**NOTE:** You cannot configure the **next term** action with a *terminating* action in the same filter term. However, you can configure the **next term** action with another *nonterminating* action in the same filter term.

[Table 54 on page 588](#) describes the terminating actions you can specify in a firewall filter term.

Table 54: Terminating Actions for Firewall Filters

| Terminating Action                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Protocols                                                                                                                                                                                                                                                                                |

| <b>accept</b>                                                | Accept the packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>• family any</li> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> <li>• family vpls</li> <li>• family ccc</li> <li>• family bridge</li> <li>• family <del>ethernet-switching</del> (for EX Series switches only)</li> </ul> |
| <b>decapsulate gre</b><br>[ routing-instance instance-name ] | <p>At a customer-facing interface on an MX Series router installed at the provider edge (PE) of an IPv4 transport network, enable de-encapsulation of generic routing encapsulation (GRE) packets transported through a filter-based GRE tunnel.</p> <p>You can configure a filter term that pairs this action with a match condition that includes a packet header match for the GRE protocol. For an IPv4 filter, include the <b>protocol gre</b> (or <b>protocol 47</b>) match condition. Attach the filter to the input of an Ethernet logical interface or aggregated Ethernet interface on a Modular Interface Card (MIC) or Modular Port Concentrator (MPC) in the router. If you commit a configuration that attaches a de-encapsulating filter to an interface that does not support filter-based GRE tunneling, the system writes a syslog warning message that the interface does not support the filter.</p> <p>When the interface receives a matched packet, processes that run on the Packet Forwarding Engine perform the following operations:</p> <ul style="list-style-type: none"> <li>• Remove the outer GRE header.</li> <li>• Forward the inner payload packet to its original destination by performing destination lookup.</li> </ul> <p>By default, the Packet Forwarding Engine uses the default routing instance to forward payload packets to the destination network. If the payload is MPLS, the Packet Forwarding Engine performs route lookup on the MPLS path routing table using the route label in the MPLS header.</p> <p>If you specify the <b>decapsulate</b> action with an optional routing instance name, the Packet Forwarding Engine performs route lookup on the routing instance, and the instance must be configured.</p> <p><b>NOTE:</b> The <b>decapsulate</b> action that you configure at the [edit firewall family inet filter filter-name term term-name] hierarchy level does not process traffic with IPv4 and IPv6 options. As a result, traffic with such options is discarded by the de-encapsulation of GRE packets functionality.</p> <p>For more information, see "<a href="#">Understanding Filter-Based Tunneling Across IPv4 Networks</a>" on page 767 and "<a href="#">Components of Filter-Based Tunneling Across IPv4 Networks</a>" on page 775.</p> | <ul style="list-style-type: none"> <li>• family inet</li> </ul>                                                                                                                                                                                                                          |

Table 54: Terminating Actions for Firewall Filters (*continued*)

| Terminating Action                                                                                                                                                                                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Protocols          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>decapsulate l2tp</b> [<br><b>routing-instance</b><br><i>instance-name</i> ] [<br><b>forwarding-class</b><br><i>class-name</i> ] [<br><b>output-interface</b><br><i>interface-name</i> ] [<br><b>cookie l2tpv3-cookie</b><br>] [ <b>sample</b> ] | <p>At a customer-facing interface on an MX Series router installed at the provider edge (PE) of an IPv4 transport network, enable de-encapsulation of Layer 2 tunneling protocol (L2TP) packets transported through a filter-based L2TP tunnel.</p> <p>You can configure a filter term that pairs this action with a match condition that includes a packet header match for the L2TP protocol. For IPv4 traffic, an input firewall filter <b>\$junos-input-filter</b> and an output firewall filter <b>\$junos-output-filter</b> are attached to the interface. Attach the filter to the input of an Ethernet logical interface or aggregated Ethernet interface on a Modular Interface Card (MIC) or Modular Port Concentrator (MPC) in the router. If you commit a configuration that attaches a de-encapsulating filter to an interface that does not support filter-based L2TP tunneling, the system writes a syslog warning message that the interface does not support the filter.</p> <p>The remote tunnel endpoint sends an IP tunnel packet that contains an Ethernet MAC address in the payload. If the destination MAC address of the payload packet contains the MAC address of the router, the Ethernet packet is sent in the outgoing direction towards the network, and it is processed and forwarded as though it is received on the customer port. If the source MAC address of the payload packet contains the MAC address of the router, the Ethernet packet is transmitted in the outgoing direction towards the customer port. If the tunnel does not contain the receive-cookie configured, packet injection does not happen. In such a case, any received tunnel packet is counted and dropped in the same manner in which packets that arrive with a wrong cookie are counted and dropped.</p> <p>The following parameters can be specified with the <b>decapsulate l2tp</b> action:</p> <ul style="list-style-type: none"> <li>• <b>routing-instance <i>instance-name</i></b>—By default, the Packet Forwarding Engine uses the default routing instance to forward payload packets to the destination network. If the payload is MPLS, the Packet Forwarding Engine performs route lookup on the MPLS path routing table using the route label in the MPLS header. If you specify the <b>decapsulate</b> action with an optional routing instance name, the Packet Forwarding Engine performs route lookup on the routing instance, and the instance must be configured.</li> <li>• <b>forwarding-class <i>class-name</i></b>—(Optional) Classify L2TP packets to the specified forwarding class.</li> <li>• <b>output-interface <i>interface-name</i></b>—(Optional) For L2TP tunnels, enable the packet to be duplicated and sent towards the customer or the network (based on the MAC address in the Ethernet payload).</li> <li>• <b>cookie <i>l2tpv3-cookie</i></b>—(Optional) For L2TP tunnels, specify the L2TP cookie for the duplicated packets. If the tunnel does not contain the receive-cookie configured, packet injection does not happen. In such a case, any received tunnel packet is counted and dropped in the same manner in which packets that arrive with a wrong cookie are counted and dropped.</li> <li>• <b>sample</b>—(Optional) Sample the packet. Junos OS does not sample packets originating from the router. If you configure a filter and apply it to the output side of an interface, then only the transit packets going through that interface are sampled. Packets that are sent from the Routing Engine to the Packet Forwarding Engine are not sampled.</li> </ul> <p><b>NOTE:</b> The <b>decapsulate l2tp</b> action that you configure at the [edit firewall family inet filter <i>filter-name</i> term <i>term-name</i>] hierarchy level does not process traffic with IPv4 and IPv6 options. As a result, traffic with such options is discarded by the de-encapsulation of L2TP packets functionality.</p> | <b>family inet</b> |

Table 54: Terminating Actions for Firewall Filters (*continued*)

| Terminating Action                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Protocols                                                                                                                                                                                                                                                                                                   |

| <b>discard</b>                       | Discard a packet silently, without sending an Internet Control Message Protocol (ICMP) message. Discarded packets are available for logging and sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <ul style="list-style-type: none"> <li>• family any</li> <li>• family inet</li> <li>• family inet6</li> <li>• family mpls</li> <li>• family vpls</li> <li>• family ccc</li> <li>• family bridge</li> <li>• family <del>ethernet-switching</del> ethernet-switching (for EX Series switches only)</li> </ul> |
| <b>encapsulate<br/>template-name</b> | <p>At a customer-facing interface on an MX Series router installed at the provider edge (PE) of an IPv4 transport network, enable filter-based generic routing encapsulation (GRE) tunneling using the specified tunnel template.</p> <p>You can configure a filter term that pairs this action with the appropriate match conditions, and then attach the filter to the input of an Ethernet logical interface or aggregated Ethernet interface on a Modular Interface Card (MIC) or Modular Port Concentrator (MPC) in the router. If you commit a configuration that attaches an encapsulating filter to an interface that does not support filter-based GRE tunneling, the system writes a syslog warning message that the interface does not support the filter.</p> <p>When the interface receives a matched packet, processes that run on the Packet Forwarding Engine use information in the specified tunnel template to perform the following operations:</p> <ol style="list-style-type: none"> <li>1. Attach a GRE header (with or without a tunnel key value, as specified in the tunnel template).</li> <li>2. Attach a header for the IPv4 transport protocol.</li> <li>3. Forward the resulting GRE packet from the tunnel source interface to the tunnel destination (the remote PE router).</li> </ol> <p>The specified tunnel template must be configured using the <a href="#">tunnel-end-point</a> statement under the <code>[edit firewall]</code> or <code>[edit logical-systems logical-system-name firewall]</code> hierarchy level. For more information, see “<a href="#">Understanding Filter-Based Tunneling Across IPv4 Networks</a>” on page 767.</p> | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> <li>• family any</li> <li>• family mpls</li> </ul>                                                                                                                                                                        |

Table 54: Terminating Actions for Firewall Filters (*continued*)

| Terminating Action                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Protocols                                                                               |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>encapsulate</b><br><i>template-name</i> (for L2TP tunnels) | <p>At a customer-facing interface on an MX Series router installed at the provider edge (PE) of an IPv4 transport network, enable filter-based L2TP tunneling using the specified tunnel template. You can configure a filter term that pairs this action with the appropriate match conditions, and then attach the filter to the input of an Ethernet logical interface or aggregated Ethernet interface on a Modular Interface Card (MIC) or Modular Port Concentrator (MPC) in the router. If you commit a configuration that attaches an encapsulating filter to an interface that does not support filter-based GRE tunneling, the system writes a syslog warning message that the interface does not support the filter. When the interface receives a matched packet, processes that run on the Packet Forwarding Engine use information in the specified tunnel template to perform the following operations:</p> <ol style="list-style-type: none"> <li>1. Attach an L2TP header (with or without a tunnel key value, as specified in the tunnel template).</li> <li>2. Attach a header for the IPv4 transport protocol.</li> <li>3. Forward the resulting L2TP packet from the tunnel source interface to the tunnel destination (the remote PE router). The specified tunnel template must be configured using the <b>tunnel-end-point</b> statement under the <b>[edit firewall]</b> or <b>[edit logical-systems logical-system-name firewall]</b> statement hierarchy.</li> </ol> | <ul style="list-style-type: none"> <li>• family inet</li> </ul>                         |
| <b>logical-system</b><br><i>logical-system-name</i>           | <p>Direct the packet to the specified logical system.</p> <p><b>NOTE:</b> This action is not supported on PTX Series Packet Transport Routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul> |

## Standard Firewall Filter Terminating Actions on ACX Series Routers

Standard stateless firewall filters support different sets of terminating actions for each protocol family.

**NOTE:** ACX Series routers do not support the `next term` action.

Table 55 on page 592 describes the terminating actions you can specify in a standard firewall filter term.

Table 55: Terminating Actions for Standard Firewall Filters on ACX Series Routers

| Terminating Action | Description                                                                                                                                               | Protocols                                                                                                                  |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>accept</b>      | Accept the packet.                                                                                                                                        | <ul style="list-style-type: none"> <li>family any</li> <li>family inet</li> <li>family mpls</li> <li>family ccc</li> </ul> |
| <b>discard</b>     | Discard a packet silently, without sending an Internet Control Message Protocol (ICMP) message. Discarded packets are available for logging and sampling. | <ul style="list-style-type: none"> <li>family any</li> <li>family inet</li> <li>family mpls</li> <li>family ccc</li> </ul> |

### Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List

This example shows how to configure a standard stateless firewall filter that limits certain TCP and Internet Control Message Protocol (ICMP) traffic destined for the Routing Engine by specifying a list of prefix sources that contain allowed BGP peers.

- [Requirements on page 595](#)
- [Overview on page 595](#)
- [Configuration on page 596](#)
- [Verification on page 597](#)

#### Requirements

No special configuration beyond device initialization is required before configuring this example.

#### Overview

In this example, you create a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except BGP peers that have a specified prefix.

A source prefix list, **plist\_bgp179**, is created that specifies the list of source prefixes that contain allowed BGP peers.

The stateless firewall filter **filter\_bgp179** matches all packets from the source prefix list **plist\_bgp179** to the destination port number 179.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set policy-options prefix-list plist_bgp179 apply-path "protocols bgp group <*> neighbor <*>"
set firewall family inet filter filter_bgp179 term 1 from source-address 0.0.0.0/0
set firewall family inet filter filter_bgp179 term 1 from source-prefix-list plist_bgp179 except
set firewall family inet filter filter_bgp179 term 1 from destination-port bgp
set firewall family inet filter filter_bgp179 term 1 then reject
set firewall family inet filter filter_bgp179 term 2 then accept
set interfaces lo0 unit 0 family inet filter input filter_bgp179
set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### Configure the Filter

### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the filter:

1. Expand the prefix list **bgp179** to include all prefixes pointed to by the BGP peer group defined by **protocols bgp group <\*> neighbor <\*>**.

```
[edit policy-options prefix-list plist_bgp179]
user@host# set apply-path " protocolsbgp group <*> neighbor <*>"
```

2. Define the filter term that rejects TCP connection attempts to port 179 from all requesters except the specified BGP peers.

```
[edit firewall family inet filter filter_bgp179]
user@host# set term term1 from source-address 0.0.0.0/0
user@host# set term term1 from source-prefix-list bgp179 except
user@host# set term term1 from destination-port bgp
user@host# set term term1 then reject
```

3. Define the other filter term to accept all packets.

```
[edit firewall family inet filter filter_bgp179]
user@host# set term term2 then accept
```

4. Apply the firewall filter to the loopback interface.

```
[edit interfaces lo0 unit 0 family inet]
user@host# set filter input filter_bgp179
user@host# set address 127.0.0.1/32
```

## Results

From configuration mode, confirm your configuration by entering the **show firewall**, **show interfaces**, and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show firewall
family inet {
  filter filter_bgp179 {
    term 1 {
      from {
        source-address {
          0.0.0.0/0;
        }
        source-prefix-list {
          plist_bgp179 except;
        }
        destination-port bgp;
      }
      then {
        reject;
      }
    }
    term 2 {
      then {
        accept;
      }
    }
  }
}

user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      filter {
        input filter_bgp179;
      }
      address 127.0.0.1/32;
    }
  }
}

user@host# show policy-options
prefix-list plist_bgp179 {
  apply-path "protocols bgp group <*> neighbor <*>";
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

### Displaying the Firewall Filter Applied to the Loopback Interface

- Purpose** Verify that the firewall filter `filter_bgp179` is applied to the IPv4 input traffic at logical interface `lo0.0`.
- Action** Use the `show interfaces statistics operational mode` command for logical interface `lo0.0`, and include the `detail` option. Under the **Protocol inet** section of the command output section, the **Input Filters** field displays the name of the stateless firewall filter applied to the logical interface in the input direction.

```
[edit]
user@host> show interfaces statistics lo0.0 detail
Logical interface lo0.0 (Index 321) (SNMP ifIndex 16) (Generation 130)
Flags: SNMP-Traps Encapsulation: Unspecified
Traffic statistics:
  Input bytes : 0
  Output bytes : 0
  Input packets: 0
  Output packets: 0
Local statistics:
  Input bytes : 0
  Output bytes : 0
  Input packets: 0
  Output packets: 0
Transit statistics:
  Input bytes : 0 0 bps
  Output bytes : 0 0 bps
  Input packets: 0 0 pps
  Output packets: 0 0 pps
Protocol inet, MTU: Unlimited, Generation: 145, Route table: 0
Flags: Sendbroadcast-pkt-to-re
Input Filters: filter_bgp179
Addresses, Flags: Primary
Destination: Unspecified, Local: 127.0.0.1, Broadcast: Unspecified,
Generation: 138
```

### Example: Configuring a Stateless Firewall Filter to Accept Traffic from Trusted Sources

This example shows how to create a stateless firewall filter that protects the Routing Engine from traffic originating from untrusted sources.

- [Requirements on page 599](#)
- [Overview on page 599](#)

- [Configuration on page 599](#)
- [Verification on page 602](#)

## Requirements

No special configuration beyond device initialization is required before configuring stateless firewall filters.

## Overview

In this example, you create a stateless firewall filter called `protect-RE` that discards all traffic destined for the Routing Engine except SSH and BGP protocol packets from specified trusted sources. This example includes the following firewall filter terms:

- **ssh-term**—Accepts TCP packets with a source address of `192.168.122.0/24` and a destination port that specifies SSH.
- **bgp-term**—Accepts TCP packets with a source address of `10.2.1.0/24` and a destination port that specifies BGP.
- **discard-rest-term**—For all packets that are not accepted by **ssh-term** or **bgp-term**, creates a firewall filter log and system logging records, then discards all packets.

**NOTE:** You can move terms within the firewall filter using the `insert` command. See *insert* in the *CLI User Guide*.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

```
set firewall family inet filter protect-RE term ssh-term from source-address
  192.168.122.0/24
set firewall family inet filter protect-RE term ssh-term from protocol tcp
set firewall family inet filter protect-RE term ssh-term from destination-port ssh
set firewall family inet filter protect-RE term ssh-term then accept
set firewall family inet filter protect-RE term bgp-term from source-address 10.2.1.0/24
set firewall family inet filter protect-RE term bgp-term from protocol tcp
set firewall family inet filter protect-RE term bgp-term from destination-port bgp
set firewall family inet filter protect-RE term bgp-term then accept
set firewall family inet filter protect-RE term discard-rest-term then log
set firewall family inet filter protect-RE term discard-rest-term then syslog
set firewall family inet filter protect-RE term discard-rest-term then discard
set interfaces lo0 unit 0 family inet filter input protect-RE
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the stateless firewall filter:

1. Create the stateless firewall filter.

```
[edit]
user@host# edit firewall family inet filter protect-RE
```

2. Create the first filter term.

```
[edit firewall family inet filter protect-RE]
user@host# edit term ssh-term
```

3. Define the protocol, destination port, and source address match conditions for the term.

```
[edit firewall family inet filter protect-RE term ssh-term]
user@host# set from protocol tcp destination-port ssh source-address
192.168.122.0/24
```

4. Define the actions for the term.

```
[edit firewall family inet filter protect-RE term ssh-term]
user@host# set then accept
```

5. Create the second filter term.

```
[edit firewall family inet filter protect-RE]
user@host# edit term bgp-term
```

6. Define the protocol, destination port, and source address match conditions for the term.

```
[edit firewall family inet filter protect-RE term bgp-term]
user@host# set from protocol tcp destination-port bgp source-address 10.2.1.0/24
```

7. Define the action for the term.

```
[edit firewall family inet filter protect-RE term bgp-term]
user@host# set then accept
```

8. Create the third filter term.

```
[edit firewall family inet filter protect-RE]
user@host# edit term discard-rest-term
```

9. Define the action for the term.

```
[edit firewall family inet filter protect-RE term discard-rest]
user@host# set then log syslog discard
```

10. Apply the filter to the input side of the Routing Engine interface.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet filter input protect-RE
```

**Results** Confirm your configuration by entering the **show firewall** command and the **show interfaces lo0** command from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@host# show firewall
family inet {
  filter protect-RE {
    term ssh-term {
      from {
        source-address {
          192.168.122.0/24;
        }
        protocol tcp;
        destination-port ssh;
      }
      then accept;
    }
    term bgp-term {
      from {
        source-address {
          10.2.1.0/24;
        }
        protocol tcp;
        destination-port bgp;
      }
      then accept;
    }
    term discard-rest-term {
      then {
        log;
        syslog;
        discard;
      }
    }
  }
}

user@host# show interfaces lo0
unit 0 {
  family inet {
    filter {
      input protect-RE;
    }
    address 127.0.0.1/32;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

```

[edit]
user@host# commit

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying Stateless Firewall Filter Configurations on page 602](#)
- [Verifying a Services, Protocols, and Trusted Sources Firewall Filter on page 602](#)
- [Displaying Stateless Firewall Filter Logs on page 603](#)

---

### Displaying Stateless Firewall Filter Configurations

|                |                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify the configuration of the firewall filter.                                                                                                                                                                                                                           |
| <b>Action</b>  | From configuration mode, enter the <b>show firewall</b> command and the <b>show interfaces lo0</b> command.                                                                                                                                                                |
| <b>Meaning</b> | Verify that the output shows the intended configuration of the firewall filter. In addition, verify that the terms are listed in the order in which you want the packets to be tested. You can move terms within a firewall filter by using the <b>insert</b> CLI command. |

---

### Verifying a Services, Protocols, and Trusted Sources Firewall Filter

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify that the actions of the firewall filter terms are taken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Action</b>  | <p>Send packets to the device that match the terms. In addition, verify that the filter actions are <i>not</i> taken for packets that do not match.</p> <ul style="list-style-type: none"><li>• Use the <b>ssh host-name</b> command from a host at an IP address that matches <b>192.168.122.0/24</b> to verify that you can log in to the device using only SSH from a host with this address prefix.</li><li>• Use the <b>show route summary</b> command to verify that the routing table on the device does not contain any entries with a protocol other than <b>Direct</b>, <b>Local</b>, <b>BGP</b>, or <b>Static</b>.</li></ul> |

## Sample Output

```
% ssh 192.168.249.71
%ssh host
user@host's password:
--- JUNOS 6.4-20040518.0 (JSERIES) #0: 2004-05-18 09:27:50 UTC

user@host>

user@host> show route summary
Router ID: 192.168.249.71

inet.0: 34 destinations, 34 routes (33 active, 0 holddown, 1 hidden)
      Direct:    10 routes,      9 active
        Local:    9 routes,      9 active
         BGP:    10 routes,     10 active
        Static:    5 routes,      5 active
...
```

**Meaning** Verify the following information:

- You can successfully log in to the device using SSH.
- The **show route summary** command does not display a protocol other than **Direct**, **Local**, **BGP**, or **Static**.

### Displaying Stateless Firewall Filter Logs

**Purpose** Verify that packets are being logged. If you included the **log** or **syslog** action in a term, verify that packets matching the term are recorded in the firewall log or your system logging facility.

**Action** From operational mode, enter the **show firewall log** command.

### Sample Output

```
user@host> show firewall log
Log :
Time      Filter  Action Interface  Protocol Src Addr      Dest Addr
15:11:02  pfe      D    ge-0/0/0.0   TCP      172.17.28.19  192.168.70.71
15:11:01  pfe      D    ge-0/0/0.0   TCP      172.17.28.19  192.168.70.71
15:11:01  pfe      D    ge-0/0/0.0   TCP      172.17.28.19  192.168.70.71
15:11:01  pfe      D    ge-0/0/0.0   TCP      172.17.28.19  192.168.70.71
...
```

**Meaning** Each record of the output contains information about the logged packet. Verify the following information:

- Under **Time**, the time of day the packet was filtered is shown.
- The **Filter** output is always **pfe**.
- Under **Action**, the configured action of the term matches the action taken on the packet—**A** (accept), **D** (discard), **R** (reject).
- Under **Interface**, the inbound (ingress) interface on which the packet arrived is appropriate for the filter.
- Under **Protocol**, the protocol in the IP header of the packet is appropriate for the filter.
- Under **Src Addr**, the source address in the IP header of the packet is appropriate for the filter.
- Under **Dest Addr**, the destination address in the IP header of the packet is appropriate for the filter.

## Example: Configuring a Filter to Block Telnet and SSH Access

---

- [Requirements on page 604](#)
- [Overview on page 604](#)
- [Configuration on page 604](#)
- [Verification on page 606](#)

### Requirements

You must have access to a remote host that has network connectivity with this device.

### Overview

In this example, you create an IPv4 stateless firewall filter that logs and rejects Telnet or SSH access packets unless the packet is destined for or originates from the 192.168.1.0/24 subnet.

- To match packets destined for or originating from the **address 192.168.1.0/24** subnet, you use the **address 192.168.1.0/24** IPv4 match condition.
- To match packets destined for or originating from a TCP port, Telnet port, or SSH port, you use the **protocol tcp**, **port telnet**, and **telnet ssh** IPv4 match conditions.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 605](#)
- [Apply the Firewall Filter to the Loopback Interface on page 605](#)
- [Confirm and Commit Your Candidate Configuration on page 605](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set firewall family inet filter local_acl term terminal_access from address 192.168.1.0/24
set firewall family inet filter local_acl term terminal_access from protocol tcp
set firewall family inet filter local_acl term terminal_access from port ssh
set firewall family inet filter local_acl term terminal_access from port telnet
set firewall family inet filter local_acl term terminal_access then accept
set firewall family inet filter local_acl term terminal_access_denied from protocol tcp
set firewall family inet filter local_acl term terminal_access_denied from port ssh
set firewall family inet filter local_acl term terminal_access_denied from port telnet
set firewall family inet filter local_acl term terminal_access_denied then log
set firewall family inet filter local_acl term terminal_access_denied then reject
set firewall family inet filter local_acl term default-term then accept
set interfaces lo0 unit 0 family inet filter input local_acl
```

```
set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### Configure the Stateless Firewall Filter

**Step-by-Step Procedure** To configure the stateless firewall filter that selectively blocks Telnet and SSH access:

1. Create the stateless firewall filter **local\_acl**.

```
[edit]
user@myhost# edit firewall family inet filter local_acl
```

2. Define the filter term **terminal\_access**.

```
[edit firewall family inet filter local_acl]
user@myhost# set term terminal_access from address 192.168.1.0/24
user@myhost# set term terminal_access from protocol tcp
user@myhost# set term terminal_access from port ssh
user@myhost# set term terminal_access from port telnet
user@myhost# set term terminal_access then accept
```

3. Define the filter term **terminal\_access\_denied**.

```
[edit firewall family inet filter local_acl]
user@myhost# set term terminal_access_denied from protocol tcp
user@myhost# set term terminal_access_denied from port ssh
user@myhost# set term terminal_access_denied from port telnet
user@myhost# set term terminal_access_denied then log
user@myhost# set term terminal_access_denied then reject
user@myhost# set term default-term then accept
```

### Apply the Firewall Filter to the Loopback Interface

**Step-by-Step Procedure** • To apply the firewall filter to the loopback interface:

```
[edit]
user@myhost# set interfaces lo0 unit 0 family inet filter input local_acl
user@myhost# set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### Confirm and Commit Your Candidate Configuration

**Step-by-Step Procedure** To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@myhost# show firewall
family inet {
  filter local_acl {
    term terminal_access {
      from {
        address {
          192.168.1.0/24;
        }
        protocol tcp;
      }
    }
  }
}
```

```
        port [ssh telnet];
    }
    then accept;
}
term terminal_access_denied {
    from {
        protocol tcp;
        port [ssh telnet];
    }
    then {
        log;
        reject;
    }
}
term default-term {
    then accept;
}
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@myhost# show interfaces
lo0 {
    unit 0 {
        family inet {
            filter {
                input local_acl;
            }
            address 127.0.0.1/32;
        }
    }
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]
user@myhost# commit
```

## Verification

Confirm that the configuration is working properly.

- [Verifying Accepted Packets on page 606](#)
- [Verifying Logged and Rejected Packets on page 607](#)

---

### Verifying Accepted Packets

**Purpose** Verify that the actions of the firewall filter terms are taken.

- Action** 1. Clear the firewall log on your router or switch.

```
user@myhost> clear firewall log
```

2. From a host at an IP address *within* the 192.168.1.0/24 subnet, use the **ssh *hostname*** command to verify that you can log in to the device using only SSH. This packet should be accepted, and the packet header information for this packet should not be logged in the firewall filter log buffer in the Packet Forwarding Engine.

```
user@host-A> ssh myhost
user@myhosts's password:
--- JUNOS 11.1-20101102.0 built 2010-11-02 04:48:46 UTC
```

```
% cli
user@myhost>
```

3. From a host at an IP address *within* the 192.168.1.0/24 subnet, use the **telnet *hostname*** command to verify that you can log in to your router or switch using only Telnet. This packet should be accepted, and the packet header information for this packet should not be logged in the firewall filter log buffer in the Packet Forwarding Engine.

```
user@host-A> telnet myhost
Trying 192.168.249.71...
Connected to myhost-fxp0.acme.net.
Escape character is '^['.
```

```
host (ttyp0)
```

```
login: user
Password:
```

```
--- JUNOS 11.1-20101102.0 built 2010-11-02 04:48:46 UTC
```

```
% cli
user@myhost>
```

4. Use the **show firewall log** command to verify that the routing table on the device does not contain any entries with a source address in the 192.168.1.0/24 subnet.

```
user@myhost> show firewall log
```

### Verifying Logged and Rejected Packets

- Purpose** Verify that the actions of the firewall filter terms are taken.

- Action** 1. Clear the firewall log on your router or switch.

```
user@myhost> clear firewall log
```

2. From a host at an IP address *outside of* the 192.168.1.0/24 subnet, use the **ssh hostname** command to verify that you cannot log in to the device using only SSH. This packet should be rejected, and the packet header information for this packet should be logged in the firewall filter log buffer in the Packet Forwarding Engine.

```
user@host-B ssh myhost
ssh: connect to host sugar port 22: Connection refused
--- JUNOS 11.1-20101102.0 built 2010-11-02 04:48:46 UTC
%
```

3. From a host at an IP address *outside of* the 192.168.1.0/24 subnet, use the **telnet hostname** command to verify that you can log in to the device using only Telnet. This packet should be rejected, and the packet header information for this packet should be logged in the firewall filter log buffer in the PFE.

```
user@host-B> telnet myhost
Trying 192.168.249.71...
telnet: connect to address 192.168.187.3: Connection refused
telnet: Unable to connect to remote host
%
```

4. Use the **show firewall log** command to verify that the routing table on the device does not contain any entries with a source address in the 192.168.1.0/24 subnet.

```
user@myhost> show firewall log
```

| Time     | Filter    | Action | Interface | Protocol | Src Addr      | Dest Addr     |

## Example: Configuring a Filter to Block TFTP Access

- [Requirements on page 608](#)
- [Overview on page 609](#)
- [Configuration on page 609](#)
- [Verification on page 611](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

By default, to decrease vulnerability to denial-of-service (DoS) attacks, the Junos OS filters and discards Dynamic Host Configuration Protocol (DHCP) or Bootstrap Protocol (BOOTP) packets that have a source address of 0.0.0.0 and a destination address of 255.255.255.255. This default filter is known as a unicast RPF check. However, some vendors' equipment automatically accepts these packets.

To interoperate with other vendors' equipment, you can configure a filter that checks for both of these addresses and overrides the default RPF-check filter by accepting these packets. In this example, you block Trivial File Transfer Protocol (TFTP) access, logging any attempts to establish TFTP connections.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 609](#)
- [Apply the Firewall Filter to the Loopback Interface on page 610](#)
- [Confirm and Commit Your Candidate Configuration on page 610](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter tftp_access_control term one from protocol udp
set firewall family inet filter tftp_access_control term one from port tftp
set firewall family inet filter tftp_access_control term one then log
set firewall family inet filter tftp_access_control term one then discard
set interfaces lo0 unit 0 family inet filter input tftp_access_control
set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter that selectively blocks TFTP access:

1. Create the stateless firewall filter **tftp\_access\_control**.  
  
[edit]  
user@host# edit firewall family inet filter tftp\_access\_control
2. Specify a match on packets received on UDP port 69.  
  
[edit firewall family inet filter tftp\_access\_control]  
user@host# set term one from protocol udp  
user@host# set term one from port tftp
3. Specify that matched packets be logged to the buffer on the Packet Forwarding Engine and then discarded.  
  
[edit firewall family inet filter tftp\_access\_control]

```
user@host# set term one then log
user@host# set term one then discard
```

---

### Apply the Firewall Filter to the Loopback Interface

---

#### Step-by-Step Procedure

To apply the firewall filter to the loopback interface:

- [edit]  
user@host# set interfaces lo0 unit 0 family inet filter input tftp\_access\_control  
user@host# set interfaces lo0 unit 0 family inet address 127.0.0.1/32

---

### Confirm and Commit Your Candidate Configuration

---

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter tftp_access_control {
    term one {
      from {
        protocol udp;
        port tftp;
      }
      then {
        log;
        discard;
      }
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      filter {
        input tftp_access_control;
      }
      address 127.0.0.1/32;
    }
  }
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]
```

```
user@host# commit
```

## Verification

Confirm that the configuration is operating properly:

- [Verifying Logged and Discarded Packets on page 611](#)

### Verifying Logged and Discarded Packets

---

**Purpose** Verify that the actions of the firewall filter terms are taken.

**Action** To

1. Clear the firewall log on your router or switch.

```
user@myhost> clear firewall log
```

2. From another host, send a packet to UDP port **69** on this router or switch.

## Example: Configuring a Filter to Accept Packets Based on IPv6 TCP Flags

---

This example shows how to configure a standard stateless firewall filter to accept packets from a trusted source.

- [Requirements on page 611](#)
- [Overview on page 611](#)
- [Configuration on page 612](#)
- [Verification on page 613](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you create a filter that accepts packets with specific IPv6 TCP flags.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Stateless Firewall Filter on page 612](#)
- [Apply the Firewall Filter to the Loopback Interface on page 612](#)
- [Confirm and Commit Your Candidate Configuration on page 613](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet6 filter tcp_filter term 1 from next-header tcp
set firewall family inet6 filter tcp_filter term 1 from tcp-flags syn
set firewall family inet6 filter tcp_filter term 1 then count tcp_syn_pkt
set firewall family inet6 filter tcp_filter term 1 then log
set firewall family inet6 filter tcp_filter term 1 then accept
set interfaces lo0 unit 0 family inet6 filter input tcp_filter
set interfaces lo0 unit 0 family inet6 address ::10.34.1.0/120
```

---

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the firewall filter

1. Create the IPv6 stateless firewall filter **tcp\_filter**.

```
[edit]
user@host# edit firewall family inet6 filter tcp_filter
```

2. Specify that a packet matches if it is the initial packet in a TCP session and the next header after the IPv6 header is type TCP.

```
[edit firewall family inet6 filter tcp_filter]
user@host# set term 1 from next-header tcp
user@host# set term 1 from tcp-flags syn
```

3. Specify that matched packets are counted, logged to the buffer on the Packet Forwarding Engine, and accepted.

```
[edit firewall family inet6 filter tcp_filter]
user@host# set term 1 then count tcp_syn_pkt
user@host# set term 1 then log
user@host# set term 1 then accept
```

---

### Apply the Firewall Filter to the Loopback Interface

#### Step-by-Step Procedure

To apply the firewall filter to the loopback interface:

- ```
[edit]
user@host# set interfaces lo0 unit 0 family inet6 filter input tcp_filter
user@host# set interfaces lo0 unit 0 family inet6 address ::10.34.1.0/120
```

## Confirm and Commit Your Candidate Configuration

### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet6 {
  filter tcp_filter {
    term 1 {
      from {
        next-header tcp;
        tcp-flags syn;
      }
      then {
        count tcp_syn_pkt;
        log;
        accept;
      }
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
lo0 {
  unit 0 {
    family inet6 {
      filter {
        input tcp_filter;
      }
      address ::10.34.1.0/120;
    }
  }
}
```

3. When you are done configuring the device, commit your candidate configuration.

```
[edit]
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the **show firewall** operational mode command.

### Related Documentation

- [Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers on page 620](#)

---

## Example: Filtering Packets Received on an Interface Set

This example shows how to configure a standard stateless firewall filter to match packets tagged for a particular interface set.

- [Requirements on page 614](#)
- [Overview on page 614](#)
- [Configuration on page 615](#)
- [Verification on page 620](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, you apply a stateless firewall filter to the input of the router or switch loopback interface. The firewall filter includes a term that matches packets tagged for a particular interface set.

---

### Topology

You create the firewall filter **L2\_filter** to apply rate limits to the protocol-independent traffic received on the following interfaces:

- **fe-0/0/0.0**
- **fe-1/0/0.0**
- **fe-1/1/0.0**

**NOTE:** The interface type in this topic is just an example. The **fe-** interface type is not supported by EX Series switches.

---

First, for protocol-independent traffic received on **fe-0/0/0.0**, the firewall filter term **t1** applies policer **p1**.

For protocol-independent traffic received on any other Fast Ethernet interfaces, firewall filter term **t2** applies policer **p2**. To define an interface set that consists of all Fast Ethernet interfaces, you include the **interface-set *interface-set-name interface-name*** statement at the **[edit firewall]** hierarchy level. To define a packet-matching criteria based on the

interface on which a packet arrives to a specified interface set, you configure a term that uses the **interface-set** firewall filter match condition.

Finally, for any other protocol-independent traffic, firewall filter term **t3** applies policer **p3**.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Interfaces for Which the Stateless Firewall Filter Terms Take Rate-Limiting Actions on page 616](#)
- [Configuring the Stateless Firewall Filter That Rate-Limits Protocol-Independent Traffic Based on the Interfaces on Which Packets Arrive on page 617](#)
- [Applying the Stateless Firewall Filter to the Routing Engine Input Interface on page 619](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces fe-0/0/0 unit 0 family inet address 10.1.1.1/30
set interfaces fe-1/0/0 unit 0 family inet address 10.2.2.1/30
set interfaces fe-1/1/0 unit 0 family inet address 10.4.4.1/30
set firewall policer p1 if-exceeding bandwidth-limit 5m
set firewall policer p1 if-exceeding burst-size-limit 10m
set firewall policer p1 then discard
set firewall policer p2 if-exceeding bandwidth-limit 40m
set firewall policer p2 if-exceeding burst-size-limit 100m
set firewall policer p2 then discard
set firewall policer p3 if-exceeding bandwidth-limit 600m
set firewall policer p3 if-exceeding burst-size-limit 1g
set firewall policer p3 then discard
set firewall interface-set ifset fe-*
set firewall family any filter L2_filter term t1 from interface fe-0/0/0.0
set firewall family any filter L2_filter term t1 then count c1
set firewall family any filter L2_filter term t1 then policer p1
set firewall family any filter L2_filter term t2 from interface-set ifset
set firewall family any filter L2_filter term t2 then count c2
set firewall family any filter L2_filter term t2 then policer p2
set firewall family any filter L2_filter term t3 then count c3
set firewall family any filter L2_filter term t3 then policer p3
set interfaces lo0 unit 0 family inet address 1.1.1.157/30
set interfaces lo0 unit 0 filter input L2_filter
```

## Configuring the Interfaces for Which the Stateless Firewall Filter Terms Take Rate-Limiting Actions

**Step-by-Step Procedure** To configure the interfaces for which the stateless firewall filter terms take rate-limiting actions:

1. Configure the logical interface whose input traffic will be matched by the first term of the firewall filter.

```
[edit]
user@host# set interfaces fe-0/0/0 unit 0 family inet address 10.1.1.1/30
```

2. Configure the logical interfaces whose input traffic will be matched by the second term of the firewall filter.

```
[edit ]
user@host# set interfaces fe-1/0/0 unit 0 family inet address 10.2.2.1/30
user@host# set interfaces fe-1/1/0 unit 0 family inet address 10.4.4.1/30
```

3. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm the configuration of the router (or switch) transit interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
fe-0/0/0 {
  unit 0 {
    family inet {
      address 10.1.1.1/30;
    }
  }
}
fe-1/0/0 {
  unit 0 {
    family inet {
      address 10.2.2.1/30;
    }
  }
}
fe-1/1/0 {
  unit 0 {
    family inet {
      address 10.4.4.1/30;
    }
  }
}
```

### Configuring the Stateless Firewall Filter That Rate-Limits Protocol-Independent Traffic Based on the Interfaces on Which Packets Arrive

**Step-by-Step Procedure** To configure the standard stateless firewall **L2\_filter** that uses policers (**p1**, **p2**, and **p3**) to rate-limit protocol-independent traffic based on the interfaces on which the packets arrive:

1. Configure the firewall statements.  

```
[edit]
user@host# edit firewall
```
2. Configure the policer **p1** to discard traffic that exceeds a traffic rate of **5m** bps or a burst size of **10m** bytes.  

```
[edit firewall]
user@host# set policer p1 if-exceeding bandwidth-limit 5m
user@host# set policer p1 if-exceeding burst-size-limit 10m
user@host# set policer p1 then discard
```
3. Configure the policer **p2** to discard traffic that exceeds a traffic rate of **40m** bps or a burst size of **100m** bytes.  

```
[edit firewall]
user@host# set policer p2 if-exceeding bandwidth-limit 40m
user@host# set policer p2 if-exceeding burst-size-limit 100m
user@host# set policer p2 then discard
```
4. Configure the policer **p3** to discard traffic that exceeds a traffic rate of **600m** bps or a burst size of **1g** bytes.  

```
[edit firewall]
user@host# set policer p3 if-exceeding bandwidth-limit 600m
user@host# set policer p3 if-exceeding burst-size-limit 1g
user@host# set policer p3 then discard
```
5. Define the interface set **ifset** to be the group of all Fast Ethernet interfaces on the router.  

```
[edit firewall]
user@host# set interface-set ifset fe-*
```
6. Create the stateless firewall filter **L2\_filter**.  

```
[edit firewall]
user@host# edit family any filter L2_filter
```
7. Configure filter term **t1** to match IPv4, IPv6, or MPLS packets received on interface **fe-0/0/0.0** and use policer **p1** to rate-limit that traffic.  

```
[edit firewall family any filter L2_filter]
user@host# set term t1 from interface fe-0/0/0.0
user@host# set term t1 then count c1
user@host# set term t1 then policer p1
```
8. Configure filter term **t2** to match packets received on interface-set **ifset** and use policer **p2** to rate-limit that traffic.  

```
[edit firewall family any filter L2_filter]
```

```
user@host# set term t2 from interface-set ifset
user@host# set term t2 then count c2
user@host# set term t2 then policer p2
```

9. Configure filter term **t3** to use policer **p3** to rate-limit all other traffic.

```
[edit firewall family any filter L2_filter]
user@host# set term t3 then count c3
user@host# set term t3 then policer p3
```

10. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

**Results** Confirm the configuration of the stateless firewall filter and the policers referenced as firewall filter actions by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family any {
  filter L2_filter {
    term t1 {
      from {
        interface fe-0/0/0.0;
      }
      then {
        policer p1;
        count c1;
      }
    }
    term t2 {
      from {
        interface-set ifset;
      }
      then {
        policer p2;
        count c2;
      }
    }
    term t3 {
      then {
        policer p3;
        count c3;
      }
    }
  }
}
policer p1 {
  if-exceeding {
    bandwidth-limit 5m;
    burst-size-limit 10m;
  }
  then discard;
```

```

}
policer p2 {
  if-exceeding {
    bandwidth-limit 40m;
    burst-size-limit 100m;
  }
  then discard;
}
policer p3 {
  if-exceeding {
    bandwidth-limit 600m;
    burst-size-limit 1g;
  }
  then discard;
}
interface-set ifset {
  fe-*;
}

```

### Applying the Stateless Firewall Filter to the Routing Engine Input Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to the Routing Engine input interface:

1. Apply the stateless firewall filter to the Routing Engine interface in the input direction.

```

[edit]
user@host# set interfaces lo0 unit 0 family inet address 1.1.1.157/30
user@host# set interfaces lo0 unit 0 filter input L2_filter

```

2. If you are done configuring the device, commit the configuration.

```

[edit]
user@host# commit

```

**Results** Confirm the application of the firewall filter to the Routing Engine input interface by entering the **show interfaces** command again. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

user@host# show interfaces
fe-0/0/0 {
  ...
}
fe-1/0/0 {
  ...
}
fe-1/1/0 {
  ...
}
lo0 {
  unit 0 {
    filter {
      input L2_filter;
    }
    family inet {
      address 1.1.1.157/30;
    }
  }
}

```

```
    }  
  }  
}
```

## Verification

To confirm that the configuration is working properly, use the [show firewall filter L2\\_filter](#) operational mode command to monitor traffic statistics about the firewall filter and three counters.

- [Statement Hierarchy for Configuring a Filter to Match on an Interface Set on page 751](#)

## Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers

---

This example shows how to configure a standard stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except from specified BGP peers.

- [Requirements on page 620](#)
- [Overview on page 620](#)
- [Configuration on page 621](#)
- [Verification on page 624](#)

## Requirements

No special configuration beyond device initialization is required before you configure this example.

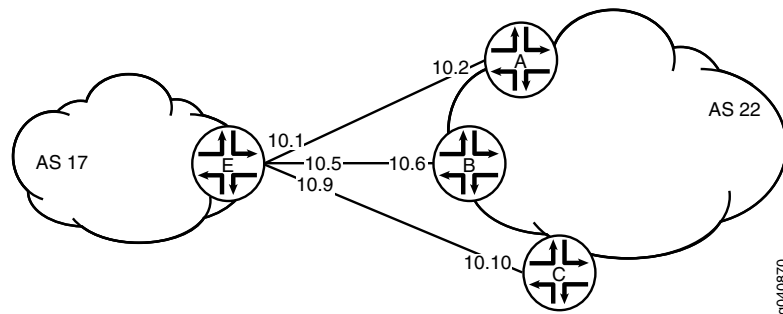

## Overview

In this example, you create a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requesters except the specified BGP peers.

The stateless firewall filter **filter\_bgp179** matches all packets from the directly connected interfaces on Device A and Device B to the destination port number 179.

[Figure 46 on page 621](#) shows the topology used in this example. Device C attempts to make a TCP connection to Device E. Device E blocks the connection attempt. This example shows the configuration on Device E.

Figure 46: Typical Network with BGP Peer Sessions

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device C**

```
set interfaces ge-1/2/0 unit 10 description to-E
set interfaces ge-1/2/0 unit 10 family inet address 10.10.10.10/30
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 17
set protocols bgp group external-peers neighbor 10.10.10.9
set routing-options autonomous-system 22
```

**Device E**

```
set interfaces ge-1/2/0 unit 0 description to-A
set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/2/1 unit 5 description to-B
set interfaces ge-1/2/1 unit 5 family inet address 10.10.10.5/30
set interfaces ge-1/0/0 unit 9 description to-C
set interfaces ge-1/0/0 unit 9 family inet address 10.10.10.9/30
set interfaces lo0 unit 2 family inet filter input filter_bgp179
set interfaces lo0 unit 2 family inet address 192.168.0.1/32
set protocols bgp group external-peers type external
set protocols bgp group external-peers peer-as 22
set protocols bgp group external-peers neighbor 10.10.10.2
set protocols bgp group external-peers neighbor 10.10.10.6
set protocols bgp group external-peers neighbor 10.10.10.10
set routing-options autonomous-system 17
set firewall family inet filter filter_bgp179 term 1 from source-address 10.10.10.2/32
set firewall family inet filter filter_bgp179 term 1 from source-address 10.10.10.6/32
set firewall family inet filter filter_bgp179 term 1 from destination-port bgp
set firewall family inet filter filter_bgp179 term 1 then accept
set firewall family inet filter filter_bgp179 term 2 then reject
```

## Configuring Device E

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device E with a stateless firewall filter that blocks all TCP connection attempts to port 179 from all requestors except specified BGP peers:

1. Configure the interfaces.

```
user@E# set interfaces ge-1/2/0 unit 0 description to-A
user@E# set interfaces ge-1/2/0 unit 0 family inet address 10.10.10.1/30
```

```
user@E# set interfaces ge-1/2/1 unit 5 description to-B
user@E# set interfaces ge-1/2/1 unit 5 family inet address 10.10.10.5/30
```

```
user@E# set interfaces ge-1/0/0 unit 9 description to-C
user@E# set interfaces ge-1/0/0 unit 9 family inet address 10.10.10.9/30
```

2. Configure BGP.

```
[edit protocols bgp group external-peers]
user@E# set type external
user@E# set peer-as 22
user@E# set neighbor 10.10.10.2
user@E# set neighbor 10.10.10.6
user@E# set neighbor 10.10.10.10
```

3. Configure the autonomous system number.

```
[edit routing-options]
user@E# set autonomous-system 17
```

4. Define the filter term that accepts TCP connection attempts to port 179 from the specified BGP peers.

```
[edit firewall family inet filter filter_bgp179]
user@E# set term 1 from source-address 10.10.10.2/32
user@E# set term 1 from source-address 10.10.10.6/32
user@E# set term 1 from destination-port bgp
user@E# set term 1 then accept
```

5. Define the other filter term to reject packets from other sources.

```
[edit firewall family inet filter filter_bgp179]
user@E# set term 2 then reject
```

6. Apply the firewall filter to the loopback interface.

```
[edit interfaces lo0 unit 2 family inet]
user@E# set filter input filter_bgp179
user@E# set address 192.168.0.1/32
```

**Results** From configuration mode, confirm your configuration by entering the **show firewall**, **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not

display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@E# show firewall
family inet {
  filter filter_bgp179 {
    term 1 {
      from {
        source-address {
          10.10.10.2/32;
          10.10.10.6/32;
        }
        destination-port bgp;
      }
      then accept;
    }
    term 2 {
      then {
        reject;
      }
    }
  }
}

user@E# show interfaces
lo0 {
  unit 2 {
    family inet {
      filter {
        input filter_bgp179;
      }
      address 192.168.0.1/32;
    }
  }
}
ge-1/2/0 {
  unit 0 {
    description to-A;
    family inet {
      address 10.10.10.1/30;
    }
  }
}
ge-1/2/1 {
  unit 5 {
    description to-B;
    family inet {
      address 10.10.10.5/30;
    }
  }
}
ge-1/0/0 {
  unit 9 {
    description to-C;
    family inet {
      address 10.10.10.9/30;
    }
  }
}

```

```

    }
  }
}

user@E# show protocols
bgp {
  group external-peers {
    type external;
    peer-as 22;
    neighbor 10.10.10.2;
    neighbor 10.10.10.6;
    neighbor 10.10.10.10;
  }
}

user@E# show routing-options
autonomous-system 17;

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying That the Filter Is Configured on page 624](#)
- [Verifying the TCP Connections on page 624](#)
- [Monitoring Traffic on the Interfaces on page 625](#)

### Verifying That the Filter Is Configured

**Purpose** Make sure that the filter is listed in output of the **show firewall filter** command.

**Action** user@E> show firewall filter filter\_bgp179  
Filter: filter\_bgp179

### Verifying the TCP Connections

**Purpose** Verify the TCP connections.

**Action** From operational mode, run the **show system connections extensive** command on Device C and Device E.

The output on Device C shows the attempt to establish a TCP connection. The output on Device E shows that connections are established with Device A and Device B only.

user@C> show system connections extensive | match 10.10.10

```
tcp4      0      0 10.10.10.9.51872    10.10.10.10.179    SYN_SENT
```

user@E> show system connections extensive | match 10.10.10

```
tcp4      0      0 10.10.10.5.179      10.10.10.6.62096   ESTABLISHED
tcp4      0      0 10.10.10.6.62096    10.10.10.5.179     ESTABLISHED
tcp4      0      0 10.10.10.1.179      10.10.10.2.61506   ESTABLISHED
tcp4      0      0 10.10.10.2.61506    10.10.10.1.179     ESTABLISHED
```

## Monitoring Traffic on the Interfaces

**Purpose** Use the **monitor traffic** command to compare the traffic on an interface that establishes a TCP connection with the traffic on an interface that does not establish a TCP connection.

**Action** From operational mode, run the **monitor traffic** command on the Device E interface to Device B and on the Device E interface to Device C. The following sample output verifies that in the first example, acknowledgment (**ack**) messages are received. In the second example, **ack** messages are not received.

```
user@E> monitor traffic size 1500 interface ge-1/2/1.5

## Example: Configuring a Stateless Firewall Filter to Protect Against TCP and ICMP Floods

---

This example shows how to create a stateless firewall filter that protects against TCP and ICMP denial-of-service attacks.

- [Requirements on page 626](#)
- [Overview on page 626](#)
- [Configuration on page 627](#)
- [Verification on page 632](#)

### Requirements

No special configuration beyond device initialization is required before configuring stateless firewall filters.

### Overview

In this example, you create a stateless firewall filter called **protect-RE** that polices TCP and ICMP packets. This example includes the following policers:

- **tcp-connection-policer**—Limits the traffic rate of the TCP packets to 500,000 bps and the burst size to 15,000 bytes. Packets that exceed the traffic rate are discarded.
- **icmp-policer**—Limits the traffic rate of the ICMP packets to 1,000,000 bps and the burst size to 15,000 bytes. Packets that exceed the traffic rate are discarded.

When specifying limits, the bandwidth limit can be from 32,000 bps to 32,000,000,000 bps and the burst-size limit can be from 1,500 bytes through 100,000,000 bytes. Use the following abbreviations when specifying limits: k (1,000), m (1,000,000), and g (1,000,000,000).

Each policer is incorporated into the action of a filter term. This example includes the following terms:

- **tcp-connection-term**—Polices certain TCP packets with a source address of 192.168.0.0/24 or 10.0.0.0/24. These addresses are defined in the **trusted-addresses** prefix list.

Filtered packets include **tcp-established** packets. The **tcp-established** match condition is an alias for the bit-field match condition **tcp-flags "(ack | rst)"**, which indicates an established TCP session, but not the first packet of a TCP connection.

- **icmp-term**—Polices ICMP packets. All ICMP packets are counted in the **icmp-counter** counter.

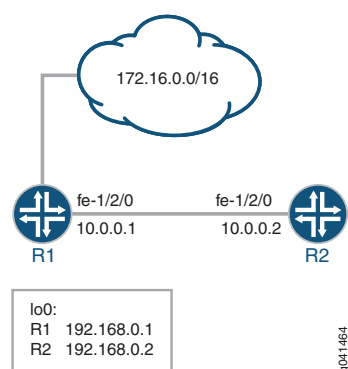

**NOTE:** You can move terms within the firewall filter by using the **insert** command. See *insert* in the *CLI User Guide*.

---

You can apply a stateless firewall to the input or output sides, or both, of an interface. To filter packets transiting the device, apply the firewall filter to any non-Routing Engine interface. To filter packets originating from, or destined for, the Routing Engine, apply the firewall filter to the loopback (lo0) interface.

Figure 47 on page 627 shows the sample network.

**Figure 47: Firewall Filter to Protect Against TCP and ICMP Floods**

Because this firewall filter limits Routing Engine traffic to TCP packets, routing protocols that use other transport protocols for Layer 4 cannot successfully establish sessions when this filter is active. To demonstrate, this example sets up OSPF between Device R1 and Device R2.

“CLI Quick Configuration” on page 627 shows the configuration for all of the devices in Figure 47 on page 627.

The section “Step-by-Step Procedure” on page 628 describes the steps on Device R2.

## Configuration

**CLI Quick Configuration** To quickly configure the stateless firewall filter, copy the following commands to a text file, remove any line breaks, and then paste the commands into the CLI.

<b>Device R1</b>	<pre> set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30 set interfaces lo0 unit 0 family inet address 192.168.0.1/32 primary set interfaces lo0 unit 0 family inet address 172.16.0.1/32 set protocols bgp group ext type external set protocols bgp group ext export send-direct set protocols bgp group ext peer-as 200 set protocols bgp group ext neighbor 10.0.0.2 set protocols ospf area 0.0.0.0 interface fe-1/2/0.0 set protocols ospf area 0.0.0.0 interface lo0.0 passive set policy-options policy-statement send-direct term 1 from protocol direct set policy-options policy-statement send-direct term 1 then accept set routing-options router-id 192.168.0.1 set routing-options autonomous-system 100           </pre>
<b>Device R2</b>	<pre> set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30 set interfaces lo0 unit 0 family inet filter input protect-RE set interfaces lo0 unit 0 family inet address 192.168.0.2/32 primary set interfaces lo0 unit 0 family inet address 172.16.0.2/32           </pre>

```

set firewall policer icmp-policer filter-specific
set firewall policer icmp-policer if-exceeding bandwidth-limit 1m
set firewall policer icmp-policer if-exceeding burst-size-limit 15k
set firewall policer icmp-policer then discard

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure stateless firewall filter policers:

1. Configure the device interfaces.

```

[edit interfaces fe-1/2/0 unit 0 family inet ]
user@R2# set address 10.0.0.2/30

```

```

[edit interfaces lo0 unit 0 family inet]
user@R2# set address 192.168.0.2/32 primary
user@R2# set address 172.16.0.2/32

```

2. Configure the BGP peering session.

```

[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set neighbor 10.0.0.1 peer-as 100

```

3. Configure the autonomous system (AS) number and router ID.

- ```
[edit routing-options]
user@R2# set autonomous-system 200
user@R2# set router-id 192.168.0.2
```
4. Configure OSPF.
 

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.0 passive
user@R2# set interface fe-1/2/0.0
```
  5. Define the list of trusted addresses.
 

```
[edit policy-options prefix-list trusted-addresses]
user@R2# set 10.0.0.0/24
user@R2# set 192.168.0.0/24
```
  6. Configure a policy to advertise direct routes.
 

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```
  7. Configure the TCP policer.
 

```
[edit firewall policer tcp-connection-policer]
user@R2# set filter-specific
user@R2# set if-exceeding bandwidth-limit 1m
user@R2# set if-exceeding burst-size-limit 15k
user@R2# set then discard
```
  8. Create the ICMP policer.
 

```
[edit firewall policer icmp-policer]
user@R2# set filter-specific
user@R2# set if-exceeding bandwidth-limit 1m
user@R2# set if-exceeding burst-size-limit 15k
user@R2# set then discard
```
  9. Configure the TCP filter rules.
 

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# set from source-prefix-list trusted-addresses
user@R2# set from protocol tcp
user@R2# set from tcp-established
user@R2# set then policer tcp-connection-policer
user@R2# set then accept
```
  10. Configure the ICMP filter rules.
 

```
[edit firewall family inet filter protect-RE term icmp-term]
user@R2# set from source-prefix-list trusted-addresses
user@R2# set from protocol icmp
user@R2# set then policer icmp-policer
user@R2# set then count icmp-counter
user@R2# set then accept
```
  11. Apply the filter to the loopback interface.
 

```
[edit interfaces lo0 unit 0]
user@R2# set family inet filter input protect-RE
```

**Results** Confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-options**, and **show firewall** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      filter {
        input protect-RE;
      }
      address 192.168.0.2/32 {
        primary;
      }
      address 172.16.0.2/32;
    }
  }
}

user@R2# show protocols
bgp {
  group ext {
    type external;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.0 {
      passive;
    }
    interface fe-1/2/0.0;
  }
}

user@R2# show policy-options
prefix-list trusted-addresses {
  10.0.0.0/24;
  192.168.0.0/24;
}
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}
```

```

}

user@R2# show routing-options
router-id 192.168.0.2;
autonomous-system 200;

user@R2# show firewall
family inet {
  filter protect-RE {
    term tcp-connection-term {
      from {
        source-prefix-list {
          trusted-addresses;
        }
        protocol tcp;
        tcp-established;
      }
      then {
        policer tcp-connection-policer;
        accept;
      }
    }
    term icmp-term {
      from {
        source-prefix-list {
          trusted-addresses;
        }
        protocol icmp;
      }
      then {
        policer icmp-policer;
        count icmp-counter;
        accept;
      }
    }
  }
}
policer tcp-connection-policer {
  filter-specific;
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 15k;
  }
  then discard;
}
policer icmp-policer {
  filter-specific;
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 15k;
  }
  then discard;
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

**NOTE:** To verify the TCP policer, you can use a packet generation tool. This task is not shown here.

- [Displaying Stateless Firewall Filter That Are in Effect on page 632](#)
- [Using telnet to Verify the tcp-established Condition in the TCP Firewall Filter on page 632](#)
- [Using telnet to Verify the Trusted Prefixes Condition in the TCP Firewall Filter on page 633](#)
- [Using OSPF to Verify the TCP Firewall Filter on page 634](#)
- [Verifying the ICMP Firewall Filter on page 635](#)

### Displaying Stateless Firewall Filter That Are in Effect

**Purpose** Verify the configuration of the firewall filter.

**Action** From operational mode, enter the **show firewall** command.

```
user@R2> show firewall
Filter: protect-RE
Counters:
Name                               Bytes      Packets
icmp-counter                        0           0
Policers:
Name                               Bytes      Packets
icmp-policer                       0           0
tcp-connection-policer             0           0
```

**Meaning** The output shows the filter, the counter, and the policers that are in effect on Device R2.

### Using telnet to Verify the tcp-established Condition in the TCP Firewall Filter

**Purpose** Make sure that telnet traffic works as expected.

**Action** Verify that the device can establish only TCP sessions with hosts that meet the **from tcp-established** condition..

1. From Device R2, make sure that the BGP session with Device R1 is established.

```
user@R2> show bgp summary | match down
Groups: 1 Peers: 1 Down peers: 0
```

2. From Device R2, telnet to Device R1.

```
user@R2> telnet 192.168.0.1
Trying 192.168.0.1...
Connected to R1.acme.net.
Escape character is '^['.
```

```
R1 (ttyp4)
```

login:

3. From Device R1, telnet to Device R2.

```
user@R1> telnet 192.168.0.2
Trying 192.168.0.2...
telnet: connect to address 192.168.0.2: Operation timed out
telnet: Unable to connect to remote host
```

4. On Device R2, deactivate the **from tcp-established** match condition.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# deactivate from tcp-established
user@R2# commit
```

5. From Device R1, try again to telnet to Device R2.

```
user@R1> telnet 192.168.0.1
Trying 192.168.0.2...
Connected to R2.acme.net.
Escape character is '^['.
```

R2 (ttyp4)

login:

**Meaning** Verify the following information:

- As expected, the BGP session is established. The **from tcp-established** match condition is not expected to block BGP session establishment.
- From Device R2, you can telnet to Device R1. Device R1 has no firewall filter configured, so this is the expected behavior.
- From Device R1, you cannot telnet to Device R2. Telnet uses TCP as the transport protocol, so this result might be surprising. The cause for the lack of telnet connectivity is the **from tcp-established** match condition. This match condition limits the type of TCP traffic that is accepted of Device R2. After this match condition is deactivated, the telnet session is successful.

### Using telnet to Verify the Trusted Prefixes Condition in the TCP Firewall Filter

**Purpose** Make sure that telnet traffic works as expected.

**Action** Verify that the device can establish only telnet sessions with a host at an IP address that matches one of the trusted source addresses. For example, log in to the device with the **telnet** command from another host with one of the trusted address prefixes. Also, verify that telnet sessions with untrusted source addresses are blocked.

1. From Device R1, telnet to Device R2 from an untrusted source address.

```
user@R1> telnet 172.16.0.2 source 172.16.0.1
Trying 172.16.0.2...
^C
```

2. From Device R2, add 172.16/16 to the list of trusted prefixes.

```
[edit policy-options prefix-list trusted-addresses]
user@R2# set 172.16.0.0/16
user@R2# commit
```

- From Device R1, try again to telnet to Device R2.

```
user@R1> telnet 172.16.0.2 source 172.16.0.1
Trying 172.16.0.2...
Connected to R2.acme.net.
Escape character is '^['.
```

R2 (ttyp4)

login:

**Meaning** Verify the following information:

- From Device R1, you cannot telnet to Device R2 with an untrusted source address. After the 172.16/16 prefix is added to the list of trusted prefixes, the telnet request from source address 172.16.0.1 is accepted.
- OSPF session establishment is blocked. OSPF does not use TCP as its transport protocol. After the **from protocol tcp** match condition is deactivated, OSPF session establishment is not blocked.

### Using OSPF to Verify the TCP Firewall Filter

**Purpose** Make sure that OSPF traffic works as expected.

**Action** Verify that the device cannot establish OSPF connectivity.

- From Device R1, check the OSPF sessions.

```
user@R1> show ospf neighbor
Address      Interface      State    ID          Pri  Dead
10.0.0.2     fe-1/2/0.0    Init    192.168.0.2 128   34
```

- From Device R2, check the OSPF sessions.

```
user@R2> show ospf neighbor
```

- From Device R2, remove the **from protocol tcp** match condition.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# deactivate from protocol
user@R2# commit
```

- From Device R1, recheck the OSPF sessions.

```
user@R1> show ospf neighbor
Address      Interface      State    ID          Pri  Dead
10.0.0.2     fe-1/2/0.0    Full    192.168.0.2 128   36
```

- From Device R2, recheck the OSPF sessions.

```
user@R2> show ospf neighbor
Address      Interface      State    ID          Pri  Dead
10.0.0.1     fe-1/2/0.0    Full    192.168.0.1 128   39
```

**Meaning** Verify the following information:

- OSPF session establishment is blocked. OSPF does not use TCP as its transport protocol. After the **from protocol tcp** match condition is deactivated, OSPF session establishment is successful.

### Verifying the ICMP Firewall Filter

**Purpose** Verify that ICMP packets are being policed and counted. Also make sure that ping requests are discarded when the requests originate from an untrusted source address.

**Action** 1. Undo the configuration changes made in previous verification steps.

Reactivate the TCP firewall settings, and delete the 172.16/16 trusted source address.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# activate from protocol
user@R2# activate from tcp-established
```

```
[edit policy-options prefix-list trusted-addresses]
user@R2# delete 172.16.0.0/16
```

```
user@R2# commit
```

2. From Device R1, ping the loopback interface on Device R2.

```
user@R1> ping 192.168.0.2 rapid count 600 size 2000
PING 192.168.0.2 (192.168.0.2): 2000 data bytes
#####
--- 192.168.0.2 ping statistics ---
600 packets transmitted, 536 packets received, 10% packet loss
pinground-trip min/avg/max/stddev = 2.976/3.405/42.380/2.293 ms
```

3. From Device R2, check the firewall statistics.

```
user@R2> show firewall

Filter: protect-RE
Counters:
Name                               Bytes          Packets
icmp-counter                        1180804         1135
Policers:
Name                               Bytes          Packets
icmp-policer                       66
tcp-connection-policer             0
```

4. From an untrusted source address on Device R1, send a ping request to Device R2's loopback interface.

```
user@R1> ping 172.16.0.2 source 172.16.0.1

PING 172.16.0.2 (172.16.0.2): 56 data bytes
^C
--- 172.16.0.2 ping statistics ---
14 packets transmitted, 0 packets received, 100% packet loss
```

**Meaning** Verify the following information:

- The ping output shows that 10% packet loss is occurring.
- The ICMP packet counter is incrementing, and the icmp-policer is incrementing.
- Device R2 does not send ICMP responses to the **ping 172.16.0.2 source 172.16.0.1** command.

## Statement Hierarchy for Configuring Firewall Fast Lookup Filters

---

To enable hardware acceleration for specific firewall filters, include the **fast-lookup-filter** statement in the **filter *filter-name*** stanza.

```
[edit firewall]
family inet {
  filter filter-name {
    fast-lookup-filter;
    term term1 {
      from {
        source-address {
          192.0.2.0/24;
        }
      }
    }
  }
}
```

```

    }
    then accept;
  }
}

```

You can include the firewall filter fast-lookup-filter configuration at one of the following hierarchy levels:

- [edit firewall family (*inet|inet6*)filter *filter-name*]
- [edit logical-systems *logical-system-name* firewall family (*inet|inet6*)filter *filter-name*]

#### Related Documentation

- [Interface-Specific Firewall Filter Instances Overview on page 747](#)
- [Statement Hierarchy for Applying Interface-Specific Firewall Filters on page 639](#)
- [Example: Configuring Interface-Specific Firewall Filter Counters on page 754](#)

## Statement Hierarchy for Configuring Interface-Specific Firewall Filters

To enable interface-specific instances for stateless firewall filters, include the **interface-specific** statement in the **filter *filter-name*** or **service-filter *service-filter-name*** stanza. Any counters specified as actions in an interface-specific filter are maintained separately per filter instance. Any policers specified as actions in an interface-specific filter are applied per filter instance.

```

firewall {
  family family-name {
    (filter filter-name | service-filter service-filter-name) {
      ...
      interface-specific;
      ...
      term term-name {
        from {
          match-conditions;
        }
        then {
          count counter-name;
          policer policer-name;
        }
      }
      ...
    }
  }
}

```

You can include the firewall configuration at one of the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

#### Related Documentation

- [Statement Hierarchy for Applying Interface-Specific Firewall Filters on page 639](#)
- [Example: Configuring Interface-Specific Firewall Filter Counters on page 754](#)

## Statement Hierarchy for Applying Interface-Specific Firewall Filters

To apply an interface-specific stateless firewall filter to a logical interface, include the **input *filter-name*** or **output *filter-name*** statement in the **filter** or **service-filter** stanza of the interfaces configuration:

```
interfaces {
  interface-name {
    unit unit-number {
      family family-name {
        filter {
          input filter-name-1;
          output filter-name-2;
        }
        service-filter {
          input service-filter-name-1;
          output service-filter-name-2;
        }
      }
    }
  }
}
```

You can include the interface configuration at one of the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

## Example: Configuring a Filter to Match on IPv6 Flags

This example shows how to configure a filter to match on IPv6 TCP flags.

- [Requirements on page 639](#)
- [Overview on page 640](#)
- [Configuration on page 640](#)
- [Verification on page 640](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you configure a filter to match on IPv6 TCP flags. You can use this example to configure IPv6 TCP flags in M Series, MX Series, and T Series routing devices.

## Configuration

### Step-by-Step Procedure

To configure a filter to match on IPv6 TCP flags:

1. Include the family statement at the firewall hierarchy level, specifying **inet6** as the protocol family.

```
[edit]
user@host# edit firewall family inet6
```

2. Create the stateless firewall filter.

```
[edit firewall family inet6]
user@host# edit filter tcpfilt
```

3. Define the first term for the filter.

```
[edit firewall family inet6 filter tcpfilt]
user@host# edit term 1
```

4. Define the source address match conditions for the term.

```
[edit firewall family inet6 filter tcpfilt term 1]
user@host# set from next-header tcp tcp-flags syn
```

5. Define the actions for the term.

```
[edit firewall family inet6 filter tcpfilt term 1]
user@host# set then count tcp_syn_pkt log accept
```

6. If you are done configuring the device, commit the configuration.

```
[edit firewall family inet6 filter tcpfilt term 1]
user@host top
```

```
[edit]
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the **show firewall filter tcpfilt** command.

---

## Example: Configuring a Filter to Match on Port and Protocol Fields

This example shows how to configure a standard stateless firewall filter to match on destination port and protocol fields.

- [Requirements on page 641](#)
- [Overview on page 641](#)

- [Configuration on page 641](#)
- [Verification on page 643](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you configure a stateless firewall filter that accepts all IPv4 packets except for TCP and UDP packets. TCP and UDP packets are accepted if destined for the SSH port or the Telnet port. All other packets are rejected.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Stateless Firewall Filter on page 641](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 642](#)
- [Confirm and Commit Your Candidate Configuration on page 642](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level:

```
set firewall family inet filter filter1 term term1 from protocol-except tcp
set firewall family inet filter filter1 term term1 from protocol-except udp
set firewall family inet filter filter1 term term1 then accept
set firewall family inet filter filter1 term term2 from address 192.168.0.0/16
set firewall family inet filter filter1 term term2 then reject
set firewall family inet filter filter1 term term3 from destination-port ssh
set firewall family inet filter filter1 term term3 from destination-port telnet
set firewall family inet filter filter1 term term3 then accept
set firewall family inet filter filter1 term term4 then reject
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input filter1
```

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter **filter1**:

1. Create the IPv4 stateless firewall filter.  
  
[edit]  
user@host# edit firewall family inet filter filter1
2. Configure a term to accept all traffic except for TCP and UDP packets.  
  
[edit firewall family inet filter filter1]  
user@host# set term term1 from protocol-except tcp  
user@host# set term term1 from protocol-except udp  
user@host# set term term1 then accept

3. Configure a term to reject packets to or from the **192.168/16** prefix.

```
[edit firewall family inet filter filter1]
user@host# set term term2 from address 192.168.0.0/16
user@host# set term term2 then reject
```

4. Configure a term to accept packets destined for either the SSH port or the Telnet port.

```
[edit firewall family inet filter filter1]
user@host# set term term3 from destination-port ssh
user@host# set term term3 from destination-port telnet
user@host# set term term3 then accept
```

5. Configure the last term to reject all packets.

```
[edit firewall family inet filter filter1]
user@host# set term term4 then reject
```

---

### Apply the Stateless Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the stateless firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input filter1
```

---

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter filter1 {
    term term1 {
      from {
        protocol-except [tcp udp];
      }
      then {
        accept;
      }
    }
  }
}
```

```

    }
    term term2 {
        from {
            address 192.168/16;
        }
        then {
            reject;
        }
    }
    term term3 {
        from {
            destination-port [ssh telnet];
        }
        then {
            accept;
        }
    }
    term term4 {
        then {
            reject;
        }
    }
}
}

```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/1 {
    unit 0 {
        family inet {
            filter {
                input filter1;
            }
            address 10.1.2.3/30;
        }
    }
}

```

3. If you are done configuring the device, commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

To confirm that the configuration is working properly, enter the **show firewall filter filter1** operational mode command.

- Related Documentation**
- [Understanding How to Use Standard Firewall Filters on page 477](#)
  - [Example: Configuring a Filter to Match on IPv6 Flags on page 639](#)

- [Example: Configuring a Filter to Match on Two Unrelated Criteria on page 662](#)

## Example: Configuring a Filter to Count Accepted and Rejected Packets

---

This example shows how to configure a firewall filter to count packets.

- [Requirements on page 644](#)
- [Overview on page 644](#)
- [Configuration on page 644](#)
- [Verification on page 647](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, you use a stateless firewall filter to reject all addresses except 192.168.5.0/24.

#### Topology

---

In the first term, the match condition **address 192.168.5.0/24 except** causes this address to be considered a mismatch, and this address is passed to the next term in the filter. The match condition **address 0.0.0.0/0** matches all other packets, and these are counted, logged, and rejected.

In the second term, all packets that passed through the first term (that is, packets whose address matches **192.168.5.0/24**) are counted, logged, and accepted.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 645](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 645](#)
- [Confirm and Commit Your Candidate Configuration on page 646](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter fire1 term 1 from address 192.168.5.0/24 except
set firewall family inet filter fire1 term 1 from address 0.0.0.0/0
set firewall family inet filter fire1 term 1 then count reject_pref1_1
set firewall family inet filter fire1 term 1 then log
set firewall family inet filter fire1 term 1 then reject
```

```

set firewall family inet filter fire1 term 2 then count reject_pref1_2
set firewall family inet filter fire1 term 2 then log
set firewall family inet filter fire1 term 2 then accept
set interfaces ge-0/0/1 unit 0 family inet filter input fire1
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30

```

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter **fire1**:

1. Create the stateless firewall filter **fire1**.  
  

```

[edit]
user@host# edit firewall family inet filter fire1

```
2. Configure the first term to reject all addresses except those to or from the **192.168.5.0/24** prefix and then count, log, and reject all other packets.  
  

```

[edit firewall family inet filter fire1]
user@host# set term 1 from address 192.168.5.0/24 except
user@host# set term 1 from address 0.0.0.0/0
user@host# set term 1 then count reject_pref1_1
user@host# set term 1 then log
user@host# set term 1 then reject

```
3. Configure the next term to count, log, and accept packets in the **192.168.5.0/24** prefix.  
  

```

[edit firewall family inet filter fire1]
user@host# set term 2 then count reject_pref1_2
user@host# set term 2 then log
user@host# set term 2 then accept

```

### Apply the Stateless Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.  
  

```

[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet

```
2. Configure the interface address for the logical interface.  
  

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30

```
3. Apply the stateless firewall filter to the logical interface.  
  

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input fire1

```

## Confirm and Commit Your Candidate Configuration

### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter fire1 {
    term 1 {
      from {
        address {
          192.168.5.0/24 except;
          0.0.0.0/0;
        }
      }
      then {
        count reject_pref1_1;
        log;
        reject;
      }
    }
    term 2 {
      then {
        count reject_pref1_2;
        log;
        accept;
      }
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      filter {
        input fire1;
      }
      address 10.1.2.3/30;
    }
  }
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the `show firewall filter fire1` operational mode command. You can also display the log and individual counters separately by using the following forms of the command:

- `show firewall counter reject_pref1_1`
- `show firewall counter reject_pref1_2`
- `show firewall log`

### Related Documentation

- [Understanding How to Use Standard Firewall Filters on page 477](#)
- [Example: Configuring a Filter to Count IP Options Packets on page 650](#)
- [Example: Configuring a Filter to Count and Discard IP Options Packets on page 647](#)

## Example: Configuring a Filter to Count and Discard IP Options Packets

This example shows how to configure a standard stateless firewall to count packets.

- [Requirements on page 647](#)
- [Overview on page 647](#)
- [Configuration on page 648](#)
- [Verification on page 650](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

Because the filter term matches on *any* IP option value, the filter term can use the **count** nonterminating action without the **discard** terminating action or (alternatively) without requiring an interface on a 10-Gigabit Ethernet Modular Port Concentrator (MPC), 60-Gigabit Ethernet MPC, 60-Gigabit Queuing Ethernet MPC, or 60-Gigabit Ethernet Enhanced Queuing MPC on an MX Series router.

## Overview

In this example, you use a standard stateless firewall filter to count and discard packets that include any IP option value but accept all other packets.

The IP option header field is an optional field in IPv4 headers only. The **ip-options** and **ip-options-except** match conditions are supported for standard stateless firewall filters and service filters only.

**NOTE:** On M and T series routers, firewall filters cannot count `ip-options` packets on a per option type and per interface basis. A limited work around is to use the `show pfe statistics ip options` command to see `ip-options` statistics on a per Packet Forwarding Engine (PFE) basis. See *show pfe statistics ip* for sample output.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 648](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 649](#)
- [Confirm and Commit Your Candidate Configuration on page 649](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter block_ip_options term 10 from ip-options any
set firewall family inet filter block_ip_options term 10 then count option_any
set firewall family inet filter block_ip_options term 10 then discard
set firewall family inet filter block_ip_options term 999 then accept
set interfaces ge-0/0/1 unit 0 family inet filter input block_ip_options
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
```

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter:

1. Create the stateless firewall filter `block_ip_options`.  
  

```
[edit]
user@host# edit firewall family inet filter block_ip_options
```
2. Configure the first term to count and discard packets that include any IP options header fields.  
  

```
[edit firewall family inet filter block_ip_options]
user@host# set term 10 from ip-options any
user@host# set term 10 then count option_any
user@host# set term 10 then discard
```
3. Configure the other term to accept all other packets.  
  

```
[edit firewall family inet filter block_ip_options]
user@host# set term 999 then accept
```

### Apply the Stateless Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the stateless firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input block_ip_options
```

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter block_ip_options {
    term 10 {
      from {
        ip-options any;
      }
      then {
        count option_any;
        discard;
      }
    }
    term 999 {
      then accept;
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      filter {
        input block_ip_options;
      }
    }
  }
}
```

```
    }  
    address 10.1.2.3/30;  
  }  
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]  
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the **show firewall filter block\_ip\_options** operational mode command. To display the count of discarded packets separately, enter the **show firewall count option\_any** form of the command.

### Related Documentation

- [Understanding How to Use Standard Firewall Filters on page 477](#)
- [Example: Configuring a Filter to Count Accepted and Rejected Packets on page 644](#)
- [Example: Configuring a Filter to Count IP Options Packets on page 650](#)

---

## Example: Configuring a Filter to Count IP Options Packets

This example shows how use a stateless firewall filter to count individual IP options packets:

- [Requirements on page 650](#)
- [Overview on page 650](#)
- [Configuration on page 651](#)
- [Verification on page 655](#)

## Requirements

This example uses an interface on a 10-Gigabit Ethernet Modular Port Concentrator (MPC), 60-Gigabit Ethernet MPC, 60-Gigabit Queuing Ethernet MPC, or 60-Gigabit Ethernet Enhanced Queuing MPC on an MX Series router. This interface enables you to apply an IPv4 firewall filter (standard or service filter) that can use the **count**, **log**, and **syslog** nonterminating actions on packets that match a *specific ip-option* value without having to also use the **discard** terminating action.

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you use a stateless firewall filter to count IP options packets but not block any traffic. Also, the filter logs packets that have loose or strict source routing.

The IP option header field is an optional field in IPv4 headers only. The **ip-options** and **ip-options-except** match conditions are supported for standard stateless firewall filters and service filters only.

**NOTE:** On M and T series routers, firewall filters cannot count **ip-options** packets on a per option type and per interface basis. A limited work around is to use the `show pfe statistics ip options` command to see **ip-options** statistics on a per Packet Forwarding Engine (PFE) basis. See *show pfe statistics ip* for sample output.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 652](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 653](#)
- [Confirm and Commit Your Candidate Configuration on page 653](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter ip_options_filter term match_strict_source from ip-options
strict-source-route
set firewall family inet filter ip_options_filter term match_strict_source then count
strict_source_route
set firewall family inet filter ip_options_filter term match_strict_source then log
set firewall family inet filter ip_options_filter term match_strict_source then accept
set firewall family inet filter ip_options_filter term match_loose_source from ip-options
loose-source-route
set firewall family inet filter ip_options_filter term match_loose_source then count
loose_source_route
set firewall family inet filter ip_options_filter term match_loose_source then log
set firewall family inet filter ip_options_filter term match_loose_source then accept
set firewall family inet filter ip_options_filter term match_record from ip-options
record-route
set firewall family inet filter ip_options_filter term match_record then count record_route
set firewall family inet filter ip_options_filter term match_record then accept
set firewall family inet filter ip_options_filter term match_timestamp from ip-options
timestamp
set firewall family inet filter ip_options_filter term match_timestamp then count timestamp
set firewall family inet filter ip_options_filter term match_timestamp then accept
set firewall family inet filter ip_options_filter term match_router_alert from ip-options
router-alert
set firewall family inet filter ip_options_filter term match_router_alert then count
router_alert
set firewall family inet filter ip_options_filter term match_router_alert then accept
set firewall family inet filter ip_options_filter term match_all then accept
```

```
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input ip_options_filter
```

### Configure the Stateless Firewall Filter

---

#### Step-by-Step Procedure

To configure the stateless firewall filter `ip_option_filter`:

1. Create the stateless firewall filter `ip_option_filter`.  

```
[edit]
user@host# edit firewall family inet filter ip_options_filter
```
2. Configure the first term to count, log, and accept packets with the `strict_source_route` IP optional header field.  

```
[edit firewall family inet filter ip_option_filter]
user@host# set term match_strict_source from ip-options strict_source_route
user@host# set term match_strict_source then count strict_source_route
user@host# set term match_strict_source then log
user@host# set term match_strict_source then accept
```
3. Configure the next term to count, log, and accept packets with the `loose-source-route` IP optional header field.  

```
[edit firewall family inet filter ip_option_filter]
user@host# set term match_loose_source from ip-options loose-source-route
user@host# set term match_loose_source then count loose_source_route
user@host# set term match_loose_source then log
user@host# set term match_loose_source then accept
```
4. Configure the next term to count and accept packets with the `record-route` IP optional header field.  

```
[edit firewall family inet filter ip_option_filter]
user@host# set term match_record from ip-options record-route
user@host# set term match_record then count record_route
user@host# set term match_record then accept
```
5. Configure the next term to count and accept packets with the `timestamp` IP optional header field.  

```
[edit firewall family inet filter ip_option_filter]
user@host# set term match_timestamp from ip-options timestamp
user@host# set term match_timestamp then count timestamp
user@host# set term match_timestamp then accept
```
6. Configure the next term to count and accept packets with the `router-alert` IP optional header field.  

```
[edit firewall family inet filter ip_option_filter]
user@host# set term match_router_alert from ip-options router-alert
user@host# set term match_router_alert then count router_alert
user@host# set term match_router_alert then accept
```
7. Create the last term to accept any packet without incrementing any counters.  

```
[edit firewall family inet filter ip_option_filter]
user@host# set term match_all then accept
```

### Apply the Stateless Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the stateless firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input ip_options_filter
```

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter ip_options_filter {
    term match_strict_source {
      from {
        ip-options strict-source-route;
      }
      then {
        count strict_source_route;
        log;
        accept;
      }
    }
    term match_loose_source {
      from {
        ip-options loose-source-route;
      }
      then {
        count loose_source_route;
        log;
        accept;
      }
    }
  }
  term match_record {
    from {
      ip-options record-route;
    }
    then {
```

```
        count record_route;
        accept;
    }
}
term match_timestamp {
    from {
        ip-options timestamp;
    }
    then {
        count timestamp;
        accept;
    }
}
term match_router_alert {
    from {
        ip-options router-alert;
    }
    then {
        count router_alert;
        accept;
    }
}
term match_all {
    then accept;
}
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
    unit 0 {
        family inet {
            filter {
                input ip_option_filter;
            }
            address 10.1.2.3/30;
        }
    }
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the **show firewall filter ip\_option\_filter** operational mode command. You can also display the log and individual counters separately by using the following forms of the command:

- **show firewall counter strict\_source\_route**
- **show firewall counter loose\_source\_route**
- **show firewall counter record\_route**
- **show firewall counter timestamp**
- **show firewall counter router\_alert**
- **show firewall log**

### Related Documentation

- [Understanding How to Use Standard Firewall Filters on page 477](#)
- [Example: Configuring a Filter to Count Accepted and Rejected Packets on page 644](#)
- [Example: Configuring a Filter to Count and Discard IP Options Packets on page 647](#)

## Example: Configuring a Filter to Count and Sample Accepted Packets

This example shows how to configure a standard stateless firewall filter to count and sample accepted packets.

- [Requirements on page 655](#)
- [Overview on page 655](#)
- [Configuration on page 656](#)
- [Verification on page 658](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

Before you begin, configure traffic sampling by including the **sampling** statement at the **[edit forwarding-options]** hierarchy level.

## Overview

In this example, you use a standard stateless firewall filter to count and sample all packets received on a logical interface.

**NOTE:** When you enable reverse path forwarding (RPF) on an interface with an input filter for firewall log and count, the input firewall filter does not log the packets rejected by RPF, although the rejected packets are counted. To log the rejected packets, use an RPF check fail filter.

**WARNING:** On MX Series routers with MPC3 or MPC4, if firewall filters are configured to count Two-Way Active Measurement Protocol (TWAMP) packets then the count is doubled for all TWAMP packets. There may also be a small increase in round trip time (RTT) when the TWAMP server is hosted on MPC3 or MPC4. This warning does not apply for routers with MPC1 or MPC2 cards.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 656](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 656](#)
- [Confirm and Commit Your Candidate Configuration on page 657](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter sam term all then count count_sam
set firewall family inet filter sam term all then sample
set interfaces at-2/0/0 unit 301 family inet address 10.1.2.3/30
set interfaces at-2/0/0 unit 301 family inet filter input sam
```

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter **sam**:

1. Create the stateless firewall filter **sam**.  
  
[edit]  
user@host# **edit firewall family inet filter sam**
2. Configure the term to count and sample all packets.  
  
[edit firewall family inet filter sam]  
user@host# **set term all then count count\_sam**  
user@host# **set term all then sample**

### Apply the Stateless Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.  
  
[edit]  
user@host# **edit interfaces ge-0/0/1 unit 0 family inet**

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the stateless firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input sam
```

**NOTE:** The Junos OS does not sample packets originating from the router or switch. If you configure a filter and apply it to the output side of an interface, then only the transit packets going through that interface are sampled. Packets that are sent from the Routing Engine to the Packet Forwarding Engine are not sampled.

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter sam {
    term all {
      then {
        count count_sam;
        sample; # default action is accept
      }
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
interfaces {
  at-2/0/0 {
    unit 301 {
      family inet {
        filter {
          input sam;
        }
        address 10.1.2.3/30;
      }
    }
  }
}
```

```
}
}
```

- If you are done configuring the device, commit your candidate configuration.

```
[edit]
user@host# commit
```

## Verification

Confirm that the configuration is working properly.

- [Displaying the Packet Counter on page 658](#)
- [Displaying the Firewall Filter Log Output on page 658](#)
- [Displaying the Sampling Output on page 659](#)

### Displaying the Packet Counter

**Purpose** Verify that the firewall filter is evaluating packets.

**Action** user@host> show firewall filter sam  
Filter:  
Counters:

| Name  | Bytes | Packets |
|-------|-------|---------|
| sam   |       |         |
| sam-1 | 98    | 8028    |

### Displaying the Firewall Filter Log Output

**Purpose** Display the packet header information for all packets evaluated by the firewall filter.

**Action** user@host> show firewall log

| Time     | Filter | A Interface    | Pro | Source address | Destination address |
|----------|--------|----------------|-----|----------------|---------------------|
| 23:09:09 | -      | A at-2/0/0.301 | TCP | 10.2.0.25      | 10.211.211.1:80     |
| 23:09:07 | -      | A at-2/0/0.301 | TCP | 10.2.0.25      | 10.211.211.1:56     |
| 23:09:07 | -      | A at-2/0/0.301 | ICM | 10.2.0.25      | 10.211.211.1:49552  |
| 23:02:27 | -      | A at-2/0/0.301 | TCP | 10.2.0.25      | 10.211.211.1:56     |
| 23:02:25 | -      | A at-2/0/0.301 | TCP | 10.2.0.25      | 10.211.211.1:80     |
| 23:01:22 | -      | A at-2/0/0.301 | ICM | 10.2.2.101     | 10.211.211.1:23251  |
| 23:01:21 | -      | A at-2/0/0.301 | ICM | 10.2.2.101     | 10.211.211.1:16557  |
| 23:01:20 | -      | A at-2/0/0.301 | ICM | 10.2.2.101     | 10.211.211.1:29471  |
| 23:01:19 | -      | A at-2/0/0.301 | ICM | 10.2.2.101     | 10.211.211.1:26873  |

**Meaning** This output file contains the following fields:

- **Time**—Time at which the packet was received (not shown in the default).
- **Filter**—Name of a filter that has been configured with the **filter** statement at the **[edit firewall]** hierarchy level. A hyphen (-) or the abbreviation **pfe** indicates that the packet was handled by the Packet Forwarding Engine. A space (no hyphen) indicates that the packet was handled by the Routing Engine.
- **A**—Filter action:

- **A**—Accept (or next term)
- **D**—Discard
- **R**—Reject
- **Interface**—Interface on which the filter is configured.

**NOTE:** We strongly recommend that you always explicitly configure an action in the then statement.

- **Pro**—Packet's protocol name or number.
- **Source address**—Source IP address in the packet.
- **Destination address**—Destination IP address in the packet.

### Displaying the Sampling Output

**Purpose** Verify that the sampling output contains appropriate data.

**Action**

```

- Related Documentation**
- [Understanding How to Use Standard Firewall Filters on page 477](#)
  - [Example: Configuring a Filter to Set the DSCP Bit to Zero on page 659](#)

### Example: Configuring a Filter to Set the DSCP Bit to Zero

This example shows how to configure a standard stateless firewall filter based on the Differentiated Services code point (DSCP).

- [Requirements on page 660](#)
- [Overview on page 660](#)
- [Configuration on page 660](#)
- [Verification on page 662](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you use a stateless firewall filter to match packets on DSCP bit patterns. If the DSCP is **2**, the packet is classified to the **best-effort** forwarding class, and the DSCP is set to **0**. If the DSCP is **3**, the packet is classified to the **best-effort** forwarding class.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 660](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 661](#)
- [Confirm and Commit Your Candidate Configuration on page 661](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall filter filter1 term 1 from dscp 2
set firewall filter filter1 term 1 then forwarding-class best-effort
set firewall filter filter1 term 1 then dscp 0
set firewall filter filter1 term 2 from dscp 3
set firewall filter filter1 term 2 then forwarding-class best-effort
set interfaces so-0/1/0 unit 0 family inet filter input filter1
```

---

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter **filter1**:

1. Create the stateless firewall filter.

```
[edit]
user@host# edit firewall filter filter1
```

2. Configure the first term to match a packet with a DSCP of **2**, change the DSCP to **0**, and classify the packet to the **best-effort** forwarding class.

```
[edit firewall filter filter1]
user@host# set term 1 from dscp 2
user@host# set term 1 then forwarding-class best-effort
user@host# set term 1 then dscp 0
```

3. Configure the other term to match a packet with a DSCP of **3** and classify the packet to the **best-effort** forwarding class.

```
[edit firewall filter filter1]
```

```
user@host# set term 2 from dscp 3
user@host# set term 2 then forwarding-class best-effort
```

### Apply the Stateless Firewall Filter to a Logical Interface

**Step-by-Step Procedure** To apply the stateless firewall filter to the logical interface corresponding to the VPN routing and forwarding (VRF) instance:

1. Configure the logical interface to which you will apply the stateless firewall filter.

```
[edit]
user@host# edit interfaces so-0/1/0 unit 0 family inet
```

2. Apply the stateless firewall filter to the logical interface.

```
[ input filter1]
user@host# set filter input filter1
```

### Confirm and Commit Your Candidate Configuration

**Step-by-Step Procedure** To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
filter filter1 {
  term term1 {
    from {
      dscp 2;
    }
    then {
      forwarding-class best-effort;
      dscp 0;
    }
  }
  term term2 {
    from {
      dscp 3;
    }
    then {
      forwarding-class best-effort;
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
so-0/1/0 {
  unit 0 {
```

```
        family inet {  
            filter input filter1;  
        }  
    }  
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]  
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the following operational mode commands:

- **show class-of-service**—Displays the entire class-of-service (CoS) configuration, including system-chosen defaults.
- **show class-of-service classifier type dscp**—Displays only the classifiers of the DSCP for IPv4 type.

### Related Documentation

- [Example: Configuring a Filter to Count and Sample Accepted Packets on page 655](#)

---

## Example: Configuring a Filter to Match on Two Unrelated Criteria

This example shows how to configure a standard stateless firewall filter to match on two unrelated criteria.

- [Requirements on page 662](#)
- [Overview on page 662](#)
- [Configuration on page 662](#)
- [Verification on page 664](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you use a standard stateless firewall filter to match IPv4 packets that are either OSPF packets or packets that come from an address in the prefix **10.108/16**, and send an **administratively-prohibited** ICMP message for all packets that do not match.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the IPv4 Firewall Filter on page 663](#)
- [Applying the IPv4 Firewall Filter to a Logical Interface on page 664](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter ospf_or_131 term protocol_match from protocol ospf
set firewall family inet filter ospf_or_131 term address-match from source-address
  10.108.0.0/16
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input ospf_or_131
```

#### Configuring the IPv4 Firewall Filter

#### Step-by-Step Procedure

To configure the IPv4 firewall filter:

1. Enable configuration of the IPv4 firewall filter.

```
[edit]
user@host# edit firewall family inet filter ospf_or_131
```

2. Configure the first term to accept OSPF packets.

```
[edit firewall family inet filter ospf_or_131]
user@host# set term protocol_match from protocol ospf
```

Packets that match the condition are accepted by default. Because another term follows this term, packets that do not match this condition are evaluated by the next term.

3. Configure the second term to accept packets from any IPv4 address in a particular prefix.

```
[edit firewall family inet filter ospf_or_131]
user@host# set term address_match from source-address 10.108.0.0/16
```

Packets that match this condition are accepted by default. Because this is the last term in the filter, packets that do not match this condition are discarded by default.

#### Results

Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter ospf_or_131 {
    term protocol_match {
      from {
        protocol ospf;
      }
    }
    term address_match {
      from {
```

```

        source-address {
            10.108.0.0/16;
        }
    }
}

```

### Applying the IPv4 Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the stateless firewall filter to a logical interface:

1. Enable configuration of a logical interface.

```

[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet

```

2. Configure an IP address for the logical interface.

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30

```

3. Apply the IPv4 firewall filter to the logical interface.

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input ospf_or_131

```

#### Results

Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/1 {
    unit 0 {
        family inet {
            filter {
                input ospf_or_131;
            }
            address 10.1.2.3/30;
        }
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

To confirm that the configuration is working properly, enter the **show firewall filter ospf\_or\_131** operational mode command.

#### Related Documentation

- [Example: Configuring a Filter to Match on Port and Protocol Fields on page 640](#)

## Example: Configuring a Filter to Accept DHCP Packets Based on Address

This example shows how to configure a standard stateless firewall filter to accept packets from a trusted source.

- [Requirements on page 665](#)
- [Overview on page 665](#)
- [Configuration on page 665](#)
- [Verification on page 667](#)

### Requirements

This example is supported only on MX Series routers and EX Series switches.

### Overview

In this example, you create a filter (**rpf\_dhcp**) that accepts DHCP packets with a source address of **0.0.0.0** and a destination address of **255.255.255.255**.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Stateless Firewall Filter on page 665](#)
- [Apply the Firewall Filter to the Loopback Interface on page 666](#)
- [Confirm and Commit Your Candidate Configuration on page 666](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter rpf_dhcp term dhcp_term from source-address 0.0.0.0/32
set firewall family inet filter rpf_dhcp term dhcp_term from destination-address
  255.255.255.255/32
set firewall family inet filter rpf_dhcp term dhcp_term then accept
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input sam
```

#### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter:

1. Create the stateless firewall filter **rpf\_dhcp**.  
  
[edit]  
user@host# edit firewall family inet filter rpf\_dhcp
2. Configure the term to match packets with a source address of **0.0.0.0** and a destination address of **255.255.255.255**.  
  
[edit firewall family inet filter rpf\_dhcp]

```
user@host# set term dhcp_term from source-address 0.0.0.0/32
user@host# set term dhcp_term from destination-address 255.255.255.255/32
```

3. Configure the term to accept packets that match the specified conditions.

```
[edit firewall family inet filter rpf_dhcp]
set term dhcp_term then accept
```

---

### Apply the Firewall Filter to the Loopback Interface

#### Step-by-Step Procedure

To apply the filter to the input at the loopback interface:

1. Apply the **rpf\_dhcp** filter if packets are not arriving on an expected path.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet rpf-check fail-filter rpf_dhcp
```

2. Configure an address for the loopback interface.

```
[edit]
user@host# set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

---

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter rpf_dhcp {
    term dhcp_term {
      from {
        source-address {
          0.0.0.0/32;
        }
        destination-address {
          255.255.255.255/32;
        }
      }
      then accept;
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
```

```

filter {
  rpf-check {
    fail-filter rpf_dhcp;
    mode loose;
  }
}
address 127.0.0.1/32;
}
}
}

```

3. When you are done configuring the device, commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

To confirm that the configuration is working properly, enter the **show firewall** operational mode command.

## Example: Configuring a Filter to Accept OSPF Packets from a Prefix

This example shows how to configure a standard stateless firewall filter to accept packets from a trusted source.

- [Requirements on page 667](#)
- [Overview on page 667](#)
- [Configuration on page 668](#)
- [Verification on page 670](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you create a filter that accepts only OSPF packets from an address in the prefix 10.108.0.0/16, discarding all other packets with an **administratively-prohibited** ICMP message

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 668](#)
- [Apply the Firewall Filter to the Loopback Interface on page 668](#)
- [Confirm and Commit Your Candidate Configuration on page 669](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter ospf_filter term term1 from source-address 10.108.0.0/16
set firewall family inet filter ospf_filter term term1 from protocol ospf
set firewall family inet filter ospf_filter term term1 then accept
set firewall family inet filter ospf_filter term default-term then reject
administratively-prohibited
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input ospf_filter
```

---

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter **ospf\_filter**:

1. Create the filter.

```
[edit]
user@host# edit firewall family inet filter ospf_filter
```

2. Configure the term that accepts packets.

```
[edit firewall family inet filter ospf_filter]
user@host# set term term1 from source-address 10.108.0.0/16
user@host# set term term1 from protocol ospf
user@host# set term term1 then accept
```

3. Configure the term that rejects all other packets.

```
[edit firewall family inet filter ospf_filter]
user@host# set term default_term then reject administratively-prohibited
```

---

### Apply the Firewall Filter to the Loopback Interface

#### Step-by-Step Procedure

To apply the firewall filter to the loopback interface:

1. Configure the interface.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the logical interface IP address.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the filter to the input.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input ospf_filter
```

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter ospf_filter {
    term term1 {
      from {
        source-address {
          10.108.0.0/16;
        }
        protocol ospf;
      }
      then {
        accept;
      }
    }
    term default_term {
      then {
        reject administratively-prohibited; # default reject action
      }
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
lo0 {
  unit 0 {
    family inet {
      filter {
        input ospf_filter;
      }
      address 10.1.2.3/30;
    }
  }
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]  
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the **show firewall filter ospf\_filter** operational mode command.

## Example: Configuring a Stateless Firewall Filter to Handle Fragments

This example shows how to create a stateless firewall filter that handles packet fragments.

- [Requirements on page 670](#)
- [Overview on page 670](#)
- [Configuration on page 671](#)
- [Verification on page 674](#)

## Requirements

No special configuration beyond device initialization is required before configuring stateless firewall filters.

## Overview

In this example, you create a stateless firewall filter called **fragment-RE** that accepts fragmented packets originating from 10.2.1.0/24 and destined for the BGP port. This example includes the following firewall filter terms:

- **not-from-prefix-term**—Discards packets that are not from 10.2.1.0/24 to ensure that subsequent terms in the firewall filter are matched against packets from 10.2.1.0/24 only.
- **small-offset-term**—Discards small (1–5) offset packets to ensure that subsequent terms in the firewall filter can be matched against all the headers in the packet. In addition, the term adds a record to the system logging destinations for the firewall facility.

- **not-fragmented-term**—Accepts unfragmented TCP packets with a destination port that specifies the BGP protocol. A packet is considered unfragmented if the MF flag is not set and the fragment offset equals 0.
- **first-fragment-term**—Accepts the first fragment of a fragmented TCP packet with a destination port that specifies the BGP protocol.
- **fragment-term**—Accepts all fragments that were not discarded by **small-offset-term**. (packet fragments 6–8191). However, only those fragments that are part of a packet containing a first fragment accepted by **first-fragment-term** are reassembled by the destination device.

Packet fragments offset can be from 1 through 8191.

**NOTE:** You can move terms within the firewall filter by using the `insert` command. For more information, see “*insert*” in the *CLI User Guide*.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter fragment-RE term not-from-prefix-term from source-address 0.0.0.0/0
set firewall family inet filter fragment-RE term not-from-prefix-term from source-address 10.2.1.0/24 except
set firewall family inet filter fragment-RE term not-from-prefix-term then discard
set firewall family inet filter fragment-RE term small-offset-term from fragment-offset 1-5
set firewall family inet filter fragment-RE term small-offset-term then syslog
set firewall family inet filter fragment-RE term small-offset-term then discard
set firewall family inet filter fragment-RE term not-fragmented-term from fragment-offset 0
set firewall family inet filter fragment-RE term not-fragmented-term from fragment-flags "!more-fragments"
set firewall family inet filter fragment-RE term not-fragmented-term from protocol tcp
set firewall family inet filter fragment-RE term not-fragmented-term from destination-port bgp
set firewall family inet filter fragment-RE term not-fragmented-term then accept
set firewall family inet filter fragment-RE term first-fragment-term from first-fragment
set firewall family inet filter fragment-RE term first-fragment-term from protocol tcp
set firewall family inet filter fragment-RE term first-fragment-term from destination-port bgp
set firewall family inet filter fragment-RE term first-fragment-term then accept
set firewall family inet filter fragment-RE term fragment-term from fragment-offset 6-8191
set firewall family inet filter fragment-RE term fragment-term then accept
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the stateless firewall filter:

1. Define the stateless firewall filter.  

```
[edit]  
user@host# edit firewall family inet filter fragment-RE
```
2. Configure the first term for the filter.  

```
[edit firewall family inet filter fragment-RE ]  
user@host# set term not-from-prefix-term from source-address 0.0.0.0/0  
user@host# set term not-from-prefix-term from source-address 10.2.1.0/24 except  
user@host# set term not-from-prefix-term then discard
```
3. Define the second term for the filter.  

```
[edit firewall family inet filter fragment-RE]  
user@host# edit term small-offset-term
```
4. Define the match conditions for the term.  

```
[edit firewall family inet filter fragment-RE term small-offset-term]  
user@host# set from fragment-offset 1-5
```
5. Define the action for the term.  

```
[edit firewall family inet filter fragment-RE term small-offset-term]  
user@host# set then syslog discard
```
6. Define the third term for the filter.  

```
[edit]  
user@host# edit firewall family inet filter fragment-RE term not-fragmented-term
```
7. Define the match conditions for the term.  

```
[edit firewall family inet filter fragment-RE term not-fragmented-term]  
user@host# set from fragment-flags "!more-fragments" fragment-offset 0 protocol  
tcp destination-port bgp
```
8. Define the action for the term.  

```
[edit firewall family inet filter fragment-RE term not-fragmented-term]  
user@host# set then accept
```
9. Define the fourth term for the filter.  

```
[edit]  
user@host# edit firewall family inet filter fragment-RE term first-fragment-term
```
10. Define the match conditions for the term.  

```
[edit firewall family inet filter fragment-RE term first-fragment-term]  
user@host# set from first-fragment protocol tcp destination-port bgp
```

11. Define the action for the term.

```
[edit firewall family inet filter fragment-RE term first-fragment-term]
user@host# set then accept
```

12. Define the last term for the filter.

```
[edit]
user@host# edit firewall family inet filter fragment-RE term fragment-term
```

13. Define the match conditions for the term.

```
[edit firewall family inet filter fragment-RE term fragment-term]
user@host# set from fragment-offset 6–8191
```

14. Define the action for the term.

```
[edit firewall family inet filter fragment-RE term fragment-term]
user@host# set then accept
```

**Results** Confirm your configuration by entering the **show firewall** command from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show firewall
family inet {
  filter fragment-RE {
    term not-from-prefix-term {
      from {
        source-address {
          0.0.0.0/0;
          10.2.1.0/24 except;
        }
      }
      then discard;
    }
    term small-offset-term {
      from {
        fragment-offset 1-5;
      }
      then {
        syslog;
        discard;
      }
    }
    term not-fragmented-term {
      from {
        fragment-offset 0;
        fragment-flags "!more-fragments";
        protocol tcp;
        destination-port bgp;
      }
      then accept;
    }
    term first-fragment-term {
      from {
        first-fragment;
      }
    }
  }
}
```

```
        protocol tcp;
        destination-port bgp;
    }
    then accept;
}
term fragment-term {
    from {
        fragment-offset 6-8191;
    }
    then accept;
}
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying Stateless Firewall Filter Configurations on page 674](#)
- [Verifying a Firewall Filter that Handles Fragments on page 674](#)

---

### Displaying Stateless Firewall Filter Configurations

- |                |                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify the configuration of the firewall filter. You can analyze the flow of the filter terms by displaying the entire configuration.                                                                                                                                      |
| <b>Action</b>  | From configuration mode, enter the <b>show firewall</b> command.                                                                                                                                                                                                           |
| <b>Meaning</b> | Verify that the output shows the intended configuration of the firewall filter. In addition, verify that the terms are listed in the order in which you want the packets to be tested. You can move terms within a firewall filter by using the <b>insert</b> CLI command. |

---

### Verifying a Firewall Filter that Handles Fragments

- |                |                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Purpose</b> | Verify that the actions of the firewall filter terms are taken.                                                                                      |
| <b>Action</b>  | Send packets to the device that match the terms.                                                                                                     |
| <b>Meaning</b> | Verify that packets from 10.2.1.0/24 with small fragment offsets are recorded in the device's system logging destinations for the firewall facility. |

- |                              |                                                                             |

## Configuring a Firewall Filter to Prevent or Allow IPv4 Packet Fragmentation

This topic explains how to use the **dont-fragment (set | clear)** actions in an ingress firewall filter to modify the Don't Fragment flag in IPv4 packet headers. These actions are supported only on MPCs in MX Series routers.

You can use a firewall filter on an ingress interface to match IPv4 packets that have the Don't Fragment flag set to one or cleared to zero. Fragmentation is prevented when this flag is set in the packet header. Fragmentation is allowed when the flag is not set.

To prevent an IPv4 packet from being fragmented:

- Configure a filter term that modifies the Don't Fragment flag to one.

```
[edit firewall family inet filter dfSet]
user@host# set term t1 then dont-fragment set
```

To allow an IPv4 packet to be fragmented:

- Configure a filter term that modifies the Don't Fragment flag to zero.

```
[edit firewall family inet filter dfClear]
user@host# set term t1 then dont-fragment clear
```

In the following example, the dfSet firewall filter matches packets that are fragmented and changes the Don't Fragment flag to prevent fragmentation. The dfClear firewall filter matches packets that are not fragmented and changes the Don't Fragment flag to allow fragmentation.

```
[edit firewall family inet]
user@host# edit filter dfSet
user@host# set term t1 from fragment-flags is-fragment
user@host# set term t1 then dont-fragment set
user@host# up
user@host# edit filter dfClear
user@host# set term t1 from fragment-flags dont-fragment
user@host# set term t1 then dont-fragment clear
```

## Configuring a Firewall Filter to Discard Ingress IPv6 Packets with a Mobility Extension Header

---

This topic explains how to configure a firewall filter to discard IPv6 packets that contain a mobility extension header. This feature is supported only on MPCs in MX Series routers.

To configure the stateless firewall filter:

1. Create the stateless firewall filter.

```
[edit]
user@host# edit firewall family inet6 filter filter-name
```

For example:

```
[edit]
user@host# edit firewall family inet6 filter drop-mobility
```

2. Configure a term to discard all traffic that contains a mobility extension header.

```
[edit firewall family inet6 filter drop-mobility]
user@host# set term term1 from extension-header mobility
user@host# set term term1 then discard
```

3. Configure a term to accept all other traffic.

```
[edit firewall family inet6 filter drop-mobility]
user@host# set term term2 then accept
```

4. Apply the firewall filter to a logical interface.

```
[edit interfaces ge-1/2/10 unit 0 family inet6]
user@host# set filter input drop-mobility
```

## Example: Configuring a Rate-Limiting Filter Based on Destination Class

---

This example shows how to configure a rate-limiting stateless firewall filter.

- [Requirements on page 676](#)
- [Overview on page 677](#)
- [Configuration on page 677](#)
- [Verification on page 679](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

Before you begin, configure the destination class **class1**.

## Overview

In this example, you use a stateless firewall filter to set rate limits based on a destination class.

To activate a policer from within a stateless firewall filter configuration:

- Create a template for the policer by including the **policer *policer-name*** statement.
- Reference the policer in a filter term that specifies the policer in the **policer *policer-name*** nonterminating action.

You can also activate a policer by including the **policer (input | output) *policer-template-name*** statement at a logical interface.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Stateless Firewall Filter on page 677](#)
- [Apply the Stateless Firewall Filter to a Logical Interface on page 678](#)
- [Confirm and Commit Your Candidate Configuration on page 678](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall filter rl_dclass1 policer police_class1 if-exceeding bandwidth-limit 25
set firewall filter rl_dclass1 policer police_class1 if-exceeding burst-size-limit 1000
set firewall filter rl_dclass1 policer police_class1 then discard
set firewall filter rl_dclass1 term term1 from destination-class class1
set firewall filter rl_dclass1 term term1 then policer police_class1
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input ospf_or_131
```

### Configure the Stateless Firewall Filter

#### Step-by-Step Procedure

To configure the stateless firewall filter **rl\_dclass1** with policer **police\_class1** for destination class **class1**:

1. Create the stateless firewall filter **rl\_dclass1**.

```
[edit]
user@host# edit firewall filter rl_dclass1
```

2. Configure the policer template **police\_class1**.

```
[edit firewall filter rl_dclass1]
user@host# set policer police_class1 if-exceeding bandwidth-limit 25
user@host# set policer police_class1 if-exceeding burst-size-limit 1000
user@host# set policer police_class1 then discard
```

3. Configure a filter term that uses policer **police\_class1** to rate-limit traffic for destination class **class1**.

```
[edit firewall filter rl_dclass1]
user@host# set term term1 from destination-class class1
user@host# set term term1 then policer police_class1
```

---

### Apply the Stateless Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the filter **rl\_dclass1** to a logical interface:

1. Configure the logical interface to which you will apply the stateless firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the stateless firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input rl_dclass1
```

---

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
filter rl_dclass1 {
  policer police_class1 {
    if-exceeding {
      bandwidth-limit 25;
      burst-size-limit 1000;
    }
    then {
      discard;
    }
  }
  term term1 {
    from {
      destination-class class1;
    }
    then {
      policer police_class1;
    }
  }
}
```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      filter {
        input rl_dclass1;
      }
      address 10.1.2.3/30;
    }
  }
}
```

3. If you are done configuring the device, commit your candidate configuration.

```
[edit]
user@host# commit
```

## Verification

To confirm that the configuration is working properly, enter the **show class-of-service ge-0/0/1** operational mode command.

## Firewall Filters in Logical Systems Overview

---

This topic covers the following information:

- [Logical Systems on page 681](#)
- [Firewall Filters in Logical Systems on page 681](#)
- [Identifiers for Firewall Objects in Logical Systems on page 682](#)

## Logical Systems

With the Junos OS, you can partition a single physical router or switch into multiple logical devices that perform independent routing tasks. Because logical systems perform a subset of the tasks once handled by the physical router or switch, logical systems offer an effective way to maximize the use of a single router or switch.

## Firewall Filters in Logical Systems

You can configure a separate set of firewall filters for each logical system on a router or switch. To configure a filter in a logical system, you must define the filter in the **firewall** stanza at the **[edit logical-systems logical-system-name]** hierarchy level, and you must apply the filter to a logical interface that is also configured at the **[edit logical-systems logical-system-name]** hierarchy level.

## Identifiers for Firewall Objects in Logical Systems

To identify firewall objects configured under logical systems, operational **show** commands and firewall-related SNMP MIB objects include a **\_\_logical-system-name/** prefix in the object name. For example, firewall objects configured under the **ls1** logical system include **\_\_ls1/** as the prefix.

## Guidelines for Configuring and Applying Firewall Filters in Logical Systems

This topic covers the following information:

- [Statement Hierarchy for Configuring Firewall Filters in Logical Systems on page 682](#)
- [Filter Types in Logical Systems on page 683](#)
- [Firewall Filter Protocol Families in Logical Systems on page 683](#)
- [Firewall Filter Match Conditions in Logical Systems on page 684](#)
- [Firewall Filter Actions in Logical Systems on page 684](#)
- [Statement Hierarchy for Applying Firewall Filters in Logical Systems on page 684](#)

## Statement Hierarchy for Configuring Firewall Filters in Logical Systems

To configure a firewall filter in a logical system, include the **filter**, **service-filter**, or **simple-filter** statement at the **[edit logical-systems *logical-system-name* firewall family *family-name*]** hierarchy level.

```
[edit]
logical systems {
  logical-system-name {
    firewall {
      family family-name {
        filter filter-name {
          interface-specific;
          physical-interface-filter;
          term term-name {
            filter filter-name;
            from {
              match-conditions;
            }
            then {
```

```

    actions;
}
}
}
service-filter filter-name { # For 'family inet' or 'family inet6' only.
    term term-name {
        from {
            match-conditions;
        }
        then {
            actions;
        }
    }
}
simple-filter filter-name { # For 'family inet' only.
    term term-name {
        from {
            match-conditions;
        }
        then {
            actions;
        }
    }
}
}
}
}
}
```

## Filter Types in Logical Systems

There are no special restrictions on the types of stateless firewall filter types that you can configure in logical systems.

In a logical system, you can use the same types of stateless firewall filters that are available on a physical router or switch:

- Standard stateless firewall filters
- Service filters
- Simple filters

## Firewall Filter Protocol Families in Logical Systems

There are no special restrictions on the protocol families supported with stateless firewall filters in logical systems.

In a logical system, you can filter the same protocol families as you can on a physical router or switch.

- **Standard stateless firewall filters**—In logical systems, you can filter the following traffic types: protocol-independent, IPv4, IPv6, MPLS, MPLS-tagged IPv4 or IPv6, VPLS, Layer 2 circuit cross-connection, and Layer 2 bridging.
- **Service filters**—In logical systems, you can filter IPv4 and IPv6 traffic.

- Simple filters—In logical systems, you can filter IPv4 traffic only.

## Firewall Filter Match Conditions in Logical Systems

There are no special restrictions on the match conditions supported with stateless firewall filters in logical systems.

## Firewall Filter Actions in Logical Systems

There are no special restrictions on the actions supported with stateless firewall filters in logical systems.

## Statement Hierarchy for Applying Firewall Filters in Logical Systems

To apply a firewall filter in a logical system, include the **filter** *filter-name*, **service-filter** *service-filter-name*, or **simple-filter** *simple-filter-name* statement to a logical interface in the logical system.

The following configuration shows the hierarchy levels at which you can apply the statements:

```
[edit]
logical-systems logical-system-name {
  interfaces {
    interface-name {
      unit logical-unit-number {
        family family-name {
          filter {
            group group-name;
            input filter-name;
            input-list [ filter-names ];
            output filter-name;
            output-list [ filter-names ]
          }
          rpf-check { # For 'family inet' or 'family inet6' only.
            fail-filter filter-name;
            mode loose;
          }
          service { # For 'family inet' or 'family inet6' only.
            input {
              service-set service-set-name <service-filter service-filter-name>;
              post-service-filter service-filter-name;
            }
            output {
              service-set service-set-name <service-filter service-filter-name>;
            }
          }
          simple-filter { # For 'family inet' only.
            input simple-filter-name;
          }
        }
      }
    }
  }
}
```

## References from a Firewall Filter in a Logical System to Subordinate Objects

---

This topic covers the following information:

- [Resolution of References from a Firewall Filter to Subordinate Objects on page 685](#)
- [Valid Reference from a Firewall Filter to a Subordinate Object on page 685](#)

### Resolution of References from a Firewall Filter to Subordinate Objects

If a firewall filter defined in a logical system references a subordinate object (for example, a policer or prefix list), that subordinate object must be defined within the **firewall** stanza of the same logical system. For example, if a firewall filter configuration references a policer, the firewall filter and the policer must be configured under the same **[edit logical-systems logical-system-name firewall]** hierarchy level.

This rule applies even if the same policer is configured under the main firewall configuration or if the same policer is configured as part of a firewall in another logical system.

### Valid Reference from a Firewall Filter to a Subordinate Object

In this example, the firewall filter **filter1** references the policer **pol1**. Both **filter1** and **pol1** are defined under the same firewall object. This configuration is valid. If **pol1** had been defined under another firewall object, the configuration would not be valid.

```
[edit]
logical systems {
  ls-A {
    firewall {
      policer pol1 {
        if-exceeding {
          bandwidth-limit 401k;
          burst-size-limit 50k;
        }
        then discard;
      }
      filter filter1 {
        term one {
          from {
            source-address 12.1.0.0/16;
```

```
    }
    then {
        reject host-unknown;
    }
}
term two {
    from {
        source-address 12.2.0.0/16;
    }
    then policer pol1;
}
}
}
```

## References from a Firewall Filter in a Logical System to Nonfirewall Objects

This topic covers the following information:

- [Resolution of References from a Firewall Filter to Nonfirewall Objects on page 686](#)
- [Valid Reference to a Nonfirewall Object Outside of the Logical System on page 687](#)

### Resolution of References from a Firewall Filter to Nonfirewall Objects

In many cases, a firewall configuration references objects outside the firewall configuration. As a general rule, the referenced object must be defined under the same logical system as the referencing object. However, there are cases when the configuration of the referenced object is not supported at the `[edit logical-systems logical-system-name]` hierarchy level.

## Valid Reference to a Nonfirewall Object Outside of the Logical System

This example configuration illustrates an exception to the general rule that the objects referenced by a firewall filter in a logical system must be defined under the same logical system as the referencing object.

In the following scenario, the service filter **inetsf1** is applied to IPv4 traffic associated with the service set **fred** at the logical interface **fe-0/3/2.0**, which is on an adaptive services interface.

- Service filter **inetsf1** is defined in **ls-B** and references prefix list **prefix1**.
- Service set **fred** is defined at the main services hierarchy level, and the policy framework software searches the **[edit services]** hierarchy for the definition of the **fred** service set.

Because service rules cannot be configured in logical systems, firewall filter configurations in the **[edit logical-systems logical-system *logical-system-name*]** hierarchy are allowed to reference *service sets* outside the logical system hierarchy.

```
[edit]
logical-systems {
  ls-B {
    interfaces {
      fe-0/3/2 {
        unit 0 {
          family inet {
            service {
              input {
                service-set fred service-filter inetsf1;
              }
            }
          }
        }
      }
    }
  }
  policy-options {
    prefix-list prefix1 {
      1.1.0.0/16;
      1.2.0.0/16;
      1.3.0.0/16;
    }
  }
  firewall { # Under logical-system 'ls-B'.
    family inet {
      filter filter1 {
        term one {
          from {
            source-address {
              12.1.0.0/16;
            }
          }
          then {
            reject host-unknown;
          }
        }
        term two {
```

```

        from {
            source-address {
                12.2.0.0/16;
            }
        }
        then policer pol1;
    }
}
service-filter inetsf1 {
    term term1 {
        from {
            source-prefix-list {
                prefix1;
            }
        }
        then count prefix1;
    }
}
}
policer pol1 {
    if-exceeding {
        bandwidth-limit 401k;
        burst-size-limit 50k;
    }
    then discard;
}
}
}
} # End of logical systems configuration.
services { # Main services hierarchy level.
    service-set fred {
        max-flows 100;
        interface-service {
            service-interface sp-1/2/0.0;
        }
    }
}
}

```

## Resolution of References from a Nonfirewall Object to a Firewall Filter

If a nonfirewall filter object in a logical system references an object in a firewall filter configured in a logical system, the reference is resolved using the following logic:

- If the nonfirewall filter object is configured in a logical system that includes firewall filter configuration statements, the policy framework software searches the **[edit logical-systems *logical-system-name* firewall]** hierarchy level. Firewall filter configurations that belong to *other* logical systems or to the main **[edit firewall]** hierarchy level are not searched.
- If the nonfirewall filter object is configured in a logical system that does not include any firewall filter configuration statements, the policy framework software searches the firewall configurations defined at the **[edit firewall]** hierarchy level.

## Invalid Reference to a Firewall Filter Outside of the Logical System

This example configuration illustrates an unresolvable reference from a nonfirewall object in a logical system to a firewall filter.

In the following scenario, the stateless firewall filters **filter1** and **fred** are applied to the logical interface **fe-0/3/2.0** in the logical system **ls-C**.

- Filter **filter1** is defined in **ls-C**.
- Filter **fred** is defined in the main firewall configuration.

Because **ls-C** contains firewall filter statements (for **filter1**), the policy framework software resolves references to and from firewall filters by searching the **[edit logical systems ls-C firewall]** hierarchy level. Consequently, the reference from **fe-0/3/2.0** in the logical system to **fred** in the main firewall configuration cannot be resolved.

```
[edit]
logical-systems {
  ls-C {
    interfaces {
      fe-0/3/2 {
        unit 0 {
          family inet {
            filter {
              input-list [ filter1 fred ];
            }
          }
        }
      }
    }
  }
  firewall { # Under logical system 'ls-C'.
    family inet {
      filter filter1 {
        term one {
          from {
            source-address 12.1.0.0/16;
          }
          then {
            reject host-unknown;
          }
        }
      }
    }
  }
}
```

```

    }
  }
  term two {
    from {
      source-address 12.2.0.0/16;
    }
    then policer pol1;
  }
}
}
policer pol1 {
  if-exceeding {
    bandwidth-limit 401k;
    burst-size-limit 50k;
  }
  then discard;
}
}
} # End of logical systems
firewall { # Under the main firewall hierarchy level
  family inet {
    filter fred {
      term one {
        from {
          source-address 11.1.0.0/16;
        }
        then {
          log;
          reject host-unknown;
        }
      }
    }
  }
} # End of main firewall configurations.

```

## Valid Reference to a Firewall Filter Within the Logical System

This example configuration illustrates resolvable references from a nonfirewall object in a logical system to two firewall filter.

In the following scenario, the stateless firewall filters **filter1** and **fred** are applied to the logical interface **fe-0/3/2.0** in the logical system **ls-C**.

- Filter **filter1** is defined in **ls-C**.
- Filter **fred** is defined in **ls-C** and also in the main firewall configuration.

Because **ls-C** contains firewall filter statements, the policy framework software resolves references to and from firewall filters by searching the **[edit logical systems ls-C firewall]** hierarchy level. Consequently, the references from **fe-0/3/2.0** in the logical system to **filter1** and **fred** use the stateless firewall filters configured in **ls-C**.

```

[edit]
logical-systems {
  ls-C {
    interfaces {

```

```

fe-0/3/2 {
  unit 0 {
    family inet {
      filter {
        input-list [ filter1 fred ];
      }
    }
  }
}
}
firewall { # Under logical system 'ls-C'.
  family inet {
    filter filter1 {
      term one {
        from {
          source-address 12.1.0.0/16;
        }
        then {
          reject host-unknown;
        }
      }
      term two {
        from {
          source-address 12.2.0.0/16;
        }
        then policer pol1;
      }
    }
  }
  filter fred { # This 'fred' is in 'ls-C'.
    term one {
      from {
        source-address 10.1.0.0/16;
      }
      then {
        log;
        reject host-unknown;
      }
    }
  }
}
}
policer pol1 {
  if-exceeding {
    bandwidth-limit 401k;
    burst-size-limit 50k;
  }
  then discard;
}
}
}
} # End of logical systems configurations.
firewall { # Main firewall filter hierarchy level
  family inet {
    filter fred {
      term one {
        from {
          source-address 11.1.0.0/16;

```

```

    }
    then {
        log;
        reject host-unknown;
    }
}
}
}
} # End of main firewall configurations.

```

## Valid Reference to a Firewall Filter Outside of the Logical System

This example configuration illustrates resolvable references from a nonfirewall object in a logical system to two firewall filter.

In the following scenario, the stateless firewall filters **filter1** and **fred** are applied to the logical interface **fe-0/3/2.0** in the logical system **ls-C**.

- Filter **filter1** is defined in the main firewall configuration.
- Filter **fred** is defined in the main firewall configuration.

Because **ls-C** does not contain any firewall filter statements, the policy framework software resolves references to and from firewall filters by searching the **[edit firewall]** hierarchy level. Consequently, the references from **fe-0/3/2.0** in the logical system to **filter1** and **fred** use the stateless firewall filters configured in the main firewall configuration.

```

[edit]
logical-systems {
  ls-C {
    interfaces {
      fe-0/3/2 {
        unit 0 {
          family inet {
            filter {
              input-list [ filter1 fred ];
            }
          }
        }
      }
    }
  }
}
} # End of logical systems configurations.
firewall { # Main firewall hierarchy level.
  family inet {
    filter filter1 {
      term one {
        from {
          source-address 12.1.0.0/16;
        }
        then {
          reject host-unknown;
        }
      }
      term two {
        from {
          source-address 12.2.0.0/16;
        }
      }
    }
  }
}

```

```
    }
    then policer pol1;
  }
}
filter fred {
  term one {
    from {
      source-address 11.1.0.0/16;
    }
    then {
      log;
      reject host-unknown;
    }
  }
}
}
policer pol1 {
  if-exceeding {
    bandwidth-limit 701k;
    burst-size-limit 70k;
  }
  then discard;
}
} # End of main firewall configurations.
```

## Example: Configuring Filter-Based Forwarding on Logical Systems

This example shows how to configure filter-based forwarding within a logical system. The filter classifies packets to determine their forwarding path within the ingress routing device.

- [Requirements on page 693](#)
- [Overview on page 693](#)
- [Configuration on page 696](#)
- [Verification on page 702](#)

### Requirements

In this example, no special configuration beyond device initialization is required.

### Overview

Filter-based forwarding is supported for IP version 4 (IPv4) and IP version 6 (IPv6).

Use filter-based forwarding for service provider selection when customers have Internet connectivity provided by different ISPs yet share a common access layer. When a shared

media (such as a cable modem) is used, a mechanism on the common access layer looks at Layer 2 or Layer 3 addresses and distinguishes between customers. You can use filter-based forwarding when the common access layer is implemented using a combination of Layer 2 switches and a single router.
