With filter-based forwarding, all packets received on an interface are considered. Each packet passes through a filter that has match conditions. If the match conditions are met for a filter and you have created a routing instance, filter-based forwarding is applied to a packet. The packet is forwarded based on the next hop specified in the routing instance. For static routes, the next hop can be a specific LSP.

**NOTE:** Source-class usage filter matching and unicast reverse-path forwarding checks are not supported on an interface configured with filter-based forwarding (FBF).

To configure filter-based forwarding, perform the following tasks:

- Create a match filter on an ingress router or switch. To specify a match filter, include the **filter filter-name** statement at the **[edit firewall]** hierarchy level. A packet that passes through the filter is compared against a set of rules to classify it and to determine its membership in a set. Once classified, the packet is forwarded to a routing table specified in the accept action in the filter description language. The routing table then forwards the packet to the next hop that corresponds to the destination address entry in the table.
- Create routing instances that specify the routing table(s) to which a packet is forwarded, and the destination to which the packet is forwarded at the **[edit routing-instances]** or **[edit logical-systems logical-system-name routing-instances]** hierarchy level. For example:

```
[edit]
routing-instances {
  routing-table-name1 {
    instance-type forwarding;
    routing-options {
      static {
        route 0.0.0.0/0 nexthop 10.0.0.1;
      }
    }
  }
  routing-table-name2 {
    instance-type forwarding;
    routing-options {
      static {
        route 0.0.0.0/0 nexthop 10.0.0.2;
      }
    }
  }
}
```

- Create a routing table group that adds interface routes to the forwarding routing instances used in filter-based forwarding (FBF), as well as to the default routing

instance **inet.0**. This part of the configuration resolves the routes installed in the routing instances to directly connected next hops on that interface. Create the routing table group at the **[edit routing-options]** or **[edit logical-systems *logical-system-name* routing-options]** hierarchy level.

**NOTE:** Specify **inet.0** as one of the routing instances that the interface routes are imported into. If the default instance **inet.0** is not specified, interface routes are not imported into the default routing instance.

This example shows a packet filter that directs customer traffic to a next-hop router in the domains, SP 1 or SP 2, based on the packet's source address.

If the packet has a source address assigned to an SP 1 customer, destination-based forwarding occurs using the **sp1-route-table.inet.0** routing table. If the packet has a source address assigned to an SP 2 customer, destination-based forwarding occurs using the **sp2-route-table.inet.0** routing table. If a packet does not match either of these conditions, the filter accepts the packet, and destination-based forwarding occurs using the standard **inet.0** routing table.

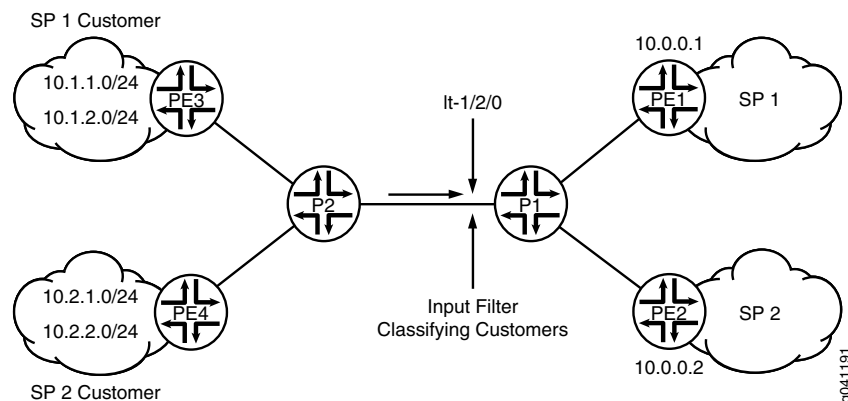

One way to make filter-based forwarding work within a logical system is to configure the firewall filter on the logical system that receives the packets. Another way is to configure the firewall filter on the main router and then reference the logical system in the firewall filter. This example uses the second approach. The specific routing instances are configured within the logical system. Because each routing instance has its own routing table, you have to reference the routing instances in the firewall filter, as well. The syntax looks as follows:

```
[edit firewall filter filter-name term term-name]
user@host# set then logical-system logical-system-name routing-instance
routing-instance-name
```

Figure 48 on page 696 shows the topology used in this example.

On Logical System P1, an input filter classifies packets received from Logical System PE3 and Logical System PE4. The packets are routed based on the source addresses. Packets with source addresses in the 10.1.1.0/24 and 10.1.2.0/24 networks are routed to Logical System PE1. Packets with source addresses in the 10.2.1.0/24 and 10.2.2.0/24 networks are routed to Logical System PE2.

Figure 48: Logical Systems with Filter-Based Forwarding

To establish connectivity, OSPF is configured on all of the interfaces. For demonstration purposes, loopback interface addresses are configured on the routing devices to represent networks in the clouds.

The [“CLI Quick Configuration” on page 696](#) section shows the entire configuration for all of the devices in the topology. The [“Configuring the Routing Instances on the Logical System P1” on page 699](#) and [“Configuring the Firewall Filter on the Main Router” on page 698](#) sections shows the step-by-step configuration of the ingress routing device, Logical System P1.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall filter classify-customers term sp1-customers from source-address 10.1.1.0/24
set firewall filter classify-customers term sp1-customers from source-address 10.1.2.0/24
set firewall filter classify-customers term sp1-customers then log
set firewall filter classify-customers term sp1-customers then logical-system P1
  routing-instance sp1-route-table
set firewall filter classify-customers term sp2-customers from source-address 10.2.1.0/24
set firewall filter classify-customers term sp2-customers from source-address 10.2.2.0/24
set firewall filter classify-customers term sp2-customers then log
set firewall filter classify-customers term sp2-customers then logical-system P1
  routing-instance sp2-route-table
set firewall filter classify-customers term default then accept
set logical-systems P1 interfaces lt-1/2/0 unit 10 encapsulation ethernet
set logical-systems P1 interfaces lt-1/2/0 unit 10 peer-unit 9
set logical-systems P1 interfaces lt-1/2/0 unit 10 family inet filter input classify-customers
set logical-systems P1 interfaces lt-1/2/0 unit 10 family inet address 172.16.0.10/30
set logical-systems P1 interfaces lt-1/2/0 unit 13 encapsulation ethernet
set logical-systems P1 interfaces lt-1/2/0 unit 13 peer-unit 14
set logical-systems P1 interfaces lt-1/2/0 unit 13 family inet address 172.16.0.13/30
set logical-systems P1 interfaces lt-1/2/0 unit 17 encapsulation ethernet
set logical-systems P1 interfaces lt-1/2/0 unit 17 peer-unit 18
set logical-systems P1 interfaces lt-1/2/0 unit 17 family inet address 172.16.0.17/30
set logical-systems P1 protocols ospf rib-group fbf-group
```

```
set logical-systems P1 protocols ospf area 0.0.0.0 interface all
set logical-systems P1 protocols ospf area 0.0.0.0 interface fxp0.0 disable
set logical-systems P1 routing-instances sp1-route-table instance-type forwarding
set logical-systems P1 routing-instances sp1-route-table routing-options static route
  0.0.0.0/0 next-hop 172.16.0.13
set logical-systems P1 routing-instances sp2-route-table instance-type forwarding
set logical-systems P1 routing-instances sp2-route-table routing-options static route
  0.0.0.0/0 next-hop 172.16.0.17
set logical-systems P1 routing-options rib-groups fbf-group import-rib inet.0
set logical-systems P1 routing-options rib-groups fbf-group import-rib
  sp1-route-table.inet.0
set logical-systems P1 routing-options rib-groups fbf-group import-rib
  sp2-route-table.inet.0
set logical-systems P2 interfaces lt-1/2/0 unit 2 encapsulation ethernet

set logical-systems P2 protocols ospf area 0.0.0.0 interface all
set logical-systems P2 protocols ospf area 0.0.0.0 interface fxp0.0 disable
set logical-systems PE1 interfaces lt-1/2/0 unit 14 encapsulation ethernet
set logical-systems PE1 interfaces lt-1/2/0 unit 14 peer-unit 13
set logical-systems PE1 interfaces lt-1/2/0 unit 14 family inet address 172.16.0.14/30
set logical-systems PE1 interfaces lo0 unit 3 family inet address 1.1.1.1/32
set logical-systems PE1 protocols ospf area 0.0.0.0 interface all
set logical-systems PE1 protocols ospf area 0.0.0.0 interface fxp0.0 disable
set logical-systems PE2 interfaces lt-1/2/0 unit 18 encapsulation ethernet
set logical-systems PE2 interfaces lt-1/2/0 unit 18 peer-unit 17
set logical-systems PE2 interfaces lt-1/2/0 unit 18 family inet address 172.16.0.18/30
set logical-systems PE2 interfaces lo0 unit 4 family inet address 2.2.2.2/32
set logical-systems PE2 protocols ospf area 0.0.0.0 interface all
set logical-systems PE2 protocols ospf area 0.0.0.0 interface fxp0.0 disable
set logical-systems PE3 interfaces lt-1/2/0 unit 1 encapsulation ethernet
set logical-systems PE3 interfaces lt-1/2/0 unit 1 peer-unit 2
set logical-systems PE3 interfaces lt-1/2/0 unit 1 family inet address 172.16.0.1/30
set logical-systems PE3 interfaces lo0 unit 1 family inet address 10.1.1.1/32
set logical-systems PE3 interfaces lo0 unit 1 family inet address 10.1.2.1/32
set logical-systems PE3 protocols ospf area 0.0.0.0 interface all
set logical-systems PE3 protocols ospf area 0.0.0.0 interface fxp0.0 disable
set logical-systems PE4 interfaces lt-1/2/0 unit 5 encapsulation ethernet
set logical-systems PE4 interfaces lt-1/2/0 unit 5 peer-unit 6
set logical-systems PE4 interfaces lt-1/2/0 unit 5 family inet address 172.16.0.5/30
set logical-systems PE4 interfaces lo0 unit 2 family inet address 10.2.1.1/32
set logical-systems PE4 interfaces lo0 unit 2 family inet address 10.2.2.1/32
set logical-systems PE4 protocols ospf area 0.0.0.0 interface all
set logical-systems PE4 protocols ospf area 0.0.0.0 interface fxp0.0 disable
```

### Configuring the Firewall Filter on the Main Router

---

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the firewall filter on the main router:

1. Configure the source addresses for SP1 customers.

```
[edit firewall filter classify-customers term sp1-customers]  
user@host# set from source-address 10.1.1.0/24  
user@host# set from source-address 10.1.2.0/24
```

2. Configure the actions that are taken when packets are received with the specified source addresses.

To track the action of the firewall filter, a log action is configured. The sp1-route-table.inet.0 routing table on Logical System P1 routes the packets.

```
[edit firewall filter classify-customers term sp1-customers]  
user@host# set then log  
user@host# set then logical-system P1 routing-instance sp1-route-table
```

3. Configure the source addresses for SP2 customers.

```
[edit firewall filter classify-customers term sp2-customers]  
user@host# set from source-address 10.2.1.0/24  
user@host# set from source-address 10.2.2.0/24
```

4. Configure the actions that are taken when packets are received with the specified source addresses.

To track the action of the firewall filter, a log action is configured. The sp2-route-table.inet.0 routing table on Logical System P1 routes the packet.

```
[edit firewall filter classify-customers term sp2-customers]  
user@host# set then log  
user@host# set then logical-system P1 routing-instance sp2-route-table
```

5. Configure the action to take when packets are received from any other source address.

All of these packets are simply accepted and routed using the default IPv4 unicast routing table, inet.0.

```
[edit firewall filter classify-customers term default]  
user@host# set then accept
```

### Configuring the Routing Instances on the Logical System P1

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the routing instances on a logical system:

1. Configure the interfaces on the logical system.

```
[edit logical-systems P1 interfaces lt-1/2/0]
user@host# set unit 10 encapsulation ethernet
user@host# set unit 10 peer-unit 9
user@host# set unit 10 family inet address 172.16.0.10/30
```

```
user@host# set unit 13 encapsulation ethernet
user@host# set unit 13 peer-unit 14
user@host# set unit 13 family inet address 172.16.0.13/30
```

```
user@host# set unit 17 encapsulation ethernet
user@host# set unit 17 peer-unit 18
user@host# set unit 17 family inet address 172.16.0.17/30
```

2. Assign the **classify-customers** firewall filter to router interface lt-1/2/0.10 as an input packet filter.

```
[edit logical-systems P1 interfaces lt-1/2/0]
user@host# set unit 10 family inet filter input classify-customers
```

3. Configure connectivity, using either a routing protocol or static routing.

As a best practice, disable routing on the management interface.

```
[edit logical-systems P1 protocols ospf area 0.0.0.0]
user@host# set interface all
user@host# set interface fxp0.0 disable
```

4. Create the routing instances.

These routing instances are referenced in the **classify-customers** firewall filter.

The forwarding instance type provides support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance, in this case Logical System P1.

```
[edit logical-systems P1 routing-instances]
user@host# set sp1-route-table instance-type forwarding
```

```
user@host# set sp2-route-table instance-type forwarding
```

5. Resolve the routes installed in the routing instances to directly connected next hops.

```
[edit logical-systems P1 routing-instances]
user@host# set sp1-route-table routing-options static route 0.0.0.0/0 next-hop
172.16.0.13
```

```
user@host# set sp2-route-table routing-options static route 0.0.0.0/0 next-hop 172.16.0.17
```

6. Group together the routing tables to form a routing table group.

The first routing table, inet.0, is the primary routing table, and the additional routing tables are the secondary routing tables.

The primary routing table determines the address family of the routing table group, in this case IPv4.

```
[edit logical-systems P1 routing-options]
user@host# set rib-groups fbf-group import-rib inet.0
user@host# set rib-groups fbf-group import-rib sp1-route-table.inet.0
user@host# set rib-groups fbf-group import-rib sp2-route-table.inet.0
```

7. Apply the routing table group to OSPF.

This causes the OSPF routes to be installed into all the routing tables in the group.

```
[edit logical-systems P1 protocols ospf]
user@host# set rib-group fbf-group
```

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

---

## Results

Confirm your configuration by issuing the **show firewall** and **show logical-systems P1** commands.

```
user@host# show firewall
filter classify-customers {
  term sp1-customers {
    from {
      source-address {
        10.1.1.0/24;
        10.1.2.0/24;
      }
    }
    then {
      log;
      logical-system P1 routing-instance sp1-route-table;
    }
  }
}
term sp2-customers {
  from {
    source-address {
      10.2.1.0/24;
      10.2.2.0/24;
    }
  }
  then {
    log;
    logical-system P1 routing-instance sp2-route-table;
  }
}
```

```
}
term default {
  then accept;
}
}

user@host# show logical-systems P1
interfaces {
  lt-1/2/0 {
    unit 10 {
      encapsulation ethernet;
      peer-unit 9;
      family inet {
        filter {
          input classify-customers;
        }
        address 172.16.0.10/30;
      }
    }
    unit 13 {
      encapsulation ethernet;
      peer-unit 14;
      family inet {
        address 172.16.0.13/30;
      }
    }
    unit 17 {
      encapsulation ethernet;
      peer-unit 18;
      family inet {
        address 172.16.0.17/30;
      }
    }
  }
}
protocols {
  ospf {
    rib-group fbf-group;
    area 0.0.0.0 {
      interface all;
      interface fxp0.0 {
        disable;
      }
    }
  }
}
routing-instances {
  sp1-route-table {
    instance-type forwarding;
    routing-options {
      static {
        route 0.0.0.0/0 next-hop 172.16.0.13;
      }
    }
  }
  sp2-route-table {
```

```

instance-type forwarding;
routing-options {
  static {
    route 0.0.0.0/0 next-hop 172.16.0.17;
  }
}
}
routing-options {
  rib-groups {
    fbf-group {
      import-rib [ inet.0 sp1-route-table.inet.0 sp2-route-table.inet.0 ];
    }
  }
}
}

```

## Verification

Confirm that the configuration is working properly.

### Pinging with Specified Source Addresses

**Purpose** Send some ICMP packets across the network to test the firewall filter.

**Action** 1. Log in to Logical System PE3.

```

user@host> set cli logical-system PE3
Logical system: PE3

```

2. Run the **ping** command, pinging the lo0.3 interface on Logical System PE1.

The address configured on this interface is 1.1.1.1.

Specify the source address 10.1.2.1, which is the address configured on the lo0.1 interface on Logical System PE3.

```

user@host:PE3> ping 1.1.1.1 source 10.1.2.1
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=62 time=1.444 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=62 time=2.094 ms
^C
--- 1.1.1.1 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.444/1.769/2.094/0.325 ms

```

3. Log in to Logical System PE4.

```

user@host:PE3> set cli logical-system PE4
Logical system: PE4

```

4. Run the **ping** command, pinging the lo0.4 interface on Logical System PE2.

The address configured on this interface is 2.2.2.2.

Specify the source address 10.2.1.1, which is the address configured on the lo0.2 interface on Logical System PE4.

```

user@host:PE4> ping 2.2.2.2 source 10.2.1.1
PING 2.2.2.2 (2.2.2.2): 56 data bytes
64 bytes from 2.2.2.2: icmp_seq=0 ttl=62 time=1.473 ms

```

```

64 bytes from 2.2.2.2: icmp_seq=1 ttl=62 time=1.407 ms
^C
--- 2.2.2.2 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.407/1.440/1.473/0.033 ms

```

**Meaning** Sending these pings activates the firewall filter actions.

### Verifying the Firewall Filter

**Purpose** Make sure the firewall filter actions take effect.

**Action** 1. Log in to Logical System P1.

```

user@host> set cli logical-system P1
Logical system: P1

```

2. Run the **show firewall log** command on Logical System P1.

```

user@host:P1> show firewall log
Log :
Time      Filter  Action Interface  Protocol  Src Addr
Dest Addr
13:52:20  pfe      A      1t-1/2/0.10  ICMP      10.2.1.1
2.2.2.2
13:52:19  pfe      A      1t-1/2/0.10  ICMP      10.2.1.1
2.2.2.2
13:51:53  pfe      A      1t-1/2/0.10  ICMP      10.1.2.1
1.1.1.1
13:51:52  pfe      A      1t-1/2/0.10  ICMP      10.1.2.1
1.1.1.1

```

## Example: Configuring a Stateless Firewall Filter to Protect a Logical System Against ICMP Floods

This example shows how to configure a stateless firewall filter that protects against ICMP denial-of-service attacks on a logical system.

- [Requirements on page 704](#)
- [Overview on page 704](#)
- [Configuration on page 704](#)
- [Verification on page 706](#)

## Requirements

In this example, no special configuration beyond device initialization is required.

## Overview

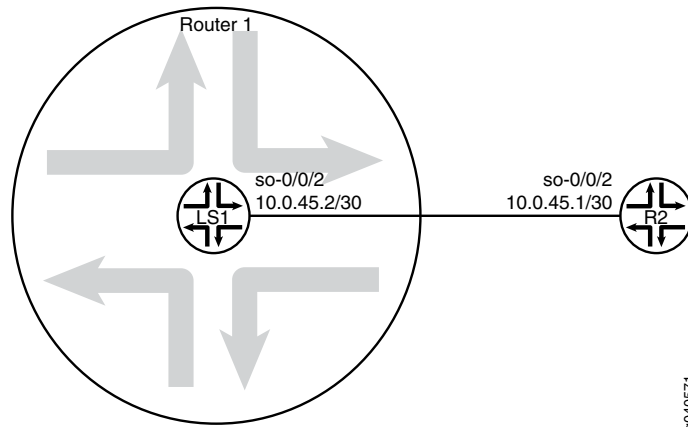

This example shows a stateless firewall filter called **protect-RE** that polices ICMP packets. The **icmp-policer** limits the traffic rate of the ICMP packets to 1,000,000 bps and the burst size to 15,000 bytes. Packets that exceed the traffic rate are discarded.

The policer is incorporated into the action of a filter term called **icmp-term**.

In this example, a ping is sent from a directly connected physical router to the interface configured on the logical system. The logical system accepts the ICMP packets if they are received at a rate of up to 1 Mbps (bandwidth-limit). The logical system drops all ICMP packets when this rate is exceeded. The **burst-size-limit** statement accepts traffic bursts up to 15 Kbps. If bursts exceed this limit, all packets are dropped. When the flow rate subsides, ICMP packets are again accepted.

Figure 49 on page 704 shows the topology used in this example.

Figure 49: Logical System with a Stateless Firewall

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet policer input icmp-policer
set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet address 10.0.45.2/30
set logical-systems LS1 firewall family inet filter protect-RE term icmp-term from protocol icmp
set logical-systems LS1 firewall family inet filter protect-RE term icmp-term then policer icmp-policer
set logical-systems LS1 firewall family inet filter protect-RE term icmp-term then accept
set logical-systems LS1 firewall policer icmp-policer if-exceeding bandwidth-limit 1m
set logical-systems LS1 firewall policer icmp-policer if-exceeding burst-size-limit 15k
```

```
set logical-systems LS1 firewall policer icmp-policer then discard
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an ICMP firewall filter on a logical system:

1. Configure the interface on the logical system.

```
[edit]
user@host# set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet address
10.0.45.2/30
```

2. Explicitly enable ICMP packets to be received on the interface.

```
[edit]
user@host# set logical-systems LS1 firewall family inet filter protect-RE term
icmp-term from protocol icmp
user@host# set logical-systems LS1 firewall family inet filter protect-RE term
icmp-term then accept
```

3. Create the policer.

```
[edit]
user@host# set logical-systems LS1 firewall policer icmp-policer if-exceeding
bandwidth-limit 1m
user@host# set logical-systems LS1 firewall policer icmp-policer if-exceeding
burst-size-limit 15k
user@host# set logical-systems LS1 firewall policer icmp-policer then discard
```

4. Apply the policer to a filter term.

```
[edit]
user@host# set logical-systems LS1 firewall family inet filter protect-RE term
icmp-term then policer icmp-policer
```

5. Apply the policer to the logical system interface.

```
[edit]
user@host# set logical-systems LS1 interfaces so-0/0/2 unit 0 family inet policer
input icmp-policer
```

6. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

## Results

Confirm your configuration by issuing the **show logical-systems LS1** command.

```
user@host# show logical-systems LS1
interfaces {
  so-0/0/2 {
    unit 0 {
      family inet {
        policer {
```

```

        input icmp-policer;
    }
    address 10.0.45.2/30;
}
}
}
}
firewall {
    family inet {
        filter protect-RE {
            term icmp-term {
                from {
                    protocol icmp;
                }
                then {
                    policer icmp-policer;
                    accept;
                }
            }
        }
    }
    policer icmp-policer {
        if-exceeding {
            bandwidth-limit 1m;
            burst-size-limit 15k;
        }
        then discard;
    }
}
}

```

## Verification

Confirm that the configuration is working properly.

### Verifying That Ping Works Unless the Limits Are Exceeded

**Purpose** Make sure that the logical system interface is protected against ICMP-based DoS attacks.

**Action** Log in to a system that has connectivity to the logical system and run the **ping** command.

```

user@R2> ping 10.0.45.2
PING 10.0.45.2 (10.0.45.2): 56 data bytes
64 bytes from 10.0.45.2: icmp_seq=0 ttl=64 time=1.316 ms
64 bytes from 10.0.45.2: icmp_seq=1 ttl=64 time=1.277 ms
64 bytes from 10.0.45.2: icmp_seq=2 ttl=64 time=1.269 ms

user@R2> ping 10.0.45.2 size 20000
PING 10.0.45.2 (10.0.45.2): 20000 data bytes
^C
--- 10.0.45.2 ping statistics ---
4 packets transmitted, 0 packets received, 100% packet loss

```

**Meaning** When you send a normal ping, the packet is accepted. When you send a ping packet that exceeds the filter limit, the packet is discarded.

## Unsupported Firewall Filter Statements for Logical Systems

Table 56 on page 707 shows statements that are supported at the `[edit firewall]` hierarchy level but not at the `[edit logical-systems logical-system-name firewall]` hierarchy level.

Table 56: Unsupported Firewall Statements for Logical Systems

| Statement            | Example                                                                                                                                                                                                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accounting-profile   | <pre>[edit] logical-systems {   ls1 {     firewall {       family inet {         filter myfilter {           accounting-profile fw-profile;           ...           term accept-all {             then {               count counter1;               accept;             }           }         }       }     }   } }</pre> | In this example, the <b>accounting-profile</b> statement is not allowed because the accounting profile <b>fw-profile</b> is configured under the <code>[edit accounting-options]</code> hierarchy.                                                                                                                                                                                                                             |
| hierarchical-policer | <pre>[edit] logical-systems {   lr1 {     firewall {       hierarchical-policer {         ...       }     }   } }</pre>                                                                                                                                                                                                    | In this example, the <b>hierarchical policer</b> statement requires a class-of-service configuration, which is not supported under logical systems.                                                                                                                                                                                                                                                                            |
| load-balance-group   | <pre>[edit] logical-systems {   ls1 {     firewall {       load-balance-group lb-group {         next-hop-group nh-group;       }     }   } }</pre>                                                                                                                                                                        | <p>This configuration is not allowed because the <b>next-hop-group nh-group</b> statement must be configured at the <code>[edit forwarding-options next-hop-group]</code> hierarchy level—outside the <code>[edit logical-systems <i>logical-system-name</i> firewall]</code> hierarchy.</p> <p>Currently, the <b>forwarding-options dhcp-relay</b> statement is the only forwarding option supported for logical systems.</p> |

Table 56: Unsupported Firewall Statements for Logical Systems (*continued*)

| Statement       | Example                                                                                                                                                                                                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| virtual-channel | <pre>[edit] logical-systems {   ls1 {     firewall {       family inet {         filter foo {           term one {             from {               source-address 10.1.0.0/16;             }             then {               virtual-channel sammy;             }           }         }       }     }   } }</pre> | <p>This configuration is not allowed because the virtual channel <b>sammy</b> refers to an object defined at the <b>[edit class-of-service]</b> hierarchy level, and class of service is not supported for logical systems.</p> <p><b>NOTE:</b></p> <p>The <b>virtual-channel</b> statement is supported for J Series devices only, provided the firewall filter is configured outside of a logical-system.</p> |

## Unsupported Actions for Firewall Filters in Logical Systems

Table 57 on page 708 describes the firewall filter actions that are supported at the **[edit firewall]** hierarchy level, but not supported at the **[edit logical-systems logical-system-name firewall]** hierarchy level.

Table 57: Unsupported Actions for Firewall Filters in Logical Systems

| Firewall Filter Action | Example | Description |
|------------------------|---------|-------------|
|------------------------|---------|-------------|

Terminating Actions Not Supported in a Logical System

Table 57: Unsupported Actions for Firewall Filters in Logical Systems (*continued*)

| Firewall Filter Action | Example                                                                                                                                                                                                                                                                                                           | Description                                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>logical-system</b>  | <pre>[edit] logical-systems {   ls1 {     firewall {       family inet {         filter foo {           term one {             from {               source-address 10.1.0.0/16;             }             then {               logical-system fred;             }           }         }       }     }   } }</pre> | Because the <b>logical-system</b> action refers to <b>fred</b> —a logical system defined outside the local logical system—, this action is not supported. |

## Nonterminating Actions Not Supported in a Logical System

|                 |                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipsec-sa</b> | <pre>[edit] logical-systems {   ls1 {     firewall {       family inet {         filter foo {           term one {             from {               source-address 10.1.0.0/16;             }             then {               ipsec-sa barney;             }           }         }       }     }   } }</pre> | Because the <b>ipsec-sa</b> action modifier references <b>barney</b> —a security association defined outside the local logical system—this action is not supported. |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Table 57: Unsupported Actions for Firewall Filters in Logical Systems (*continued*)

| Firewall Filter Action | Example                                                                                                                                                                                                                                                                                                             | Description                                                                                                                                                                            |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>next-hop-group</b>  | <pre> [edit] logical-systems {   ls1 {     firewall {       family inet {         filter foo {           term one {             from {               source-address 10.1.0.0/16;             }             then {               next-hop-group fred;             }           }         }       }     }   } } </pre> | Because the <b>next-hop-group</b> action refers to <b>fred</b> —an object defined at the <b>[edit forwarding-options next-hop-group]</b> hierarchy level—this action is not supported. |
| <b>port-mirror</b>     | <pre> [edit] logical-systems {   ls1 {     firewall {       family inet {         filter foo {           term one {             from {               source-address 10.1.0.0/16;             }             then {               port-mirror;             }           }         }       }     }   } } </pre>         | Because the <b>port-mirror</b> action relies on a configuration defined at the <b>[edit forwarding-options port-mirroring]</b> hierarchy level, this action is not supported.          |

Table 57: Unsupported Actions for Firewall Filters in Logical Systems (*continued*)

| Firewall Filter Action | Example                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                              |

### Accounting for Firewall Filters Overview

---

Juniper Networks devices can collect various kinds of data about traffic passing through the device. You can set up one or more accounting profiles that specify some common characteristics of this data, including the following:

- Fields used in the accounting records.
- Number of files that the routing platform retains before discarding, and the number of bytes per file.
- Polling period that the system uses to record the data

There are several types of accounting profiles: interface, firewall filter, source class and destination class usage, and Routing Engine. If you apply the same profile name to both a firewall filter and an interface, it causes an error.

## System Logging Overview

---

The Junos OS generates system log messages (also called *syslog messages*) to record *system events* that occur on the device. Events consist of routine operations, failure and error conditions, and critical conditions that might require urgent resolution. This system logging utility is similar to the UNIX **syslogd** utility.

Each Junos OS system log message belongs to a message category, called a *facility*, that reflects the hardware- or software-based source of the triggering event. A group of messages belonging to the same facility are either generated by the same software process or concern a similar hardware condition or user activity (such as authentication attempts). Each system log message is also preassigned a *severity*, which indicates how seriously the triggering event affects router (or switch) functions. Together, the facility and severity of an event are known as the message *priority*. The content of a syslog message identifies the Junos OS *process* that generates the message and briefly describes the operation or error that occurred.

By default, syslog messages that have a severity of **info** or more serious are written to the main system log file **messages** in the **/var/log** directory of the local Routing Engine. To configure global settings and facility-specific settings that override these default values, you can include statements at the **[edit system syslog]** hierarchy level.

For all syslog facilities or for a specified facility, you can configure the syslog message utility to redirect messages of a specified severity to a specified file instead of to the main system log file. You can also configure the syslog message utility to write syslog messages of a specified severity, for all syslog facilities or for a specified facility, to additional destinations. In addition to writing syslog messages to a log file, you can write syslog messages to the terminal sessions of any logged-in users, to the router (or switch) console, or to a remote host or the other Routing Engine.

At the global level—for all system logging messages, regardless of facility, severity, or destination—you can override the default values for file-archiving properties and the default timestamp format.

## System Logging of Events Generated for the Firewall Facility

---

System log messages generated for firewall filter actions belong to the **firewall** facility. Just as you can for any other Junos OS system logging facility, you can direct **firewall** facility syslog messages to one or more specific destinations: to a specified file, to the terminal session of one or more logged in users (or to all users), to the router (or switch) console, or to a remote host or the other Routing Engine on the router (or switch).

When you configure a syslog message destination for **firewall** facility syslog messages, you include a statement at the **[edit system syslog]** hierarchy level, and you specify the

**firewall** facility name together with a severity level. Messages from the **firewall** that are rated at the specified level or more severe are logged to the destination.

System log messages with the **DFWD\_** prefix are generated by the firewall process (**dfwd**), which manages compilation and downloading of Junos OS firewall filters. System log messages with the **PFE\_FW\_** prefix are messages about firewall filters, generated by the Packet Forwarding Engine controller, which manages packet forwarding functions. For more information, see the [System Log Explorer](#).

Table 58 on page 715 lists the system log destinations you can configure for the **firewall** facility.

**Table 58: Syslog Message Destinations for the Firewall Facility**

| Destination                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Configuration Statements Under [edit system syslog]                                                                                                                                                                                          |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File                       | <p>Configuring this option keeps the <b>firewall</b> syslog messages out of the main system log file.</p> <p>To include priority and facility with messages written to the file, include the <b>explicit-priority</b> statement.</p> <p>To override the default standard message format, which is based on a UNIX system log format, include the <b>structured-data</b> statement. When the <b>structured-data</b> statement is included, other statements that specify the format for messages written to the file are ignored (the <b>explicit-priority</b> statement at the [edit system syslog file <i>filename</i>] hierarchy level and the <b>time-format</b> statement at the [edit system syslog] hierarchy level).</p> | <pre>file <i>filename</i> {   firewall <i>severity</i>;   allow-duplicates;   archive <i>archive-options</i>;   explicit-priority;   structured-data; } allow-duplicates; archive <i>archive-options</i>; time-format (<i>option</i>);</pre> |
| Terminal session           | <p>Configuring this option causes a copy of the <b>firewall</b> syslog messages to be written to the specified terminal sessions. Specify one or more user names, or specify <b>*</b> for all logged in users.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <pre>user (<i>username</i>   *) {   firewall <i>severity</i>; } time-format (<i>option</i>);</pre>                                                                                                                                           |
| Router (or switch) console | <p>Configuring this option causes a copy of the <b>firewall</b> syslog messages to be written to the router (or switch) console.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <pre>console {   firewall <i>severity</i>; } time-format (<i>option</i>);</pre>                                                                                                                                                              |

Table 58: Syslog Message Destinations for the Firewall Facility (*continued*)

| Destination                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Configuration Statements Under [edit system syslog]                                                                                                                                                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote host or the other Routing Engine | <p>Configuring this option causes a copy of the <b>firewall</b> syslog messages to be written to the specified remote host or to the other Routing Engine.</p> <p>To override the default alternative facility for forwarding <b>firewall</b> syslog messages to a remote machine (<b>local3</b>), include the <b>facility-override firewall</b> statement.</p> <p>To include priority and facility with messages written to the file, include the <b>explicit-priority</b> statement.</p> | <pre>host (hostname   other-routing-engine) {   firewall severity;   allow-duplicates;   archive archive-options;   facility-override firewall;   explicit-priority; } allow-duplicates; # All destinations archive archive-options; time-format (option);</pre> |

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the example:

```
Sep 07 08:00:10
```

To include the year, the millisecond, or both in the timestamp for all system logging messages, regardless of the facility, include one of the following statement at the **[edit system syslog]** hierarchy level:

- **time-format year;**
- **time-format millisecond;**
- **time-format year millisecond;**

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Sep 07 08:00:10.401.2010
```

## Logging of Packet Headers Evaluated by a Firewall Filter Term

Built in to the stateless firewall filtering software is the capability to log packet-header information for the packets evaluated by a stateless firewall filter term. You can write the packet header information to the system log file on the local Routing Engine or to a firewall filter buffer in the Packet Forwarding Engine. Logging of packet headers evaluated by firewall filters is supported for standard stateless firewall filters for IPv4 or IPv6 traffic only. Service filters and simple filters do not support logging of packet headers.

Table 59 on page 717 lists the packet-header logs you can configure for a firewall filter action.

**Table 59: Packet-Header Logs for Stateless Firewall Filter Terms**

| Log                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Configuration Statements                                                                                                                                                                          |

## Statement Hierarchy for Configuring Firewall Filter Accounting Profiles

---

To configure an accounting profile that you can apply to a firewall filter, include the **filter-profile** *filter-profile-name* statement in the **accounting-options** stanza.

```
accounting-options {  
  filter-profile filter-profile-name {  
    file log-filename {  
      archive-sites {  
        site-urls;  
      }  
      files number;  
      size bytes;  
      start-time time;  
      transfer-interval minutes;  
    }  
    interval minutes;  
    counters {  
      counter-name-1;  
      counter-name-2;  
    }  
  }  
}
```

You can include the accounting options configuration at one of the following hierarchy levels:

- **[edit]**
- **[edit logical-systems** *logical-system-name*]

To specify the name of the accounting data log file in the **/var/log** directory to be used in conjunction with the accounting profile, include the **file** *log-filename* statement.

To specify how often statistics are collected for the accounting profile, include the **interval** *minutes* statement.

To specify the names of the firewall filter counters for which filter profile statistics are collected, include the **counters** statement.

### Related Documentation

- [Example: Configuring Statistics Collection for a Firewall Filter on page 719](#)

## Statement Hierarchy for Applying Firewall Filter Accounting Profiles

---

You can apply an accounting profile to a standard stateless firewall filter for any supported protocol family except **family any**.

To apply a filter-accounting profile to a stateless firewall filter, include the **accounting-profile** *accounting-profile-name* statement at the firewall **filter** stanza:

```
firewall {
  family family-name {
    filter filter-name {
      accounting-profile accounting-profile-name;
      interface-specific;
      physical-interface-policer;
      term {
        filter filter-profile-name;
      }
      term term-name {
        from {
          match-conditions;
        }
        then {
          actions;
        }
      }
    }
  }
}
```

You can include the firewall configuration at one of the following hierarchy levels:

- **[edit]**
- **[edit logical-systems** *logical-system-name*]

## Example: Configuring Statistics Collection for a Firewall Filter

This example shows how to configure and apply a firewall filter that collects data according to parameters specified in an associated accounting profile.

- [Requirements on page 719](#)
- [Overview on page 720](#)
- [Configuration on page 720](#)
- [Verification on page 724](#)

### Requirements

Firewall filter accounting profiles are supported for all traffic types except **family any**.

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you create a firewall filter accounting profile and apply it to a firewall filter. The accounting profile specifies how frequently to collect packet and byte count statistics and the name of the file to which the statistics are written. The profile also specifies that statistics are to be collected for three firewall filter counters.

### Topology

---

The firewall filter accounting profile **filter\_acctg\_profile** specifies that statistics are collected every 60 minutes, and the statistics are written to the file **/var/log/ff\_accounting\_file**. Statistics are collected for counters named **counter1**, **counter2**, and **counter3**.

The IPv4 firewall filter named **my\_firewall\_filter** increments a counter for each of three filter terms. The filter is applied to logical interface **ge-0/0/1.0**.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure an Accounting Profile on page 721](#)
- [Configure a Firewall Filter That References the Accounting Profile on page 721](#)
- [Apply the Firewall Filter to an Interface on page 722](#)
- [Confirm Your Candidate Configuration on page 722](#)
- [Clear the Counters and Commit Your Candidate Configuration on page 723](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set accounting-options filter-profile filter_acctg_profile file ff_accounting_file
set accounting-options filter-profile filter_acctg_profile interval 60
set accounting-options filter-profile filter_acctg_profile counters counter1
set accounting-options filter-profile filter_acctg_profile counters counter2
set accounting-options filter-profile filter_acctg_profile counters counter3
set firewall family inet filter my_firewall_filter accounting-profile filter_acctg_profile
set firewall family inet filter my_firewall_filter term term1 from protocol ospf
set firewall family inet filter my_firewall_filter term term1 then count counter1
set firewall family inet filter my_firewall_filter term term1 then discard
set firewall family inet filter my_firewall_filter term term2 from source-address
  10.108.0.0/16
set firewall family inet filter my_firewall_filter term term2 then count counter2
set firewall family inet filter my_firewall_filter term term2 then discard
set firewall family inet filter my_firewall_filter term accept-all then count counter3
set firewall family inet filter my_firewall_filter term accept-all then accept
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input my_firewall_filter
```

### Configure an Accounting Profile

#### Step-by-Step Procedure

To configure an accounting profile:

1. Create the accounting profile **filter\_acctg\_profile**.  
  

```
[edit]
user@host# edit accounting-options filter-profile filter_acctg_profile
```
2. Configure the accounting profile to filter and collect packet and byte count statistics every 60 minutes and write them to the `/var/log/ff_accounting_file` file.  
  

```
[edit accounting-options filter-profile filter_acctg_profile]
user@host# set file ff_accounting_file
user@host# set interval 60
```
3. Configure the accounting profile to collect filter profile statistics (packet and byte counts) for three counters.  
  

```
[edit accounting-options filter-profile filter_acctg_profile]
user@host# set counters counter1
user@host# set counters counter2
user@host# set counters counter3
```

### Configure a Firewall Filter That References the Accounting Profile

#### Step-by-Step Procedure

To configure a firewall filter that references the accounting profile:

1. Create the firewall filter **my\_firewall\_filter**.  
  

```
[edit]
user@host# edit firewall family inet filter my_firewall_filter
```
2. Apply the filter-accounting profile **filter\_acctg\_profile** to the firewall filter.  
  

```
[edit firewall family inet filter my_firewall_filter]
user@host# set accounting-profile filter_acctg_profile
```
3. Configure the first filter term and counter.  
  

```
[edit firewall family inet filter my_firewall_filter]
user@host# set term term1 from protocol ospf
user@host# set term term1 then count counter1
user@host# set term term1 then discard
```
4. Configure the second filter term and counter.  
  

```
[edit firewall family inet filter my_firewall_filter]
user@host# set term term2 from source-address 10.108.0.0/16
user@host# set term term2 then count counter2
user@host# set term term2 then discard
```
5. Configure the third filter term and counter.  
  

```
[edit firewall family inet filter my_firewall_filter]
user@host# set term accept-all then count counter3
user@host# set term accept-all then accept
```

### Apply the Firewall Filter to an Interface

---

#### Step-by-Step Procedure

To apply the firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input my_firewall_filter
```

### Confirm Your Candidate Configuration

---

#### Step-by-Step Procedure

To confirm your candidate configuration:

1. Confirm the configuration of the accounting profile by entering the **show accounting-options** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show accounting-options
filter-profile filter_acctg_profile {
  file ff_accounting_file;
  interval 60;
  counters {
    counter1;
    counter2;
    counter3;
  }
}
```

2. Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter my_firewall_filter {
    accounting-profile filter_acctg_profile;
    term term1 {
      from {
        protocol ospf;
      }
      then {
        count counter1;
        discard;
      }
    }
  }
}
```

```

    }
    term term2 {
      from {
        source-address {
          10.108.0.0/16;
        }
      }
      then {
        count counter2;
        discard;
      }
    }
    term accept-all {
      then {
        count counter3;
        accept;
      }
    }
  }
}

```

3. Confirm the configuration of the interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      filter {
        input my_firewall_filter;
      }
      address 10.1.2.3/30;
    }
  }
}

```

### Clear the Counters and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To clear the counters and commit your candidate configuration:

1. From operational command mode, use the **clear firewall all** command to clear the statistics for all firewall filters.

To clear only the counters incremented in this example, include the name of the firewall filter.

```

[edit]
user@host> clear firewall filter my_firewall_filter

```

2. Commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

To verify that the filter is applied to the logical interface, run the **show interfaces** command with the **detail** or **extensive** output level.

To verify that the three counters are collected separately, run the **show firewall filter my\_firewall\_filter** command.

```
user@host> show firewall filter my_firewall_filter
```

```
Filter: my_firewall_filter
```

```
Counters:
```

| Name     | Bytes | Packets |
|----------|-------|---------|
| counter1 | 0     | 0       |
| counter2 | 0     | 0       |
| counter3 | 0     | 0       |

## Example: Configuring Logging for a Firewall Filter Term

This example shows how to configure a firewall filter to log packet headers.

- [Requirements on page 724](#)
- [Overview on page 724](#)
- [Configuration on page 724](#)
- [Verification on page 727](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you use a firewall filter that logs and counts ICMP packets that have **192.168.207.222** as either their source or destination.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Syslog Messages File for the Firewall Facility on page 725](#)
- [Configure the Firewall Filter on page 725](#)
- [Apply the Firewall Filter to a Logical Interface on page 726](#)
- [Confirm and Commit Your Candidate Configuration on page 726](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog file messages_firewall_any firewall any
set system syslog file messages_firewall_any archive no-world-readable
set firewall family inet filter icmp_syslog term icmp_match from address
  192.168.207.222/32
set firewall family inet filter icmp_syslog term icmp_match from protocol icmp
set firewall family inet filter icmp_syslog term icmp_match then count packets
set firewall family inet filter icmp_syslog term icmp_match then syslog
set firewall family inet filter icmp_syslog term icmp_match then accept
set firewall family inet filter icmp_syslog term default_term then accept
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
set interfaces ge-0/0/1 unit 0 family inet filter input icmp_syslog
```

#### Configure the Syslog Messages File for the Firewall Facility

##### Step-by-Step Procedure

To configure a syslog messages file for the **firewall** facility:

1. Configure a messages file for all syslog messages generated for the **firewall** facility.

```
user@host# set system syslog file messages_firewall_any firewall any
```

2. Restrict permission to the archived **firewall** facility syslog files to the root user and users who have the Junos OS maintenance permission.

```
user@host# set system syslog file messages_firewall_any archive no-world-readable
```

#### Configure the Firewall Filter

##### Step-by-Step Procedure

To configure the firewall filter **icmp\_syslog** that logs and counts ICMP packets that have **192.168.207.222** as either their source or destination:

1. Create the firewall filter **icmp\_syslog**.

```
[edit]
user@host# edit firewall family inet filter icmp_syslog
```

2. Configure matching on the ICMP protocol and an address.

```
[edit firewall family inet filter icmp_syslog]
user@host# set term icmp_match from address 192.168.207.222/32
user@host# set term icmp_match from protocol icmp
```

3. Count, log, and accept matching packets.

```
[edit firewall family inet filter icmp_syslog]
user@host# set term icmp_match then count packets
```

```
user@host# set term icmp_match then syslog
user@host# set term icmp_match then accept
```

4. Accept all other packets.

```
[edit firewall family inet filter icmp_syslog]
user@host# set term default_term then accept
```

---

### Apply the Firewall Filter to a Logical Interface

#### Step-by-Step Procedure

To apply the firewall filter to a logical interface:

1. Configure the logical interface to which you will apply the firewall filter.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet
```

2. Configure the interface address for the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30
```

3. Apply the firewall filter to the logical interface.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set filter input icmp_syslog
```

---

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the syslog message file for the **firewall** facility by entering the **show system** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show system
syslog {
  file messages_firewall_any {
    firewall any;
    archive no-world-readable;
  }
}
```

2. Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter icmp_syslog {
    term icmp_match {
      from {
        address {
          192.168.207.222/32;

```

```

    }
    protocol icmp;
  }
  then {
    count packets;
    syslog;
    accept;
  }
}
term default_term {
  then accept;
}
}
}

```

3. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      filter {
        input icmp_syslog;
      }
      address 10.1.2.3/30;
    }
  }
}

```

4. If you are done configuring the device, commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

To confirm that the configuration is working properly, enter the **show log filter** command:

```

user@host> show log messages_firewall_any
Mar 20 08:03:11 hostname feb FW: so-0/1/0.0  A icmp 192.168.207.222
192.168.207.223      0      0 (1 packets)

```

This output file contains the following fields:

- **Date and Time**—Date and time at which the packet was received (not shown in the default).
- Filter action:
  - **A**—Accept (or next term)
  - **D**—Discard
  - **R**—Reject

- **Protocol**—Packet's protocol name or number.
- **Source address**—Source IP address in the packet.
- **Destination address**—Destination IP address in the packet.

**NOTE:** If the protocol is ICMP, the ICMP type and code are displayed. For all other protocols, the source and destination ports are displayed.

The last two fields (both zero) are the source and destination TCP/UDP ports, respectively, and are shown for TCP or UDP packets only. This log message indicates that only one packet for this match has been detected in about a 1-second interval. If packets arrive faster, the system log function compresses the information so that less output is generated, and displays an output similar to the following:

```
user@host> show log messages_firewall_any
Mar 20 08:08:45 hostname feb FW: so-0/1/0.0   A icmp 192.168.207.222
192.168.207.223      0      0 (515 packets)
```

## Understanding Multiple Firewall Filters in a Nested Configuration

---

This topic covers the following information:

- [The Challenge: Simplify Large-Scale Firewall Filter Administration on page 729](#)
- [A Solution: Configure Nested References to Firewall Filters on page 730](#)
- [Configuration of Nested Firewall Filters on page 730](#)
- [Application of Nested Firewall Filters to a Router or Switch Interface on page 730](#)

### The Challenge: Simplify Large-Scale Firewall Filter Administration

Typically, you apply a single firewall filter to an interface in the input or output direction or both. This approach might not be practical, however, when you have a router (or switch) configured with many, even hundreds of interfaces. In an environment of this scale, you want the flexibility of being able to modify filtering terms common to multiple interfaces without having to reconfigure the filter of every affected interface.

In general, the solution is to apply an effectively “chained” structure of multiple stateless firewall filters to a single interface. You partition your filtering terms into multiple firewall filters configured so that you can apply a unique filter to each router (or switch) interface but also apply common filters to multiple router (or switch) interfaces as required. The Junos OS policy framework provides two options for managing the application of multiple separate firewall filters to individual router (or switch) interfaces. One option is to apply multiple filters as a single input list or output list. The other option is to reference a stateless firewall filter from within the term of another stateless firewall filter.

## A Solution: Configure Nested References to Firewall Filters

The most structured way to avoid configuring duplicate filtering terms common to multiple firewall filters is to configure multiple firewall filters so that each filter includes the shared filtering terms by *referencing* a separate filter that contains the common filtering terms. The Junos OS uses the filter terms—in the order in which they appear in the filter definition—to evaluate packets that transit the interface. If you need to modify filtering terms shared across multiple interfaces, you only need to modify one firewall filter.

**NOTE:** Similar to the alternative approach (applying a list of firewall filters), configuring a nested firewall filter combines multiple firewall filters into a new firewall filter definition.

---

## Configuration of Nested Firewall Filters

Configuring a nested firewall filter for each router (or switch) interface involves separating shared packet-filtering rules from interface-specific packet-filtering rules as follows:

- For each set of packet-filtering rules common across multiple interfaces, configure a separate firewall filter that contains the shared filtering terms.
- For each router (or switch) interface, configure a separate firewall filter that contains:
  - All the filtering terms unique to that interface.
  - An additional filtering term that includes a **filter** reference to the firewall filter that contains the common filtering terms.

## Application of Nested Firewall Filters to a Router or Switch Interface

Applying nested firewall filters is no different from applying an unnested firewall filter. For each interface, you can include an **input** or **output** statement (or both) within the **filter** stanza to specify the appropriate nested firewall filter.

Applying nested firewall filters to an interface, the shared filtering terms and the interface-specific firewall filters are applied through a *single nested firewall filter* that includes other filters through the **filter** statement within a separate filtering term.

### Related Documentation

- [Guidelines for Nesting References to Multiple Firewall Filters on page 730](#)
- [Example: Nesting References to Multiple Firewall Filters on page 742](#)

---

## Guidelines for Nesting References to Multiple Firewall Filters

This topic covers the following information:

- [Statement Hierarchy for Configuring Nested Firewall Filters on page 731](#)
- [Filter-Defining Terms and Filter-Referencing Terms on page 731](#)
- [Types of Filters Supported in Nested Configurations on page 731](#)

- [Number of Filter References in a Single Filter on page 732](#)
- [Depth of Filter Nesting on page 732](#)

## Statement Hierarchy for Configuring Nested Firewall Filters

To reference a filter from within a filter, include the **filter *filter-name*** statement as a separate filter term:

```
firewall firewall-name {
  family family-name {
    filter filter-name {
      term term-name {
        filter filter-name;
      }
    }
  }
}
```

You can include the firewall configuration at one of the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

## Filter-Defining Terms and Filter-Referencing Terms

You cannot configure a firewall filter term that both references another firewall filter and defines a match condition or action. If a firewall filter term includes the **filter** statement, then it cannot also include the **from** or **then** statement.

For example, the firewall filter term **term term1** in the configuration is *not* valid:

```
[edit]
firewall {
  family inet {
    filter filter_1 {
      term term1 {
        filter filter_2;
        from {
          source-address 1.1.1.1/32;
        }
        then {
          accept;
        }
      }
    }
  }
}
```

In order for **term term1** to be a valid filter term, you must either remove the **filter filter\_2** statement or remove both the **from** and **then** stanzas.

## Types of Filters Supported in Nested Configurations

Nested configurations of firewall filters support firewall filters only. You cannot use service filters or simple filters in a nested firewall filter configuration.

## Number of Filter References in a Single Filter

The total number of filters referenced from within a filter cannot exceed 256.

## Depth of Filter Nesting

The Junos OS supports a single level of firewall filter nesting. If **filter\_1** references **filter\_2**, you cannot configure a filter that references a filter that references **filter\_1**.

## Understanding Multiple Firewall Filters Applied as a List

This topic covers the following information:

- [The Challenge: Simplify Large-Scale Firewall Filter Administration on page 732](#)
- [A Solution: Apply Lists of Firewall Filters on page 733](#)
- [Configuration of Multiple Filters for Filter Lists on page 733](#)
- [Application of Filter Lists to a Router Interface on page 733](#)
- [Interface-Specific Names for Filter Lists on page 734](#)
- [How Filter Lists Evaluate Packets When the Matched Term Includes Terminating or Next Term Actions on page 734](#)
- [How Filter Lists Evaluate Packets When the List Includes Protocol-Independent and IP Firewall Filters on page 735](#)

### The Challenge: Simplify Large-Scale Firewall Filter Administration

Typically, you apply a single firewall filter to an interface in the input or output direction or both. However, this approach might not be practical when you have a device configured with many interfaces. In large environments, you want the flexibility of being able to modify filtering terms common to multiple interfaces without having to reconfigure the filter of every affected interface.

In general, the solution is to apply an effectively “chained” structure of multiple firewall filters to a single interface. You partition your filtering terms into multiple firewall filters that each perform a filtering task. You can then choose which filtering tasks you want to perform for a given interface and apply the filtering tasks to that interface. In this way, you only manage the configuration for a filtering task in a single firewall filter.

The Junos OS policy framework provides two options for managing the application of multiple separate firewall filters to individual router interfaces. One option is to apply multiple filters as a single input list or output list. The other option is to reference a firewall filter from within the term of another firewall filter.

## A Solution: Apply Lists of Firewall Filters

The most straightforward way to avoid configuring duplicate filtering terms common to multiple firewall filters is to configure multiple firewall filters and then apply a customized *list* of filters to each interface. The Junos OS uses the filters—in the order in which they appear in the list—to evaluate packets that transit the interface. If you need to modify filtering terms shared across multiple interfaces, you only need to modify one firewall filter that contains those terms.

**NOTE:** In contrast with the alternative approach (configuring nested firewall filters) applying firewall filter lists combines multiple firewall filters at each interface application point.

## Configuration of Multiple Filters for Filter Lists

Configuring firewall filters to be applied in unique lists for each router interface involves separating shared packet-filtering rules from interface-specific packet-filtering rules as follows:

- **Unique filters**—For each set of packet-filtering rules unique to a specific interface, configure a separate firewall filter that contains only the filtering terms for that interface.
- **Shared filters**—For each set of packet-filtering rules common across two or more interfaces, consider configuring a separate firewall filter that contains the shared filtering terms.

**TIP:** When planning for a large number firewall filters to be applied using filter lists, administrators often organize the shared filters by filtering criteria, by the services to which customers subscribe, or by the purposes of the interfaces.

## Application of Filter Lists to a Router Interface

Applying a list of firewall filters to an interface is a matter of selecting the filters that meet the packet-filtering requirements of that interface. For each interface, you can include an **input-list** or **output-list** statement (or both) within the **filter** stanza to specify the relevant filters in the order in which they are to be used:

- Include any filters that contain common filtering terms relevant to the interface.
- Include the filter that contain only the filtering terms unique to the interface.

## Interface-Specific Names for Filter Lists

Because a filter list is configured under an interface, the resulting concatenated filter is *interface-specific*.

**NOTE:** When a filter list is configured under an interface, the resulting concatenated filter is interface-specific, regardless whether the firewall filters in the filter list are configured as interface-specific or not. Furthermore, the instantiation of interface-specific firewall filters not only creates separate instances of any firewall filter counters, but also separate instances of any policer actions. Any policers applied through an action specified in the firewall filter configuration are applied separately to each interface in the interface group.

The system-generated name of an interface-specific filter consists of the full interface name followed by either '-i' for an input filter list or '-o' for an output filter list.

- **Input filter list name**—For example, if you use the **input-list** statement to apply a chain of filters to logical interface **ge-1/3/0.0**, the Junos OS uses the following name for the filter:

**ge-1/3/0.0-i**

- **Output filter list name**—For example, if you use the **output-list** statement to apply a chain of filters to logical interface **fe-0/1/2.0**, the Junos OS uses the following name for the filter:

**fe-0/1/2.0-o**

You can use the interface-specific name of a filter list when you enter a Junos OS operational mode command that specifies a firewall filter name.

## How Filter Lists Evaluate Packets When the Matched Term Includes Terminating or Next Term Actions

The device evaluates a packet against the filters in a list sequentially, beginning with the first filter in the list until either a terminating action occurs or the packet is implicitly discarded.

[Table 60 on page 735](#) describes how a firewall filter list evaluates a packet based on whether the matched term specifies a terminating action and the **next term** action. The **next term** action is neither a terminating action nor a nonterminating action but a *flow control* action.

Table 60: Firewall Filter List Behavior

| Firewall Filter Actions Included in the Matched Term |           | Term Description                                                                                             | Packet-Filtering Behavior                                                                                                                                                                                                                                         |
|------------------------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Terminating                                          | next term |                                                                                                              |                                                                                                                                                                                                                                                                   |
| Yes                                                  | —         | The matched term includes a terminating action (such as <b>discard</b> ) but not the <b>next term</b> action | The device executes the terminating action. No subsequent terms in the filter and no subsequent filters in the list are used to evaluate the packet.                                                                                                              |
| —                                                    | Yes       | The matched term includes the <b>next term</b> action, but it does not include any terminating actions.      | The device executes any nonterminating actions, then the device evaluates the packet against the next term in the filter or the next filter in the list.                                                                                                          |
| —                                                    | —         | The matched term includes neither the <b>next term</b> action nor any terminating actions.                   | The device executes any nonterminating actions, then the device implicitly accepts the packet. Because the <b>accept</b> action is a terminating action, no subsequent terms in the filter and no subsequent filters in the list are used to evaluate the packet. |

For information about terminating actions, see “Firewall Filter Terminating Actions” on page 587.

**NOTE:** You cannot configure the **next term** action with a terminating action in the same firewall filter term.

## How Filter Lists Evaluate Packets When the List Includes Protocol-Independent and IP Firewall Filters

On a single interface associated with a protocol-independent (**family any**) firewall filter and a protocol-specific (**family inet** or **family inet6**) firewall filter simultaneously, the protocol-independent firewall filter executes first.

The terminating action of the first filter determines whether the second filter also evaluates the packet:

- If the first filter terminates by executing the **accept** action, the second filter also evaluates the packet.
- If the first filter terminates without any terms matching the packet (an *implicit discard* action), the second filter also evaluates the packet.
- If the first filter terminates by executing an *explicit discard* action, the second filter does not evaluate the packet.

- [Example: Applying Lists of Multiple Firewall Filters on page 737](#)

## Guidelines for Applying Multiple Firewall Filters as a List

---

This topic covers the following information:

- [Statement Hierarchy for Applying Lists of Multiple Firewall Filters on page 736](#)
- [Filter Input Lists and Output Lists for Router or Switch Interfaces on page 736](#)
- [Types of Filters Supported in Lists on page 736](#)
- [Restrictions on Applying Filter Lists for MPLS or Layer 2 CCC Traffic on page 737](#)

### Statement Hierarchy for Applying Lists of Multiple Firewall Filters

To apply a single filter to the input or output direction of a router (or switch) logical interface, you include the **input** *filter-name* or **output** *filter-name* statement under the **filter** stanza for a protocol family.

To apply a list of multiple filters to the input or output direction of a router (or switch) logical interface, include the **input-list** [ *filter-names* ] or **output-list** [ *filter-names* ] statement under the **filter** stanza for a protocol family:

```
interfaces {
  interface-name {
    unit logical-unit-number {
      family family-name {
        filter {
          ...filter-options...
          input-list [ filter-names ];
          output-list [ filter-names ];
        }
      }
    }
  }
}
```

You can include the interface configuration at one of the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

### Filter Input Lists and Output Lists for Router or Switch Interfaces

When applying a list of firewall filters as a list, the following limitations apply:

- You can specify up to 16 firewall filters for a filter input list.
- You can specify up to 16 firewall filters for a filter output list.

### Types of Filters Supported in Lists

Lists of multiple firewall filters applied to a router (or switch) interface support standard stateless firewall filters only. You cannot apply lists containing service filters or simple filters to a router (or switch) interface.

## Restrictions on Applying Filter Lists for MPLS or Layer 2 CCC Traffic

When applying firewall filters that evaluate MPLS traffic (**family mpls**) or Layer 2 circuit cross-connection traffic (**family ccc**), you can use the **input-list [ *filter-names* ]** and **output-list [ *filter-names* ]** statements for all interfaces except the following:

- Management and internal Ethernet (**fxp**) interfaces
- Loopback (**lo0**) interfaces
- USB modem (**umd**) interfaces

### Related Documentation

- [Understanding Multiple Firewall Filters Applied as a List on page 732](#)
- [Example: Applying Lists of Multiple Firewall Filters on page 737](#)

## Example: Applying Lists of Multiple Firewall Filters

This example shows how to apply lists of multiple firewall filters.

- [Requirements on page 737](#)
- [Overview on page 738](#)
- [Configuration on page 738](#)
- [Verification on page 741](#)

### Requirements

Before you begin, be sure that you have:

- Installed your router or switch, and supported PIC, DPC, or MPC and performed the initial router or switch configuration.
- Configured basic Ethernet in the topology.
- Configured a logical interface to run the IP version 4 (IPv4) protocol (**family inet**) and configured the logical interface with an interface address. This example uses logical interface **ge-1/3/0.0** configured with the IP address 1.1.1.2/30.

**NOTE:** For completeness, the configuration section of this example includes setting an IP address for logical interface **ge-1/3/0.0**.

- Verified that traffic is flowing in the topology and that ingress and egress IPv4 traffic is flowing through logical interface **ge-1/3/0.0**.
- Verified that you have access to the remote host that is connected to this router's or switch's logical interface **ge-1/3/0.0**.

## Overview

In this example, you configure three IPv4 firewall filters and apply each filter directly to the same logical interface by using a list.

### Topology

This example applies the following firewall filters as a *list of input filters* at logical interface **ge-1/3/0.0**. Each filter contains a single term that evaluates IPv4 packets and accepts packets based on the value of the **destination port** field in the TCP header:

- Filter **filter\_FTP** matches on the FTP port number (**21**).
- Filter **filter\_SSH** matches on the SSH port number (**22**).
- Filter **filter\_Telnet** matches on the Telnet port number (**23**).

If an inbound packet does not match any of the filters in the input list, the packet is discarded.

**NOTE:** The Junos OS uses filters in a list in the order in which the filter names appear in the list. In this simple example, the order is irrelevant because all of the filters specify the same action.

Any of the filters can be applied to other interfaces, either alone (using the **input** or **output** statement) or in combination with other filters (using the **input-list** or **output-list** statement). The objective is to configure multiple “minimalist” firewall filters that you can reuse in interface-specific filter lists.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure Multiple IPv4 Firewall Filters on page 739](#)
- [Apply the Filters to a Logical Interface as an Input List and an Output List on page 739](#)
- [Confirm and Commit Your Candidate Configuration on page 740](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter filter_FTP term 0 from protocol tcp
set firewall family inet filter filter_FTP term 0 from destination-port 21
set firewall family inet filter filter_FTP term 0 then count pkts_FTP
set firewall family inet filter filter_FTP term 0 then accept
set firewall family inet filter filter_SSH term 0 from protocol tcp
set firewall family inet filter filter_SSH term 0 from destination-port 22
set firewall family inet filter filter_SSH term 0 then count pkts_SSH
set firewall family inet filter filter_SSH term 0 then accept
set firewall family inet filter filter_Telnet term 0 from protocol tcp
set firewall family inet filter filter_Telnet term 0 from destination-port 23
```

```

set firewall family inet filter filter_Telnet term 0 then count pkts_Telnet
set firewall family inet filter filter_Telnet term 0 then accept
set firewall family inet filter filter_discard term 1 then count pkts_discarded
set firewall family inet filter filter_discard term 1 then discard
set interfaces ge-1/3/0 unit 0 family inet address 1.1.1.2/30
set interfaces ge-1/3/0 unit 0 family inet filter input-list filter_FTP
set interfaces ge-1/3/0 unit 0 family inet filter input-list filter_SSH
set interfaces ge-1/3/0 unit 0 family inet filter input-list filter_Telnet
set interfaces ge-1/3/0 unit 0 family inet filter input-list filter_discard

```

### Configure Multiple IPv4 Firewall Filters

#### Step-by-Step Procedure

To configure the IPv4 firewall filters:

1. Navigate the CLI to the hierarchy level at which you configure IPv4 firewall filters.

```

[edit]
user@host# edit firewall family inet

```

2. Configure the first firewall filter to count and accept packets for port 21.

```

[edit firewall family inet]
user@host# set filter filter_FTP term 0 from protocol tcp
user@host# set filter filter_FTP term 0 from destination-port 21
user@host# set filter filter_FTP term 0 then count pkts_FTP
user@host# set filter filter_FTP term 0 then accept

```

3. Configure the second firewall filter to count and accept packets for port 22.

```

[edit firewall family inet]
user@host# set filter filter_SSH term 0 from protocol tcp
user@host# set filter filter_SSH term 0 from destination-port 22
user@host# set filter filter_SSH term 0 then count pkt_SSH
user@host# set filter filter_SSH term 0 then accept

```

4. Configure the third firewall filter to count and accept packets from port 23.

```

[edit firewall family inet]
user@host# set filter filter_Telnet term 0 from protocol tcp
user@host# set filter filter_Telnet term 0 from destination-port 23
user@host# set filter filter_Telnet term 0 then count pkts_Telnet
user@host# set filter filter_Telnet term 0 then accept

```

5. Configure the last firewall filter to count the discarded packets.

```

[edit firewall family inet]
user@host# set filter filter_discard term 1 then count pkts_discarded
user@host# set filter filter_discard term 1 then discard

```

### Apply the Filters to a Logical Interface as an Input List and an Output List

#### Step-by-Step Procedure

To apply the six IPv4 firewall filters as a list of input filters and a list of output filters:

1. Navigate the CLI to the hierarchy level at which you apply IPv4 firewall filters to logical interface ge-1/3/0.0.

```

[edit]
user@host# edit interfaces ge-1/3/0 unit 0 family inet

```

2. Configure the IPv4 protocol family for the logical interface.

```
[edit interfaces ge-1/3/0 unit 0 family inet]
user@host# set address 1.1.1.2/30
```

3. Apply the filters as a list of input filters.

```
[edit interfaces ge-1/3/0 unit 0 family inet]
user@host# set filter input-list [ filter_FTP filter_SSH filter_Telnet filter_discard ]
```

---

### Confirm and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the firewall filters by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter filter_FTP {
    term 0 {
      from {
        protocol tcp;
        destination-port 21;
      }
      then {
        count pkts_FTP;
        accept;
      }
    }
  }
  filter filter_SSH {
    term 0 {
      from {
        protocol tcp;
        destination-port 22;
      }
      then {
        count pkts_SSH;
        accept;
      }
    }
  }
  filter filter_Telnet {
    term 0 {
      from {
        protocol tcp;
        destination-port 23;
      }
      then {
        count pkts_Telnet;
        accept;
      }
    }
  }
}
```

```

    }
    filter filter_discard {
        term 1 {
            then {
                count pkts_discarded;
                discard;
            }
        }
    }
}

```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-1/3/0 {
    unit 0 {
        family inet {
            filter {
                input-list [ filter_FTP filter_SSH filter_Telnet filter_discard ];
            }
            address 1.1.1.2/30;
        }
    }
}

```

3. If you are done configuring the device, commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

Confirm that the configuration is working properly.

- [Verifying That Inbound Packets Are Accepted Only If Destined for the FTP, SSH or Telnet Port on page 741](#)

### Verifying That Inbound Packets Are Accepted Only If Destined for the FTP, SSH or Telnet Port

**Purpose** Verify that all three filters are active for the logical interface.

**Action** To verify that input packets are accepted according to the three filters:

1. From the remote host that is connected to this router's (or switch's) logical interface **ge-1/3/0.0**, send a packet with destination port number 21 in the header. The packet should be accepted.
2. From the remote host that is connected to this router's (or switch's) logical interface **ge-1/3/0.0**, send a packet with destination port number 23 in the header. The packet should be accepted.

3. From the remote host that is connected to this router's (or switch's) logical interface **ge-1/3/0.0**, send a packet with destination port number 22 in the header. The packet should be accepted.
4. From the remote host that is connected to this router's (or switch's) logical interface **ge-1/3/0.0**, send a packet with a destination port number *other than* 21, 22, or 23. The packet should be discarded.
5. To display counter information for the list of filters applied to the input at **ge-1/3/0.0-i** enter the **show firewall filter ge-1/3/0.0-i** operational mode command. The command output displays the number of bytes and packets that match filter terms associated with the following counters:
  - **pkts\_FTP-ge-1/3/0.0-i**
  - **pkts\_SSH-ge-1/3/0.0-i**
  - **pkts\_Telnet-ge-1/3/0.0-i**
  - **pkts\_discard-ge-1/3/0.0-i**

---

## Example: Nesting References to Multiple Firewall Filters

---

This example shows how to configure nested references to multiple firewall filters.

- [Requirements on page 742](#)
- [Overview on page 742](#)
- [Configuration on page 743](#)
- [Verification on page 745](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, you configure a firewall filter for a match condition and action combination that can be shared among multiple firewall filters. You then configure two firewall filters that reference the first firewall filter. Later, if the common filtering criteria needs to be changed, you would modify only the one shared firewall filter configuration.

---

### Topology

---

The **common\_filter** firewall filter discards packets that have a UDP source or destination port field number of **69**. Both of the two additional firewall filters, **filter1** and **filter2**, reference the **common\_filter**.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

- [Configure the Nested Firewall Filters on page 743](#)
- [Apply Both Nested Firewall Filters to Interfaces on page 744](#)
- [Confirm and Commit Your Candidate Configuration on page 744](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter common_filter term common_term from protocol udp
set firewall family inet filter common_filter term common_term from port tftp
set firewall family inet filter common_filter term common_term then discard
set firewall family inet filter filter1 term term1 filter common-filter
set firewall family inet filter filter1 term term2 from address 192.168.0.0/16
set firewall family inet filter filter1 term term2 then reject
set firewall family inet filter filter2 term term1 filter common-filter
set firewall family inet filter filter2 term term2 from protocol udp
set firewall family inet filter filter2 term term2 from port bootps
set firewall family inet filter filter2 term term2 then accept
set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24
set interfaces ge-0/0/0 unit 0 family inet filter input filter1
set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24
set interfaces ge-0/0/0 unit 0 family inet filter input filter2
```

### Configure the Nested Firewall Filters

### Step-by-Step Procedure

To configure two nested firewall filters that share a common filter:

1. Navigate the CLI to the hierarchy level at which you configure IPv4 firewall filters.

```
[edit]
user@host# edit firewall family inet
```

2. Configure the common filter that will be referenced by multiple other filters.

```
[edit firewall family inet]
user@host# set filter common_filter term common_term from protocol udp
user@host# set filter common_filter term common_term from port tftp
user@host# set filter common_filter term common_term then discard
```

3. Configure a filter that references the common filter.

```
[edit firewall family inet]
user@host# set filter filter1 term term1 filter common-filter
user@host# set filter filter1 term term2 from address 192.168.0.0/16
user@host# set filter filter1 term term2 then reject
```

4. Configure a second filter that references the common filter.

```
[edit firewall family inet]
user@host# set filter filter2 term term1 filter common-filter
user@host# set filter filter2 term term2 from protocol udp
```

```
user@host# set filter filter2 term term2 from port bootps
user@host# set filter filter2 term term2 then accept
```

---

### Apply Both Nested Firewall Filters to Interfaces

---

#### Step-by-Step Procedure

To apply both nested firewall filters to logical interfaces:

1. Apply the first nested filter to a logical interface input.  
  
[edit]  
user@host# set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24  
user@host# set interfaces ge-0/0/0 unit 0 family inet filter input filter1
2. Apply the second nested filter to a logical interface input.  
  
[edit]  
user@host# set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24  
user@host# set interfaces ge-0/0/0 unit 0 family inet filter input filter2

---

### Confirm and Commit Your Candidate Configuration

---

#### Step-by-Step Procedure

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter common_filter {
    term common_term {
      from {
        protocol udp;
        port tftp;
      }
      then {
        discard;
      }
    }
  }
}
filter filter1 {
  term term1 {
    filter common-filter;
  }
  term term2 {
    from {
      address 192.168/16;
    }
    then {
      reject;
    }
  }
}
filter filter2 {
  term term1 {
```

```

        filter common-filter;
    }
    term term2 {
        from {
            protocol udp;
            port bootps;
        }
        then {
            accept;
        }
    }
}

```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/0 {
    unit 0 {
        family inet {
            filter {
                input filter1;
            }
            address 10.1.0.1/24;
        }
    }
}
ge-0/0/3 {
    unit 0 {
        family inet {
            filter {
                input filter2;
            }
            address 10.1.3.1/24;
        }
    }
}

```

3. If you are done configuring the device, commit your candidate configuration.

```

[edit]
user@host# commit

```

## Verification

To confirm that the configuration is working properly, enter the **show firewall filter filter1** and **show firewall filter filter2** operational mode commands.

## Interface-Specific Firewall Filter Instances Overview

---

This topic covers the following information:

- [Instantiation of Interface-Specific Firewall Filters on page 747](#)
- [Interface-Specific Names for Firewall Filter Instances on page 748](#)
- [Interface-Specific Firewall Filter Counters on page 748](#)
- [Interface-Specific Firewall Filter Policers on page 749](#)

## Instantiation of Interface-Specific Firewall Filters

On T Series, M120, M320, and MX Series routers, you can enable the Junos OS to automatically create an interface-specific instance of a firewall filter for each interface to which you apply the filter. If you enable interface-specific instantiation of a firewall filter and then apply that filter to multiple interfaces, any **count** actions or **policer** actions configured in the filter terms act on the traffic stream entering or exiting each individual interface, regardless of the sum of traffic on the multiple interfaces.

You can enable this option per firewall filter by including the **interface-specific** statement in the filter configuration.

**NOTE:** On T Series, M120, M320, and MX Series routers, interfaces are distributed among multiple packet-forwarding components.

Interface-specific firewall filtering is not supported on M Series routers other than the M120 and M320 routers. If you apply a firewall filter to multiple interfaces on an M Series router other than the M120 or M320 routers, the filter acts on the sum of traffic entering or exiting those interfaces.

Interface-specific firewall filtering is supported for standard stateless firewall filters and for service filters. Interface-specific instances are not supported for simple filters.

**NOTE:** A firewall filter cannot be both interface-specific and interface-shared.

## Interface-Specific Names for Firewall Filter Instances

When the Junos OS creates a separate instance of a firewall filter for a logical interface, the instance is associated with an interface-specific name. The system-generated name of a firewall filter instance consists of the name of the configured filter followed by a hyphen ('-'), the full interface name, and either '-i' for an input filter instance or '-o' for an output filter instance.

- **Input filter instance name**—For example, if you apply the interface-specific firewall filter `filter_s_tcp` to the input at logical interface `at-1/1/1.0`, the Junos OS instantiates an interface-specific filter instance with the following system-generated name:

`filter_s_tcp-at-1/1/1.0-i`

- **Output filter instance name**—For example, if you apply the interface-specific firewall filter `filter_s_tcp` to the output at logical interface `so-2/2/2.2`, the Junos OS instantiates an interface-specific filter instance with the following system-generated name:

`count_s_tcp-so-2/2/2.2-o`

You can use the interface-specific name of a filter instance when you enter a Junos OS operational mode command that specifies a stateless firewall filter name.

**TIP:** When you configure a firewall filter with interface-specific instances enabled, we recommend you limit the filter name to 52 bytes in length. This is because firewall filter names are restricted to 64 bytes in length. If a system-generated filter instance name exceeds this maximum length, the policy framework software might reject the instance name.

## Interface-Specific Firewall Filter Counters

Instantiation of interface-specific firewall filters causes the Packet Forwarding Engine to maintain any counters for the firewall filter separately for each interface. You specify interface-specific counters per firewall filter term by specifying the `count counter-name` non-terminating action.

The system-generated name of an interface-specific firewall filter counter consists of the name of the configured counter followed by a hyphen ('-'), the full interface name, and either '-i' for an input filter instance or '-o' for an output filter instance.

- **Interface-specific input filter counter name**—For example, suppose you configure the filter counter `count_tcp` for an interface-specific firewall filter. If the filter is applied to the input at logical interface `at-1/1/1.0`, the Junos OS creates the following system-generated counter name:

```
count_tcp-at-1/1/1.0-i
```

- **Interface-specific output filter counter name**—For example, suppose you configure the filter counter `count_udp` for an interface-specific firewall filter. If the filter is applied to the output at logical interface `so-2/2/2.2`, the Junos OS creates the following system-generated counter name:

```
count_udp-so-2/2/2.2-o
```

## Interface-Specific Firewall Filter Policers

Instantiation of interface-specific firewall filters not only creates separate instances of any firewall filter counters but also creates separate instances of any policer actions. Any policers applied through an action specified in the firewall filter configuration are applied separately to each interface in the interface group. You specify interface-specific policers per firewall filter term by specifying the **policer *policer-name*** non-terminating action.

### Related Documentation

## Filtering Packets Received on a Set of Interface Groups Overview

You can configure a firewall filter term that matches packets tagged for a specified *interface group* or set of interface groups. An interface group consists of one or more logical interfaces with the same group number. Packets received on an interface in an interface group are tagged as being part of that group.

For standard stateless firewall filters, you can filter packets received on an interface group for IPv4, IPv6, virtual private LAN service (VPLS), Layer 2 circuit cross-connection (CCC), and Layer 2 bridging traffic. For service filters, you can filter packets received on an interface group for either IPv4 or IPv6 traffic.

**NOTE:** You can also configure a firewall filter term that matches on packets tagged for a specified *interface set*. For more information, see [“Filtering Packets Received on an Interface Set Overview” on page 750](#).

### Related Documentation

- [Statement Hierarchy for Assigning Interfaces to Interface Groups on page 751](#)

- [Statement Hierarchy for Configuring a Filter to Match on a Set of Interface Groups on page 752](#)
- [Example: Configuring a Stateless Firewall Filter on an Interface Group on page 758](#)

---

## Filtering Packets Received on an Interface Set Overview

---

You can configure a standard stateless firewall filter term that matches packets tagged for a specified *interface set*. An interface set groups two or more physical or logical interfaces into a single interface-set name. You can filter packets received on an interface set for protocol-independent, IPv4, IPv6, MPLS, VPLS, or bridging traffic.

**NOTE:** You can also configure a standard stateless firewall filter term or a service filter term that matches on packets tagged for a specified *interface group*. For more information, see [“Filtering Packets Received on a Set of Interface Groups Overview” on page 749](#).

---

### Related Documentation

- [Statement Hierarchy for Defining an Interface Set on page 750](#)
- [Statement Hierarchy for Configuring a Filter to Match on an Interface Set on page 751](#)
- [Example: Configuring a Rate-Limiting Filter Based on Destination Class on page 676](#)
- [Example: Filtering Packets Received on an Interface Set on page 614](#)

---

## Statement Hierarchy for Defining an Interface Set

---

To configure a named group of interfaces that can be referenced in a stateless firewall filter match condition, use the **interface-set** statement to define the interface-set name and two or more interfaces:

```
firewall {  
  interface-set interface-set-name {  
    interface-name;  
  }  
}
```

You can include the statements at one of the following hierarchy levels:

- **[edit firewall]**
- **[edit logical-systems *logical-system-name* firewall]**

To specify that the interface set contains all interfaces of a particular type, you can use the '\*' (asterisk) wildcard character. For example, use **fe-\*** to specify all Fast Ethernet interfaces.

### Related Documentation

- [Filtering Packets Received on an Interface Set Overview on page 750](#)
- [Statement Hierarchy for Configuring a Filter to Match on an Interface Set on page 751](#)

- [Example: Configuring a Rate-Limiting Filter Based on Destination Class on page 676](#)
- [Example: Filtering Packets Received on an Interface Set on page 614](#)

## Statement Hierarchy for Configuring a Filter to Match on an Interface Set

To configure a standard stateless firewall filter that matches packets tagged for a specified interface group or set of interface groups, configure a filter term that uses the **interface-group** *interface-group-name* match condition:

```
firewall {
  family (any | inet | inet6 | mpls | vpls | bridge) {
    filter filter-name {
      term term-name {
        from {
          interface-set interface-set-name;
        }
        then {
          filter-actions;
        }
      }
    }
  }
}
```

**NOTE:** The interface set, for which the *interface-set-name* variable is defined, cannot contain dynamic interfaces because it supports only static interfaces when it is used in the filter's match condition.

### Related Documentation

- [Filtering Packets Received on an Interface Set Overview on page 750](#)
- [Statement Hierarchy for Defining an Interface Set on page 750](#)
- [Example: Configuring a Rate-Limiting Filter Based on Destination Class on page 676](#)
- [Example: Filtering Packets Received on an Interface Set on page 614](#)

## Statement Hierarchy for Assigning Interfaces to Interface Groups

To assign a logical interface to an interface group, specify the group number by including the **group** *interface-group-number* statement in the **filter** stanza:

```
interfaces {
  interface-name {
    unit unit-number {
      family ( inet | inet6 | vpls | ccc | bridge ) {
        filter {
          group interface-group-number;
        }
      }
    }
  }
}
```

}

**NOTE:** The number 0 is not a valid number for an interface group.

You can configure the firewall filter at one of the following hierarchy levels:

- `[edit]`
- `[edit logical-systems logical-system-name]`

#### Related Documentation

- [Filtering Packets Received on a Set of Interface Groups Overview on page 749](#)
- [Statement Hierarchy for Configuring a Filter to Match on a Set of Interface Groups on page 752](#)
- [Example: Configuring a Stateless Firewall Filter on an Interface Group on page 758](#)

## Statement Hierarchy for Configuring a Filter to Match on a Set of Interface Groups

You can configure a standard stateless firewall filter or a service filter term that matches packets tagged for a specified interface group or set of interface groups.

To configure a standard stateless firewall filter that matches packets tagged for a specified interface group or set of interface groups, configure a filter term that uses the **interface-group** *interface-group-number* match condition:

```
firewall {
  family (inet | inet6 | vpls | ccc | bridge) {
    filter filter-name {
      term term-name {
        from {
          interface-group interface-group-number;
        }
        then {
          filter-actions;
        }
      }
    }
  }
}
```

To configure a service filter that matches packets tagged for a specified interface group or set of interface groups, configure a filter term that uses the **interface-group** *interface-group-name* match condition:

```
firewall {
  family (inet | inet6) {
    service-filter filter-name {
      term term-name {
        from {
          interface-group interface-group-number;
        }
        then {
          service-filter-actions;
        }
      }
    }
  }
}
```

```

    }
  }
}

```

You can configure the firewall filter at one of the following hierarchy levels:

- [\[edit\]](#)
- [\[edit logical-systems \*logical-system-name\*\]](#)

#### Related Documentation

- [Filtering Packets Received on a Set of Interface Groups Overview on page 749](#)
- [Statement Hierarchy for Assigning Interfaces to Interface Groups on page 751](#)
- [Example: Configuring a Stateless Firewall Filter on an Interface Group on page 758](#)

## Statement Hierarchy for Applying Filters to an Interface Group

To apply a standard stateless firewall filter to an interface group, include the **input *filter-name*** or **output *filter-name*** in the **filter** stanza:

```

interfaces {
  interface-name {
    unit unit-number {
      family family-name {
        ...
        filter {
          input filter-name;
          output filter-name;
        }
      }
    }
  }
}

```

You can include the interface configuration at one of the following hierarchy levels:

- [\[edit\]](#)
- [\[edit logical-systems \*logical-system-name\*\]](#)

#### Related Documentation

- [Interface-Specific Firewall Filter Instances Overview on page 747](#)
- [Statement Hierarchy for Assigning Interfaces to Interface Groups on page 751](#)

## Example: Configuring Interface-Specific Firewall Filter Counters

---

This example shows how to configure and apply an interface-specific standard stateless firewall filter.

- [Requirements on page 754](#)
- [Overview on page 754](#)
- [Configuration on page 754](#)
- [Verification on page 757](#)

### Requirements

Interface-specific stateless firewall filters are supported on T Series, M120, M320, and MX Series routers only.

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, you create an interface-specific stateless firewall filter that counts and accepts packets with source or destination addresses in a specified prefix and the IP protocol type field set to a specific value.

#### Topology

---

You configure the interface-specific stateless firewall filter **filter\_s\_tcp** to count and accept packets with IP source or destination addresses in the **10.0.0.0/12** prefix and the IP protocol type field set to **tcp** (or the numeric value **6**).

The name of the firewall filter counter is **count\_s\_tcp**.

You apply the firewall filter to multiple logical interfaces:

- **at-1/1/1.0** input
- **so-2/2/2.2** output

Applying the filter to these two interfaces results in two instances of the filter: **filter\_s\_tcp-at-1/1/1.0-i** and **filter\_s\_tcp-so-2/2/2.2-o**, respectively.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Interface-Specific Firewall Filter on page 755](#)
- [Apply the Interface-Specific Firewall Filter to Multiple Interfaces on page 755](#)

- [Confirm Your Candidate Configuration on page 756](#)
- [Clear the Counters and Commit Your Candidate Configuration on page 757](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet filter filter_s_tcp interface-specific
set firewall family inet filter filter_s_tcp term 1 from address 10.0.0.0/12
set firewall family inet filter filter_s_tcp term 1 from protocol tcp
set firewall family inet filter filter_s_tcp term 1 then count count_s_tcp
set firewall family inet filter filter_s_tcp term 1 then accept
set interfaces at-1/1/1 unit 0 family inet filter input filter_s_tcp
set interfaces so-2/2/2 unit 2 family inet filter filter_s_tcp
```

### Configure the Interface-Specific Firewall Filter

**Step-by-Step Procedure** To configure the interface-specific firewall filter:

1. Create the IPv4 firewall filter **filter\_s\_tcp**.  
  
[edit]  
user@host# edit firewall family inet filter filter\_s\_tcp
2. Enable interface-specific instances of the filter.  
  
[edit firewall family inet filter filter\_s\_tcp]  
user@host# set interface-specific
3. Configure the match conditions for the term.  
  
[edit firewall family inet filter filter\_s\_tcp]  
user@host# set term 1 from address 10.0.0.0/12  
user@host# set term 1 from protocol tcp
4. Configure the actions for the term.  
  
[edit firewall family inet filter filter\_s\_tcp]  
user@host# set term 1 then count count\_s\_tcp  
user@host# set term 1 then accept

### Apply the Interface-Specific Firewall Filter to Multiple Interfaces

**Step-by-Step Procedure** To apply the filter **filter\_s\_tcp** to logical interfaces **at-1/1/1.0** and **so-2/2/2.2**:

1. Apply the interface-specific filter to packets received on logical interface **at-1/1/1.0**.  
  
[edit]  
user@host# set interfaces at-1/1/1 unit 0 family inet filter input filter\_s\_tcp
2. Apply the interface-specific filter to packets transmitted from logical interface **so-2/2/2.2**.  
  
[edit]  
user@host# set interfaces so-2/2/2 unit 2 family inet filter filter\_s\_tcp

## Confirm Your Candidate Configuration

### Step-by-Step Procedure

To confirm your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter filter_s_tcp {
    interface-specific;
    term 1 {
      from {
        address {
          10.0.0.0/12;
        }
        protocol tcp;
      }
      then {
        count count_s_tcp;
        accept;
      }
    }
  }
}
```

2. Confirm the configuration of the interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show interfaces
at-1/1/1 {
  unit 0
    family inet {
      filter {
        input filter_s_tcp;
      }
    }
}
so-2/2/2 {
  unit 2
    family inet {
      filter {
        output filter_s_tcp;
      }
    }
}
```

### Clear the Counters and Commit Your Candidate Configuration

#### Step-by-Step Procedure

To clear the counters and commit your candidate configuration:

1. From operational command mode, use the **clear firewall all** command to clear the statistics for all firewall filters.

To clear only the counters used in this example, include the interface-specific filter instance names:

```
[edit]
user@host> clear firewall filter filter_s_tcp-at-1/1/1.0-i
user@host> clear firewall filter filter_s_tcp-so-2/2/2.2-o
```

2. Commit your candidate configuration.

```
[edit]
user@host# commit
```

#### Verification

Confirm that the configuration is working properly.

- [Verifying That the Filter Is Applied to Each of the Multiple Interfaces on page 757](#)
- [Verifying That the Counters Are Collected Separately by Interface on page 758](#)

### Verifying That the Filter Is Applied to Each of the Multiple Interfaces

**Purpose** Verify that the filter is applied to each of the multiple interfaces.

**Action** Run the **show interfaces** command with the **detail** or **extensive** output level.

1. Verify that the filter is applied to the input for **at-1/1/1.0**:

```
user@host> show interfaces at-1/1/1 detail
Physical interface: at-1/1/1, Enabled, Physical link is Up
  Interface index: 300, SNMP ifIndex: 194, Generation: 183
...
  Logical interface at-1/1/1.0 (Index 64) (SNMP ifIndex 204) (Generation 5)
    Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: ATM-SNAP
...
  Protocol inet, MTU: 4470, Generation: 13, Route table: 0
    Flags: Sendbroadcast-pkt-to-re
    Input Filters: filter_s_tcp-at-1/1/1.0-i,,,,,
```

2. Verify that the filter is applied to the output for **so-2/2/2.2**:

```
user@host> show interfaces so-2/2/2 detail
Physical interface: so-2/2/2, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 502, Generation: 132
...
  Logical interface so-2/2/2.2 (Index 70) (SNMP ifIndex 536) (Generation 135)
    Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPP
...
```

```
Protocol inet, MTU: 4470, Generation: 146, Route table: 0
Flags: Sendbroadcast-pkt-to-re
Output Filters: filter_s_tcp-so-2/2/2.2-o,,,,,
```

---

### Verifying That the Counters Are Collected Separately by Interface

---

**Purpose** Make sure that the `count_s_tcp` counters are collected separately for the two logical interfaces.

**Action** Run the `show firewall` command.

```
user@host> show firewall filter filter_s_tcp
Filter: filter_s_tcp
Counters:
Name                               Bytes      Packets
count_s_tcp-at-1/1/1.0-i           420         5
count_s_tcp-so-2/2/2.2-o          8888       101
```

---

## Example: Configuring a Stateless Firewall Filter on an Interface Group

---

Firewall filters are essential for securing a network and simplifying network management. In Junos OS, you can configure a stateless firewall filters to control the transit of data packets through the system and to manipulate packets as necessary. Applying a stateless firewall filter to an interface group helps to filter packets transiting through each interface in the interface group. This example shows how to configure a standard stateless firewall filter to match packets tagged for a particular interface group.

- [Requirements on page 758](#)
- [Overview on page 758](#)
- [Configuration on page 759](#)
- [Verification on page 762](#)

### Requirements

This example uses the following hardware and software components:

- Any two Juniper Networks routers or switches that are physically or logically connected to each other through interfaces belonging to a routing instance
- Junos OS Release 7.4 or later

### Overview

You can apply a stateless firewall filter to an interface group to apply it across all the interfaces in the interface group. This helps you to manage the packet filtering on various interfaces simultaneously.

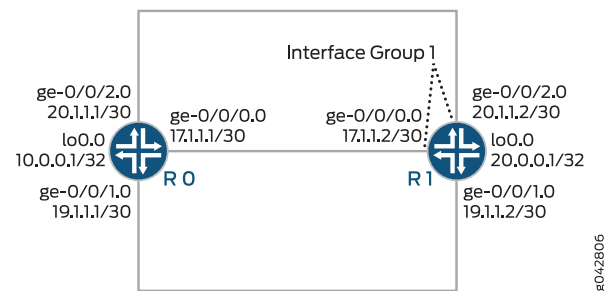

In this example, you configure two router or switch interfaces to belong to the interface group. You also configure a stateless firewall filter with three terms. In term **term1**, the filter matches packets that have been tagged as received on that interface group and contain an ICMP protocol tag. The filter counts, logs, and rejects packets that match the conditions. In term **term2**, the filter matches packets that contain the ICMP protocol tag. The filter counts, logs, and accepts all packets that match the condition. In term **term3**, the filter counts all the transit packets.

By applying the firewall filter to the routing instance, you can simultaneously apply the filtering mechanism on all the interfaces in the interface group. For this to happen, all the interfaces in the interface group must belong to a single routing instance.

**NOTE:** When you apply a firewall filter to a loopback interface, the interface filters all the packets destined to the Routing Engine.

**Figure 50: Configuring a Stateless Firewall Filter on an Interface Group**

CLI Quick Configuration shows the configuration for all of the devices in [Figure 50 on page 759](#). The section Step-by-Step Procedure describes the steps on Device R1.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Configure and Apply the Stateless Firewall Filter on an Interface Group

---

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the stateless firewall filter **filter\_if\_group** on an interface group:

1. Create the stateless firewall filter **filter\_if\_group**.

```
[edit firewall]
user@R1# edit family inet filter filter_if_group
```

2. Configure the interfaces and assign two interfaces to interface group 1.

```
[edit interfaces]
user@R1# set ge-0/0/0 unit 0 family inet filter group 1
user@R1# set ge-0/0/0 unit 0 family inet address 17.1.1.2/30

user@R1# set ge 0/0/1 unit 0 family inet address 19.1.1.2/30

user@R1# set ge-0/0/2 unit 0 family inet filter group 1
user@R1# set ge-0/0/2 unit 0 family inet address 20.1.1.2/30

user@R1# set lo0 unit 0 family inet address 20.0.0.1/32
```

3. Configure term **term1** to match packets received on interface group 1 and with the ICMP protocol.

```
[edit firewall]
user@R1# set family inet filter filter_if_group term term1 from interface-group 1
user@R1# set family inet filter filter_if_group term term1 from protocol icmp
```

4. Configure term **term1** to count, log, and reject all the matching packets.

```
[edit firewall]
user@R1# set family inet filter filter_if_group term term1 then count if_group_counter1
user@R1# set family inet filter filter_if_group term term1 then log
user@R1# set family inet filter filter_if_group term term1 then reject
```

5. Configure term **term2** to match packets with the ICMP protocol.

```
[edit firewall]
user@R1# set family inet filter filter_if_group term term2 from protocol icmp
```

- Configure term **term2** to count, log, and accept all the matching packets.

```
[edit firewall]
user@R1# set family inet filter filter_if_group term term2 then count if_group_counter2
user@R1# set family inet filter filter_if_group term term2 then log
user@R1# set family inet filter filter_if_group term term2 then accept
```

- Configure term **term3** to count all the transit packets.

```
[edit firewall]
user@R1# set family inet filter filter_if_group term term3 then count default
```

- Apply the firewall filter to the router's (or switch's) interface group by applying it to the routing instance.

```
[edit]
user@R1# set forwarding-options family inet filter input filter_if_group
```

- If you are done configuring the device, commit your candidate configuration.

```
[edit]
user@host# commit
```

## Results

From configuration mode, confirm your configuration by issuing the **show interfaces**, **show firewall**, and **show forwarding-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@R1# show interfaces
ge-0/0/0 {
  unit 0 {
    family inet {
      filter {
        group 1;
      }
      address 17.1.1.2/30;
    }
  }
}
ge-0/0/1 {
  unit 0 {
    family inet {
      address 19.1.1.2/30;
    }
  }
}
ge-0/0/2 {
  unit 0 {
    family inet {
      filter {
        group 1;
      }
      address 20.1.1.2/30;
    }
  }
}
```

```
}
lo0 {
  unit 0 {
    family inet {
      address 20.0.0.1/32;
    }
  }
}

[edit]
user@R1# show firewall
family inet {
  filter filter_if_group {
    term term1 {
      from {
        interface-group 1;
        protocol icmp;
      }
      then {
        count if_group_counter1;
        log;
        reject;
      }
    }
    term term2 {
      from {
        protocol icmp;
      }
      then {
        count if_group_counter2;
        log;
        accept;
      }
    }
    term term3 {
      then count default;
    }
  }
}

[edit]
user@R1# show forwarding-options
family inet {
  filter {
    input filter_if_group;
  }
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying the Configuration of the Interfaces on page 763](#)
- [Verifying Stateless Firewall Filter Configuration on page 763](#)

### Verifying the Configuration of the Interfaces

**Purpose** Verify that the interfaces are properly configured.

**Action** To display the state of the interfaces, use the **show interfaces terse** operational mode command.

#### Device R0

```
user@R0> show interfaces terse
Interface      Admin Link Proto  Local          Remote
ge-0/0/0       up   up   inet   17.1.1.1/30
ge-0/0/0.0     up   up   inet   17.1.1.1/30
                multiservice
ge-0/0/1       up   up   inet   19.1.1.1/30
ge-0/0/1.0     up   up   inet   19.1.1.1/30
                multiservice
ge-0/0/2       up   up   inet   20.1.1.1/30
ge-0/0/2.0     up   up   inet   20.1.1.1/30
                multiservice
lo0            up   up
lo0.0          up   up   inet   10.0.0.1      --> 0/0
```

#### Device R1

```
user@R1> show interfaces terse
Interface      Admin Link Proto  Local          Remote
ge-0/0/0       up   up   inet   17.1.1.2/30
ge-0/0/0.0     up   up   inet   17.1.1.2/30
                multiservice
...
ge-0/0/1       up   up
ge-0/0/1.0     up   up   inet   19.1.1.2/30
                multiservice
ge-0/0/2       up   up
ge-0/0/2.0     up   up   inet   20.1.1.2/30
                multiservice
...
```

**Meaning** All the interfaces on Devices R0 and R1 are physically connected and up. The interface group 1 on Device R1 consists of two interfaces, namely ge-0/0/0.0 and ge-0/0/2.0.

### Verifying Stateless Firewall Filter Configuration

**Purpose** Verify that the firewall filter match conditions are configured properly.

**Action** • To display the firewall filter counters, enter the **show firewall filter filter\_if\_group** operational mode command.

```
user@R1> show firewall filter filter_if_group
```

```
Filter: filter_if_group
```

```
Counters:
```

| Name              | Bytes  | Packets |
|-------------------|--------|---------|
| default           | 192975 | 3396    |
| if_group_counter1 | 2520   | 30      |
| if_group_counter2 | 2604   | 41      |

- To display the local log of packet headers for packets evaluated by the firewall filter, enter the `show firewall log` operational mode command.

```
user@R1> show firewall log
```

```
Log :
```

| Time     | Filter          | Action | Interface  | Protocol | Src Addr   |
|----------|-----------------|--------|------------|----------|------------|
| 22:27:33 | pfe             | A      | lo0.0      | ICMP     | 20.1.1.2   |
| 22:27:33 | pfe             | R      | ge-0/0/2.0 | ICMP     | 20.1.1.1   |
| 22:27:32 | pfe             | A      | lo0.0      | ICMP     | 20.1.1.2   |
| 22:27:32 | pfe             | R      | ge-0/0/2.0 | ICMP     | 20.1.1.1   |
| 22:27:31 | pfe             | A      | lo0.0      | ICMP     | 20.1.1.2   |
| 22:27:31 | pfe             | R      | ge-0/0/2.0 | ICMP     | 20.1.1.1   |
| 22:27:30 | pfe             | A      | lo0.0      | ICMP     | 20.1.1.2   |
| 22:27:30 | pfe             | R      | ge-0/0/2.0 | ICMP     | 20.1.1.1   |
| 22:27:29 | pfe             | A      | lo0.0      | ICMP     | 20.1.1.2   |
| 22:27:29 | pfe             | A      | lo0.0      | ICMP     | 20.1.1.2   |
| 22:27:29 | pfe             | R      | ge-0/0/2.0 | ICMP     | 20.1.1.1   |
| 22:27:21 | pfe             | A      | ge-0/0/1.0 | ICMP     | 19.1.1.1   |
| 22:27:20 | pfe             | A      | ge-0/0/1.0 | ICMP     | 19.1.1.1   |
| 22:27:19 | pfe             | A      | ge-0/0/1.0 | ICMP     | 19.1.1.1   |
| 22:27:18 | pfe             | A      | ge-0/0/1.0 | ICMP     | 19.1.1.1   |
| 22:27:04 | pfe             | A      | lo0.0      | ICMP     | 17.1.1.2   |
| 22:27:04 | pfe             | R      | ge-0/0/0.0 | ICMP     | 17.1.1.1   |
| 22:27:04 | pfe             | A      | lo0.0      | ICMP     | 17.1.1.2   |
| 22:27:04 | pfe             | R      | ge-0/0/0.0 | ICMP     | 17.1.1.1   |
| 22:27:02 | pfe             | A      | lo0.0      | ICMP     | 17.1.1.2   |
| 22:27:02 | pfe             | R      | ge-0/0/0.0 | ICMP     | 17.1.1.1   |
| 22:27:01 | pfe             | A      | lo0.0      | ICMP     | 17.1.1.2   |
| 22:27:01 | pfe             | R      | ge-0/0/0.0 | ICMP     | 17.1.1.1   |
| 22:27:00 | pfe             | A      | lo0.0      | ICMP     | 17.1.1.2   |
| 22:27:00 | pfe             | R      | ge-0/0/0.0 | ICMP     | 17.1.1.1   |
| 22:24:48 | filter_if_group | A      | fxp0.0     | ICMP     | 10.92.16.2 |

- To make sure that the firewall filters are active on interface group 1 on Device R1, use the **ping <address>** operational mode command on the CLI of Device R0.

```
user@R0> ping 17.1.1.2
PING 17.1.1.2 (17.1.1.2): 56 data bytes

...
```

**Meaning** The stateless firewall filter is applied to all interfaces in interface group 1. The term **term1** match condition in the stateless firewall filter counts, logs, and rejects packets that are received on or sent from the interfaces in interface group 1 and with a source ICMP protocol. The term **term2** match condition matches packets tagged with the ICMP protocol and counts, logs, and accepts those packets. The term **term3** match condition counts all the transit packets.

## Understanding Filter-Based Tunneling Across IPv4 Networks

Generic routing encapsulation (GRE) in its simplest form is the encapsulation of any network layer protocol over any other network layer protocol to connect disjointed networks that lack a native routing path between them. You can configure an IPv4 network to transport IPv4, IPv6, or MPLS transit traffic by using GRE tunneling protocol mechanisms initiated by two standard firewall filter actions. This feature is also supported in logical systems.

When you configure GRE tunneling with firewall filters, you do not need to create tunnel interfaces on Tunnel Services physical interface cards (PICs) or on MPC3E Modular Port Concentrators (MPCs). Instead, Packet Forwarding Engines provide tunnel services to Ethernet logical interfaces or aggregated Ethernet interfaces hosted on Modular Interface Cards (MICs) or MPCs in MX Series 3D Universal Edge Routers.

**NOTE:** GRE is a connectionless and stateless Layer 3 encapsulation protocol, and it offers no mechanisms for reliability, flow control, or sequencing. Traffic flows through the tunnel provided that the tunnel destination is routable.

Two MX Series routers installed as provider edge (PE) routers provide connectivity to customer edge (CE) routers on two disjoint networks. MIC or MPC interfaces on the PE routers perform GRE IPv4 encapsulation and de-encapsulation of payloads.

**NOTE:** Filter-based GRE tunneling is supported on PTX Series routers only when network services is set to **enhanced-mode**. For more information, see **enhanced-mode**.

---

### Ingress Firewall Filter on the Ingress PE Router

On the ingress PE router, you configure a tunnel definition that specifies a unidirectional GRE tunnel. On a MIC or MPC ingress logical interface, you attach an encapsulating firewall filter. The firewall filter action references a tunnel definition and initiates the encapsulation of matched packets. The encapsulation process attaches an IPv4 header and a GRE header to the payload packet and then forwards the resulting GRE packet to the filter-specified tunnel.

---

### Ingress Firewall Filter on the Egress PE Router

On the egress PE router, you attach a de-encapsulating firewall filter to the input of all MIC or MPC logical interfaces that are advertised addresses for the router. The firewall filter initiates the de-encapsulation of GRE protocol packets. De-encapsulation removes the inner GRE header and then forwards the original payload packet to its original destination on the destination customer network. If the action specifies an optional routing instance, route lookup is performed using that secondary table instead of the primary table.

## Characteristics of Filter-Based Tunneling Across IPv4 Networks

Filter-based tunnels across IPv4 networks are unidirectional. They transport transit packets only, and they do not require tunnel interfaces.

---

### Unidirectional Tunneling

Filter-based tunneling across IPv4 networks is unidirectional. You construct a filter-based GRE tunnel by attaching standard firewall filters at the *input* of each tunnel endpoint (at both the ingress PE router and the egress PE router). At the input to the ingress PE router, you apply an encapsulating firewall filter. At the input to the egress PE router, you apply a de-encapsulating firewall filter.

If you want to configure bidirectional GRE tunneling, you can use the same pair of PE routers, but you must configure a second tunnel in the reverse direction.

---

### Transit Traffic Payloads

A filter-based GRE IPv4 tunnel can transport unicast or multicast transit traffic payloads only. Filter-initiated encapsulation and de-encapsulation operations execute on Packet Forwarding Engines for Ethernet logical interfaces and aggregated Ethernet interfaces hosted on MICs or MPCs in MX Series routers. This design enables more efficient use of Packet Forwarding Engine bandwidth as compared to GRE tunneling using tunnel

interfaces. One of the trade-offs for this optimization, however, is the inability to transport router control traffic.

Packet Forwarding Engines operate in the Junos OS *forwarding plane* to process packets by forwarding them between input and output interfaces using a locally stored forwarding table (a local copy of the information from the Routing Engine). Routing Engines, on the other hand, operate in the Junos OS *control plane* to handle system management, user access to the router, and processes for routing protocols, router interface control, and some chassis component control. The Junos OS architecture separates the functions of these planes to enable flexibility of platform support and scalability of platform performance. Ingress control packets are directed to the control plane where the GRE encapsulation and de-encapsulation processes of the Packet Forwarding Engine are not available.

Although you can apply firewall filters to loopback addresses, GRE encapsulating and de-encapsulating firewall filter actions are not supported on router loopback interfaces.

### Compact Configuration for Multiple GRE Tunnels

Firewall filters support a wide variety of match criteria and, by extension, the ability to terminate multiple GRE tunnels that match criteria specified in a single firewall filter definition. By creating multiple tunnels, each with its own set of match conditions, you can create tunnels that do not interfere with customer GRE packets or with one another and that re-inject packets to separate routing tables after de-encapsulation.

## Tunneling with Firewall Filters and Tunneling with Tunnel Interfaces

Unlike tunneling with firewall filters, tunneling with tunnel interfaces supports router control traffic (in addition to transit traffic) and encryption. On the other hand, tunneling with firewall filters carries advantages in performance and scaling.

### Tunnel Security

Filter-based tunneling across IPv4 networks is not encrypted. If you require secure tunneling, you must use IP Security (IPsec) encryption, which is not supported on MIC or MPC interfaces. However, Multiservices DPC (MS-DPC) interfaces on MX240, MX480, and MX960 routers support IPsec tools for configuring manual or dynamic security associations (SAs) for encryption of data traffic as well as traffic destined to or originating at the Routing Engine.

For information about Junos OS support for the IPsec security suite for the IPv4 and IPv6 network layers, see the *Security Services Administration Guide for Routing Devices*, the *Junos VPN Site Secure* guide, and *Enabling Service Packages*.

IPsec encryption is also supported on Adaptive Services PIC interfaces and Multiservices PIC interfaces on supported M Series Multiservice Edge Routers and T Series Core Routers.

### Forwarding Performance

Filter-based tunneling across IPv4 networks enables more efficient use of Packet Forwarding Engine bandwidth as compared to GRE tunneling using tunnel interfaces. Encapsulation, de-encapsulation, and route lookup are packet header-processing activities that, for firewall filter-based tunneling, are performed on the Junos Trio chipset-based

Packet Forwarding Engine. Consequently, the encapsulator never needs to send payload packets to a separate tunnel interface (which might reside on a PIC in a different slot than the interface that receives payload packets).

### **Forwarding Scalability**

---

Forwarding GRE traffic with tunnel interfaces requires traffic to be sent to a slot that hosts the tunnel interfaces. When you use tunnel interfaces to forward GRE traffic, this requirement limits the amount of traffic that can be forwarded per GRE tunnel destination address.

As an example, suppose you want to send 100 Gbps of GRE traffic from Router A to Router B and you have only 10 Gbps interfaces. To ensure that your configuration does not encapsulate all the traffic on the same board going to the same 10 Gbps interface, you must distribute the traffic across multiple encapsulation points.

## **Firewall Filter-Based L2TP Tunneling in IPv4 Networks Overview**

---

The Layer 2 Tunneling Protocol (L2TP) is a client-server protocol that allows the Point-to-Point Protocol (PPP) to be tunneled across a network. L2TP encapsulates Layer 2 packets, such as PPP, for transmission across a network. An L2TP access concentrator (LAC), configured on an access device, receives packets from a remote client and forwards them to an L2TP network server (LNS) on a remote network. L2TPv3 defines the base control protocol and encapsulation for tunneling multiple Layer 2 connections between two IP nodes. The significant differences between L2TPv2 and L2TPv3 include the following:

- Separation of all PPP-related AVPs and references, which enables the inclusion of a portion of the L2TP data header that was specific to the needs of PPP.
- Transition from a 16-bit Session ID and Tunnel ID to a 32-bit Session ID and Control Connection ID respectively.
- Extension of the tunnel authentication mechanism to cover the entire control message rather than just a portion of certain messages.

L2TP is comprised of two types of messages, control messages and data messages (sometimes referred to as control packets and data packets respectively). Control messages are used in the establishment, maintenance, and clearing of control connections and sessions. These messages utilize a reliable control channel within L2TP to guarantee delivery. Data messages are used to encapsulate the L2 traffic being carried over the L2TP session.

You can configure an IPv4 network to transport IPv4, IPv6, or MPLS transit traffic by using GRE tunneling protocol mechanisms initiated by two standard firewall filter actions. This feature is also supported in logical systems. When you configure L2TP tunneling with firewall filters, you do not need to create tunnel interfaces on Tunnel Services physical interface cards (PICs) or on MPC3E Modular Port Concentrators (MPCs). Instead, Packet Forwarding Engines provide tunnel services to Ethernet logical interfaces or aggregated Ethernet interfaces hosted on Modular Interface Cards (MICs) or MPCs in MX Series 3D Universal Edge Routers.

Two MX Series routers installed as provider edge (PE) routers provide connectivity to customer edge (CE) routers on two disjoint networks. MIC or MPC interfaces on the PE routers perform L2TP IPv4 encapsulation and de-encapsulation of payloads. After decapsulation, packets are sent to the local interface of a routing table specified in the action, or to the default routing table, based on the protocol field of the L2TP header. However, an L2TP packet can optionally be sent across the fabric with a token equal to an output interface index to perform Layer 2 cross-connect. You can specify the output interface specifier to be used for the L2TP packet to be sent by including the **decapsulate l2tp output-interface *interface-name* cookie l2tpv3-cookie** statement at the **[edit firewall family *family-name* filter *filter-name* term *term-name* then]** hierarchy level.

During decapsulation, the inner header must be Ethernet for L2TP tunnels. Forwarding class by default is applied before the firewall and it is not preserved for the decapsulated packet (by using the **forwarding-class *class-name*** statement at the **[edit firewall family *family-name*]** hierarchy level, which is a nonterminating filter action). However, you can specify the forwarding class that the packet must be classified against by including the filter action for a decapsulated packet by using the **decapsulate l2tp forwarding-class *class-name*** statement at the **[edit firewall family *family-name* filter *filter-name* term *term-name* then]** hierarchy level.

The following field definitions are defined for use in all L2TP Session Header encapsulations.

- The Session ID field is a 32-bit field containing a non-zero identifier for a session. L2TP sessions are named by identifiers that have local significance only. The same logical session will be given different Session IDs by each end of the control connection for the life of the session. When the L2TP control connection is used for session establishment, Session IDs are selected and exchanged as Local Session ID AVPs during the creation of a session. The Session ID alone provides the necessary context for all further packet processing, including the presence, size, and value of the Cookie, the type of L2-Specific Sublayer, and the type of payload being tunneled.
- The optional Cookie field contains a variable-length value (maximum 64 bits) used to check the association of a received data message with the session identified by the Session ID. The Cookie field must be set to the configured or signaled random value for this session. The Cookie provides an additional level of guarantee that a data message has been directed to the proper session by the Session ID. A well-chosen Cookie might prevent inadvertent misdirection of random packets with recently reused Session IDs or for Session IDs subject to packet corruption. The Cookie might also provide protection against some specific malicious packet insertion attacks. When the

L2TP control connection is used for session establishment, random Cookie values are selected and exchanged as Assigned Cookie AVPs during session creation.

A session is a logical connection created between the LAC and the LNS when an end-to-end PPP connection is established between a remote system and the LNS. There is a one-to-one relationship between established L2TP sessions and their associated PPP connections. A tunnel is an aggregation of one or more L2TP sessions.

Starting with Junos OS Release 15.1, decapsulation of IP packets that are sent through an L2TP tunnel with standard firewall filter match conditions and actions specified is performed using a Layer 3 lookup. Until Junos OS release 14.2, decapsulation of traffic over an L2TP tunnel with firewall filter actions configured was performed using Layer 2 interface properties.

This topic covers the following information:

- [Unidirectional Tunneling on page 772](#)
- [Tunnel Security on page 772](#)
- [Forwarding Performance on page 772](#)
- [Forwarding Scalability on page 773](#)

## Unidirectional Tunneling

Filter-based L2TP tunnels across IPv4 networks are unidirectional. They transport transit packets only, and they do not require tunnel interfaces. Although you can apply firewall filters to loopback addresses, GRE encapsulating and de-encapsulating firewall filter actions are not supported on router loopback interfaces. Filter-initiated encapsulation and de-encapsulation operations of L2TP packets execute on Packet Forwarding Engines for Ethernet logical interfaces and aggregated Ethernet interfaces hosted on MICs or MPCs in MX Series routers. This design enables more efficient use of Packet Forwarding Engine bandwidth as compared to GRE tunneling using tunnel interfaces. One of the trade-offs for this optimization, however, is the inability to transport router control traffic.

## Tunnel Security

Filter-based tunneling across IPv4 networks is not encrypted. If you require secure tunneling, you must use IP Security (IPsec) encryption, which is not supported on MIC or MPC interfaces. However, Multiservices DPC (MS-DPC) interfaces on MX240, MX480, and MX960 routers support IPsec tools for configuring manual or dynamic security associations (SAs) for encryption of data traffic as well as traffic destined to or originating at the Routing Engine.

## Forwarding Performance

Filter-based tunneling across IPv4 networks enables more efficient use of Packet Forwarding Engine bandwidth as compared to L2TP tunneling using tunnel interfaces. Encapsulation, de-encapsulation, and route lookup are packet header-processing activities that, for firewall filter-based tunneling, are performed on the Junos Trio chipset-based Packet Forwarding Engine. Consequently, the encapsulator never needs to send payload packets to a separate tunnel interface (which might reside on a PIC in a different slot than the interface that receives payload packets).

## Forwarding Scalability

Forwarding L2TP traffic with tunnel interfaces requires traffic to be sent to a slot that hosts the tunnel interfaces. When you use tunnel interfaces to forward GRE traffic, this requirement limits the amount of traffic that can be forwarded per GRE tunnel destination address. As an example, suppose you want to send 100 Gbps of L2TP traffic from Router A to Router B and you have only 10 Gbps interfaces. To ensure that your configuration does not encapsulate all the traffic on the same board going to the same 10 Gbps interface, you must distribute the traffic across multiple encapsulation points.

## Interfaces That Support Filter-Based Tunneling Across IPv4 Networks

You can attach IPv4 encapsulation and de-encapsulation firewall filters to the input of Ethernet logical interfaces or aggregated Ethernet interfaces hosted on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs) in MX Series routers.

**NOTE:** Filter-based generic routing encapsulation (GRE) tunneling is supported on PTX Series routers only when network services is set to **enhanced-mode**. For more information, see **enhanced-mode**.

- [Interfaces on MX5, MX10, MX40, and MX80 Routers on page 774](#)
- [CLI Commit Check for Filter-Based Tunneling Across IPv4 Networks on page 774](#)

### Interfaces on MX240, MX480, MX960, MX2010, and MX2020 Routers

On MX240, MX480, MX960, MX2010, and MX2020 routers, firewall filter actions for IPv4 tunneling are supported on Ethernet logical interfaces or aggregated Ethernet interfaces configured on the following types of ports:

- Ports on MICs that insert into slots in MPCs, which have two Packet Forwarding Engines.
- Ports on a 16-port 10-Gigabit Ethernet MPC (MPC-3D-16XGE-SFPP), a specialized fixed-configuration MPC that has four Packet Forwarding Engines and contains no slots for MICs.

For these physical interfaces, Trio chipset-based Packet Forwarding Engine processes operate in *fabric mode* to provide forwarding and storage functions and lookup and processing functions between Ethernet interfaces and the routing fabric of the chassis.

For information about MPCs, see *MX Series MPC Overview* and *MPCs Supported by MX240, MX480, MX960, MX2010, and MX2020 Routers*. For information about MICs, see *MX Series MIC Overview* and *MICs Supported by MX Series Routers*.

## Interfaces on MX5, MX10, MX40, and MX80 Routers

On the MX Series midrange family of routers (MX5, MX10, MX40, and MX80 routers), firewall filter actions for IPv4 tunneling are supported on Ethernet logical interfaces and aggregated Ethernet interfaces configured on ports on a built-in MIC or on MICs that install into dedicated slots in the router chassis.

- The MX80 router—available as a modular (MX80) or fixed (MX80-48T) chassis—has a built-in 4-port 10-Gigabit Ethernet MIC. The modular chassis has two dedicated slots for MICs. The fixed chassis has 48 built-in tri-rate (10/100/1000Base-T) RJ-45 ports in place of two front-pluggable MIC slots.
- On the MX40 router, only the first two of the four built-in 10-Gigabit Ethernet MIC ports are enabled. As with the modular MX80, the two front-pluggable MIC slots are enabled and support dual-wide MICs that span the two slots.
- The MX5 and MX10 routers are pre-populated with a front-pluggable 20-port Gigabit Ethernet MIC with SFP, and none of the four built-in 10-Gigabit Ethernet MIC ports is enabled. The MX10 supports MICs in both front-pluggable slots, but the MX5 supports MICs in the second slot only.

For more information, see *MX5, MX10, MX40, and MX80 Modular Interface Card Description*.

The MX Series midrange routers have no switching fabric, and the single Packet Forwarding Engine resides on the base board of the chassis and operates in *standalone mode*. In standalone mode, the Packet Forwarding Engine provides—in addition to forwarding and storage functions and lookup and processing functions—hierarchical queuing, congestion management, and granular statistical functions.

## CLI Commit Check for Filter-Based Tunneling Across IPv4 Networks

If you commit a configuration that attaches an encapsulating or de-encapsulating firewall filter to an interface that does not support filter-based tunneling across IPv4 networks, a system event writes a syslog warning message that the interface does not support the filter.

- [GRE Protocol Format for Filter-Based Tunneling Across IPv4 Networks on page 777](#)

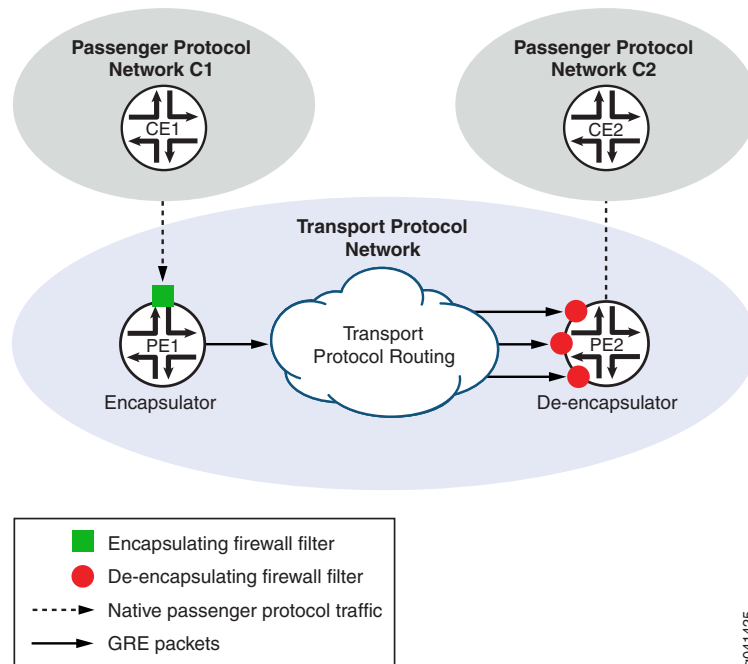

## Topology of Filter-Based Tunneling Across IPv4 Networks

**NOTE:** Filter-based generic routing encapsulation (GRE) tunneling is supported on PTX Series routers only when network services is set to enhanced-mode. For more information, see [enhanced-mode](#).

Figure 51 on page 775 shows the path of passenger protocol packets from customer network C1 as they are transported across a service provider IPv4 network to customer network C2.

Figure 51: Unidirectional Filter-Based Tunnel Across an IPv4 Network

g041425

In this example topology, C1 and C2 are disjoint networks that lack a native routing path between them. The IPv4 transport network is configured with a unidirectional generic routing encapsulation (GRE) tunnel from PE1 to PE2 using firewall filters and without

requiring tunnel interfaces. The GRE tunnel from PE1 to PE2 provides a logical path from C1 to C2 across the IPv4 transport network.

### Routing of GRE Packets Across the Tunnel

---

Traffic flows through the tunnel provided that PE2 is routable from PE1. Routing paths from PE1 to PE2 can be provided by static routes manually added to routing tables or by static or dynamic route-sharing protocols.

### Routing of Passenger Protocol Packets from PE2 to C2

---

By default, PE2 forwards packets based on interface routes (direct routes) imported from the primary routing table. As an option, the de-encapsulating filter can specify that the Packet Forwarding Engine uses an alternate routing table to forward payload packets to the destination customer network. Specify the alternate routing table in a routing instance installed with routes into C2, then use a routing information base (RIB) group definition to share the primary routes with the alternate routes. A RIB group specifies the sharing of routing information (including routes learned from peers, local routes resulting from the application of protocol policies to the learned routes, and the routes advertised to peers) of multiple routing tables.

## Terminology at the Network Layer Protocols Level

In filter-based tunneling across an IPv4 network, the network-layer protocols are described in the following terms:

passenger protocol—The type of protocol (IPv4, IPv6, or MPLS) used by the networks that are connected by a GRE tunnel. Packets that are encapsulated and routed across the transport network are *payload packets*.

encapsulation protocol—The type of network layer protocol (GRE) used to encapsulate passenger protocol packets so that the resulting GRE packets can be carried over the transport protocol network as the packet payload.

transport protocol—The type of protocol (IPv4) used by the network that routes passenger protocol packets through a GRE tunnel. The transport protocol is also called the *delivery protocol*.

## Terminology at the Ingress PE Router

In filter-based tunneling across an IPv4 network, an egress PE router is described in the following terms:

encapsulator—A PE router that receives packets from a passenger protocol source network, adds an encapsulation protocol (GRE) header and a transport protocol (IPv4) header to this payload, and forwards the resulting GRE packet to the GRE tunnel. This ingress node is also known as the *tunnel source*.

encapsulating interface—On the encapsulator, an Ethernet logical interface or an aggregated Ethernet interface configured on a customer-facing interface hosted on a MIC or an MPC. The encapsulating interface receives passenger protocol packets from a CE router. For more information, see [“Interfaces That Support Filter-Based Tunneling Across IPv4 Networks” on page 773](#).

encapsulation filter—On the encapsulator, a firewall filter that you apply to the input of the encapsulating interface. The encapsulating filter action causes the Packet Forwarding Engine to use information in the specified tunnel template to encapsulate matched packets and forward the resulting GRE packets.

tunnel source interface—On the encapsulator, one or more core-facing egress interfaces to the tunnel.

tunnel template—On the encapsulator, a named CLI construct that defines the characteristics of a tunnel:

- Transport protocol family (IPv4).
- IP address or address range of tunnel-facing *egress* interfaces on the encapsulator.
- IP address or address range of tunnel-facing *ingress* interfaces on the de-encapsulator (the egress PE router).
- Encapsulation protocol (GRE).

## Terminology at the Egress PE Router

In filter-based tunneling across IPv4 networks, an egress PE router is described in the following terms:

de-encapsulator—A PE router that receives GRE packets routed through a filter-based GRE tunnel, removes the transport protocol header and GRE header, and forwards the resulting payload protocol packets to the destination network CE router. The de-encapsulator node is also known as a *de-encapsulating tunnel endpoint* or the *tunnel destination*.

de-encapsulating interfaces—On the de-encapsulator, any Ethernet logical interface or aggregated Ethernet interface configured on any core-facing ingress interface that can receive GRE packets from a GRE tunnel. The underlying physical interface must be hosted on a MIC or an MPC. For more information, see [“Interfaces That Support Filter-Based Tunneling Across IPv4 Networks” on page 773](#).

de-encapsulation filter—On the de-encapsulator, a firewall filter that causes the Packet Forwarding Engine to de-encapsulate matched GRE packets and then forward the original passenger protocol packets to destination network CE routers.

GRE packets transported through a single GRE tunnel can arrive at the de-encapsulator node on any of multiple ingress interfaces, depending on how routing is configured. Therefore, you must apply the de-encapsulation firewall filter to the input of every core-facing interface that is an advertised address for the de-encapsulator.

## GRE Protocol Format for Filter-Based Tunneling Across IPv4 Networks

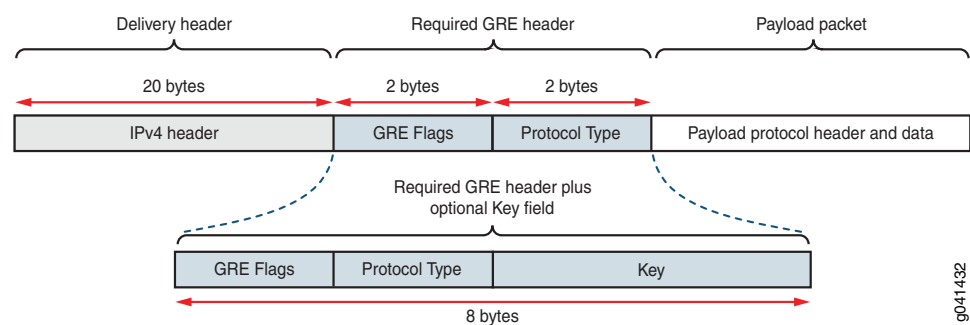

In filter-based tunneling across IPv4 networks, the encapsulating interface is an *RFC 1701-compliant transmitter* and the de-encapsulating interfaces are *RFC 1701-compliant receivers*. The packet encapsulation structure implemented in this feature uses a GRE header format that complies with informational RFC 1701, *Generic*

*Routing Encapsulation (GRE)*, October 1994, and with standards track RFC 2784, *Generic Routing Encapsulation (GRE)*, March 2000.

### Packet Encapsulation Structure

Filter-based tunneling encapsulates the original passenger protocol packet in an outer shell. For filter-based tunneling across IPv4 networks, the shell adds 24 bytes or 28 bytes of overhead, including 20 bytes of IPv4 header. [Figure 52 on page 778](#) shows the structure of a passenger protocol packet (the GRE payload) with a GRE header and IPv4 header attached.

**Figure 52: Encapsulation Structure for Filter-Based Tunneling Across an IPv4 Network**

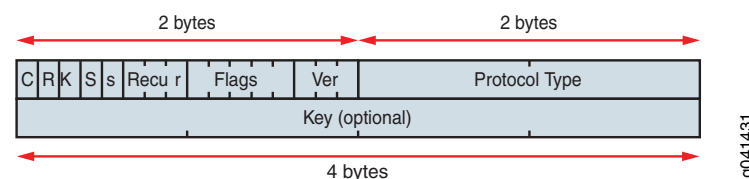

As specified in RFC 1701, five GRE flag bits indicate whether a particular GRE header includes any optional fields (Checksum, Offset, Key, Sequence Number, and Routing). Of the five optional fields, filter-based GRE IPv4 tunneling uses the Key field only.

### GRE Header Format

[Figure 53 on page 778](#) shows the format of the variable-size GRE header used for filter-based tunneling across IPv4 networks, with bit 0 the most significant bit and bit 15 the least significant bit.

**Figure 53: GRE Header Format for Filter-Based Tunneling Across IPv4 Networks**

The first two octets encode GRE flags, as described in [Table 61 on page 779](#).

The 2-octet Protocol Type field contains the value 0x0800 to specify the EtherType value for the IPv4 protocol.

The 4-octet Key field is included only if the Key Present bit is set to 1. The Key field carries the key value of the tunnel defined on the encapsulator. If the GRE tunnel definition specifies a key, the Packet Forwarding Engine for the encapsulating endpoint sets the Key Present bit and adds the Key to the GRE header.

Table 61: GRE Flag Values for Filter-Based Tunneling Across IPv4 Networks

| Bit Offset and Field Name |                                              | Transmitted Value for Filter-Based GRE Tunneling |                                                                              |
|---------------------------|----------------------------------------------|--------------------------------------------------|------------------------------------------------------------------------------|
| 0                         | <b>C</b> = Checksum Present                  | <b>0</b>                                         | Checksum field is not used.                                                  |
| 1                         | <b>R</b> = Routing Present                   | <b>0</b>                                         | Offset and Routing fields are not used.                                      |
| 2                         | <b>K</b> = Key Present                       | <b>0 or 1</b>                                    | Transmitted as <b>0</b> for a keyless tunnel or <b>1</b> for a keyed tunnel. |
| 3                         | <b>S</b> = Sequence Number Present           | <b>0</b>                                         | Sequence Number field is not used.                                           |
| 4                         | <b>s</b> = Strict Source Route               | <b>0</b>                                         | Not all routing information is Strict Source Routes.                         |
| 5 - 7                     | <b>Recur</b> = Recursion Control information | <b>000</b>                                       | No additional encapsulations are permitted.                                  |
| 8 - 12                    | <b>Flags</b> = Flag bits                     | <b>00000</b>                                     | Reserved.                                                                    |
| 13 - 15                   | <b>Ver</b> = Version number                  | <b>000</b>                                       | Reserved.                                                                    |

When the Packet Forwarding Engine performs encapsulation for a keyed GRE IPv4 tunnel, the process constructs the first two octets of the GRE header as 0x0000. When the Packet Forwarding Engine performs encapsulation for a non-keyed GRE IPv4 tunnel, the process constructs the first two octets of the GRE header as 0x2000.

### Example: Transporting IPv6 Traffic Across IPv4 Using Filter-Based Tunneling

This example shows how to configure a unidirectional generic routing encapsulation (GRE) tunnel to transport IPv6 unicast transit traffic across an IPv4 transport network. To provide network connectivity to the two disjoint IPv6 networks, two MX Series 3D Universal Edge Routers are configured with interfaces that can originate and understand both IPv4 and IPv6 packets. The configuration does not require the creation of tunnel interfaces on Tunnel Services physical interface cards (PICs) or on MPC3E Modular Port Concentrators (MPCs). Instead, you attach firewall filters to Ethernet logical interfaces hosted on Modular Interface Cards (MICs) or MPCs in the two MX Series routers.

**NOTE:** Filter-based GRE tunneling is supported on PTX Series routers only when network services is set to enhanced-mode. For more information, see [enhanced-mode](#).

## Requirements

This example uses the following Juniper Networks hardware and Junos OS software:

- Transport network—An IPv4 network running Junos OS Release 12.3R2 or later.
- PE routers—Two MX80 routers installed as provider edge (PE) routers that connect the IPv4 network to two disjoint IPv6 networks that require a logical path from one network to the other.
- Encapsulating interface—On the encapsulator (the ingress PE router), one Ethernet logical interface configured on the built-in 10-Gigabit Ethernet MIC.
- De-encapsulating interfaces—On the de-encapsulator (the egress PE router), Ethernet logical interfaces configured on three ports of the built-in 10-Gigabit Ethernet MIC.

Before you begin configuring this example:

1. On each PE router, use the **show chassis fpc pic-status** operational mode command to determine which router line cards support filter-based GRE IPv4 tunneling and then use the **interfaces** configuration statement to configure encapsulating and de-encapsulating interfaces.
  - At PE1, the encapsulator, configure *one encapsulating interface* on a supported line card.
  - At PE2, the de-encapsulator, configure *three de-encapsulating interfaces* on a supported line card.

2. Check that IPv4 routing protocols are enabled across the network to support routing paths from the encapsulator to the de-encapsulator.

Configure routing information by manually adding static routes to route tables or by configuring static or dynamic route-sharing protocols. For more information, see *Transport and Internet Protocols Feature Guide for Routing Devices*.

3. At PE1, *ping* the PE2 IPv4 loopback address to verify that the de-encapsulator is reachable from the encapsulator.
4. At PE2, *ping* the CE2 router IPv6 loopback address to verify that the destination customer edge router is reachable from the de-encapsulator..

IPv6 routing paths from PE2 to CE2 can be provided by static routes manually added to routing tables or by static or dynamic route-sharing protocols.

- By default, PE2 forwards packets based on interface routes (direct routes) imported from the primary routing table.
- As an option, the de-encapsulating filter can specify that the Packet Forwarding Engine uses an alternate routing table to forward payload packets to the destination customer network. In an optional configuration task in this example, you specify an alternate routing table by installing static routes from PE2 to C1 in the routing instance **blue**. You configure the routing information base (RIB) group **blue\_group** to specify that the route information of **inet6.0** is shared with **blue.inet6.0**, then you associate the PE2 interfaces with routes stored in both the default routes and the routing instance.

## Overview

In this example you configure a unidirectional filter-based GRE IPv4 tunnel from Router PE1 to Router PE2, providing a logical path from IPv6 network C1 to IPv6 network C2.

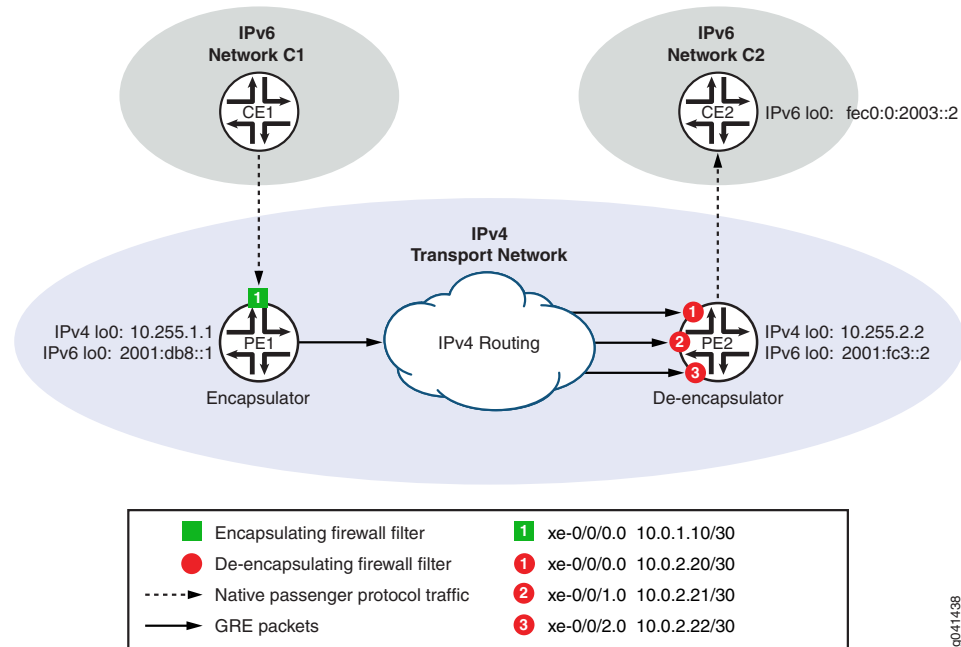

**NOTE:** To enable *bidirectional* filter-based GRE tunneling, you must configure a second tunnel in the reverse direction.

As an optional task in this example, you can create a RIB group, which specifies the sharing of routing information (including routes learned from peers, local routes resulting from the application of protocol policies to the learned routes, and the routes advertised to peers) of multiple routing tables.

## Topology

Figure 54 on page 782 shows the path of IPv6 traffic transported from network C1 to network C2, across an IPv4 transport network using a filter-based tunnel from PE1 to PE2 and without requiring tunnel interfaces.

Figure 54: Filter-Based Tunnel from PE1 to PE2 in an IPv4 Network

9041498

Table 62 on page 782 summarizes the configuration of Router PE1 as the encapsulator.  
 Table 63 on page 783 summarizes the configuration of Router PE2 as the de-encapsulator.

Table 62: Encapsulator Components on PE1

| Component               | CLI Names                                                                                                       | Description                                                                                                                                                                                                                                                                                             |

## Configuration

To transport IPv6 packets from CE1 to CE2 across an IPv4 transport network using a filter-based tunnel from PE1 to PE2 and without configuring tunnel interfaces, perform these tasks:

- [Configuring PE1 to Encapsulate IPv6 Packets on page 784](#)
- [Configuring PE2 to De-Encapsulate GRE Packets on page 786](#)
- [Optional: Configuring PE2 with an Alternate Routing Table on page 789](#)

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

### Configuring PE1 to Encapsulate IPv6 Packets

```
set interfaces lo0 unit 0 family inet address 10.255.1.1
set interfaces lo0 unit 0 family inet6 address 2001:db8::1
set interfaces xe-0/0/0 unit 0 family inet address 10.0.1.10/30
set interfaces xe-0/0/0 unit 0 family inet6 address ::10.34.1.10/120
set interfaces xe-0/0/0 unit 0 family inet6 filter input gre_encap_1
set interfaces xe-0/0/2 unit 0 family inet address 10.0.1.12/30
set firewall family inet6 filter gre_encap_1 term t1 then count c_gre_encap_1
set firewall family inet6 filter gre_encap_1 term t1 then encapsulate tunnel_1
set firewall tunnel-end-point tunnel_1 ipv4 source-address 10.255.1.1
```

```
set firewall tunnel-end-point tunnel_1 ipv4 destination-address 10.255.2.2
set firewall tunnel-end-point tunnel_1 gre
```

### Configuring PE2 to De-Encapsulate GRE Packets

```
set interfaces lo0 unit 0 family inet address 10.255.2.2
set interfaces lo0 unit 0 family inet6 address 2001:fc3::2
set interfaces xe-0/0/0 unit 0 family inet address 10.0.2.20/30
set interfaces xe-0/0/1 unit 0 family inet address 10.0.2.21/30
set interfaces xe-0/0/2 unit 0 family inet address 10.0.2.22/30
set interfaces xe-0/0/3 unit 0 family inet address 10.0.2.23/30
set interfaces xe-0/0/3 unit 0 family inet6 address ::20.34.2.23/120
set forwarding-options family inet filter input gre_decap_1
set firewall family inet filter gre_decap_1 term t1 from source-address
10.255.1.1/32
set firewall family inet filter gre_decap_1 term t1 from destination-address
10.255.2.2/32
set firewall family inet filter gre_decap_1 term t1 then count c_gre_decap_1
set firewall family inet filter gre_decap_1 term t1 then decapsulate gre
```

### Optional: Configuring PE2 with an Alternate Routing Table

```
set routing-instances blue instance-type forwarding
set routing-instances blue routing-options rib blue.inet6.0 static route 0::/0
next-hop fec0:0:2003::2
set routing-options passive
set routing-options rib inet6.0
set routing-options rib-groups blue_group import-rib inet6.0
set routing-options rib-groups blue_group import-rib blue.inet6.0
set routing-options interface-routes rib-group inet6 blue_group
set firewall family inet filter gre_decap_1 term t1 then decapsulate gre
routing-instance blue
```

### Configuring PE1 to Encapsulate IPv6 Packets

#### Step-by-Step Procedure

To configure Router PE1 to encapsulate IPv6 packets arriving from CE1:

1. Configure the router loopback addresses.

```
[edit]
user@PE1# set interfaces lo0 unit 0 family inet address 10.255.1.1
user@PE1# set interfaces lo0 unit 0 family inet6 address 2001:db8::1
```

2. Configure the encapsulating interface IPv4 and IPv6 addresses and attach the encapsulating filter to the IPv6 input.

```
[edit]
user@PE1# set interfaces xe-0/0/0 unit 0 family inet address 10.0.1.10/30
user@PE1# set interfaces xe-0/0/0 unit 0 family inet6 address ::10.34.1.10/120
user@PE1# set interfaces xe-0/0/0 unit 0 family inet6 filter input gre_encap_1
```

3. Configure the core-facing egress interface to the tunnel.

```
[edit]
user@PE2# set interfaces xe-0/0/2 unit 0 family inet address 10.0.1.12/30
```

4. Define an IPv6 firewall filter that causes the Packet Forwarding Engine to encapsulate all packets.

```
[edit]
```

```

user@PE1# set firewall family inet6 filter gre_encap_1 term t1 then count
c_gre_encap_1
user@PE1# set firewall family inet6 filter gre_encap_1 term t1 then encapsulate
tunnel_1

```

**NOTE:** The encapsulate firewall filter action is a *terminating* filter action. A filter-terminating action halts all evaluation of a firewall filter for a specific packet. The router performs the specified action, and no additional terms are examined.

5. Define a GRE IPv4 tunnel template named tunnel\_1 that specifies the host IP addresses of the one tunnel source interface and three tunnel destination interfaces.

```

[edit]
user@PE1# set firewall tunnel-end-point tunnel_1 ipv4 source-address 10.255.1.1
user@PE1# set firewall tunnel-end-point tunnel_1 ipv4 destination-address 10.255.2.2
user@PE1# set firewall tunnel-end-point tunnel_1 gre

```

**NOTE:** You can tunnel multiple but distinct flows from 10.0.1.10 (the tunnel source interface on PE1) to 10.0.2.20 – 10.0.2.22 (the de-encapsulating interfaces on PE2) if you use the GRE option *key number* to uniquely identify each tunnel.

6. If you are done configuring the device, commit the configuration.

```

[edit ]
user@PE1# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show firewall** and **show interfaces** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Router PE1** Confirm the firewall filter and tunnel template on the encapsulator.

```

user@PE2# show firewall
family inet6 {
  filter gre_encap_1 {
    term t1 {
      then {
        count c_gre_encap_1;
        encapsulate tunnel_1;
      }
    }
  }
}
tunnel-end-point tunnel_1 {
  ipv4 {
    source-address 10.255.1.1;
    destination-address 10.255.2.2;
  }
}

```

```
gre;
}
```

**Router PE1** Confirm the interfaces on the encapsulator.

```
user@PE1# show interfaces
lo0 {
  unit 0 {
    family inet {
      address 10.255.1.1;
    }
    family inet6 {
      address 2001:db8::1;
    }
  }
}
xe-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.1.10/30;
    }
    family inet6 {
      address ::10.34.1.10/120;
      filter input gre_encap_1;
    }
  }
}
xe-0/0/2 {
  unit 0 {
    family inet {
      address 10.0.1.12/30;
    }
  }
}
```

### Configuring PE2 to De-Encapsulate GRE Packets

**Step-by-Step Procedure** To configure Router PE2 to de-encapsulate GRE packets arriving from the IPv4 tunnel:

1. Configure the router loopback address.

```
[edit]
user@PE2# set interfaces lo0 unit 0 family inet address 10.255.2.2
user@PE2# set interfaces lo0 unit 0 family inet6 address 2001:fc3::2
```

2. Configure the de-encapsulating interfaces.

```
[edit]
user@PE2# set interfaces xe-0/0/0 unit 0 family inet address 10.0.2.20/30
user@PE2# set interfaces xe-0/0/1 unit 0 family inet address 10.0.2.21/30
user@PE2# set interfaces xe-0/0/2 unit 0 family inet address 10.0.2.22/30
```

3. Configure the customer-facing egress interface to CE2.

```
[edit]
user@PE2# set interfaces xe-0/0/3 unit 0 family inet address 10.0.2.23/30
user@PE2# set interfaces xe-0/0/3 unit 0 family inet6 address ::20.34.2.23/120
```

4. Apply the ingress de-encapsulating firewall filter to all forwarded packets.

```
[edit]
user@PE2# set forwarding-options family inet filter input gre_decap_1
```

5. Define IPv4 filter **gre\_decap\_1**.

Define an IPv4 filter that de-encapsulates and forwards all GRE packets.

```
[edit]
user@PE2# set firewall family inet filter gre_decap_1
```

6. Configure term **t1** to match packets transported across the tunnel **tunnel\_1** defined on Router PE1. The tunnel sends packets from Router PE1 (configured with IPv4 loopback address 10.255.1.1) to Router PE2 (configured with IPv4 loopback address 10.255.2.2).

```
[edit firewall family inet filter gre_decap_1]
user@PE2# set term t1 from source-address 10.255.1.1
user@PE2# set term t1 from destination-address 10.255.2.2
```

7. Configure term **t1** to count and de-encapsulate matched packets.

```
[edit firewall family inet filter gre_decap_1]
user@PE2# set term t1 then count c_gre_decap_1
user@PE2# set term t1 then decapsulate gre
```

If the de-encapsulating filter action **decapsulate** references the **blue** routing instance, make sure that the routing instance is configured and that the RIB group **blue\_group** defines the sharing of the alternate routes into the primary table.

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@PE2# commit
```

**Results** From configuration mode, confirm your configuration by entering the **show firewall**, **show forwarding-options**, and **show interfaces** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Router PE2** Confirm the firewall filter on the de-encapsulator.

```
user@PE2# show firewall
family inet {
  filter gre_decap_1 {
    term t1 {
      from {
        source-address 10.255.1.1;
        destination-address 10.255.2.2;
      }
      then {
        count c_gre_decap_1;
        decapsulate gre routing-instance blue;
      }
    }
  }
}
```

**NOTE:** If the de-encapsulating filter action `decapsulate` references the `blue` routing instance, make sure that the routing instance is configured and that the RIB group `blue_group` defines the sharing of the alternate routes into the primary table.

**Router PE2** Confirm the forwarding options (for attaching the de-encapsulating firewall filter to all input forwarded packets) on the de-encapsulator.

```
user@PE2# show forwarding-options
forwarding-options {
  family inet {
    filter {
      input gre_decap_1;
    }
  }
}
```

**Router PE2** Confirm the interfaces on the de-encapsulator.

```
user@PE2# show interfaces
lo0 {
  unit 0 {
    family inet {
      address 10.255.2.2;
    }
    family inet6 {
      address 2001:fc3::2;
    }
  }
}
xe-0/0/0 {
  unit 0 {
    family inet {
      address 10.0.2.20/30;
      filter input gre_decap_1;
    }
  }
}
xe-0/0/1 {
  unit 0 {
    family inet {
      address 10.0.2.21/30;
      filter input gre_decap_1;
    }
  }
}
xe-0/0/2 {
  unit 0 {
    family inet {
      address 10.0.2.22/30;
      filter input gre_decap_1;
    }
  }
}
```

```

    }
  }
  xe-0/0/3 {
    unit 0 {
      family inet {
        address 10.0.2.23/30;
      }
      family inet6 {
        address ::20.34.2.23/120;
      }
    }
  }
}

```

### Optional: Configuring PE2 with an Alternate Routing Table

#### Step-by-Step Procedure

To configure Router PE2 with an alternate routing table:

1. Configure the routing instance **blue**, and add static routes to CE2.

```

[edit ]
user@PE2# set routing-instances blue instance-type forwarding
user@PE2# set routing-instances blue routing-options rib blue.inet6.0 static route
O::/0 next-hop fec0:0:2003::2

```

The Junos OS software generates the routing table **blue.inet6.0** using the routing information learned within the instance.

2. Enable routes to remain in routing and forwarding tables, even if the routes become inactive. This allows a static route to remain in the table if the next hop is unavailable.

```

[edit ]
user@PE2# set routing-options passive

```

3. Create a RIB group by explicitly creating the default routing table.

```

[edit ]
user@PE2# set routing-options rib inet6.0

```

4. Define the RIB group **blue\_group**.

```

[edit ]
user@PE2# set routing-options rib-groups blue_group import-rib inet6.0
user@PE2# set routing-options rib-groups blue_group import-rib blue.inet6.0

```

In the **import-rib** statement, specify the primary routing table first.

5. Associate the router interfaces with routing information specified by the RIB group.

```

[edit ]
user@PE2# set routing-options interface-routes rib-group inet6 blue_group

```

6. If you are done configuring the device, commit the configuration.

```

[edit ]
user@PE2# commit

```

**Results** From configuration mode, confirm your configuration by entering the **show firewall**, **show routing-instances**, and **show routing-options** commands. If the output does not

display the intended configuration, repeat the instructions in this example to correct the configuration.

**Router PE2** If you configured an alternate routing table on Router PE2, confirm the routing instance configuration.

```
user@PE2# show routing-instances
blue {
  instance-type forwarding;
  routing-options {
    static route 0::/0 next-hop fec0:0:2003::2;
  }
}
```

**Router PE2** If you configured an alternate routing table on Router PE2, confirm the RIB group and direct routing configurations.

```
user@PE2# show routing-options
interface-routes {
  rib-group blue_group;
}
passive;
rib inet6.0;
rib-groups {
  blue_group {
    import-rib [ inet6.0 blue.inet6.0 ];
  }
}
```

## Verification

Confirm that the configurations are working properly.

- [Verifying Routing Information on page 790](#)
- [Verifying Encapsulation on PE1 on page 791](#)
- [Verifying De-Encapsulation on PE2 on page 792](#)

### Verifying Routing Information

---

**Purpose** Verify that the direct routes include the alternate routing table information.

**Action** To perform the verification:

1. (Optional) To verify the routing instance **blue** on PE2, use the **show route instance** operational mode command to display the primary table and number of routes for that routing instance.

```
user@PE2> show route instance blue summary
Instance      Type
Primary RIB
blue          forwarding
              blue.inet6.0          2/0/0
```

2. (Optional) To view the routing table associated with the routing instance **blue** on PE2, use the **show route table** operational mode command

```
user@PE2> show route table blue.inet6.0
```

```
blue.inet6.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

```
abcd::192:168:239:17/128
    * [Direct/0] 00:02:26
    > via lo0.0
fe80::2a0:a50f:fc64:e032/128
    * [Direct/0] 00:02:26
    > via lo0.0
```

- (Optional) To verify that the alternate routes from routing instance blue have been imported to the PE2 forwarding table, use the **show route forwarding-table** operational mode command to display the contents of the router forwarding table and the routing instance forwarding table.

```
user@PE2> show route forwarding-table blue
```

```
Routing table: blue.inet
```

```
Internet:
```

| Destination        | Type | RtRef | Next hop  | Type | Index | NhRef | Netif |
|--------------------|------|-------|-----------|------|-------|-------|-------|
| default            | perm | 0     |           | rjct | 689   | 1     |       |
| 0.0.0.0/32         | perm | 0     |           | dscd | 687   | 1     |       |
| 224.0.0.0/4        | perm | 0     |           | mdsc | 688   | 1     |       |
| 224.0.0.1/32       | perm | 0     | 224.0.0.1 | mcst | 684   | 1     |       |
| 255.255.255.255/32 | perm | 0     |           | bcst | 685   | 1     |       |

```
Routing table: blue.iso
```

```
ISO:

### Verifying Encapsulation on PE1

**Purpose** Verify the encapsulating interface on PE1.

**Action** To perform the verification:

- Use the **show interfaces filters** operational mode command to verify that the encapsulating firewall filter is attached to the ingress of the encapsulating interface.

```
user@PE1> show interfaces filters xe-0/0/0.0
```

| Interface  | Admin | Link | Proto | Input Filter | Output Filter |
|------------|-------|------|-------|--------------|---------------|
| xe-0/0/0.0 | up    | down | inet6 | gre_encap_1  |               |

2. Use the **show interfaces** operational mode command to verify that the encapsulating interface is receiving packets.

```

user@PE1> show interfaces xe-0/0/0.0 detail | filter "Ingress traffic"
...
Physical interface: xe-0/0/0, Enabled, Physical link is Up
...
Ingress traffic statistics at Packet Forwarding Engine:
  Input bytes :          6970299398          0 bps
  Input packets:          81049992          0 pps
  Drop bytes :              0          0 bps
  Drop packets:              0          0 pps
...

```

3. Use the **show firewall filter** operational mode command to verify that ingress passenger protocol traffic triggers the encapsulating filter.

```

user@PE1> show firewall filter gre_encap_1
Filter: gre_encap_1
Counters:
Name          Bytes          Packets
c_gre_encap_1 6970299398      81049992

```

**Meaning** If the encapsulating filter is attached to the encapsulating interface, and the encapsulating interface receives passenger protocol traffic, and the firewall filter statistics show that ingress passenger protocol traffic is being encapsulated, then GRE packets are being forwarded through the tunnel.

### Verifying De-Encapsulation on PE2

**Purpose** Verify the de-encapsulating interfaces on PE2.

**Action** To perform the verification:

1. On PE1, use the **ping** operational mode command to verify that PE2 is reachable.

```

user@PE1> ping 10.255.2.2
PING 10.255.2.2 (10.255.2.2): 56 data bytes
64 bytes from 10.255.2.2: icmp_seq=0 ttl=64 time=0.576 ms
64 bytes from 10.255.2.2: icmp_seq=1 ttl=64 time=0.269 ms
^C [abort]

```

2. On PE2, use the **show interfaces filter** operational mode command to verify that the de-encapsulating firewall filter is attached to the ingress of the de-encapsulating interfaces.

```

user@PE2> show interfaces filter | match xe-
Interface      Admin Link Proto Input Filter      Output Filter
xe-0/0/0.0     up   down inet gre_decap_1
xe-0/0/1.0     up   down inet gre_decap_1
xe-0/0/2.0     up   down inet gre_decap_1

```

3. On PE2, use the **show interfaces** operational mode command to verify that the de-encapsulating interfaces are receiving packets.

```

user@PE2> show interfaces xe-0/0/0.0 detail | filter "Ingress traffic"

```

```
Physical interface: xe-0/0/0, Enabled, Physical link is Up
...
Ingress traffic statistics at Packet Forwarding Engine:
  Input bytes :          6970299398          0 bps
  Input packets:          81049992          0 pps
  Drop bytes :              0          0 bps
  Drop packets:              0          0 pps
...
```

```
user@PE2> show interfaces xe-0/0/1.0 detail | filter "Ingress traffic"
Physical interface: xe-0/0/2, Enabled, Physical link is Up
...
```

```
user@PE2> show interfaces xe-0/0/2.0 detail | filter "Ingress traffic"
Physical interface: xe-0/0/2, Enabled, Physical link is Up
...
```

Depending on how routing is configured and which links are up and which links are down, some of the de-encapsulating interfaces might not be receiving packets although the tunnel is operating properly.

- On PE2, use the **show firewall filter** operational mode command to verify that ingress GRE traffic triggers the de-encapsulating filter.

```
user@PE2> show firewall filter gre_decap_1

Filter: gre_decap_1
Counters:
Name                               Bytes          Packets
c_gre_decap_1                     6970299398     81049992
```

**Meaning** The verification confirms the following operational states and activities of the encapsulator:

- PE2 is reachable from the PE1.
- The de-encapsulating filter is attached to the input of all de-encapsulating interfaces.
- The de-encapsulator is receiving traffic at de-encapsulating interfaces as expected.
- GRE packets received at the de-encapsulating interfaces trigger the de-encapsulating firewall filter action.

## Service Filter Overview

---

This topic covers the following information:

- [Services on page 795](#)
- [Service Rules on page 795](#)
- [Service Rule Refinement on page 796](#)
- [Service Filter Counters on page 796](#)

## Services

The Adaptive Services Physical Interface Cards (PICs), Multiservices PICs, and Multiservices Dense Port Concentrators (DPCs) provide *adaptive services interfaces*. Adaptive services interfaces enable you to coordinate a special range of services on a single PIC or DPC by configuring a set of services and applications.

**NOTE:** Service filters are not supported on T4000 routers.

---

## Service Rules

A *service set* is an optional definition you can apply to the traffic at an adaptive services interface. A service set enables you to configure combinations of directional rules and default settings that control the behavior of each service in the service set.

## Service Rule Refinement

When you apply a service set to the traffic at an adaptive services interface, you can optionally use *service filters* to refine the target of the set of services and also to process traffic. Service filters enable you to manipulate traffic by performing packet filtering to a defined set of services on an adaptive services interface before the traffic is delivered to its destination. You can apply a service filter to traffic before packets are accepted for input or output service processing or after packets return from input service processing.

## Service Filter Counters

Like standard firewall filters, service filters support counting of matched packets. When you display counters for a service filter, however, the syntax for specifying the filter name includes the name of the *service set* to which the service filter is applied.

- To enable counting of the packets matched by a service filter term, specify the **count** *counter-name* nonterminating action in that term.
- To display counters for service filters, use the **show firewall filter** *filter-name* <counter *counter-name*> operational mode command, and specify the *filter-name* as follows:

**\_\_service-service-set-name:service-filter-name**

For example, suppose you configure a service filter named **out\_filter** with a counter named **out\_counter** and apply that service filter to a logical interface to direct certain packets for processing by the output services associated with the service set **nat\_set**. In this scenario, the syntax for using the **show firewall** operational mode command to display the counter is as follows:

```
[edit]
user@host> show firewall filter __service-nat_set:out_filter counter out_counter
```

## How Service Filters Evaluate Packets

This topic covers the following information:

- [Service Filters That Contain a Single Term on page 797](#)
- [Service Filters That Contain Multiple Terms on page 797](#)

- [Service Filter Terms That Do Not Contain Any Match Conditions on page 797](#)
- [Service Filter Terms That Do Not Contain Any Actions on page 797](#)
- [Service Filter Default Action on page 797](#)

## Service Filters That Contain a Single Term

For a service filter that consists of a single term, the policy framework software evaluates a packet as follows:

- If the packet matches all the conditions, the actions are taken.
- If the packet matches all the conditions and no actions are specified, the packet is accepted.
- If the packet does not match all the conditions, it is discarded.

## Service Filters That Contain Multiple Terms

For a service filter that consists of multiple terms, the policy framework software evaluates a packet against the terms in the filter sequentially, beginning with the first term in the filter, until either the packet matches all the conditions in one of the terms or there are no more terms in the filter.

- If the packet matches all the conditions in a term, the actions in that term are performed and evaluation of the packet ends at that term. Any subsequent terms in the filter are not used.
- If the packet does not match all the conditions in the term, evaluation of the packet proceeds to the next term in the filter.

## Service Filter Terms That Do Not Contain Any Match Conditions

For service filters with a single term and for filters with multiple terms, if a term does not contain any match conditions, the actions are taken on any packet evaluated.

## Service Filter Terms That Do Not Contain Any Actions

If a term does not contain any actions, and if the packet matches the conditions in the term, the packet is accepted.

## Service Filter Default Action

Each service filter has an *implicit skip* action at the end of the filter, which is equivalent to including the following example term **explicit\_skip** as the final term in the service filter:

```
term explicit_skip {
  then skip;
}
```

By default, if a packet matches none of the terms in a service filter, the packet bypasses service processing.

- [Guidelines for Applying Service Filters on page 800](#)
- [Example: Configuring and Applying Service Filters on page 803](#)

## Guidelines for Configuring Service Filters

---

This topic covers the following information:

- [Statement Hierarchy for Configuring Service Filters on page 798](#)
- [Service Filter Protocol Families on page 798](#)
- [Service Filter Names on page 798](#)
- [Service Filter Terms on page 799](#)
- [Service Filter Match Conditions on page 799](#)
- [Service Filter Terminating Actions on page 799](#)

### Statement Hierarchy for Configuring Service Filters

To configure a service filter, include the **service-filter *service-filter-name*** statement at the **[edit firewall family (inet | inet6)]** hierarchy level:

```
[edit]
firewall {
  family (inet | inet6) {
    service-filter service-filter-name {
      term term-name {
        from {
          match-conditions;
        }
        then {
          actions;
        }
      }
    }
  }
}
```

Individual statements supported under the **service-filter *service-filter-name*** statement are described separately in this topic and are illustrated in the example of configuring and applying a service filter.

### Service Filter Protocol Families

You can configure service filters to filter IPv4 traffic (**family inet**) and IPv6 traffic (**family inet6**) only. No other protocol families are supported for service filters.

### Service Filter Names

Under the **family inet** or **family inet6** statement, you can include **service-filter *service-filter-name*** statements to create and name service filters. The filter name can

contain letters, numbers, and hyphens (-) and be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

## Service Filter Terms

Under the **service-filter** *service-filter-name* statement, you can include **term** *term-name* statements to create and name filter terms.

- You must configure at least one term in a firewall filter.
- You must specify a unique name for each term within a firewall filter. The term name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").
- The order in which you specify terms within a firewall filter configuration is important. Firewall filter terms are evaluated in the order in which they are configured. By default, new terms are always added to the end of the existing filter. You can use the **insert** configuration mode command to reorder the terms of a firewall filter.

## Service Filter Match Conditions

Service filter terms support only a subset of the IPv4 and IPv6 match conditions that are supported for standard stateless firewall filters.

If you specify an IPv6 address in a match condition (the **address**, **destination-address**, or **source-address** match conditions), use the syntax for text representations described in RFC 4291, *IP Version 6 Addressing Architecture*. For more information about IPv6 addresses, see “IPv6 Overview” and “IPv6 Standards” in the *Junos OS Routing Protocols Library for Routing Devices*.

## Service Filter Terminating Actions

When configuring a service filter term, you must specify one of the following filter-terminating actions:

- **service**
- **skip**

**NOTE:** These actions are unique to service filters.

Service filter terms support only a subset of the IPv4 and IPv6 nonterminating actions that are supported for standard stateless firewall filters:

- **count** *counter-name*
- **log**
- **port-mirror**
- **sample**

Service filters do not support the **next** action.

---

## Guidelines for Applying Service Filters

This topic covers the following information:

- [Restrictions for Adaptive Services Interfaces on page 800](#)
- [Statement Hierarchy for Applying Service Filters on page 800](#)
- [Associating Service Rules with Adaptive Services Interfaces on page 801](#)
- [Filtering Traffic Before Accepting Packets for Service Processing on page 801](#)
- [Postservice Filtering of Returning Service Traffic on page 802](#)

### Restrictions for Adaptive Services Interfaces

The following restrictions apply to adaptive services interfaces and service filters.

---

#### Adaptive Services Interfaces

You can apply a service filter to IPv4 or IPv6 traffic associated with a service set at an *adaptive services interface* only. Adaptive services interfaces are supported for the following hardware only:

- Adaptive Services (AS) PICs on M Series and T Series routers
- Multiservices (MS) PICs on M Series and T Series routers
- Multiservices (MS) DPCs on MX Series routers (and EX Series switches)

---

#### System Logging to a Remote Host from M Series Routers

Logging of adaptive services interfaces messages to an external server by means of the **fxp0** or **em0** port is not supported on M Series routers. The architecture does not support system logging traffic out of a management interface. Instead, access to an external server is supported on a Packet Forwarding Engine interface.

### Statement Hierarchy for Applying Service Filters

You can enable packet filtering of IPv4 or IPv6 traffic before a packet is accepted for input or output service processing. To do this, apply a service filter to the adaptive services interface input or output in conjunction with an interface service set.

You can also enable packet filtering of IPv4 or IPv6 traffic that is returning to the Packet Forwarding Engine after input service processing completes. To do this, apply a post-service filter to the adaptive services interface input.

The following configuration shows the hierarchy levels at which you can apply the service filters to adaptive services interfaces:

```
[edit]
interfaces {
  interface-name {
    unit unit-number {
      family (inet | inet6) {
        service {
          input {
            service-set service-set-name service-filter service-filter-name;
            post-service-filter service-filter-name;
          }
          output {
            service-set service-set-name service-filter service-filter-name;
          }
        }
      }
    }
  }
}
```

## Associating Service Rules with Adaptive Services Interfaces

To define and group the service rules be applied to an adaptive services interface, you define an *interface service set* by including the **service-set service-set-name** statement at the **[edit services]** hierarchy level.

To apply an interface service set to the input and output of an adaptive services interface, you include the **service-set service-set-name** at the following hierarchy levels:

- **[edit interfaces interface-name unit unit-number input]**
- **[edit interfaces interface-name unit unit-number output]**

If you apply a service set to one direction of an adaptive services interface but do not apply a service set to the other direction, an error occurs when you commit the configuration.

The adaptive services PIC performs different actions depending on whether the packet is sent to the PIC for input service or for output service. For example, you can configure a single service set to perform Network Address Translation (NAT) in one direction and destination NAT (dNAT) in the other direction.

## Filtering Traffic Before Accepting Packets for Service Processing

To filter IPv4 or IPv6 traffic before accepting packets for input or output service processing, include the **service-set service-set-name service-filter service-filter-name** at one of the following interfaces:

- **[edit interfaces interface-name unit unit-number family (inet | inet6) service input]**

- **[edit interfaces *interface-name* unit *unit-number* family (inet | inet6) service output]**

For the ***service-set-name***, specify a service set configured at the **[edit services *service-set*]** hierarchy level.

The service set retains the input interface information even after services are applied, so that functions such as filter-class forwarding and destination class usage (DCU) that depend on input interface information continue to work.

The following requirements apply to filtering inbound or outbound traffic before accepting packets for service processing:

- You configure the same service set on the input and output sides of the interface.
- If you include the ***service-set*** statement without an optional ***service-filter*** definition, the Junos OS assumes the match condition is true and selects the service set for processing automatically.
- The service filter is applied only if a service set is configured and selected.

You can include more than one service set definition on each side of an interface. The following guidelines apply:

- If you include multiple service sets, the router (or switch) software evaluates them in the order in which they appear in the configuration. The system executes the first service set for which it finds a match in the service filter and ignores the subsequent definitions.
- A maximum of six service sets can be applied to an interface.
- When you apply multiple service sets to an interface, you must also configure and apply a service filter to the interface.

## Postservice Filtering of Returning Service Traffic

As an option to filtering of IPv4 or IPv6 input service traffic, you can apply a service filter to IPv4 or IPv6 traffic that is returning to the services interface after the service set is executed. To apply a service filter in this manner, include the ***post-service-filter service-filter-name*** statement at the **[edit interfaces *interface-name* unit *unit-number* family (inet | inet6) service input]** hierarchy level.

## Example: Configuring and Applying Service Filters

---

This example shows how to configure and apply service filters.

- [Requirements on page 803](#)
- [Overview on page 803](#)
- [Configuration on page 804](#)
- [Verification on page 807](#)

### Requirements

This example use the logical interface **xe-0/1/0.0** on any of the following hardware components:

- Adaptive Services (AS) PIC on an M Series or T Series router
- Multiservices (MS) PIC on an M Series or T Series router
- Multiservices (MS) DPC on an MX Series router
- EX Series switch

Before you begin, make sure that you have:

- Installed your supported router (or switch) and PICs or DPCs and performed the initial router (or switch) configuration.
- Configured basic Ethernet in the topology, and verified that traffic is flowing in the topology and that IPv4 traffic is flowing through logical interface **xe-0/1/0.0**.
- Configured the service set **vrf\_svcs** with service input and output rules and default settings for services at a service interface.

For guidelines for configuring service sets, see *Configuring Service Sets to be Applied to Services Interfaces*.

### Overview

In this example, you create three types of service filters for IPv4 traffic: one input service filter, one postservice input filter, and one output service filter.

#### Topology

---

You apply the input service filter and postservice input filter to input traffic at logical interface **xe-0/1/0.0**, and you apply the output service filter to the output traffic at the same logical interface.

- Filtering IPv4 traffic before it is accepted for input service processing—At logical interface **xe-0/1/0.0**, you use the service filter **in\_filter\_presvc** to filter IPv4 input traffic before the traffic can be accepted for processing by services associated with service set **vrf\_svcs**. The **in\_filter\_presvc** service filter counts packets sent from ICMP port 179, directs these packets to the input services associated with the service set **vrf\_svcs**, and discards all other packets.

- Filtering IPv4 traffic after it has completed input service processing—At logical interface **xe-0/1/0.0**, you use the service filter **in\_filter\_postsvc** to filter traffic that is returning to the services interface after the input service set **in\_filter\_presvc** is executed. The **in\_filter\_postsvc** service filter counts packets sent from ICMP port 179 and then discards them.
- Filtering IPv4 traffic before it is accepted for output service processing—At logical interface **xe-0/1/0.0**, you use the service-filter **out\_filter\_presvc** to filter IPv4 output traffic before the traffic can be accepted for processing by the services associated with service set **vrf\_svcs**. The **out\_filter\_presvc** service filter counts packets destined for TCP port 179 and then directs the packets to the output services associated with the service set **vrf\_svcs**.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Three Service Filters on page 804](#)
- [Applying the Three Service Filters on page 806](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet service-filter in_filter_presvc term t1 from protocol tcp
set firewall family inet service-filter in_filter_presvc term t1 from source-port bgp
set firewall family inet service-filter in_filter_presvc term t1 then count svc_in_pkts
set firewall family inet service-filter in_filter_presvc term t1 then service
set firewall family inet service-filter in_filter_postsvc term t2 from protocol tcp
set firewall family inet service-filter in_filter_postsvc term t2 from source-port bgp
set firewall family inet service-filter in_filter_postsvc term t2 then count svc_in_pkts_rtn
set firewall family inet service-filter in_filter_postsvc term t2 then skip
set firewall family inet service-filter out_filter_presvc term t3 from protocol icmp
set firewall family inet service-filter out_filter_presvc term t3 from destination-port bgp
set firewall family inet service-filter out_filter_presvc term t3 then count svc_out_pkts
set firewall family inet service-filter out_filter_presvc term t3 then service
set interfaces xe-0/1/0 unit 0 family inet service input service-set vrf_svcs service-filter
  in_filter_presvc
set interfaces xe-0/1/0 unit 0 family inet service input post-service-filter in_filter_postsvc
set interfaces xe-0/1/0 unit 0 family inet service output service-set vrf_svcs service-filter
  out_filter_presvc
```

### Configuring the Three Service Filters

#### Step-by-Step Procedure

To configure the three service filters:

1. Configure the input service filter.

```
[edit]
user@host# edit firewall family inet service-filter in_filter_presvc
```

```
[edit firewall family inet service-filter in_filter_presvc]
user@host# set term t1 from protocol tcp
user@host# set term t1 from source-port bgp
user@host# set term t1 then count svc_in_pkts
user@host# set term t1 then service
```

2. Configure the postservice input filter.

```
[edit]
user@host# edit firewall family inet service-filter in_filter_postsvc
```

```
[edit firewall family inet service-filter in_filter_postsvc]
user@host# set term t2 from protocol tcp
user@host# set term t2 from source-port bgp
user@host# set term t2 then count svc_in_pkts_rtn
user@host# set term t2 then skip
```

3. Configure the output service filter.

```
[edit]
user@host# edit firewall family inet service-filter out_filter_presvc
```

```
[edit firewall family inet service-filter out_filter_presvc]
user@host# set term t3 from protocol icmp
user@host# set term t3 from destination-port bgp
user@host# set term t3 then count svc_out_pkts
user@host# set term t3 then service
```

**Results** Confirm the configuration of the input and output service filters and the postservice input filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  service-filter in_filter_presvc {
    term t1 {
      from {
        protocol tcp;
        source-port bgp;
      }
      then {
        count svc_in_pkts;
        service;
      }
    }
  }
  service-filter in_filter_postsvc {
    term t2 {
      from {
        protocol tcp;
        source-port bgp;
      }
      then {
        count svc_in_pkts_rtn;
      }
    }
  }
}
```

```

        skip;
    }
}
}
service-filter out_filter_presvc {
    term t3 {
        from {
            protocol icmp;
            destination-port bgp;
        }
        then {
            count svc_out_pkts;
            service;
        }
    }
}
}
}

```

### Applying the Three Service Filters

#### Step-by-Step Procedure

To apply the three service filters:

1. Access the IPv4 protocol on the input interface **xe-0/1/0.0**.

```

[edit]
user@host# edit interfaces xe-0/1/0 unit 0 family inet

```

2. Apply the input service filter and the postservice input filter.

```

[edit interfaces xe-0/1/0 unit 0 family inet]
user@host# set service input service-set vrf_svcs service-filter in_filter_presvc
user@host# set service input post-service-filter in_filter_postsvc
user@host# set service output service-set vrf_svcs service-filter out_filter_presvc

```

**Results** Confirm the configuration of the interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
xe-0/1/0 {
    unit 0 {
        family inet {
            service {
                input {
                    service-set vrf_svcs service-filter in_filter_presvc;
                    post-service-filter in_filter_postsvc;
                }
                output {
                    service-set vrf_svcs service-filter out_filter_presvc;
                }
            }
        }
    }
}
}

```

When you are done configuring the device, commit your candidate configuration.

## Verification

Confirm that the configuration is working properly.

- [Verifying That Inbound Traffic Is Filtered Before Input Service on page 807](#)
- [Verifying That Inbound Traffic Is Filtered After Input Service Processing on page 807](#)
- [Verifying That Outbound Traffic Is Filtered Before Output Service Processing on page 807](#)

### Verifying That Inbound Traffic Is Filtered Before Input Service

**Purpose** Verify that inbound packets sent from TCP port 179 are sent for processing by the *input* services associated with the service set **vrf\_svcs**.

**Action** Display the count of packets sent for processing by the *input* services associated with the service set **vrf\_svcs**.

[edit]

```
user@host> show firewall filter in_filter_presvc-vrf_svcs counter svc_in_pkts
```

### Verifying That Inbound Traffic Is Filtered After Input Service Processing

**Purpose** Verify that inbound packets sent from TCP port 179 are returned from processing by the *input* services associated with the service set **vrf\_svcs**.

**Action** Display the count of packets returned from processing by the *input* services associated with the service set **vrf\_svcs**.

[edit]

```
user@host> show firewall filter in_filter_postsvc-vrf_svcs counter svc_in_pkts_rtn
```

### Verifying That Outbound Traffic Is Filtered Before Output Service Processing

**Purpose** Verify that outbound packets sent to ICMP port 179 are sent for processing by the *output* services associated with the service set **vrf\_svcs**.

**Action** Display the count of packets sent for processing by the *output* services associated with the service set **vrf\_svcs**.

[edit]

```
user@host> show firewall filter out_filter_presvc-vrf_svcs counter svc_out_pkts
```

## Service Filter Match Conditions for IPv4 or IPv6 Traffic

Service filters support only a subset of the stateless firewall filter match conditions for IPv4 and IPv6 traffic. [Table 64 on page 808](#) describes the service filter match conditions.

**Table 64: Service Filter Match Conditions for IPv4 or IPv6 Traffic**

| Match Condition                           | Description                                                                                                                                                               | Protocol Families                                                                       |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>address address</b>                    | Match the IP source or destination address field.                                                                                                                         | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul> |
| <b>address address except</b>             | Do not match the IP source or destination address field.                                                                                                                  | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul> |
| <b>ah-spi spi-value</b>                   | (M Series routers, except M120 and M320) Match on the IPsec authentication header (AH) security parameter index (SPI) value.                                              | <ul style="list-style-type: none"> <li>• family inet</li> </ul>                         |
| <b>ah-spi-except spi-value</b>            | (M Series routers, except M120 and M320) Do not match on the IPsec AH SPI value.                                                                                          | <ul style="list-style-type: none"> <li>• family inet</li> </ul>                         |
| <b>destination-address address</b>        | <p>Match the IP destination address field.</p> <p>You cannot specify both the <b>address</b> and <b>destination-address</b> match conditions in the same term.</p>        | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul> |
| <b>destination-address address except</b> | <p>Do not match the IP destination address field.</p> <p>You cannot specify both the <b>address</b> and <b>destination-address</b> match conditions in the same term.</p> | <ul style="list-style-type: none"> <li>• family inet</li> <li>• family inet6</li> </ul> |

**Table 64: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*continued*)**

| Match Condition                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Protocol Families                                                                   |

| <b>destination-port number</b>        | <p>Match the UDP or TCP destination port field.</p> <p>You cannot specify both the <b>port</b> and <b>destination-port</b> match conditions in the same term.</p> <p>If you configure this match condition for IPv4 traffic, we recommend that you also configure the <b>protocol udp</b> or <b>protocol tcp</b> match statement in the same term to specify which protocol is being used on the port.</p> <p>If you configure this match condition for IPv6 traffic, we recommend that you also configure the <b>next-header udp</b> or <b>next-header tcp</b> match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed): <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cmd</b> (514), <b>cvspserver</b> (2401), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>ldp</b> (646), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>tacacs</b> (49), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), or <b>xdmcp</b> (177).</p> | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>destination-port-except number</b> | Do not match the UDP or TCP destination port field. For details, see the <b>destination-port</b> match description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>destination-prefix-list name</b>   | Match the list of destination prefixes. The prefix list is defined at the <b>[edit policy-options prefix-list prefix-list-name]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>esp-spi value</b>                  | Match the IPsec encapsulating security payload (ESP) SPI value. Specify a single value or a range of values. You can specify a <i>value</i> in hexadecimal, binary, or decimal form. To specify the value in hexadecimal form, include <b>0x</b> as a prefix. To specify the value in binary form, include <b>b</b> as a prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>esp-spi-except value</b>           | Do not match the IPsec ESP SPI value or range of values. For details, see the <b>esp-spi</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |

Table 64: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Protocol Families                                                                   |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>first-fragment</b>                             | <p>Match if the packet is the first fragment of a fragmented packet. Do not match if the packet is a trailing fragment of a fragmented packet. The first fragment of a fragmented packet has a fragment offset value of 0.</p> <p>This match condition is an alias for the bit-field match condition <b>fragment-offset 0</b> match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions: <b>first-fragment</b> and <b>is-fragment</b>.</p>                                                                        | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <b>fragment-flags <i>number</i></b>               | <p>(Ingress only) Match the three-bit IP fragmentation flags field in the IP header.</p> <p>In place of the numeric field value, you can specify one of the following keywords (the field values are also listed): <b>dont-fragment</b> (0x4), <b>more-fragments</b> (0x2), or <b>reserved</b> (0x8).</p>                                                                                                                                                                                                                                                                                 | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <b>fragment-offset <i>number</i></b>              | <p>Match the 13-bit fragment offset field in the IP header. The value is the offset, in 8-byte units, in the overall datagram message to the data fragment. Specify a numeric value, a range of values, or a set of values. An offset value of 0 indicates the first fragment of a fragmented packet.</p> <p>The <b>first-fragment</b> match condition is an alias for the <b>fragment-offset 0</b> match condition.</p> <p>To match both first and trailing fragments, you can use two terms that specify different match conditions (<b>first-fragment</b> and <b>is-fragment</b>).</p> | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <b>fragment-offset-except <i>number</i></b>       | Do not match the 13-bit fragment offset field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <b>interface-group <i>group-number</i></b>        | <p>Match the interface group (set of one or more logical interfaces) on which the packet was received. For <b>group-number</b>, specify a value from 0 through 255.</p> <p>For information about configuring interface groups, see <a href="#">“Filtering Packets Received on a Set of Interface Groups Overview”</a> on page 749.</p>                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>interface-group-except <i>group-number</i></b> | Do not match the interface group on which the packet was received. for details, see the <b>interface-group</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |

Table 64: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*continued*)

| Match Condition                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Protocol Families                                                                              |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>ip-options values</b>        | <p>Match the 8-bit IP option field, if present, to the specified value or list of values.</p> <p>In place of a numeric value, you can specify one of the following text synonyms (the option values are also listed): <b>loose-source-route</b> (131), <b>record-route</b> (7), <b>router-alert</b> (148), <b>security</b> (130), <b>stream-id</b> (136), <b>strict-source-route</b> (137), or <b>timestamp</b> (68).</p> <p>To match <i>any</i> value for the IP option, use the text synonym <b>any</b>. To match on <i>multiple</i> values, specify the list of values within square brackets ('[' and ']'). To match a <i>range</i> of values, use the value specification [ <i>value1-value2</i> ].</p> <p>For example, the match condition <b>ip-options [ 0-147 ]</b> matches on an IP options field that contains the <b>loose-source-route</b>, <b>record-route</b>, or <b>security</b> values, or any other value from 0 through 147. However, this match condition does not match on an IP options field that contains only the <b>router-alert</b> value (148).</p> <p>For most interfaces, a filter term that specifies an <b>ip-option</b> match on one or more <i>specific</i> IP option values (a value other than <b>any</b>) causes packets to be sent to the Routing Engine so that the kernel can parse the IP option field in the packet header.</p> <ul style="list-style-type: none"> <li>For a firewall filter term that specifies an <b>ip-option</b> match on one or more specific IP option values, you cannot specify the <b>count</b>, <b>log</b>, or <b>syslog</b> nonterminating actions <i>unless</i> you also specify the <b>discard</b> terminating action in the same term. This behavior prevents double-counting of packets for a filter applied to a transit interface on the router (or switch).</li> <li>Packets processed on the kernel might be dropped in case of a system bottleneck. To ensure that matched packets are instead sent to the Packet Forwarding Engine (where packet processing is implemented in hardware), use the <b>ip-options any</b> match condition.</li> </ul> <p>The 10-Gigabit Ethernet Modular Port Concentrator (MPC), 60-Gigabit Ethernet MPC, 60-Gigabit Queuing Ethernet MPC, 60-Gigabit Ethernet Enhanced Queuing MPC on MX Series routers and EX Series switches are capable of parsing the IP option field of the IPv4 packet header. This capability is supported on EX Series switches also. For interfaces configured on those MPCs, <i>all</i> packets that are matched using the <b>ip-options</b> match condition are sent to the Packet Forwarding Engine for processing.</p> | <p><b>family inet</b></p> <ul style="list-style-type: none"> <li><b>family inet</b></li> </ul> |
| <b>ip-options-except values</b> | <p>Do not match the IP option field to the specified value or list of values. For details about specifying the <b>values</b>, see the <b>ip-options</b> match condition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <ul style="list-style-type: none"> <li><b>family inet</b></li> </ul>                           |
| <b>is-fragment</b>              | <p>Match if the packet is a trailing fragment of a fragmented packet. Do not match the first fragment of a fragmented packet.</p> <p>This match condition is an alias for the bit-field match condition <b>fragment-offset 0 except</b> bits.</p> <p><b>NOTE:</b> To match both first and trailing fragments, you can use two terms that specify different match conditions (<b>first-fragment</b> and <b>is-fragment</b>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <ul style="list-style-type: none"> <li><b>family inet</b></li> </ul>                           |

Table 64: Service Filter Match Conditions for IPv4 or IPv6 Traffic (*continued*)

| Match Condition                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Protocol Families                                                                   |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>port number</b>                            | <p>Match the UDP or TCP source or destination port field.</p> <p>If you configure this match condition, you cannot configure the <b>destination-port</b> match condition or the <b>source-port</b> match condition in the same term.</p> <p>If you configure this match condition for IPv4 traffic, we recommend that you also configure the <b>protocol udp</b> or <b>protocol tcp</b> match statement in the same term to specify which protocol is being used on the port.</p> <p>If you configure this match condition for IPv6 traffic, we recommend that you also configure the <b>next-header udp</b> or <b>next-header tcp</b> match condition in the same term to specify which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the text synonyms listed under <b>destination-port</b>.</p> | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>port-except number</b>                     | Do not match the UDP or TCP source or destination port field. For details, see the <b>port</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>prefix-list</b><br><b>prefix-list-name</b> | Match the prefixes of the source or destination address fields to the prefixes in the specified list. The prefix list is defined at the [edit policy-options prefix-list <b>prefix-list-name</b> ] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |
| <b>protocol number</b>                        | <p>Match the IP protocol type field.</p> <p>In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed): <b>ah</b> (51), <b>dstopts</b> (60), <b>egp</b> (8), <b>esp</b> (50), <b>fragment</b> (44), <b>gre</b> (47), <b>hop-by-hop</b> (0), <b>icmp</b> (1), <b>icmp6</b> (58), <b>icmpv6</b> (58), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>sctp</b> (132), <b>tcp</b> (6), <b>udp</b> (17), or <b>vrrp</b> (112).</p>                                                                                                                                                                                                                                                                                                 | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <b>protocol-except number</b>                 | Do not match the IP protocol type field. For details, see the <b>protocol</b> match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <ul style="list-style-type: none"> <li>family inet</li> </ul>                       |
| <b>source-address address</b>                 | <p>Match the IP source address.</p> <p>You cannot specify both the <b>address</b> and <b>source-address</b> match conditions in the same term.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>family inet</li> <li>family inet6</li> </ul> |

## Service Filter Nonterminating Actions

Service filters support different sets of terminating actions for each protocol family.

**NOTE:** Service filters do not support the next term action.

Table 65 on page 815 describes the nonterminating actions you can configure in a service filter term.

**Table 65: Nonterminating Actions for Service Filters**

| Nonterminating Action           | Description                                                                                                                                                                                                   | Protocol Families                                                                                   |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>count counter-name</code> | Count the packet in the named counter.                                                                                                                                                                        | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |
| <code>log</code>                | Log the packet header information in a buffer within the Packet Forwarding Engine. You can access this information by issuing the <code>show firewall log</code> command at the command-line interface (CLI). | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |
| <code>port-mirror</code>        | Port-mirror the packet based on the specified family. Supported on M120 routers, M320 routers configured with Enhanced III FPCs, MX Series routers, and EX Series switches only.                              | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |
| <code>sample</code>             | Sample the packet.                                                                                                                                                                                            | <ul style="list-style-type: none"> <li>• <code>inet</code></li> <li>• <code>inet6</code></li> </ul> |

## Service Filter Terminating Actions

Service filters support different sets of terminating actions than standard stateless firewall filters or simple filters.

**NOTE:** Service filters do not support the next term action.

Table 66 on page 816 describes the terminating actions you can configure in a service filter term.

**Table 66: Terminating Actions for Service Filters**

| Terminating Action | Description                               | Protocol Families                                                                    |
|--------------------|-------------------------------------------|--------------------------------------------------------------------------------------|
| <b>service</b>     | Direct the packet to service processing.  | <ul style="list-style-type: none"><li>• <b>inet</b></li><li>• <b>inet6</b></li></ul> |
| <b>skip</b>        | Let the packet bypass service processing. | <ul style="list-style-type: none"><li>• <b>inet</b></li><li>• <b>inet6</b></li></ul> |

## Simple Filter Overview

---

Simple filters are supported on Gigabit Ethernet intelligent queuing 2 (IQ2) and Enhanced Queuing Dense Port Concentrator (DPC) interfaces only.

Simple filters are recommended for metropolitan Ethernet applications.

## How Simple Filters Evaluate Packets

---

This topic covers the following information:

- [Simple Filters That Contain a Single Term on page 817](#)
- [Simple Filters That Contain Multiple Terms on page 818](#)
- [Simple Filter Terms That Do Not Contain Any Match Conditions on page 818](#)
- [Simple Filter Terms That Do Not Contain Any Actions on page 818](#)
- [Simple Filter Default Action on page 818](#)

## Simple Filters That Contain a Single Term

For a simple filter that consists of a single term, the policy framework software evaluates a packet as follows:

- If the packet matches all the conditions, the actions are taken.

- If the packet matches all the conditions and no actions are specified, the packet is accepted.
- If the packet does not match all the conditions, it is discarded.

## Simple Filters That Contain Multiple Terms

For a simple filter that consists of multiple terms, the policy framework software evaluates a packet against the terms in the filter sequentially, beginning with the first term in the filter, until either the packet matches all the conditions in one of the terms or there are no more terms in the filter.

- If the packet matches all the conditions in a term, the actions in that term are performed and evaluation of the packet ends at that term. Any subsequent terms in the filter are not used.
- If the packet does not match all the conditions in the term, evaluation of the packet proceeds to the next term in the filter.

## Simple Filter Terms That Do Not Contain Any Match Conditions

For simple filters with a single term and for filters with multiple terms, if a term does not contain any match conditions, the actions are taken on any packet evaluated.

## Simple Filter Terms That Do Not Contain Any Actions

If a simple filter term does not contain any actions, and if the packet matches the conditions in the term, the packet is accepted.

## Simple Filter Default Action

Each simple filter has an *implicit discard* action at the end of the filter, which is equivalent to including the following example term **explicit\_discard** as the final term in the simple filter:

```
term explicit_discard {  
    then discard;  
}
```

By default, if a packet matches none of the terms in a simple filter, the packet is discarded.

## Guidelines for Configuring Simple Filters

This topic covers the following information:

- [Statement Hierarchy for Configuring Simple Filters on page 819](#)
- [Simple Filter Protocol Families on page 819](#)
- [Simple Filter Names on page 819](#)
- [Simple Filter Terms on page 820](#)
- [Simple Filter Match Conditions on page 820](#)
- [Simple Filter Terminating Actions on page 821](#)
- [Simple Filter Nonterminating Actions on page 821](#)

### Statement Hierarchy for Configuring Simple Filters

To configure a simple filter, include the **simple-filter** *simple-filter-name* statement at the **[edit firewall family inet]** hierarchy level.

```
[edit]
firewall {
  family inet {
    simple-filter simple-filter-name {
      term term-name {
        from {
          match-conditions;
        }
        then {
          actions;
        }
      }
    }
  }
}
```

Individual statements supported under the **simple-filter** *simple-filter-name* statement are described separately in this topic and are illustrated in the example of configuring and applying a simple filter.

### Simple Filter Protocol Families

You can configure simple filters to filter IPv4 traffic (**family inet**) only. No other protocol family is supported for simple filters.

### Simple Filter Names

Under the **family inet** statement, you can include **simple-filter** *simple-filter-name* statements to create and name simple filters. The filter name can contain letters, numbers, and hyphens (-) and be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").

## Simple Filter Terms

Under the **simple-filter** *simple-filter-name* statement, you can include **term** *term-name* statements to create and name filter terms.

- You must configure at least one term in a firewall filter.
- You must specify a unique name for each term within a firewall filter. The term name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" ").
- The order in which you specify terms within a firewall filter configuration is important. Firewall filter terms are evaluated in the order in which they are configured. By default, new terms are always added to the end of the existing filter. You can use the **insert** configuration mode command to reorder the terms of a firewall filter.

Simple filters do *not* support the **next term** action.

## Simple Filter Match Conditions

Simple filter terms support only a subset of the IPv4 match conditions that are supported for standard stateless firewall filters.

Unlike standard stateless firewall filters, the following restrictions apply to simple filters:

- On MX Series routers with the Enhanced Queuing DPC and on EX Series switches, simple filters do *not* support the **forwarding-class** match condition.
- Simple filters support only one **source-address** and one **destination-address** prefix for each filter term. If you configure multiple prefixes, only the last one is used.
- Simple filters do *not* support multiple source addresses and destination addresses in a single term. If you configure multiple addresses, only the last one is used.
- Simple filters do *not* support negated match conditions, such as the **protocol-except** match condition or the **exception** keyword.
- Simple filters support a range of values for **source-port** and **destination-port** match conditions only. For example, you can configure **source-port 400-500** or **destination-port 600-700**.
- Simple filters do *not* support noncontiguous mask values.

Table 67 on page 820 lists the simple filter match conditions.

Table 67: Simple Filter Match Conditions

| Match Condition                                       | Description                   |
|-------------------------------------------------------|-------------------------------|
| <b>destination-address</b> <i>destination-address</i> | Match IP destination address. |

Table 67: Simple Filter Match Conditions (*continued*)

| Match Condition                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>destination-port</b> <i>number</i>          | <p>TCP or UDP destination port field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol</b> match statement to determine which protocol is being used on the port.</p> <p>In place of the numeric value, you can specify one of the following text aliases (the port numbers are also listed): <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cmd</b> (514), <b>cvspserver</b> (2401), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobilip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>telnet</b> (23), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), or <b>xmcp</b> (177).</p> |
| <b>forwarding-class</b> <i>class</i>           | <p>Match the forwarding class of the packet.</p> <p>Specify <b>assured-forwarding</b>, <b>best-effort</b>, <b>expedited-forwarding</b>, or <b>network-control</b>.</p> <p>For information about forwarding classes and router-internal output queues, see <i>Forwarding Classes Overview</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>protocol</b> <i>number</i>                  | <p>IP protocol field. In place of the numeric value, you can specify one of the following text aliases (the field values are also listed): <b>ah</b> (51), <b>dstdpts</b> (60), <b>egp</b> (8), <b>esp</b> (50), <b>fragment</b> (44), <b>gre</b> (47), <b>hop-by-hop</b> (0), <b>icmp</b> (1), <b>icmp6</b> (58), <b>icmpv6</b> (58), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>sctp</b> (132), <b>tcp</b> (6), <b>udp</b> (17), or <b>vrrp</b> (112).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>source-address</b> <i>ip-source-address</i> | Match the IP source address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>source-port</b> <i>number</i>               | <p>Match the UDP or TCP source port field.</p> <p>If you configure this match condition, we recommend that you also configure the <b>protocol</b> match statement to determine which protocol is being used on the port.</p> <p>In place of the numeric field, you can specify one of the text aliases listed for <b>destination-port</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Simple Filter Terminating Actions

Simple filters do *not* support explicitly configurable terminating actions, such as **accept**, **reject**, and **discard**. Terms configured in a simple filter always accept packets.

Simple filters do *not* support the **next** action.

## Simple Filter Nonterminating Actions

Simple filters support only the following nonterminating actions:

- **forwarding-class** (*forwarding-class* | **assured-forwarding** | **best-effort** | **expedited-forwarding** | **network-control**)

**NOTE:** On the MX Series routers and EX Series switches with the Enhanced Queuing DPC, the forwarding class is not supported as a from match condition.

- **loss-priority (high | low | medium-high | medium-low)**

Simple filters do not support actions that perform other functions on a packet (such as incrementing a counter, logging information about the packet header, sampling the packet data, or sending information to a remote host using the system log functionality).

## Guidelines for Applying Simple Filters

This topic covers the following information:

- [Statement Hierarchy for Applying Simple Filters on page 822](#)
- [Restrictions for Applying Simple Filters on page 822](#)

### Statement Hierarchy for Applying Simple Filters

You can apply a simple filter to the IPv4 ingress traffic at a logical interface by including the **simple-filter** input *simple-filter-name* statement at the **[edit interfaces *interface-name* unit *unit-number* family inet]** hierarchy level.

```
[edit]
interfaces {
  interface-name {
    unit logical-unit-number {
      family inet {
        simple-filter {
          input filter-name;
        }
      }
    }
  }
}
```

### Restrictions for Applying Simple Filters

You can apply a simple filter to the ingress IPv4 traffic at a logical interface configured on the following hardware only:

- Gigabit Ethernet intelligent queuing (IQ2) PICs installed on M120, M320, or T Series routers.

- Enhanced Queuing Dense Port Concentrators (EQ DPCs) installed on MX Series routers and EX Series switches.

The following additional restrictions pertain to applying simple filters:

- Simple filters are not supported on Modular Port Concentrator (MPC) interfaces, including Enhanced Queuing MPC interfaces.
- Simple filters are not supported for interfaces in an aggregated-Ethernet bundle.
- You can apply simple filters to **family inet** traffic only. No other protocol family is supported.
- You can apply simple filters to ingress traffic only. Egress traffic is not supported.
- You can apply only a single simple filter to a supported logical interface. Input lists are not supported.

## Example: Configuring and Applying a Simple Filter

This example shows how to configure a simple filter.

- [Requirements on page 823](#)
- [Overview on page 824](#)
- [Configuration on page 824](#)
- [Verification on page 826](#)

### Requirements

This example uses one of the following hardware components:

- One Gigabit Ethernet intelligent queuing (IQ2) PIC installed on an M120, M320, or T Series router
- One Enhanced Queuing Dense Port Concentrator (EQ DPC) installed on an MX Series router or an EX Series switch

Before you begin, make sure that you have:

- Installed your supported router (or switch) and PIC or DPC and performed the initial router (or switch) configuration.
- Configured basic Ethernet in the topology, and verified that traffic is flowing in the topology and that ingress IPv4 traffic is flowing into logical interface **ge-0/0/1.0**.

## Overview

This simple filter sets the loss priority to low for TCP traffic with source address 1.1.1.1, sets the loss priority to high for HTTP (Web) traffic with source addresses in the 4.0.0.0/8 range, and sets the loss priority to low for all traffic with destination address 6.6.6.6.

### Topology

The simple filter is applied as an input filter (arriving packets are checking for destination address 6.6.6.6, not queued output packets) on interface **ge-0/0/1.0**.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Simple Firewall Filter on page 824](#)
- [Applying the Simple Filter to the Logical Interface Input on page 826](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall family inet simple-filter sf_classify_1 term 1 from source-address 1.1.1.1/32
set firewall family inet simple-filter sf_classify_1 term 1 from protocol tcp
set firewall family inet simple-filter sf_classify_1 term 1 then loss-priority low
set firewall family inet simple-filter sf_classify_1 term 2 from source-address 4.0.0.0/8
set firewall family inet simple-filter sf_classify_1 term 2 from protocol tcp
set firewall family inet simple-filter sf_classify_1 term 2 from source-port http
set firewall family inet simple-filter sf_classify_1 term 2 then loss-priority high
set firewall family inet simple-filter sf_classify_1 term 3 from destination-address 6.6.6.6/32
set firewall family inet simple-filter sf_classify_1 term 3 then loss-priority low
set firewall family inet simple-filter sf_classify_1 term 3 then forwarding-class best-effort
set interfaces ge-0/0/1 unit 0 family inet simple-filter input sf_classify_1
set interfaces ge-0/0/1 unit 0 family inet address 10.1.2.3/30
```

### Configuring the Simple Firewall Filter

#### Step-by-Step Procedure

To configure the simple filter:

1. Create the simple filter **sf\_classify\_1**.

```
[edit]
user@host# edit firewall family inet simple-filter sf_classify_1
```

2. Configure classification of TCP traffic based on the source IP address.

```
[edit firewall family inet simple-filter sf_classify_1]
user@host# set term 1 from source-address 1.1.1.1/32
user@host# set term 1 from protocol tcp
user@host# set term 1 then loss-priority low
```

3. Configure classification of HTTP traffic based on the source IP address.

```
[edit firewall family inet simple-filter sf_classify_1]
user@host# set term 2 from source-address 4.0.0/8
user@host# set term 2 from protocol tcp
user@host# set term 2 from source-port http
user@host# set term 2 then loss-priority high
```

4. Configure classification of other traffic based on the destination IP address.

```
[edit firewall family inet simple-filter sf_classify_1]
user@host# set term 3 from destination-address 6.6.6/32
user@host# set term 3 then loss-priority low
user@host# set term 3 then forwarding-class best-effort
```

**Results** Confirm the configuration of the simple filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  simple-filter sf_classify_1 {
    term 1 {
      from {
        source-address {
          1.1.1/32;
        }
        protocol {
          tcp;
        }
      }
      then loss-priority low;
    }
    term 2 {
      from {
        source-address {
          4.0.0/8;
        }
        source-port {
          http;
        }
        protocol {
          tcp;
        }
      }
      then loss-priority high;
    }
    term 3 {
      from {
        destination-address {
          6.6.6/32;
        }
      }
      then {
        loss-priority low;
      }
    }
  }
}
```

```

        forwarding-class best-effort;
    }
}
}

```

### Applying the Simple Filter to the Logical Interface Input

#### Step-by-Step Procedure

To apply the simple filter to the logical interface input:

1. Configure the logical interface to which you will apply the simple filter.

```

[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet

```

2. Configure the interface address for the logical interface.

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set address 10.1.2.3/30

```

3. Apply the simple filter to the logical interface input.

```

[edit interfaces ge-0/0/1 unit 0 family inet]
user@host# set simple-filter input sf_classify_1

```

**Results** Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show interfaces
ge-0/0/1 {
  unit 0 {
    family inet {
      simple-filter {
        input sf_classify_1;
      }
      address 10.1.2.3/30;
    }
  }
}

```

When you are done configuring the device, commit your candidate configuration.

### Verification

Confirm that the configuration is working properly.

- [Displaying the Mapping of Forwarding Class Maps and Names to Queue Numbers on page 827](#)
- [Displaying CoS Queue Counters for the Interface on page 827](#)
- [Displaying CoS Queue Counter Details for the Physical Interface on page 827](#)

### Displaying the Mapping of Forwarding Class Maps and Names to Queue Numbers

**Purpose** Display the mapping of forwarding class names to queue numbers.

**Action** Enter the **show class-of-service forwarding-class** operational mode command.

```
[edit]
user@host> show class-of-service forwarding-class
```

For information about the command output, see “**show class-of-service forwarding-class**” in the [CLI Explorer](#).

### Displaying CoS Queue Counters for the Interface

**Purpose** Verify that the class-of-service (CoS) queue counters for the interface reflect the simple filter applied to the logical interface.

**Action** Enter the **show interfaces** command for the physical interface on which the simple filter is applied, and specify **detail** or **extensive** output level.

```
[edit]
user@host> show interfaces ge-0/0/1 detail
```

In the **Physical interface** section, under **Ingress queues**, the **Queue counters** section displays ingress queue counters for each forwarding class.

For more detailed information about the command output, see “**show interfaces (Gigabit Ethernet)**” or “**show interfaces (10-Gigabit Ethernet)**” in the [CLI Explorer](#).

### Displaying CoS Queue Counter Details for the Physical Interface

**Purpose** Verify that the CoS queue counter details for the physical interface reflect the simple filter applied to the logical interface.

**Action** Enter the **show interfaces queue** command for the physical interface on which the simple filter is applied, and specify the **ingress** option.

```
[edit]
user@host> show interfaces queue ge-0/0/1 ingress
```

For information about the command output, see “**show interfaces queue**” in the [CLI Explorer](#).

## Filter-Based Forwarding Overview

---

Firewall filters can be used to block specific packets. They can also be used to affect how specific packets are forwarded.

- [Filters That Classify Packets or Direct Them to Routing Instances on page 829](#)
- [Input Filtering to Classify and Forward Packets Within the Router or Switch on page 830](#)
- [Output Filtering to Forward Packets to Another Routing Table on page 830](#)
- [Restrictions for Applying Filter-Based Forwarding on page 831](#)

## Filters That Classify Packets or Direct Them to Routing Instances

For IPv4 or IPv6 traffic only, you can use stateless firewall filters in conjunction with forwarding classes and routing instances to control how packets travel in a network. This is called *filter-based forwarding* (FBF).

You can define a filtering term that matches incoming packets based on source address and then classifies matching packets to a specified forwarding class. This type of filtering can be configured to grant certain types of traffic preferential treatment or to improve

load balancing. To configure a stateless firewall filter to classify packets to a forwarding class, configure a term with the *nonterminating action* **forwarding-class class-name**.

You can also define a filtering term that directs matching packets to a specified routing instance. This type of filtering can be configured to route specific types of traffic through a firewall or other security device before the traffic continues on its path. To configure a stateless firewall filter to direct traffic to a routing instance, configure a term with the *terminating action* **routing-instance routing-instance-name <topology topology-name>** to specify the routing instance to which matching packets will be forwarded.

**NOTE:** Unicast Reverse Path Forwarding (uRPF) check is compatible with FBF actions. uRPF check is processed for source address checking before any FBF actions are enabled for static and dynamic interfaces. This applies to both IPv4 and IPv6 families.

To forward traffic to the master routing instance, reference **routing-instance default** in the firewall configuration, as shown here:

```
[edit firewall]
family inet {
  filter test {
    term 1 {
      then {
        routing-instance default;
      }
    }
  }
}
```

**NOTE:** Do not reference **routing-instance master**. This does not work.

## Input Filtering to Classify and Forward Packets Within the Router or Switch

You can configure filters to classify packets based on source address and specify the forwarding path the packets take within the router or switch by configuring a filter on the ingress interface.

For example, you can use this filter for applications to differentiate traffic from two clients that have a common access layer (for example, a Layer 2 switch) but are connected to different Internet service providers (ISPs). When the filter is applied, the router or switch can differentiate the two traffic streams and direct each to the appropriate network. Depending on the media type the client is using, the filter can use the source IP address to forward the traffic to the corresponding network through a tunnel. You can also configure filters to classify packets based on IP protocol type or IP precedence bits.

## Output Filtering to Forward Packets to Another Routing Table

You can also forward packets based on output filters by configuring a filter on the egress interfaces. In the case of port mirroring, it is useful for port-mirrored packets to be

distributed to multiple monitoring PICs and collection PICs based on patterns in packet headers. FBF on the port-mirroring egress interface must be configured.

Packets forwarded to the output filter have been through at least one route lookup when an FBF filter is configured on the egress interface. After the packet is classified at the egress interface by the FBF filter, it is redirected to another routing table for further route lookup.

## Restrictions for Applying Filter-Based Forwarding

An interface configured with filter-based forwarding does not support source-class usage (SCU) filter matching or source-class and destination-class usage (SCU/DCU) accounting.

---

## Firewall Filters That Handle Fragmented Packets Overview

You can create stateless firewall filters that handle fragmented packets destined for the Routing Engine. By applying these policies to the Routing Engine, you protect against the use of IP fragmentation as a means to disguise TCP packets from a firewall filter.

For example, consider an IP packet that is fragmented into the smallest allowable fragment size of 8 bytes (a 20-byte IP header plus an 8-byte payload). If this IP packet carries a TCP packet, the first fragment (fragment offset of 0) that arrives at the device contains only the TCP source and destination ports (first 4 bytes), and the sequence number (next 4 bytes). The TCP flags, which are contained in the next 8 bytes of the TCP header, arrive in the second fragment (fragment offset of 1).

See RFC 1858, *Security Considerations for IP Fragment Filtering*.

---

## Stateless Firewall Filters That Reference Policers Overview

Policing, or rate limiting, is an important component of firewall filters that lets you limit the amount of traffic that passes into or out of an interface.

A firewall filter that references a policer can provide protection from denial-of-service (DOS) attacks. Traffic that exceeds the rate limits configured for the policer is either discarded or marked as lower priority than traffic that conforms to the configured rate limits. Packets can be marked for a lower priority by being set to a specific output queue, set to a specific packet loss priority (PLP) level, or both. When necessary, low-priority traffic can be discarded to prevent congestion.

A policer specifies two types of rate limits on traffic:

- Bandwidth limit—The average traffic rate permitted, specified as a number of bits per second.
- Maximum burst size—The packet size permitted for bursts of data that exceed the bandwidth limit.

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can use policing to define specific classes of traffic on an interface and apply a set of rate limits to each class. After you name and configure a policer, it is stored as a template. You can then apply the policer in an interface configuration or, to rate-limit packet-filtered traffic only, in a firewall filter configuration.

For an IPv4 firewall filter term only, you can also specify a *prefix-specific action* as a nonterminating action that applies a policer to the matched packets. A prefix-specific action applies additional matching criteria on the filter-matched packets based on specified address prefix bits and then associates the matched packets with a counter and policer instance for that filter term or for all terms in the firewall filter.

To apply a policer or a prefix action to packet-filtered traffic, you can use the following firewall filter nonterminating actions:

- **policer** *policer-name*
- **three-color-policer** (*single-rate* | *two-rate*) *policer-name*
- **prefix-action** *action-name*

**NOTE:** The packet lengths that a policer considers depends on the address family of the firewall filter. See [“Understanding the Frame Length for Policing Packets” on page 875](#).

---

## Statement Hierarchy for Configuring FBF for IPv4 or IPv6 Traffic

---

You can configure stateless firewall filters for filter-based forwarding by configuring filter terms that specify the **forwarding-class** *class-name* nonterminating action or the **routing-instance** *routing-instance-name* terminating action:

```
firewall {  
  family (inet | inet6) {  
    filter filter-name {  
      term term-name {  
        from {  
          ipv4-or-ipv6-match-conditions;  
        }  
      }  
    }  
  }  
}
```

```

        then {
            forwarding-class class-name; #optional
            other-optional-nonterminating-actions;
            routing-instance routing-instance-name <topology topology-name>;
        }
    }
}

```

You can include the firewall configuration at one of the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

#### Related Documentation

## Statement Hierarchy for Configuring FBF for IPv4 Traffic on ACX Series Routers

On ACX Series routers, you can configure stateless firewall filters for filter-based forwarding (FBF) by configuring filter terms that specify the optional nonterminating actions or the **routing-instance *routing-instance-name*** terminating action:

```

firewall {
  family inet {
    filter filter-name {
      term term-name {
        from {
          ipv4-match-conditions;
        }
        then {
          optional-nonterminating-actions;
          routing-instance routing-instance-name ;
        }
      }
    }
  }
}

```

You can include the firewall configuration at the **[edit]** hierarchy level:

The **[edit logical-systems *logical-system-name*]** hierarchy level is not supported on the ACX Series routers.

## Statement Hierarchy for Configuring FBF for MPLS-Tagged IPv4 Traffic

- [Matching on IPv4 Address and TCP/UDP Port Fields on page 834](#)
- [Configuration Example on page 835](#)

### Matching on IPv4 Address and TCP/UDP Port Fields

To configure a firewall filter term that matches on IP source and destination address fields, and TCP and UDP ports in the IPv4 header of packets in an MPLS flow, you can specify supported match conditions as shown here:

```
[edit]
interfaces {
  interface-name {
    unit logical-unit-number {
      family family {
        address ip-address;
      }
      family mpls {
        filter {
          input filter-name;
        }
      }
    }
  }
}
firewall {
  family mpls {
    filter filter-name {
      term term-name {
        from {
          ip-version ipv4 {
            destination-address {
              ip-address;
            }
          }
          source-address {
            ip-address;
          }
        }
        protocol tcp {
          destination-port tcp-port;
          destination-port-except tcp-port;
          source-port tcp-port;
        }
      }
    }
  }
}
```

```

        source-port-except tcp-port;
    }
    protocol udp {
        destination-port udp-port;
        destination-port-except udp-port;
        source-port udp-port;
        source-port-except udp-port;
    }
}
}
then {
    ...
}
}
}
}
}
}
}
}
}

```

### Configuration Example

```

interfaces {
    ge-6/0/0 {
        unit 0 {
            family inet {
                address 20.20.20.1/30;
            }
            family mpls {
                filter {
                    input mpls-ipv4-filter1;
                }
            }
        }
    }
}
firewall {
    family mpls {
        filter mpls-ipv4-filter1 {
            term term1 {
                from {
                    ip-version ipv4 {
                        source-address {
                            10.0.0.1/32;
                        }
                    }
                    protocol tcp {
                        destination-port ftp;
                    }
                }
            }
        }
    }
    then {
        count counter1;
        discard;
    }
}
}
}
}
}
}
}
}
}
}

```

## Statement Hierarchy for Configuring Routing Instances for FBF

A routing instance is a collection of routing tables, interfaces, and routing protocol parameters. The set of interfaces belongs to the routing tables, and the routing protocol parameters control the information in the routing tables.

To configure a routing instance for filter-based forwarding:

1. The **instance-type** must be **forwarding**. The **forwarding** routing instance type supports filter-based forwarding, where interfaces are not associated with instances. For this instance type, there is no one-to-one mapping between an interface and a routing instance. All interfaces belong to the default instance **inet.0**.
2. The name of the routing instance name must be the one referenced in the firewall filter action.

**NOTE:** In Junos OS Release 9.0 and later, you can no longer specify a routing-instance name of **default** or include special characters within the name of a routing instance.

You must also create a routing table group that adds interface routes to the following routing instances:

- Routing instance named in the action
- Default routing table **inet.0**

You create a routing table group to resolve the routes installed in the routing instance to directly connected next hops on that interface. For more information on routing table groups and interface routes, see the *Routing Databases Overview*.

```
routing-instances {
  routing-table-name {
    instance-type forwarding;
    routing-options {
      static {
        route destination-prefix nexthop address;
      }
    }
  }
}
```

You can include the **forwarding** routing instance at one of the following hierarchy levels:

- [\[edit\]](#)
- [\[edit logical-systems \*logical-system-name\*\]](#)

#### Related Documentation

- [Example: Configuring Filter-Based Forwarding on the Source Address on page 838](#)

## Statement Hierarchy for Applying FBF Filters to Interfaces

To apply filter-based forwarding to a logical interface, include the **input** or **output** statement in the **filter** stanza.

**NOTE:** An interface configured with filter-based forwarding does not support source-class usage (SCU) filter matching check filters.

```

interfaces {
  interface-name {
    unit unit-number {
      family (inet | inet6 | mpls) {
        filter {
          input filter-name;
          output filter-name;
        }
        address address;
      }
    }
  }
}

```

You can include the interfaces configuration at one of the following hierarchy levels:

- [\[edit\]](#)
- [\[edit logical-systems \*logical-system-name\*\]](#)

## Example: Configuring Filter-Based Forwarding on the Source Address

---

This example shows how to configure filter-based forwarding. The filter classifies packets to determine their forwarding path within the ingress routing device.

- [Requirements on page 838](#)
- [Overview on page 838](#)
- [Configuration on page 840](#)
- [Verification on page 845](#)

### Requirements

In this example, no special configuration beyond device initialization is required.

### Overview

Filter-based forwarding is supported for IP version 4 (IPv4) and IP version 6 (IPv6).

Use filter-based forwarding for service provider selection when customers have Internet connectivity provided by different ISPs yet share a common access layer. When a shared media (such as a cable modem) is used, a mechanism on the common access layer looks at Layer 2 or Layer 3 addresses and distinguishes between customers. You can use filter-based forwarding when the common access layer is implemented using a combination of Layer 2 switches and a single router.

With filter-based forwarding, all packets received on an interface are considered. Each packet passes through a filter that has match conditions. If the match conditions are met for a filter and you have created a routing instance, filter-based forwarding is applied to a packet. The packet is forwarded based on the next hop specified in the routing instance. For static routes, the next hop can be a specific LSP.

**NOTE:** Source-class usage filter matching and unicast reverse-path forwarding checks are not supported on an interface configured with filter-based forwarding (FBF).

To configure filter-based forwarding, perform the following tasks:

- Create a match filter on an ingress router or switch. To specify a match filter, include the **filter filter-name** statement at the **[edit firewall]** hierarchy level. A packet that passes through the filter is compared against a set of rules to classify it and to determine its membership in a set. Once classified, the packet is forwarded to a routing table specified in the accept action in the filter description language. The routing table then forwards the packet to the next hop that corresponds to the destination address entry in the table.
- Create routing instances that specify the routing table(s) to which a packet is forwarded, and the destination to which the packet is forwarded at the **[edit routing-instances]** hierarchy level. For example:

```
[edit]
routing-instances {
  routing-table-name1 {
    instance-type forwarding;
    routing-options {
      static {
        route 0.0.0.0/0 nexthop 10.0.0.1;
      }
    }
  }
  routing-table-name2 {
    instance-type forwarding;
    routing-options {
      static {
        route 0.0.0.0/0 nexthop 10.0.0.2;
      }
    }
  }
}
```

- Create a routing table group that adds interface routes to the forwarding routing instances used in filter-based forwarding (FBF), as well as to the default routing instance inet.0. This part of the configuration resolves the routes installed in the routing instances to directly connected next hops on that interface. Create the routing table group at the **[edit routing-options]** hierarchy level.

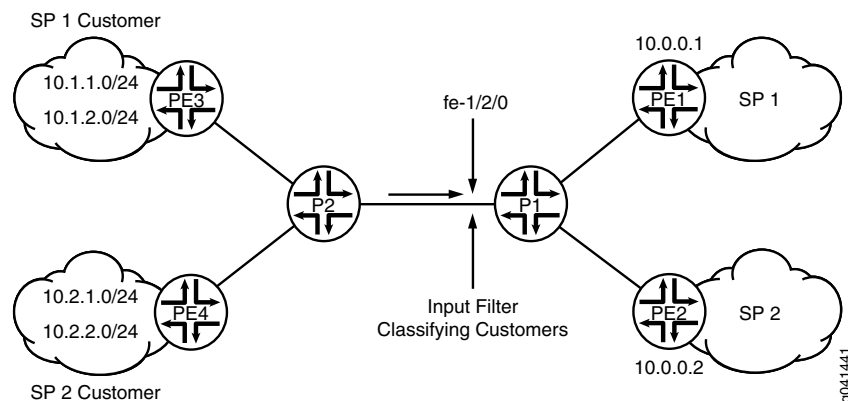

**NOTE:** Specify inet.0 as one of the routing instances that the interface routes are imported into. If the default instance inet.0 is not specified, interface routes are not imported into the default routing instance.

This example shows a packet filter that directs customer traffic to a next-hop router in the domains, SP 1 or SP 2, based on the packet's source address.

If the packet has a source address assigned to an SP 1 customer, destination-based forwarding occurs using the sp1-route-table.inet.0 routing table. If the packet has a source address assigned to an SP 2 customer, destination-based forwarding occurs using the sp2-route-table.inet.0 routing table. If a packet does not match either of these conditions, the filter accepts the packet, and destination-based forwarding occurs using the standard inet.0 routing table.

Figure 55 on page 840 shows the topology used in this example.

On Device P1, an input filter classifies packets received from Device PE3 and Device PE4. The packets are routed based on the source addresses. Packets with source addresses in the 10.1.1.0/24 and 10.1.2.0/24 networks are routed to Device PE1. Packets with source addresses in the 10.2.1.0/24 and 10.2.2.0/24 networks are routed to Device PE2.

**Figure 55: Filter-Based Forwarding**

To establish connectivity, OSPF is configured on all of the interfaces. For demonstration purposes, loopback interface addresses are configured on the routing devices to represent networks in the clouds.

The [“CLI Quick Configuration” on page 840](#) section shows the entire configuration for all of the devices in the topology. The [“Configuring the Routing Instances on the Device P1” on page 842](#) section shows the step-by-step configuration of the ingress routing device, Device P1.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device P1

```
set firewall filter classify-customers term sp1-customers from source-address 10.1.1.0/24
set firewall filter classify-customers term sp1-customers from source-address 10.1.2.0/24
set firewall filter classify-customers term sp1-customers then log
set firewall filter classify-customers term sp1-customers then routing-instance
  sp1-route-table
set firewall filter classify-customers term sp2-customers from source-address 10.2.1.0/24
set firewall filter classify-customers term sp2-customers from source-address 10.2.2.0/24
set firewall filter classify-customers term sp2-customers then log
set firewall filter classify-customers term sp2-customers then routing-instance
  sp2-route-table
set firewall filter classify-customers term default then accept
set interfaces fe-1/2/0 unit 0 family inet filter input classify-customers
set interfaces fe-1/2/0 unit 0 family inet address 172.16.0.10/30
set interfaces fe-1/2/1 unit 0 family inet address 172.16.0.13/30
set interfaces fe-1/2/2 unit 0 family inet address 172.16.0.17/30
set protocols ospf rib-group fbf-group
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable
set routing-instances sp1-route-table instance-type forwarding
set routing-instances sp1-route-table routing-options static route 0.0.0.0/0 next-hop
  172.16.0.13
set routing-instances sp2-route-table instance-type forwarding
```

```

set routing-instances sp2-route-table routing-options static route 0.0.0.0/0 next-hop
  172.16.0.17
set routing-options rib-groups fbf-group import-rib inet.0
set routing-options rib-groups fbf-group import-rib sp1-route-table.inet.0
set routing-options rib-groups fbf-group import-rib sp2-route-table.inet.0

```

**Device P2**

```

set interfaces fe-1/2/0 unit 0 family inet address 172.16.0.2/30
set interfaces fe-1/2/1 unit 0 family inet address 172.16.0.6/30
set interfaces fe-1/2/2 unit 0 family inet address 172.16.0.9/30
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable

```

**Device PE1**

```

set interfaces fe-1/2/0 unit 0 family inet address 172.16.0.14/30
set interfaces lo0 unit 0 family inet address 1.1.1.1/32
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable

```

**Device PE2**

```

set interfaces fe-1/2/0 unit 0 family inet address 172.16.0.18/30
set interfaces lo0 unit 0 family inet address 2.2.2.2/32
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable

```

**Device PE3**

```

set interfaces lo0 unit 0 family inet address 10.2.1.1/32
set interfaces lo0 unit 0 family inet address 10.2.2.1/32
set protocols ospf area 0.0.0.0 interface all
set protocols ospf area 0.0.0.0 interface fxp0.0 disable

```

### Configuring the Firewall Filter

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the firewall filter on the main router or switch:

1. Configure the source addresses for SP1 customers.  

```

[edit firewall filter classify-customers term sp1-customers]
user@host# set from source-address 10.1.1.0/24
user@host# set from source-address 10.1.2.0/24

```
2. Configure the actions that are taken when packets are received with the specified source addresses.

To track the action of the firewall filter, a log action is configured. The sp1-route-table.inet.0 routing table on Device P1 routes the packets.

```

[edit firewall filter classify-customers term sp1-customers]
user@host# set then log

```

```
user@host# set then routing-instance sp1-route-table
```

3. Configure the source addresses for SP2 customers.

```
[edit firewall filter classify-customers term sp2-customers]  
user@host# set from source-address 10.2.1.0/24  
user@host# set from source-address 10.2.2.0/24
```

4. Configure the actions that are taken when packets are received with the specified source addresses.

To track the action of the firewall filter, a log action is configured. The sp2-route-table.inet.0 routing table on Device P1 routes the packet.

```
[edit firewall filter classify-customers term sp2-customers]  
user@host# set then log  
user@host# set then routing-instance sp2-route-table
```

5. Configure the action to take when packets are received from any other source address.

All of these packets are simply accepted and routed using the default IPv4 unicast routing table, inet.0.

```
[edit firewall filter classify-customers term default]  
user@host# set then accept
```

---

### Configuring the Routing Instances on the Device P1

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the routing instances:

1. Configure the interfaces.

```
[edit interfaces fe-1/2/0]  
user@host# set unit 0 family inet address 172.16.0.10/30
```

```
[edit interfaces fe-1/2/1]  
user@host# set unit 0 family inet address 172.16.0.13/30
```

```
[edit interfaces fe-1/2/2]  
user@host# set unit 0 family inet address 172.16.0.17/30
```

2. Assign the **classify-customers** firewall filter to router interface fe-1/2/0.0 as an input packet filter.

```
[edit interfaces fe-1/2/0]  
user@host# set unit 0 family inet filter input classify-customers
```

3. Configure connectivity, using either a routing protocol or static routing.

As a best practice, disable routing on the management interface.

```
[edit protocols ospf area 0.0.0.0]  
user@host# set interface all
```

```
user@host# set interface fxp0.0 disable
```

4. Create the routing instances.

These routing instances are referenced in the **classify-customers** firewall filter.

The forwarding instance type provides support for filter-based forwarding, where interfaces are not associated with instances. All interfaces belong to the default instance, in this case Device P1.

```
[edit routing-instances]
user@host# set sp1-route-table instance-type forwarding
```

```
user@host# set sp2-route-table instance-type forwarding
```

5. Resolve the routes installed in the routing instances to directly connected next hops.

```
[edit routing-instances sp1-route-table routing-options]
user@host# set static route 0.0.0.0/0 next-hop 172.16.0.13
```

```
user@host# set static route 0.0.0.0/0 next-hop 172.16.0.17
```

6. Group together the routing tables to form a routing table group.

The first routing table, inet.0, is the primary routing table, and the additional routing tables are the secondary routing tables.

The primary routing table determines the address family of the routing table group, in this case IPv4.

```
[edit routing-options]
user@host# set rib-groups fbf-group import-rib inet.0
user@host# set rib-groups fbf-group import-rib sp1-route-table.inet.0
user@host# set rib-groups fbf-group import-rib sp2-route-table.inet.0
```

7. Apply the routing table group to OSPF.

This causes the OSPF routes to be installed into all the routing tables in the group.

```
[edit protocols ospf]
user@host# set rib-group fbf-group
```

8. If you are done configuring the device, commit the configuration.

```
[edit]
user@host# commit
```

## Results

Confirm your configuration by issuing the **show interfaces**, **show firewall**, **show protocols**, **show routing-instances**, and **show routing-options** commands.

```
user@host# show interfaces
fe-1/2/0 {
  unit 0 {
    family inet {
      filter {
        input classify-customers;
```

```
    }
    address 172.16.0.10/30;
  }
}
fe-1/2/1 {
  unit 0 {
    family inet {
      address 172.16.0.13/30;
    }
  }
}
fe-1/2/2 {
  unit 0 {
    family inet {
      address 172.16.0.17/30;
    }
  }
}

user@host# show firewall
filter classify-customers {
  term sp1-customers {
    from {
      source-address {
        10.1.1.0/24;
        10.1.2.0/24;
      }
    }
    then {
      log;
      routing-instance sp1-route-table;
    }
  }
  term sp2-customers {
    from {
      source-address {
        10.2.1.0/24;
        10.2.2.0/24;
      }
    }
    then {
      log;
      routing-instance sp2-route-table;
    }
  }
  term default {
    then accept;
  }
}

user@host# show protocols
ospf {
  rib-group fbf-group;
  area 0.0.0.0 {
    interface all;
    interface fxp0.0 {
```

```

        disable;
    }
}
}
user@host# show routing-instances
sp1-route-table {
    instance-type forwarding;
    routing-options {
        static {
            route 0.0.0.0/0 next-hop 172.16.0.13;
        }
    }
}
sp2-route-table {
    instance-type forwarding;
    routing-options {
        static {
            route 0.0.0.0/0 next-hop 172.16.0.17;
        }
    }
}
user@host# show routing-options
rib-groups {
    fbf-group {
        import-rib [ inet.0 sp1-route-table.inet.0 sp2-route-table.inet.0 ];
    }
}

```

## Verification

Confirm that the configuration is working properly.

### Pinging with Specified Source Addresses

**Purpose** Send some ICMP packets across the network to test the firewall filter.

**Action** 1. Run the **ping** command, pinging the lo0.0 interface on Device PE1.

The address configured on this interface is 1.1.1.1.

Specify the source address 10.1.2.1, which is the address configured on the lo0.0 interface on Device PE3.

```

user@PE3> ping 1.1.1.1 source 10.1.2.1
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=62 time=1.444 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=62 time=2.094 ms
^C
--- 1.1.1.1 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.444/1.769/2.094/0.325 ms

```

2. Run the **ping** command, pinging the lo0.0 interface on Device PE2.

The address configured on this interface is 2.2.2.2.

Specify the source address 10.2.1.1, which is the address configured on the lo0.0 interface on Device PE4.

```
user@PE4> ping 2.2.2.2 source 10.2.1.1
PING 2.2.2.2 (2.2.2.2): 56 data bytes
64 bytes from 2.2.2.2: icmp_seq=0 ttl=62 time=1.473 ms
64 bytes from 2.2.2.2: icmp_seq=1 ttl=62 time=1.407 ms
^C
--- 2.2.2.2 ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.407/1.440/1.473/0.033 ms
```

**Meaning** Sending these pings activates the firewall filter actions.

### Verifying the Firewall Filter

**Purpose** Make sure the firewall filter actions take effect.

**Action** 1. Run the **show firewall log** command on Device P1.

```
user@P1> show firewall log
Log :
Time      Filter  Action Interface  Protocol  Src Addr
Dest Addr
13:52:20  pfe        A      fe-1/2/0.0    ICMP      10.2.1.1
2.2.2.2
13:52:19  pfe        A      fe-1/2/0.0    ICMP      10.2.1.1
2.2.2.2
13:51:53  pfe        A      fe-1/2/0.0    ICMP      10.1.2.1
1.1.1.1
13:51:52  pfe        A      fe-1/2/0.0    ICMP      10.1.2.1
1.1.1.1
```

## Understanding Filter-Based Forwarding to a Specific Outgoing Interface or Destination IP Address

Policy-based routing (also known as filter-based forwarding) refers to the use of firewall filters that are applied to an interface to match certain IP header characteristics and to route only those matching packets differently than the packets would normally be routed.

Starting in Junos OS Release 12.2, you can use **then next-interface**, **then next-ip**, or **then next-ip6** as an action in a firewall filter. From specific match conditions, IPv4 and IPv6 addresses or an interface name can be specified as the response action to a match.

The set of match conditions can be as follows:

- Layer-3 properties (for example, the source or destination IP address or the TOS byte)
- Layer-4 properties (for example, the source or destination port)

The route for the given IPv4 or IPv6 address has to be present in the routing table for policy-based routing to take effect. Similarly, the route through the given interface has to be present in the forwarding table for **next-interface** action to take effect. This can be achieved by configuring an interior gateway protocol (IGP), such as OSPF or IS-IS, to advertise Layer 3 routes.

The firewall filter matches the conditions and forwards the packet to one of the following:

- An IPv4 address (using the **next-ip** firewall filter action)
- An IPv6 address (using the **next-ip6** firewall filter action)
- An interface (using the **next-interface** firewall filter action)

Suppose, for example, that you want to offer services to your customers, and the services reside on different servers. An example of a service might be hosted DNS or hosted FTP. As customer traffic arrives at the Juniper Networks routing device, you can use filter-based forwarding to send traffic to the servers by applying a match condition on a MAC address or an IP address or simply an incoming interface and send the packets to a certain outgoing interface that is associated with the appropriate server. Some of your destinations might be IPv4 or IPv6 addresses, in which case the **next-ip** or **next-ip6** action is useful.

Optionally, you can associate the outgoing interfaces or IP addresses with routing instances.

For example:

```
firewall {
  filter filter1 {
    term t1 {
      from {
        source-address {
          10.1.1.3/32;
        }
      }
      then {
        next-interface {
```

```

        xe-0/1/0.1;
        routing-instance rins1;
    }
}
term t2 {
    from {
        source-address {
            10.1.1.4/32;
        }
    }
    then {
        next-interface {
            xe-0/1/0.2;
            routing-instance rins2;
        }
    }
}
}
}
routing-instances {
    rins1 {
        instance-type virtual-router;
        interface xe-0/1/0.1;
    }
    rins2 {
        instance-type virtual-router;
        interface xe-0/1/0.2;
    }
}
}

```

### Example: Configuring Filter-Based Forwarding to a Specific Outgoing Interface

This example shows how to use **then next-interface** as an action in a firewall filter.

- [Requirements on page 848](#)
- [Overview on page 849](#)
- [Configuration on page 849](#)
- [Verification on page 852](#)

#### Requirements

This example has the following hardware and software requirements:

- MX Series 3D Universal Edge Router as the routing device with the firewall filter configured.
- Junos OS Release 12.2 running on the routing device with the firewall filter configured.
- The filter with the **next-interface** (or **next-ip**) action can only be applied to an interface that is hosted on a Trio MPC. If you apply the filter to an I-chip based DPC, the commit operation fails.
- The outgoing interface referred to in the **next-interface interface-name** action can be hosted on a Trio MPC or an I-chip based DPC.

## Overview

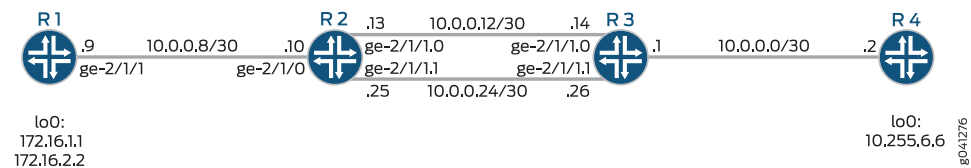

In this example, Device R1 has two loopback interface addresses configured: 172.16.1.1 and 172.16.2.2.

On Device R2, a firewall filter has multiple terms configured. Each term matches one of the source addresses in incoming traffic, and routes the traffic to specified outgoing interfaces. The outgoing interfaces are configured as VLAN-tagged interfaces between Device R2 and Device R3.

IS-IS is used for connectivity among the devices.

Figure 56 on page 849 shows the topology used in this example.

**Figure 56: Filter-Based Forwarding to Specified Outgoing Interfaces**

This example shows the configuration on Device R2.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R2

```
set interfaces ge-2/1/0 unit 0 family inet filter input filter1
set interfaces ge-2/1/0 unit 0 family inet address 10.0.0.10/30
set interfaces ge-2/1/0 unit 0 description to-R1
set interfaces ge-2/1/0 unit 0 family iso
set interfaces ge-2/1/1 vlan-tagging
set interfaces ge-2/1/1 description to-R3
set interfaces ge-2/1/1 unit 0 vlan-id 1001
set interfaces ge-2/1/1 unit 0 family inet address 10.0.0.13/30
set interfaces ge-2/1/1 unit 0 family iso
set interfaces ge-2/1/1 unit 1 vlan-id 1002
set interfaces ge-2/1/1 unit 1 family inet address 10.0.0.25/30
set interfaces ge-2/1/1 unit 1 family iso
set interfaces lo0 unit 0 family inet address 10.255.4.4/32
set interfaces lo0 unit 0 family iso address 49.0001.0010.0000.0404.00
set firewall family inet filter filter1 term t1 from source-address 172.16.1/32
set firewall family inet filter filter1 term t1 then next-interface ge-2/1/1.0
set firewall family inet filter filter1 term t2 from source-address 172.16.2/32
set firewall family inet filter filter1 term t2 then next-interface ge-2/1/1.1
set protocols isis interface all level 1 disable
set protocols isis interface fxp0.0 disable
set protocols isis interface lo0.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set ge-2/1/0 unit 0 family inet filter input filter1
user@R2# set ge-2/1/0 unit 0 family inet address 10.0.0.10/30
user@R2# set ge-2/1/0 unit 0 description to-R1
user@R2# set ge-2/1/0 unit 0 family iso

user@R2# set ge-2/1/1 vlan-tagging
user@R2# set ge-2/1/1 description to-R3

user@R2# set ge-2/1/1 unit 0 vlan-id 1001
user@R2# set ge-2/1/1 unit 0 family inet address 10.0.0.13/30
user@R2# set ge-2/1/1 unit 0 family iso

user@R2# set ge-2/1/1 unit 1 vlan-id 1002
user@R2# set ge-2/1/1 unit 1 family inet address 10.0.0.25/30
user@R2# set ge-2/1/1 unit 1 family iso

user@R2# set lo0 unit 0 family inet address 10.255.4.4/32
user@R2# set lo0 unit 0 family iso address 49.0001.0010.0000.0404.00
```

2. Configure the firewall filter.

```
[edit firewall family inet filter filter1]
user@R2# set term t1 from source-address 172.16.1.1/32
user@R2# set term t1 then next-interface ge-2/1/1.0

user@R2# set term t2 from source-address 172.16.2.2/32
user@R2# set term t2 then next-interface ge-2/1/1.1
```

3. Enable IS-IS on the interfaces.

```
[edit protocols is-is]
user@R2# set interface all level 1 disable
user@R2# set interface fxp0.0 disable
user@R2# set interface lo0.0
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show firewall**, and **show protocols** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
user@R2# show interfaces
ge-2/1/0 {
  unit 0 {
    description to-R1;
    family inet {
      filter {
        input filter1;
```

```

    }
    address 10.0.0.10/30;
  }
  family iso;
}
}
ge-2/1/1 {
  description to-R3;
  vlan-tagging;
  unit 0 {
    vlan-id 1001;
    family inet {
      address 10.0.0.13/30;
    }
    family iso;
  }
  unit 1 {
    vlan-id 1002;
    family inet {
      address 10.0.0.25/30;
    }
    family iso;
  }
}
lo0 {
  unit 0 {
    family inet {
      address 10.255.4.4/32;
    }
    family iso {
      address 49.0001.0010.0000.0404.00;
    }
  }
}
}

user@R2# show firewall
family inet {
  filter filter1 {
    term t1 {
      from {
        source-address {
          172.16.1.1/32;
        }
      }
      then {
        next-interface {
          ge-2/1/1.0;
        }
      }
    }
    term t2 {
      from {
        source-address {
          172.16.2.2/32;
        }
      }
      then {

```

```

        next-interface {
            ge-2/1/1.1;
        }
    }
}

user@R2# show protocols
isis {
    interface all {
        level 1 disable;
    }
    interface fxp0.0 {
        disable;
    }
    interface lo0.0;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Checking the Paths Used

**Purpose** Make sure that the expected paths are used when sending traffic from Device R1 to Device R4.

**Action** On Device R1, enter the **traceroute** command.

```

user@R1> traceroute 10.255.6.6 source 172.16.1.1
traceroute to 10.255.6.6 (10.255.6.6) from 172.16.1.1, 30 hops max, 40 byte packets

 1  10.0.0.10 (10.0.0.10)  0.976 ms  0.895 ms  0.815 ms
 2  10.0.0.14 (10.0.0.14)  0.868 ms  0.888 ms  0.813 ms
 3  10.255.6.6 (10.255.6.6)  1.715 ms  1.442 ms  1.382 ms

user@R1> traceroute 10.255.6.6 source 172.16.2.2
traceroute to 10.255.6.6 (10.255.6.6) from 172.16.2.2, 30 hops max, 40 byte packets

 1  10.0.0.10 (10.0.0.10)  0.973 ms  0.907 ms  0.782 ms
 2  10.0.0.26 (10.0.0.26)  0.844 ms  0.890 ms  0.852 ms
 3  10.255.6.6 (10.255.6.6)  1.384 ms  1.516 ms  1.462 ms

```

**Meaning** The output shows that the second hop changes, depending on the source address used in the **traceroute** command.

To verify this feature, a traceroute operation is performed on Device R1 to Device R4. When the source IP address is 172.16.1.1, packets are forwarded out the ge-2/1/1.0 interface on Device R2. When the source IP address is 172.16.2.2, packets are forwarded out the ge-2/1/1.1 interface on Device R2.

## Example: Configuring Filter-Based Forwarding to a Specific Destination IP Address

This example shows how to use **then next-ip** as an action in a firewall filter.

- [Overview on page 853](#)
- [Configuration on page 854](#)
- [Verification on page 860](#)

### Requirements

This example has the following hardware and software requirements:

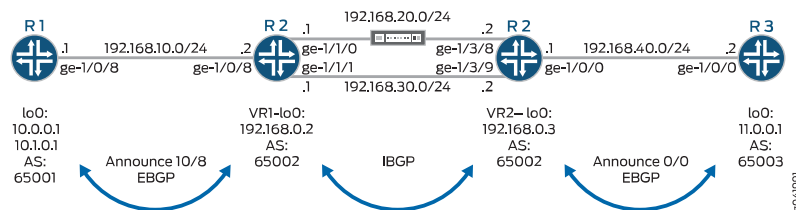

- MX Series 3D Universal Edge Router as the routing device with the firewall filter configured.
- Junos OS Release 12.2 running on the routing device with the firewall filter configured.
- The filter with the **next-interface** (or **next-ip**) action can only be applied to an interface that is hosted on a Trio MPC. If you apply the filter to an I-chip based DPC, the commit operation fails.
- The outgoing interface referred to in the next-interface interface-name action can be hosted on a Trio MPC or an I-chip based DPC.

### Overview

In this example, Device R2 has two routing instances that are interconnected with physical links. Traffic from certain sources is required to be directed across the upper link for inspection by a traffic optimizer, which acts transparently on the IP layer. When the traffic optimizer fails, the traffic moves to the lower link. Flows in direction R1>R3 and R3>R1 follow identical paths.

Figure 57 on page 853 shows the topology used in this example.

Figure 57: Filter-Based Forwarding to Specified Outgoing Interfaces

On Device R2, a firewall filter is applied to interface ge-1/0/8 in the input direction. The second term matches the specific source addresses 10.0.0.0/24, and routes the traffic to address 192.168.0.3. This address resolves to next-hop 192.168.20.2. If the link connected to interface ge-1/1/0 goes down, the address 192.168.0.3 will resolve to next-hop 192.168.30.2.

On Device R2, a firewall filter is applied to interface ge-1/0/0 in the input direction. The second term matches the specific destination addresses 10.0.0.0/24, and routes the traffic to address 192.168.0.2. This address resolves to next-hop 192.168.20.1. If the link connected to interface ge-1/3/8 goes down, the address 192.168.0.2 will resolve to next-hop 192.168.30.1.

**NOTE:** The address configured using the `next-ip` action is not automatically resolved. On Ethernet interfaces, it is assumed that the configured address is resolved using a routing protocol or static routes.

Internal BGP (IBGP) is used between Device R2-VR1 and Device R2-VR2. External BGP (EBGP) is used between Device R1 and Device R2-VR1, as well as between Device R2-VR2 and Device R3.

BGP operations proceed as follows:

- R2-VR1 learns 10/8 from R1, and 0/0 from R2-VR2.
- R2-VR2 learns 0/0 from R3, and 10/8 from R2-VR1.
- R1 advertises 10/8, and receives 0/0 from R2-VR1.
- R3 advertises 0/0, and receives 10/8 from R2-VR2.

The firewall filter applied to Device R2 needs to allow control-plane traffic for the directly connected interfaces, in this case the EBGP sessions.

This example shows the configuration on Device R2.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R2:

1. Configure the interfaces.

```
[edit interfaces]
user@R2# set ge-1/0/8 unit 0 family inet address 192.168.10.2/24
user@R2# set ge-1/0/8 unit 0 family inet filter input SteerSrcTrafficOptimizer
user@R2# set ge-1/1/0 unit 0 family inet address 192.168.20.1/24
user@R2# set ge-1/1/1 unit 0 family inet address 192.168.30.1/24
```

```
user@R2# set ge-1/0/0 unit 0 family inet address 192.168.40.1/24
user@R2# set ge-1/0/0 unit 0 family inet filter input SteerDstTrafficOptimizer
user@R2# set ge-1/3/8 unit 0 family inet address 192.168.20.2/24
user@R2# set ge-1/3/9 unit 0 family inet address 192.168.30.2/24
```

2. Configure the routing instance.

```
[edit routing-instances]
user@R2# set VR1 instance-type virtual-router
user@R2# set VR1 interface ge-1/0/8.0
user@R2# set VR1 interface ge-1/1/0.0
user@R2# set VR1 interface ge-1/1/1.0
```

```
user@R2# set VR2 instance-type virtual-router
user@R2# set VR2 interface ge-1/0/0.0
user@R2# set VR2 interface ge-1/3/8.0
user@R2# set VR2 interface ge-1/3/9.0
```

3. Configure the static and BGP routing.

```
[edit routing-instances]
user@R2# set VR1 routing-options static route 192.168.0.3 next-hop 192.168.20.2
user@R2# set VR1 routing-options static route 192.168.0.3 qualified-next-hop
192.168.30.2 metric 100
user@R2# set VR1 routing-options autonomous-system 65002
user@R2# set VR1 protocols bgp group eBGP neighbor 192.168.10.1 peer-as 65001
user@R2# set VR1 protocols bgp group iBGP neighbor 192.168.30.2 peer-as 65002
user@R2# set VR1 protocols bgp group iBGP neighbor 192.168.30.2 export
AcceptExternal
```

```
user@R2# set VR2 routing-options static route 192.168.0.2/32 next-hop 192.168.20.1
user@R2# set VR2 routing-options static route 192.168.0.2/32 qualified-next-hop
192.168.30.1 metric 100
user@R2# set VR2 routing-options autonomous-system 65002
user@R2# set VR2 protocols bgp group eBGP neighbor 192.168.40.2 peer-as 65003
user@R2# set VR2 protocols bgp group iBGP neighbor 192.168.30.1 peer-as 65002
user@R2# set VR2 protocols bgp group iBGP neighbor 192.168.30.1 export
AcceptExternal
```

4. Configure the firewall filters.

```
[edit firewall family inet]
```

```

user@R2# set filter SteerSrcTrafficOptimizer term 0 from source-address
192.168.10.0/24
user@R2# set filter SteerSrcTrafficOptimizer term 0 then accept
user@R2# set filter SteerSrcTrafficOptimizer term 1 from source-address 10.0.0.0/24
user@R2# set filter SteerSrcTrafficOptimizer term 1 then next-ip 192.168.0.3
routing-instance VR1
user@R2# set filter SteerSrcTrafficOptimizer term 2 from source-address 10.0.0.0/8
user@R2# set filter SteerSrcTrafficOptimizer term 2 then accept

```

```

user@R2# set filter SteerDstTrafficOptimizer term 0 from source-address
192.168.40.0/24
user@R2# set filter SteerDstTrafficOptimizer term 0 then accept
user@R2# set filter SteerDstTrafficOptimizer term 1 from destination-address
10.0.0.0/24
user@R2# set filter SteerDstTrafficOptimizer term 1 then next-ip 192.168.0.2
routing-instance VR2
user@R2# set filter SteerDstTrafficOptimizer term 2 from destination-address
10.0.0.0/8
user@R2# set filter SteerDstTrafficOptimizer term 2 then accept

```

5. Configure the routing policy.

```

[edit policy-options policy-statement AcceptExternal term 1]
user@R2# set from route-type external
user@R2# set term 1 then accept

```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show firewall**, and **show protocols** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

user@R2# show interfaces

            }
        }
    }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### *Checking the Paths Used*

**Purpose** Make sure that the expected paths are used when sending traffic from Device R1 to Device R3.

**Action** On Device R1, enter the **traceroute** command before and after the link failure

#### Before Failure of the Traffic Optimizer

```
user@R1> traceroute 11.0.0.1 source 10.0.0.1
traceroute to 11.0.0.1 (11.0.0.1) from 10.0.0.1, 30 hops max, 40 byte packets
 1  192.168.10.2 (192.168.10.2)  0.519 ms  0.403 ms  0.380 ms
 2  192.168.20.2 (192.168.20.2)  0.404 ms  0.933 ms  0.402 ms
 3  11.0.0.1 (11.0.0.1)  0.709 ms  0.656 ms  0.644 ms

user@R1> traceroute 11.0.0.1 source 10.1.0.1
traceroute to 11.0.0.1 (11.0.0.1) from 10.1.0.1, 30 hops max, 40 byte packets
 1  192.168.10.2 (192.168.10.2)  0.524 ms  0.396 ms  0.380 ms
 2  192.168.30.2 (192.168.30.2)  0.412 ms  0.410 ms  0.911 ms
 3  11.0.0.1 (11.0.0.1)  0.721 ms  0.639 ms  0.659 ms
```

#### After Failure of the Traffic Optimizer

```
user@R1> traceroute 11.0.0.1 source 10.0.0.1
traceroute to 11.0.0.1 (11.0.0.1) from 10.0.0.1, 30 hops max, 40 byte packets
 1  192.168.10.2 (192.168.10.2)  0.506 ms  0.400 ms  0.378 ms
 2  192.168.30.2 (192.168.30.2)  0.433 ms  0.550 ms  0.415 ms
 3  11.0.0.1 (11.0.0.1)  0.723 ms  0.638 ms  0.638 ms

user@R1> traceroute 11.0.0.1 source 10.1.0.1
traceroute to 11.0.0.1 (11.0.0.1) from 10.1.0.1, 30 hops max, 40 byte packets
 1  192.168.10.2 (192.168.10.2)  0.539 ms  0.411 ms  0.769 ms
 2  192.168.30.2 (192.168.30.2)  0.426 ms  0.413 ms  2.429 ms
 3  11.0.0.1 (11.0.0.1)  10.868 ms  0.662 ms  0.647 ms
```

**Meaning** The output shows that the second hop changes, depending on the source address used in the **traceroute** command.

To verify this feature, a traceroute operation is performed on Device R1 to Device R3. When the source IP address is 10.0.0.1, packets are forwarded out the ge-1/1/0.0 interface on Device R2. When the source IP address is 10.1.0.1, packets are forwarded out the ge-1/1/1.0 interface on Device R2.

When the link between ge-1/1/0 and ge-1/3/8 fails, packets with source IP address 10.0.0.1 are forwarded out the ge-1/1/1.0 interface on Device R2.

## Controlling Network Access Using Traffic Policing Overview

---

This topic covers the following information:

- [Congestion Management for IP Traffic Flows on page 865](#)
- [Traffic Limits on page 866](#)
- [Traffic Color Marking on page 867](#)
- [Forwarding Classes and PLP Levels on page 869](#)
- [Policer Application to Traffic on page 870](#)

## Congestion Management for IP Traffic Flows

Traffic policing, also known as *rate limiting*, is an essential component of network access security that is designed to thwart denial-of-service (DoS) attacks. Traffic policing enables you to control the maximum rate of IP traffic sent or received on an interface and also to partition network traffic into multiple priority levels, also known as *classes of service*. A policer defines a set of traffic rate limits and sets consequences for traffic that does not conform to the configured limits. Packets in a traffic flow that do not conform to traffic limits are either discarded or marked with a different forwarding class or packet loss priority (PLP) level.

With the exception of policers configured to rate-limit aggregate traffic (all protocol families and logical interfaces configured on a physical interface), you can apply a policer to all IP packets in a Layer 2 or Layer 3 traffic flow at a logical interface.

With the exception of policers configured to rate-limit based on physical interface media rate, you can apply a policer to specific IP packets in a Layer 3 traffic flow at a logical interface by using a stateless firewall filter.

You can apply a policer to inbound or outbound interface traffic. Policers applied to inbound traffic help to conserve resources by dropping traffic that does not need to be routed through a network. Dropping inbound traffic also helps to thwart denial-of-service (DoS) attacks. Policers applied to outbound traffic control the bandwidth used.

**NOTE:** Traffic policers are instantiated on a per-PIC basis. Traffic policing does not work when the traffic for one local policy decision function (L-PDF) subscriber is distributed over multiple Multiservices PICs in an AMS group.

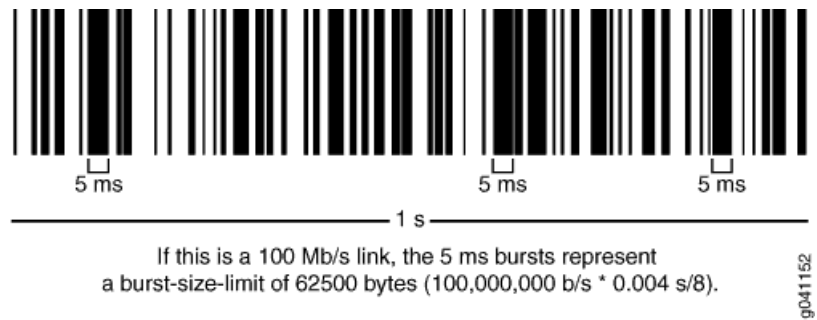

## Traffic Limits

Junos OS policers use a *token bucket algorithm* to enforce a limit on an average transmit or receive rate of traffic at an interface while allowing bursts of traffic up to a maximum value based on the configured bandwidth limit and configured burst size. The token bucket algorithm offers more flexibility than a *leaky bucket algorithm* in that you can allow a specified traffic burst before starting to discard packets or apply a penalty such as packet output-queuing priority or packet-drop priority.

In the token-bucket model, the bucket represents the rate-limiting function of the policer. Tokens are added to the bucket at a fixed rate, but once the specified depth of the bucket is reached, tokens allocated after cannot be stored and used. Each token represents a “credit” for some number of bits, and tokens in the bucket are “cashed in” for the ability to transmit or receive traffic at the interface. When sufficient tokens are present in the bucket, a traffic flow continues unrestricted. Otherwise, packets might be dropped or else re-marked with a lower forwarding class, a higher packet loss priority (PLP) level, or both.

- The rate at which tokens are added to the bucket represents the highest average transmit or receive rate in bits per second allowed for a given service level. You specify this highest average traffic rate as the *bandwidth limit* of the policer. If the traffic arrival rate (or fixed bits-per-second) is so high that at some point insufficient tokens are present in the bucket, then the traffic flow is no longer conforming to the traffic limit. During periods of relatively low traffic (traffic that arrives at or departs from the interface at average rates below the token arrival rate), unused tokens accumulate in the bucket.
- The depth of the bucket in bytes controls the amount of back-to-back bursting allowed. You specify this factor as the *burst-size limit* of the policer. This second limit affects the average transmit or receive rate by limiting the number of bytes permitted in a transmission burst for a given interval of time. Bursts exceeding the current burst-size limit are dropped until there are sufficient tokens available to permit the burst to proceed.

Figure 58: Network Traffic and Burst Rates

As shown in the figure above, a UPC bar code is a good facsimile of what traffic looks like on the line; an interface is either transmitting (bursting at full rate) or it is not. The black lines represent periods of data transmission and the white space represents periods of silence when the token bucket can replenish.

Depending on the type of policer used, packets in a policed traffic flow that surpasses the defined limits might be implicitly set to a higher PLP level, assigned to a configured forwarding class or set to a configured PLP level (or both), or simply discarded. If packets encounter downstream congestion, packets with a **low** PLP level are less likely to be discarded than those with a **medium-low**, **medium-high**, or **high** PLP level.

## Traffic Color Marking

Based on the particular set of traffic limits configured, a policer identifies a traffic flow as belonging to one of either two or three categories that are similar to the colors of a traffic light used to control automobile traffic.

- *Single-rate two-color*—A two-color marking policer (or “policer” when used without qualification) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit in some way, or simply discard them.

A policer is most useful for metering traffic at the port (physical interface) level.

- *Single-rate three-color*—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured committed information rate (CIR), committed burst size (CBS), and the excess burst size (EBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets arriving are below the CBS (green), exceed the CBS (yellow) but not the EBS, or exceed the EBS (red).

A single-rate three-color policer is most useful when a service is structured according to packet length and not peak arrival rate.

- *Two-rate three-color*—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured CIR and peak information rate (PIR),

along with their associated burst sizes, the CBS and *peak burst size* (PBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets arriving are below the CIR (green), exceed the CIR (yellow) but not the PIR, or exceed the PIR (red).

A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

Policer actions are implicit or explicit and vary by policer type. The term *Implicit* means that Junos assigns the loss-priority automatically. [Table 68 on page 868](#) describes the policer actions.

**Table 68: Policer Actions**

| Policer                 | Marking                        | Implicit Action                  | Configurable Action                                                                                                                                  |
|-------------------------|--------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Single-rate two-color   | Green (Conforming)             | Assign low loss priority         | None                                                                                                                                                 |
|                         | Red (Nonconforming)            | None                             | Assign low or high loss priority, assign a forwarding class, or discard<br>On some platforms, you can assign medium-low or medium-high loss priority |
| Single-rate three-color | Green (Conforming)             | Assign low loss priority         | None                                                                                                                                                 |
|                         | Yellow (Above the CIR and CBS) | Assign medium-high loss priority | None                                                                                                                                                 |
|                         | Red (Above the EBS)            | Assign high loss priority        | Discard                                                                                                                                              |
| Two-rate three-color    | Green (Conforming)             | Assign low loss priority         | None                                                                                                                                                 |
|                         | Yellow (Above the CIR and CBS) | Assign medium-high loss priority | None                                                                                                                                                 |
|                         | Red (Above the PIR and PBS)    | Assign high loss priority        | Discard                                                                                                                                              |

Two-color-marking policers allows bursts of traffic for short periods, whereas three-color-marking policers allow more sustained bursts of traffic.

Three-color policers are not bound by a green-yellow-red coloring convention. Packets are marked with low, medium-high, or high PLP bit configurations based on color, so both three-color policer schemes extend the functionality of class-of-service (CoS) traffic policing by providing three levels of drop precedence (loss priority) instead of the two

normally available in port-level policers. Both single-rate and two-rate three-color policer schemes can operate in two modes:

- *Color-blind*—In color-blind mode, the three-color policer assumes that all packets examined have not been previously marked or metered. In other words, the three-color policer is “blind” to any previous coloring a packet might have had.
- *Color-aware*—In color-aware mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer is “aware” of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

**NOTE:** We recommend you use the naming convention *policertypeTCM#-color type* when configuring three-color policers and *policer#* when configuring two-color policers. TCM stands for three-color marker. Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly.

For example, the first single-rate, color-aware three-color policer configured would be named *srTCM1-ca*. The second two-rate, color-blind three-color policer configured would be named *trTCM2-cb*.

## Forwarding Classes and PLP Levels

A packet's forwarding class assignment and PLP level are used by the Junos OS class of service (CoS) features. The Junos OS CoS features include a set of mechanisms that you can use to provide differentiated services when best-effort traffic delivery is insufficient. For router (and switch) interfaces that carry IPv4, IPv6, and MPLS traffic, you can configure CoS features to take in a single flow of traffic entering at the edge of your network and provide different levels of service across the network—internal forwarding and scheduling (queuing) for output—based on the forwarding class assignments and PLP levels of the individual packets.

**NOTE:** Forwarding-class or loss-priority assignments performed by a policer or a stateless firewall filter override any such assignments performed on the ingress by the CoS default IP precedence classification at all logical interfaces or by any configured behavior aggregate (BA) classifier that is explicitly mapped to a logical interface.

Based on CoS configurations, packets of a given forwarding class are transmitted through a specific output queue, and each output queue is associated with a transmission service level defined in a *scheduler*.

Based on other CoS configurations, when packets in an output queue encounter congestion, packets with higher loss-priority values are more likely to be dropped by the

random early detection (RED) algorithm. Packet loss priority values affect the scheduling of a packet without affecting the packet's relative ordering within the traffic flow.

## Policer Application to Traffic

After you have defined and named a policer, it is stored as a template. You can later use the same policer name to provide the same policer configuration each time you want to use it. This eliminates the need to define the same policer values more than once.

You can apply a policer to a traffic flow in either of two ways:

- You can configure a standard stateless firewall filter that specifies the **police** *police-name* nonterminating action or the **three-color-policer (single-rate | two-rate)** *police-name* nonterminating action. When you apply the standard filter to the input or output at a logical interface, the policer is applied to all packets of the filter-specific protocol family that match the conditions specified in the filter configuration.

With this method of applying a policer, you can define specific classes of traffic on an interface and apply traffic rate-limiting to each class.

- You can apply a policer directly to an interface so that traffic rate-limiting applies to all traffic on that interface, regardless of protocol family or any match conditions.

You can configure policers at the queue, logical interface, or Layer 2 (MAC) level. Only a single policer is applied to a packet at the egress queue, and the search for policers occurs in this order:

- Queue level
- Logical interface level
- Layer 2 (MAC) level

---

## Traffic Policer Types

This topic covers the following information:

- [Single-Rate Two-Color Policers on page 871](#)
- [Three-Color Policers on page 871](#)
- [Hierarchical Policers on page 872](#)
- [Two-Color and Three-Color Policer Options on page 872](#)

## Single-Rate Two-Color Policers

You can use a single-rate two-color policer, or “policer” when used without qualification, to rate-limit a traffic flow to an average bits-per-second arrival rate (specified by the single specified bandwidth limit) while allowing bursts of traffic for short periods (controlled by the single specified burst-size limit). This type of policer categorizes a traffic flow as either green (conforming) or red (nonconforming). Packets in a green flow are implicitly set to a **low** loss priority and then transmitted. Packets in a red flow are handled according to actions specified in the policer configuration. Packets in a red flow can be marked—set to a specified forwarding class, set to a specified loss priority, or both—or they can be discarded.

A single-rate two-color policer is most useful for metering traffic at the port (physical interface) level.

---

### Basic Single-Rate Two-Color Policer

You can apply a basic single-rate two-color policer to Layer 3 traffic in either of two ways: as an interface policer or as a firewall filter policer. You can apply the policer as an *interface policer*, meaning that you apply the policer directly to a logical interface at the protocol family level. If you want to apply the policer to selected packets only, you can apply the policer as a *firewall filter policer*, meaning that you reference the policer in a stateless firewall filter term and then apply the filter to a logical interface at the protocol family level.

---

### Bandwidth Policer

A bandwidth policer is simply a single-rate two-color policer that is defined using a bandwidth limit specified as a percentage value rather than as an absolute number of bits per second. When you apply the policer (as an interface policer or as a firewall filter policer) to a logical interface at the protocol family level, the effective bandwidth limit is calculated based on either the physical interface media rate or the logical interface configured shaping rate.

---

### Logical Bandwidth Policer

A logical bandwidth policer is a bandwidth policer for which the effective bandwidth limit is calculated based on the logical interface configured shaping rate. You can apply the policer as a firewall filter policer only, and the firewall filter must be configured as an interface-specific filter. When you apply an interface-specific filter to multiple logical interfaces on supported routing platforms, any **count** or **policer** actions act on the traffic stream entering or exiting each individual interface, regardless of the sum of traffic on the multiple interfaces.

## Three-Color Policers

The Junos OS supports two types of three-color policers: single-rate and two-rate. The main difference between a single-rate and a two-rate policer is that the single-rate policer allows bursts of traffic for short periods, while the two-rate policer allows more sustained bursts of traffic. Single-rate policing is implemented using a single token-bucket model, so that periods of relatively low traffic must occur between traffic bursts to allow the

token bucket to refill. Two-rate policing is implemented using a dual token-bucket model, which allows bursts of traffic for longer periods.

### Single-Rate Three-Color Policers

---

The single-rate three-color type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*. You use this type of policer to rate-limit a traffic flow to a single rate and three traffic categories (green, yellow, and red). A single-rate three-color policer defines a *committed* bandwidth limit and burst-size limit plus an excess burst-size limit. Traffic that conforms to the committed traffic limits is categorized as green (conforming). Traffic that conforms to the bandwidth limit while allowing bursts of traffic as controlled by the excess burst-size limit is categorized as yellow. All other traffic is categorized as red.

A single-rate three-color policer is most useful when a service is structured according to packet length, not peak arrival rate.

### Two-Rate Three-Color Policers

---

The two-rate three-color type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*. You use this type of policer to rate-limit a traffic flow to two rates and three traffic categories (green, yellow, and red). A two-rate three-color policer defines a *committed* bandwidth limit and burst-size limit plus a *peak* bandwidth limit and burst-size limit. Traffic that conforms to the committed traffic limits is categorized as green (conforming). Traffic that exceeds the committed traffic limits but remains below the peak traffic limits is categorized as yellow. Traffic that exceeds the peak traffic limits is categorized as red.

A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

## Hierarchical Policers

You can use a hierarchical policer to rate-limit ingress Layer 2 traffic at a physical or logical interface and apply different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority output queue. This feature is supported on SONET interfaces hosted on M40e, M120, and M320 edge routers with incoming Flexible PIC Concentrators (FPCs) as SFPC and outgoing FPCs as FFPC, and on T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs.

## Two-Color and Three-Color Policer Options

Both two-color and three-color policers can be configured with the following options:

- [Logical Interface \(Aggregate\) Policers on page 873](#)
- [Physical Interface Policers on page 873](#)
- [Policers Applied to Layer 2 Traffic on page 873](#)
- [Multifield Classification on page 873](#)

---

### Logical Interface (Aggregate) Policers

---

A logical interface policer—also called an aggregate policer—is a two-color or three-color policer that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer. You apply a logical interface policer directly to a logical interface configuration (and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface).

- You can apply the policer at the interface logical unit level to rate-limit all traffic types, regardless of the protocol family.

When applied in this manner, the logical interface policer will be used by all traffic types (inet, inet6, etc.) and across all layers (layer 2, layer 3) no matter where the policer is attached on the logical interface.

- You can also apply the policer at the logical interface protocol family level, to rate-limit traffic for a specific protocol family.

You can apply a logical interface policer to unicast traffic only. For information about configuring a stateless firewall filter for flooded traffic, see “*Applying Forwarding Table Filters*” in the “Traffic Sampling, Forwarding, and Monitoring” section of the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

---

### Physical Interface Policers

---

A physical interface policer is a two-color or three-color policer that applies to all logical interfaces and protocol families configured on a physical interface, even if the logical interfaces belong to different routing instances. You apply a physical interface policer to a logical interface at the protocol level through a physical interface filter only, but rate limiting is performed aggregately for all logical interfaces and protocol families configured on the underlying physical interface.

This feature enables you to use a single policer instance to perform aggregate policing for different protocol families and different logical interfaces on the same physical interface.

---

### Policies Applied to Layer 2 Traffic

---

In addition to hierarchical policing, you can also apply single-rate two-color policers and three-color policers (both single-rate and two-rate) to Layer 2 input or output traffic. You must configure the two-color or three-color policer as a logical interface policer and reference the policer in the interface configuration at the logical unit level, and not at the protocol level. You cannot apply a two-color or three-color policer to Layer 2 traffic as a stateless firewall filter action.

---

### Multifield Classification

---

Like behavior aggregate (BA) classification, which is sometimes referred to as class-of-service (CoS) value traffic classification, multifield classification is a method of classifying incoming traffic by associating each packet with a forwarding class, a packet loss priority level, or both. The CoS scheduling configuration assigns packets to output queues based on forwarding class. The CoS random early detection (RED) process uses

the drop probability configuration, output queue fullness percentage, and packet loss priority to drop packets as needed to control congestion at the output stage.

BA classification and multifield classification use different fields of a packet to perform traffic classification. BA classification is based on a *CoS value* in the IP packet header. Multifield classification can be based on *multiple fields* in the IP packet header, including CoS values. Multifield classification is used instead of BA classification when you need to classify packets based on information in the packet other than the CoS values only. Multifield classification is configured using a stateless firewall filter term that matches on any packet header fields and associates matched packets with a forwarding class, a loss priority, or both. The forwarding class or loss priority can be set by a firewall filter action or by a policer referenced as a firewall filter action.

## Order of Policer and Firewall Filter Operations

You can apply both a traffic policer and a stateless firewall filter (with or without policing actions) to a single logical interface at the same time. In this case, the order of precedence of operations is such that policers applied directly to the logical interface are evaluated before input filters but after output filters.

- If an input firewall filter is configured on the same logical interface as a policer, the policer is executed first.
- If an output firewall filter is configured on the same logical interface as a policer, the firewall filter is executed first.

[Figure 59 on page 874](#) illustrates the order of policer and firewall filter processing at the same interface.

## Understanding the Frame Length for Policing Packets

[Table 69 on page 875](#) describes the packet lengths that are considered when you use a traffic policer.

**Table 69: Packet Lengths Considered for Traffic Policers**

| Protocol | Policing Packet Lengths         |
|----------|---------------------------------|
| Any      | L3 frame including header       |
| IPv4     | L3 frame including header       |
| IPv6     | L3 frame including header       |
| MPLS     | L3 frame including header       |
| VPLS     | L2 frame including header + FCS |
| Bridge   | L2 frame including header + FCS |
| CCC      | L2 frame including header + FCS |

**Related Documentation** • [Policer Overhead to Account for Rate Shaping in the Traffic Manager on page 1000](#)

## Supported Standards for Policing

Three-color policers are part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment, which is described and defined in the following RFCs:

- RFC 2474, *Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers*
- RFC 2475, *An Architecture for Differentiated Service*
- RFC 2597, *Assured Forwarding PHB Group*
- RFC 2598, *An Expedited Forwarding PHB*
- RFC 2698, *A Two Rate Three Color Marker*

In a DiffServ environment, the most significant 6 bits of the type-of-service (ToS) octet in the IP header contain a value called the *Differentiated Services code point* (DSCP). Within the DSCP field, the most significant 3 bits are interpreted as the *IP precedence* field, which can be used to select different per-hop forwarding treatments for the packet.

## Statement Hierarchy for Configuring Policers

```

firewall {
  family (any | bridge | ccc | inet | inet6 | mpls | vpls) {
    filter filter-name {
      ... protocol-family-specific-firewall-filter-configuration ...

## Hierarchical Policer Configuration Overview

Table 70 on page 878 describes the hierarchy levels at which you can configure and apply hierarchical policers.

Table 70: Hierarchical Policer Configuration and Application Summary

| Policer Configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Layer 2 Application                                                                                                                                              | Key Points                                                                                                                                                                                                                                                                                              |

## Guidelines for Applying Traffic Policers

---

The following general guidelines pertain to applying traffic policers:

- Only one type of policer can be applied to the input or output of the same physical or logical interface. For example, you are not allowed to apply a policer and a hierarchical policer in the same direction at the same logical interface.
- Chaining of policers—that is, applying policers to both a port and the logical interfaces of that port—is not allowed.
- A maximum of 64 policers is supported per physical or logical interface, provided no behavior aggregate (BA) classification—traffic classification based on CoS values in the packet headers—is applied to the logical interface.
- The policer should be independent of BA classification. Without BA classification, all traffic on an interface is treated either as expedited forwarding (EF) or non-EF, based on the configuration. With BA classification, a physical or logical interface can support up to 64 policers. The interface might be a physical interface or logical interface.
- With BA classification, the miscellaneous traffic (the traffic *not* matching any of the BA classification DSCP/EXP bits) is policed as non-EF traffic. No separate policers are installed for this traffic.
- Policers can be applied to unicast packets only. For information about configuring a filter for flooded traffic, see *Applying Forwarding Table Filters*.

## Policer Support for Aggregated Ethernet Bundle Overview

Aggregated interfaces support single-rate policers, three-color marking policers, two-rate three-color marking policers, hierarchical policers, and percentage-based policers. By default, policer bandwidth and burst-size applied on aggregated bundles is not matched to the user-configured bandwidth and burst-size.

You can configure interface-specific policers applied on an aggregated Ethernet bundle or an aggregated SONET bundle to match the effective bandwidth and burst-size to user-configured values. The **shared-bandwidth-policer** statement is required to achieve this match behavior.

This capability applies to all interface-specific policers of the following types: single-rate policers, single-rate three-color marking policers, two-rate three-color marking policers, and hierarchical policers. Percentage-based policers match the bandwidth to the user-configured values by default, and do not require shared-bandwidth-policer configuration. The **shared-bandwidth-policer** statement causes a split in burst-size for percentage-based policers.

**NOTE:** This feature is supported on the following platforms: T Series routers (excluding T4000 Type 5 FPCs), M120, M10i, M7i (CFEB-E only), M320 (SFPC only), MX240, MX480, and MX960 with DPC, MIC, and MPC interfaces, and EX Series switches.

The following usage scenarios are supported:

- Interface policers used by the following configuration:  

```
[edit] interfaces (aeX | asX) unit unit-num family family policer [input | output | arp]
```
- Policers and three-color policers (both single-rate three-color marking and two-rate three-color marking) used inside interface-specific filters; that is, filters that have an interface-specific keyword and are used by the following configuration:  

```
[edit] interfaces (aeX | asX) unit unit-num family family filter [input | output]
```
- Common-edge service filters, which are derived from CLI-configured filters and thus inherit interface-specific properties. All policers and three-color policers used by these filters are also affected.

The following usage scenarios are not supported:

- Policers and three-color policers used inside filters that are not interface specific; such a filter is meant to be shared across multiple interfaces.
- Any implicit policers or policers that are part of implicit filters; for example, the default ARP policer applied to an aggregate Ethernet interface. Such a policer is meant to be shared across multiple interfaces.
- Prefix-specific action policers.

To configure this feature, include the **shared-bandwidth-policer** statement at the following hierarchy levels: **[edit firewall policer *policer-name*]**, **[edit firewall three-color-policer *policer-name*]**, or **[edit firewall hierarchical-policer *policer-name*]**.

## Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers

This topic provides a list of firewall and policier features available on PTX Packet Transport Routers and compares them with firewall and policing features on T Series routers.

### Firewall Filters

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers do not support:
  - Egress Forwarding Table Filters
  - Forwarding Table Filters for MPLS/CCC
  - Family VPLS
- PTX Series Packet Transport Routers do not support nested firewall filters. The **filter** statement at the **[edit firewall family *family-name* filter *filter-name* term *term-name*]** hierarchy level is disabled.
- Because no service PICs are present in PTX Series Packet Transport Routers, service filters are not supported for both IPv4 and IPv6 traffic. The **service-filter** statement at **[edit firewall family (inet | inet6)]** hierarchy level is disabled.
- The PTX Series Packet Transport Routers exclude simple filters. These filters are supported on Gigabit Ethernet intelligent queuing (IQ2) and Enhanced Queuing Dense Port Concentrator (EQ DPC) interfaces only. The **simple-filter** statement at the **[edit firewall family inet]** hierarchy level is disabled.
- Physical interface filtering is not supported. The **physical-interface-filter** statement at the **[edit firewall family *family-name* filter *filter-name*]** hierarchy level is disabled.
- The prefix action feature is not supported on PTX Series Packet Transport Routers. The **prefix-action** statement at **[edit firewall family inet]** hierarchy level is disabled.
- On T Series routers, you can collect a variety of information about traffic passing through the device by setting up one or more accounting profiles that specify some common characteristics of the data. The PTX Series Packet Transport Routers do not support accounting configurations for firewall filters. The **accounting-profile** statement at the **[edit firewall family *family-name* filter *filter-name*]** hierarchy level is disabled.
- The **reject** action is not supported on the loopback (**lo0**) interface. If you apply a filter to the **lo0** interface and the filter includes a **reject** action, an error message appears.

- PTX Series Packet Transport Routers do not support aggregated ethernet logical interface match conditions. However, child link interface matching is supported.
- PTX Series Packet Transport Routers displays both counts if two different terms in a filter have the same match condition but they have different counts. T Series routers display one count only.
- PTX Series Packet Transport Routers do not have separate policer instances when a filter is bound to multiple interfaces. Use the **interface-specific** configuration statement to create the configuration.
- On PTX Series Packet Transport Routers, when an ingress interface has CCC encapsulation, packets coming in through the ingress CCC interface will not be processed by the egress filters.
- For CCC encapsulation, the PTX Series Packet Transport Routers append an extra 8 bytes for egress Layer 2 filtering. The T Series routers do not. Therefore, egress counters on PTX Series Packet Transport Routers show an extra eight bytes for each packet which impacts policer accuracy.
- On PTX Series Packet Transport Routers, output for the **show pfe statistics traffic** CLI command includes the packets discarded by DMAC and SMAC filtering. On T Series routers, the command output does not include these discarded packets because MAC filters are implemented in the PIC and not in the FPC.
- The last-fragment packet that goes through a PTX firewall cannot be matched by the **is-fragment** matching condition. This feature is supported on T Series routers.

A possible workaround on PTX Series Packet Transport Routers is to configure two separate terms with same the actions: one term contains a match to **is-fragment** and the other term contains a match to **fragment-offset -except 0**.

- On PTX Series Packet Transport Routers, MAC pause frames are generated when packet discards exceed 100 Mbps. This occurs only for frame sizes that are less than 105 bytes.

#### Traffic Policers

Junos OS firewall and policing software on PTX Series Packet Transport Routers supports IPv4 filters, IPv6 filters, MPLS filters, CCC filters, interface policing, LSP policing, MAC filtering, ARP policing, L2 policing, and other features. Exceptions are noted below.

- PTX Series Packet Transport Routers support ARP policing. T Series routers do not.
- PTX Series Packet Transport Routers do not support LSP policing.
- PTX Series Packet Transport Routers do not support the **hierarchical-policer** configuration statement. .
- PTX Series Packet Transport Routers do not support the **interface-set** configuration statement. This statement groups a number of interfaces into a single, named interface set.
- PTX Series Packet Transport Routers do not support the following policer types for both normal policers and three-color policers:

- **logical-bandwidth-policer** — Policer uses logical interface bandwidth.
- **physical-interface-policer** — Policer is a physical interface policer.
- **shared-bandwidth-policer** — Share policer bandwidth among bundle links.
- When a policer action and forwarding-class, loss-priority actions are configured within the same rule (a *Multifield Classification*), the PTX Series Packet Transport Routers work differently than T Series routers. As shown below, you can configure two rules in the filter to make the PTX filter behave the same as the T Series filter:

PTX Series configuration:

```
rule-1 {  
  match: {x, y, z}  
  action: {forwarding-class, loss-prio, next}  
}  
rule-2 {  
  match: {x, y, z}  
  action: {policer}  
}
```

T Series configuration:

```
rule-1 {  
  match: {x, y, z}  
  action: {forwarding-class, loss-prio, policer}  
}
```

## Policer Bandwidth and Burst-Size Limits

Table 71 on page 885 lists each of the Junos OS policer types supported. For each policer type, the table summarizes the bandwidth limits and burst-size limits used to rate-limit traffic.

Table 71: Policer Bandwidth Limits and Burst-Size Limits

| Policer Type                                                                                                                                                                                                                                                                                                                          | Bandwidth Limits                                                                                                                                    | Burst-Size Limits                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Single-Rate Two-Color Policer</b>                                                                                                                                                                                                                                                                                                  |                                                                                                                                                     |                                                                                                  |
| Defines a single rate limit: a bandwidth limit and an allowed burst size for conforming traffic.                                                                                                                                                                                                                                      | <b>bandwidth-limit <i>bps</i>;</b><br>M and T Series routers:<br>8000..1000000000000<br>MX Series routers:<br>8000..18446744073709551615            | <b>burst-size-limit <i>bytes</i>;</b><br>M, MX, and T Series routers:<br>1500..1000000000000     |
| For a single-rate two-color policer only, you can specify the bandwidth limit as a percentage value from 1 through 100 instead of as an absolute number of bits per second. The effective bandwidth limit is calculated as a percentage of either the physical interface media rate or the logical interface configured shaping rate. | <b>bandwidth-percent</b><br>1..100 percent                                                                                                          |                                                                                                  |
| <b>Single-Rate Three-Color Policer</b>                                                                                                                                                                                                                                                                                                |                                                                                                                                                     |                                                                                                  |
| Defines a single rate limit: a bandwidth limit and an allowed burst size for conforming traffic.                                                                                                                                                                                                                                      | <b>committed-information-rate <i>bps</i>;</b><br>M and T Series routers:<br>1500..1000000000000<br>MX Series routers:<br>8000..18446744073709551615 | <b>committed-burst-size <i>bytes</i>;</b><br>M, MX, and T Series routers:<br>1500..1000000000000 |
| Also defines a second, larger burst size. This second burst size is used to differentiate between two categories of nonconforming traffic (yellow or red).                                                                                                                                                                            |                                                                                                                                                     | <b>excess-burst-size <i>bytes</i>;</b><br>M, MX, and T Series routers:                           |

Table 71: Policer Bandwidth Limits and Burst-Size Limits (*continued*)

| Policer Type                                                                                                                                                                                                                                  | Bandwidth Limits                                                                                                                                                                                                                                             | Burst-Size Limits                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                              | 1500..1000000000000                                                                                                                                                                                      |
| <b>Two-Rate Three-Color Policer</b>                                                                                                                                                                                                           |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                          |
| Defines a committed rate limit: a bandwidth limit and an allowed burst size for conforming traffic.                                                                                                                                           | <b>committed-information-rate <i>bps</i>;</b><br>M and T Series routers:<br>1500..1000000000000<br>MX Series routers:<br>8000..18446744073709551615                                                                                                          | <b>committed-burst-size <i>bytes</i>;</b><br>M, MX, and T Series routers:<br>1500..1000000000000                                                                                                         |
| Also defines a peak rate limit: a second, larger burst size and a second, higher bandwidth limit. These additional rate-limit components are used to differentiate between two categories of nonconforming traffic (yellow or red).           | <b>peak-information-rate <i>bps</i>;</b><br>M and T Series routers:<br>1500..1000000000000<br>MX Series routers:<br>8000..18446744073709551615                                                                                                               | <b>peak-burst-size <i>bytes</i>;</b><br>M, MX, and T Series routers:<br>1500..1000000000000                                                                                                              |
| <b>Hierarchical Policer</b>                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                          |
| Defines two policers, each with a bandwidth limit and an allowed burst size for conforming traffic. Different policing actions are applied based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. | <b>bandwidth-limit <i>bps</i>;</b><br>M40e, M120, and M320 (with FFPC and SFPC) edge routers and T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs:<br>32000..500000000000<br>MX Series routers:<br>8000..18446744073709551615 | <b>burst-size-limit <i>bytes</i>;</b><br>M40e, M120, and M320 (with FFPC and SFPC) edge routers and T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs:<br>1500..2147450880 |
| Rate-limits ingress Layer 2 traffic at a SONET physical or logical interface hosted on supported routing platforms only.                                                                                                                      |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                          |

## Policer Color-Marking and Actions

Table 72 on page 886 lists each of the Junos OS policer types supported. For each policer type, the table summarizes the color-marking criteria used to categorize a traffic flow and, for each color, the actions taken on packets in that type of traffic flow.

Table 72: Implicit and Configurable Policer Actions Based on Color Marking

| Policer Rate Limits and Color Marking                                                     | Implicit Action | Configurable Actions |
|-------------------------------------------------------------------------------------------|-----------------|----------------------|
| <b>Single-Rate Two-Color Policer</b>                                                      |                 |                      |

## Single Token Bucket Algorithm

This topic covers the following information:

- [Token Bucket Concepts on page 888](#)
- [Single Token Bucket Algorithm on page 888](#)
- [Conformance Measurement for Two-Color Marking on page 889](#)

### Token Bucket Concepts

When you apply traffic policing to the input or output traffic at an interface, the rate limits and actions specified in the policer configuration are used to enforce a limit on the average throughput rate at the interface while also allowing bursts of traffic up to a maximum number of bytes based on the overall traffic load. Junos OS policers measure traffic-flow conformance to a policing rate limit by using a *token bucket algorithm*. An algorithm based on a single token bucket allows burst of traffic for short periods, whereas an algorithm based dual token buckets allows more sustained bursts of traffic.

### Single Token Bucket Algorithm

A single-rate two-color policer limits traffic throughput at an interface based on how the traffic conforms to rate-limit values specified in the policer configuration. Similarly, a hierarchical policer limits traffic throughput at an interface based on how aggregate and

premium traffic subflows conform to aggregate and premium rate-limit values specified in the policer configuration. For both two-color policer types, packets in a conforming traffic flow are categorized as *green*, and packets in a non-conforming traffic flow are categorized as *red*.

The single token bucket algorithm measures traffic-flow conformance to a two-color policer rate limit as follows:

- The token arrival rate represents the single *bandwidth limit* configured for the policer. You can specify the bandwidth limit as an absolute number of bits per second by including the **bandwidth-limit bps** statement. Alternatively, for single-rate two-color policers only, you can use the **bandwidth-percent percentage** statement to specify the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate.
- The token bucket depth represents the single *burst size* configured for the policer. You specify the burst size by including the **burst-size-limit bytes** statement.
- If the bucket is filled to capacity, arriving tokens “overflow” the bucket and are lost.

When the bucket contains insufficient tokens for receiving or transmitting the traffic at the interface, packets might be dropped or else re-marked with a lower forwarding class, a higher packet loss priority (PLP) level, or both.

## Conformance Measurement for Two-Color Marking

In two-color-marking policing, a traffic flow whose average arrival or departure rate does not exceed the token arrival rate (bandwidth limit) is considered *conforming traffic*. Packets in a conforming traffic flow (categorized as green traffic) are implicitly marked with a packet loss priority (PLP) level of **low** and then passed through the interface.

For a traffic flow whose average arrival or departure rate exceeds the token arrival rate, conformance to a two-color policer rate limit depends on the tokens in the bucket. If sufficient tokens remain in the bucket, the flow is considered conforming traffic. If the bucket does not contain sufficient tokens, the flow is considered *non-conforming traffic*. Packets in a non-conforming traffic flow (categorized as red traffic) are handled according to policing actions. Depending on the configuration of the two-color policer, packets might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.

**NOTE:** The number of tokens remaining in the bucket at any given time is a function of the token bucket depth and the overall traffic load.

The token bucket is initially filled to capacity, and so the policer allows an initial traffic burst (back-to-back traffic at average rates that exceed the token arrival rate) up to the size of the token bucket depth.

During periods of relatively low traffic (traffic that arrives at or departs from the interface at average rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

## Dual Token Bucket Algorithms

This topic covers the following information:

- [Token Bucket Concepts on page 890](#)
- [Guaranteed Bandwidth for Three-Color Marking on page 890](#)
- [Nonconformance Measurement for Single-Rate Three-Color Marking on page 891](#)
- [Nonconformance Measurement for Two-Rate Three-Color Marking on page 891](#)

### Token Bucket Concepts

When you apply traffic policing to the input or output traffic at an interface, the rate limits and actions specified in the policer configuration are used to enforce a limit on the average throughput rate at the interface while also allowing bursts of traffic up to a maximum number of bytes based on the overall traffic load. Junos OS policers measure traffic-flow conformance to a policing rate limit by using a *token bucket algorithm*. An algorithm based on a single token bucket allows burst of traffic for short periods, whereas an algorithm based dual token buckets allows more sustained bursts of traffic.

### Guaranteed Bandwidth for Three-Color Marking

A committed information rate (CIR) defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green, and packets in a green flow are implicitly marked with **low** packet loss priority (PLP) and then passed through the interface. During periods of relatively low traffic (traffic that arrives at or departs from the interface at average rates below the CIR), any unused bandwidth capacity accumulates in the first token bucket, but only up to a configured number of bytes. If any unused bandwidth capacity overflows the first bucket, the excess accumulates in a second token bucket.

The committed burst size (CBS) defines the maximum number of bytes for which unused amounts of the guaranteed bandwidth can be accumulated in the first token bucket. A burst of traffic at an average rate that exceeds the CIR is also categorized as green provided that sufficient unused bandwidth capacity is available in the first token bucket.

## Nonconformance Measurement for Single-Rate Three-Color Marking

Single-rate three-color policer configurations specify a second burst size—the excess burst size (EBS)—that defines the maximum number of bytes for which the second token bucket can accumulate unused bandwidth that overflows from the first bucket.

A traffic flow is categorized yellow if its average rate exceeds the CIR and the available bandwidth capacity accumulated in the first bucket if sufficient unused bandwidth capacity is available in the second token bucket. Packets in a yellow flow are implicitly marked with **medium-high** PLP and then passed through the interface.

A traffic flow is categorized red if its average rate exceeds the CIR and the available bandwidth capacity accumulated in the second bucket. Packets in a red flow are implicitly marked with **high** PLP and then either passed through the interface or optionally discarded.

## Nonconformance Measurement for Two-Rate Three-Color Marking

Two-rate three-color policer configurations include a second rate limit—the peak-information-rate (PIR)—that you set to the expected average data rate for traffic arriving at or departing from the interface under peak conditions.

Two-rate three-color policer configurations also include a second burst size—the peak burst size (PBS)—that defines the maximum number of bytes for which the second token bucket can accumulate unused peak bandwidth capacity. During periods of relatively little peak traffic (traffic that arrives at or departs from the interface at average rates that exceed the PIR), any unused peak bandwidth capacity accumulates in the second token bucket, but only up to the maximum number of bytes specified by the PBS.

A traffic flow is categorized yellow if it exceeds the CIR and the available committed bandwidth capacity accumulated in the first token bucket but conforms to the PIR. Packets in a yellow flow are implicitly marked with **medium-high** PLP and then passed through the interface.

A traffic flow is categorized red if it exceeds the PIR and the available peak bandwidth capacity accumulated in the second token bucket. Packets in a red flow are implicitly marked with **high** PLP and then either passed through the interface or optionally discarded.

## Policer Implementation Overview

The Juniper Networks® Junos® operating system (Junos OS) supports three types of policers:

- *Single-rate two-color policer* — The most common policer. Single-rate means that there is only a single bandwidth and burst rate referenced in the policer. The two colors associated with this policer are red (nonconforming) and green (conforming).
- *Single-rate three-color policer* — Similar to the single-rate two-color policer with the addition of the color yellow. This type also introduces the *committed information rate* (CIR) and a *committed burst rate* (CBR).
- *Two-rate three-color policer* — Builds off of the single-rate three-color policer by adding a second rate tier. *Two-rate* means there is an upper bandwidth limit and associated burst size as well as a *peak information rate* (PIR) and a *peak burst rate* (PBS).

There are two types of token bucket algorithms that can be used, depending on the type of policer that is applied to network traffic. Single-rate two-color policers use the *single token bucket algorithm* to measure traffic flow conformance to a two-color policer rate limit. Single-rate three-color policers and two-rate three-color policers both use the *dual token bucket algorithm* to measure traffic flow conformance to a three-color policer rate. The main difference between these two token bucket algorithms is that the single token bucket algorithm allows bursts of traffic for short periods, whereas the dual token bucket algorithm allows more sustained bursts of traffic. (The remainder of this topic discusses the single token bucket algorithm.)

To configure a policer, you need to set two parameters:

- Bandwidth limit configured in bps (using the **bandwidth-limit** statement)
- Burst size configured in bytes (using the **burst-size-limit** statement)

**NOTE:** For single-rate two-color policers only, you can also specify the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate by using the **bandwidth-percent *percentage*** statement. You cannot configure a policer to use bandwidth percentage for aggregate, tunnel, or software interfaces.

Use the following command to set the policer conditions:

```
user@router# set firewall policer <policer name> if-exceeding ?
Possible completions:
  <[Enter]>          Execute this command
+ apply-groups      Groups from which to inherit configuration data
+ apply-groups-except Don't inherit configuration data from these groups
  bandwidth-limit   Bandwidth limit (8000..1000000000000 bits per second)
  bandwidth-percent Bandwidth limit in percentage (1..100 percent)
  burst-size-limit   Burst size limit (1500..1000000000000 bytes)
  |                 Pipe through a command
```

The bandwidth limit parameter is used to determine the average rate limit applied to the traffic, while the burst-size parameter is used to allow for short periods of traffic bursting (back-to-back traffic at average rates that exceed the configured bandwidth limit). Once you apply a set of policer configuration settings (bandwidth limit and burst size), the configured values are adjusted to hardware programmable values. The conversion adjustment introduced is normally less than 1 percent of the configured bandwidth limit. This adjustment is needed because the software allows you to configure the bandwidth limit and burst size to any value within the specified ranges, but those values must be adjusted to the nearest value that can be programmed in the hardware.

The policer bandwidth limit configuration in the hardware is represented by two values: the *credit update frequency* and the *credit size*. The credit update frequency is used by the hardware to determine how frequently tokens (bits of unused bandwidth) are added to the token bucket. The credit size is based on the number of tokens that can fit in the token bucket. The MX Series, M120, M320 routers, and EX Series switches contain a set of credit update frequencies instead of having a single credit update frequency to minimize the adjustment difference from the configured bandwidth limit and to support a wide range of policer bandwidth rates (from 40 Kbps to 40 Gbps). One of the frequencies is used to program the policer (bandwidth limit and burst size) in the hardware.

The burst size is based on the overall traffic load and allows bursts of traffic to exceed the configured bandwidth limit. A policer with a large burst size effectively disables the configured bandwidth limit function, so the burst size must be relative to the configured bandwidth limit. You need to consider the traffic patterns in your network before determining the burst size. For more information about determining burst size, see [“Determining Proper Burst Size for Traffic Policers” on page 898](#).

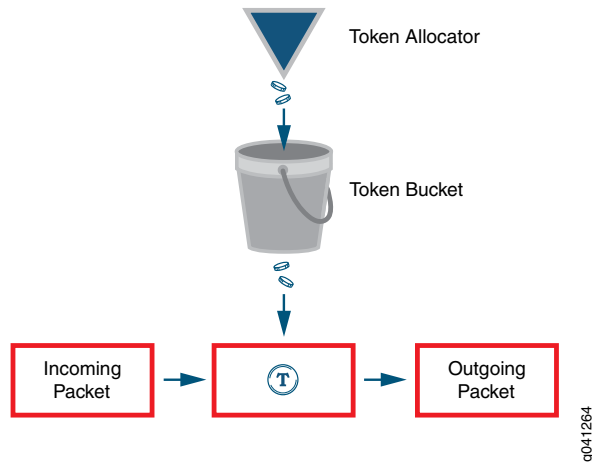

The configured burst size is adjusted in the hardware to a value that is based on the configured bandwidth limit. The burst size extends the configured bandwidth limit for bursty traffic that exceeds the configured bandwidth limit.

When a policer is applied to the traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified in the **burst-size-limit** statement.

Figure 60 on page 895 represents how a policer is implemented using the token bucket algorithm. The token allocator allocates tokens to the policer based on the configured bandwidth limit, which is the token size multiplied by the token arrival rate.

**token size x token arrival rate = policer rate (configured bandwidth limit)**

Figure 60: Token Bucket Algorithm

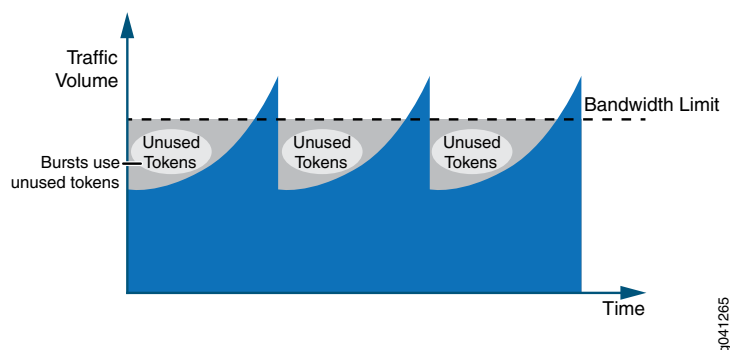

When a packet arrives at an interface configured with a policer, tokens that represent the number of bits that correspond to the length of the packet are used (or “cashed in”) from the token bucket. If the token arrival rate is higher than the rate of traffic so that there are tokens not being used, the token bucket is filled to capacity, and arriving tokens “overflow” the bucket and are lost. The token bucket depth represents the single user-configured burst size for the policer.

If there are tokens in the token bucket and the incoming traffic rate is higher than the token rate (the configured policer rate, bandwidth limit), the traffic can use the tokens until the bucket is empty. The token consumption rate can be as high as the incoming traffic rate, which creates the burst of traffic shown in Figure 61 on page 895.

By using the token bucket algorithm, the average bandwidth rate being allowed is close to the configured bandwidth limit while simultaneously supporting bursty traffic, as shown in Figure 61 on page 895.

Figure 61: Traffic Behavior Using Policer and Burst Size

**NOTE:** The measured length of a packet changes according to the family type that the policer applies to. If the policer is applied under the family inet hierarchy, the policer considers only the IPv4 packet length. If the policer is applied under the family vpls hierarchy, the entire Ethernet frame (including the Ethernet MAC header) is included in the packet length.

The major factor that affects the policer shaping result is not the conversion adjustment, but the traffic pattern since most network traffic is not consistent and is not sent at a constant rate. Due to the fluctuation of the incoming traffic rate, some of the allocated tokens are not used. As a result, the shaped traffic rate is lower than you might expect, and the TCP connection behavior discussed in [“Understanding the Benefits of Policers and Token Bucket Algorithms” on page 896](#) is a typical example of this. To alleviate this effect of the lower shaped traffic rate, a proper burst size configuration is required.

## Understanding the Benefits of Policers and Token Bucket Algorithms

This topic describes some scenarios that demonstrate how difficult it is to control traffic that comes into your network without the help of policers and the token bucket algorithm. These scenarios assume that traffic is coming from a TCP-based connection. Depending on the number of TCP connections, policers can have different effects on rate limits.

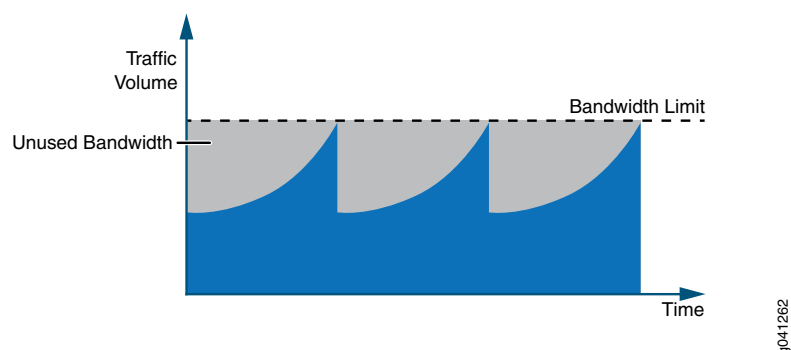

This topic presents the following scenarios:

- [Scenario 1: Single TCP Connection on page 896](#)
- [Scenario 2: Multiple TCP Connections on page 897](#)

### Scenario 1: Single TCP Connection

[Figure 62 on page 897](#) shows the traffic loading on an interface with a policer configured. When the traffic rate reaches the configured bandwidth limit (which results in a packet drop), a TCP slow-start mechanism reduces the traffic rate down to half of what it was. When the traffic rate rises again, the same cycle repeats.

Figure 62: Policer Behavior with a Single TCP Connection

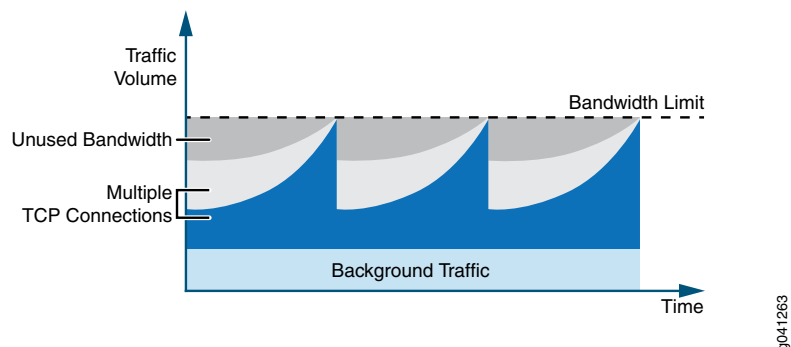

The problem presented in this scenario is that some bandwidth is available, but it is not being used by the traffic. The unused bandwidth shown in [Figure 62 on page 897](#) is the result of an overall data throughput that is lower than the configured bandwidth value. This example is an extreme case because there is only a single TCP connection.

## Scenario 2: Multiple TCP Connections

With multiple TCP connections or some background non-TCP-based traffic, there is less unused bandwidth, as depicted in [Figure 63 on page 897](#). However, the same issue of unused bandwidth still exists if all the TCP connections experience a drop when the aggregated traffic rate exceeds the configured bandwidth limit.

Figure 63: Policer Behavior with Background Traffic (Multiple TCP Connections)

To reduce the problem of unused bandwidth in your network, you can configure a burst size.

### Policer Burst Size Limit Overview

A policer burst-size limit controls the number of bytes of traffic that can pass unrestricted through a policed interface when a burst of traffic pushes the average transmit or receive rate above the configured bandwidth limit. The actual number of bytes of bursty traffic allowed to pass through a policed interface can vary from zero to the configured burst-size limit, depending on the overall traffic load.

By configuring a proper burst size, the effect of a lower shaped rate is alleviated. Use the **burst-size-limit** statement to configure the burst size.

**NOTE:** If you set the burst-size limit too low, too many packets will be subjected to rate limiting. If you set the burst-size limit too high, too few packets will be rate-limited.

Consider these two main factors when determining the burst size to use:

- The allowed duration of a blast of traffic on the line.
- The burst size is large enough to handle the maximum transmission unit (MTU) size of the packets.

The following general guidelines apply to choosing a policer burst-size limit:

- A burst-size limit should not be set lower than 10 times the MTU of the traffic on the interface to be policed.
- The amount of time to allow a burst of traffic at the full line rate of a policed interface should not be lower than 5 ms.
- The minimum and maximum values you can specify for a policer burst-size limit depends on the policer type (two-color or three-color).

**BEST PRACTICE:** The preferred method for choosing a burst-size limit is based on the line rate of the interface on which you apply the policer and the amount of time you want to allow a burst of traffic at the full line rate.

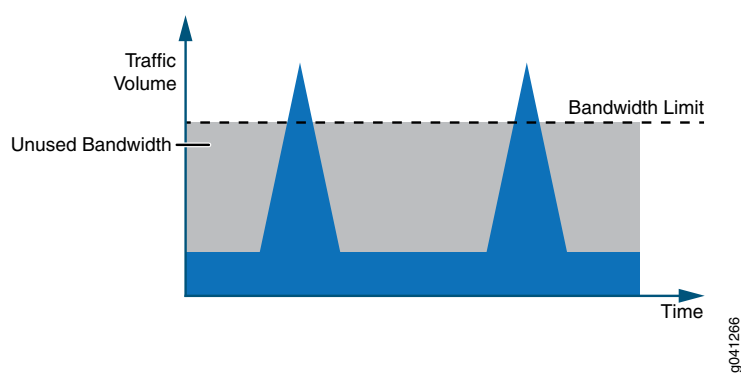

## Effect of Burst-Size Limit

Bursty traffic requires a relatively large burst size so that extra tokens can be allocated into the token bucket for upcoming traffic to use.

### Bursty Traffic Policed Without a Burst-Size Limit

Figure 64 on page 899 shows an extreme case of bursty traffic where the opportunity to allocate tokens is missed, and the bandwidth goes unused because a large burst size is not configured.

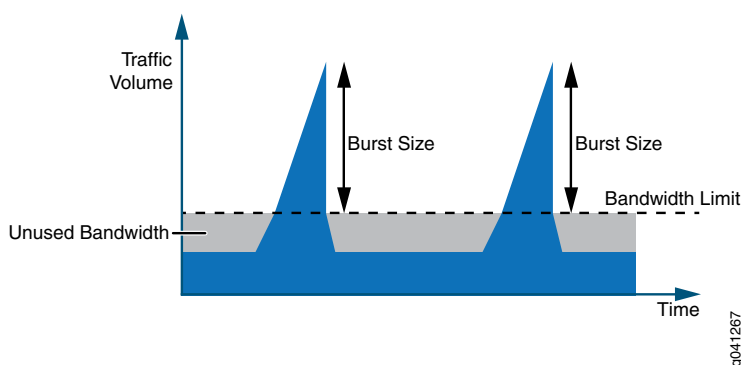

**Figure 64: Bursty Traffic Without Configured Burst Size (Excessive Unused Bandwidth)**

### Burst-Size Limit Configured to Match Bandwidth Limit and Flow Burstiness

Figure 65 on page 899 depicts how bandwidth usage changes when a large burst size is configured to handle bursty traffic. The large burst size minimizes the amount of unused bandwidth because tokens are being allocated in between the bursts of traffic that can be used during traffic peaks. The burst size determines the depth of the token bucket.

**Figure 65: Bursty Traffic with Configured Burst Size (Less Unused Bandwidth)**

### Burst-Size Limit That Depletes All Accumulated Tokens

Configuring a large burst size for the unused tokens creates another issue. If the burst size is set to a very large value, the burst of traffic can be transmitted from the interface

at line rate until all the accumulated tokens in the token bucket are used up. This means that configuring a large burst size can allow too many packets to avoid rate limiting, which can lead to a traffic rate that exceeds the bandwidth limit for an extended period of time.

If the average rate is considered within 1 second, the rate is still below the configured bandwidth limit. However, the downstream device might not be able to handle bursty traffic, so some packets might be dropped.

## Two Methods for Calculating Burst-Size Limit

For policers configured on MX Series, M120, and M320 routers, and EX Series switches, configurable burst-size limit values range from 1 ms through 600 ms of traffic at the policer rate (the configured bandwidth limit).

Because one burst size is not suitable for every traffic pattern, select the best burst size for an interface by performing experimental configurations. For your first test configuration, select the burst-size limit by using one of the calculation methods described in the next two sections.

### Calculation Based on Interface Bandwidth and Allowable Burst Time

---

If the bandwidth of the policed interface is known, the preferred method for calculating the policer burst-size limit is based on the following values:

- **bandwidth**—Line rate of the policed interface (in bps units)
- **burst-period**—Allowable traffic-burst time (5 ms or longer)

To calculate policer bandwidth in bytes:

$$\text{bandwidth} \times \text{burst-period} / 8$$

### Calculation Based on Interface Traffic MTU

---

If the bandwidth of the policed interface is unknown, calculate the policer burst-size limit based on the following value:

- **interface MTU**—Maximum transmission unit (in bytes) for the policed interface.

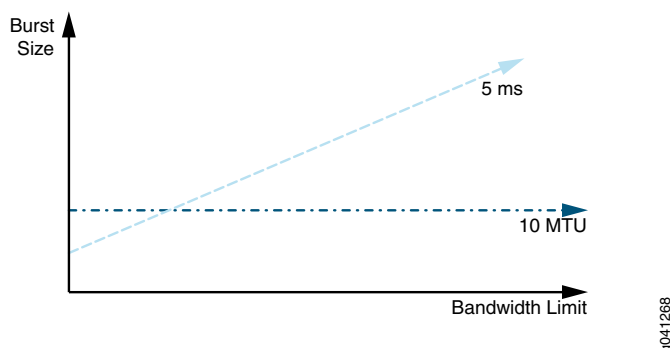

To calculate policer bandwidth in bytes:

$$\text{interface MTU} \times 10$$

## Comparison of the Two Methods

Figure 66 on page 901 illustrates the relationship between the policer rate (the configured bandwidth limit) and the effective burst-size limit for the two methods of calculating the best policer burst-size limit. For the method based on interface bandwidth and allowable burst time, the correlation is labeled **5 ms**. For the method based on MTU size, the correlation is labeled **10 MTU**.

Figure 66: Comparing Burst Size Calculation Methods

For a policer burst-size limit calculated using the **5 ms** method, the effective burst-size limit is proportional to the configured bandwidth limit. With a very low bandwidth limit, the effective burst-size limit might be so small that the policer rate-limits traffic more aggressively than desired. For example, a traffic “burst” consisting of two MTU-sized packets might be rate-limited. In this scenario, a policer burst-size limit calculated using the **10 MTU** method appears to be a better choice.

#### 10 x MTU Method for Selecting Initial Burst Size for Gigabit Ethernet with 100 Kbps Bandwidth

The following sequence illustrates the use of the 10 x MTU method for selecting an initial burst size for test configurations for a Gigabit Ethernet interface configured with a 100 Kbps bandwidth limit:

1. If you configure a 100 ms burst-size limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 1250 bytes, calculated as follows:

$$100 \text{ Kbps} \times 100 \text{ ms} = \frac{100,000 \text{ bps} \times 0.1 \text{ s}}{8 \text{ bits per byte}} = 1250 \text{ bytes}$$

2. In theory, a 10 x MTU burst size would allow up to 15,000 bytes to pass unrestricted. However, the maximum configurable burst-size limit for MX Series, M120, and M320 routers is 600 ms of the bandwidth limit. If you configure the maximum burst-size limit of 600 ms of the bandwidth limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 7500 bytes, calculated as follows:

$$100 \text{ Kbps} \times 600 \text{ ms} = \frac{100,000 \text{ bps} \times 0.6 \text{ s}}{8 \text{ bits per byte}} = 7500 \text{ bytes}$$

On a Gigabit Ethernet interface, a configured burst-size limit of 600 ms creates a burst duration of 60  $\mu$ s at Gigabit Ethernet line rate, calculated as follows:

$$\frac{7500 \text{ bytes}}{1 \text{ Gbps}} = \frac{60,000 \text{ bits}}{1,000,000,000 \text{ bps}} = 0.00006 \text{ s} = 60 \mu\text{s}$$

3. If the downstream device is unable to handle the amount of bursty traffic allowed using the initial burst size configuration, reduce the burst-size limit until you achieve acceptable results.

### 5 ms Method for Selecting Initial Burst Size for Gigabit Ethernet Interface with 200 Mbps Bandwidth

The following sequence illustrates the use of the 5 ms method for selecting an initial burst size for test configurations for a Gigabit Ethernet interface configured with a 200 Mbps bandwidth limit. This example calculation shows how a larger burst-size limit can affect the measured bandwidth rate.

1. If you configure a 5 ms burst-size limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 125,000 bytes (approximately 83 1500-byte packets), calculated as follows:

$$200 \text{ Mbps} \times 5 \text{ ms} = \frac{200,000,000 \text{ bps} \times 0.005 \text{ s}}{8 \text{ bits per byte}} = 125,000 \text{ bytes}$$

On a Gigabit Ethernet interface, a configured burst-size limit of 5 ms creates a burst duration of 1 ms at Gigabit Ethernet line rate, calculated as follows:

$$\frac{125,000 \text{ bytes}}{1 \text{ Gbps}} = \frac{1,000,000 \text{ bits}}{1,000,000,000 \text{ bps}} = 0.001 \text{ s} = 1 \text{ ms}$$

The average bandwidth rate in 1 second becomes 200 Mbps + 1 Mbps = 201 Mbps, which is a minimal increase over the configured bandwidth limit at 200 Mbps.

2. If you configure a 600 ms burst-size limit, the maximum amount of traffic allowed to pass through the interface unrestricted is 15 Mbytes (approximately 10,000 1500-byte packets), calculated as follows:

$$200 \text{ Mbps} \times 600 \text{ ms} = \frac{200,000,000 \text{ bps} \times 0.6 \text{ s}}{8 \text{ bits per byte}} = 15,000,000 \text{ bytes}$$

On a Gigabit Ethernet interface, a configured burst-size limit of 600 ms creates a burst duration of 120 ms at Gigabit Ethernet line rate, calculated as follows:

$$\frac{15,000 \text{ bytes}}{1 \text{ Gbps}} = \frac{120,000 \text{ bits}}{1,000,000,000 \text{ bps}} = 0.012 \text{ s} = 12 \text{ ms}$$

The average bandwidth rate in 1 second becomes 200 Mbps + 120 Mbps = 320 Mbps, which is much higher than the configured bandwidth limit at 200 Mbps.

### 200 Mbps Bandwidth Limit, 5 ms Burst Duration

---

If a 200 Mbps bandwidth limit is configured with a 5 ms burst size, the calculation becomes **200 Mbps x 5 ms = 125 Kbytes**, which is approximately 83 1500-byte packets. If the 200 Mbps bandwidth limit is configured on a Gigabit Ethernet interface, the burst duration is **125000 bytes / 1 Gbps = 1 ms** at the Gigabit Ethernet line rate.

### 200 Mbps Bandwidth Limit, 600 ms Burst Duration

---

If a large burst size is configured at 600 ms with the bandwidth limit configured at 200 Mbps, the calculation becomes **200 Mbps x 600 ms = 15 Mbytes**. This creates a burst duration of 120 ms at the Gigabit Ethernet line rate. The average bandwidth rate in 1 second becomes **200 Mbps + 15 Mbytes = 320 Mbps**, which is much higher than the configured bandwidth limit at 200 Mbps. This example shows that a larger burst size can affect the measured bandwidth rate.

## Hierarchical Policers

---

- [Hierarchical Policer Overview on page 905](#)
- [Example: Configuring a Hierarchical Policer on page 906](#)

### Hierarchical Policer Overview

You can use a hierarchical policer to rate-limit ingress Layer 2 traffic at a physical or logical interface and apply different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority.

Hierarchical policing is supported on M40e, M120, and M320 edge routers with incoming Flexible PIC Concentrators (FPCs) as SFPC and outgoing FPCs as FFPC, and on MX Series, T320, T640, and T1600 core routers with Enhanced Intelligent Queuing (IQE) PICs.

You can apply hierarchical policing to a logical interface.

A hierarchical policer configuration defines two policers—one for EF traffic only and another for non-EF traffic—that function in a hierarchical manner:

- **Premium policer**—You configure the premium policer with traffic limits for high-priority EF traffic only: a guaranteed bandwidth and a corresponding burst-size limit. EF traffic is categorized as nonconforming when its average arrival rate exceeds the guaranteed bandwidth and its average packet size exceeds the premium burst-size limit. For a premium policer, the only configurable action for nonconforming traffic is to discard the packets.
- **Aggregate policer**—You configure the aggregate policer with an aggregate bandwidth (to accommodate both high-priority EF traffic up to the guaranteed bandwidth and normal-priority non-EF traffic) and a burst-size limit for non-EF traffic only. Non-EF traffic is categorized as nonconforming when its average arrival rate exceeds the amount of aggregate bandwidth not currently consumed by EF traffic and its average packet size exceeds the burst-size limit defined in the aggregate policer. For an aggregate policer, the configurable actions for nonconforming traffic are to discard the packets, assign a forwarding class, or assign a packet loss priority (PLP) level.

**NOTE:** You must configure the bandwidth limit of the premium policer at or below the bandwidth limit of the aggregate policer. If the two bandwidth limits are equal, then non-EF traffic passes through the interface unrestricted only while no EF traffic arrives at the interface.

EF traffic is guaranteed the bandwidth specified as the premium bandwidth limit, while non-EF traffic is rate-limited to the amount of aggregate bandwidth not currently consumed by the EF traffic. Non-EF traffic is rate-limited to the entire aggregate bandwidth only while no EF traffic is present.

For example, suppose that you configure a hierarchical policer with the following components:

- Premium policer with bandwidth limit set to 2 Mbps, burst-size limit set to 3000 bytes, and nonconforming action set to discard packets.
- Aggregate policer with bandwidth limit set to 10 Mbps, burst-size limit set to 3000 bytes, and nonconforming action set to discard packets.

EF traffic is guaranteed a bandwidth of 2 Mbps. Bursts of EF traffic—EF traffic that arrives at the interface at rates above 2 Mbps—can also pass through the interface provided sufficient tokens are available in the 3000-byte bucket. When no tokens are available for a burst of non-EF traffic, packets are rate-limited using policing actions for the premium policer.

Non-EF traffic is metered to a bandwidth limit that ranges between 8 Mbps and 10 Mbps, depending on the average arrival rate of the EF traffic. Bursts of non-EF traffic—non-EF traffic that arrives at the interface at rates above the current limit for non-EF traffic—also pass through the interface provided sufficient tokens are available in the 3000-byte bucket. When non-EF traffic exceeds the currently allowed bandwidth or when no tokens are available for a burst of non-EF traffic, packets are rate-limited using policing actions for the aggregate policer.

### Example: Configuring a Hierarchical Policer

This example shows how to configure a hierarchical policer and apply the policer to ingress Layer 2 traffic at a logical interface on a supported platform.

- [Requirements on page 907](#)
- [Overview on page 907](#)
- [Configuration on page 907](#)
- [Verification on page 911](#)

## Requirements

Before you begin, be sure that your environment meets the following requirements:

- The interface on which you apply the hierarchical policer is a SONET interface hosted on one of the following routing platforms:
  - M40e, M120, or M320 edge router with incoming FPCs as SFPC and outgoing FPCs as FFPC.
  - MX Series, T320, T640, or T1600 core router with Enhanced Intelligent Queuing (IQE) PICs.
- No other policer is applied to the input of the interface on which you apply the hierarchical policer.
- You are aware that, if you apply the hierarchical policer to logical interface on which an input filter is also applied, the policer is executed first.

## Overview

In this example, you configure a hierarchical policer and apply the policer to ingress Layer 2 traffic at a logical interface.

### Topology

You apply the policer to the SONET logical interface **so-1/0/0.0**, which you configure for IPv4 and VPLS traffic. When you apply the hierarchical policer to that logical interface, both IPv4 and VPLS traffic is hierarchically rate-limited.

You also configure the logical interface **so-1/0/0.1** for MPLS traffic. If you choose to apply the hierarchical policer to physical interface **so-1/0/0**, hierarchical policing would apply to IPv4 and VPLS traffic at **so-1/0/0.0** and to MPLS traffic at **so-1/0/0.1**.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Defining the Interfaces on page 908](#)
- [Defining the Forwarding Classes on page 909](#)
- [Configuring the Hierarchical Policer on page 909](#)
- [Applying the Hierarchical Policer to Layer 2 Ingress Traffic at a Physical or Logical Interface on page 910](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces so-1/0/0 unit 0 family inet address 192.168.1.1/24
set interfaces so-1/0/0 unit 0 family vpls
```

```

set interfaces so-1/0/0 unit 1 family mpls
set class-of-service forwarding-classes class fc0 queue-num 0 priority high
  policing-priority premium
set class-of-service forwarding-classes class fc1 queue-num 1 priority low policing-priority
  normal
set class-of-service forwarding-classes class fc2 queue-num 2 priority low policing-priority
  normal
set class-of-service forwarding-classes class fc3 queue-num 3 priority low policing-priority
  normal
set firewall hierarchical-policer policer1 aggregate if-exceeding bandwidth-limit 300m
  burst-size-limit 30k
set firewall hierarchical-policer policer1 aggregate then forwarding-class fc1
set firewall hierarchical-policer policer1 premium if-exceeding bandwidth-limit 100m
  burst-size-limit 50k
set firewall hierarchical-policer policer1 premium then discard
set interfaces so-1/0/0 unit 0 layer2-policer input-hierarchical-policer policer1

```

### Defining the Interfaces

#### Step-by-Step Procedure

To define the interfaces:

1. Enable configuration of the physical interface.

```

[edit]
user@host# edit interfaces so-1/0/0

```

2. Configure logical unit 0.

```

[edit interfaces so-1/0/0]
user@host# set unit 0 family inet address 192.168.1.1/24
user@host# set unit 0 family vpls

```

If you apply a Layer 2 policer to this logical interface, you must configure at least one protocol family.

3. Configure logical unit 1.

```

[edit interfaces so-1/0/0]
user@host# set unit 1 family mpls

```

**Results** Confirm the configuration of the interfaces by entering the **show interfaces** configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show interfaces
so-1/0/0 {
  unit 0 {
    family inet {
      address 192.168.1.1/24;
    }
    family vpls;
  }
  unit 1 {
    family mpls;
  }
}

```

*Defining the Forwarding Classes***Step-by-Step Procedure**

To define the forwarding classes referenced as aggregate policer actions:

1. Enable configuration of the forwarding classes.

```
[edit]
user@host# edit class-of-service forwarding-classes
```

2. Define the forwarding classes.

```
[edit class-of-service forwarding-classes]
user@host# set class fc0 queue-num 0 priority high policing-priority premium
user@host# set class fc1 queue-num 1 priority low policing-priority normal
user@host# set class fc2 queue-num 2 priority low policing-priority normal
user@host# set class fc3 queue-num 3 priority low policing-priority normal
```

**Results**

Confirm the configuration of the forwarding classes referenced as aggregate policer actions by entering the **show class-of-service** configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
forwarding-classes {
  class fc0 queue-num 0 priority high policing-priority premium;
  class fc1 queue-num 1 priority low policing-priority normal;
  class fc2 queue-num 2 priority low policing-priority normal;
  class fc3 queue-num 3 priority low policing-priority normal;
}
```

*Configuring the Hierarchical Policier***Step-by-Step Procedure**

To configure a hierarchical policier:

1. Enable configuration of the hierarchical policier.

```
[edit]
user@host# edit firewall hierarchical-policer policer1
```

2. Configure the aggregate policier.

```
[edit firewall hierarchical-policer policer1]
user@host# set aggregate if-exceeding bandwidth-limit 300m burst-size-limit 30k
user@host# set aggregate then forwarding-class fc1
```

For the aggregate policier, the configurable actions for a packet in a nonconforming flow are to discard the packet, change the loss priority, or change the forwarding class.

3. Configure the premium policier.

```
[edit firewall hierarchical-policer policer1]
user@host# set premium if-exceeding bandwidth-limit 100m burst-size-limit 50k
user@host# set premium then discard
```

The bandwidth limit for the premium policier must not be greater than that of the aggregate policier.

For the premium policer, the only configurable action for a packet in a nonconforming traffic flow is to discard the packet.

**Results** Confirm the configuration of the hierarchical policer by entering the **show firewall** configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
hierarchical-policer policer1 {
  aggregate {
    if-exceeding {
      bandwidth-limit 300m;
      burst-size-limit 30k;
    }
    then {
      forwarding-class fc1;
    }
  }
  premium {
    if-exceeding {
      bandwidth-limit 100m;
      burst-size-limit 50k;
    }
    then {
      discard;
    }
  }
}
```

#### *Applying the Hierarchical Policer to Layer 2 Ingress Traffic at a Physical or Logical Interface*

**Step-by-Step Procedure** To hierarchically rate-limit Layer 2 ingress traffic for IPv4 and VPLS traffic only on logical interface **so-1/0/0.0**, reference the policer from the logical interface configuration:

1. Enable configuration of the logical interface.

```
[edit]
user@host# edit interfaces so-1/0/0 unit 0
```

When you apply a policer to Layer 2 traffic at a logical interface, you must define at least one protocol family for the logical interface.

2. Apply the policer to the logical interface.

```
[edit]
user@host# set layer2-policer input-hierarchical-policer policer1
```

Alternatively, to hierarchically rate-limit Layer 2 ingress traffic for all protocol families and for *all logical interfaces* configured on physical interface **so-1/0/0**, you could reference the policer from the physical interface configuration.

**Results** Confirm the configuration of the hierarchical policer by entering the **show interfaces** configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
  unit 0 {
    layer2-policer {
      input-hierarchical-policer policer1;
    }
    family inet {
      address 192.168.1.1/24;
    }
    family vpls;
  }
  unit 1 {
    family mpls;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Displaying Traffic Statistics and Policers for the Logical Interface on page 911](#)
- [Displaying Statistics for the Policer on page 911](#)

#### *Displaying Traffic Statistics and Policers for the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces** operational mode command for logical interface **so-1/0/0.0**, and include the **detail** or **extensive** option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer **policer1** as an input or output policer as follows:

- **Input:** policer1-so-1/0/0.0-inet-i
- **Output:** policer1-so-1/0/0.0-inet-o

In this example, the policer is applied to logical interface traffic in the input direction only.

#### *Displaying Statistics for the Policer*

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the [show policer](#) operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer **policer1**, the input and output policer names are displayed as follows:

- **policer1-so-1/0/0.0-inet-i**
- **policer1-so-1/0/0.0-inet-o**

The **-inet-i** suffix denotes a policer applied to IPv4 input traffic, while the **-inet-o** suffix denotes a policer applied to IPv4 output traffic. In this example, the policer is applied to input traffic only.

- [Statement Hierarchy for Applying a Two-Color Policer to Layer 2 Traffic on page 913](#)

---

#### Guidelines for Configuring Two-Color Policing of Layer 2 Traffic

The following guidelines apply to two-color policing of Layer 2 traffic:

- You can apply a two-color policer to ingress or egress Layer 2 traffic at a logical interface hosted on a Gigabit Ethernet interface (**ge-**) or a 10-Gigabit Ethernet interface (**xe-**) only.
- A single logical interface supports Layer 2 policing in both directions.
- You can apply a two-color policer to Layer 2 traffic as a logical interface policer only. You cannot apply a two-color policer to Layer 2 traffic as a stateless firewall filter action.
- You can apply a two-color policer to Layer 2 traffic by referencing the policer in the interface configuration at the logical unit level, and not at the protocol level.

### Statement Hierarchy for Configuring a Two-Color Policer for Layer 2 Traffic

To enable a single-rate two-color policer to rate-limit Layer 2 traffic, include the **logical-interface-policer** statement in the **policer** configuration.

```
firewall {
  policer policer-name {
    logical-interface-policer;
    if-exceeding {
      (bandwidth-limit bps | bandwidth-percent percentage);
      burst-size-limit bytes;
    }
    then {
      discard;
      forwarding-class class-name;
      loss-priority (high | low | medium-high | medium-low);
    }
  }
}
```

You can include the configuration at the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

### Statement Hierarchy for Applying a Two-Color Policer to Layer 2 Traffic

To apply a logical interface policer to Layer 2 traffic, include the **layer2-policer input-policer *policer-name*** statement or the **layer2-policer output-policer *policer-name*** statement to a supported logical interface. Use the **input-policer** or **output-policer** statements to apply a two-color policer at Layer 2.

```
interfaces {
  (ge-fpc/pic/port | xe-fpc/pic/port) {
    unit unit-number {
      layer2-policer {
        input-policer policer-name;
        output-policer policer-name;
      }
    }
  }
}
```

You can include the configuration at the following hierarchy levels:

- [edit]
- [edit logical-systems *logical-system-name*]

## Three-Color Policing at Layer 2 Overview

This topic covers the following information:

- [Guidelines for Configuring Three-Color Policing of Layer 2 Traffic on page 914](#)
- [Statement Hierarchy for Configuring a Three-Color Policer for Layer 2 Traffic on page 914](#)
- [Statement Hierarchy for Applying a Three-Color Policer to Layer 2 Traffic on page 915](#)

---

### Guidelines for Configuring Three-Color Policing of Layer 2 Traffic

The following guidelines apply to three-color policing of Layer 2 traffic:

- You can apply a three-color policer to Layer 2 traffic at a logical interface hosted on a Gigabit Ethernet interface (**ge-**) or a 10-Gigabit Ethernet interface (**xe-**) only.
- A single logical interface supports Layer 2 policing in both directions.
- You can apply a three-color policer to Layer 2 traffic as a logical interface policer only. You cannot apply a two-color policer to Layer 2 traffic as a stateless firewall filter action.
- You can apply a three-color policer to Layer 2 traffic by referencing the policer in the interface configuration at the logical unit level, and not at the protocol level.
- You can apply a color-aware three-color policer to Layer 2 traffic in the egress direction only, but you apply a color-blind three-color policer to Layer 2 traffic in either direction.

For information about configuring two-color policing of Layer 2 traffic, see [“Two-Color Policing at Layer 2 Overview” on page 912](#).

---

### Statement Hierarchy for Configuring a Three-Color Policer for Layer 2 Traffic

To enable a single-rate or two-rate three-color policer to rate-limit Layer 2 traffic, include the **logical-interface-policer** statement in the **three-color-policer** configuration.

```
firewall {  
  three-color-policer policer-name {  
    action {  
      loss-priority high then discard;  
    }  
    logical-interface-policer;  
    single-rate {  
      (color-aware | color-blind);  
      committed-burst-size bytes;  
      committed-information-rate bps;  
      excess-burst-size bytes;  
    }  
    two-rate {  
      (color-aware | color-blind);  
      committed-burst-size bytes;  
      committed-information-rate bps;  
      peak-burst-size bytes;  
      peak-information-rate bps;  
    }  
  }  
}
```

```
}
```

You can include the configuration at the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

### Statement Hierarchy for Applying a Three-Color Policer to Layer 2 Traffic

To apply a logical interface policer to Layer 2 traffic, include the **layer2-policer** statement for a supported logical interface at the logical unit level. Use the **input-three-color *policer-name*** statement or **output-three-color *policer-name*** statement to specify the direction of the traffic to be policed.

```
interfaces {
  (ge-fpc/pic/port | xe-fpc/pic/port) {
    unit unit-number {
      layer2-policer {
        input-three-color policer-name;
        output-three-color policer-name;
      }
    }
  }
}
```

You can include the configuration at the following hierarchy levels:

- **[edit]**
- **[edit logical-systems *logical-system-name*]**

### Example: Configuring a Three-Color Logical Interface (Aggregate) Policer

This example shows how to configure a two-rate three-color color-blind policer as a logical interface (aggregate) policer and apply the policer directly to Layer 2 input traffic at a supported logical interface.

- [Requirements on page 915](#)
- [Overview on page 916](#)
- [Configuration on page 917](#)
- [Verification on page 920](#)

#### Requirements

Before you begin, make sure that the logical interface to which you apply the three-color logical interface policer is hosted on a Gigabit Ethernet interface (**ge-**) or a 10-Gigabit Ethernet interface (**xe-**) on an MX Series router.

## Overview

---

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a second set of bandwidth and burst-size limits for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed the bandwidth and burst-size limits for peak traffic is categorized as yellow.
- Nonconforming traffic that exceeds the bandwidth and burst-size limits for peak traffic is categorized as red.

A logical interface policer defines traffic rate-limiting rules that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer.

**NOTE:** You apply a logical interface policer directly to a logical interface at the logical unit level, and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface at the protocol family level.

---

## Topology

In this example, you configure the two-rate three-color policer **trTCM2-cb** as a color-blind logical interface policer and apply the policer to incoming Layer 2 traffic on logical interface **ge-1/3/1.0**.

**NOTE:** When using a three-color policer to rate-limit Layer 2 traffic, color-aware policing can be applied to egress traffic only.

The policer defines guaranteed traffic rate limits such that traffic that conforms to the bandwidth limit of 40 Mbps with a 100 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as green. As with any policed traffic, the packets in a green flow are implicitly set to a **low** loss priority and then transmitted.

Nonconforming traffic that falls within the peak traffic limits of a 60 Mbps bandwidth limit and a 200 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as yellow. The packets in a yellow traffic flow are implicitly set to a **medium-high** loss priority and then transmitted.

Nonconforming traffic that exceeds the peak traffic limits are categorized as red. The packets in a red traffic flow are implicitly set to a **high** loss priority. In this example, the optional policer action for red traffic (**loss-priority high then discard**) is configured, so packets in a red traffic flow are discarded instead of transmitted.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Logical Interfaces on page 917](#)
- [Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer on page 918](#)
- [Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface on page 919](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
  00:00:11:22:33:44
set firewall three-color-policer trTCM2-cb logical-interface-policer
set firewall three-color-policer trTCM2-cb two-rate color-blind
set firewall three-color-policer trTCM2-cb two-rate committed-information-rate 40m
set firewall three-color-policer trTCM2-cb two-rate committed-burst-size 100k
set firewall three-color-policer trTCM2-cb two-rate peak-information-rate 60m
set firewall three-color-policer trTCM2-cb two-rate peak-burst-size 200k
set firewall three-color-policer trTCM2-cb action loss-priority high then discard
set interfaces ge-1/3/1 unit 0 layer2-policer input-three-color trTCM2-cb
```

### Configuring the Logical Interfaces

### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface.

```
[edit]
user@host# edit interfaces ge-1/3/1
```

2. Configure single tagging.

```
[edit interfaces ge-1/3/1]
user@host# set vlan-tagging
```

3. Configure logical interface **ge-1/3/1.0**.

```
[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30
```

4. Configure logical interface **ge-1/3/1.0**.

```
[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
```

```
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44
```

**Results** Confirm the configuration of the logical interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}
```

#### *Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer*

**Step-by-Step Procedure** To configure the two-rate three-color policer as a logical interface policer:

1. Enable configuration of a three-color policer.

```
[edit]
user@host# edit firewall three-color-policer trTCM2-cb
```

2. Specify that the policer is a logical interface (aggregate) policer.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set logical-interface-policer
```

A logical interface policer rate-limits traffic based on a percentage of the media rate of the physical interface underlying the logical interface to which the policer is applied, and the policer is applied directly to the interface rather than referenced by a firewall filter.

3. Specify that the policer is two-rate and color-blind.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate color-blind
```

A color-aware three-color policer takes into account any coloring markings that might have been set for a packet by another traffic policer configured at a previous network node, and any preexisting color markings are used in determining the appropriate policing action for the packet.

Because you are applying this three-color policer applied to input at Layer 2, you must configure the policer to be color-blind.

4. Specify the policer traffic limits used to classify a green traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

5. Specify the additional policer traffic limits used to classify a yellow or red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

6. (Optional) Specify the configured policer action for packets in a red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set action loss-priority high then discard
```

In color-aware mode, the three-color policer configured action can increase the packet loss priority (PLP) level of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

**Results** Confirm the configuration of the three-color policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM2-cb {
  logical-interface-policer;
  action {
    loss-priority high then discard;
  }
  two-rate {
    color-blind;
    committed-information-rate 40m;
    committed-burst-size 100k;
    peak-information-rate 60m;
    peak-burst-size 200k;
  }
}
```

#### *Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface*

##### **Step-by-Step Procedure**

To apply the three-color policer to the Layer 2 input at the logical interface:

1. Enable application of Layer 2 logical interface policers.

```
[edit]
user@host# edit interfaces ge-1/3/1 unit 0
```

2. Apply the three-color logical interface policer to a logical interface input.

```
[edit interfaces ge-1/3/1 unit 0]
```

```
user@host# set layer2-policerinput-three-color trTCM2-cb
```

**Results** Confirm the configuration of the logical interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    layer2-policer {
      input-three-color trTCM2-cb;
    }
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Displaying Traffic Statistics and Policers for the Logical Interface on page 920](#)
- [Displaying Statistics for the Policer on page 921](#)

#### *Displaying Traffic Statistics and Policers for the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces** operational mode command for logical interface **ge-1/3/1.0**, and include the **detail** or **extensive** option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer **trTCM2-cb** as an input or output policer as follows:

- Input: trTCM2-cb-ge-1/3/1.0-log\_int-i
- Output: trTCM2-cb-ge-1/3/1.0-log\_int-o

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to in the input direction only.

#### *Displaying Statistics for the Policer*

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the **show policer** operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer **trTCM2-cb**, the input and output policer names are displayed as follows:

- **trTCM2-cb-ge-1/3/1.0-log\_int-i**
- **trTCM2-cb-e-1/3/1.0-log\_int-o**

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

| <b>Bandwidth Policer</b><br><i>Defines traffic rate limiting that you can apply to Layer 3 protocol-specific traffic at a logical interface, but the bandwidth limit is specified as a percentage value. Bandwidth can be based on physical interface line rate (the default) or the logical interface shaping rate. Can be applied as an interface policer or as a firewall filter policer where the filter is either interface-specific or a physical interface filter.</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### Single-Rate Two-Color Policer Overview

Single-rate two color policing enforces a configured rate of traffic flow for a particular service level by applying implicit or configured actions to traffic that does not conform to the limits. When you apply a single-rate two-color policer to the input or output traffic at an interface, the policer meters the traffic flow to the rate limit defined by the following components:

- **Bandwidth limit**—The average number of bits per second permitted for packets received or transmitted at the interface. You can specify the bandwidth limit as an absolute number of bits per second or as a percentage value from 1 through 100. If a percentage value is specified, the effective bandwidth limit is calculated as a percentage of either the physical interface media rate or the logical interface configured shaping rate.
- **Burst-size limit**—The maximum size permitted for bursts of data.

For a traffic flow that conforms to the configured limits (categorized as green traffic), packets are implicitly marked with a packet loss priority (PLP) level of **low** and are allowed to pass through the interface unrestricted.

For a traffic flow that exceeds the configured limits (categorized as red traffic), packets are handled according to the traffic-policing actions configured for the policer. The action might be to discard the packet, or the action might be to re-mark the packet with a specified forwarding class, a specified PLP, or both, and then transmit the packet.

To rate-limit Layer 3 traffic, you can apply a two-color policer in the following ways:

- Directly to a logical interface, at a specific protocol level.
- As the action of a standard stateless firewall filter that is applied to a logical interface, at a specific protocol level.

To rate-limit Layer 2 traffic, you can apply a two-color policer as a *logical interface policer* only. You cannot apply a two-color policer to Layer 2 traffic through a firewall filter.

### Example: Limiting Inbound Traffic at Your Network Border by Configuring an Ingress Single-Rate Two-Color Policer

This example shows you how to configure an ingress single-rate two-color policer to filter incoming traffic. The policer enforces the class-of-service (CoS) strategy for in-contract and out-of-contract traffic. You can apply a single-rate two-color policer to incoming packets, outgoing packets, or both. This example applies the policer as an input

(ingress) policer. The goal of this topic is to provide you with an introduction to policing by using a example that shows traffic policing in action.

Policers use a concept known as a token bucket to allocate system resources based on the parameters defined for the policer. A thorough explanation of the token bucket concept and its underlying algorithms is beyond the scope of this document. For more information about traffic policing, and CoS in general, refer to *QOS-Enabled Networks—Tools and Foundations* by Miguel Barreiros and Peter Lundqvist. This book is available at many online booksellers and at [www.juniper.net/books](http://www.juniper.net/books).

- [Requirements on page 929](#)
- [Overview on page 929](#)
- [Configuration on page 931](#)
- [Verification on page 935](#)

## Requirements

To verify this procedure, this example uses a traffic generator. The traffic generator can be hardware-based or it can be software running on a server or host machine.

The functionality in this procedure is widely supported on devices that run Junos OS. The example shown here was tested and verified on MX Series routers running Junos OS Release 10.4.

## Overview

Single-rate two-color policing enforces a configured rate of traffic flow for a particular service level by applying implicit or configured actions to traffic that does not conform to the limits. When you apply a single-rate two-color policer to the input or output traffic at an interface, the policer meters the traffic flow to the rate limit defined by the following components:

- **Bandwidth limit**—The average number of bits per second permitted for packets received or transmitted at the interface. You can specify the bandwidth limit as an absolute number of bits per second or as a percentage value from 1 through 100. If a percentage value is specified, the effective bandwidth limit is calculated as a percentage of either the physical interface media rate or the logical interface configured shaping rate.
- **Burst-size limit**—The maximum size permitted for bursts of data. Burst sizes are measured in bytes. We recommend two formulas for calculating burst size:

Burst size = bandwidth x allowable time for burst traffic / 8

Or

Burst size = interface mtu x 10

For information about configuring the burst size, see [“Determining Proper Burst Size for Traffic Policers” on page 898](#).

**NOTE:** There is a finite buffer space for an interface. In general, the estimated total buffer depth for an interface is about 125 ms.

For a traffic flow that conforms to the configured limits (categorized as green traffic), packets are implicitly marked with a packet loss priority (PLP) level of low and are allowed to pass through the interface unrestricted.

For a traffic flow that exceeds the configured limits (categorized as red traffic), packets are handled according to the traffic-policing actions configured for the policer. This example discards packets that burst over the 15 KBps limit.

To rate-limit Layer 3 traffic, you can apply a two-color policer in the following ways:

- Directly to a logical interface, at a specific protocol level.
- As the action of a standard stateless firewall filter that is applied to a logical interface, at a specific protocol level. This is the technique used in this example.

To rate-limit Layer 2 traffic, you can apply a two-color policer as a logical interface policer only. You cannot apply a two-color policer to Layer 2 traffic through a firewall filter.

**CAUTION:** You can choose either bandwidth-limit or bandwidth percent within the policer, as they are mutually exclusive. You cannot configure a policer to use bandwidth percent for aggregate, tunnel, and software interfaces.

In this example, the host is a traffic generator emulating a webserver. Devices R1 and R2 are owned by a service provider. The webserver is accessed by users on Device Host2. Device Host1 will be sending traffic with a source TCP HTTP port of 80 to the users. A single-rate two-color policer is configured and applied to the interface on Device R1 that connects to Device Host1. The policer enforces the contractual bandwidth availability made between the owner of the webserver and the service provider that owns Device R1 for the web traffic that flows over the link that connects Device Host1 to Device R1.

In accordance with the contractual bandwidth availability made between the owner of the webserver and the service provider that owns Devices R1 and R2, the policer will limit the HTTP port 80 traffic originating from Device Host1 to using 700 Mbps (70 percent) of the available bandwidth with an allowable burst rate of 10 x the MTU size of the gigabit Ethernet interface between the host Device Host1 and Device R1.

**NOTE:** In a real-world scenario you would probably also rate limit traffic for a variety of other ports such as FTP, SFTP, SSH, TELNET, SMTP, IMAP, and POP3 because they are often included as additional services with web hosting services.

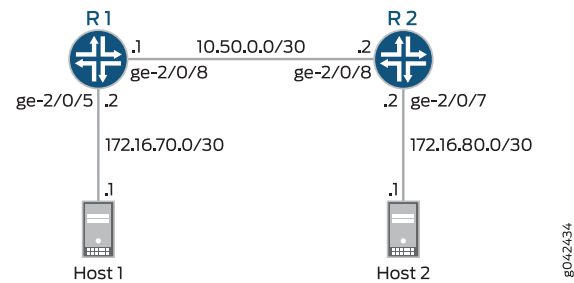

**NOTE:** You need to leave some additional bandwidth available that is not rate limited for network control protocols such as routing protocols, DNS, and any other protocols required to keep network connectivity operational. This is why the firewall filter has a final accept condition on it.

### Topology

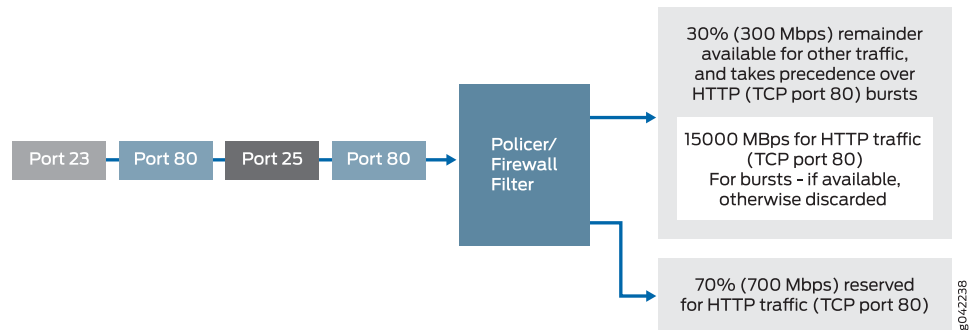

This example uses the topology in [Figure 67 on page 931](#).

Figure 67: Single-Rate Two-Color Policer Scenario

[Figure 68 on page 931](#) shows the policing behavior.

Figure 68: Traffic Limiting in a Single-Rate Two-Color Policer Scenario

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

#### Device R1

```
set interfaces ge-2/0/5 description to-Host
set interfaces ge-2/0/5 unit 0 family inet address 172.16.70.2/30
set interfaces ge-2/0/5 unit 0 family inet filter input mf-classifier
set interfaces ge-2/0/8 description to-R2
set interfaces ge-2/0/8 unit 0 family inet address 10.50.0.1/30
set interfaces lo0 unit 0 description loopback-interface
set interfaces lo0 unit 0 family inet address 192.168.13.1/32
set firewall policer discard if-exceeding bandwidth-limit 700m
set firewall policer discard if-exceeding burst-size-limit 15k
set firewall policer discard then discard
set firewall family inet filter mf-classifier term t1 from protocol tcp
set firewall family inet filter mf-classifier term t1 from port 80
set firewall family inet filter mf-classifier term t1 then policer discard
set firewall family inet filter mf-classifier term t2 then accept
```

```
set protocols ospf area 0.0.0.0 interface ge-2/0/5.0 passive
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface ge-2/0/8.0
```

**Device R2**

```
set interfaces ge-2/0/8 description to-R1
set interfaces ge-2/0/8 unit 0 family inet address 10.50.0.2/30
set interfaces ge-2/0/7 description to-Host
set interfaces ge-2/0/7 unit 0 family inet address 172.16.80.2/30
set interfaces lo0 unit 0 description loopback-interface
set interfaces lo0 unit 0 family inet address 192.168.14.1/32
set protocols ospf area 0.0.0.0 interface ge-2/0/7.0 passive
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface ge-2/0/8.0
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.  

```
[edit interfaces]
user@R1# set ge-2/0/5 description to-Host
user@R1# set ge-2/0/5 unit 0 family inet address 172.16.70.2/30
user@R1# set ge-2/0/8 description to-R2
user@R1# set ge-2/0/8 unit 0 family inet address 10.50.0.1/30
user@R1# set lo0 unit 0 description loopback-interface
user@R1# set lo0 unit 0 family inet address 192.168.13.1/32
```
2. Apply the firewall filter to interface ge-2/0/5 as an input filter.  

```
[edit interfaces ge-2/0/5 unit 0 family inet]
user@R1# set filter input mf-classifier
```
3. Configure the policer to rate-limit to a bandwidth of 700 Mbps and a burst size of 15000 KBps for HTTP traffic (TCP port 80).  

```
[edit firewall policer discard]
user@R1# set if-exceeding bandwidth-limit 700m
user@R1# set if-exceeding burst-size-limit 15k
```
4. Configure the policer to discard packets in the red traffic flow.  

```
[edit firewall policer discard]
user@R1# set then discard
```
5. Configure the two conditions of the firewall to accept all TCP traffic to port HTTP (port 80).  

```
[edit firewall family inet filter mf-classifier]
user@R1# set term t1 from protocol tcp
user@R1# set term t1 from port 80
```
6. Configure the firewall action to rate-limit HTTP TCP traffic using the policer.  

```
[edit firewall family inet filter mf-classifier]
user@R1# set term t1 then policer discard
```

7. At the end of the firewall filter, configure a default action that accepts all other traffic.

Otherwise, all traffic that arrives on the interface and is not explicitly accepted by the firewall is discarded.

```
[edit firewall family inet filter mf-classifier]
user@R1# set term t2 then accept
```

8. Configure OSPF.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface ge-2/0/5.0 passive
user@R1# set area 0.0.0.0 interface lo0.0 passive
user@R1# set area 0.0.0.0 interface ge-2/0/8.0
```

#### Step-by-Step Procedure

To configure Device R2:

1. Configure the device interfaces.

```
[edit interfaces]
user@R1# set ge-2/0/8 description to-R1
user@R1# set ge-2/0/7 description to-Host
user@R1# set lo0 unit 0 description loopback-interface
user@R1# set ge-2/0/8 unit 0 family inet address 10.50.0.2/30
user@R1# set ge-2/0/7 unit 0 family inet address 172.16.80.2/30
user@R1# set lo0 unit 0 family inet address 192.168.14.1/32
```

2. Configure OSPF.

```
[edit protocols ospf]
user@R1# set area 0.0.0.0 interface ge-2/0/7.0 passive
user@R1# set area 0.0.0.0 interface lo0.0 passive
user@R1# set area 0.0.0.0 interface ge-2/0/8.0
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces** , **show firewall**, and **show protocols ospf** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
ge-2/0/5 {
  description to-Host;
  unit 0 {
    family inet {
      filter {
        input mf-classifier;
      }
      address 172.16.70.2/30;
    }
  }
}
ge-2/0/8 {
  description to-R2;
  unit 0 {
    family inet {
      address 10.50.0.1/30;
    }
  }
}
```

```

    }
  }
  lo0 {
    unit 0 {
      description loopback-interface;
      family inet {
        address 192.168.13.1/32;
      }
    }
  }
}

```

user@R1# show firewall

```

family inet {
  filter mf-classifier {
    term t1 {
      from {
        protocol tcp;
        port 80;
      }
      then policer discard;
    }
    term t2 {
      then accept;
    }
  }
}
policer discard {
  if-exceeding {
    bandwidth-limit 700m;
    burst-size-limit 15k;
  }
  then discard;
}

```

user@R1# show protocols ospf

```

area 0.0.0.0 {
  interface ge-2/0/5.0 {
    passive;
  }
  interface lo0.0 {
    passive;
  }
  interface ge-2/0/8.0;
}

```

If you are done configuring Device R1, enter **commit** from configuration mode.

user@R2# show interfaces

```

ge-2/0/7 {
  description to-Host;
  unit 0 {
    family inet {
      address 172.16.80.2/30;
    }
  }
}
ge-2/0/8 {

```

```

description to-R1;
unit 0 {
    family inet {
        address 10.50.0.2/30;
    }
}
lo0 {
    unit 0 {
        description loopback-interface;
        family inet {
            address 192.168.14.1/32;
        }
    }
}

user@R2# show protocols ospf
area 0.0.0.0 {
    interface ge-2/0/7.0 {
        passive;
    }
    interface lo0.0 {
        passive;
    }
    interface ge-2/0/8.0;
}

```

If you are done configuring Device R2, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Clearing the Counters on page 935](#)
- [Sending TCP Traffic into the Network and Monitoring the Discards on page 935](#)

#### *Clearing the Counters*

**Purpose** Confirm that the firewall counters are cleared.

**Action** On Device R1, run the **clear firewall all** command to reset the firewall counters to 0.

```
user@R1> clear firewall all
```

#### *Sending TCP Traffic into the Network and Monitoring the Discards*

**Purpose** Make sure that the traffic of interest that is sent is rate-limited on the input interface (ge-2/0/5).

**Action** 1. Use a traffic generator to send 10 TCP packets with a source port of 80.

The **-s** flag sets the source port. The **-k** flag causes the source port to remain steady at 80 instead of incrementing. The **-c** flag sets the number of packets to 10. The **-d** flag sets the packet size.

The destination IP address of 172.16.80.1 belongs to Device Host 2 that is connected to Device R2. The user on Device Host 2 has requested a webpage from Device Host 1 (the webserver emulated by the traffic generator on Device Host 1). The packets that being rate-limited are sent from Device Host 1 in response to the request from Device Host 2.

**NOTE:** In this example the policer numbers are reduced to a bandwidth limit of 8 Kbps and a burst size limit of 1500 KBps to ensure that some packets are dropped during this test.

```
[root@host]# hping 172.16.80.1 -c 10 -s 80 -k -d 300
```

```
[User@Host]# hping 172.16.80.1 -c 10 -s 80 -k -d 350
HPING 172.16.80.1 (eth1 172.16.80.1): NO FLAGS are set, 40 headers + 350 data
bytes
len=46 ip=172.16.80.1 ttl=62 DF id=0 sport=0 flags=RA seq=0 win=0 rtt=0.5 ms
.
.
.
--- 172.16.80.1 hping statistic ---
10 packets transmitted, 6 packets received, 40% packet loss
round-trip min/avg/max = 0.5/3000.8/7001.3 ms
```

- On Device R1, check the firewall counters by using the **show firewall** command.

```
user@R1> show firewall
```

```
User@R1# run show firewall
```

```
Filter: __default_bpdu_filter__
```

```
Filter: mf-classifier
```

```
Policers:
```

| Name       | Bytes | Packets |
|------------|-------|---------|
| discard-t1 | 1560  | 4       |

**Meaning** In Steps 1 and 2 the output from both devices shows that 4 packets were discarded. This means that there was at least 8 Kbps of green (in-contract HTTP port 80) traffic and that the 1500 KBps burst option for red out-of-contract HTTP port 80 traffic was exceeded.

## Example: Configuring Interface and Firewall Filter Policers at the Same Interface

This example shows how to configure three single-rate two-color policers and apply the policers to the IPv4 input traffic at the same single-tag virtual LAN (VLAN) logical interface.

- [Requirements on page 937](#)
- [Overview on page 937](#)

- [Configuration on page 938](#)
- [Verification on page 944](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

In this example, you configure three single-rate two-color policers and apply the policers to the IPv4 input traffic at the same single-tag VLAN logical interface. Two policers are applied to the interface through a firewall filter, and one policer is applied directly to the interface.

You configure one policer, named **p-all-1m-5k-discard**, to rate-limit traffic to 1 Mbps with a burst size of 5000 bytes. You apply this policer directly to IPv4 input traffic at the logical interface. When you apply a policer directly to protocol-specific traffic at a logical interface, the policer is said to be applied as an *interface policer*.

You configure the other two policers to allow burst sizes of 500 KB, and you apply these policers to IPv4 input traffic at the logical interface by using an IPv4 standard stateless firewall filter. When you apply a policer to protocol-specific traffic at a logical interface through a firewall filter action, the policer is said to be applied as a *firewall-filter policer*.

- You configure the policer named **p-icmp-500k-500k-discard** to rate-limit traffic to 500 Kbps with a burst size of 500 K bytes by discarding packets that do not conform to these limits. You configure one of the firewall filter terms to apply this policer to Internet Control Message Protocol (ICMP) packets.
- You configure the policer named **p-ftp-10p-500k-discard** to rate-limit traffic to a 10 percent bandwidth with a burst size of 500 KB by discarding packets that do not conform to these limits. You configure another firewall-filter term to apply this policer to File Transfer Protocol (FTP) packets.

A policer that you configure with a bandwidth limit expressed as a percentage value (rather than as an absolute bandwidth value) is called a *bandwidth policer*. Only single-rate two-color policers can be configured with a percentage bandwidth specification. By default, a bandwidth policer rate-limits traffic to the specified percentage of the line rate of the physical interface underlying the target logical interface.

## Topology

You configure the target logical interface as a single-tag VLAN logical interface on a Fast Ethernet interface operating at 100 Mbps. This means that the policer you configure with the 10-percent bandwidth-limit (the policer that you apply to FTP packets) rate-limits the FTP traffic on this interface to 10 Mbps.

**NOTE:** In this example, you do not configure the bandwidth policer as a *logical-bandwidth policer*. Therefore, the percentage is based on the physical media rate rather than on the configured shaping rate of the logical interface.

The firewall filter that you configure to reference two of the policers must be configured as an *interface-specific filter*. Because the policer that is used to rate-limit FTP packets specifies the bandwidth limit as a percentage value, the firewall filter that references this policer must be configured as an interface-specific filter. Thus, if this firewall filter were to be applied to multiple interfaces instead of just the Fast Ethernet interface in this example, unique policers and counters would be created for each interface to which the filter is applied.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Single-Tag VLAN Logical Interface on page 939](#)
- [Configuring the Three Policers on page 940](#)
- [Configuring the IPv4 Firewall Filter on page 941](#)
- [Applying the Interface Policer and Firewall Filter Policers to the Logical Interface on page 943](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces fe-0/1/1 vlan-tagging
set interfaces fe-0/1/1 unit 0 vlan-id 100
set interfaces fe-0/1/1 unit 0 family inet address 10.20.15.1/24
set interfaces fe-0/1/1 unit 1 vlan-id 101
set interfaces fe-0/1/1 unit 1 family inet address 10.20.240.1/24
set firewall policer p-all-1m-5k-discard if-exceeding bandwidth-limit 1m
set firewall policer p-all-1m-5k-discard if-exceeding burst-size-limit 5k
set firewall policer p-all-1m-5k-discard then discard
set firewall policer p-ftp-10p-500k-discard if-exceeding bandwidth-percent 10
set firewall policer p-ftp-10p-500k-discard if-exceeding burst-size-limit 500k
set firewall policer p-ftp-10p-500k-discard then discard
set firewall policer p-icmp-500k-500k-discard if-exceeding bandwidth-limit 500k
set firewall policer p-icmp-500k-500k-discard if-exceeding burst-size-limit 500k
set firewall policer p-icmp-500k-500k-discard then discard
set firewall family inet filter filter-ipv4-with-limits interface-specific
set firewall family inet filter filter-ipv4-with-limits term t-ftp from protocol tcp
set firewall family inet filter filter-ipv4-with-limits term t-ftp from port ftp
set firewall family inet filter filter-ipv4-with-limits term t-ftp from port ftp-data
set firewall family inet filter filter-ipv4-with-limits term t-ftp then policer
  p-ftp-10p-500k-discard
set firewall family inet filter filter-ipv4-with-limits term t-icmp from protocol icmp
set firewall family inet filter filter-ipv4-with-limits term t-icmp then policer
  p-icmp-500k-500k-discard
set firewall family inet filter filter-ipv4-with-limits term catch-all then accept
set interfaces fe-0/1/1 unit 1 family inet filter input filter-ipv4-with-limits
set interfaces fe-0/1/1 unit 1 family inet policer input p-all-1m-5k-discard
```

*Configuring the Single-Tag VLAN Logical Interface***Step-by-Step Procedure**

To configure the single-tag VLAN logical interface:

1. Enable configuration of the Fast Ethernet interface.  

```
[edit]
user@host# edit interfaces fe-0/1/1
```
2. Enable single-tag VLAN framing.  

```
[edit interfaces fe-0/1/1]
user@host# set vlan-tagging
```
3. Bind VLAN IDs to the logical interfaces.  

```
[edit interfaces fe-0/1/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 1 vlan-id 101
```
4. Configure IPv4 on the single-tag VLAN logical interfaces.  

```
[edit interfaces fe-0/1/1]
user@host# set unit 0 family inet address 10.20.15.1/24
user@host# set unit 1 family inet address 10.20.240.1/24
```

**Results** Confirm the configuration of the VLAN by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
fe-0/1/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.20.15.1/24;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 10.20.240.1/24;
    }
  }
}
```

### Configuring the Three Policers

#### Step-by-Step Procedure

To configure the three policers:

1. Enable configuration of a two-color policer that discards packets that do not conform to a bandwidth of 1 Mbps and a burst size of 5000 bytes.

**NOTE:** You apply this policer directly to all IPv4 input traffic at the single-tag VLAN logical interface, so the packets will not be filtered before being subjected to rate limiting.

[edit]

user@host# edit **firewall policer p-all-1m-5k-discard**

2. Configure the first policer.

[edit firewall policer p-all-1m-5k-discard]

user@host# set if-exceeding **bandwidth-limit 1m**

user@host# set if-exceeding **burst-size-limit 5k**

user@host# set then discard

3. Enable configuration of a two-color policer that discards packets that do not conform to a bandwidth specified as "10 percent" and a burst size of 500,000 bytes.

You apply this policer only to the FTP traffic at the single-tag VLAN logical interface.

You apply this policer as the action of an IPv4 firewall filter term that matches FTP packets from TCP.

[edit firewall policer p-all-1m-5k-discard]

user@host# up

[edit]

user@host# edit **firewall policer p-ftp-10p-500k-discard**

4. Configure policing limits and actions.

[edit firewall policer p-ftp-10p-500k-discard]

user@host# set if-exceeding **bandwidth-percent 10**

user@host# set if-exceeding **burst-size-limit 500k**

user@host# set then discard

Because the bandwidth limit is specified as a percentage, the firewall filter that references this policer must be configured as an interface-specific filter.

**NOTE:** If you wanted this policer to rate-limit to 10 percent of the logical interface configured shaping rate (rather than to 10 percent of the physical interface media rate), you would need to include the **logical-bandwidth-policer** statement at the [edit firewall policer p-all-1m-5k-discard] hierarchy level. This type of policer is called a *logical-bandwidth policer*.

5. Enable configuration of the IPv4 firewall filter policer for ICMP packets.

```
[edit firewall policer p-ftp-10p-500k-discard]
user@host# up

[edit]
user@host# edit firewall policer p-icmp-500k-500k-discard
```

6. Configure policing limits and actions.

```
[edit firewall policer p-icmp-500k-500k-discard]
user@host# set if-exceeding bandwidth-limit 500k
user@host# set if-exceeding burst-size-limit 500k
user@host# set then discard
```

**Results** Confirm the configuration of the policers by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer p-all-1m-5k-discard {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 5k;
  }
  then discard;
}
policer p-ftp-10p-500k-discard {
  if-exceeding {
    bandwidth-percent 10;
    burst-size-limit 500k;
  }
  then discard;
}
policer p-icmp-500k-500k-discard {
  if-exceeding {
    bandwidth-limit 500k;
    burst-size-limit 500k;
  }
  then discard;
}
```

### *Configuring the IPv4 Firewall Filter*

**Step-by-Step Procedure** To configure the IPv4 firewall filter:

1. Enable configuration of the IPv4 firewall filter.

```
[edit]
user@host# edit firewall family inet filter filter-ipv4-with-limits
```

2. Configure the firewall filter as interface-specific.

```
[edit firewall family inet filter filter-ipv4-with-limits]
user@host# set interface-specific
```

The firewall filter must be interface-specific because one of the policers referenced is configured with a bandwidth limit expressed as a percentage value.

3. Enable configuration of a filter term to rate-limit FTP packets.

```
[edit firewall family inet filter filter-ipv4-with-limits]
user@host# edit term t-ftp
```

```
[edit firewall family inet filter filter-ipv4-with-limits term t-ftp]
user@host# set from protocol tcp
user@host# set from port [ ftp ftp-data ]
```

FTP messages are sent over TCP port 20 (**ftp**) and received over TCP port 21 (**ftp-data**).

4. Configure the filter term to match FTP packets.

```
[edit firewall family inet filter filter-ipv4-with-limits term t-ftp]
user@host# set then policer p-ftp-10p-500k-discard
```

5. Enable configuration of a filter term to rate-limit ICMP packets.

```
[edit firewall family inet filter filter-ipv4-with-limits term t-ftp]
user@host# up
```

```
[edit firewall family inet filter filter-ipv4-with-limits]
user@host# edit term t-icmp
```

6. Configure the filter term for ICMP packets

```
[edit firewall family inet filter filter-ipv4-with-limits term t-icmp]
user@host# set from protocol icmp
user@host# set then policer p-icmp-500k-500k-discard
```

7. Configure a filter term to accept all other packets without policing.

```
[edit firewall family inet filter filter-ipv4-with-limits term t-icmp]
user@host# up
```

```
[edit firewall family inet filter filter-ipv4-with-limits]
user@host# set term catch-all then accept
```

**Results** Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter filter-ipv4-with-limits {
    interface-specific;
    term t-ftp {
      from {
        protocol tcp;
        port [ ftp ftp-data ];
      }
      then policer p-ftp-10p-500k-discard;
    }
  }
}
```

```

term t-icmp {
    from {
        protocol icmp;
    }
    then policer p-icmp-500k-500k-discard;
}
term catch-all {
    then accept;
}
}
}
policer p-all-1m-5k-discard {
    if-exceeding {
        bandwidth-limit 1m;
        burst-size-limit 5k;
    }
    then discard;
}
policer p-ftp-10p-500k-discard {
    if-exceeding {
        bandwidth-percent 10;
        burst-size-limit 500k;
    }
    then discard;
}
policer p-icmp-500k-500k-discard {
    if-exceeding {
        bandwidth-limit 500k;
        burst-size-limit 500k;
    }
    then discard;
}
}

```

### *Applying the Interface Policer and Firewall Filter Policers to the Logical Interface*

#### **Step-by-Step Procedure**

To apply the three policers to the VLAN:

1. Enable configuration of IPv4 on the logical interface.  

```
[edit]
user@host# edit interfaces fe-0/1/1 unit 1 family inet
```
2. Apply the firewall filter policers to the interface.  

```
[edit interfaces fe-0/1/1 unit 1 family inet]
user@host# set filter input filter-ipv4-with-limits
```
3. Apply the interface policer to the interface.  

```
[edit interfaces fe-0/1/1 unit 1 family inet]
user@host# set policer input p-all-1m-5k-discard
```

Input packets at **fe-0/1/1.0** are evaluated against the interface policer before they are evaluated against the firewall filter policers. For more information, see [“Order of Policer and Firewall Filter Operations” on page 874](#).

**Results** Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
fe-0/1/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.20.15.1/24;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      filter {
        input filter-ipv4-with-limits;
      }
      policer {
        input p-all-1m-5k-discard;
      }
      address 10.20.240.1/24;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Displaying Policers Applied Directly to the Logical Interface on page 944](#)
- [Displaying Statistics for the Policer Applied Directly to the Logical Interface on page 945](#)
- [Displaying the Policers and Firewall Filters Applied to an Interface on page 945](#)
- [Displaying Statistics for the Firewall Filter Policers on page 946](#)

### *Displaying Policers Applied Directly to the Logical Interface*

**Purpose** Verify that the interface policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces policers** operational mode command for logical interface **fe-0/1/1.1**. The command output section for the **Proto** column and **Input Policer** column shows that the policer **p-all-1m-5k-discard** is evaluated when packets are received on the logical interface.

```
user@host> show interfaces policers fe-0/1/1.1
Interface      Admin Link Proto Input Policer      Output Policer
fe-0/1/1.1     up      up      inet  p-all-1m-5k-discard-fe-0/1/1.1-inet-i
```

In this example, the interface policer is applied to logical interface traffic in the input direction only.

### *Displaying Statistics for the Policer Applied Directly to the Logical Interface*

**Purpose** Verify the number of packets evaluated by the interface policer.

**Action** Use the `show policer` operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction.

```
user@host> show policer p-all-1m-5k-discard-fe-0/1/1.1-inet-i
Policers:
Name                                     Bytes      Packets
p-all-1m-5k-discard-fe-0/1/1.1-inet-i    200         5
```

### *Displaying the Policers and Firewall Filters Applied to an Interface*

**Purpose** Verify that the firewall filter `filter-ipv4-with-limits` is applied to the IPv4 input traffic at logical interface `fe-0/1/1.1`.

**Action** Use the `show interfaces statistics` operational mode command for logical interface `fe-0/1/1.1`, and include the `detail` option. Under the **Protocol inet** section of the command output section, the **Input Filters** and **Policer** lines display the names of filter and policer applied to the logical interface in the input direction.

```
user@host> show interfaces statistics fe-0/1/1.1 detail
Logical interface fe-0/1/1.1 (Index 83) (SNMP ifIndex 545) (Generation 153)
Flags: SNMP-Traps 0x4000 VLAN-Tag [ 0x8100.100 ] Encapsulation: ENET2
Traffic statistics:
  Input bytes : 0
  Output bytes : 46
  Input packets: 0
  Output packets: 1
Local statistics:
  Input bytes : 0
  Output bytes : 46
  Input packets: 0
  Output packets: 1
Transit statistics:
  Input bytes : 0 0 bps
  Output bytes : 0 0 bps
  Input packets: 0 0 pps
  Output packets: 0 0 pps
Protocol inet, MTU: 1500, Generation: 176, Route table: 0
Flags: Sendbcst-pkt-to-re
Input Filters: filter-ipv4-with-limits-fe-0/1/1.1-i
Policer: Input: p-all-1m-5k-discard-fe-0/1/1.1-inet-i
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.20.130/24, Local: 10.20.130.1, Broadcast: 10.20.130.255,
Generation: 169
```

In this example, the two firewall filter policers are applied to logical interface traffic in the input direction only.

### *Displaying Statistics for the Firewall Filter Policers*

**Purpose** Verify the number of packets evaluated by the firewall filter policers.

**Action** Use the **show firewall** operational mode command for the filter you applied to the logical interface.

[edit]

```
user@host> show firewall filter filter-ipv4-with-limits-fe-0/1/1.1-i
```

```
Filter: filter-ipv4-with-limits-fe-0/1/1.1-i
```

```
Policers:
```

| Name                                         | Bytes | Packets |
|----------------------------------------------|-------|---------|
| p-ftp-10p-500k-discard-t-ftp-fe-0/1/1.1-i    | 0     | 0       |
| p-icmp-500k-500k-discard-t-icmp-fe-0/1/1.1-i | 0     | 0       |

The command output displays the names of the policers (**p-ftp-10p-500k-discard** and **p-icmp-500k-500k-discard**), combined with the names of the filter terms (**t-ftp** and **t-icmp**, respectively) under which the policer action is specified. The policer-specific output lines display the number of packets that matched the filter term. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

## Bandwidth Policers

- [Bandwidth Policar Overview on page 946](#)
- [Example: Configuring a Logical Bandwidth Policar on page 947](#)

### Bandwidth Policar Overview

For a single-rate two-color policar only, you can specify the bandwidth limit as a percentage value from 1 through 100 instead of as an absolute number of bits per second. This type of two-color policar, called a *bandwidth policar*, rate-limits traffic to a bandwidth limit that is calculated as a percentage of either the physical interface media rate or the logical interface configured shaping rate.

---

#### Guidelines for Configuring a Bandwidth Policar

The following guidelines apply to configuring a bandwidth policar:

- To specify a percentage bandwidth limit, you include the **bandwidth-percent *percentage*** statement in place of the **bandwidth-limit *bps*** statement.

- By default, a bandwidth policer calculates the percentage bandwidth limit based on the physical interface port speed. To configure a bandwidth policer to calculate the percentage bandwidth limit based on the configured logical interface shaping rate instead, include the `logical-bandwidth-policer` statement at the `[edit firewall policer policer-name]` hierarchy level. This type of bandwidth policer is called a *logical bandwidth policer*.

You can configure a logical interface shaping rate by including the `shaping-rate bps` statement at the `[edit class-of-service interfaces interface interface-name unit logical-unit-number]` hierarchy level. A logical interface shaping rate causes the specified amount of bandwidth to be allocated to the logical interface.

**NOTE:** If you configure a logical-bandwidth policer and then apply the policer to a logical interface that is not configured with a shaping rate, then the policer rate-limits traffic on that logical interface to calculate the percentage bandwidth limit based on the physical interface port speed, even if you include the `logical-bandwidth-policer` statement in the bandwidth policer configuration.

- If you reference a bandwidth policer from a stateless firewall filter term, you must include the `interface-specific` statement in the firewall filter configuration.

### Guidelines for Applying a Bandwidth Policer

The following guidelines pertain to applying a bandwidth policer to traffic:

- You can use a bandwidth policer to rate-limit protocol-specific traffic (not **family any**) at the input or output of a logical interface.
- You can apply a bandwidth policer directly to protocol-specific input or output traffic at a logical interface.
- To send only selected packets to a bandwidth policer, you can reference the bandwidth policer from a stateless firewall filter term and then apply the filter to logical interface traffic for a specific protocol family.
  - To reference a *logical bandwidth policer* from a firewall filter, you must include the `interface-specific` statement in the firewall filter configuration.
  - You cannot use a bandwidth policer for forwarding-table filters.
- You cannot apply a bandwidth policer to an aggregate interface, a tunnel interface, or a software interface.

### Example: Configuring a Logical Bandwidth Policer

This example shows how to configure a logical bandwidth policer.

- [Requirements on page 948](#)
- [Overview on page 948](#)

- [Configuration on page 949](#)
- [Verification on page 953](#)

## Requirements

---

Before you begin, make sure that you have two logical units available on a Gigabit Ethernet interface.

## Overview

---

In this example, you configure a single-rate two-color policer that specifies the bandwidth limit as a percentage value rather than as an absolute number of bits per second. This type of policer is called a *bandwidth policer*. By default, a bandwidth policer enforces a bandwidth limit based on the line rate of the underlying physical interface. As an option, you can configure a bandwidth policer to enforce a bandwidth limit based on the configured shaping rate of the logical interface. To configure this type of bandwidth policer, called a *logical bandwidth policer*, you include the [logical-bandwidth-policer](#) statement in the policer configuration.

To configure a logical interface shaping rate, include the **shaping-rate *bps*** statement at the **[edit class-of-service interfaces interface *interface-name* unit *logical-unit-number*]** hierarchy level. This class-of-service (CoS) configuration statement causes the specified amount of bandwidth to be allocated to the logical interface.

**NOTE:** If you configure a policer bandwidth limit as a percentage but a shaping rate is not configured for the target logical interface, the policer bandwidth limit is calculated as a percentage of the physical interface media rate, even if you enable the logical-bandwidth policing feature.

To apply a logical bandwidth policer to a logical interface, you can apply the policer directly to the logical interface at the protocol family level or (if you only need to rate-limit filtered packets) you can reference the policer from a stateless firewall filter configured to operate in *interface-specific* mode.

## Topology

In this example, you configure two logical interfaces on a single Gigabit Ethernet interface and configure a shaping rate on each logical interface. On logical interface **ge-1/3/0.0**, you allocate 4 Mbps of bandwidth. On logical interface **ge-1/3/0.1**, you allocate 2 Mbps of bandwidth.

You also configure a logical bandwidth policer with a bandwidth limit of 50 percent and a maximum burst size of 125,000 bytes, and then you apply the policer to input and output traffic at the logical units configured on **ge-1/3/0.0**. For logical interface **ge-1/3/0.0**, the policer rate-limits to a bandwidth limit of 2 Mbps (50 percent of the 4 Mbps shaping rate configured for the logical interface). For logical interface **ge-1/3/0.1**, the policer rate-limits traffic to a bandwidth limit of 1 Mbps (50 percent of the 2 Mbps shaping rate configured for the logical interface).

If no shaping rate is configured for a target logical interface, the policer rate-limits to a bandwidth limit calculated as 50 percent of the physical interface media rate. For example, if you apply a 50 percent bandwidth policer to input or output traffic at a Gigabit Ethernet logical interface without rate shaping, the policer applies a bandwidth limit of 500 Mbps (50 percent of 1000 Mbps).

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Logical Interfaces on page 949](#)
- [Configuring Traffic Rate-Shaping by Specifying the Amount of Bandwidth to be Allocated to the Logical Interface on page 950](#)
- [Configuring the Logical Bandwidth Policer on page 951](#)
- [Applying the Logical Bandwidth Policers to the Logical Interfaces on page 952](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/3/0 per-unit-scheduler
set interfaces ge-1/3/0 vlan-tagging
set interfaces ge-1/3/0 unit 0 vlan-id 100
set interfaces ge-1/3/0 unit 0 family inet address 172.1.1.1/30
set interfaces ge-1/3/0 unit 1 vlan-id 200
set interfaces ge-1/3/0 unit 1 family inet address 172.2.1.1/30
set class-of-service interfaces ge-1/3/0 unit 0 shaping-rate 4m
set class-of-service interfaces ge-1/3/0 unit 1 shaping-rate 2m
set firewall policer LB-policer logical-bandwidth-policer
set firewall policer LB-policer if-exceeding bandwidth-percent 50
set firewall policer LB-policer if-exceeding burst-size-limit 125k
set firewall policer LB-policer then discard
set interfaces ge-1/3/0 unit 0 family inet policer input LB-policer
set interfaces ge-1/3/0 unit 0 family inet policer output LB-policer
set interfaces ge-1/3/0 unit 1 family inet policer input LB-policer
set interfaces ge-1/3/0 unit 1 family inet policer output LB-policer
```

#### Configuring the Logical Interfaces

#### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the physical interface.

```
[edit]
user@host# edit interfaces ge-1/3/0
```

```
[edit interfaces ge-1/3/0]
user@host# set per-unit-scheduler
user@host# set vlan-tagging
```

2. Configure the first logical interface.

```
[edit interfaces ge-1/3/0]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 172.1.1.1/30
```

3. Configure the second logical interface.

```
[edit interfaces ge-1/3/0]
user@host# set unit 1 vlan-id 200
user@host# set unit 1 family inet address 172.2.1.1/30
```

**Results** Confirm the configuration of the interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/0 {
  per-unit-scheduler;
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 172.1.1.1/30;
    }
  }
  unit 1 {
    vlan-id 200;
    family inet {
      address 172.2.1.1/30;
    }
  }
}
```

#### *Configuring Traffic Rate-Shaping by Specifying the Amount of Bandwidth to be Allocated to the Logical Interface*

**Step-by-Step Procedure** To configure rate shaping by specifying the bandwidth to be allocated to the logical interface:

1. Enable CoS configuration on the physical interface.

```
[edit]
user@host# edit class-of-service interfaces ge-1/3/0
```

2. Configure rate shaping for the logical interfaces.

```
[edit class-of-service interfaces ge-1/3/0]
user@host# set unit 0 shaping-rate 4m
user@host# set unit 1 shaping-rate 2m
```

These statements allocate 4 Mbps of bandwidth to logical unit **ge-1/3/0.0** and 2 Mbps of bandwidth to logical unit **ge-1/3/0.1**.

**Results** Confirm the configuration of the rate shaping by entering the **show class-of-service** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
interfaces {
  ge-1/3/0 {
    unit 0 {
      shaping-rate 4m;
    }
    unit 1 {
      shaping-rate 2m;
    }
  }
}
```

### *Configuring the Logical Bandwidth Policer*

**Step-by-Step Procedure** To configure the logical bandwidth policer:

1. Enable configuration of a single-rate two-color policer.

```
[edit]
user@host# edit firewall policer LB-policer
```

2. Configure the policer as a logical-bandwidth policer.

```
[edit firewall policer LB-policer]
user@host# set logical-bandwidth-policer
```

This applies the rate-limiting to logical interfaces.

3. Configure the policer traffic limits and actions.

```
[edit firewall policer LB-policer]
user@host# set if-exceeding bandwidth-percent 50
user@host# set if-exceeding burst-size-limit 125k
user@host# set then discard
```

**Results** Confirm the configuration of the policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer LB-policer {
  logical-bandwidth-policer;
  if-exceeding {
    bandwidth-percent 50;
    burst-size-limit 125k;
  }
  then discard;
}
```

*Applying the Logical Bandwidth Policers to the Logical Interfaces***Step-by-Step Procedure**

To configure the logical bandwidth policers to the logical interfaces:

1. Enable configuration of the interface.  
  
[edit]  
user@host# edit interfaces ge-1/3/0
2. Apply the logical bandwidth policer to the first logical interface.  
  
[edit interfaces ge-1/3/0]  
user@host# set unit 0 family inet policer input LB-policer  
user@host# set unit 0 family inet policer output LB-policer
3. Apply the policing to the second logical interface.  
  
[edit interfaces ge-1/3/0]  
user@host# set unit 1 family inet policer input LB-policer  
user@host# set unit 1 family inet policer output LB-policer

**Results**

Confirm the configuration of the interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/0 {
  per-unit-scheduler;
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      policer {
        input LB-policer;
        output LB-policer;
      }
      address 172.1.1/30;
    }
  }
  unit 1 {
    vlan-id 200;
    family inet {
      policer {
        input LB-policer;
        output LB-policer;
      }
      address 172.2.1/30;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Displaying Traffic Statistics and Policers for the Logical Interface on page 953](#)
- [Displaying Statistics for the Policer on page 954](#)

### *Displaying Traffic Statistics and Policers for the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces** operational mode command for logical interfaces **ge-1/3/0.0** and **ge-1/3/0.1**, and include the **detail** or **extensive** option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that lists the policer **LB-policer** as an input or output policer as follows:

- **Input:** LB-policer-ge-1/3/0.0-inet-i
- **Output:** LB-policer-ge-1/3/0.0-inet-o

In this example, the policer is applied to logical interface traffic in both the input and output directions.

```
user@host> show interfaces ge-1/3/0.0 detail
Logical interface ge-1/3/0.0 (Index 80) (SNMP ifIndex 154) (Generation 150)

```

### Displaying Statistics for the Policer

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the [show policer](#) operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer **LB-policer**, the input and output policer names are displayed as follows:

- **LB-policer-ge-1/3/0.0-inet-i**
- **LB-policer-ge-1/3/0.0-inet-o**
- **LB-policer-ge-1/3/0.1-inet-i**
- **LB-policer-ge-1/3/0.1-inet-o**

The **-inet-i** suffix denotes a policer applied to logical interface input traffic, while the **-inet-o** suffix denotes a policer applied to logical interface output traffic. In this example, the policer is applied to both input and output traffic on logical interface **ge-1/3/0.0** and logical interface **ge-1/3/0.1**.

```

user@host> show policer
Policers:
Name                                     Packets
__default_arp_policer__                 0
LB-policer-ge-1/3/0.0-inet-i             0
LB-policer-ge-1/3/0.0-inet-o             0
LB-policer-ge-1/3/0.1-inet-i             0
LB-policer-ge-1/3/0.1-inet-o             0

```

## Filter-Specific Counters and Policers

- [Filter-Specific Policer Overview on page 955](#)
- [Example: Configuring a Stateless Firewall Filter to Protect Against TCP and ICMP Floods on page 955](#)

### Filter-Specific Policer Overview

By default, a policer operates in *term-specific* mode so that, for a given firewall filter, the Junos OS creates a separate policer instance for every filter term that references the policer. As an option, you can configure a policer to operate in *filter-specific* mode so that a single policer instance is used by all terms (within the same firewall filter) that reference the policer.

For an IPv4 firewall filter with multiple terms that reference the same policer, configuring the policer to operate in filter-specific mode enables you to count and monitor the activity of the policer at the firewall filter level.

**NOTE:** Term-specific mode and filter-specific mode also apply to prefix-specific policer sets.

To enable a single-rate two-color policer to operate in filter-specific mode, you can include the **filter-specific** statement at the following hierarchy levels:

- **[edit firewall policer *policer-name*]**
- **[edit logical-systems *logical-system-name* firewall policer *policer-name*]**

You can reference filter-specific policers from IPv4 (**family inet**) firewall filters only.

### Example: Configuring a Stateless Firewall Filter to Protect Against TCP and ICMP Floods

This example shows how to create a stateless firewall filter that protects against TCP and ICMP denial-of-service attacks.

- [Requirements on page 955](#)
- [Overview on page 956](#)
- [Configuration on page 957](#)
- [Verification on page 961](#)

#### Requirements

No special configuration beyond device initialization is required before configuring stateless firewall filters.

## Overview

---

In this example, you create a stateless firewall filter called **protect-RE** that polices TCP and ICMP packets. This example includes the following policers:

- **tcp-connection-policer**—Limits the traffic rate of the TCP packets to 500,000 bps and the burst size to 15,000 bytes. Packets that exceed the traffic rate are discarded.
- **icmp-policer**—Limits the traffic rate of the ICMP packets to 1,000,000 bps and the burst size to 15,000 bytes. Packets that exceed the traffic rate are discarded.

When specifying limits, the bandwidth limit can be from 32,000 bps to 32,000,000,000 bps and the burst-size limit can be from 1,500 bytes through 100,000,000 bytes. Use the following abbreviations when specifying limits: k (1,000), m (1,000,000), and g (1,000,000,000).

Each policer is incorporated into the action of a filter term. This example includes the following terms:

- **tcp-connection-term**—Policies certain TCP packets with a source address of 192.168.0.0/24 or 10.0.0.0/24. These addresses are defined in the **trusted-addresses** prefix list.

Filtered packets include **tcp-established** packets. The **tcp-established** match condition is an alias for the bit-field match condition **tcp-flags "(ack | rst)"**, which indicates an established TCP session, but not the first packet of a TCP connection.

- **icmp-term**—Policies ICMP packets. All ICMP packets are counted in the **icmp-counter** counter.

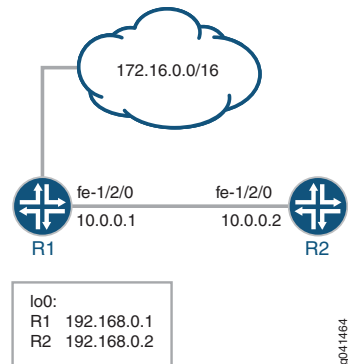

**NOTE:** You can move terms within the firewall filter by using the **insert** command. See *insert* in the *CLI User Guide*.

---

You can apply a stateless firewall to the input or output sides, or both, of an interface. To filter packets transiting the device, apply the firewall filter to any non-Routing Engine interface. To filter packets originating from, or destined for, the Routing Engine, apply the firewall filter to the loopback (lo0) interface.

Figure 47 on page 627 shows the sample network.

Figure 69: Firewall Filter to Protect Against TCP and ICMP Floods

Because this firewall filter limits Routing Engine traffic to TCP packets, routing protocols that use other transport protocols for Layer 4 cannot successfully establish sessions when this filter is active. To demonstrate, this example sets up OSPF between Device R1 and Device R2.

“CLI Quick Configuration” on page 627 shows the configuration for all of the devices in Figure 47 on page 627.

The section “Step-by-Step Procedure” on page 628 describes the steps on Device R2.

### Configuration

#### CLI Quick Configuration

To quickly configure the stateless firewall filter, copy the following commands to a text file, remove any line breaks, and then paste the commands into the CLI.

#### Device R1

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.1/30
set interfaces lo0 unit 0 family inet address 192.168.0.1/32 primary
set interfaces lo0 unit 0 family inet address 172.16.0.1/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext peer-as 200
set protocols bgp group ext neighbor 10.0.0.2
set protocols ospf area 0.0.0.0 interface fe-1/2/0.0
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set policy-options policy-statement send-direct term 1 from protocol direct
set policy-options policy-statement send-direct term 1 then accept
set routing-options router-id 192.168.0.1
set routing-options autonomous-system 100
```

#### Device R2

```
set interfaces fe-1/2/0 unit 0 family inet address 10.0.0.2/30
set interfaces lo0 unit 0 family inet filter input protect-RE
set interfaces lo0 unit 0 family inet address 192.168.0.2/32 primary
set interfaces lo0 unit 0 family inet address 172.16.0.2/32
set protocols bgp group ext type external
set protocols bgp group ext export send-direct
set protocols bgp group ext neighbor 10.0.0.1 peer-as 100
set protocols ospf area 0.0.0.0 interface lo0.0 passive
set protocols ospf area 0.0.0.0 interface fe-1/2/0.0
set policy-options prefix-list trusted-addresses 10.0.0.0/24
set policy-options prefix-list trusted-addresses 192.168.0.0/24
set policy-options policy-statement send-direct term 1 from protocol direct
```

```
set policy-options policy-statement send-direct term 1 then accept
set routing-options router-id 192.168.0.2
set routing-options autonomous-system 200
set firewall family inet filter protect-RE term tcp-connection-term from source-prefix-list
trusted-addresses
set firewall family inet filter protect-RE term tcp-connection-term from protocol tcp
set firewall family inet filter protect-RE term tcp-connection-term from tcp-established
set firewall family inet filter protect-RE term tcp-connection-term then policer
tcp-connection-policer
set firewall family inet filter protect-RE term tcp-connection-term then accept
set firewall family inet filter protect-RE term icmp-term from source-prefix-list
trusted-addresses
set firewall family inet filter protect-RE term icmp-term from protocol icmp
set firewall family inet filter protect-RE term icmp-term then policer icmp-policer
set firewall family inet filter protect-RE term icmp-term then count icmp-counter
set firewall family inet filter protect-RE term icmp-term then accept
set firewall policer tcp-connection-policer filter-specific
set firewall policer tcp-connection-policer if-exceeding bandwidth-limit 1m
set firewall policer tcp-connection-policer if-exceeding burst-size-limit 15k
set firewall policer tcp-connection-policer then discard
set firewall policer icmp-policer filter-specific
set firewall policer icmp-policer if-exceeding bandwidth-limit 1m
set firewall policer icmp-policer if-exceeding burst-size-limit 15k
set firewall policer icmp-policer then discard
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure stateless firewall filter policers:

1. Configure the device interfaces.

```
[edit interfaces fe-1/2/0 unit 0 family inet ]
user@R2# set address 10.0.0.2/30
```

```
[edit interfaces lo0 unit 0 family inet]
user@R2# set address 192.168.0.2/32 primary
user@R2# set address 172.16.0.2/32
```

2. Configure the BGP peering session.

```
[edit protocols bgp group ext]
user@R2# set type external
user@R2# set export send-direct
user@R2# set neighbor 10.0.0.1 peer-as 100
```

3. Configure the autonomous system (AS) number and router ID.

```
[edit routing-options]
user@R2# set autonomous-system 200
user@R2# set router-id 192.168.0.2
```

4. Configure OSPF.

```
[edit protocols ospf area 0.0.0.0]
user@R2# set interface lo0.0 passive
```

```
user@R2# set interface fe-1/2/0.0
```

5. Define the list of trusted addresses.

```
[edit policy-options prefix-list trusted-addresses]
user@R2# set 10.0.0.0/24
user@R2# set 192.168.0.0/24
```

6. Configure a policy to advertise direct routes.

```
[edit policy-options policy-statement send-direct term 1]
user@R2# set from protocol direct
user@R2# set then accept
```

7. Configure the TCP policer.

```
[edit firewall policer tcp-connection-policer]
user@R2# set filter-specific
user@R2# set if-exceeding bandwidth-limit 1m
user@R2# set if-exceeding burst-size-limit 15k
user@R2# set then discard
```

8. Create the ICMP policer.

```
[edit firewall policer icmp-policer]
user@R2# set filter-specific
user@R2# set if-exceeding bandwidth-limit 1m
user@R2# set if-exceeding burst-size-limit 15k
user@R2# set then discard
```

9. Configure the TCP filter rules.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# set from source-prefix-list trusted-addresses
user@R2# set from protocol tcp
user@R2# set from tcp-established
user@R2# set then policer tcp-connection-policer
user@R2# set then accept
```

10. Configure the ICMP filter rules.

```
[edit firewall family inet filter protect-RE term icmp-term]
user@R2# set from source-prefix-list trusted-addresses
user@R2# set from protocol icmp
user@R2# set then policer icmp-policer
user@R2# set then count icmp-counter
user@R2# set then accept
```

11. Apply the filter to the loopback interface.

```
[edit interfaces lo0 unit 0]
user@R2# set family inet filter input protect-RE
```

**Results** Confirm your configuration by entering the **show interfaces**, **show protocols**, **show policy-options**, **show routing-options**, and **show firewall** commands from configuration mode. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R2# show interfaces
```

```
fe-1/2/0 {
  unit 0 {
    family inet {
      address 10.0.0.2/30;
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      filter {
        input protect-RE;
      }
      address 192.168.0.2/32 {
        primary;
      }
      address 172.16.0.2/32;
    }
  }
}

user@R2# show protocols
bgp {
  group ext {
    type external;
    export send-direct;
    neighbor 10.0.0.1 {
      peer-as 100;
    }
  }
}
ospf {
  area 0.0.0.0 {
    interface lo0.0 {
      passive;
    }
    interface fe-1/2/0.0;
  }
}

user@R2# show policy-options
prefix-list trusted-addresses {
  10.0.0.0/24;
  192.168.0.0/24;
}
policy-statement send-direct {
  term 1 {
    from protocol direct;
    then accept;
  }
}

user@R2# show routing-options
router-id 192.168.0.2;
autonomous-system 200;

user@R2# show firewall
```

```

family inet {
  filter protect-RE {
    term tcp-connection-term {
      from {
        source-prefix-list {
          trusted-addresses;
        }
        protocol tcp;
        tcp-established;
      }
      then {
        policer tcp-connection-policer;
        accept;
      }
    }
    term icmp-term {
      from {
        source-prefix-list {
          trusted-addresses;
        }
        protocol icmp;
      }
      then {
        policer icmp-policer;
        count icmp-counter;
        accept;
      }
    }
  }
}
policer tcp-connection-policer {
  filter-specific;
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 15k;
  }
  then discard;
}
policer icmp-policer {
  filter-specific;
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 15k;
  }
  then discard;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

**NOTE:** To verify the TCP policer, you can use a packet generation tool. This task is not shown here.

- [Displaying Stateless Firewall Filter That Are in Effect on page 962](#)
- [Using telnet to Verify the tcp-established Condition in the TCP Firewall Filter on page 962](#)
- [Using telnet to Verify the Trusted Prefixes Condition in the TCP Firewall Filter on page 963](#)
- [Using OSPF to Verify the TCP Firewall Filter on page 964](#)
- [Verifying the ICMP Firewall Filter on page 965](#)

### *Displaying Stateless Firewall Filter That Are in Effect*

**Purpose** Verify the configuration of the firewall filter.

**Action** From operational mode, enter the **show firewall** command.

```
user@R2> show firewall
Filter: protect-RE
Counters:
Name                               Bytes      Packets
icmp-counter                        0           0
Policers:
Name                               Bytes      Packets
icmp-policer                       0           0
tcp-connection-policer             0           0
```

**Meaning** The output shows the filter, the counter, and the policers that are in effect on Device R2.

### *Using telnet to Verify the tcp-established Condition in the TCP Firewall Filter*

**Purpose** Make sure that telnet traffic works as expected.

**Action** Verify that the device can establish only TCP sessions with hosts that meet the **from tcp-established** condition..

1. From Device R2, make sure that the BGP session with Device R1 is established.

```
user@R2> show bgp summary | match down
Groups: 1 Peers: 1 Down peers: 0
```

2. From Device R2, telnet to Device R1.

```
user@R2> telnet 192.168.0.1
Trying 192.168.0.1...
Connected to R1.acme.net.
Escape character is '^['.
```

```
R1 (ttyp4)
```

```
login:
```

3. From Device R1, telnet to Device R2.

```
user@R1> telnet 192.168.0.2
```

```
Trying 192.168.0.2...
telnet: connect to address 192.168.0.2: Operation timed out
telnet: Unable to connect to remote host
```

4. On Device R2, deactivate the **from tcp-established** match condition.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# deactivate from tcp-established
user@R2# commit
```

5. From Device R1, try again to telnet to Device R2.

```
user@R1> telnet 192.168.0.1
Trying 192.168.0.2...
Connected to R2.acme.net.
Escape character is '^['.
```

```
R2 (ttyp4)
```

```
login:
```

**Meaning** Verify the following information:

- As expected, the BGP session is established. The **from tcp-established** match condition is not expected to block BGP session establishment.
- From Device R2, you can telnet to Device R1. Device R1 has no firewall filter configured, so this is the expected behavior.
- From Device R1, you cannot telnet to Device R2. Telnet uses TCP as the transport protocol, so this result might be surprising. The cause for the lack of telnet connectivity is the **from tcp-established** match condition. This match condition limits the type of TCP traffic that is accepted of Device R2. After this match condition is deactivated, the telnet session is successful.

#### *Using telnet to Verify the Trusted Prefixes Condition in the TCP Firewall Filter*

**Purpose** Make sure that telnet traffic works as expected.

**Action** Verify that the device can establish only telnet sessions with a host at an IP address that matches one of the trusted source addresses. For example, log in to the device with the **telnet** command from another host with one of the trusted address prefixes. Also, verify that telnet sessions with untrusted source addresses are blocked.

1. From Device R1, telnet to Device R2 from an untrusted source address.

```
user@R1> telnet 172.16.0.2 source 172.16.0.1
Trying 172.16.0.2...
^C
```

2. From Device R2, add 172.16/16 to the list of trusted prefixes.

```
[edit policy-options prefix-list trusted-addresses]
user@R2# set 172.16.0.0/16
user@R2# commit
```

3. From Device R1, try again to telnet to Device R2.

```
user@R1> telnet 172.16.0.2 source 172.16.0.1
```

```
Trying 172.16.0.2...
Connected to R2.acme.net.
Escape character is '^['.
```

```
R2 (ttyp4)
```

```
login:
```

**Meaning** Verify the following information:

- From Device R1, you cannot telnet to Device R2 with an untrusted source address. After the 172.16/16 prefix is added to the list of trusted prefixes, the telnet request from source address 172.16.0.1 is accepted.
- OSPF session establishment is blocked. OSPF does not use TCP as its transport protocol. After the **from protocol tcp** match condition is deactivated, OSPF session establishment is not blocked.

#### *Using OSPF to Verify the TCP Firewall Filter*

**Purpose** Make sure that OSPF traffic works as expected.

**Action** Verify that the device cannot establish OSPF connectivity.

1. From Device R1, check the OSPF sessions.

```
user@R1> show ospf neighbor
Address      Interface      State    ID          Pri    Dead
10.0.0.2     fe-1/2/0.0    Init     192.168.0.2 128    34
```

2. From Device R2, check the OSPF sessions.

```
user@R2> show ospf neighbor
```

3. From Device R2, remove the **from protocol tcp** match condition.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# deactivate from protocol
user@R2# commit
```

4. From Device R1, recheck the OSPF sessions.

```
user@R1> show ospf neighbor
Address      Interface      State    ID          Pri    Dead
10.0.0.2     fe-1/2/0.0    Full     192.168.0.2 128    36
```

5. From Device R2, recheck the OSPF sessions.

```
user@R2> show ospf neighbor
Address      Interface      State    ID          Pri    Dead
10.0.0.1     fe-1/2/0.0    Full     192.168.0.1 128    39
```

**Meaning** Verify the following information:

- OSPF session establishment is blocked. OSPF does not use TCP as its transport protocol. After the **from protocol tcp** match condition is deactivated, OSPF session establishment is successful.

### Verifying the ICMP Firewall Filter

**Purpose** Verify that ICMP packets are being policed and counted. Also make sure that ping requests are discarded when the requests originate from an untrusted source address.

- Action** 1. Undo the configuration changes made in previous verification steps.

Reactivate the TCP firewall settings, and delete the 172.16/16 trusted source address.

```
[edit firewall family inet filter protect-RE term tcp-connection-term]
user@R2# activate from protocol
user@R2# activate from tcp-established
```

```
[edit policy-options prefix-list trusted-addresses]
user@R2# delete 172.16.0.0/16
```

```
user@R2# commit
```

2. From Device R1, ping the loopback interface on Device R2.

```
user@R1> ping 192.168.0.2 rapid count 600 size 2000
PING 192.168.0.2 (192.168.0.2): 2000 data bytes
#####
--- 192.168.0.2 ping statistics ---
600 packets transmitted, 536 packets received, 10% packet loss
pinground-trip min/avg/max/stddev = 2.976/3.405/42.380/2.293 ms
```

3. From Device R2, check the firewall statistics.

```
user@R2> show firewall

Filter: protect-RE
Counters:
Name                               Bytes          Packets
icmp-counter                        1180804         1135
Policers:
Name                               Bytes          Packets
icmp-policer                       66
tcp-connection-policer             0
```

4. From an untrusted source address on Device R1, send a ping request to Device R2's loopback interface.

```
user@R1> ping 172.16.0.2 source 172.16.0.1

PING 172.16.0.2 (172.16.0.2): 56 data bytes
^C
--- 172.16.0.2 ping statistics ---
14 packets transmitted, 0 packets received, 100% packet loss
```

**Meaning** Verify the following information:

- The ping output shows that 10% packet loss is occurring.

- The ICMP packet counter is incrementing, and the icmp-policer is incrementing.
- Device R2 does not send ICMP responses to the **ping 172.16.0.2 source 172.16.0.1** command.

### Prefix-Specific Counting and Policing Overview

This topic covers the following information:

- [Separate Counting and Policing for Each IPv4 Address Range on page 966](#)
- [Prefix-Specific Action Configuration on page 967](#)
- [Counter and Policer Set Size and Indexing on page 968](#)

---

#### Separate Counting and Policing for Each IPv4 Address Range

Prefix-specific counting and policing enables you to configure an IPv4 firewall filter term that matches on a source or destination address, applies a single-rate two-color policer as the term action, but associates the matched packet with a specific counter and policer instance based on the source or destination in the packet header. You can implicitly create a separate counter or policer instance for a single address or for a group of addresses.

Prefix-specific counting and policing uses a *prefix-specific action* configuration that specifies the name of the policer you want to apply, whether prefix-specific counting is to be enabled, and a source or destination address prefix range.

The prefix range specifies between 1 and 16 sequential set bits of an IPv4 address mask. The length of the prefix range determines the size of the counter and policer set, which consists of as few as 2 or as many as 65,536 counter and policer instances. The position of the bits of the prefix range determines the indexing of filter-matched packets into the set of instances.

**NOTE:** A prefix-specific action is specific to a source or destination *prefix range*, but it is not specific to a particular source or destination *address range*, and it is not specific to a particular interface.

To apply a prefix-specific action to the traffic at an interface, you configure a firewall filter term that matches on source or destination addresses, and then you apply the firewall filter to the interface. The flow of filtered traffic is rate-limited using prefix-specific counter and policer instances that are selected per packet based on the source or destination address in the header of the filtered packet.

### Prefix-Specific Action Configuration

To configure a prefix-specific action, you specify the following information:

- Prefix-specific action name—Name that can be referenced as the action of an IPv4 standard firewall filter term that matches packets on source or destination addresses.
- Policer name—Name of a single-rate two-color policer for which you want to implicitly create prefix-specific instances.

**NOTE:** For aggregated Ethernet interfaces, you can configure a prefix-specific action that references a logical interface policer (also called an aggregate policer). You can reference this type of prefix-specific action from an IPv4 standard firewall filter and then apply the filter at the aggregate level of the interface.

- Counting option—Option to include if you want to enable prefix-specific counters.
- Filter-specific option—Option to include if you want a single counter and policer set to be shared across all terms in the firewall filter. A prefix-specific action that operates in this way is said to operate in *filter-specific* mode. If you do not enable this option, the prefix-specific action operates in *term-specific* mode, meaning that a separate counter and policer set is created for each filter term that references the prefix-specific action.
- Source address prefix length—Length of the address prefix, from 0 through 32, to be used with a packet matched on the source address.
- Destination address prefix length—Length of the address prefix, from 0 through 32, to be used with a packet matched on the destination address.
- Subnet prefix length—Length of the subnet prefix, from 0 through 32, to be used with a packet matched on either the source or destination address.

You must configure source and destination address prefix lengths to be from 1 to 16 bits longer than the subnet prefix length. If you configure source or destination address prefix lengths to be more than 16 bits beyond the configured subnet prefix length, an error occurs when you try to commit the configuration.

### Counter and Policer Set Size and Indexing

The number of prefix-specific actions (counters or policers) implicitly created for a prefix-specific action is determined by the length of the address prefix and the length of the subnet prefix:

$$\text{Size of Counter and Policer Set} = 2^{(\text{source-or-destination-prefix-length} - \text{subnet-prefix-length})}$$

Table 74 on page 968 shows examples of counter and policer set size and indexing.

**Table 74: Examples of Counter and Policer Set Size and Indexing**

| Example Prefix Lengths Specified in the Prefix-Specific Action       | Calculation of Counter or Policer Set Size                                                                                              | Indexing of Instances |             |
|----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----------------------|-------------|
| <i>source-prefix-length</i> = 32<br><i>subnet-prefix-length</i> = 16 | Size = $2^{(32-16)} = 2^{16} = 65,536$ instances<br><br>NOTE: This calculation shows the largest counter or policer set size supported. | Instance 0:           | x.x.0.0     |
|                                                                      |                                                                                                                                         | Instance 1:           | x.x.0.1     |
|                                                                      |                                                                                                                                         | Instance 65535:       | x.x.255.255 |
| <i>source-prefix-length</i> = 32<br><i>subnet-prefix-length</i> = 24 | Size = $2^{(32-24)} = 2^8 = 256$ instances                                                                                              | Instance 0:           | x.x.x.0     |
|                                                                      |                                                                                                                                         | Instance 1:           | x.x.x.1     |
|                                                                      |                                                                                                                                         | Instance 255:         | x.x.x.255   |
| <i>source-prefix-length</i> = 32<br><i>subnet-prefix-length</i> = 25 | Size = $2^{(32-25)} = 2^7 = 128$ instances                                                                                              | Instance 0:           | x.x.x.0     |
|                                                                      |                                                                                                                                         | Instance 1:           | x.x.x.1     |
|                                                                      |                                                                                                                                         | Instance 127:         | x.x.x.127   |
| <i>source-prefix-length</i> = 24<br><i>subnet-prefix-length</i> = 20 | Size = $2^{(24-20)} = 2^4 = 16$ instances                                                                                               | Instance 0:           | x.x.0.x     |
|                                                                      |                                                                                                                                         | Instance 1:           | x.x.1.x     |
|                                                                      |                                                                                                                                         | Instance 15:          | x.x.15.x    |

### Filter-Specific Counter and Policer Set Overview

By default, a prefix-specific policer set operates in *term-specific* mode so that, for a given firewall filter, the Junos OS creates a separate counter and policer set for every filter term that references the prefix-specific action. As an option, you can configure a prefix-specific policer set to operate in *filter-specific* mode so that a single prefix-specific policer set is used by all terms (within the same firewall filter) that reference the policer.

For an IPv4 firewall filter with multiple terms that reference the same prefix-specific policer set, configuring the policer set to operate in filter-specific mode enables you to count and monitor the activity of the policer set at the firewall filter level.

**NOTE:** Term-specific mode and filter-specific mode also apply to policers. See “[Filter-Specific Policer Overview](#)” on page 955.

To enable a prefix-specific policer set to operate in filter-specific mode, you can include the **filter-specific** statement at the following hierarchy levels:

- **[edit firewall family inet prefix-action *prefix-action-name*]**
- **[edit logical-systems *logical-system-name* firewall family inet prefix-action *prefix-action-name*]**

You can reference filter-specific, prefix-specific policer sets from IPv4 (**family inet**) firewall filters only.

## Example: Configuring Prefix-Specific Counting and Policing

This example shows how to configure prefix-specific counting and policing.

- [Requirements on page 969](#)
- [Overview on page 969](#)
- [Configuration on page 970](#)
- [Verification on page 974](#)

### Requirements

No special configuration beyond device initialization is required before configuring this example.

### Overview

In this example, you configure prefix-specific counting and policing based on the last octet of the source address field in packets matched by an IPv4 firewall filter.

The single-rate two-color policer named **1Mbps-policer** rate-limits traffic to a bandwidth of 1,000,000 bps and a burst-size limit of 63,000 bytes, discarding any packets in a traffic flow that exceeds the traffic limits.

Independent of the IPv4 addresses contained in any packets passed from a firewall filter, the prefix-specific action named **psa-1Mbps-per-source-24-32-256** specifies a set of 256 counters and policers, numbered from 0 through 255. For each packet, the last octet of the source address field is used to index into the associated prefix-specific counter and policer in the set:

- Packets with a source address ending with the octet 0x0000 0000 index the first counter and policer in the set.

- Packets with a source address ending with the octet 0x0000 0001 index the second counter and policer in the set.
- Packets with a source address ending with the octet 0x1111 1111 index the last counter and policer in the set.

The **limit-source-one-24** firewall filter contains a single term that matches all packets from the /24 subnet of source address 10.10.10.0, passing these packets to the prefix-specific action **psa-1Mbps-per-source-24-32-256**.

### **Topology**

In this example, because the filter term matches the /24 subnet of a single source address, each counting and policing instance in the prefix-specific set is used for only one source address.

- Packets with a source address 10.10.10.0 index the first counter and policer in the set.
- Packets with a source address 10.10.10.1 index the second counter and policer in the set.
- Packets with a source address 10.10.10.255 index the last counter and policer in the set.

This example shows the simplest case of prefix-specific actions, in which the filter term matches on one address with a prefix length that is the same as the prefix length specified in the prefix-specific action for indexing into the set of prefix-specific counters and policers.

For descriptions of other configurations for prefix-specific counting and policing, see [“Prefix-Specific Counting and Policing Configuration Scenarios” on page 976](#).

### **Configuration**

---

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring a Policer for Prefix-Specific Counting and Policing on page 971](#)
- [Configuring a Prefix-Specific Action Based on the Policer on page 972](#)
- [Configuring an IPv4 Filter That References the Prefix-Specific Action on page 973](#)
- [Applying the Firewall Filter to IPv4 Input Traffic at a Logical Interface on page 974](#)

#### **CLI Quick Configuration**

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall policer 1Mbps-policer if-exceeding bandwidth-limit 1m
set firewall policer 1Mbps-policer if-exceeding burst-size-limit 63k
set firewall policer 1Mbps-policer then discard
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 policer
  1Mbps-policer
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 count
```

```

set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256
  subnet-prefix-length 24
set firewall family inet prefix-action psa-1Mbps-per-source-24-32-256 source-prefix-length
  32
set firewall family inet filter limit-source-one-24 term one from source-address
  10.10.10.0/24
set firewall family inet filter limit-source-one-24 term one then prefix-action
  psa-1Mbps-per-source-24-32-256
set interfaces so-0/0/2 unit 0 family inet filter input limit-source-one-24
set interfaces so-0/0/2 unit 0 family inet address 10.39.1.1/16

```

### *Configuring a Policer for Prefix-Specific Counting and Policing*

#### **Step-by-Step Procedure**

To configure a policer to be used for prefix-specific counting and policing:

1. Enable configuration of a single-rate two-color policer.

```

[edit]
user@host# edit firewall policer 1Mbps-policer

```

2. Define the traffic limit.

```

[edit firewall policer 1Mbps-policer]
user@host# set if-exceeding bandwidth-limit 1m
user@host# set if-exceeding burst-size-limit 63k

```

Packets in a traffic flow that conforms to this limit are passed with the PLP set to **low**.

3. Define the actions for nonconforming traffic.

```

[edit firewall policer 1Mbps-policer]
user@host# set then discard

```

Packets in a traffic flow that exceeds this limit are discarded. Other configurable actions for a single-rate two-color policer are to set the forwarding class and to set the PLP level.

**Results** Confirm the configuration of the policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show firewall
policer 1Mbps-policer {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 63k;
  }
  then discard;
}

```

*Configuring a Prefix-Specific Action Based on the Policer*

**Step-by-Step Procedure** To configure a prefix-specific action that references the policer and specifies a portion of a source address prefix:

1. Enable configuration of a prefix-specific action.

```
[edit]
user@host# edit firewall family inet prefix-action psa-1Mbps-per-source-24-32-256
```

Prefix-specific counting and policing can be defined for IPv4 traffic only.

2. Reference the policer for which a prefix-specific set is to be created.

```
[edit firewall family inet prefix-action psa-1Mbps-per-source-24-32-256]
user@host# set policer 1Mbps-policer
user@host# set count
```

**NOTE:** For aggregated Ethernet interfaces, you can configure a prefix-specific action that references a logical interface policer (also called an aggregate policer). You can reference this type of prefix-specific action from an IPv4 standard firewall filter and then apply the filter at the aggregate level of the interface.

3. Specify the prefix range on which IPv4 addresses are to be indexed to the counter and policer set.

```
[edit firewall family inet prefix-action psa-1Mbps-per-source-24-32-256]
user@host# set source-prefix-length 32
user@host# set subnet-prefix-length 24
```

**Results** Confirm the configuration of the prefix-specific action by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 1Mbps-policer {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 63k;
  }
  then discard;
}
family inet {
  prefix-action psa-1Mbps-per-source-24-32-256 {
    policer 1Mbps-policer;
    subnet-prefix-length 24;
    source-prefix-length 32;
  }
}
```

*Configuring an IPv4 Filter That References the Prefix-Specific Action***Step-by-Step Procedure**

To configure an IPv4 standard firewall filter that references the prefix-specific action:

1. Enable configuration of the IPv4 standard firewall filter.

```
[edit]
user@host# edit firewall family inet filter limit-source-one-24
```

Prefix-specific counting and policing can be defined for IPv4 traffic only.

2. Configure the filter term to match on the packet source address or destination address.

```
[edit firewall family inet filter limit-source-one-24]
user@host# set term one from source-address 10.10.10.0/24
```

3. Configure the filter term to reference the prefix-specific action.

```
[edit firewall family inet filter limit-source-one-24]
user@host# set term one then prefix-action psa-1Mbps-per-source-24-32-256
```

You could also use the **next term** action to configure all Hypertext Transfer Protocol (HTTP) traffic to each host to transmit at 500 Kbps and have the total HTTP traffic limited to 1 Mbps.

**Results** Confirm the configuration of the prefix-specific action by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 1Mbps-policer {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 63k;
  }
  then discard;
}
family inet {
  prefix-action psa-1Mbps-per-source-24-32-256 {
    policer 1Mbps-policer;
    subnet-prefix-length 24;
    source-prefix-length 32;
  }
  filter limit-source-one-24 {
    term one {
      from {
        source-address {
          10.10.10.0/24;
        }
      }
      then prefix-action psa-1Mbps-per-source-24-32-256;
    }
  }
}
```

### *Applying the Firewall Filter to IPv4 Input Traffic at a Logical Interface*

#### **Step-by-Step Procedure**

To apply the firewall filter to IPv4 input traffic at a logical interface:

1. Enable configuration of IPv4 on the logical interface.

```
[edit]
user@host# edit interfaces so-0/0/2 unit 0 family inet
```

2. Configure an IP address.

```
[edit interfaces so-0/0/2 unit 0 family inet]
user@host# set address 10.39.1.1/16
```

3. Apply the IPv4 standard stateless firewall filter.

```
[edit interfaces so-0/0/2 unit 0 family inet]
user@host# set filter input limit-source-one-24
```

#### **Results**

Confirm the configuration of the prefix-specific action by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-0/0/2 {
  unit 0 {
    family inet {
      filter {
        input limit-source-one-24;
      }
      address 10.39.1.1/16;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### **Verification**

Confirm that the configuration is working properly.

- [Displaying the Firewall Filters Applied to an Interface on page 974](#)
- [Displaying Prefix-Specific Actions Statistics for the Firewall Filter on page 975](#)

### *Displaying the Firewall Filters Applied to an Interface*

#### **Purpose**

Verify that the firewall filter **limit-source-one-24** is applied to the IPv4 input traffic at logical interface **so-0/0/2.0**.

#### **Action**

Use the [show interfaces statistics](#) operational mode command for logical interface **so-0/0/2.0**, and include the **detail** option. In the command output section for **Protocol inet**,

the **Input Filters** field displays **limit-source-one-24**, indicating that the filter is applied to IPv4 traffic in the input direction:

```
user@host> show interfaces statistics so-0/0/2.0 detail
Logical interface so-0/0/2.0 (Index 79) (SNMP ifIndex 510) (Generation 149)
Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPP
Protocol inet, MTU: 4470, Generation: 173, Route table: 0
Flags: Sendbroadcast-pkt-to-re, Protocol-Down
Input Filters: limit-source-one-24
Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
Destination: 10.39/16, Local: 10.39.1.1, Broadcast: 10.39.255.255,
Generation: 163
```

### *Displaying Prefix-Specific Actions Statistics for the Firewall Filter*

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the **show firewall prefix-action-stats filter filter-name prefix-action name** operational mode command to display statistics about a prefix-specific action configured on a firewall filter.

As an option, you can use the **from set-index to set-index** command option to specify the starting and ending counter or policer to be displayed. A policer set is indexed from 0 through 65535.

The command output displays the specified filter name followed by a listing of the number of bytes and packets processed by each policer in the policer set.

For a term-specific policer, each policer in the set is identified as follows:

*prefix-specific-action-name-term-name-set-index*

For a filter-specific policer, each policer is identified in the command output as follows:

*prefix-specific-action-name-set-index*

Because the example prefix-specific action **psa-1Mbps-per-source-24-32-256** is referenced by only one term of the example filter **limit-source-one-24**, the example policer **1Mbps-policer** is configured as term-specific. In the **show firewall prefix-action-stats** command output, the policer statistics are displayed as **psa-1Mbps-per-source-24-32-256-one-0**, **psa-1Mbps-per-source-24-32-256-one-1**, and so on through **psa-1Mbps-per-source-24-32-256-one-255**.

```
user@host> show firewall prefix-action-stats filter limit-source-one-24 prefix-action
psa-1Mbps-per-source-24-32-256 from 0 to 9
Filter: limit-source-one-24
Counters:

## Prefix-Specific Counting and Policing Configuration Scenarios

This topic covers the following information:

- [Prefix Length of the Action and Prefix Length of Addresses in Filtered Packets on page 976](#)
- [Scenario 1: Firewall Filter Term Matches on Multiple Addresses on page 977](#)
- [Scenario 2: Subnet Prefix Is Longer Than the Prefix in the Filter Match Condition on page 979](#)
- [Scenario 3: Subnet Prefix Is Shorter Than the Prefix in the Firewall Filter Match Condition on page 980](#)

### Prefix Length of the Action and Prefix Length of Addresses in Filtered Packets

[Table 75 on page 976](#) describes the relationship between the prefix length specified in the prefix-specific action and the prefix length of the addresses matched by the firewall filter term that references the prefix-specific action.

**Table 75: Summary of Prefix-Specific Action Scenarios**

| Counter and Policer Set                                                                                                      | Packet-Filtering Criteria             | Indexing of Instances |                              |
|------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|-----------------------|------------------------------|

|                                                                                                                                               |                                                                                                                                                                              |                       | Instances 128 – 255: unused   |

### Scenario 1: Firewall Filter Term Matches on Multiple Addresses

The complete example, "Example: Configuring Prefix-Specific Counting and Policing" on page 969, shows the simplest case of prefix-specific actions, in which a single-term firewall filter matches on one address with a prefix length that is the same as the subnet prefix length specified in the prefix-specific action. Unlike the example, this scenario describes a configuration in which a single-term firewall filter matches on two IPv4 source addresses. In addition, the additional condition matches on a source address with a prefix length that is different from the subnet prefix length defined in the prefix-specific action. In this case, the additional condition matches on the /16 subnet of the source address 10.11.0.0.

**NOTE:** Unlike packets that match the source address 10.10.10.0/24, packets that match the source address 10.11.0.0/16 are in a many-to-one correspondence with the instances in the counter and policer set.

The filter-matched packets that are passed to the prefix-specific action index into the counter and policer set in such a way that the counting and policing instances are shared by packets that contain source addresses across the **10.10.10.0/24** and **10.11.0.0/16** subnets as follows:

- The first counter and policer in the set are indexed by packets with source addresses **10.10.10.0** and **10.11.x.0**, where **x** ranges from **0** through **255**.
- The second counter and policer in the set are indexed by packets with source addresses **10.10.10.1** and **10.11.x.1**, where **x** ranges from **0** through **255**.
- The 256th (last) counter and policer in the set are indexed by packets with source addresses **10.10.10.255** and **10.11.x.255**, where **x** ranges from **0** through **255**.

The following configuration shows the statements for configuring the single-rate two-color policer, the prefix-specific action that references the policer, and the IPv4 standard stateless firewall filter that references the prefix-specific action:

```
[edit]
firewall {
  policer 1Mbps-policer {
    if-exceeding {
      bandwidth-limit 1m;
      burst-size-limit 63k;
    }
    then discard;
  }
  family inet {
    prefix-action psa-1Mbps-per-source-24-32-256 {
      policer 1Mbps-policer;
      subnet-prefix-length 24;
      source-prefix-length 32;
    }
    filter limit-source-two-24-16 {
      term one {
        from {
          source-address {
            10.10.10.0/24;
            10.11.0.0/16;
          }
        }
        then prefix-action psa-1Mbps-per-source-24-32-256;
      }
    }
  }
}
interfaces {
  so-0/0/2 {
    unit 0 {
      family inet {
        filter {
          input limit-source-two-24-16;
        }
        address 10.39.1.1/16;
      }
    }
  }
}
```

```

    }
  }
}

```

### Scenario 2: Subnet Prefix Is Longer Than the Prefix in the Filter Match Condition

The complete example, “[Example: Configuring Prefix-Specific Counting and Policing](#)” on [page 969](#), shows the simplest case of prefix-specific actions, in which the single-term firewall filter matches on one address with a prefix length that is the same as the subnet prefix length specified in the prefix-specific action. Unlike the example, this scenario describes a configuration in which the prefix-specific action defines a subnet prefix length that is longer than the prefix of the source address matched by the firewall filter. In this case, the prefix-specific action defines a subnet-prefix value of **25**, while the firewall filter matches on a source address in the **/24** subnet.

**NOTE:** The firewall filter passes the prefix-specific action packets with source addresses that range from 10.10.10.0 through 10.10.10.255, while the prefix-specific action specifies a set of only 128 counters and policers, numbered from 0 through 127.

The filter-matched packets that are passed to the prefix-specific action index into the counter and policer set in such a way that the counting and policing instances are shared by packets that contain either of two source addresses within the **10.10.10.0/24** subnet:

- The first counter and policer in the set are indexed by packets with source addresses **10.10.10.0** and **10.10.10.128**.
- The second counter and policer in the set are indexed by packets with source addresses **10.10.10.1** and **10.10.10.129**.
- The 128th (last) counter and policer in the set are indexed by packets with source addresses **10.10.10.127** and **10.10.10.255**.

The following configuration shows the statements for configuring the single-rate two-color policer, the prefix-specific action that references the policer, and the IPv4 standard stateless firewall filter that references the prefix-specific action:

```

[edit]
firewall {
  policer 1Mbps-policer {
    if-exceeding {
      bandwidth-limit 1m;
      burst-size-limit 63k;
    }
    then discard;
  }
  family inet {
    prefix-action psa-1Mbps-per-source-25-32-128 {
      policer 1Mbps-policer;
      subnet-prefix-length 25;
      source-prefix-length 32;
    }
  }
}

```

```

filter limit-source-one-24 {
    term one {
        from {
            source-address {
                10.10.10.0/24;
            }
        }
        then prefix-action psa-1Mbps-per-source-25-32-128;
    }
}
}
}
interfaces {
    so-0/0/2 {
        unit 0 {
            family inet {
                filter {
                    input limit-source-one-24;
                }
                address 10.39.1.1/16;
            }
        }
    }
}
}

```

### Scenario 3: Subnet Prefix Is Shorter Than the Prefix in the Firewall Filter Match Condition

The complete example, “[Example: Configuring Prefix-Specific Counting and Policing](#)” on [page 969](#), shows the simplest case of prefix-specific actions, in which the single-term firewall filter matches on one address with a prefix length that is the same as the subnet prefix length specified in the prefix-specific action. Unlike the example, this scenario describes a configuration in which the prefix-specific action defines a subnet prefix length that is shorter than the prefix of the source address matched by the firewall filter. In this case, the filter term matches on the /25 subnet of the source address 10.10.10.0.

**NOTE:** The firewall filter passes the prefix-specific action only packets with source addresses that range from 10.10.10.0 through 10.10.10.127, while the prefix-specific action specifies a set of 256 counters and policers, numbered from 0 through 255.

The matched packets that are passed to the prefix-specific action index into the lower half of the counter and policer set only:

- The first counter and policer in the set are indexed by packets with source address 10.10.10.0.
- The second counter and policer in the set are indexed by packets with source address 10.10.10.1 and 10.10.10.129.

- The 128th counter and policer in the set are indexed by packets with source address 10.10.10.127.
- The upper half of the set (instances numbered from 128 through 255) are not indexed by packets passed to the prefix-specific action from this particular firewall filter.

The following configuration shows the statements for configuring the single-rate two-color policer, the prefix-specific action that references the policer, and the IPv4 standard stateless firewall filter that references the prefix-specific action:

```
[edit]
firewall {
  policer 1Mbps-policer {
    if-exceeding {
      bandwidth-limit 1m;
      burst-size-limit 63k;
    }
    then discard;
  }
  family inet {
    prefix-action psa-1Mbps-per-source-24-32-256 {
      policer 1Mbps-policer;
      subnet-prefix-length 24;
      source-prefix-length 32;
    }
    filter limit-source-one-25 {
      term one {
        from {
          source-address {
            10.10.10.0/25;
          }
        }
        then prefix-action psa-1Mbps-per-source-24-32-256;
      }
    }
  }
}
interfaces {
  so-0/0/2 {
    unit 0 {
      family inet {
        filter {
          input limit-source-one-25;
        }
        address 10.39.1.1/16;
      }
    }
  }
}
```

### Multifield Classification Overview

This topic covers the following information:

- [Forwarding Classes and PLP Levels on page 982](#)
- [Multifield Classification and BA Classification on page 982](#)
- [Multifield Classification Used In Conjunction with Policers on page 983](#)

#### Forwarding Classes and PLP Levels

---

You can configure the Junos OS class of service (CoS) features to classify incoming traffic by associating each packet with a forwarding class, a packet loss priority (PLP) level, or both:

- Based on the associated forwarding class, each packet is assigned to an output queue, and the router services the output queues according to the associated scheduling you configure.
- Based on the associated PLP, each packet carries a lower or higher likelihood of being dropped if congestion occurs. The CoS random early detection (RED) process uses the drop probability configuration, output queue fullness percentage, and packet PLP to drop packet as needed to control congestion at the output stage.

#### Multifield Classification and BA Classification

---

The Junos OS supports two general types of packet classification: behavior aggregate (BA) classification and multifield classification:

- BA classification, or CoS value traffic classification, refers to a method of packet classification that uses a CoS configuration to set the forwarding class or PLP of a packet based on the *CoS value* in the IP packet header. The CoS value examined for BA classification purposes can be the Differentiated Services code point (DSCP) value, DSCP IPv6 value, IP precedence value, MPLS EXP bits, and IEEE 802.1p value. The default classifier is based on the IP precedence value.
- Multifield classification refers to a method of packet classification that uses a standard stateless firewall filter configuration to set the forwarding class or PLP for each packet entering or exiting the interface based on *multiple fields* in the IP packet header, including the DSCP value (for IPv4 only), the IP precedence value, the MPLS EXP bits, and the IEEE 802.1p bits. Multifield classification commonly matches on IP address fields, the IP protocol type field, or the port number in the UDP or TCP pseudoheader field.

Multifield classification is used instead of BA classification when you need to classify packets based on information in the packet information other than the CoS values only.

With multifield classification, a firewall filter term can specify the packet classification actions for matching packets through the use of the **forwarding-class** *class-name* or **loss-priority** (**high** | **medium-high** | **medium-low** | **low**) nonterminating actions in the term's **then** clause.

**NOTE:** BA classification of a packet can be overridden by the stateless firewall filter actions **forwarding-class** and **loss-priority**.

---

### Multifield Classification Used In Conjunction with Policers

---

To configure multifield classification in conjunction with rate limiting, a firewall filter term can specify the packet classification actions for matching packets through the use of a **policer** nonterminating action that references a single-rate two-color policer.

When multifield classification is configured to perform classification through a policer, the filter-matched packets in the traffic flow are rate-limited to the policer-specified traffic limits. Packets in a conforming flow of filter-matched packets are implicitly set to a **low** PLP. Packets in a nonconforming traffic flow can be discarded, or the packets can be set to a specified forwarding class, set to a specified PLP level, or both, depending on the type of policer and how the policer is configured to handle nonconforming traffic.

**NOTE:** Before you apply a firewall filter that performs multifield classification and also a policer to the same logical interface and for the same traffic direction, make sure that you consider the order of policer and firewall filter operations.

As an example, consider the following scenario:

- You configure a firewall filter that performs multifield classification (acts on matched packets by setting the forwarding class, the PLP, or both) based on the packet's existing forwarding class or PLP. You apply the firewall filter at the input of a logical interface.
- You also configure a single-rate two-color policer that acts on a red traffic flow by re-marking (setting the forwarding class, the PLP, or both) rather than discarding those packets. You apply the policer as an interface policer at the input of the same logical interface to which you apply the firewall filter.

Because of the order of policer and firewall operations, the input policer is executed before the input firewall filter. This means that the multifield classification specified by the firewall filter is performed on input packets that have already been re-marked once by policing actions. Consequently, any input packet that matches the conditions specified in a firewall filter term is then subject to a second re-marking according to the forwarding-class or loss-priority nonterminating actions also specified in that term.

---

## Multifield Classification Requirements and Restrictions

This topic covers the following information:

- [Supported Platforms on page 984](#)
- [CoS Tricolor Marking Requirement on page 985](#)
- [Restrictions on page 985](#)

### Supported Platforms

---

The **loss-priority** firewall filter action is supported on the following routing platforms only:

- EX Series switches
- M7i and M10i routers with the Enhanced CFEB (CFEB-E)
- M120 and M320 routers
- MX Series routers
- T Series routers with Enhanced II Flexible PIC Concentrators (FPCs)
- PTX Series routers

### CoS Tricolor Marking Requirement

The **loss-priority** firewall filter action has platform-specific requirements dependencies on the CoS tricolor marking feature, as defined in RFC 2698:

- On an M320 router, you cannot commit a configuration that includes the **loss-priority** firewall filter action unless you enable the CoS tricolor marking feature.
- On all routing platforms that support the **loss-priority** firewall filter action, you cannot set the **loss-priority** firewall filter action to **medium-low** or **medium-high** unless you enable the CoS tricolor marking feature. .

To enable the CoS tricolor marking feature, include the **tri-color** statement at the **[edit class-of-service]** hierarchy level.

### Restrictions

You cannot configure the **loss-priority** and **three-color-policer** nonterminating actions for the same firewall filter term. These two nonterminating actions are mutually exclusive.

**NOTE:** On a PTX router, you must configure the **policer** action in a separate rule and not combine it with the rule configuring the **forwarding-class**, and **loss-priority** actions. See [“Firewall and Policing Differences Between PTX Series Packet Transport Routers and T Series Matrix Routers”](#) on page 501.

## Multifield Classification Limitations on M Series Routers

This topic covers the following information:

- [Problem: Output-Filter Matching on Input-Filter Classification](#) on page 985
- [Workaround: Configure All Actions in the Ingress Filter](#) on page 986

### Problem: Output-Filter Matching on Input-Filter Classification

On M Series routers (except M120 routers), you cannot classify packets with an output filter match based on the ingress classification that is set with an input filter applied to the same IPv4 logical interface.

For example, in the following configuration, the filter called **ingress** assigns all incoming IPv4 packets to the **expedited-forwarding** class. The filter called **egress** counts all packets that were assigned to the **expedited-forwarding** class in the **ingress** filter. This configuration does not work on most M Series routers. It works on all other routing platforms, including M120 routers, MX Series routers, and T Series routers.

```
[edit]
user@host # show firewall
family inet {
  filter ingress {
    term 1 {
      then {
        forwarding-class expedited-forwarding;
```

```
        accept;
    }
}
term 2 {
    then accept;
}
}
filter egress {
    term 1 {
        from {
            forwarding-class expedited-forwarding;
        }
        then count ef;
    }
    term 2 {
        then accept;
    }
}
}

[edit]
user@host# show interfaces
ge-1/2/0 {
    unit 0 {
        family inet {
            filter {
                input ingress;
                output egress;
            }
        }
    }
}
```

---

### Workaround: Configure All Actions in the Ingress Filter

As a workaround, you can configure all of the actions in the ingress filter.

```
user@host # show firewall
family inet {
    filter ingress {
        term 1 {
            then {
                forwarding-class expedited-forwarding;
                accept;
                count ef;
            }
        }
        term 2 {
            then accept;
        }
    }
}

[edit]
user@host# show interfaces
ge-1/2/0 {
```

```

unit 0 {
  family inet {
    filter {
      input ingress;
    }
  }
}

```

## Example: Configuring Multifield Classification

This example shows how to configure multifield classification of IPv4 traffic by using firewall filter actions and two firewall filter policers.

- [Requirements on page 987](#)
- [Overview on page 988](#)
- [Configuration on page 989](#)
- [Verification on page 993](#)

### Requirements

Before you begin, make sure that your environment supports the features shown in this example:

1. The **loss-priority** firewall filter action must be supported on the router and configurable to all four values.
  - a. To be able to set a **loss-priority** firewall filter action, configure this example on logical interface **ge-1/2/0.0** on one of the following routing platforms:
    - MX Series router
    - M120 or M320 router
    - M7i or M10i router with the Enhanced CFEB (CFEB-E)
    - T Series router with Enhanced II Flexible PIC Concentrator (FPC)
  - b. To be able to set a **loss-priority** firewall filter action to **medium-low** or **medium-high**, make sure that the CoS tricolor marking feature is enabled. To enable the CoS tricolor marking feature, include the **tri-color** statement at the **[edit class-of-service]** hierarchy level.
2. The **expedited-forwarding** and **assured-forwarding** forwarding classes must be scheduled on the underlying physical interface **ge-1/2/0**.
  - a. Make sure that the following forwarding classes are assigned to output queues:
    - **expedited-forwarding**
    - **assured-forwarding**

Forwarding-class assignments are configured at the **[edit class-of-service forwarding-classes queue *queue-number*]** hierarchy level.

**NOTE:** You cannot commit a configuration that assigns the same forwarding class to two different queues.

- b. Make sure that the output queues to which the forwarding classes are assigned are associated with schedulers. A scheduler defines the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the random early detection (RED) drop profiles associated with the queue.
  - You configure output queue schedulers at the **[edit class-of-service schedulers]** hierarchy level.
  - You associate output queue schedulers with forwarding classes by means of a scheduler map that you configure at the **[edit class-of-service scheduler-maps map-name]** hierarchy level.
- c. Make sure that output-queue scheduling is applied to the physical interface **ge-1/2/0**.

You apply a scheduler map to a physical interface at the **[edit class-of-service interfaces ge-1/2/0 scheduler-map map-name]** hierarchy level.

## Overview

In this example, you apply multifield classification to the input IPv4 traffic at a logical interface by using stateless firewall filter actions and two firewall filter policers that are referenced from the firewall filter. Based on the source address field, packets are either set to the **low** loss priority or else policed. Neither of the policers discards nonconforming traffic. Packets in nonconforming flows are marked for a specific forwarding class (**expedited-forwarding** or **assured-forwarding**), set to a specific loss priority, and then transmitted.

**NOTE:** Single-rate two-color policers always transmit packets in a conforming traffic flow after implicitly setting a low loss priority.

## Topology

In this example, you apply multifield classification to the IPv4 traffic on logical interface **ge-1/2/0.0**. The classification rules are specified in the IPv4 stateless firewall filter **mfc-filter** and two single-rate two-color policers, **ef-policer** and **af-policer**.

The IPv4 standard stateless firewall filter **mfc-filter** defines three filter terms:

- **isp1-customers**—The first filter term matches packets with the source address 10.1.1.0/24 or 10.1.2.0/24. Matched packets are assigned to the **expedited-forwarding** forwarding class and set to the **low** loss priority.
- **isp2-customers**—The second filter term matches packets with the source address 10.1.3.0/24 or 10.1.4.0/24. Matched packets are passed to **ef-policer**, a policer that

rate-limits traffic to a bandwidth limit of 300 Kbps with a burst-size limit of 50 KB. This policer specifies that packets in a nonconforming flow are marked for the **expedited-forwarding** forwarding class and set to the **high** loss priority.

- **other-customers**—The third and final filter term passes all other packets to **af-policer**, a policer that rate-limits traffic to a bandwidth limit of 300 Kbps and a burst-size limit of 50 KB (the same traffic limits as defined by **ef-policer**). This policer specifies that packets in a nonconforming flow are marked for the **assured-forwarding** forwarding class and set to the **medium-high** loss priority.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring Policers to Rate-Limit Expedited-Forwarding and Assured-Forwarding Traffic on page 990](#)
- [Configuring a Multifield Classification Filter That Also Applies Policing on page 991](#)
- [Applying Multifield Classification Filtering and Policing to the Logical Interface on page 992](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall policer ef-policer if-exceeding bandwidth-limit 300k
set firewall policer ef-policer if-exceeding burst-size-limit 50k
set firewall policer ef-policer then loss-priority high
set firewall policer ef-policer then forwarding-class expedited-forwarding
set firewall policer af-policer if-exceeding bandwidth-limit 300k
set firewall policer af-policer if-exceeding burst-size-limit 50k
set firewall policer af-policer then loss-priority high
set firewall policer af-policer then forwarding-class assured-forwarding
set firewall family inet filter mfc-filter term isp1-customers from source-address 10.1.1.0/24
set firewall family inet filter mfc-filter term isp1-customers from source-address 10.1.2.0/24
set firewall family inet filter mfc-filter term isp1-customers then loss-priority low
set firewall family inet filter mfc-filter term isp1-customers then forwarding-class
  expedited-forwarding
set firewall family inet filter mfc-filter term isp2-customers from source-address
  10.1.3.0/24
set firewall family inet filter mfc-filter term isp2-customers from source-address
  10.1.4.0/24
set firewall family inet filter mfc-filter term isp2-customers then policer ef-policer
set firewall family inet filter mfc-filter term other-customers then policer af-policer
set interfaces ge-1/2/0 unit 0 family inet address 192.168.1.1/24
set interfaces ge-1/2/0 unit 0 family inet filter input mfc-filter
```

*Configuring Policers to Rate-Limit Expedited-Forwarding and Assured-Forwarding Traffic*

**Step-by-Step Procedure** To configure policers to rate-limit expedited-forwarding and assured-forwarding traffic:

1. Define traffic limits for expedited-forwarding traffic.

```
[edit]
user@host# edit firewall policer ef-policer
[edit firewall policer ef-policer]
user@host# set if-exceeding bandwidth-limit 300k
user@host# set if-exceeding burst-size-limit 50k
user@host# set then loss-priority high
user@host# set then forwarding-class expedited-forwarding
```

2. Configure a policer for assured-forwarding traffic.

```
[edit firewall policer ef-policer]
user@host# up

[edit firewall]
user@host# edit policer af-policer

[edit firewall policer af-policer]
user@host# set if-exceeding bandwidth-limit 300k
user@host# set if-exceeding burst-size-limit 50k
user@host# set then loss-priority high
user@host# set then forwarding-class assured-forwarding
```

**Results** Confirm the configuration of the policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer af-policer {
  if-exceeding {
    bandwidth-limit 300k;
    burst-size-limit 50k;
  }
  then {
    loss-priority high;
    forwarding-class assured-forwarding;
  }
}
policer ef-policer {
  if-exceeding {
    bandwidth-limit 300k;
    burst-size-limit 50k;
  }
  then {
    loss-priority high;
    forwarding-class expedited-forwarding;
  }
}
```

*Configuring a Multifield Classification Filter That Also Applies Policing***Step-by-Step Procedure**

To configure a multifield classification filter that additionally applies policing:

1. Enable configuration of a firewall filter term for IPv4 traffic.  
  
[edit]  
user@host# edit firewall family inet filter mfc-filter
2. Configure the first term to match on source addresses and then classify the matched packets.  
  
[edit firewall family inet filter mfc-filter]  
user@host# set term isp1-customers from source-address 10.1.1.0/24  
user@host# set term isp1-customers from source-address 10.1.2.0/24  
user@host# set term isp1-customers then loss-priority low  
user@host# set term isp1-customers then forwarding-class expedited-forwarding
3. Configure the second term to match on different source addresses and then police the matched packets.  
  
[edit firewall family inet filter mfc-filter]  
user@host# set term isp2-customers from source-address 10.1.3.0/24  
user@host# set term isp2-customers from source-address 10.1.4.0/24  
user@host# set term isp2-customers then policer ef-policer
4. Configure the third term to police all other packets to a different set of traffic limits and actions.  
  
[edit firewall family inet filter mfc-filter]  
user@host# set term other-customers then policer af-policer

**Results**

Confirm the configuration of the filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter mfc-filter {
    term isp1-customers {
      from {
        source-address 10.1.1.0/24;
        source-address 10.1.2.0/24;
      }
      then {
        loss-priority low;
        forwarding-class expedited-forwarding;
      }
    }
  }
  term isp2-customers {
    from {
      source-address 10.1.3.0/24;
      source-address 10.1.4.0/24;
    }
    then {
      policer ef-policer;
    }
  }
}
```

```

    }
  }
  term other-customers {
    then {
      policer af-policer;
    }
  }
}
policer af-policer {
  if-exceeding {
    bandwidth-limit 300k;
    burst-size-limit 50k;
  }
  then discard;
}
policer ef-policer {
  if-exceeding {
    bandwidth-limit 200k;
    burst-size-limit 50k;
  }
  then {
    loss-priority high;
    forwarding-class expedited-forwarding;
  }
}

```

### *Applying Multifield Classification Filtering and Policing to the Logical Interface*

#### **Step-by-Step Procedure**

To apply multifield classification filtering and policing to the logical interface:

1. Enable configuration of IPv4 on the logical interface.  
  
[edit]  
user@host# edit interfaces ge-1/2/0 unit 0 family inet
2. Configure an IP address for the logical interface.  
  
[edit interfaces ge-1/2/0 unit 0 family inet ]  
user@host# set address 192.168.1.1/24
3. Apply the firewall filter to the logical interface input.  
  
[edit interfaces ge-1/2/0 unit 0 family inet ]  
user@host# set filter input mfc-filter

**NOTE:** Because the policer is executed before the filter, if an input policer is also configured on the logical interface, it cannot use the forwarding class and PLP of a multifield classifier associated with the interface.

**Results** Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/2/0 {
  unit 0 {
    family inet {
      filter {
        input mfc-filter;
      }
      address 192.168.1.1/24;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### *Displaying the Number of Packets Processed by the Policer at the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show firewall** operational mode command for the filter you applied to the logical interface.

```
user@host> show firewall filter rate-limit-in
Filter: rate-limit-in
Policers:
Name                                     Packets
ef-policer-isp2-customers                32863
af-policer-other-customers                3870
```

The command output lists the policers applied by the firewall filter **rate-limit-in**, and the number of packets that matched the filter term.

**NOTE:** The packet count includes the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

The policer name is displayed concatenated with the name of the firewall filter term in which the policer is referenced as an action.

## Example: Configuring and Applying a Firewall Filter for a Multifield Classifier

This example shows how to configure a firewall filter to classify traffic using a multifield classifier. The classifier detects packets of interest to CoS as they arrive on an interface.

- [Requirements on page 994](#)
- [Overview on page 994](#)
- [Configuration on page 995](#)
- [Verification on page 998](#)

---

### Requirements

To verify this procedure, this example uses a traffic generator. The traffic generator can be hardware-based or it can be software running on a server or host machine.

The functionality in this procedure is widely supported on devices that run Junos OS. The example shown here was tested and verified on MX Series routers running Junos OS Release 10.4.

---

### Overview

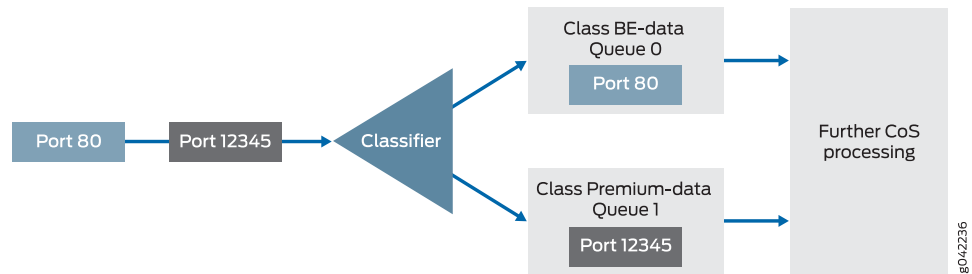

A classifier is a software operation that inspects a packet as it enters the router or switch. The packet header contents are examined, and this examination determines how the packet is treated when the network becomes too busy to handle all of the packets and you want your devices to drop packets intelligently, instead of dropping packets indiscriminately. One common way to detect packets of interest is by source port number. The TCP port numbers 80 and 12345 are used in this example, but many other matching criteria for packet detection are available to multifield classifiers, using firewall filter match conditions. The configuration in this example specifies that TCP packets with source port 80 are classified into the BE-data forwarding class and queue number 0. TCP packets with source port 12345 are classified into the Premium-data forwarding class and queue number 1.

Multifield classifiers are typically used at the network edge as packets enter an autonomous system (AS).

In this example, you configure the firewall filter mf-classifier and specify some custom forwarding classes on Device R1. In specifying the custom forwarding classes, you also associate each class with a queue.

The classifier operation is shown in [Figure 70 on page 995](#).

Figure 70: Multifield Classifier Based on TCP Source Ports

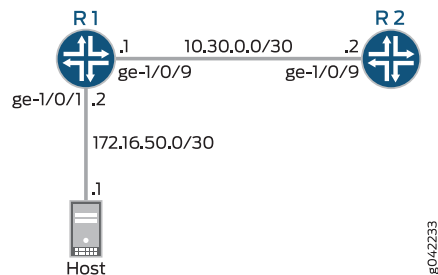

You apply the multifield classifier's firewall filter as an input filter on each customer-facing or host-facing interface that needs the filter. The incoming interface is ge-1/0/0 on Device R1. The classification and queue assignment is verified on the outgoing interface. The outgoing interface is Device R1's ge-1/0/2 interface.

### Topology

Figure 71 on page 995 shows the sample network.

Figure 71: Multifield Classifier Scenario

"CLI Quick Configuration" on page 995 shows the configuration for all of the Juniper Networks devices in Figure 71 on page 995.

The section "Step-by-Step Procedure" on page 996 describes the steps on Device R1.

Classifiers are described in more detail in the following Juniper Networks Learning Byte video.

Video: [Class of Service Basics, Part 2: Classification Learning Byte](#)

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from the configuration mode.

#### Device R1

```
set interfaces ge-1/0/0 description to-host
set interfaces ge-1/0/0 unit 0 family inet filter input mf-classifier
set interfaces ge-1/0/0 unit 0 family inet address 172.16.50.2/30
```

```
set interfaces ge-1/0/2 description to-R2
set interfaces ge-1/0/2 unit 0 family inet address 10.30.0.1/30
set class-of-service forwarding-classes class BE-data queue-num 0
set class-of-service forwarding-classes class Premium-data queue-num 1
set class-of-service forwarding-classes class Voice queue-num 2
set class-of-service forwarding-classes class NC queue-num 3
set firewall family inet filter mf-classifier term BE-data from protocol tcp
set firewall family inet filter mf-classifier term BE-data from port 80
set firewall family inet filter mf-classifier term BE-data then forwarding-class BE-data
set firewall family inet filter mf-classifier term Premium-data from protocol tcp
set firewall family inet filter mf-classifier term Premium-data from port 12345
set firewall family inet filter mf-classifier term Premium-data then forwarding-class
Premium-data
set firewall family inet filter mf-classifier term accept-all-else then accept
```

**Device R2**      `set interfaces ge-1/0/2 description to-R1`  
`set interfaces ge-1/0/2 unit 0 family inet address 10.30.0.2/30`

**Step-by-Step Procedure**      The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Device R1:

1. Configure the device interfaces.

```
[edit interfaces]
user@R1# set ge-1/0/0 description to-host
user@R1# set ge-1/0/0 unit 0 family inet address 172.16.50.2/30

user@R1# set ge-1/0/2 description to-R2
user@R1# set ge-1/0/2 unit 0 family inet address 10.30.0.1/30
```

2. Configure the custom forwarding classes and associated queue numbers.

```
[edit class-of-service forwarding-classes]
user@R1# set BE-data queue-num 0
user@R1# set Premium-data queue-num 1
user@R1# set Voice queue-num 2
user@R1# set NC queue-num 3
```

3. Configure the firewall filter term that places TCP traffic with a source port of 80 (HTTP traffic) into the BE-data forwarding class, associated with queue 0.

```
[edit firewall family inet filter mf-classifier]
user@R1# set term BE-data from protocol tcp
user@R1# set term BE-data from port 80
user@R1# set term BE-data then forwarding-class BE-data
```

4. Configure the firewall filter term that places TCP traffic with a source port of 12345 into the Premium-data forwarding class, associated with queue 1.

```
[edit firewall family inet filter mf-classifier]
user@R1# set term Premium-data from protocol tcp
user@R1# set term Premium-data from port 12345
user@R1# set term Premium-data then forwarding-class Premium-data
```

5. At the end of your firewall filter, configure a default term that accepts all other traffic.

Otherwise, all traffic that arrives on the interface and is not explicitly accepted by the firewall filter is discarded.

```
[edit firewall family inet filter mf-classifier]
user@R1# set term accept-all-else then accept
```

6. Apply the firewall filter to the ge-1/0/0 interface as an input filter.

```
[edit interfaces]
user@R1# set ge-1/0/0 unit 0 family inet filter input mf-classifier
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces**, **show class-of-service**, **show firewall** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show interfaces
ge-1/0/0 {
  description to-host;
  unit 0 {
    family inet {
      filter {
        input mf-classifier;
      }
      address 172.16.50.2/30;
    }
  }
}
ge-1/0/2 {
  description to-R2;
  unit 0 {
    family inet {
      address 10.30.0.1/30;
    }
  }
}

user@R1# show class-of-service
forwarding-classes {
  class BE-data queue-num 0;
  class Premium-data queue-num 1;
  class Voice queue-num 2;
  class NC queue-num 3;
}

user@R1# show firewall
family inet {
  filter mf-classifier {
    term BE-data {
      from {
        protocol tcp;
        port 80;
      }
      then forwarding-class BE-data;
    }
  }
}
```

```

term Premium-data {
  from {
    protocol tcp;
    port 12345;
  }
  then forwarding-class Premium-data;
}
term accept-all-else {
  then accept;
}
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Checking the CoS Settings on page 998](#)
- [Sending TCP Traffic into the Network and Monitoring the Queue Placement on page 998](#)

#### Checking the CoS Settings

**Purpose** Confirm that the forwarding classes are configured correctly.

**Action** From Device R1, run the **show class-of-service forwarding-classes** command.

```
user@R1> show class-of-service forwarding-class
```

| Forwarding class                        | ID | Queue | Restricted queue | Fabric |
|-----------------------------------------|----|-------|------------------|--------|
| priority Policing priority SPU priority |    |       |                  |        |
| <b>BE-data</b>                          | 0  | 0     |                  | low    |
| normal                                  |    |       |                  |        |
| <b>Premium-data</b>                     | 1  | 1     | 1                | low    |
| normal                                  |    |       |                  |        |
| Voice                                   | 2  | 2     | 2                | low    |
| normal                                  |    |       |                  |        |
| NC                                      | 3  | 3     | 3                | low    |
| normal                                  |    |       |                  |        |

**Meaning** The output shows the configured custom classifier settings.

#### Sending TCP Traffic into the Network and Monitoring the Queue Placement

**Purpose** Make sure that the traffic of interest is sent out the expected queue.

**Action** 1. Clear the interface statistics on Device R1's outgoing interface.

```
user@R1> clear interfaces statistics ge-1/0/2
```

2. Use a traffic generator to send 50 TCP port 80 packets to Device R2 or to some other downstream device.

3. On Device R1, check the queue counters.

Notice that you check the queue counters on the downstream output interface, not on the incoming interface.

```
user@R1> show interfaces extensive ge-1/0/2 | find "Queue counters"
```

| Queue counters: | Queued packets | Transmitted packets | Dropped packets |
|-----------------|----------------|---------------------|-----------------|
| 0               | 50             | 50                  |                 |
| 0               |                |                     |                 |
| 1               | 0              | 57                  |                 |
| 0               |                |                     |                 |
| 2               | 0              | 0                   |                 |
| 0               |                |                     |                 |
| 3               | 0              | 0                   |                 |
| 0               |                |                     |                 |

4. Use a traffic generator to send 50 TCP port 12345 packets to Device R2 or to some other downstream device.

```
[root@host]# hping 172.16.60.1 -c 50 -s 12345 -k
```

5. On Device R1, check the queue counters.

```
user@R1> show interfaces extensive ge-1/0/2 | find "Queue counters"
```

| Queue counters: | Queued packets | Transmitted packets | Dropped packets |
|-----------------|----------------|---------------------|-----------------|
| 0               | 50             | 50                  |                 |
| 0               |                |                     |                 |
| 1               | 50             | 57                  |                 |
| 0               |                |                     |                 |
| 2               | 0              | 0                   |                 |
| 0               |                |                     |                 |
| 3               | 0              | 0                   |                 |
| 0               |                |                     |                 |

**Meaning** The output shows that the packets are classified correctly. When port 80 is used in the TCP packets, queue 0 is incremented. When port 12345 is used, queue 1 is incremented.

## Policer Overhead to Account for Rate Shaping in the Traffic Manager

---

- [Policer Overhead to Account for Rate Shaping Overview on page 1000](#)
- [Example: Configuring Policer Overhead to Account for Rate Shaping on page 1000](#)

### Policer Overhead to Account for Rate Shaping Overview

If you configure ingress or egress traffic-shaping overhead values for an interface, the traffic manager cannot apply these values to any rate-limiting also applied to the interface. To enable the router to account for the additional Ethernet frame length when policing actions are being determined, you must configure the ingress or egress overhead values for policers separately.

**NOTE:** When a policer overhead value is changed, the PIC or DPC goes offline and then comes back online.

For Gigabit Ethernet Intelligent Queuing 2 (IQ2) and Enhanced IQ2 (IQ2E) PICs or interfaces on Dense Port Concentrators (DPCs) in MX Series routers, you can control the rate of traffic that passes through all interfaces on the PIC or DPC by configuring a *policer overhead*. You can configure a policer ingress overhead and a policer egress overhead, each with values from 0 through 255 bytes. The policer overhead values are added to the length of the final Ethernet frame when determining ingress and egress policer actions.

### Example: Configuring Policer Overhead to Account for Rate Shaping

This example shows how to configure overhead values for policers when rate-shaping overhead is configured.

- [Requirements on page 1000](#)
- [Overview on page 1000](#)
- [Configuration on page 1001](#)
- [Verification on page 1007](#)

#### Requirements

---

Before you begin, make sure that interface for which you are applying ingress or egress policer overhead is hosted on one of the following:

- Gigabit Ethernet IQ2 PIC
- IQ2E PIC
- DPCs in MX Series routers

#### Overview

---

This example shows how to configure policer overhead values for all physical interfaces on a supported PIC or MPC so that the rate shaping value configured on a logical interface is accounted for in any policing on that logical interface.

### Topology

The router hosts a Gigabit Ethernet IQ2 PIC, installed in PIC location 3 of the Flexible PIC Concentrator (FPC) in slot number 1. The physical interface on port 1 on that PIC is configured to receive traffic on logical interface 0 and send it back out on logical interface 1. Class-of-service scheduling includes 100 Mbps of traffic rate-shaping overhead for the output traffic. A policer egress overhead of 100 bytes is configured on the entire PIC so that, for any policers applied to the output traffic, 100 bytes are added to the final Ethernet frame length when determining ingress and egress policer actions.

#### NOTE:

Traffic rate-shaping and corresponding policer overhead are configured separately:

- You configure rate shaping at the `[edit class-of-service interfaces interface-name unit unit-number]` hierarchy level.
- You configure policer overhead at the `[edit chassis fpc slot-number pic pic-number]` hierarchy level.

When a policer overhead value is changed, the PIC or DPC goes offline and then comes back online.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Logical Interfaces on page 1002](#)
- [Configuring Traffic Rate-Shaping on the Logical Interface That Carries Output Traffic on page 1003](#)
- [Configuring Policer Overhead on the PIC or DPC That Hosts the Rate-Shaped Logical Interface on page 1005](#)
- [Applying a Policer to the Logical Interface That Carries Input Traffic on page 1005](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the `[edit]` hierarchy level.

```
set interfaces ge-1/3/1 per-unit-scheduler
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
  00:00:11:22:33:44
set class-of-service schedulers be transmit-rate percent 5
set class-of-service schedulers ef transmit-rate percent 30
```

```

set class-of-service schedulers af transmit-rate percent 30
set class-of-service schedulers nc transmit-rate percent 35
set class-of-service scheduler-maps my-map forwarding-class best-effort scheduler be
set class-of-service scheduler-maps my-map forwarding-class expedited-forwarding
  scheduler ef
set class-of-service scheduler-maps my-map forwarding-class network-control scheduler
  nc
set class-of-service scheduler-maps my-map forwarding-class assured-forwarding
  scheduler af
set class-of-service interfaces ge-1/3/1 unit 1 scheduler-map my-map
set class-of-service interfaces ge-1/3/1 unit 1 shaping-rate 100m
set firewall policer 500Kbps logical-interface-policer
set firewall policer 500Kbps if-exceeding bandwidth-limit 500k
set firewall policer 500Kbps if-exceeding burst-size-limit 625k
set firewall policer 500Kbps then discard
set chassis fpc 1 pic 3 ingress-policer-overhead 100
set chassis fpc 1 pic 3 egress-policer-overhead 100
set interfaces ge-1/3/1 unit 0 family inet policer input 500Kbps

```

### Configuring the Logical Interfaces

#### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface

```

[edit]
user@host# edit interfaces ge-1/3/1

```

2. Enable multiple queues for each logical interface (so that you can associate an output scheduler with each logical interface).

```

[edit interfaces ge-1/3/1]
user@host# set per-unit scheduler
user@host# set vlan-tagging

```

**NOTE:** For Gigabit Ethernet IQ2 PICs only, use the shared-scheduler statement to enable shared schedulers and shapers on a physical interface.

3. Configure logical interface **ge-1/3/1.0**.

```

[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30

```

4. Configure logical interface **ge-1/3/1.1**.

```

[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
  00:00:11:22:33:44

```

**Results** Confirm the configuration of the interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
  per-unit-scheduler;
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}
```

#### *Configuring Traffic Rate-Shaping on the Logical Interface That Carries Output Traffic*

**Step-by-Step Procedure** To configure traffic rate-shaping on the logical interface that carries output traffic:

1. Enable configuration of class-of-service features.

```
[edit]
user@host# edit class-of-service
```

2. Configure packet scheduling on logical interface **ge-1/3/1.0**.
  - a. Configure schedulers that specify the percentage of transmission capacity.

```
[edit class-of-service]
user@host# edit schedulers
```

```
[edit class-of-service schedulers]
user@host# set be transmit-rate percent 5
user@host# set ef transmit-rate percent 30
user@host# set af transmit-rate percent 30
user@host# set nc transmit-rate percent 35
```

A percentage of zero drops all packets in the queue. When the **rate-limit** option is specified, the transmission rate is limited to the rate-controlled amount. In contrast with the **exact** option, a scheduler with the **rate-limit** option shares unused bandwidth above the rate-controlled amount.

- b. Configure a scheduler map to associate each scheduler with a forwarding class.

```
[edit class-of-service]
user@host# edit scheduler-maps my-map
```

```
[edit class-of-service scheduler-maps my-map]
user@host# set forwarding-class best-effort scheduler be
user@host# set forwarding-class expedited-forwarding scheduler ef
user@host# set forwarding-class network-control scheduler nc
user@host# set forwarding-class assured-forwarding scheduler af
```

- c. Associate the scheduler map with logical interface **ge-1/3/1.0**.

```
[edit class-of-service]
user@host# edit interfaces ge-1/3/1 unit 1
```

```
[edit class-of-service interfaces ge-1/3/1 unit 1]
user@host# set scheduler-map my-map
```

3. Configure 100 Mbps of traffic rate-shaping overhead on logical interface **ge-1/3/1.1**.

```
[edit class-of-service interfaces ge-1/3/1 unit 1]
user@host# set shaping-rate 100
```

Alternatively, you can configure a shaping rate for a logical interface and oversubscribe the physical interface by including the **shaping-rate** statement at the **[edit class-of-service traffic-control-profiles]** hierarchy level. With this configuration approach, you can independently control the delay-buffer rate.

**Results** Confirm the configuration of the class-of-service features (including the 100 Mbp of shaping of the egress traffic) by entering the **show class-of-service** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
interfaces {
  ge-1/3/1 {
    unit 1 {
      scheduler-map my-map;
      shaping-rate 100m;
    }
  }
}
scheduler-maps {
  my-map {
    forwarding-class best-effort scheduler be;
    forwarding-class expedited-forwarding scheduler ef;
    forwarding-class network-control scheduler nc;
    forwarding-class assured-forwarding scheduler af;
  }
}
schedulers {
  be {
    transmit-rate percent 5;
  }
  ef {
    transmit-rate percent 30;
  }
  af {
    transmit-rate percent 30;
  }
}
```

```

    }
    nc {
        transmit-rate percent 35;
    }
}

```

### *Configuring Policer Overhead on the PIC or DPC That Hosts the Rate-Shaped Logical Interface*

**Step-by-Step Procedure** To configure policer overhead on the PIC or MPC that hosts the rate-shaped logical interface:

1. Enable configuration of the supported PIC or MPC.

```

[edit]
user@host# set chassis fpc 1 pic 3

```

2. Configure 100 bytes of policer overhead on the supported PIC or MPC.

```

[edit chassis fpc 1 pic 3]
user@host# set ingress-policer-overhead 100
user@host# set egress-policer-overhead 100

```

**NOTE:** These values are added to the length of the final Ethernet frame when determining ingress and egress policer actions for all physical interfaces on the PIC or MPC.

You can specify policer overhead with values from 0 through 255 bytes.

**Results** Confirm the configuration of the policer overhead on the physical interface to account for rate-shaping by entering the **show chassis** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show chassis
chassis {
  fpc 1 {
    pic 3 {
      egress-policer-overhead 100;
      ingress-policer-overhead 100;
    }
  }
}

```

### *Applying a Policer to the Logical Interface That Carries Input Traffic*

**Step-by-Step Procedure** To apply a policer to the logical interface that carries input traffic:

1. Configure the logical interface (aggregate) policer.

```

[edit]
user@host# edit firewall policer 500Kbps

```

```
[edit firewall policer 500Kbps]
user@host# set logical-interface-policer
user@host# set if-exceeding bandwidth-limit 500k
user@host# set if-exceeding burst-size-limit 625k
user@host# set then discard
```

2. Apply the policer to Layer 3 input on the IPv4 logical interface.

```
[edit]
user@host# set interfaces ge-1/3/1 unit 0 family inet policer input 500Kbps
```

**NOTE:** The 100 Mbps policer overhead is added to the length of the final Ethernet frame when determining ingress and egress policer actions,

**Results** Confirm the configuration of the policer with rate-shaping overhead by entering the **show firewall** and **show interfaces** configuration mode commands. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer 500Kbps {
  logical-interface-policer;
  if-exceeding {
    bandwidth-limit 500k;
    burst-size-limit 625k;
  }
  then discard;
}
[edit]
user@host# show interfaces
ge-1/3/1 {
  per-unit-scheduler;
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    layer2-policer {
      input-policer 500Kbps;
    }
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 0 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Displaying Traffic Statistics and Policers for the Logical Interface on page 1007](#)
- [Displaying Statistics for the Policer on page 1007](#)

#### *Displaying Traffic Statistics and Policers for the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces** operational mode command for logical interface **ge-1/3/1.0**, and include the **detail** or **extensive** option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer **500Kbps** as an input or output policer as follows:

- **Input: 500Kbps-ge-1/3/1.0-log\_int-i**
- **Output: 500Kbps-ge-1/3/1.0-log\_int-o**

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to Input traffic only.

#### *Displaying Statistics for the Policer*

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the **show policer** operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer **500Kbps**, the input and output policer names are displayed as follows:

- **500Kbps-ge-1/3/1.0-log\_int-i**
- **500Kbps-ge-1/3/1.0-log\_int-o**

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## Three-Color Policer Configuration Overview

[Table 76 on page 1009](#) describes the hierarchy levels at which you can configure and apply single-rate tricolor-marking (single-rate TCM) policers and two-rate tricolor-marking (two-rate TCM) policers to Layer 3 traffic. For information about applying three-color policers to Layer 2 traffic, see [“Three-Color Policing at Layer 2 Overview” on page 914](#).

Table 76: Three-Color Policer Configuration and Application Overview

| Policy Configuration                                                                                                                                                                                                                                                                                                                                   | Layer 3 Application                                                                                                                                                                                                                                                                                                                                                                | Key Points                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- [Color Modes for Three-Color Policers on page 1013](#)
- [Naming Conventions for Three-Color Policers on page 1014](#)

## Platforms Supported for Three-Color Policers

Three-color policers are supported on the following Juniper Networks routers:

- M120 Multiservice Edge Routers
- M320 Multiservice Edge Routers and T Series Core Routers with Enhanced II Flexible PIC Concentrators (FPCs)
- MX Series 3D Universal Edge Routers
- T640 Core Routers with Enhanced Scaling FPC4
- T4000 Core Routers with FPC5

On MX Series and M120 routers, you can apply three-color policers to aggregated interfaces.

The **discard** action for a tricolor marking policer for a firewall filter is supported on the M120 routers, M320 routers with Enhanced-III FPCs, M7i and M10i routers with the Enhanced CFEB (CFEB-E), and MX Series routers with Trio MPCs, so it is not necessary to include the **logical-interface-policer** statement for them.

## Color Modes for Three-Color Policers

Three-color policers—both single-rate and two-rate three-color policer schemes—can operate in either of two modes:

- [Color-Blind Mode on page 1013](#)
- [Color-Aware Mode on page 1013](#)

### Color-Blind Mode

In *color-blind* mode, the three-color policer assumes that all packets examined have not been previously marked or metered. If you configure a three-color policer to be color-blind instead of color-aware, the policer ignores preexisting color markings that might have been set for a packet by another traffic policer configured at a previous network node.

### Color-Aware Mode

In *color-aware* mode, the three-color policer assumes that all packets examined have been previously marked or metered. In other words, the three-color policer takes into account any coloring markings that might have been set for a packet by another traffic policer configured at a previous network node. At the node where color-aware policing is configured, any preexisting color markings are used in determining the appropriate policing action for the packet.

In color-aware mode, the three-color policer can increase the packet loss priority (PLP) level of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

For two-rate, three-color policing, the Junos OS uses two token buckets to manage bandwidth based on the two rates of traffic. For example, two-rate policing might be

configured on a node upstream in the network. The two-rate policer has marked a packet as yellow (loss priority medium-low). The color-aware policer takes this yellow marking into account when determining the appropriate policing action. In color-aware policing, the yellow packet would never receive the action associated with either the green packets or red packets. This way, tokens for violating packets are never taken from the metering token buckets at the color-aware policing node.

**NOTE:** For a three-color policer operating in color-aware mode and when the PLP of the input packet is medium-low, the color of the input packet to the policer is mapped to the color yellow.

In such a scenario, if the color of the input packet remains unchanged, the policer operates in the following way:

- On a T1600 Enhanced Scaling Type 4 FPC (T1600-FPC4-ES), the PLP of the output packet remains medium-low.
- On a T4000 Type 5 FPC (T4000-FPC5-3D), the PLP of the output packet is marked as medium-high.

Because of this difference, for any applications (such as rewrite and WRED selection on egress interface) that use PLP, the packets are treated differently for the same flow depending on the FPC type (T1600 Enhanced Scaling FPC4 (T1600-FPC4-ES) or T4000 FPC5 (T4000-FPC5-3D)) on which the policer is applied.

---

## Naming Conventions for Three-Color Policers

Because policers can be numerous and must be applied correctly to work, a simple naming convention makes it easier to apply the policers properly.

We recommend that you name your policer using a convention that identifies the basic components of the policer:

- Three-color policer type—Where **srTCM** identifies a *single-rate* three-color policer and **trTCM** identifies a *two-rate* three-color policer.
- Three-color policer color mode—Where **ca** identifies a *color-aware* three-color policer and **cb** identifies a *color-blind three-color policer*.

**NOTE:**

TCM stands for tricolor marking.

Table 77 on page 1015 describes a recommended naming convention for policers.

Table 77: Recommended Naming Convention for Policers

| Three-Color Policer Type             | Naming Convention     | Example Names                                 |
|--------------------------------------|-----------------------|-----------------------------------------------|
| Single-rate three-color, color-aware | <i>srTCMnumber-ca</i> | srTCM1-ca,<br>srTCM2-ca,<br>srTCM3-ca,<br>... |
| Single-rate three-color, color-blind | <i>srTCMnumber-cb</i> | srTCM1-cb,<br>srTCM2-cb,<br>srTCM3-cb,<br>... |
| Two-rate three-color, color-aware    | <i>trTCMnumber-ca</i> | trTCM1-ca,<br>trTCM2-ca,<br>trTCM3-ca,<br>... |
| Two-rate three-color, color-blind    | <i>trTCMnumber-cb</i> | trTCM1-cb,<br>trTCM2-cb,<br>trTCM3-cb,<br>... |

## Basic Single-Rate Three-Color Policers

- [Single-Rate Three-Color Policer Overview on page 1015](#)
- [Example: Configuring a Single-Rate Three-Color Policer on page 1016](#)

### Single-Rate Three-Color Policer Overview

A single-rate three-color policer defines a bandwidth limit and a maximum burst size for guaranteed traffic and a second burst size for peak traffic. A single-rate three-color policer is most useful when a service is structured according to packet length and not peak arrival rate.

Single-rate three-color policing meters a traffic stream based on the following configured traffic criteria:

- Committed information rate (CIR)—Bandwidth limit for guaranteed traffic.
- Committed burst size (CBS)—Maximum packet size permitted for bursts of data that exceed the CIR.
- Excess burst size (EBS)—Maximum packet size permitted for peak traffic.

Single-rate tricolor marking (single-rate TCM) classifies traffic as belonging to one of three color categories and performs congestion-control actions on the packets based on the color marking:

- Green—Traffic that conforms to *either* the bandwidth limit *or* the burst size for guaranteed traffic (CIR or CBS). For a green traffic flow, single-rate marks the packets with an implicit loss priority of **low** and transmits the packets.
- Yellow—Traffic that exceeds *both* the bandwidth limit *and* the burst size for guaranteed traffic (CIR and CBS) but not the burst size for peak traffic (EBS). For a yellow traffic flow, single-rate marks the packets with an implicit loss priority of **medium-high** and transmits the packets.
- Red—Traffic that exceeds the burst size for peak traffic (EBS), single-rate marks packets with an implicit loss priority of **high** and, optionally, discards the packets.

If congestion occurs downstream, the packets with higher loss priority are more likely to be discarded.

**NOTE:** For both single-rate and two-rate three-color policers, the only *configurable* action is to discard packets in a red traffic flow.

---

The **discard** action for a tricolor marking policer for a firewall filter is supported on the M120 routers, M320 routers with Enhanced-III FPCs, M7i and M10i routers with the Enhanced CFEB (CFEB-E), and MX Series routers with MPCs, so it is not necessary to include the **logical-interface-policer** statement for them.

## Example: Configuring a Single-Rate Three-Color Policer

This example shows how to configure a single-rate three-color policer.

- [Requirements on page 1016](#)
- [Overview on page 1016](#)
- [Configuration on page 1017](#)
- [Verification on page 1020](#)

---

### Requirements

No special configuration beyond device initialization is required before configuring this example.

---

### Overview

A single-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a second burst-size limit for excess traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed the burst size for excess traffic is categorized as yellow.

- Nonconforming traffic that exceeds the burst size for excess traffic is categorized as red.

Each category is associated with an action. For green traffic, packets are implicitly set with a loss-priority value of **low** and then transmitted. For yellow traffic, packets are implicitly set with a loss-priority value of **medium-high** and then transmitted. For red traffic, packets are implicitly set with a loss-priority value of **high** and then transmitted. If the policer configuration includes the optional **action** statement (**action loss-priority high then discard**), then packets in a red flow are discarded instead.

You can apply a three-color policer to Layer 3 traffic as a firewall filter policer only. You reference the policer from a stateless firewall filter term, and then you apply the filter to the input or output of a logical interface at the protocol level.

### Topology

In this example, you apply a color-aware, single-rate three-color policer to the input IPv4 traffic at logical interface **ge-2/0/5.0**. The IPv4 firewall filter term that references the policer does not apply any packet-filtering. The filter is used only to apply the three-color policer to the interface.

You configure the policer to rate-limit traffic to a bandwidth limit of 40 Mbps and a burst-size limit of 100 KB for green traffic but also allow an excess burst-size limit of 200 KB for yellow traffic. Only nonconforming traffic that exceeds the peak burst-size limit is categorized as red. In this example, you configure the three-color policer action **loss-priority high then discard**, which overrides the implicit marking of red traffic to a **high** loss priority.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring a Single-Rate Three-Color Policer on page 1018](#)
- [Configuring an IPv4 Stateless Firewall Filter That References the Policer on page 1019](#)
- [Applying the Filter to the Logical Interface on page 1019](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set firewall three-color-policer srTCM1-ca single-rate color-aware
set firewall three-color-policer srTCM1-ca single-rate committed-information-rate 40m
set firewall three-color-policer srTCM1-ca single-rate committed-burst-size 100k
set firewall three-color-policer srTCM1-ca single-rate excess-burst-size 200k
set firewall three-color-policer srTCM1-ca action loss-priority high then discard
set firewall family inet filter filter-srTCM1ca-all term 1 then three-color-policer single-rate
srTCM1-ca
set class-of-service interfaces ge-2/0/5 unit 0 forwarding-class af
set interfaces ge-2/0/5 unit 0 family inet address 10.20.130.1/24
```

```
set interfaces ge-2/0/5 unit 0 family inet filter input filter-srTCM1ca-all
```

### Configuring a Single-Rate Three-Color Policer

#### Step-by-Step Procedure

To configure a single-rate three-color policer:

1. Enable configuration of a three-color policer.  

```
[edit]
user@host# edit firewall three-color-policer srTCM1-ca
```
2. Configure the color mode of the single-rate three-color policer.  

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set single-rate color-aware
```
3. Configure the single-rate guaranteed traffic limits.  

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set single-rate committed-information-rate 40m
user@host# set single-rate committed-burst-size 100k
```
4. Configure the single-rate burst-size limit that is used to classify nonconforming traffic.  

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set single-rate excess-burst-size 200k
```
5. (Optional) Configure the action for nonconforming traffic.  

```
[edit firewall three-color-policer srTCM1-ca]
user@host# set action loss-priority high then discard
```

For three-color policers, the only configurable action is to discard packets in a red traffic flow. In this example, packets in a red traffic flow have been implicitly marked with a **high** packet loss priority (PLP) level because the traffic flow exceeded the rate-limiting defined by the single rate-limit (specified by the **committed-information-rate 40m** statement) and the larger burst-size limit (specified by the **excess-burst-size 200k** statement). Because the optional **action** statement is included, this example takes the more severe action of discarding packets in a red traffic flow.

**Results** Confirm the configuration of the hierarchical policer by entering the **show firewall** configuration command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
three-color-policer srTCM1-ca {
  action {
    loss-priority high then discard;
  }
  single-rate {
    color-aware;
    committed-information-rate 40m;
    committed-burst-size 100k;
    excess-burst-size 200k;
  }
}
```

*Configuring an IPv4 Stateless Firewall Filter That References the Policer***Step-by-Step Procedure**

To configure a standard stateless firewall filter that references the policer:

1. Enable configuration of an IPv4 standard stateless firewall filter.

```
[edit]
user@host# edit firewall family inet filter filter-srtcm1ca-all
```

2. Specify the filter term that references the policer.

```
[edit firewall family inet filter filter-srtcm1ca-all]
user@host# set term 1 then three-color-policer single-rate srTCM1-ca
```

Note that the term does not specify any match conditions. The firewall filter passes all packets to the policer.

**Results**

Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter filter-srtcm1ca-all {
    term 1 {
      then {
        three-color-policer {
          single-rate srTCM1-ca;
        }
      }
    }
  }
}
three-color-policer srTCM1-ca {
  action {
    loss-priority high then discard;
  }
  single-rate {
    color-aware;
    committed-information-rate 40m;
    committed-burst-size 100k;
    excess-burst-size 200k;
  }
}
```

*Applying the Filter to the Logical Interface***Step-by-Step Procedure**

To apply the filter to the logical interface:

1. (MX Series routers only) (Optional) Reclassify all incoming packets on the logical interface **ge-2/0/5.0** to assured forwarding, regardless of any preexisting classification.

```
[edit]
user@host# set class-of-service interfaces ge-2/0/5 unit 0 forwarding-class af
```

The classifier name can be a configured classifier or one of the default classifiers.

2. Enable configuration of the logical interface.

```
[edit]
user@host# edit interfaces ge-2/0/5 unit 0 family inet
```

3. Configure an IP address.

```
[edit interfaces ge-2/0/5 unit 0 family inet]
user@host# set address 10.20.130.1/24
```

4. Reference the filter as an input filter.

```
[edit interfaces ge-2/0/5 unit 0 family inet]
user@host# set filter input filter-srtcm1ca-all
```

**Results** Confirm the configuration of the interface by entering the **show class-of-service** and **show interfaces** configuration mode commands. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show class-of-service
interfaces {
  ge-2/0/5 {
    unit 0 {
      forwarding-class af;
    }
  }
}
[edit]
user@host# show interfaces
ge-2/0/5 {
  unit 0 {
    family inet {
      filter {
        input filter-srtcm1ca-all;
      }
      address 10.20.130.1/24;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

#### *Displaying the Firewall Filters Applied to the Logical Interface*

**Purpose** Verify that the firewall filter is applied to IPv4 input traffic at the logical interface.

**Action** Use the **show interfaces** operational mode command for the logical interface **ge-2/0/5.0**, and specify **detail** mode. The **Protocol inet** section of the command output displays IPv4

information for the logical interface. Within that section, the **Input Filters** field displays the name of the firewall filter applied to IPv4 input traffic at the logical interface.

```
user@host> show interfaces ge-2/0/5.0 detail

## Basic Two-Rate Three-Color Policers

- [Two-Rate Three-Color Policer Overview on page 1021](#)
- [Example: Configuring a Two-Rate Three-Color Policer on page 1022](#)

### Two-Rate Three-Color Policer Overview

A two-rate three-color policer defines two bandwidth limits (one for guaranteed traffic and one for peak traffic) and two burst sizes (one for each of the bandwidth limits). A two-rate three-color policer is most useful when a service is structured according to arrival rates and not necessarily packet length.

Two-rate three-color policing meters a traffic stream based on the following configured traffic criteria:

- Committed information rate (CIR)—Bandwidth limit for guaranteed traffic.
- Committed burst size (CBS)—Maximum packet size permitted for bursts of data that exceed the CIR.

- Peak information rate (PIR)—Bandwidth limit for peak traffic.
- Peak burst size (PBS)—Maximum packet size permitted for bursts of data that exceed the PIR.

Two-rate tricolor marking (two-rate TCM) classifies traffic as belonging to one of three color categories and performs congestion-control actions on the packets based on the color marking:

- Green—Traffic that conforms to the bandwidth limit and burst size for guaranteed traffic (CIR and CBS). For a green traffic flow, two-rate TCM marks the packets with an implicit loss priority of **low** and transmits the packets.
- Yellow—Traffic that exceeds the bandwidth limit or burst size for guaranteed traffic (CIR or CBS) but not the bandwidth limit and burst size for peak traffic (PIR and PBS). For a yellow traffic flow, two-rate TCM marks packets with an implicit loss priority of **medium-high** and transmits the packets.
- Red—Traffic that exceeds the bandwidth limit and burst size for peak traffic (PIR and PBS). For a red traffic flow, two-rate TCM marks packets with an implicit loss priority of **high** and, optionally, discards the packets.

If congestion occurs downstream, the packets with higher loss priority are more likely to be discarded.

**NOTE:** For both single-rate and two-rate three-color policers, the only *configurable* action is to discard packets in a red traffic flow.

---

For a tricolor marking policer referenced by a firewall filter term, the **discard** policing action is supported on the following routing platforms:

- M7i and M10i routers with the Enhanced CFEB (CFEB-E)
- M120 and M320 routers with Enhanced-III FPCs
- MX Series routers with Trio MPCs

To apply a tricolor marking policer on these routing platforms, it is not necessary to include the **logical-interface-policer** statement.

### Example: Configuring a Two-Rate Three-Color Policer

This example shows how to configure a two-rate three-color policer.

- [Requirements on page 1023](#)
- [Overview on page 1023](#)
- [Configuration on page 1023](#)
- [Verification on page 1026](#)

## Requirements

No special configuration beyond device initialization is required before configuring this example.

## Overview

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a bandwidth limit and burst-size limit for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed peak traffic limits is categorized as yellow.
- Nonconforming traffic that exceeds peak traffic limits is categorized as red.

Each category is associated with an action. For green traffic, packets are implicitly set with a loss-priority value of **low** and then transmitted. For yellow traffic, packets are implicitly set with a loss-priority value of **medium-high** and then transmitted. For red traffic, packets are implicitly set with a loss-priority value of **high** and then transmitted. If the policer configuration includes the optional **action** statement (**action loss-priority high then discard**), then packets in a red flow are discarded instead.

You can apply a three-color policer to Layer 3 traffic as a firewall filter policer only. You reference the policer from a stateless firewall filter term, and then you apply the filter to the input or output of a logical interface at the protocol level.

## Topology

In this example, you apply a color-aware, two-rate three-color policer to the input IPv4 traffic at logical interface **fe-0/1/1.0**. The IPv4 firewall filter term that references the policer does not apply any packet-filtering. The filter is used only to apply the three-color policer to the interface.

You configure the policer to rate-limit traffic to a bandwidth limit of 40 Mbps and a burst-size limit of 100 KB for green traffic, and you configure the policer to also allow a peak bandwidth limit of 60 Mbps and a peak burst-size limit of 200 KB for yellow traffic. Only nonconforming traffic that exceeds the peak traffic limits is categorized as red. In this example, you configure the three-color policer action **loss-priority high then discard**, which overrides the implicit marking of red traffic to a **high** loss priority.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring a Two-Rate Three-Color Policer on page 1024](#)
- [Configuring an IPv4 Stateless Firewall Filter That References the Policer on page 1025](#)
- [Applying the Filter to a Logical Interface at the Protocol Family Level on page 1026](#)

**CLI Quick Configuration** To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the [edit] hierarchy level.

```
set firewall three-color-policer trTCM1-ca two-rate color-aware
set firewall three-color-policer trTCM1-ca two-rate committed-information-rate 40m
set firewall three-color-policer trTCM1-ca two-rate committed-burst-size 100k
set firewall three-color-policer trTCM1-ca two-rate peak-information-rate 60m
set firewall three-color-policer trTCM1-ca two-rate peak-burst-size 200k
set firewall three-color-policer trTCM1-ca action loss-priority high then discard
set firewall family inet filter filter-trtcm1ca-all term 1 then three-color-policer two-rate
trTCM1-ca
set interfaces ge-2/0/5 unit 0 family inet address 10.10.10.1/30
set interfaces ge-2/0/5 unit 0 family inet filter input filter-trtcm1ca-all
set class-of-service interfaces ge-2/0/5 forwarding-class af
```

### *Configuring a Two-Rate Three-Color Policer*

**Step-by-Step Procedure** To configure a two-rate three-color policer:

1. Enable configuration of a three-color policer.

```
[edit]
user@host# set firewall three-color-policer trTCM1-ca
```

2. Configure the color mode of the two-rate three-color policer.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate color-aware
```

3. Configure the two-rate guaranteed traffic limits.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

Traffic that does not exceed both of these limits is categorized as green. Packets in a green flow are implicitly set to **low** loss priority and then transmitted.

4. Configure the two-rate peak traffic limits.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

Nonconforming traffic that does not exceed both of these limits is categorized as yellow. Packets in a yellow flow are implicitly set to **medium-high** loss priority and then transmitted. Nonconforming traffic that exceeds both of these limits is categorized as red. Packets in a red flow are implicitly set to **high** loss priority.

5. (Optional) Configure the policer action for red traffic.

```
[edit firewall three-color-policer trTCM1-ca]
user@host# set action loss-priority high then discard
```

For three-color policers, the only configurable action is to discard red packets. Red packets are packets that have been assigned high loss priority because they exceeded the peak information rate (PIR) and the peak burst size (PBS).

**Results** Confirm the configuration of the policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM1-ca {
  action {
    loss-priority high then discard;
  }
  two-rate {
    color-aware;
    committed-information-rate 40m;
    committed-burst-size 100k;
    peak-information-rate 60m;
    peak-burst-size 200k;
  }
}
```

#### *Configuring an IPv4 Stateless Firewall Filter That References the Policer*

**Step-by-Step Procedure** To configure an IPv4 stateless firewall filter that references the policer:

1. Enable configuration of an IPv4 standard stateless firewall filter.

```
[edit]
user@host# set firewall family inet filter filter-trtcm1ca-all
```

2. Specify the filter term that references the policer.

```
[edit firewall family inet filter filter-trtcm1ca-all]
user@host# set term 1 then three-color-policer two-rate trTCM1-ca
```

Note that the term does not specify any match conditions. The firewall filter passes all packets to the policer.

**Results** Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter filter-trtcm1ca-all {
    term 1 {
      then {
        three-color-policer {
          two-rate trTCM1-ca;
        }
      }
    }
  }
}
three-color-policer trTCM1-ca {
  action {
    loss-priority high then discard;
  }
}
```

```
two-rate {  
  color-aware;  
  committed-information-rate 40m;  
  committed-burst-size 100k;  
  peak-information-rate 60m;  
  peak-burst-size 200k;  
}  
}
```

### *Applying the Filter to a Logical Interface at the Protocol Family Level*

#### **Step-by-Step Procedure**

To apply the filter to the logical interface at the protocol family level:

1. Enable configuration of an IPv4 firewall filter.

```
[edit]  
user@host# edit interfaces ge-2/0/5 unit 0 family inet
```

2. Apply the policer to the logical interface at the protocol family level.

```
[edit interfaces ge-2/0/5 unit 0 family inet]  
user@host# set address 10.10.10.1/30  
user@host# set filter input filter-trtcm1ca-all
```

3. (MX Series routers only) (Optional) For input policers, you can configure a fixed classifier. A fixed classifier reclassifies all incoming packets, regardless of any preexisting classification.

```
[edit]  
user@host# set class-of-service interfaces ge-2/0/5 forwarding-class af
```

The classifier name can be a configured classifier or one of the default classifiers.

**Results** Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]  
user@host# show interfaces  
ge-2/0/5 {  
  unit 0 {  
    family inet {  
      address 10.10.10.1/30;  
      filter {  
        input filter-trtcm1ca-all;  
      }  
    }  
  }  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### **Verification**

Confirm that the configuration is working properly.

- [Displaying the Firewall Filters Applied to the Logical Interface on page 1027](#)

*Displaying the Firewall Filters Applied to the Logical Interface*

**Purpose** Verify that the firewall filter is applied to IPv4 input traffic at the logical interface.

**Action** Use the **show interfaces** operational mode command for the logical interface **ge-2/0/5.0**, and specify **detail** mode. The **Protocol inet** section of the command output displays IPv4 information for the logical interface. Within that section, the **Input Filters** field displays the name of IPv4 firewall filters associated with the logical interface.

```
user@host> show interfaces ge-2/0/5.0 detail

# Configuring Logical and Physical Interface Traffic Policers at Layer 3

- [Two-Color and Three-Color Logical Interface Policers on page 1029](#)
- [Two-Color and Three-Color Physical Interface Policers on page 1041](#)

## Two-Color and Three-Color Logical Interface Policers

---

- [Logical Interface \(Aggregate\) Policer Overview on page 1029](#)
- [Example: Configuring a Two-Color Logical Interface \(Aggregate\) Policer on page 1030](#)
- [Example: Configuring a Three-Color Logical Interface \(Aggregate\) Policer on page 1035](#)

### Logical Interface (Aggregate) Policer Overview

A *logical interface policer*—also called an *aggregate policer*—is a two-color or three-color policer that defines traffic rate limiting that you can apply to input or output traffic for multiple protocol families on the same logical interface without creating multiple instances of the policer.

To configure a single-rate two-color logical interface policer, include the **logical-interface-policer** statement at one of the following hierarchy levels:

- [edit **firewall policer** *policer-name*]
- [edit logical-systems *logical-system-name* **firewall policer** *policer-name*]

To configure a single-rate or two-rate three-color logical interface policer, include the **logical-interface-policer** statement at one of the following hierarchy levels:

- [edit **firewall three-color-policer** *name*]
- [edit logical-systems *logical-system-name* **firewall three-color-policer** *name*]

**NOTE:** A three-color policer can be applied to Layer 2 traffic as a logical interface policer only. You cannot apply a three-color policer to Layer 2 traffic as a physical interface policer (through a firewall filter).

You apply a logical interface policer to Layer 3 traffic directly to the interface configuration at the logical unit level (to rate-limit all traffic types, regardless of the protocol family) or at the protocol family level (to rate-limit traffic of a specific protocol family). It is OK to reference a logical interface policer from a stateless firewall filter term and then apply the filter to a logical interface.

You can apply a logical interface policer to unicast traffic only. For information about configuring a stateless firewall filter for flooded traffic, see “*Applying Forwarding Table Filters*” in the “Traffic Sampling, Forwarding, and Monitoring” section of the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

To display a logical interface policer on a particular interface, issue the **show interfaces policers** operational mode command.

### Example: Configuring a Two-Color Logical Interface (Aggregate) Policer

This example shows how to configure a single-rate two-color policer as a logical interface policer and apply it to incoming IPv4 traffic on a logical interface.

- [Requirements on page 1030](#)
- [Overview on page 1030](#)
- [Configuration on page 1030](#)
- [Verification on page 1034](#)

---

#### Requirements

Before you begin, make sure that the logical interface to which you apply the two-color logical interface policer is hosted on a Gigabit Ethernet interface (**ge-**) or a 10-Gigabit Ethernet interface (**xe-**).

---

#### Overview

In this example, you configure the single-rate two-color policer **policer\_IFL** as a logical interface policer and apply it to incoming IPv4 traffic at logical interface **ge-1/3/1.0**.

#### Topology

If the input IPv4 traffic on the physical interface **ge-1/3/1** exceeds the bandwidth limit equal to 90 percent of the media rate with a 300 KB burst-size limit, then the logical interface policer **policer\_IFL** rate-limits the input IPv4 traffic on the logical interface **ge-1/3/1.0**. Configure the policer to mark nonconforming traffic by setting packet loss priority (PLP) levels to **high** and classifying packets as **best-effort**.

As the incoming IPv4 traffic rate on the physical interface slows and conforms to the configured limits, Junos OS stops marking the incoming IPv4 packets at the logical interface.

---

#### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Logical Interfaces on page 1031](#)
- [Configuring the Single-Rate Two-Color Policer as a Logical Interface Policer on page 1032](#)
- [Applying the Logical Interface Policer to Input IPv4 Traffic at a Logical Interface on page 1033](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44
set firewall policer policer_IFL logical-interface-policer
set firewall policer policer_IFL if-exceeding bandwidth-percent 90
set firewall policer policer_IFL if-exceeding burst-size-limit 300k
set firewall policer policer_IFL then loss-priority high
set firewall policer policer_IFL then forwarding-class best-effort
set interfaces ge-1/3/1 unit 0 family inet policer input policer_IFL
```

#### Configuring the Logical Interfaces

#### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface.

```
[edit]
user@host# edit interfaces ge-1/3/1
```

2. Configure single tagging.

```
[edit interfaces ge-1/3/1]
user@host# set vlan-tagging
```

3. Configure logical interface **ge-1/3/1.0**.

```
[edit interfaces ge-1/3/1]
user@host# set unit 0 vlan-id 100
user@host# set unit 0 family inet address 10.10.10.1/30
```

4. Configure logical interface **ge-1/3/1.0**.

```
[edit interfaces ge-1/3/1]
user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44
```

#### Results

Confirm the configuration of the logical interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
```

```

ge-1/3/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}

```

### *Configuring the Single-Rate Two-Color Policer as a Logical Interface Policer*

#### **Step-by-Step Procedure**

To configure a single-rate two-color policer as a logical interface policer:

1. Enable configuration of a single-rate two-color policer.

```

[edit]
user@host# edit firewall policer policer_IFL

```

2. Specify that the policer is a logical interface (aggregate) policer.

```

[edit firewall policer policer_IFL]
user@host# set logical-interface-policer

```

A logical interface policer rate-limits traffic based on a percentage of the media rate of the physical interface underlying the logical interface to which the policer is applied. The policer is applied directly to the interface rather than referenced by a firewall filter.

3. Specify the policer traffic limits.
  - a. Specify the bandwidth limit.
    - To specify the bandwidth limit as an absolute rate, from 8,000 bits per second through 50,000,000,000 bits per second, include the **bandwidth-limit *bps*** statement.
    - To specify the bandwidth limit as a percentage of the physical port speed on the interface, include the **bandwidth-percent *percent*** statement.

In this example, the CLI commands and output are based on a bandwidth limit specified as a percentage rather than as an absolute rate.

```

[edit firewall policer policer_IFL]
user@host# set if-exceeding bandwidth-percent 90

```

- b. Specify the burst-size limit, from 1,500 bytes through 100,000,000,000 bytes, which is the maximum packet size to be permitted for bursts of data that exceed the specified bandwidth limit.

```
[edit firewall policer policer_IFL]
user@host# set if-exceeding burst-size-limit 300k
```

4. Specify the policer actions to be taken on traffic that exceeds the configured rate limits.
  - To discard the packet, include the **discard** statement.
  - To set the loss-priority value of the packet, include the **loss-priority (low | medium-low | medium-high | high)** statement.
  - To classify the packet to a forwarding class, include the **forwarding-class (forwarding-class | assured-forwarding | best-effort | expedited-forwarding | network-control)** statement.

In this example, the CLI commands and output are based on both setting the packet loss priority level and classifying the packet.

```
[edit firewall policer policer_IFL]
user@host# set then loss-priority high
user@host# set then forwarding-class best-effort
```

**Results** Confirm the configuration of the policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer policer_IFL {
  logical-interface-policer;
  if-exceeding {
    bandwidth-percent 90;
    burst-size-limit 300k;
  }
  then {
    loss-priority high;
    forwarding-class best-effort;
  }
}
```

#### *Applying the Logical Interface Policer to Input IPv4 Traffic at a Logical Interface*

**Step-by-Step Procedure** To apply the two-color logical interface policer to input IPv4 traffic a logical interface:

1. Enable configuration of the logical interface.

```
[edit]
user@host# edit interfaces ge-1/3/1 unit 0
```

2. Apply the policer to all traffic types or to a specific traffic type on the logical interface.

- To apply the policer to all traffic types, regardless of the protocol family, include the **policer (input | output) *policer-name*** statement at the **[edit interfaces *interface-name* unit *number*]** hierarchy level.
- To apply the policer to traffic of a specific protocol family, include the **policer (input | output) *policer-name*** statement at the **[edit interfaces *interface-name* unit *unit-number* family *family-name*]** hierarchy level.

To apply the logical interface policer to incoming packets, use the **policer input *policer-name*** statement. To apply the logical interface policer to outgoing packets, use the **policer output *policer-name*** statement.

In this example, the CLI commands and output are based on rate-limiting the IPv4 input traffic at logical interface **ge-1/3/1.0**.

```
[edit interfaces ge-1/3/1 unit 0]
user@host# set family inet policer input policer_IFL
```

**Results** Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      policer input policer_IFL;
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Displaying Traffic Statistics and Policers for the Logical Interface on page 1035](#)
- [Displaying Statistics for the Policer on page 1035](#)

### *Displaying Traffic Statistics and Policers for the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces** operational mode command for logical interface **ge-1/3/1.0**, and include the **detail** or **extensive** option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface. The **Protocol inet** subsection contains a **Policer** field that would list the policer **policer\_IFL** as an input or output logical interface policer as follows:

- Input: **policer\_IFL-ge-1/3/1.0-log\_int-i**
- Output: **policer\_IFL-ge-1/3/1.0-log\_int-o**

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

### *Displaying Statistics for the Policer*

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the **show policer** operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer **policer\_IFL**, the input and output policer names are displayed as follows:

- **policer\_IFL-ge-1/3/1.0-log\_int-i**
- **policer\_IFL-ge-1/3/1.0-log\_int-o**

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## **Example: Configuring a Three-Color Logical Interface (Aggregate) Policer**

This example shows how to configure a two-rate three-color color-blind policer as a logical interface (aggregate) policer and apply the policer directly to Layer 2 input traffic at a supported logical interface.

- [Requirements on page 1036](#)
- [Overview on page 1036](#)
- [Configuration on page 1037](#)
- [Verification on page 1040](#)

## Requirements

---

Before you begin, make sure that the logical interface to which you apply the three-color logical interface policer is hosted on a Gigabit Ethernet interface (**ge-**) or a 10-Gigabit Ethernet interface (**xe-**) on an MX Series router.

## Overview

---

A two-rate three-color policer meters a traffic flow against a bandwidth limit and burst-size limit for guaranteed traffic, plus a second set of bandwidth and burst-size limits for peak traffic. Traffic that conforms to the limits for guaranteed traffic is categorized as green, and nonconforming traffic falls into one of two categories:

- Nonconforming traffic that does not exceed the bandwidth and burst-size limits for peak traffic is categorized as yellow.
- Nonconforming traffic that exceeds the bandwidth and burst-size limits for peak traffic is categorized as red.

A logical interface policer defines traffic rate-limiting rules that you can apply to multiple protocol families on the same logical interface without creating multiple instances of the policer.

**NOTE:** You apply a logical interface policer directly to a logical interface at the logical unit level, and not by referencing the policer in a stateless firewall filter and then applying the filter to the logical interface at the protocol family level.

---

## Topology

In this example, you configure the two-rate three-color policer **trTCM2-cb** as a color-blind logical interface policer and apply the policer to incoming Layer 2 traffic on logical interface **ge-1/3/1.0**.

**NOTE:** When using a three-color policer to rate-limit Layer 2 traffic, color-aware policing can be applied to egress traffic only.

---

The policer defines guaranteed traffic rate limits such that traffic that conforms to the bandwidth limit of 40 Mbps with a 100 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as green. As with any policed traffic, the packets in a green flow are implicitly set to a **low** loss priority and then transmitted.

Nonconforming traffic that falls within the peak traffic limits of a 60 Mbps bandwidth limit and a 200 KB allowance for traffic bursting (based on the token-bucket formula) is categorized as yellow. The packets in a yellow traffic flow are implicitly set to a **medium-high** loss priority and then transmitted.

Nonconforming traffic that exceeds the peak traffic limits are categorized as red. The packets in a red traffic flow are implicitly set to a **high** loss priority. In this example, the

optional policer action for red traffic (**loss-priority high then discard**) is configured, so packets in a red traffic flow are discarded instead of transmitted.

### Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Logical Interfaces on page 1037](#)
- [Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer on page 1038](#)
- [Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface on page 1039](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces ge-1/3/1 vlan-tagging
set interfaces ge-1/3/1 unit 0 vlan-id 100
set interfaces ge-1/3/1 unit 0 family inet address 10.10.10.1/30
set interfaces ge-1/3/1 unit 1 vlan-id 101
set interfaces ge-1/3/1 unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
  00:00:11:22:33:44
set firewall three-color-policer trTCM2-cb logical-interface-policer
set firewall three-color-policer trTCM2-cb two-rate color-blind
set firewall three-color-policer trTCM2-cb two-rate committed-information-rate 40m
set firewall three-color-policer trTCM2-cb two-rate committed-burst-size 100k
set firewall three-color-policer trTCM2-cb two-rate peak-information-rate 60m
set firewall three-color-policer trTCM2-cb two-rate peak-burst-size 200k
set firewall three-color-policer trTCM2-cb action loss-priority high then discard
set interfaces ge-1/3/1 unit 0 layer2-policer input-three-color trTCM2-cb
```

### Configuring the Logical Interfaces

#### Step-by-Step Procedure

To configure the logical interfaces:

1. Enable configuration of the interface.  
  
[edit]  
user@host# edit interfaces ge-1/3/1
2. Configure single tagging.  
  
[edit interfaces ge-1/3/1]  
user@host# set vlan-tagging
3. Configure logical interface ge-1/3/1.0.  
  
[edit interfaces ge-1/3/1]  
user@host# set unit 0 vlan-id 100  
user@host# set unit 0 family inet address 10.10.10.1/30
4. Configure logical interface ge-1/3/1.0.  
  
[edit interfaces ge-1/3/1]

```

user@host# set unit 1 vlan-id 101
user@host# set unit 1 family inet address 20.20.20.1/30 arp 20.20.20.2 mac
00:00:11:22:33:44

```

**Results** Confirm the configuration of the logical interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show interfaces
ge-1/3/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}

```

### *Configuring the Two-Rate Three-Color Policer as a Logical Interface Policer*

**Step-by-Step Procedure** To configure the two-rate three-color policer as a logical interface policer:

1. Enable configuration of a three-color policer.

```

[edit]
user@host# edit firewall three-color-policer trTCM2-cb

```

2. Specify that the policer is a logical interface (aggregate) policer.

```

[edit firewall three-color-policer trTCM2-cb]
user@host# set logical-interface-policer

```

A logical interface policer rate-limits traffic based on a percentage of the media rate of the physical interface underlying the logical interface to which the policer is applied, and the policer is applied directly to the interface rather than referenced by a firewall filter.

3. Specify that the policer is two-rate and color-blind.

```

[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate color-blind

```

A color-aware three-color policer takes into account any coloring markings that might have been set for a packet by another traffic policer configured at a previous network node, and any preexisting color markings are used in determining the appropriate policing action for the packet.

Because you are applying this three-color policer applied to input at Layer 2, you must configure the policer to be color-blind.

4. Specify the policer traffic limits used to classify a green traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate committed-information-rate 40m
user@host# set two-rate committed-burst-size 100k
```

5. Specify the additional policer traffic limits used to classify a yellow or red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set two-rate peak-information-rate 60m
user@host# set two-rate peak-burst-size 200k
```

6. (Optional) Specify the configured policer action for packets in a red traffic flow.

```
[edit firewall three-color-policer trTCM2-cb]
user@host# set action loss-priority high then discard
```

In color-aware mode, the three-color policer configured action can increase the packet loss priority (PLP) level of a packet, but never decrease it. For example, if a color-aware three-color policer meters a packet with a medium PLP marking, it can raise the PLP level to high, but cannot reduce the PLP level to low.

**Results** Confirm the configuration of the three-color policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
three-color-policer trTCM2-cb {
  logical-interface-policer;
  action {
    loss-priority high then discard;
  }
  two-rate {
    color-blind;
    committed-information-rate 40m;
    committed-burst-size 100k;
    peak-information-rate 60m;
    peak-burst-size 200k;
  }
}
```

#### *Applying the Three-Color Policer to the Layer 2 Input at the Logical Interface*

##### **Step-by-Step Procedure**

To apply the three-color policer to the Layer 2 input at the logical interface:

1. Enable application of Layer 2 logical interface policers.

```
[edit]
user@host# edit interfaces ge-1/3/1 unit 0
```

2. Apply the three-color logical interface policer to a logical interface input.

```
[edit interfaces ge-1/3/1 unit 0]
```

```
user@host# set layer2-policerinput-three-color trTCM2-cb
```

**Results** Confirm the configuration of the logical interfaces by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
ge-1/3/1 {
  vlan-tagging;
  unit 0 {
    vlan-id 100;
    layer2-policer {
      input-three-color trTCM2-cb;
    }
    family inet {
      address 10.10.10.1/30;
    }
  }
  unit 1 {
    vlan-id 101;
    family inet {
      address 20.20.20.1/30 {
        arp 20.20.20.2 mac 00:00:11:22:33:44;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Displaying Traffic Statistics and Policers for the Logical Interface on page 1040](#)
- [Displaying Statistics for the Policer on page 1041](#)

#### *Displaying Traffic Statistics and Policers for the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show interfaces** operational mode command for logical interface **ge-1/3/1.0**, and include the **detail** or **extensive** option. The command output section for **Traffic statistics** lists the number of bytes and packets received and transmitted on the logical interface, and the **Protocol inet** section contains a **Policer** field that would list the policer **trTCM2-cb** as an input or output policer as follows:

- **Input:** trTCM2-cb-ge-1/3/1.0-log\_int-i
- **Output:** trTCM2-cb-ge-1/3/1.0-log\_int-o

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to in the input direction only.

#### *Displaying Statistics for the Policer*

**Purpose** Verify the number of packets evaluated by the policer.

**Action** Use the **show policer** operational mode command and optionally specify the name of the policer. The command output displays the number of packets evaluated by each configured policer (or the specified policer), in each direction. For the policer **trTCM2-cb**, the input and output policer names are displayed as follows:

- **trTCM2-cb-ge-1/3/1.0-log\_int-i**
- **trTCM2-cb-e-1/3/1.0-log\_int-o**

The **log\_int-i** suffix denotes a logical interface policer applied to input traffic, while the **log\_int-o** suffix denotes a logical interface policer applied to output traffic. In this example, the logical interface policer is applied to input traffic only.

## Two-Color and Three-Color Physical Interface Policers

- [Physical Interface Policer Overview on page 1041](#)
- [Example: Configuring a Physical Interface Policer for Aggregate Traffic at a Physical Interface on page 1043](#)

### Physical Interface Policer Overview

A *physical interface policer* is a two-color or three-color policer that defines traffic rate limiting that you can apply to input or output traffic for all the logical interfaces and protocol families configured on a physical interface, even if the logical interfaces belong to different routing instances. This feature is useful when you want to perform aggregate policing for different protocol families and different logical interfaces on the same physical interface.

For example, suppose that a provider edge (PE) router has numerous logical interfaces, each corresponding to a different customer, configured on the same link to a customer edge (CE) device. Now suppose that a customer wants to apply one set of rate limits aggregately for certain types of traffic on a single physical interface. To accomplish this, you could apply a single physical interface policer to the physical interface, which rate-limits all the logical interfaces configured on the interface and all the routing instances to which those interfaces belong.

To configure a single-rate two-color physical interface policer, include the **physical-interface-policer** statement at one of the following hierarchy levels:

- [edit **firewall policer** *policer-name*]
- [edit logical-system *logical-system-name* **firewall policer** *policer-name*]
- [edit routing-instances *routing-instance-name* **firewall policer** *policer-name*]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* **firewall policer** *policer-name*]

To configure a single-rate or two-rate three-color physical interface policer, include the **physical-interface-policer** statement at one of the following hierarchy levels:

- [edit **firewall three-color-policer** *policer-name*]
- [edit logical-system *logical-system-name* **firewall three-color-policer** *policer-name*]
- [edit routing-instances *routing-instance-name* **firewall three-color-policer** *policer-name*]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* **firewall three-color-policer** *policer-name*]

You apply a physical interface policer to Layer 3 traffic by referencing the policer from a stateless firewall filter term and then applying the filter to a logical interface. You cannot apply a physical interface to Layer 3 traffic directly to the interface configuration.

To reference a single-rate two-color policer from a stateless firewall filter term, use the **policer** nonterminating action. To reference a single-rate or two-rate three-color policer from a stateless firewall filter term, use the **three-color-policer** nonterminating action.

The following requirements apply to a stateless firewall filter that references a physical interface policer:

- You must configure the firewall filter for a specific, supported protocol family: **ipv4**, **ipv6**, **mpls**, **vpls**, or circuit cross-connect (**ccc**), but not for **family any**.
- You must configure the firewall filter as a *physical interface filter* by including the **physical-interface-filter** statement at the [edit **firewall family** *family-name* **filter** *filter-name*] hierarchy level.
- A firewall filter that is defined as a physical interface filter can reference a physical interface policer only.
- A firewall filter that is defined as a physical interface filter cannot reference a policer configured with the **interface-specific** statement.
- You cannot configure a firewall filter as both a physical interface filter and as a logical interface filter that also includes the **interface-specific** statement.

## Example: Configuring a Physical Interface Policer for Aggregate Traffic at a Physical Interface

This example shows how to configure a single-rate two-color policer as a physical interface policer.

- [Requirements on page 1043](#)
- [Overview on page 1043](#)
- [Configuration on page 1044](#)
- [Verification on page 1048](#)

---

### Requirements

No special configuration beyond device initialization is required before configuring this example.

---

### Overview

A *physical interface policer* specifies rate-limiting for aggregate traffic, which encompasses all protocol families and logical interfaces configured on a physical interface, even if the interfaces belong to different routing instances.

You can apply a physical interface policer to Layer 3 input or output traffic only by referencing the policer from a stateless firewall filter that is configured for specific a specific protocol family (not for **family any**) and configured as a physical interface filter. You configure the filter terms with match conditions that select the types of packets you want to rate-limit, and you specify the physical interface policer as the action to apply to matched packets.

### Topology

The physical interface policer in this example, **shared-policer-A**, rate-limits to 10,000,000 bps and permits a maximum burst of traffic of 500,000 bytes. You configure the policer to discard packets in nonconforming flows, but you could instead configure the policer to re-mark nonconforming traffic with a forwarding class, a packet loss priority (PLP) level, or both.

To be able to use the policer to rate-limit IPv4 traffic, you reference the policer from an IPv4 physical interface filter. For this example, you configure the filter to pass the policer IPv4 packets that meet either of the following match terms:

- Packets received through TCP and with the IP precedence fields **critical-ecp** (0xa0), **immediate** (0x40), or **priority** (0x20)
- Packets received through TCP and with the IP precedence fields **internet-control** (0xc0) or **routine** (0x00)

You could also reference the policer from physical interface filters for other protocol families.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configuring the Logical Interfaces on the Physical Interface on page 1044](#)
- [Configuring a Physical Interface Policer on page 1045](#)
- [Configuring an IPv4 Physical Interface Filter on page 1046](#)
- [Applying the IPv4 Physical interface Filter to a Physical Interface on page 1047](#)

### CLI Quick Configuration

To quickly configure this example, copy the following configuration commands into a text file, remove any line breaks, and then paste the commands into the CLI at the **[edit]** hierarchy level.

```
set interfaces so-1/0/0 unit 0 family inet address 192.168.1.1/24
set interfaces so-1/0/0 unit 0 family vpls
set interfaces so-1/0/0 unit 1 family mpls
set firewall policer shared-policer-A physical-interface-policer
set firewall policer shared-policer-A if-exceeding bandwidth-limit 100m burst-size-limit 500k
set firewall policer shared-policer-A then discard
set firewall family inet filter ipv4-filter physical-interface-filter
set firewall family inet filter ipv4-filter term tcp-police-1 from precedence [ critical-ecp immediate priority ]
set firewall family inet filter ipv4-filter term tcp-police-1 from protocol tcp
set firewall family inet filter ipv4-filter term tcp-police-1 then policer shared-policer-A
set firewall family inet filter ipv4-filter term tcp-police-2 from precedence [ internet-control routine ]
set firewall family inet filter ipv4-filter term tcp-police-2 from protocol tcp
set firewall family inet filter ipv4-filter term tcp-police-2 then policer shared-policer-A
set interfaces so-1/0/0 unit 0 family inet filter input ipv4-filter
```

### Configuring the Logical Interfaces on the Physical Interface

#### Step-by-Step Procedure

To configure the logical interfaces on the physical interface:

1. Enable configuration of logical interfaces.  
  
[edit]  
user@host# edit interfaces so-1/0/0
2. Configure protocol families on logical unit 0.  
  
[edit interfaces so-1/0/0]  
user@host# set unit 0 family inet address 192.168.1.1/24  
user@host# set unit 0 family vpls
3. Configure protocol families on logical unit 1.  
  
[edit interfaces so-1/0/0]  
user@host# set unit 1 family mpls

**Results** Confirm the configuration of the firewall filter by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show interfaces
so-1/0/0 {
  unit 0 {
    family inet {
      address 192.168.1.1/24;
    }
    family vpls;
  }
  unit 1 {
    family mpls;
  }
}
```

#### *Configuring a Physical Interface Policer*

**Step-by-Step Procedure** To configure a physical interface policer:

1. Enable configuration of the two-color policer.

```
[edit]
user@host# edit firewall policer shared-policer-A
```

2. Configure the type of two-color policer.

```
[edit firewall policer shared-policer-A]
user@host# set physical-interface-policer
```

3. Configure the traffic limits and the action for packets in a nonconforming traffic flow.

```
[edit firewall policer shared-policer-A]
user@host# set if-exceeding bandwidth-limit 100m burst-size-limit 500k
user@host# set then discard
```

For a physical interface filter, the actions you can configure for packets in a nonconforming traffic flow are to discard the packets, assign a forwarding class, assign a PLP value, or assign both a forwarding class and a PLP value.

**Results** Confirm the configuration of the policer by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
policer shared-policer-A {
  physical-interface-policer;
  if-exceeding {
    bandwidth-limit 100m;
    burst-size-limit 500k;
  }
  then discard;
}
```

*Configuring an IPv4 Physical Interface Filter*

- Step-by-Step Procedure** To configure a physical interface policer as the action for terms in an IPv4 physical interface filter:
1. Configure a standard stateless firewall filter under a specific protocol family.  

```
[edit]
user@host# edit firewall family inet filter ipv4-filter
```

You cannot configure a physical interface firewall filter for **family any**.
  2. Configure the filter as a physical interface filter so that you can apply the physical interface policer as an action.  

```
[edit firewall family inet filter ipv4-filter]
user@host# set physical-interface-filter
```
  3. Configure the first term to match IPv4 packets received through TCP with the IP precedence fields **critical-ecp**, **immediate**, or **priority** and to apply the physical interface policer as a filter action.  

```
[edit firewall family inet filter ipv4-filter]
user@host# set term tcp-police-1 from precedence [ critical-ecp immediate priority ]
user@host# set term tcp-police-1 from protocol tcp
user@host# set term tcp-police-1 then policer shared-policer-A
```
  4. Configure the first term to match IPv4 packets received through TCP with the IP precedence fields **internet-control** or **routine** and to apply the physical interface policer as a filter action.  

```
[edit firewall family inet filter ipv4-filter]
user@host# set term tcp-police-2 from precedence [ internet-control routine ]
user@host# set term tcp-police-2 from protocol tcp
user@host# set term tcp-police-2 then policer shared-policer-A
```
- Results** Confirm the configuration of the firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```
[edit]
user@host# show firewall
family inet {
  filter ipv4-filter {
    physical-interface-filter;
    term tcp-police-1 {
      from {
        precedence [ critical-ecp immediate priority ];
        protocol tcp;
      }
      then policer shared-policer-A;
    }
  }
  term tcp-police-2 {
    from {
      precedence [ internet-control routine ];
      protocol tcp;
    }
  }
}
```

```

    }
    then policer shared-policer-A;
  }
}
}
policer shared-policer-A {
  physical-interface-policer;
  if-exceeding {
    bandwidth-limit 100m;
    burst-size-limit 500k;
  }
  then discard;
}

```

### *Applying the IPv4 Physical interface Filter to a Physical Interface*

#### **Step-by-Step Procedure**

To apply the physical interface filter to a physical interface:

1. Enable configuration of IPv4 on the logical interface.

```

[edit]
user@host# edit interfaces so-1/0/0 unit 0 family inet

```

2. Apply the IPv4 physical interface filter in the input direction.

```

[edit interfaces so-1/0/0 unit 0 family inet]
user@host# set filter input ipv4-filter

```

**Results** Confirm the configuration of the firewall filter by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this procedure to correct the configuration.

```

[edit]
user@host# show interfaces
so-1/0/0 {
  unit 0 {
    family inet {
      filter {
        input ipv4-filter;
      }
      address 192.168.1.1/24;
    }
    family vpls;
  }
  unit 1 {
    family mpls;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Displaying the Firewall Filters Applied to an Interface on page 1048](#)
- [Displaying the Number of Packets Processed by the Policer at the Logical Interface on page 1048](#)

### *Displaying the Firewall Filters Applied to an Interface*

**Purpose** Verify that the firewall filter **ipv4-filter** is applied to the IPv4 input traffic at logical interface **so-1/0/0.0**.

**Action** Use the [show interfaces statistics](#) operational mode command for logical interface **so-1/0/0.0**, and include the **detail** option. In the **Protocol inet** section of the command output, the **Input Filters** field shows that the firewall filter **ipv4-filter** is applied in the input direction.

```
user@host> show interfaces statistics so-1/0/0 detail
Logical interface so-1/0/0.0 (Index 79) (SNMP ifIndex 510) (Generation 149)
Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPP
Protocol inet, MTU: 4470, Generation: 173, Route table: 0
Flags: Sendbcst-pkt-to-re, Protocol-Down
Input Filters: ipv4-filter
Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
Destination: 10.39/16, Local: 10.39.1.1, Broadcast: 10.39.255.255,
Generation: 163
```

### *Displaying the Number of Packets Processed by the Policer at the Logical Interface*

**Purpose** Verify the traffic flow through the logical interface and that the policer is evaluated when packets are received on the logical interface.

**Action** Use the **show firewall** operational mode command for the filter you applied to the logical interface.

```
user@host> show firewall filter ipv4-filter
Filter: ipv4-filter
Policers:
Name                                     Packets
shared-policer-A-tcp-police-1           32863
shared-policer-A-tcp-police-2           3870
```

The command output displays the name of policer (**shared-policer-A**), the name of the filter term (**police-1**) under which the policer action is specified, and the number of packets that matched the filter term. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.

| <b>Description</b>         | Define a community or extended community for use in a routing policy match condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b><i>name</i></b>—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b><i>invert-match</i></b>—Invert the results of the community expression matching. The <b>community</b> match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The <b>invert-match</b> statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result.</p> <p><b><i>members community-ids</i></b>—One or more community members. If you specify more than one member, you must enclose all members in brackets.</p> <p>The format for <b><i>community-ids</i></b> is:</p> <p><b><i>as-number:community-value</i></b></p> <p>Starting in Junos OS Release 15.1, you can apply a wildcard member <b><i>segmented-nh.*:0</i></b> to apply the BGP policy to all the S-PMSI A-D routes carrying extended community information.</p> <p><b><i>as-number</i></b> is the AS number and can be a value in the range from 0 through 65,535.</p> <p><b><i>community-value</i></b> is the community identifier and can be a number in the range from 0 through 65,535.</p> <p>You also can specify <b><i>community-ids</i></b> for communities as one of the following well-known community names, which are defined in RFC 1997, <i>BGP Communities Attribute</i>:</p> <ul style="list-style-type: none"> <li><b>no-export</b>—Routes containing this community name are not advertised outside a BGP confederation boundary.</li> </ul> |

- **no-advertise**—Routes containing this community name are not advertised to other BGP peers.
- **no-export-subconfed**—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.

You can explicitly exclude BGP community information with a static route using the **none** option. Include **none** when configuring an individual route in the **route** portion of the **static** statement to override a **community** option specified in the **defaults** portion of the statement.

The format for extended **community-ids** is the following:

*type:administrator:assigned-number*

**type** is the type of extended community and can be either a **bandwidth**, **target**, **origin**, **domain-id**, **src-as**, or **rt-import** community or a 16-bit number that identifies a specific BGP extended community. The **target** community identifies the destination to which the route is going. The **origin** community identifies where the route originated. The **domain-id** community identifies the OSPF domain from which the route originated. The **src-as** community identifies the autonomous system from which the route originated. The **rt-import** community identifies the route to install in the routing table.

**NOTE:** For **src-as**, you can specify only an AS number and not an IP address. For **rt-import**, you can specify only an IP address and not an AS number.

---

**administrator** is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

**assigned-number** identifies the local provider.

The format for linking a bandwidth with an AS number is:

*bandwidth:as-number:bandwidth*

**as-number** specifies the AS number and **bandwidth** specifies the bandwidth in bytes per second.

**NOTE:** In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a target or origin extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as target:334324L:132.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the target and origin extended communities. Specify two integers joined by a period: *16-bit high-order value in decimal.16-bit low-order value in decimal*. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

| <b>Description</b>         | Define route flap damping properties to set on BGP routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>disable</b>—Disable damping on a per-prefix basis. Any damping state that is present in the routing table for a prefix is deleted if damping is disabled.</p> <p><b>half-life <i>minutes</i></b>—Decay half-life. <i>minutes</i> is the interval after which the accumulated figure-of-merit value is reduced by half if the route remains stable.</p> <p><b>Range:</b> 1 through 45</p> <p><b>Default:</b> 15 minutes</p> <hr/> <p> <b>NOTE:</b> For the half-life, configure a value that is less than the max-suppress. If you do not, the configuration is rejected.</p> <hr/> <p><b>max-suppress <i>minutes</i></b>—Maximum hold-down time. <i>minutes</i> is the maximum time that a route can be suppressed no matter how unstable it has been.</p> <p><b>Range:</b> 1 through 720</p> <p><b>Default:</b> 60 minutes</p> <hr/> <p> <b>NOTE:</b> For the max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.</p> <hr/> <p><b><i>name</i></b>—Name that identifies the set of damping parameters. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b>reuse <i>number</i></b>—Reuse threshold. <i>number</i> is the figure-of-merit value below which a suppressed route can be used again.</p> <p><b>Range:</b> 1 through 20,000</p> <p><b>Default:</b> 750 (unitless)</p> |

**suppress *number***—Cutoff (suppression) threshold. *number* is the figure-of-merit value above which a route is suppressed for use or inclusion in advertisements.

**Range:** 1 through 20,000

**Default:** 3000 (unitless)

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Define the termination action for GRE and L2TP tunnels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>gre</b>—(Optional) Terminate a GRE tunnel for the filter conditions that are matched.</p> <p><b>l2tp</b>—(Optional) Terminate an L2TP tunnel for the filter conditions that are matched.</p> <p><b>output-interface</b> <i>interface-name</i>—(Optional) For L2TP tunnels, enable the packet to be duplicated and sent towards the customer or the network (based on the MAC address in the Ethernet payload),</p> <p><b>cookie</b> <i>l2tpv3-cookie</i>—(Optional) For L2TP tunnels, specify the L2TP cookie for the duplicated packets. If the tunnel does not contain the receive-cookie configured, packet injection does not happen. In such a case, any received tunnel packet is counted and dropped in the same manner in which packets that arrive with a wrong cookie are counted and dropped.</p> |
| <b>Required Privilege Level</b> | <p><b>firewall</b>—To view this statement in the configuration.</p> <p><b>firewall-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Release Information      | Statement introduced in Junos OS Release 13.3 on ACX Series, EX 4600, M Series, MX Series, PTX Series, QFabric System, QFX Series standalone switches, and T Series platforms.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | Establish defaults for a particular policy statement or globally. Defaults include the walkup feature, which examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Apply one or more policies to routes being exported from the routing table into BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Apply one or more policies to routes being exported from the routing table into DVMRP. If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching policy is applied to the route. If no match is found, the routing table exports into DVMRP only the routes that it learned from DVMRP and direct routes. |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Apply one or more policies to routes being exported from the routing table into IS-IS.</p> <p>All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.</p> <p>For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a <i>routing policy</i> for that protocol.</p> |
|                                 | <div>  <p><b>NOTE:</b> For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Apply a policy or list of policies to routes being exported to the neighbors.</p> <p>By default, RIPng does not export routes it has learned to its neighbors. To have RIPng export routes, apply one or more export policies. To apply export policies and to filter routes being exported from the local routing device to its neighbors, include the <b>export</b> statement and list the name of the policy to be evaluated.</p> <p>You can define one or more export policies. If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the <b>metric-in</b> and <b>metric-out</b> statements.</p> |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | <p>Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p> <p>It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.</p> <p>Hidden routes can be viewed by using the <b>show route receive-protocol bgp neighbor-address hidden</b> command. The hidden routes can then be retained or dropped from the routing table by configuring the <b>keep all   none</b> statement at the <b>[edit protocols bgp]</b> or <b>[edit protocols bgp group group-name]</b> hierarchy level.</p> |

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options** *policy-names*—Name of one or more policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## import (Protocols DVMRP)

**Syntax** `import [ policy-names ];`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols dvmrp],  
[edit protocols dvmrp]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Apply one or more policies to routes being imported into the routing table from DVMRP. If you specify more than one policy, they are evaluated in the order specified, from first to last, and the first matching policy is applied to the route. If no match is found, DVMRP shares with the routing table only those routes that were learned from DVMRP routers.

**Options** *policy-names*—Name of one or more policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3 on ACX Series, EX 4600, M Series, MX Series, PTX Series, QFabric System, QFX Series standalone switches, and T Series platforms.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Override route filter walkup globally or locally for a particular policy statement. The walkup feature examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | By default, the policy statement performs the type of route filter processing that is enabled at the global level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | <p>Define a routing policy, including subroutine policies.</p> <p>A <i>term</i> is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.</p> <p>Each term contains a set of match conditions and a set of actions:</p>                                                                                                                                                                                                                                                                                              |

- Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.
- Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.

Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of **accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement *policy-name*** in alphabetical order, enter the **show policy-options** configuration command.

**Options** *actions*—(Optional) One or more actions to take if the conditions match. The actions are described in [“Configuring Flow Control Actions” on page 52](#).

*family family-name*—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**. For traffic engineering, specify **traffic-engineering**.

**NOTE:** When *family* is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

*from*—(Optional) Match a route based on its source address.

*match-conditions*—(Optional in *from* statement; required in *to* statement) One or more conditions to use to make a match. The qualifiers are described in [“Routing Policy Match Conditions” on page 40](#).

*policy subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form **\_\_.\*-internal\_\_**, as this form is reserved. For information about how to configure subroutines, see [“Understanding Policy Subroutines in Routing Policy Match Conditions” on page 159](#).

*no-entropy-label-capability*—(Optional) Disable the entropy label capability advertisement at egress or transit routes specified in the policy.

*policy subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form **\_\_.\*-internal\_\_**, as this form is reserved. For information about how to configure subroutines, see [“Understanding Policy Subroutines in Routing Policy Match Conditions” on page 159](#).

*policy-name*—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

*prefix-list prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

*prefix-list-filter prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match (see [“Configuring Prefix List Filters” on page 175](#)), and *actions* is the action to take if the prefixes match.

**protocol** *protocol-name*—Name of the protocol used to control traffic engineering database import at the originating point.

**route-filter** *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see [“Configuring Route Filters” on page 178](#)), and *actions* is the action to take if the *destination-prefix* matches.

**source-address-filter** *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see [“Configuring Route Filters” on page 178](#)), and *actions* is the action to take if the *source-prefix* matches.

**term** *term-name*—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (“ ”). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

**to**—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

**then**—(Optional) Actions to take on matching routes. The actions are described in [“Configuring Flow Control Actions” on page 52](#) and [“Configuring Actions That Manipulate Route Characteristics” on page 53](#).

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3 on ACX Series, EX 4600, M Series, MX Series, PTX Series, QFabric System, QFX Series standalone switches, and T Series platforms.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Enable or disable walkup globally or locally for route filters in a particular policy statement or globally. The walkup feature examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.                                                                                                                                                                                                                                                                         |
| <b>Default</b>                  | By default, no route filter walkup is performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | <p>Define a list of route target prefixes for use in a routing policy statement. These prefixes are only useful for filtering routes in the <code>bpg.target.0</code> table.</p> <p>The route target filtering prefix is in the format: <i>AS number:route target extended community/length</i>. The first number represents the autonomous system (AS) of the device that sent the advertisement. The second group of numbers represent the route target extended community. The format of the extended community is the same as the extended community type <b>target</b>. For more information about extended communities, see <a href="#">“Understanding How to Define BGP Communities and Extended Communities” on page 296</a>.</p> <p>In this route target prefix example 200:200:101/96, 200 is the AS number, 200:101 is the BGP extended community used for the route target, and 96 is the prefix length.</p> <p>For more information about the route target community, see RFC 4360, <i>BGP Extended Communities Attribute</i>.</p> <p>For more information about the route target filtering prefix format, see RFC 4684, <i>Constrained Route Distribution for Border Gateway Protocol/MultiProtocol Label Switching (BGP/MPLS) Internet Protocol (IP) Virtual Private Networks (VPNs)</i>.</p> |
| <b>Options</b>                  | <p><b>name</b>—Name that identifies the list of route target filtering prefixes. The name can contain letters, numbers, and hyphens ( - ) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in quotation marks ( “ ” ).</p> <p><b>route-targets</b>—List of route target filtering prefixes, one route target filter per line in the configuration. When you use the <b>rtf-prefix-list</b> statement as a match condition, you do not have the option of configuring the list of route target filtering prefixes. You must first define and configure the route target filtering prefixes with the <a href="#">policy-options</a> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Syntax</b>                   | walkup;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Hierarchy Level</b>          | [edit logical-system <i>logical-system-name</i> policy-options defaults route-filter],<br>[edit logical-system <i>logical-system-name</i> policy-options policy-statement<br><i>policy-statement-name</i> defaults route-filter],<br>[edit policy-options defaults route-filter],<br>[edit policy-options policy-statement <i>policy-statement-name</i> defaults route-filter]                                                                                                                                                                                                                        |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3 on ACX Series, EX 4600, M Series, MX Series, PTX Series, QFabric System, QFX Series standalone switches, and T Series platforms.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Enable route filter walkup globally or locally for a particular policy statement. The walkup feature examines more than the longest match route filters in a policy statement term with more than one route filter, allowing consolidation of terms and a potential performance enhancement.                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>                  | By default, no route filter walkup is performed and only the longest match route filter in a policy statement term is examined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## **[edit firewall] Hierarchy Level**

Several statements in the **[edit firewall]** hierarchy are valid at numerous locations within the hierarchy.

- [Common Firewall Actions on page 1108](#)
- [Common IPv6 Firewall Actions on page 1109](#)
- [Common IPv4 Firewall Actions on page 1109](#)
- [Common IPv6 Firewall Match Conditions on page 1110](#)
- [Common IPv4 Firewall Match Conditions on page 1111](#)
- [Common Layer 2 Firewall Match Conditions on page 1112](#)
- [Complete \[edit firewall\] Hierarchy on page 1113](#)

### **Common Firewall Actions**

---

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113 instead of the statements being repeated.

- **[edit firewall family (any | bridge | ccc | inet | inet6 | mpls | vpls) filter *filter-name* term *term-name* then]**
- **[edit firewall filter *filter-name* term *term-name* then]**

The common firewall actions are as follows:

```
count counter-name;  
forwarding-class class-name;  
loss-priority (high | low | medium-high | medium-low);  
next term;  
policer policer-name;  
three-color-policer policer-name {  
    (single-rate single-rate-policer-name | two-rate two-rate-policer-name);
```

```
}
```

### Common IPv6 Firewall Actions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113 instead of the statements being repeated.

- **[edit firewall family inet filter *filter-name* term *term-name* then]**
- **[edit firewall family inet6 filter *filter-name* term *term-name* then]**
- **[edit firewall filter *filter-name* term *term-name* then]**

The common IP firewall actions are as follows:

```
log;
logical-system logical-system-name <routing-instance routing-instance-name>
  <topology topology-name>;
port-mirror;
port-mirror-instance instance-name;
routing-instance <routing-instance-name> <topology topology-name>;
sample;
service-filter-hit;
syslog;
topology topology-name;
```

### Common IPv4 Firewall Actions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113 instead of the statements being repeated.

- **[edit firewall family inet filter *filter-name* term *term-name* then]**
- **[edit firewall filter *filter-name* term *term-name* then]**

The common IP version 4 (IPv4) firewall actions are as follows:

```
(accept | discard <accounting collector-name> | reject <administratively-prohibited |
  bad-host-tos | bad-network-tos | fragmentation-needed | host-prohibited |
  host-unknown | host-unreachable | network-prohibited | network-unknown |
  network-unreachable | port-unreachable | precedence-cutoff | precedence-violation |
  protocol-unreachable | source-host-isolated | source-route-failed | tcp-reset>);
ipsec-sa sa-name;
load-balance sa-name;
prefix-action action-name;
```

## Common IPv6 Firewall Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113 instead of the statements being repeated.

- `[edit firewall family inet dialer-filter filter-name term term-name from]` (with the exceptions noted at this level in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113)
- `[edit firewall family inet filter filter-name term term-name from]`
- `[edit firewall family inet6 dialer-filter filter-name term term-name from]` (with the exceptions noted at this level in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113)
- `[edit firewall family inet6 filter filter-name term term-name from]`
- `[edit firewall filter filter-name term term-name from]`

The common IP firewall match conditions are as follows:

**NOTE:** You cannot specify the address and destination-address match conditions in the same term. Also, you cannot specify the address and source-address match conditions in the same term.

**NOTE:** For IPv4 addresses, the filter description syntax supports either a mask value that can be noncontiguous, such as 10.0.0.10/255.0.0.255, or prefix notation such as 10.0.0.0/8. Simple filters do not support noncontiguous mask values.

```
address {
  ip-prefix</prefix-length | /ipv4-noncontiguous-mask> <except>;
}
destination-address {
  ip-prefix</prefix-length | /ipv4-noncontiguous-mask> <except>;
}
destination-class [ class-names ] | destination-class-except [ class-names ];
(destination-port [ port-names ] | destination-port-except [ port-names ]);
destination-prefix-list {
  list-name <except>;
}
(forwarding-class [ class-names ] | forwarding-class-except [ class-names ]);
icmp-code [ codes ] | icmp-code-except [ codes ];
icmp-type [ types ] | icmp-type-except [ types ];
interface interface-name;
(interface-group [ group-names ] | interface-group-except [ group-names ]);
interface-set set-name;
(loss-priority [ priorities ] | loss-priority-except [ priorities ]);
(packet-length [ values ] | packet-length-except [ values ]);
(port [ port-names ] | port-except [ port-names ]);
prefix-list {
  list-name <except>;
}
```

```

service-filter-hit;
source-address {
    ip-prefix</prefix-length | /ipv4-noncontiguous-mask> <except>;
}
(source-class [ class-names ] | source-class-except [ class-names ]);
(source-port [ port-names ] | source-port-except [ port-names ]);
source-prefix-list {
    list-name <except>;
}
tcp-established;
tcp-flags flag;
tcp-initial;

```

### Common IPv4 Firewall Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113 instead of the statements being repeated.

- **[edit firewall family inet dialer-filter *filter-name* term *term-name* from]** (with the exceptions noted at this level in “[Complete \[edit firewall\] Hierarchy](#)” on page 1113)
- **[edit firewall family inet filter *filter-name* term *term-name* from]**
- **[edit firewall filter *filter-name* term *term-name* from]**

The common IPv4 firewall match conditions are as follows:

```

(ah-spi [ values ] | ah-spi-except [ values ]);
(dscp [ code-point-values ] | dscp-except [ code-point-values ]);
(esp-spi [ values ] | esp-spi-except [ values ]);
first-fragment;
fragment-flags flag;
(fragment-offset [ offsets ] | fragment-offset-except [ offsets ]);
(ip-options [ option-names ] | ip-options-except [ option-names ]);
is-fragment;
(precedence [ precedence-names ] | precedence-except [ precedence-names ]);
(protocol [ protocol-names ] | protocol-except [ protocol-names ]);
(ttl [ ttl-values ] | ttl-except [ ttl-values ]);

```

**NOTE:** On M Series and T Series routers, firewall filters cannot count ip-options packets on a per option type and per interface basis. A limited workaround is to use the `show pfe statistics ip options` command to see ip-options statistics on a per Packet Forwarding Engine basis. See `show pfe statistics ip` for sample output.

## Common Layer 2 Firewall Match Conditions

This section lists statements that are valid at the following hierarchy levels, and is referenced at those levels in [“Complete \[edit firewall\] Hierarchy” on page 1113](#) instead of the statements being repeated.

- [edit firewall family bridge filter *filter-name* term *term-name* from]
- [edit firewall family vpls filter *filter-name* term *term-name* from]

The common Layer 2 firewall match conditions are as follows:

```
destination-mac-address {
    mac-address <except>;
}
(destination-port [ port-names ] | destination-port-except [ port-names ]);
(dscp [ code-point-values ] | dscp-except [ code-point-values ]);
(ether-type [ protocol-types ] | ether-type-except [ protocol-types ]);
(forwarding-class [ class-names ] | forwarding-class-except [ class-names ]);
icmp-code [ codes ] | icmp-code-except [ codes ];
icmp-type [ types ] | icmp-type-except [ types ];
(interface-group [ group-names ] | interface-group-except [ group-names ]);
ip-address {

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Limit static service filters or API-client filters to term-based filter format only for inet or inet6 families when enhanced network services mode is configured at the [edit chassis network-services] hierarchy level. When used with one of the chassis enhanced network services modes, firewall filters are generated in term-based format for use with MPC modules.</p> <p>If enhanced network services are not configured for the chassis, the <b>enhanced-mode</b> statement is ignored and any enhanced mode firewall filters are generated in both term-based and, the default, compiled format. Only term-based (enhanced) firewall filters will be generated, regardless of the setting of the <b>enhanced-mode</b> statement at the [edit chassis network-services] hierarchy level, if any of the following are true:</p> <ul style="list-style-type: none"> <li>Flexible filter match conditions are configured at the [edit firewall family <i>family-name</i> filter <i>filter-name</i> term <i>term-name</i> from] or [edit firewall filter <i>filter-name</i> term <i>term-name</i> from] hierarchy levels.</li> <li>A tunnel header push or pop action, such as GRE encapsulate or decapsulate is configured at the [edit firewall family <i>family-name</i> filter <i>filter-name</i> term <i>term-name</i> then] hierarchy level.</li> <li>Payload-protocol match conditions are configured at the [edit firewall family <i>family-name</i> filter <i>filter-name</i> term <i>term-name</i> from] or [edit firewall filter <i>filter-name</i> term <i>term-name</i> from] hierarchy levels.</li> <li>An extension-header match is configured at the [edit firewall family <i>family-name</i> filter <i>filter-name</i> term <i>term-name</i> from] or [edit firewall filter <i>filter-name</i> term <i>term-name</i> from] hierarchy levels.</li> <li>A match condition is configured that only works with MPC cards, such as firewall bridge filters for IPv6 traffic.</li> </ul> |

**NOTE:** You cannot attach enhanced mode filters to local loopback, management, or MS-DPC interfaces. These interfaces are processed by the Routing Engine and DPC modules and can accept only compiled firewall filter format. In cases where both filter formats are needed for dynamic service filters, you can use the *enhanced-mode-override* statement on the specific

filter definition to override the default filter term-based only format of chassis network-service enhanced IP mode.

**NOTE:** Do not use enhanced mode for firewall filters that are intended for control plane traffic. Control plane filtering is handled by the Routing Engine kernel, which cannot use the term-based format of the enhanced mode filters.

For packets sourced from the Routing Engine, the Routing Engine processes Layer 3 packets by applying output filters to the packets and forwards Layer 2 packets to the Packet Forwarding Engine for transmission. By configuring the enhanced mode filter, you explicitly specify that only the term-based filter format is used, which also implies that the Routing Engine cannot use this filter.

**NOTE:** The `enhanced-mode` and the `enhanced-mode-override` statements are mutually exclusive; you can define the filter with either `enhanced-mode` or `enhanced-mode-override`, but not both.

            }
            then {
                action;
                action-modifiers;
            }
        }
    }
}
```

**Hierarchy Level** [edit [firewall](#)],  
[edit logical-systems *logical-system-name* [firewall](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Logical systems support introduced in Junos OS Release 9.3.  
**simple-filter** statement introduced in Junos OS Release 7.6.  
**any** family type introduced in Junos OS Release 8.0.  
**bridge** family type introduced in Junos OS Release 8.4 (MX Series routers only).  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure a firewall filter for IP version 4 (IPv4) or IP version 6 (IPv6) traffic. Only on MX Series routers and EX Series switches, configure a firewall filter for Layer 2 traffic in a bridging environment.

**Options** *family-name*—Version or type of addressing protocol:

- **any**—Protocol-independent match conditions.
- **bridge**—(MX Series routers only) Layer 2 packets that are part of bridging domain.
- **ethernet-switching**—(EX Series switches) Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets.
- **ccc**—Layer 2 switching cross-connects.

- **inet**—IPv4 addressing protocol.
- **inet6**—IPv6 addressing protocol.
- **mpls**—MPLS.
- **vpls**—Virtual private LAN service (VPLS).

The remaining statements are explained separately.

**NOTE:** The packet lengths that a policer considers depends on the address family of the firewall filter.

| <b>Description</b>         | <p>(MX5, MX10, MX40, and MX80 routers, and routers that use MX Series MPC line cards only) Configure all interfaces that use the same filter list to use a common template. This feature can be used to save microkernel memory and DMEM memory.</p> <p>If the same filter list cannot be used on all interfaces, consider merging the filters and using the <b>from interface</b> firewall filter term to group the per-interface terms to produce a new common filter list.</p> |

**NOTE:** If you configure both **fast-lookup-filter** and **interface-specific** statements, filter list templates are also used.

## filter (Dynamic Profiles Filter Creation)

**Syntax**

```
filter filter-name {
    enhanced-mode-override;
    fast-lookup-filter;
    instance-shared;
    interface-shared;
    interface-specific;
    term term-name {
        from {
            match-conditions;
        }
        then {
            action;
            action-modifiers;
        }
    }
}
```

**Hierarchy Level** [edit dynamic-profiles *profile-name* firewall family *family*]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Create firewall filters to be applied by dynamic profile.

**Options** *filter-name*—Name that identifies the filter. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (" "). The name can also be a predefined variable.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>     | [edit <code>firewall family</code> <i>family-name</i> <code>filter</code> <i>filter-name</i> ]                                                                                                                                                                                                                         |
| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1F3 for PTX Series Routers with third generation FPCs.                                                                                                                                                                                                                     |
| <b>Description</b>         | You must configure the <b>promote gre-key</b> statement if you want to use gre-key as one of the matches in a filter. When you configure <b>promote gre-key</b> and use gre-key in any of the terms in a filter, the entire filter is compiled in a way that optimizes performance of the filter for gre-key matching. |

**NOTE:** The **promote gre-key** configuration statement is supported on PTX Series routers only when network services is set to **enhanced-mode**. For more information, see **enhanced-mode**.

| <b>Description</b>         | Define a firewall filter term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>actions</b>—(Optional) Actions to perform on the packet if conditions match. You can specify one <i>terminating action</i> supported for the specified filter type. If you do not specify a terminating action, the packets that match the conditions in the <b>from</b> statement are accepted by default. As an option, you can specify one or more <i>nonterminating actions</i> supported for the specified filter type.</p> <p><b>filter-name</b>—(Optional) For <b>family</b> <i>family-name</i> <b>filter</b> <i>filter-name</i> only, reference another standard stateless firewall filter from within this term.</p> <p><b>from</b>—(Optional) Match packet fields to values. If not included, all packets are considered to match and the actions and action modifiers in the <b>then</b> statement are taken.</p> <p><b>match-conditions</b>—One or more conditions to use to make a match on a packet.</p> <p><b>match-conditions-mpls-ipv4-address</b>—(MPLS-tagged IPv4 traffic only) One or more IP address match conditions to match on the IPv4 packet header. Supports network-based service in a core network with IPv4 packets as an inner payload of an MPLS packet with labels stacked up to five deep.</p> |

***match-conditions-mpls-ipv4-port***—(MPLS-tagged IPv4 traffic only) One or more UDP or TCP port match conditions to use to match a packet in an MPLS flow. Supports network-based service in a core network with IPv4 packets as an inner payload of an MPLS packet with labels stacked up to five deep.

***term-name***—Name that identifies the term. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (" ").

***then***—(Optional) Actions to take on matching packets. If not included and a packet matches all the conditions in the ***from*** statement, the packet is accepted.

**Required Privilege** firewall—To view this statement in the configuration.  
**Level** firewall-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3R2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>         | On an MX Series router installed as an <i>encapsulator</i> (an ingress PE router) for filter-based IP tunneling, define a <i>tunnel template</i> . The template specifies a set of characteristics for transporting passenger protocol packets across an IP transport network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b><i>destination-host-address</i></b>—IP address or address range of the de-encapsulator (the remote egress PE router).</p> <p><b><i>encapsulation-protocol</i></b>—Encapsulation protocol:</p> <ul style="list-style-type: none"> <li><b>gre</b>—Filter-based GRE encapsulation is supported on IPv4 transport networks.</li> <li><b>l2tp</b>—Filter-based L2TP encapsulation is supported on IPv4 transport networks.</li> </ul> <p><b><i>protocol-options</i></b>—(Optional) Protocol-specific encapsulation options:</p> <ul style="list-style-type: none"> <li><b>key <i>number</i></b>—An integer value that uniquely identifies a GRE IPv4 tunnel if multiple traffic flows share the same <b><i>source-address</i></b> and <b><i>destination-address</i></b> pair. Range: 1 through 0xFFFFFFFF (4,294,967,295 decimal)</li> </ul> <p>If a tunnel definition specifies GRE IPv4 tunneling using a key, the system includes the key in the GRE header whenever a Packet Forwarding Engine is instructed to use that tunnel definition to encapsulate a packet.</p> <ul style="list-style-type: none"> <li><b>session-id <i>session-id</i></b>—(Optional) Unique integer that identifies the L2TP control connection for the L2TP session. It is a 32-bit field containing a non-zero identifier for a session. L2TP sessions are named by identifiers that have local significance only</li> <li><b>tunnel-id <i>tunnel-id</i></b>—(Optional) Unique integer that identifies the L2TP control connection for the tunnel defined.</li> <li><b>cookie <i>l2tpv3-cookie</i></b>—(Optional) For L2TP tunnels, specify the L2TP cookie for the duplicated packets. If the tunnel does not contain the receive-cookie configured, packet injection does not happen. In such a case, any received tunnel packet is counted and dropped in the same manner in which packets that arrive with a wrong cookie are counted and dropped.</li> </ul> |

**source-host-address**—IP address or address range of the encapsulator (the local ingress PE router).

**transport-protocol**—The IP network protocol used to transport encapsulated passenger protocol packets:

- **ipv4**—IPv4 can transport IPv4, IPv6, or MPLS packets encapsulated using filter-based generic routing encapsulation (GRE).

**tunnel-name**—Name that identifies the tunnel template using a non-reserved string of not more than 64 characters. To include spaces in the name, enclose it in quotation marks (" "). You can reference a tunnel template name in an ingress firewall filter of type **inet**, **inet6**, **any**, or **mpls** by configuring the **encapsulate** terminating action.

**Required Privilege Level** firewall—To view this statement in the configuration.  
firewall-control—To add this statement to the configuration.

| <b>Description</b>         | <p>For a single-rate two-color policer, configure the bandwidth limit as a number of bits per second. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.</p> <p>Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with <b>low</b> packet loss priority (PLP) and then passed through the interface.</p> <p>Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> This statement specifies the bandwidth limit as an absolute number of bits per second. Alternatively, for single-rate two-color policers only, you can use the <b>bandwidth-percent <i>percentage</i></b> statement to specify the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate.</p> </div> <p>Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.</p> <p>Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.</p> |

| <b>Description</b>         | For a single-rate two-color policer, configure the bandwidth limit as a percentage value. Single-rate two-color policing uses the <i>single token bucket algorithm</i> to measure traffic-flow conformance to a two-color policer rate limit.<br><br>Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with <b>low</b> packet loss priority and then passed through the interface.<br><br>Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface. |

**NOTE:** This statement specifies the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate. Alternatively, you can use the **bandwidth-limit *bps*** statement to specify the bandwidth limit as an absolute number of bits per second.

The function of the bandwidth limit is extended by the burst size (configured using the **burst-size-limit *bytes*** statement) to allow bursts of traffic up to a limit based on the overall traffic load:

- When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.
- During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short periods and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

**Options** *percentage*—Traffic rate as a percentage of either the physical interface media rate or the logical interface configured shaping rate. You can configure a shaping rate on a logical interface by using class-of-service statement.

**NOTE:** You cannot rate-limit based on bandwidth percentage for tunnel or software interfaces. The bandwidth percentage policer also cannot be used for forwarding table filters. Bandwidth percentage policers can only be used for interface-specific filters. Bandwidth percentage policers applied on an aggregated Ethernet bundle or an aggregated SONET bundle *do* match the effective bandwidth and burst-size to user-configured values by default and do not require shared-bandwidth-policer configuration.

**Range:** 0 through 100

**Default:** None.

**Required Privilege Level** firewall—To view this statement in the configuration.  
firewall-control—To add this statement to the configuration.

| <b>Description</b>         | <p>For a single-rate two-color policer, configure the burst size as a number of bytes. The burst size allows for short periods of traffic bursting (back-to-back traffic at average rates that exceed the configured bandwidth limit). Single-rate two-color policing uses the <i>single token bucket algorithm</i> to measure traffic-flow conformance to a two-color policer rate limit.</p> <p>Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with <b>low</b> packet loss priority and then passed through the interface.</p> <p>Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.</p> <p>The burst size extends the function of the bandwidth limit (configured using either the <b>bandwidth-limit bps</b> statement or the <b>bandwidth-percent percentage</b> statement) to allow bursts of traffic up to a limit based on the overall traffic load:</p> <ul style="list-style-type: none"><li>• When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.</li><li>• During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.</li></ul> <p>Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.</p> <p>Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.</p> |

Table 78 on page 1155 summarizes the relationship between the **bandwidth-limit** and the token arrival rate. This information is useful in calculating the minimum **burst-size-limit**.

**Table 78: Bandwidth Limits and Token Rates**

| Bandwidth Limit     | Token Rate         |
|---------------------|--------------------|
| 0-333 Mbps          | low (262 $\mu$ s)  |
| 334-666 Mbps        | high (8.2 $\mu$ s) |
| 667-1333 Mbps       | low                |
| 1334 Mbps and above | high               |

The burst-size limit enforced is based on the burst-size limit you configure. For a rate-limited logical interface, the Packet Forwarding Engine calculates the optimum burst-size-limit values and then applies the value closest to the burst-size-limit value specified in the policer configuration.

On MX Series routers and EX Series switches, the burst-size limit is not as freely configurable as it is on other platforms. Junos OS does not support an unlimited combination of policer bandwidth and burst-size limits on MX Series routers and EX Series switches. For a single-rate two-color policer on an MX Series router and on an EX Series switch, the minimum supported burst-size limit is equivalent to the amount of traffic allowed by the policer bandwidth limit in a time span of 1 millisecond. For example, for a policer configured with a **bandwidth-limit** value of 1 Gbps, the minimum supported value for **burst-size-limit** on an MX Series router is 125 KB. If you configure a value that is smaller than the minimum, Junos OS overrides the configuration and applies the actual minimum.

**Options** **bytes**—Burst-size limit in bytes. The minimum recommended value is the maximum transmission unit (MTU) of the IP packets being policed. You can specify the value either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

**Range:** 1500 through 100,000,000,000

**Default:** None

| <b>Description</b>              | <p>For a three-color policer, configure the way preclassified packets are metered. In color-blind mode, the local router ignores the preclassification of packets and can assign a higher or lower packet loss priority.</p> <p>For example, suppose an upstream router assigned medium-high packet loss priority to a packet because the packet exceeded the committed information rate on the upstream router interface.</p> <ul style="list-style-type: none"> <li>• If the local router applies color-aware policing to the packet, the router <i>cannot</i> change the packet loss priority to low, even if the packet conforms to the configured committed information route on the local router interface.</li> </ul> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>NOTE:</b> A color-aware policer cannot be applied to Layer 2 traffic.</p> </div> <ul style="list-style-type: none"> <li>• If the local router applies color-blind policing to the packet, the router <i>can</i> change the packet loss priority to low if the packet conforms to the configured committed information route on the local router interface.</li> </ul> |
| <b>Default</b>                  | If you omit the <b>color-blind</b> statement, the default behavior is color-aware mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b> | Statement introduced in Junos OS Release 7.4.<br>Support at the [edit dynamic-profiles ... <b>single-rate</b> ] and [edit dynamic-profiles ... <b>two-rate</b> ] hierarchy levels introduced in Junos OS Release 11.4.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                               |
| <b>Description</b>         | For a three-color policer, configure the committed burst size (CBS) as a number of bytes.                                                                                                                                                                                                                                                                                       |

**NOTE:** When you include the **committed-burst-size** statement in the configuration, you must also include the **committed-information-rate** statement at the same hierarchy level.

In three-color policing, a committed information rate (CIR) defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green.

During periods of average traffic rates below the CIR, any unused bandwidth capacity accumulates up to a maximum amount defined by the CBS. Short periods of bursting traffic (back-to-back traffic at averages rates that exceed the CIR) are also categorized as green provided that unused bandwidth capacity is available.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policers use a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red, based on the **excess-burst-size** statement included in the policer configuration.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits. Nonconforming traffic is categorized as yellow or red based on the **peak-information-rate** and **peak-burst-rate** statements included in the policer configuration.

**Options** **bytes**—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

**Range:** 1500 through 100,000,000,000 bytes

| <b>Release Information</b> | Statement introduced in Junos OS Release 7.4.<br>Support at the [edit dynamic-profiles ... <b>single-rate</b> ] and [edit dynamic-profiles ... <b>two-rate</b> ] hierarchy levels introduced in Junos OS Release 11.4.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                           |
| <b>Description</b>         | For a three-color policer, configure the committed information rate as a number of bits per second. The committed information rate (CIR) is the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions.                                                                                                                                                  |

**NOTE:** When you include the **committed-information-rate** statement in the configuration, you must also include the **committed-burst-size** statement at the same hierarchy level.

In three-color policing, a CIR defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green.

During periods of average traffic rates below the CIR, any unused bandwidth capacity accumulates up to a maximum amount defined by the committed burst size (CBS). Short periods of bursting traffic (back-to-back traffic at averages rates that exceed the CIR) are also categorized as green provided that unused bandwidth capacity is available.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policers use a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red, based on the **excess-burst-size** statement included in the policer configuration.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits. Nonconforming traffic is categorized as yellow or red based on the **peak-information-rate** and **peak-burst-rate** statements included in the policer configuration.

**Options** ***bps***—Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

**Range:**

- 1500 through 100,000,000,000 bps on EX, M, and T Series routers

- 1500 through 18,446,744,073,709,551,615 bps on Mx Series routers

**Required Privilege Level** firewall—To view this statement in the configuration.  
 firewall-control—To add this statement to the configuration.

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | For a single-rate three-color policer, configure the excess burst size (EBS) as a number of bytes. The EBS allows for moderate periods of bursting traffic that exceeds both the committed information rate (CIR) and the committed burst size (CBS).                           |
| <div>  <p><b>NOTE:</b> When you include the <b>excess-burst-size</b> statement in the configuration, you must also include the <b>committed-burst-size</b> and <b>committed-information-rate</b> statements at the same hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                 |
| <p>Traffic that exceeds both the CIR and the CBS is considered nonconforming.</p> <p>Single-rate three-color policing uses a <i>dual token bucket algorithm</i> to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red based on the <b>excess-burst-size</b> statement included in the policer configuration.</p> <p>During periods of traffic that conforms to the CIR, any unused portion of the guaranteed bandwidth capacity accumulates in the first token bucket, up to the maximum number of bytes defined by the CBS. If any accumulated bandwidth capacity overflows the first bucket, the excess accumulates in a second token bucket, up to the maximum number of bytes defined by the EBS.</p> <p>A nonconforming traffic flow is categorized yellow if its size conforms to bandwidth capacity accumulated in the first token bucket. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</p> <p>A nonconforming traffic flow is categorized red if its size exceeds the bandwidth capacity accumulated in the second token bucket. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</p> |                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>bytes</b> —Number of bytes. | <b>Description</b>              | Set the prefix-specific action or policer to operate in <i>filter-specific</i> mode, meaning that a single policer and counter are shared by all filter terms that reference the prefix-specific action or policer. By default, the prefix-specific action or policer operates in <i>term-specific</i> mode, meaning that a separate policer and counter are used for each filter term that references the prefix-specific action or policer.    |

| <b>Release Information</b> | Statement introduced before Junos OS Release 11.1.<br>Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | <p>Add the configured number of bytes to the length of a packet entering the interface.</p> <p>Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.</p> <p>Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.</p> <p>You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.</p> |

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the `ingress-policer-overhead` statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over

1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options** *bytes*—Number of bytes added to a frame entering an interface.

**Range:** 0–255 bytes

**Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Apply a single-rate or two-rate three-color policer to the Layer 2 input traffic at the logical interface. The <b>input-three-color</b> and <b>input-policer</b> statements are mutually exclusive.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <b><i>policer-name</i></b> —Name of the single-rate or two-rate three-color policer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Usage Guidelines</b>         | See <i>Applying Layer 2 Policers to Gigabit Ethernet Interfaces</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | For a two-rate three-color policer, configure the peak burst size (PBS) as a number of bytes. The PBS defines the maximum number of bytes of unused peak bandwidth capacity that can be accumulated. The accumulated bandwidth allows for moderate periods of bursting traffic that exceeds the peak information rate (PIR) and the committed burst size (CBS). |
| <div>  <b>NOTE:</b> When you include the <code>peak-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>peak-information-rate</code> statements at the same hierarchy level. </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                 |
| <p>Two-rate three-color policers use a <i>dual-rate dual token bucket algorithm</i> to measure traffic against two rate limits.</p> <ul style="list-style-type: none"> <li>A traffic flow is categorized green if it conforms to both the committed information rate (CIR) and the CBS-bounded accumulation of available committed bandwidth capacity.</li> <li>A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</li> <li>A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure an aggregate policer for a physical interface.</p> <p>A physical interface policer can be a two-color or three-color policer. When you apply physical interface policer, to different protocol families on the same logical interface, the protocol families share the same policer instance. This means that rate limiting is performed aggregately for the protocol families for which the policer is applied. This feature enables you to use a single policer instance to perform aggregate policing for different protocol families on the same physical interface. If you want a policer instance to be associated with a protocol family, the corresponding physical interface filter needs to be applied to that protocol family. The policer is not automatically applied to all protocol families configured on the physical interface.</p> <p>In contrast, with logical interface policers there are multiple separate policer instances.</p>               |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Policer instances share bandwidth. This enables configuration of interface-specific policers applied on an aggregated Ethernet bundle or an aggregated SONET bundle to match the effective bandwidth and burst-size to user-configured values.</p> <p>This feature is supported on the following platforms: T Series routers (excluding T4000 Type 5 FPCs) , M120, M10i, M7i (CFEB-E only), M320 (SFPC only), MX240, MX480, and MX960 with DPC, MIC, and MPC interfaces and EX Series switches.</p> |

| <b>Description</b>              | <p>Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| Description              | <p>Configure a two-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), peak information rate (PIR), and peak burst size (PBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the PIR or the PBS are assigned medium-high loss priority (yellow). Packets that exceed the PIR and the PBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| <b>Output Fields</b>            | Table 79 on page 1200 lists the output fields for the <b>show accounting profile</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                  |

**Table 79: show accounting profile Output Fields**

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Profile</b>                 | Name of the accounting profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Sampling interval</b>       | Configured interval, in minutes, for statistic collection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Profile Usage Count</b>     | Number of items configured for collecting accounting statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>file information</i></b> | Information about the accounting profile log, including: <ul style="list-style-type: none"> <li>• <b>File</b>—Name of accounting profile log. If no name is explicitly provided, the name of the accounting profile is used. All statistics files are placed in the <code>/var/log</code> directory.</li> <li>• <b>maximum size</b>—Configured size. When the size is exceeded, the log file closes and a new log file opens.</li> <li>• <b>maximum number</b>—Configured maximum number of log files.</li> <li>• <b>bytes written</b>—Number of bytes written to the log file.</li> </ul> |
| <b>Transfer Interval</b>       | Length of time (in minutes) the file remains open, receiving statistics before it is closed, transferred, and rotated. When either the time or the file size is exceeded, the file is closed and a new one opened, whether or not a transfer site is specified.                                                                                                                                                                                                                                                                                                                            |
| <b>Next Scheduled Transfer</b> | Time at which the next transfer occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 79: show accounting profile Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## show interfaces destination-class

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show interfaces destination-class<br>(all   <i>destination-class-name logical-interface-name</i> )                                                                                                                                                                                                                                                                                                                                             |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>all option introduced in Junos OS Release 8.0.                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Display information about interfaces grouped by destination class.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>all</b>—Display information about all configured destination classes.</p> <p><b><i>destination-class-name</i></b>—Name of a logical grouping of prefixes that count packets having the destination address matching those prefixes. Whenever a destination class is specified, you must also specify a particular logical interface, not all interfaces.</p> <p><b><i>logical interface-name</i></b>—Name of a logical interface.</p>    |
| <b>Additional Information</b>   | For interfaces that carry IPv4, IPv6, or Multiprotocol Label Switching (MPLS) traffic, you can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into sets defined as source classes and destination classes. For more information, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> . |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>List of Sample Output</b>    | <a href="#">show interfaces destination-class all on page 1205</a>                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Output Fields</b>            | <a href="#">Table 80 on page 1204</a> lists the output fields for the <b>show interfaces destination-class</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                |

**Table 80: show interfaces destination-class Output Fields**

| Field Name               | Field Description                                                            |
|--------------------------|------------------------------------------------------------------------------|
| <b>Logical interface</b> | Name of the logical interface.                                               |
| <b>Destination class</b> | Name of destination class usage (DCU) counters per class for this interface. |
| <b>Packets</b>           | Packets going to designated user-selected prefixes.                          |
| <b>Bytes</b>             | Bytes going to designated user-selected prefixes.                            |

## Sample Output

## show interfaces statistics

**Syntax** `show interfaces statistics interface-name`  
`<detail>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.  
 Command introduced in Junos OS Release 12.2 for ACX Series Routers.

**Description** Display static interface statistics, such as errors.

**NOTE:** When the `show interfaces statistics` command is executed on an interface that is configured on T4000 Type 5 FPC, the *IPv6 transit statistics* field displays:

- Total statistics (sum of transit and local statistics) at the physical interface level
- Transit statistics at the logical interface level

**Options** *interface-name*—Name of an interface.  
`detail`—(Optional) Display detail output.

**Required Privilege Level** view

**Related Documentation**

- [clear interfaces statistics on page 1199](#)

**List of Sample Output**
[show interfaces statistics \(Fast Ethernet\) on page 1211](#)  
[show interfaces statistics \(Gigabit Ethernet PIC—Egress\) on page 1211](#)  
[show interfaces statistics detail \(Aggregated Ethernet\) on page 1213](#)  
[show interfaces statistics detail \(Aggregated Ethernet—Ingress\) on page 1214](#)  
[show interfaces statistics detail \(Aggregated Ethernet—Egress\) on page 1215](#)  
[show interfaces statistics \(SONET/SDH\) on page 1217](#)  
[show interfaces statistics \(Aggregated SONET/SDH—Ingress\) on page 1218](#)  
[show interfaces statistics \(Aggregated SONET/SDH—Egress\) on page 1219](#)  
[show interfaces statistics \(PTX Series Packet Transport Switches\) on page 1220](#)  
[show interfaces statistics \(ACX Series routers\) on page 1220](#)

**Output Fields** Output from both the `show interfaces interface-name detail` and the `show interfaces interface-name extensive` commands include all the information displayed in the output from the `show interfaces statistics` command. For more information, see the particular interface type in which you are interested. For information about destination class and source class statistics, see the “Destination Class Field” section and the “Source Class Field” section under *Common Output Fields Description*. For information about the input errors and output errors, see *Fast Ethernet and Gigabit Ethernet Counters*.

| <b>Description</b>                 | Display information about configured routing policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                     | <p><b>none</b>—List the names of all configured routing policies.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b><i>policy-name</i></b>—(Optional) Show the contents of the specified policy.</p> <p><b>statistics</b>—(Optional) Use in conjunction with the <b>test policy</b> command to show the length of time (in microseconds) required to evaluate a given policy and the number of times it has been executed. This information can be used, for example, to help structure a policy so it is evaluated efficiently. Timers shown are per route; times are not cumulative. Statistics are incremented even when the router is learning (and thus evaluating) routes from peering routers.</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                        |

**Table 83: show policy conditions Output Fields**

| Field Name              | Field Description                                                                                                                                  | Level of Output |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Condition</b>        | Name of configured condition.                                                                                                                      | All levels      |
| <b>event</b>            | Condition type. If the <b>if-route-exists</b> option is configured, the event type is:<br><b>Existence of a route in a specific routing table.</b> | All levels      |
| <b>Dependent routes</b> | List of routes dependent on the condition, along with the latest generation number.                                                                | <b>detail</b>   |
| <b>Condition tables</b> | List of routing tables associated with the condition, along with the latest generation number and number of dependencies.                          | All levels      |

Table 83: show policy conditions Output Fields (*continued*)

| Field Name                 | Field Description                                                         | Level of Output |
|----------------------------|---------------------------------------------------------------------------|-----------------|
| If-route-exists conditions | List of conditions configured to look for a route in the specified table. | All levels      |

## Sample Output

### show policy conditions detail

```
user@host> show policy conditions detail
Configured conditions:
Condition cond1, event: Existence of a route in a specific routing table
Dependent routes:
  4.4.4.4/32, generation 3
  6.6.6.6/32, generation 3
  10.10.10.10/32, generation 3

Condition cond2, event: Existence of a route in a specific routing table
Dependent routes:
None

Condition tables:
Table inet.0, generation 4, dependencies 3, If-route-exists conditions: cond1
(static) cond2 (static)
```

## show policy damping

| <b>Description</b>                              | Display information about BGP route flap damping parameters.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                                  | <p><b>none</b>—Display information about BGP route flap damping parameters.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                          |
| <b>Additional Information</b>                   | In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes. |
| <b>Required Privilege Level</b>                 | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 84: show policy damping Output Fields**

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Halflife</b> | Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes. |

Table 84: show policy damping Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reuse merit</b>           | Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.                                                                                        |
| <b>Suppress/cutoff merit</b> | Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols. |
| <b>Maximum suppress time</b> | Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.                                                                                                                                                                                                                                 |
| <b>Computed values</b>       | <ul style="list-style-type: none"> <li>• <b>Merit ceiling</b>—Maximum merit that a flapping route can collect.</li> <li>• <b>Maximum decay</b>—Maximum decay half-life, in minutes.</li> </ul>                                                                                                                                                                                                               |

## Sample Output

### show policy damping

```

user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453

```

## show route

**Syntax**    show route  
                   <all>  
                   <*destination-prefix*>  
                   <logical-system (all | *logical-system-name*)>  
                   <private>

**Syntax (EX Series Switches)**    show route  
                                           <all>  
                                           <*destination-prefix*>  
                                           <private>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   Option **private** introduced in Junos OS Release 9.5.  
                                   Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                                   Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

***destination-prefix***—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number routes</i>       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>  | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |

Table 85: show route Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ <i>protocol, preference</i> ]                   | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                   |
| <i>weeks:days</i><br><i>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| metric                                            | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| localpref                                         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>via</b>              | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |
| <b>Private unicast</b>  | <p>(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    * [MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    * [BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via 1t-0/3/0.24, label-switched-path toD

```

```

[BGP/170] 19:53:26, localpref 100, from 10.0.0.33
AS path: I
> to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
*[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
AS path: I

[BGP/170] 19:53:25, localpref 100, from 10.0.0.33
AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

### show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 192.0.2.0
```

```

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

192.0.2.0/24      @[BGP/170] 00:28:32, localpref 100, from 10.9.9.160
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                  [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)

| <b>Release Information</b>         | <p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>                                                                                                                                                                                                                                                        |
| <b>Description</b>                 | Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.                                                                                                                                                                                                                                        |
| <b>Options</b>                     | <p><b>none</b>—Display all active routes.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                |
| <b>List of Sample Output</b>       | <a href="#">show route active-path on page 1235</a><br><a href="#">show route active-path brief on page 1236</a><br><a href="#">show route active-path detail on page 1236</a><br><a href="#">show route active-path extensive on page 1237</a><br><a href="#">show route active-path terse on page 1239</a>                                                                        |
| <b>Output Fields</b>               | For information about output fields, see the output field tables for the <a href="#">show route</a> command, the <a href="#">show route detail</a> command, the <a href="#">show route extensive</a> command, or the <a href="#">show route terse</a> command.                                                                                                                      |

## Sample Output

### show route active-path

```
user@host> show route active-path

inet.0: 7 destinations, 7 routes (6 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.70.19/32    *[Direct/0] 21:33:52
                  > via lo0.0
10.255.71.50/32   *[IS-IS/15] 00:18:13, metric 10
                  > to 100.1.2.1 via so-2/1/3.0
100.1.2.0/24      *[Direct/0] 00:18:36
                  > via so-2/1/3.0
```

```

100.1.2.2/32      *[Local/0] 00:18:41
                  Local via so-2/1/3.0
192.168.64.0/21  *[Direct/0] 21:33:52
                  > via fxp0.0
192.168.70.19/32 *[Local/0] 21:33:52
                  Local via fxp0.0

```

### show route active-path brief

The output for the **show route active-path brief** command is identical to that for the **show route active-path** command. For sample output, see [show route active-path on page 1235](#).

### show route active-path detail

```

user@host> show route active-path detail

|---------------------------|--------------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table—for example, <b>inet.0</b> . | All levels      |

Table 86: show route advertising-protocol Output Fields (*continued*)

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>number destinations</b>                   | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                             | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                | All levels              |
| <b>Prefix</b>                                | Destination prefix.                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>brief none</b>       |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>BGP group and type</b>                    | BGP group name and type ( <b>Internal</b> or <b>External</b> ).                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Route Distinguisher</b>                   | Unique 64-bit prefix augmenting each IP subnet.                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Advertised Label</b>                      | Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label. | <b>detail extensive</b> |
| <b>Label-Base, range</b>                     | First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>VPN Label</b>                             | Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Nexthop</b>                               | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.<br><br>If the next-hop advertisement to the peer is <b>Self</b> , and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See <a href="#">show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address)</a> on page 1243.                      | All levels              |
| <b>MED</b>                                   | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                            | <b>brief</b>            |
| <b>Lclpref or Localpref</b>                  | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                       | All levels              |

Table 86: show route advertising-protocol Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Level of Output         |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels              |
| <b>Communities</b>         | Community path attribute for the route. see the output field table for the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>AIGP</b>                | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Attrset AS</b>          | Number, local preference, and path of the autonomous system (AS) that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Layer2-info: encaps</b> | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b> |

| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                |
| <b>Description</b>                 | Display information about all routes in all routing tables, including private, or internal, tables.                                                                                                                                                                                                                                  |
| <b>Options</b>                     | <p><b>none</b>—Display information about all routes in all routing tables, including private, or internal, tables.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                   |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                 |
| <b>List of Sample Output</b>       | <a href="#">show route all on page 1245</a>                                                                                                                                                                                                                                                                                          |
| <b>Output Fields</b>               | In Junos OS Release 9.5 and later, only the output fields for the <b>show route all</b> command display all routing tables, including private, or hidden, routing tables. The output field table of the <b>show route</b> command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later. |

## Sample Output

### show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```

user@host> show route
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
1          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
2          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
800017     *[VPLS/7] 1d 14:00:16
            > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 14:00:26
            > via vt-3/2/0.32772, Pop

```

```
user@host> show route all
mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:19:12, metric 1
            Receive
1          *[MPLS/0] 2d 02:19:12, metric 1
            Receive
2          *[MPLS/0] 2d 02:19:12, metric 1
            Receive
800017     *[VPLS/7] 1d 13:54:49
            > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 13:54:59
            > via vt-3/2/0.32772, Pop
vt-3/2/0.32769 [VPLS/7] 1d 13:54:49
              Unusable
vt-3/2/0.32772 [VPLS/7] 1d 13:54:59
              Unusable
```

## show route aspath-regex

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>                 | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                     | <p><i>regular-expression</i>—Regular expression that matches an entire AS path.</p> <p><i>logical-system</i> (all   <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Additional Information</b>      | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"> <li>• An individual AS number</li> <li>• A period wildcard used in place of an AS number</li> <li>• An AS path regular expression that is enclosed in parentheses</li> </ul> <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"> <li>• <b>{<i>m,n</i>}</b>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.</li> <li>• <b>{<i>m</i>}</b>—Exactly <i>m</i> repetitions of the AS path term.</li> <li>• <b>{<i>m</i>,}</b>—<i>m</i> or more repetitions of the AS path term.</li> <li>• <b>*</b>—Zero or more repetitions of an AS path term.</li> <li>• <b>+</b>—One or more repetitions of an AS path term.</li> <li>• <b>?</b>—Zero or one repetition of an AS path term.</li> <li>• <b><i>aspath_term</i>   <i>aspath_term</i></b>—Match one of the two AS path terms.</li> </ul> <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> <pre>show route aspath-regex ". * 234 . *"</pre> |

|                                 |                                                                                                                                                                                      |

| Description                 | Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options                     | <p><b><i>as-number:community-value</i></b>—One or more community identifiers. <b><i>as-number</i></b> is the AS number, and <b><i>community-value</i></b> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information      | Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.                                                                                                                                                                                                                                                                                                                                                                 |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Output Fields                            | <a href="#">Table 87 on page 1259</a> lists the output fields for the <b>show route damping</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 87: show route damping Output Fields

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output         |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holdddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

Table 87: show route damping Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |

| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |
| Announcement bits | List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| to                | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | brief none       |
| via               | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | brief none       |
| Communities       | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Localpref         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels       |
| Router ID         | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |

Table 87: show route damping Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                        | Level of Output         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Merit (last update/now)</b> | Last updated and current figure-of-merit value.                                                                                                                          | <b>detail extensive</b> |
| <b>damping-parameters</b>      | Name that identifies the damping parameters used, which is defined in the damping statement at the <b>[edit policy-options]</b> hierarchy level.                         | <b>detail extensive</b> |
| <b>Last update</b>             | Time of most recent change in path attributes.                                                                                                                           | <b>detail extensive</b> |
| <b>First update</b>            | Time of first change in path attributes, which started the route damping process.                                                                                        | <b>detail extensive</b> |
| <b>Flaps</b>                   | Number of times the route has gone up or down or its path attributes have changed.                                                                                       | <b>detail extensive</b> |
| <b>Suppressed</b>              | ( <b>suppressed</b> keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels              |
| <b>Reusable in</b>             | ( <b>suppressed</b> keyword only) Time when a suppressed route will again be available.                                                                                  | All levels              |
| <b>Preference will be</b>      | ( <b>suppressed</b> keyword only) Preference value that will be applied to the route when it is again active.                                                            | All levels              |

| <b>Output Fields</b>               | <a href="#">Table 88 on page 1263</a> describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                         |

**Table 88: show route detail Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 88: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| [ <i>protocol, preference</i> ]                | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>- —</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                                                                                                |
| Level                                          | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Route Distinguisher                            | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 89 on page 1268</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See <a href="#">Table 90 on page 1270</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Local AS</b>                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Age</b>                                           | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Metric</b>            | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MED-plus-IGP</b>      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>TTL-Action</b>        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.<br><br>For sample output, see <a href="#">show route table</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Task</b>              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Announcement bits</b> | The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <b><i>n-Resolve inet</i></b> indicates that the specified route is used for route resolution for next hops found in the routing table.<br><br><ul style="list-style-type: none"> <li><b><i>n</i></b>—An index used by Juniper Networks customer support only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>AS path</b>           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 88: show route detail Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>validation-state</b>        | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| <b>FECs bound to route</b>     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Primary Upstream</b>        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>RPF Nexthops</b>            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Label</b>                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>weight</b>                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>VC Label</b>                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>MTU</b>                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>VLAN ID</b>                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Prefixes bound to route</b> | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Communities</b>             | Community path attribute for the route. | <b>Accepted Multipath</b>                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Accepted LongLivedStale</b>             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| <b>Accepted LongLivedStaleImport</b>       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| <b>ImportAccepted LongLivedStaleImport</b> | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                      |
| <b>Accepted MultipathContrib</b>           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Localpref</b>                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Router ID</b>                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Primary Routing Table</b>               | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Secondary Tables</b>                    | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                       |

[Table 89 on page 1268](#) describes all possible values for the Next-hop Types output field.

Table 89: Next-Hop Types Output Field Values

| Next-Hop Type            | Description                                                                                                                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast (bcast)</b> | Broadcast next hop.                                                                                                                                                                                                               |
| <b>Deny</b>              | Deny next hop.                                                                                                                                                                                                                    |
| <b>Discard</b>           | Discard next hop.                                                                                                                                                                                                                 |
| <b>Flood</b>             | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by P2MP RSVP, P2MP LDP, P2MP CCC, and multicast. |
| <b>Hold</b>              | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                              |

Table 89: Next-Hop Types Output Field Values (*continued*)

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Indexed (idxd)</b>           | Indexed next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                                                                                                                                               |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Routed multicast (mcrst)</b> | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Router</b>                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Unicast (ucst)</b>           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Unilist (ulst)</b>           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

Table 90 on page 1270 describes all possible values for the State output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 90: State Output Field Values

| Value                                                    | Description                                                                                                                                                                          |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accounting</b>                                        | Route needs accounting.                                                                                                                                                              |
| <b>Active</b>                                            | Route is active.                                                                                                                                                                     |
| <b>Always Compare MED</b>                                | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| <b>AS path</b>                                           | Shorter AS path is available.                                                                                                                                                        |
| <b>Cisco Non-deterministic MED selection</b>             | Route is a clone.                                                                                                                                                                    |
| <b>Clone</b>                                             | Cisco nondeterministic MED is enabled and a path with a lower MED is available.                                                                                                      |
| <b>Cluster list length</b>                               | Length of cluster list sent by the route reflector.                                                                                                                                  |
| <b>Delete</b>                                            | Route has been deleted.                                                                                                                                                              |
| <b>Ex</b>                                                | Exterior route.                                                                                                                                                                      |
| <b>Ext</b>                                               | BGP route received from an external BGP neighbor.                                                                                                                                    |
| <b>FlashAll</b>                                          | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| <b>Hidden</b>                                            | Route not used because of routing policy.                                                                                                                                            |
| <b>IfCheck</b>                                           | Route needs forwarding RPF check.                                                                                                                                                    |
| <b>IGP metric</b>                                        | Path through next hop with lower IGP metric is available.                                                                                                                            |
| <b>Inactive reason</b>                                   | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| <b>Initial</b>                                           | Route being added.                                                                                                                                                                   |
| <b>Int</b>                                               | Interior route.                                                                                                                                                                      |
| <b>Int Ext</b>                                           | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.                                                                                                                              |

Table 90: State Output Field Values (*continued*)

| Value                                 | Description                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Martian</b>                        | Route is a martian (ignored because it is obviously invalid).                                                                                                                                                                     |
| <b>MartianOK</b>                      | Route exempt from martian filtering.                                                                                                                                                                                              |
| <b>Next hop address</b>               | Path with lower metric next hop is available.                                                                                                                                                                                     |
| <b>No difference</b>                  | Path from neighbor with lower IP address is available.                                                                                                                                                                            |
| <b>NoReadvrt</b>                      | Route not to be advertised.                                                                                                                                                                                                       |
| <b>NotBest</b>                        | Route not chosen because it does not have the lowest MED.                                                                                                                                                                         |
| <b>Not Best in its group</b>          | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                                                                         |
| <b>NotInstall</b>                     | Route not to be installed in the forwarding table.                                                                                                                                                                                |
| <b>Number of gateways</b>             | Path with a greater number of next hops is available.                                                                                                                                                                             |
| <b>Origin</b>                         | Path with a lower origin code is available.                                                                                                                                                                                       |
| <b>Pending</b>                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| <b>Release</b>                        | Route scheduled for release.                                                                                                                                                                                                      |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| <b>Route Preference</b>               | Route with lower preference value is available                                                                                                                                                                                    |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| <b>Secondary</b>                      | Route not a primary route.                                                                                                                                                                                                        |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 91 on page 1272 describes the possible values for the Communities output field.

Table 91: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is <b>0</b> . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                                  |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.                   |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                                             |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                                     |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from <b>0</b> through <b>4,294,967,295</b> (bytes per second).                                                                                                                                                                                                                   |
| <i>local AS number</i>                                  | Local AS number: from <b>1</b> through <b>65,535</b> .                                                                                                                                                                                                                                                  |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is <b>5</b> or <b>7</b> . Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                        |
| <b>origin</b>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                                  |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as <b>1</b> or <b>2</b> for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); <b>3</b> for summary routes; <b>5</b> for external routes (area number must be <b>0</b> ); <b>7</b> for NSSA routes; or <b>129</b> for sham link endpoint addresses. |
| <b>route-type-vendor</b>                                | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> .                                                                                            |
| <b>rte-type</b>                                         | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> .                                                                                            |
| <b>target</b>                                           | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                                                                                                                          |
| <b>unknown IANA</b>                                     | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                        |
| <b>unknown OSPF vendor community</b>                    | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                                         |

## Sample Output

### show route detail

| <b>Output Fields</b>               | <a href="#">Table 92 on page 1283</a> lists the output fields for the <b>show route export</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 92: show route export Output Fields**

| Field Name                 | Field Description                                                                                                                                           | Level of Output   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Table or table-name</b> | Name of the routing tables that either import or export routes.                                                                                             | All levels        |
| <b>Routes</b>              | Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one. | <b>brief</b> none |

Table 92: show route export Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                           | Level of Output   |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Export</b>        | Whether the table is currently exporting routes to other tables: <b>Y</b> or <b>N</b> (Yes or No).                                                                                                                                                                                                                                                                          | <b>brief none</b> |
| <b>Import</b>        | Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)                                                                                                                                                                                                                                                  | <b>detail</b>     |
| <b>Flags</b>         | ( <b>instance</b> keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> <li><b>config auto-policy</b>—The policy was deduced from the configured IGP export policies.</li> <li><b>cleanup</b>—Configuration information for this instance is no longer valid.</li> <li><b>config</b>—The instance was explicitly configured.</li> </ul> | <b>detail</b>     |
| <b>Options</b>       | ( <b>instance</b> keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> <li><b>unicast</b>—Indicates <i>instance.inet.0</i>.</li> <li><b>multicast</b>—Indicates <i>instance.inet.2</i>.</li> <li><b>unicast multicast</b>—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>.</li> </ul>    | <b>detail</b>     |
| <b>Import policy</b> | ( <b>instance</b> keyword only) Policy that <b>route export</b> uses to construct the import-export matrix. Not displayed if the instance type is <b>vrf</b> .                                                                                                                                                                                                              | <b>detail</b>     |
| <b>Instance</b>      | ( <b>instance</b> keyword only) Name of the routing instance.                                                                                                                                                                                                                                                                                                               | <b>detail</b>     |
| <b>Type</b>          | ( <b>instance</b> keyword only) Type of routing instance: <b>forwarding</b> , <b>non-forwarding</b> , or <b>vrf</b> .                                                                                                                                                                                                                                                       | <b>detail</b>     |

## Sample Output

### show route export

```

user@host> show route export
Table      Export      Routes
inet.0     N            0
black.inet.0 Y           3
red.inet.0 Y            4

```

### show route export detail

```

user@host> show route export detail
inet.0                                Routes:      0
black.inet.0                          Routes:      3
  Import: [ inet.0 ]
red.inet.0                            Routes:      4
  Import: [ inet.0 ]

```

### show route export instance detail

```

user@host> show route export instance detail
Instance: master                      Type: forwarding
Flags: <config auto-policy> Options: <unicast multicast>
Import policy: [ (ospf-master-from-red || isis-master-from-black) ]

```

Instance: black  
Instance: red

Type: non-forwarding  
Type: non-forwarding

## show route extensive

| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the Multiprotocol Label Switching (MPLS) label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                             |

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>                                         | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>PMSI</b>                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when Multiprotocol Label Switching (MPLS) label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable Border Gateway Protocol (BGP) multipath load balancing.</li> </ul> |
| <b>Label-switched-path lsp-path-name</b>             | Name of the label-switched path (LSP) used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 93: show route extensive Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>label-operation</i></b> | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                 |
| <b>Indirect next hops</b>     | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul> |
| <b>State</b>                  | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Session ID</b>             | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Weight</b>                 | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 93: show route extensive Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGP path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Age             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AIGP            | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TTL-Action      | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signalled and LDP-signalled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Task</b>                          | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>             | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AS path</b>                       | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>              | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>FECs bound to route</b>           | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>AS path: I &lt;Originator&gt;</b> | (For route reflected output only) Originator ID attribute set by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 93: show route extensive Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route status</b>     | <p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul> |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Prefixes bound to route | Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| control flags           | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 93: show route extensive Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>status vector</b>         | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| <b>Localpref</b>             | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| <b>Router ID</b>             | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| <b>Primary Routing Table</b> | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| <b>Secondary Tables</b>      | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| <b>Originating RIB</b>       | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| <b>Node path count</b>       | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding nexthops</b>   | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                            |

## show route flow validation

**List of Syntax** [Syntax on page 1303](#)  
[Syntax \(EX Series Switches\) on page 1303](#)

**Syntax** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display flow route information.

**Options** **none**—Display flow route information.

**brief | detail**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

**ip-prefix**—(Optional) IP address for the flow route.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *table-name***—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

**Required Privilege Level** view

**List of Sample Output** [show route flow validation on page 1304](#)

**Output Fields** [Table 94 on page 1303](#) lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

**Table 94: show route flow validation Output Fields**

| Field Name                | Field Description                                | Level of Output |
|---------------------------|--------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |
| <i>prefix</i>             | Route address.                                   | All levels      |
| Active unicast route      | Active route in the routing table.               | All levels      |

Table 94: show route flow validation Output Fields (*continued*)

| Field Name                  | Field Description                                                       | Level of Output |
|-----------------------------|-------------------------------------------------------------------------|-----------------|
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.                                               | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```

Options **all** and **vlan** introduced in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

**NOTE:** The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

**Options** **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

**detail | extensive | summary**—(Optional) Display the specified level of output.

**all**—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

**bridge-domain (all | bridge-domain-name)**—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

**ccc interface-name**—(Optional) Display route entries for the specified circuit cross-connect interface.

**destination destination-prefix**—(Optional) Destination prefix.

**family family**—(Optional) Display routing table entries for the specified family: **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

**interface-name interface-name**—(Optional) Display routing table entries for the specified interface.

**label name**—(Optional) Display route entries for the specified label.

**lcc number**—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**learning-vlan-id** *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

**matching** *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

**multicast**—(Optional) Display routing table entries for multicast routes.

**table** (**default** | *logical-system-name/routing-instance-name* | *routing-instance-name*)—(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

**vlan** (**all** | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

**vpn** *vpn*—(Optional) Display routing table entries for a specified VPN.

**Required Privilege Level**

[show route forwarding-table vpn on page 1318](#)

**Output Fields** [Table 95 on page 1308](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

**Table 95: show route forwarding-table Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output         |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Logical system          | Name of the logical system. This field is displayed if you specify the <b>table logical-system-name/routing-instance-name</b> option on a device that is configured for and supports logical systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels              |
| Routing table           | Name of the routing table (for example, inet, inet6, mpls).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels              |
| Address family          | Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels              |
| Destination             | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| Route Type (Type)       | How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> <li><b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li><b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li><b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li><b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li><b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li><b>ignore (ignr)</b>—Ignore this route.</li> <li><b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li><b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li><b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul> | All levels              |
| Route Reference (RtRef) | Number of routes to reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| Flags                   | Route type flags: <ul style="list-style-type: none"> <li><b>none</b>—No flags are enabled.</li> <li><b>accounting</b>—Route has accounting enabled.</li> <li><b>cached</b>—Cache route.</li> <li><b>incoming-iface interface-number</b>—Check against incoming interface.</li> <li><b>prefix load balance</b>—Load balancing is enabled for this prefix.</li> <li><b>rt nh decoupled</b>—Route has been decoupled from the next hop to the destination.</li> <li><b>sent to PFE</b>—Route has been sent to the Packet Forwarding Engine.</li> <li><b>static</b>—Static route.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| Next hop                | IP address of the next hop to the destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |

Table 95: show route forwarding-table Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output              |

| Next hop Type (Type)       | <p>Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b>—Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>discard (dscd)</b> —Discard.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcrst)</b>—Regular multicast next hop.</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b>—Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b>—Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b>      |
| Index                      | Software index of the next hop that is used to route the traffic for a given prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| Route interface-index      | Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| Reference (NhRef)          | Number of routes that refer to this next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| Next-hop interface (Netif) | Interface used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive none</b> |
| Weight                     | Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the <b>Balance</b> field description).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| Balance                    | Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>             |
| RPF interface              | List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when <b>rpf-check</b> is configured on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>             |

## Sample Output

### show route forwarding-table

```

### show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;

| MED                                             | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                      | none <b>brief</b>       |
| <i>destination-prefix</i><br>(entry, announced) | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Accepted LongLivedStale</b>                  | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                           | <b>detail extensive</b> |
| <b>Accepted LongLivedStaleImport</b>            | The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.<br><br>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table | <b>detail extensive</b> |
| <b>ImportAccepted LongLivedStaleImport</b>      | Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table<br><br>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.                                                                                                                                                                      | <b>detail extensive</b> |
| Route Distinguisher                             | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| Label-Base, range                               | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| VPN Label                                       | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Next hop             | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels       |
| Localpref or Lclpref | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels       |
| AS path              | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• [ ]—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| Cluster list         | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| Originator ID        | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | detail extensive |
| Communities          | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail extensive |
| AIGP                 | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail extensive |
| Attrset AS           | Number, local preference, and path of the AS that originated the route. These values are stored in the <b>Attrset</b> attribute at the originating routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | detail extensive |

| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Restart complete           | <p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> <li>• <b>Pending:</b><i>protocol-name</i>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li>• <b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> <p>For example, if the output shows-</p> <ul style="list-style-type: none"> <li>• LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden)<br/>Restart Pending: OSPF LDP VPN</li> </ul> <p>This indicates that <b>OSPF</b>, <b>LDP</b>, and <b>VPN</b> protocols did not restart for <b>LDP.inet.0</b> routing table.</p> <ul style="list-style-type: none"> <li>• vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)<br/>Restart Complete</li> </ul> <p>This indicates that all protocols have restarted for <b>vpls_1.l2vpn.0</b> routing table.</p> |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number routes</i>       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 98: show route table Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> <li>• <b>inclusive multicast Ethernet tag route</b>—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> <li>• <b>route distinguisher</b>—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI.</li> <li>• <b>Ethernet tag ID</b>—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value.</li> <li>• <b>IP address length</b>—(1 octet) Length of IP address in bits.</li> <li>• <b>originating router's IP address</b>—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.</li> </ul> </li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| [ <i>protocol, preference</i> ]                | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level                                         | (IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Route Distinguisher                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PMSI                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Next-hop type                                 | Type of next hop. For a description of possible values for this field, see <a href="#">Table 89 on page 1268</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Next-hop reference count                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Flood nexthop branches exceed maximum message | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Next hop                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| via                                           | Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b> . This field can also contain the following information: <ul style="list-style-type: none"> <li>Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| Label-switched-path <i>lsp-path-name</i>      | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Label operation                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interface                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Protocol next hop                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Indirect next hop                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| State                                         | State of the route (a route can be in more than one state). See <a href="#">Table 90 on page 1270</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| AI GP             | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric <i>n</i>   | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP      | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TTL-Action        | For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Announcement bits | <p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, <i>n-Resolve inet</i> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <li><i>n</i>—An index used by Juniper Networks customer support only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li><b>I</b>—IGP.</li> <li><b>E</b>—EGP.</li> <li><b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li><b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li><b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li><b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li><b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li><b>( )</b>—Parentheses enclose a confederation.</li> <li><b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 98: show route table Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| validation-state        | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| FECs bound to route     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| status vector           | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 98: show route table Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accepted Multipath                  | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Accepted LongLivedStale             | The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.                                                                                                                                                                  |
| Accepted LongLivedStaleImport       | <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p> |
| ImportAccepted LongLivedStaleImport | <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>                                                                                                                                                                       |
| Accepted MultipathContrib           | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Localpref                           | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Router ID                           | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Primary Routing Table               | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                           |
| Secondary Tables                    | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                                                                                                                                                                                        |

[Table 89 on page 1268](#) describes all possible values for the Next-hop Types output field.

Table 99: Next-hop Types Output Field Values

| Next-Hop Type     | Description                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Broadcast (bcast) | Broadcast next hop.                                                                                                                                                                                                                                                            |
| Deny              | Deny next hop.                                                                                                                                                                                                                                                                 |
| Discard           | Discard next hop.                                                                                                                                                                                                                                                              |
| Flood             | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |

Table 99: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                                                                                                                                                       |
| Indexed (idxd)           | Indexed next hop.                                                                                                                                                                                                                                                                                                                                                                                          |
| Indirect (indr)          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                                                                                                                                               |
| Interface                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                                                                                                                                               |
| Local (locl)             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                                                                                                                                                     |
| Multicast (mcst)         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                                                                                                                                              |
| Multicast discard (mdsc) | Multicast discard.                                                                                                                                                                                                                                                                                                                                                                                         |
| Multicast group (mgrp)   | Multicast group member.                                                                                                                                                                                                                                                                                                                                                                                    |
| Receive (recv)           | Receive.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reject (rjct)            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                                                                                                                                             |
| Resolve (rslv)           | Resolving next hop.                                                                                                                                                                                                                                                                                                                                                                                        |
| Routed multicast (mcrtr) | Regular multicast next hop.                                                                                                                                                                                                                                                                                                                                                                                |
| Router                   | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| Table                    | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| Unicast (ucst)           | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Unilist (ulst)           | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

Table 90 on page 1270 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

**Table 100: State Output Field Values**

| Value                                       | Description                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accounting                                  | Route needs accounting.                                                                                                                                                              |
| Active                                      | Route is active.                                                                                                                                                                     |
| Always Compare MED                          | Path with a lower multiple exit discriminator (MED) is available.                                                                                                                    |
| AS path                                     | Shorter AS path is available.                                                                                                                                                        |
| Cisco Non-deterministic MED selection       | Cisco nondeterministic MED is enabled, and a path with a lower MED is available.                                                                                                     |
| Clone                                       | Route is a clone.                                                                                                                                                                    |
| Cluster list length                         | Length of cluster list sent by the route reflector.                                                                                                                                  |
| Delete                                      | Route has been deleted.                                                                                                                                                              |
| Ex                                          | Exterior route.                                                                                                                                                                      |
| Ext                                         | BGP route received from an external BGP neighbor.                                                                                                                                    |
| FlashAll                                    | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| Hidden                                      | Route not used because of routing policy.                                                                                                                                            |
| IfCheck                                     | Route needs forwarding RPF check.                                                                                                                                                    |
| IGP metric                                  | Path through next hop with lower IGP metric is available.                                                                                                                            |
| Inactive reason                             | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| Initial                                     | Route being added.                                                                                                                                                                   |
| Int                                         | Interior route.                                                                                                                                                                      |
| Int Ext                                     | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| Interior > Exterior > Exterior via Interior | Direct, static, IGP, or EBGp path is available.                                                                                                                                      |

Table 100: State Output Field Values (*continued*)

| Value                          | Description                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Preference               | Path with a higher local preference value is available.                                                                                                                                                                           |
| Martian                        | Route is a martian (ignored because it is obviously invalid).                                                                                                                                                                     |
| MartianOK                      | Route exempt from martian filtering.                                                                                                                                                                                              |
| Next hop address               | Path with lower metric next hop is available.                                                                                                                                                                                     |
| No difference                  | Path from neighbor with lower IP address is available.                                                                                                                                                                            |
| NoReadvrt                      | Route not to be advertised.                                                                                                                                                                                                       |
| NotBest                        | Route not chosen because it does not have the lowest MED.                                                                                                                                                                         |
| Not Best in its group          | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                                                                         |
| NotInstall                     | Route not to be installed in the forwarding table.                                                                                                                                                                                |
| Number of gateways             | Path with a greater number of next hops is available.                                                                                                                                                                             |
| Origin                         | Path with a lower origin code is available.                                                                                                                                                                                       |
| Pending                        | Route pending because of a hold-down configured on another route.                                                                                                                                                                 |
| Release                        | Route scheduled for release.                                                                                                                                                                                                      |
| RIB preference                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| Route Distinguisher            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| Route Metric or MED comparison | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| Route Preference               | Route with lower preference value is available.                                                                                                                                                                                   |
| Router ID                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| Secondary                      | Route not a primary route.                                                                                                                                                                                                        |
| Unusable path                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| Update source                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 91 on page 1272 describes the possible values for the Communities output field.

Table 101: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                        |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                           |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                   |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).                                                                                                                                                                                                               |
| <i>local AS number</i>                                  | Local AS number: from 1 through 65,535.                                                                                                                                                                                                                                               |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                     |
| <b>origin</b>                                           | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                                                |
| <i>ospf-route-type</i>                                  | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.                                 |
| <b>route-type-vendor</b>                                | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is <b>area-number:ospf-route-type:options</b> .                                                                                  |
| <b>rte-type</b>                                         | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is <b>area-number:ospf-route-type:options</b> .                                                                                  |
| <b>target</b>                                           | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                                                                                                        |
| <b>unknown IANA</b>                                     | Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                     |
| <b>unknown OSPF vendor community</b>                    | Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                                                               |

## Sample Output

### show route table bgp.l2vpn

```
user@host> show route table bgp.l2vpn
bgp.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

192.168.24.1:1:4:1/96
    *[BGP/170] 01:08:58, localpref 100, from 192.168.24.1
    AS path: I
    > to 10.0.16.2 via fe-0/0/1.0, label-switched-path am
```

### show route table bgp.l3vpn.0

```
user@host> show route table bgp.l3vpn.0
bgp.l3vpn.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

10.255.71.15:100:10.255.71.17/32
    *[BGP/170] 00:03:59, MED 1, localpref 100, from
10.255.71.15
    AS path: I
    > via so-2/1/0.0, Push 100020, Push 100011(top)
10.255.71.15:200:10.255.71.18/32
    *[BGP/170] 00:03:59, MED 1, localpref 100, from

### show route table mpls.0 (RSVP Route—Transit LSP)

In the sample output, the 1 in [RSVP/7/1] indicates the secondary preference value. The secondary preference value becomes significant when multiple RSVP LSPs of different types are signaled to the destination. The possible values of RSVP secondary preferences are:

1—Normal Point-to-Point RSVP-TE LSP

2—Point-to-Multipoint (P2MP) RSVP-TE LSP

3—Dynamic RSVP-TE LSP

### show route table MVPN.mvpn.0

Starting in Junos OS Release 15.1, multicast routes on the locally originated type 7 customer multicast routes are added exclusively by PIM. The functionality of the BGP-MVPN service (which, internally, depends on contributions of state from both the MVPN and PIM protocol components of Junos OS) remains unchanged. MVPN, however, no longer appears as the originator of the locally advertised route. Routes advertised by remote PEs are, as usual, always learned locally from their respective [BGP/...] protocol.

```

user@host> show route table MVPN.mvpn.0

## show route terse

**List of Syntax** [Syntax on page 1395](#)  
[Syntax \(EX Series Switches\) on page 1395](#)

**Syntax** show route terse  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route terse

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display a high-level summary of the routes in the routing table.

**NOTE:** For BGP routes, the **show route terse** command displays the local preference attribute and MED instead of metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the [show route extensive](#) command.

**Options** none—Display a high-level summary of the routes in the routing table.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**Required Privilege Level** view

**List of Sample Output** [show route terse on page 1397](#)

**Output Fields** [Table 102 on page 1395](#) describes the output fields for the **show route terse** command. Output fields are listed in the approximate order in which they appear.

**Table 102: show route terse Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, <i>inet.0</i> ).                                                                                                                                                                                                                                                                                                              |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                               |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active)</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 102: show route terse Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route key</b>   | Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>                                                                                                                   |
| <b>A</b>           | Active route. An asterisk (*) indicates this is the active route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Destination</b> | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>P</b>           | Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>                                                                                        |
| <b>Prf</b>         | Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value. |
| <b>Metric 1</b>    | First metric value in the route. For routes learned from BGP, this is the MED metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Metric 2</b>    | Second metric value in the route. For routes learned from BGP, this is the IGP metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Next hop</b>    | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>AS path</b>     | AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul>                                                                                                                                                                                                          |

## Sample Output

| <b>Release Information</b>      | Command introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Display information about the route validation database when resource public key infrastructure (RPKI) BGP route validation is configured. You can query all route validation records that match a given prefix or origin-autonomous-system. In addition, you can filter the output by a specific RPKI cache session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>none</b>—Display all route validation database entries.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about route validation database entries for the specified routing instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on a particular logical system.</p> <p><b>mismatch</b>—(Optional) Filter the output by mismatched origin autonomous systems.</p> <p><b>origin-autonomous-system <i>as-number</i></b>—(Optional) Filter the output by mismatched origin autonomous systems. The <b>mismatch</b> qualifier is useful for finding conflicting origin-autonomous-system information between RPKI caches. Mismatches might occur during cache reconfiguration.</p> <p><b>record <i>ip-prefix</i></b>—(Optional) Filter the output by route validation records that match a given prefix.</p> <p><b>session <i>ip-address</i></b>—(Optional) Filter the output by a specific RPKI cache session.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Output Fields** Table 103 on page 1399 describes the output fields for the **show validation database** command. Output fields are listed in the approximate order in which they appear.

**Table 103: show validation database Output Fields**

| Field Name   | Field Description                                                                                                                                                                                        | Level of Output |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Prefix       | Route validation (RV) record prefix.<br><br>RV records are received from the cache server and can also be configured statically at the <b>[edit routing-options validation static]</b> hierarchy level . | All levels      |
| Origin-AS    | Legitimate originator autonomous system (AS).                                                                                                                                                            | All levels      |
| Session      | IP address of the RPKI cache server.                                                                                                                                                                     | All levels      |
| State        | State of the route validation records. The state can be <b>valid</b> , <b>invalid</b> or <b>unknown</b> .                                                                                                | All levels      |
| Mismatch     | Conflicting origin-autonomous-system information between RPKI caches when nonstop active routing (NSR) is configured.                                                                                    | All levels      |
| IPv4 records | Number of IPv4 route validation records.                                                                                                                                                                 | All levels      |
| IPv6 records | Number of IPv6 route validation records.                                                                                                                                                                 | All levels      |

## Sample Output

### show validation database

```

user@host> show validation database
RV database for instance master

    Prefix                Origin-AS  Session      State  Mismatch
    1.0.1.0/24-32          1 10.0.77.1   valid
    1.0.2.0/24-32          2 10.0.77.1   valid

| <b>Output Fields</b>            | <a href="#">Table 104 on page 1400</a> describes the output fields for the <b>show validation group</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                     |

**Table 104: show validation group Output Fields**

| Field Name       | Field Description                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group            | Group name.                                                                                                                                                                               |
| Maximum sessions | Number of concurrent sessions for each group. The default is 2. The number is configurable with the <b>max-sessions</b> statement.                                                        |
| Session          | Resource public key infrastructure (RPKI) cache session IP address.                                                                                                                       |
| State            | State of the connection between the routing device and the cache server. <b>Up</b> means that the connection is established. <b>Connect</b> means that the connection is not established. |

Table 104: show validation group Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preference | <p>Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.</p> <p>The default preference is 100. The preference is configurable with the <b>preference</b> statement.</p> |

## Sample Output

### show validation group

```
user@host> show validation group
master
  Group: test, Maximum sessions: 3
    Session 10.255.255.11, State: Up, Preference: 100
    Session 10.255.255.12, State: Up, Preference: 100
  Group: test2, Maximum sessions: 2
    Session 10.255.255.13, State: Connect, Preference: 100
```

## show validation replication database

---

| <b>Release Information</b>      | Command introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Display the state of the nonstop active routing (NSR) records. The output is the same as the output of the <a href="#">show validation database</a> command, except for the <b>Mismatch</b> column.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>none</b>—Display all route validation database entries.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance <i>instance-name</i></b>—(Optional) Display information about route validation database entries for the specified routing instance. The instance name can be master for the main instance, or any valid configured instance name or its prefix.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on a particular logical system.</p> <p><b>origin-autonomous-system <i>as-number</i></b>—(Optional) Filter the output by mismatched origin autonomous systems. The <b>mismatch</b> qualifier is useful for finding conflicting origin-autonomous-system information between resource public key infrastructure (RPKI) caches. Mismatches might occur during cache reconfiguration.</p> <p><b>record <i>ip-prefix</i></b>—(Optional) Filter the output by route validation records that match a given prefix.</p> <p><b>session <i>ip-address</i></b>—(Optional) Filter the output by a specific RPKI cache session.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Output Fields</b>            | <a href="#">Table 105 on page 1403</a> describes the output fields for the <b>show validation replication database</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 105: show validation replication database Output Fields

| Field Name   | Field Description                                                                                                                                                                                       | Level of Output |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Prefix       | Route validation (RV) record prefix.<br><br>RV records are received from the cache server and can also be configured statically at the <b>[edit routing-options validation static]</b> hierarchy level. | All levels      |
| Origin-AS    | Legitimate originator autonomous system (AS).                                                                                                                                                           | All levels      |
| Session      | IP address of the RPKI cache server.                                                                                                                                                                    | All levels      |
| State        | State of the route validation records. The state can be <b>valid</b> or <b>invalid</b> .                                                                                                                | All levels      |
| IPv4 records | Number of IPv4 route validation records.                                                                                                                                                                | All levels      |
| IPv6 records | Number of IPv6 route validation records.                                                                                                                                                                | All levels      |

## Sample Output

### show validation replication database

```

user@host> show validation replication database
RV database for instance master

    Prefix                Origin-AS  Session      State
1.0.1.0/24-32             1 10.0.77.1    valid
1.0.2.0/24-32             2 10.0.77.1    valid
1.0.3.0/24-32             3 10.0.77.1    valid
1.0.4.0/24-32             4 10.0.77.1    valid
1.0.5.0/24-32             5 10.0.77.1    valid
1.0.6.0/24-32             6 10.0.77.1    valid
1.0.7.0/24-32             7 10.0.77.1    valid
1.0.8.0/24-32             8 10.0.77.1    valid
72.9.224.0/19-24          26234 192.168.1.100 valid
72.9.224.0/19-24          3320 192.168.1.200 invalid
10.0.0.0/8-32             0 internal    valid

IPv4 records: 14
IPv6 records: 0

```

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Flaps                | Number of attempts to establish a session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | None and brief  |
| Uptime               | Length of time that the session has remained established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | None and brief  |
| #IPv4/IPv6 records   | Number of IPv4 and IPv6 route validation records.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | None and brief  |
| Session index        | Every session has an index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | detail          |
| Group                | Name of the group to which the session belongs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail          |
| Preference           | <p>Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.</p> <p>The default preference is 100. The preference is configurable with the <b>preference</b> statement.</p>                                                                                                                                                                                                                                | detail          |
| Port                 | <p>TCP port number for the outgoing connection with the cache server. The well-known RPKI port is TCP port 2222. For a given deployment, an RPKI cache server might listen on some other TCP port number. If so, you can configure the alternative port number with the <b>port</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                     | detail          |
| Refresh time         | <p>Liveliness check interval for an RPKI cache server. Every <b>refresh-time</b> (seconds), a serial query protocol data unit (PDU) with the last known serial number is transmitted. The <b>hold-time</b> must be at least 2 x the <b>refresh-time</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                           | detail          |
| Hold time            | <p>Length of time in seconds that the session between the routing device and the cache server is considered operational without any activity. After the hold time expires, the session is dropped.</p> <p>Reception of any PDU from the cache server resets the hold timer. The <b>hold-time</b> is 600 seconds, by default, and must be at least 2 x the <b>refresh-time</b>. If the hold time expires, the session is considered to be down. This, in turn, triggers a session restart event. During a session restart, the routing device attempts to start a session with the cache server that has the numerically highest <b>preference</b>.</p> | detail          |
| Record Life time     | <p>Amount of time that route validation (RV) records learned from a cache server are valid. RV records expire if the session to the cache server goes down and remains down for the <b>record-lifetime</b> (seconds).</p>                                                                                                                                                                                                                                                                                                                                                                                                                              | detail          |
| Serial (Full Update) | Number of full serial updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail          |

Table 106: show validation session Output Fields (*continued*)

| Field Name                  | Field Description                                         | Level of Output |
|-----------------------------|-----------------------------------------------------------|-----------------|
| Serial (Incremental Update) | Number of incremental serial updates.                     | <b>detail</b>   |
| Session flaps               | Number of attempts to establish a session.                | <b>detail</b>   |
| Session uptime              | Length of time that the session has remained established. | <b>detail</b>   |
| Last PDU received           | Time when the most recent PDU was received.               | <b>detail</b>   |
| IPv4 prefix count           | Number of IPv4 sessions.                                  | <b>detail</b>   |
| IPv6 prefix count           | Number of IPv6 sessions.                                  | <b>detail</b>   |

## Sample Output

### show validation session brief

```

user@host> show validation session brief

| <b>List of Sample Output</b>    | <a href="#">show validation statistics on page 1408</a>                                                                                                                                                                                                                                                                                                                                                               |
| <b>Output Fields</b>            | <a href="#">Table 107 on page 1407</a> describes the output fields for the <b>show validation statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                         |

**Table 107: show validation statistics Output Fields**

| Field Name                   | Field Description                                                                                                                                                       |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total RV records             | Group name.                                                                                                                                                             |
| Total Replication RV records | Number of concurrent sessions for each group. The default is 2. The number is configurable with the <b>max-sessions</b> statement.                                      |
| Prefix entries               | Resource public key infrastructure (RPKI) cache session IP address.                                                                                                     |
| Origin-AS entries            | State of the connection between the routing device and the cache server. <b>Up</b> means that the connection is up. <b>Connect</b> means that the connection is not up. |

Table 107: show validation statistics Output Fields (*continued*)

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Memory utilization                           | Each cache server has a preference. Higher preferences are preferred. During a session start or restart, the routing device attempts to start a session with the cache server that has the numerically highest preference. The routing device connects to multiple cache servers in preference order.<br><br>The default preference is 100. The preference is configurable with the <b>preference</b> statement. |
| Policy origin-validation requests            | Number of queries for validation state of a given instance and prefix.                                                                                                                                                                                                                                                                                                                                           |
| Valid                                        | Number of valid prefixes reported by the validation query.                                                                                                                                                                                                                                                                                                                                                       |
| Invalid                                      | Number of invalid prefixes reported by the validation query.                                                                                                                                                                                                                                                                                                                                                     |
| Unknown                                      | Number of unknown prefixes reported by the validation query. This means that the prefix is not found in the database.                                                                                                                                                                                                                                                                                            |
| BGP import policy reevaluation notifications | A change, addition, or deletion of a route validation record triggers a BGP import reevaluation for all exact matching and more specific prefixes.                                                                                                                                                                                                                                                               |
| inet.0                                       | Number of IPv4 route validation records that have been added, deleted, or changed.                                                                                                                                                                                                                                                                                                                               |
| inet6.0                                      | Number of IPv6 route validation records that have been added, deleted, or changed.                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### show validation statistics

```

user@host> show validation statistics
Total RV records:          453455
Total Replication RV records: 453455
  Prefix entries:          35432
  Origin-AS entries:       124400
Memory utilization: 16.31MB
Policy origin-validation requests: 234995
  valid:                   23445
  invalid:                  14666
  unknown:                  34567

| <b>Description</b>              | Test a policy configuration to determine which prefixes match routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                                 | <div>  <p><b>NOTE:</b> If you are using the <code>test policy</code> command on a logical system, you must first set the CLI to the logical system context. For example, if you want to test a routing policy that is configured on logical system R2, first run the <code>set cli logical-system R2</code> command.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><i>policy-name</i>—Name of a policy.</p> <p><i>prefix</i>—Destination prefix to match.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Additional Information</b>   | <p>All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the <b>from</b> clause in the specified policy. All prefixes accepted by the policy are displayed. The <b>test policy</b> command evaluates a policy differently from the BGP import process. When testing a policy that contains an <b>interface</b> match condition in the <b>from</b> clause, the <b>test policy</b> command uses the match condition. In contrast, BGP does not use the <b>interface</b> match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.</p> <p>When testing a policy, you can see the length of time (in microseconds) required to evaluate the policy and the number of times it has been executed by running the <code>show policy <i>policy-name</i> statistics</code> command.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Clear statistics about configured firewall filters.</p> <p>When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.</p> <p>Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The <b>clear firewall</b> command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.</p>                                                                                                                                 |
| <div>  <p><b>NOTE:</b> The <b>clear firewall</b> command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).</p> </div>                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the <b>prefix-action</b> action on matched packets, wait at least 5 seconds before you enter the <b>show firewall prefix-action-stats</b> command. A 5-second pause between issuing the <b>clear firewall</b> and <b>show firewall prefix-action-stats</b> commands avoids a possible timeout of the <b>show firewall prefix-action-stats</b> command.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p><b>all</b>—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.</p> <p><b>counter <i>counter-name</i></b>—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.</p> <p><b>filter <i>filter-name</i></b>—Clear the packet and byte counts for the specified firewall filter.</p> <p><b>log (all   <i>logical-system-name</i>)</b>—Clear log entries for IPv4 firewall filters that have <b>then log</b> as an action. Use <b>log all</b> to clear all log entries or <b>log <i>logical-system-name</i></b> to clear log entries for the specified logical system.</p> |

**logical-system** *logical-system-name*—Clear the packet and byte counts for the specified logical system.

**policer counter** (**all** | **counter-id** *counter-index*)—(EX8200 switches only) Clear all policer counters using the **policer counter all** command, or clear a specific policer counter using the **policer counter counter-id** *counter-index* command. The value of *counter-index* can be 0, 1, or 2.

**Required Privilege Level**

## Sample Output

**clear firewall all**

```
user@host> clear firewall all
```

**clear firewall (counter counter-name)**

```
user@host> clear firewall counter port-filter-counter
```

**clear firewall (filter filter-name)**

```
user@host> clear firewall filter ingress-port-filter
```

**clear firewall (policer counter all) (EX8200 Switch)**

```
user@switch> clear firewall policer counter all
```

**clear firewall (policer counter counter-id counter-index) (EX8200 Switch)**

```
user@switch> clear firewall policer counter counter-id 0
```

**Output Fields** [Table 108 on page 1414](#) lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

**Table 108: show firewall Output Fields**

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter</b> | <p>Name of a filter that has been configured with the <b>filter</b> statement at the <b>[edit firewall]</b> hierarchy level.</p> <p>Except on EX Series switches:</p> <ul style="list-style-type: none"> <li>• When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <b>-i</b> for an input filter or <b>-o</b> for an output filter.</li> <li>• When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <b>-in</b> for an input filter or <b>-out</b> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, __ls1/filter1).</li> <li>• When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (;).</li> </ul> <p><b>NOTE:</b> For <b>bridge family filter</b>, the <b>ip-protocol</b> match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</p> |

Table 108: show firewall Output Fields (*continued*)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Counters</b>              | <p>Display filter counter information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of a filter counter that has been configured with the <b>counter</b> firewall filter action.</li> <li>• <b>Bytes</b>—Number of bytes that match the filter term under which the <b>counter</b> action is specified.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the <b>counter</b> action is specified.</li> </ul> <p><b>NOTE:</b> On M and T Series routers, firewall filters cannot count <b>ip-options</b> packets on a per option type and per interface basis. A limited work around is to use the <b>show pfe statistics ip options</b> command to see <b>ip-options</b> statistics on a per Packet Forwarding Engine (PFE) basis. See <i>show pfe statistics ip</i> for sample output.</p> |
| <b>Policers</b>              | <p>Display policer information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of policer.</li> <li>• <b>Bytes</b>—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer.<br/>For other platforms, this field is blank.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</li> </ul>                   |
| <b>Policer Counter Index</b> | (EX8200 switch only) Global management counter ID. The counter ID value ( <i>counter-index</i> ) can be 0, 1, or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Green</b>                 | (EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Yellow</b>                | (EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Discard</b>               | (EX8200 switch only) Number of discarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Bytes</b>                 | (EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Packets</b>               | (EX8200 switch only) Number of green, yellow, red, or discarded packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Filter name</b>           | (EX8200 switch only) Name of the filter with a term associated to a policer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 108: show firewall Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P1-t1      | <ul style="list-style-type: none"><li>• OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter.</li><li>• Offered packet statistics for traffic subjected to policing.</li><li>• Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</li></ul> |

---

## Sample Output

### show firewall filter (MX Series Router and EX Series Switch)

```
user@host> show firewall filter test
Filter: test
Counters:
Name                               Bytes          Packets
Counter-1                          0              0
Counter-2                          0              0
Policers:
Name                               Bytes          Packets
Policer-1                         2770           70
```

### show firewall filter (non MX Series Router and EX Series Switch)

```
user@host> show firewall filter test
Filter: test
Counters:
Name                               Bytes          Packets
Counter-1                          0              0
Counter-2                          0              0
Policers:
Name                               Bytes          Packets
Policer-1                         70
```

### show firewall filter (Hierarchical Policers, MX Series with MPC)

```
user@host> show firewall filter

## show firewall filter version

|                                 |                                                                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show firewall filter version < <i>filter-name</i> >                                                                                                                                                                                                                |
| <b>Release Information</b>      | Command introduced in Junos OS Release 10.2R2.                                                                                                                                                                                                                     |
| <b>Description</b>              | Display the version number of the installed firewall filter in the Routing Engine.                                                                                                                                                                                 |
| <b>Options</b>                  | <p>none—(Optional) Display the version number of all installed firewall filters.</p> <p><i>filter-name</i>—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.</p>                   |
| <b>Additional Information</b>   | The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                               |

| Description                   | <p>Display prefix action statistics about configured firewall filters.</p> <p>If you clear statistics for firewall filters that are applied to MPCs and that also use the <b>prefix-action</b> action on matched packets, wait at least 5 seconds before you enter the <b>show firewall prefix-action-stats</b> command. A 5-second pause between issuing the <b>clear firewall</b> and <b>show firewall prefix-action-stats</b> commands avoids a possible timeout of the <b>show firewall prefix-action-stats</b> command.</p> <p>By default, policers operate in <i>term-specific</i> mode.</p> <p>See “<a href="#">Filter-Specific Policer Overview</a>” on <a href="#">page 955</a> for information about how to configure policers in <i>filter-specific</i> mode.</p> |

| Output Fields                 | <a href="#">Table 111 on page 1426</a> lists the output fields for the <b>show firewall prefix-action-stats</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 111: show firewall prefix-action-stats Output Fields

| Field Name    | Field Description                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Filter</b> | Filter name.<br><br>Filters configured for logical systems include the name of the filter prefixed with the two underscore characters (__) and the name of the logical system (for example, __ls1/filter1). |

## Sample Output

The following sample output assumes that the policer *act1* is in term mode and that there is a term named *term1* configured in the firewall filter *test*.

### show firewall prefix-action-stats

```

user@host> show firewall prefix-action-stats filter test prefix-action act1-term1 from 0 to 9
Filter: test
Counters:
Name                Bytes                Packets
act1-0              0                    0
act1-1              0                    0
act1-2              0                    0
act1-3              0                    0

| <b>Release Information</b>      | Command introduced in Junos OS 14.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Display interface accounting information by forwarding class for IPv4, IPv6, MPLS, Layer 2, and Other traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <b>comprehensive</b> —(Optional) Display forwarding-class-counters per traffic family for all logical interfaces under the physical interface along with other quality-of-service information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Additional Information</b>   | <p>For physical interface-level statistics, if none of the logical interfaces have any of the traffic families configured on them, the forwarding class statistics for that family are still displayed with a value of 0.</p> <p>For physical interface-level statistics, in case of Layer 2 families such as <b>ccc</b>, <b>tcc</b>, or <b>vpls</b>, the <b>Layer2</b> keyword is displayed because it is possible that different Layer 2 families are configured on the logical interface.</p> <p>For logical interface-level statistics, the output displays statistics only for families that are configured on that logical interface. The statistics under <b>Other</b> family are still displayed because these are packets that are not classified as belonging to any family.</p> <p>In the case of Layer 2 families such as <b>ccc</b>, <b>tcc</b>, or <b>vpls</b> configured on the logical interface, the actual family name is displayed in the output.</p> <p>Statistics include input and output byte and packets and corresponding rates.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Output Fields</b>            | <a href="#">Table 112 on page 1427</a> lists the output fields for the <b>show interfaces forwarding-class-counters</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 112: show interfaces forwarding-class-counters Output Fields**

| Field Name   | Field Description                                             |
|--------------|---------------------------------------------------------------|
| Input bytes  | A count of received bytes that match the forwarding class.    |
| Output bytes | A count of transmitted bytes that match the forwarding class. |

Table 112: show interfaces forwarding-class-counters Output Fields (*continued*)

| Field Name            | Field Description                                               |
|-----------------------|-----------------------------------------------------------------|
| <b>Input packets</b>  | A count of received packets that match the forwarding class.    |
| <b>Output packets</b> | A count of transmitted packets that match the forwarding class. |

## Sample Output

show interfaces forwarding-class-counters interface-name

```

user@host> show interfaces forwarding-class-counters ge-4/2/1

user@host> show interfaces forwarding-class-counters ge-4/2/1
Physical interface ge-4/2/1 (Index 228) (SNMP ifIndex 870)
Aggregate Forwarding-class statistics :
  Forwarding-class statistics : best-effort
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
  Forwarding-class statistics : network-control
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps

IPv4 Forwarding-class statistics :
  Forwarding-class statistics : best-effort
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
  Forwarding-class statistics : expedited-forwarding
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
  Forwarding-class statistics : assured-forwarding
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
  Forwarding-class statistics : network-control
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps

IPv6 Forwarding-class statistics :
  Forwarding-class statistics : best-effort
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
  Forwarding-class statistics : expedited-forwarding
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps

```

```

      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : assured-forwarding
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : network-control
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps

MPLS Forwarding-class statistics :
Forwarding-class statistics : best-effort
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : expedited-forwarding
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : assured-forwarding
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : network-control
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps

Layer2 Forwarding-class statistics
Forwarding-class statistics : best-effort
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : expedited-forwarding
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : assured-forwarding
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps
Forwarding-class statistics : network-control
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps
      Input  packets :                0 0 pps
      output packets :                0 0 pps

Other Forwarding-class statistics :
Forwarding-class statistics : best-effort
      Input  bytes   :                0 0 bps
      output bytes   :                0 0 bps

```

```

    Input  packets :                0 0 pps
    output packets :                0 0 pps
Forwarding-class statistics : expedited-forwarding
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
Forwarding-class statistics : assured-forwarding
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps
Forwarding-class statistics : network-control
    Input  bytes   :                0 0 bps
    output bytes   :                0 0 bps
    Input  packets :                0 0 pps
    output packets :                0 0 pps

Logical interface ge-4/2/1.0 (Index 347) (SNMP ifIndex 1032)
Forwarding-class accounting parameters :
Aggregate Forwarding-class statistics :
    Forwarding-class statistics : best-effort
        Input  bytes   :                0 0 bps
        output bytes   :                0 0 bps
        Input  packets :                0 0 pps
        output packets :                0 0 pps
    Forwarding-class statistics : expedited-forwarding
        Input  bytes   :                0 0 bps
        output bytes   :                0 0 bps
        Input  packets :                0 0 pps
        output packets :                0 0 pps
    Forwarding-class statistics : assured-forwarding
        Input  bytes   :                0 0 bps
