YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- [QFX Series](#)

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

Documentation Conventions

Table 1 on page xiii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xiii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none">Introduces or emphasizes important new terms.Identifies guide names.Identifies RFC and Internet draft titles.	<ul style="list-style-type: none">A policy <i>term</i> is a named structure that defines match conditions and actions.<i>Junos OS CLI User Guide</i>RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none">To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level.The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric <i>metric</i>>;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none">In the Logical Interfaces box, select All Interfaces.To cancel the configuration, click Cancel.

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page of the Juniper Networks TechLibrary site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <http://www.juniper.net/techpubs/feedback/>.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

PART 1

Adaptive Load Balancing

- [Configuring Load Balancing on page 3](#)

CHAPTER 1

Configuring Load Balancing

- [Understanding Aggregated Ethernet Load Balancing on page 3](#)
- [Configuring Adaptive Load Balancing on page 5](#)

Understanding Aggregated Ethernet Load Balancing

The link aggregation feature is used to bundle several physical aggregated Ethernet interfaces to form one logical interface. One or more links are aggregated to form a virtual link or link aggregation group (LAG). The MAC client treats this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability.

In addition to these benefits, an aggregated Ethernet bundle is enhanced to provide load-balancing capabilities that ensure that the link utilization among the member links of the aggregated Ethernet bundle are fully and efficiently utilized.

The load-balancing feature allows a device to divide incoming and outgoing traffic along multiple paths or interfaces in order to reduce congestion in the network. Load balancing improves the utilization of various network paths and provides more effective network bandwidth.

Typically, the applications that use load balancing include:

- Aggregated Interfaces (Layer 2)

Aggregated Interfaces (also called AE for aggregated Ethernet, and AS for aggregated SONET) are a Layer 2 mechanism for load-balancing across multiple interfaces between two devices. Because this is a Layer 2 load-balancing mechanism, all of the individual component links must be between the same two devices on each end. Junos OS supports a non-signaled (static) configuration for Ethernet and SONET, as well as the 802.3ad standardized LACP protocol for negotiation over Ethernet links.

- Equal-Cost Multipath (ECMP) (Layer 3)

By default, when there are multiple equal-cost paths to the same destination for the active route, Junos OS uses a hash algorithm to choose one of the next-hop addresses to install in the forwarding table. Whenever the set of next hops for a destination changes in any way, the next-hop address is rechosen using the hash algorithm. There is also an option that allows multiple next-hop addresses to be installed in the forwarding table, known as per-packet load balancing.

ECMP load balancing can be:

- Across BGP paths (BGP multipath)
- Within a BGP path, across multiple LSPs

In complex Ethernet topologies, traffic imbalances occur due to increased traffic flow, and load balancing becomes challenging for some of the following reasons:

- Incorrect load balancing by aggregate next hops
- Incorrect packet hash computation
- Insufficient variance in the packet flow
- Incorrect pattern selection

As a result of traffic imbalance, the load is not well distributed causing congestion in certain links, whereas some other links are not efficiently utilized.

To overcome these challenges, Junos OS provides the following solutions for resolving the genuine traffic imbalance on aggregated Ethernet bundles (IEEE 802.3ad).

- Adaptive Load Balancing

Adaptive load balancing uses a feedback mechanism to correct a genuine traffic imbalance. To correct the imbalance weights, the bandwidth and packet stream of links are adapted to achieve efficient traffic distribution across the links in an AE bundle.

To configure adaptive load balancing, include the **adaptive** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

NOTE: Adaptive load balancing is not supported if the VLAN ID is configured on the aggregated Ethernet interface. This limitation affects the PTX Series Packet Transport Routers and QFX10000 switches only.

To configure the tolerance value as a percentage, include the **tolerance** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

To configure adaptive load balancing based on packets per second (instead of the default bits per second setting), include the **pps** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

To configure the scan interval for the hash value based on the sample rate for the last two seconds, include the **scan-interval** optional keyword at the **[edit interfaces aex aggregated-ether-options load-balance adaptive]** hierarchy level.

NOTE: The **pps** and **scan-interval** optional keywords are supported on PTX Series Packet Transport Routers only.

- Per-Packet Random Spray Load Balancing

When the adaptive load-balancing option fails, per-packet random spray load balancing serves as a last resort. It ensures that the members of an AE bundle are equally loaded without taking bandwidth into consideration. Per packet causes packet reordering and hence is recommended only if the applications absorb reordering. Per-packet random spray eliminates traffic imbalance that occurs as a result of software errors, except for packet hash.

To configure per-packet random spray load balancing, include the **per-packet** statement at the **[edit interfaces aex aggregated-ether-options load-balance]** hierarchy level.

NOTE: The Per-Packet option for load balancing is not supported on PTX Series Packet Transport Routers.

The aggregated Ethernet load-balancing solutions are mutually exclusive. When more than one of the load-balancing solutions is configured, the solution that is configured last overrides the previously configured one. You can verify the load-balancing solution being used by issuing the **show interfaces aex aggregated-ether-options load-balance** command.

Related Documentation

- *Example: Configuring Aggregated Ethernet Load Balancing*

Configuring Adaptive Load Balancing

This topic describes how to configure adaptive load balancing. Adaptive load balancing maintains efficient utilization of member link bandwidth for an aggregated Ethernet (AE) bundle. Adaptive load balancing uses a feedback mechanism to correct traffic load imbalance by adjusting the bandwidth and packet streams on links within an AE bundle.

Before you begin:

- Configure a set of interfaces with a protocol family and IP address. These interfaces can make up the membership for the AE bundle.
- Create an AE bundle by configuring a set of router interfaces as aggregated Ethernet and with a specific AE group identifier.

To configure adaptive load balancing for an AE bundles:

1. Enable adaptive load balancing on the AE bundle:

```
[edit interfaces ae-x aggregated-ether-options load-balance]
user@router# set adaptive
```

2. Configure the scan interval value for adaptive load balancing on the AE bundle. The scan interval value determines the length of the traffic scan by multiplying the integer value with a 30-second time period:

```
[edit interfaces ae-x aggregated-ether-options load-balance adaptive]
user@router# set scan-interval multiplier
```

3. Configure the tolerance percentage value. The tolerance value determines the allowed deviation in the traffic rates among the members of the AE bundle before the router triggers an adaptive load balancing update:

```
[edit interfaces ae-x aggregated-ether-options load-balance adaptive]
user@router# set tolerance percentage
```

4. (Optional) Enable packet-per-second-based adaptive load balancing on the AE bundle:

```
[edit interfaces ae-x aggregated-ether-options load-balance adaptive]
user@router# set pps
```

PART 2

Graceful Restart

- [Configuring Graceful Restart on page 9](#)

CHAPTER 2

Configuring Graceful Restart

- [Graceful Restart Concepts on page 9](#)
- [Configuring Routing Protocols Graceful Restart on page 10](#)

Graceful Restart Concepts

With routing protocols, any service interruption requires that an affected router recalculate adjacencies with neighboring routers, restore routing table entries, and update other protocol-specific information. An unprotected restart of a router can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Three main types of graceful restart are available on Juniper Networks routing platforms:

- Graceful restart for aggregate and static routes and for routing protocols—Provides protection for aggregate and static routes and for Border Gateway Protocol (BGP), End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), next-generation RIP (RIPng), and Protocol Independent Multicast (PIM) sparse mode routing protocols.
- Graceful restart for MPLS-related protocols—Provides protection for Label Distribution Protocol (LDP), Resource Reservation Protocol (RSVP), circuit cross-connect (CCC), and translational cross-connect (TCC). (Not supported on OCX Series switches.)
- Graceful restart for virtual private networks (VPNs)—Provides protection for Layer 2 and Layer 3 VPNs.

Graceful restart works similarly for routing protocols and MPLS protocols and combines components of these protocol types to enable graceful restart in VPNs. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart thus enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Most graceful restart implementations define two types of routers—the restarting router and the helper router. The restarting router requires rapid restoration of forwarding state

information so it can resume the forwarding of network traffic. The helper router assists the restarting router in this process. Graceful restart configuration statements typically affect either the restarting router or the helper router.

- [Tracking Graceful Restart Events on page 16](#)

Enabling Graceful Restart

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {  
  graceful-restart;  
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

NOTE: Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```
[edit]
routing-options {
  graceful-restart {
    disable;
    restart-duration seconds;
  }
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

NOTE: If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

Configuring Graceful Restart Options for BGP

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]
protocols {
  bgp {
    graceful-restart {
      disable;
      restart-time seconds;
      stale-routes-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

NOTE: To set BGP graceful restart properties or disable them for a group, include the desired statements at the `[edit protocols bgp group group-name graceful-restart]` hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the `[edit protocols bgp group group-name neighbor ip-address graceful-restart]` hierarchy level.

NOTE: Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

Configuring Graceful Restart Options for ES-IS

On J Series Services Routers, to configure the duration of the ES-IS graceful restart period, include the **restart-duration** statement at the `[edit protocols esis graceful-restart]` hierarchy level.

```
[edit]
protocols {
  esis {
    graceful-restart {
      disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable ES-IS graceful restart capability, include the **disable** statement at the `[edit protocols esis graceful-restart]` hierarchy level.

Configuring Graceful Restart Options for IS-IS

To configure the duration of the IS-IS graceful restart period, include the **restart-duration** statement at the `[edit protocols isis graceful-restart]` hierarchy level.

```
[edit]
protocols {
  isis {
    graceful-restart {
      disable;
      helper-disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

```
}
```

To disable IS-IS graceful restart helper capability, include the **helper-disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level. To disable IS-IS graceful restart capability, include the **disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

NOTE: If you configure Bidirectional Forwarding Detection (BFD) and graceful restart for IS-IS, graceful restart might not work as expected.

NOTE: If adjacencies between the Routing Engine and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the hold-time for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

NOTE: You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols isis]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 16](#).

Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospfv3) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  ospf | ospfv3 {
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
  graceful-restart {
    helper-disable <both | restart-signaling | standard>
  }
```

To reenble the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

TIP: You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospf3)]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 16](#).

NOTE: You cannot enable OSPFv3 graceful restart between a routing platform running Junos OS Release 7.5 and earlier and a routing platform running Junos OS Release 7.6 or later. As a workaround, make sure both routing platforms use the same Junos OS version.

NOTE: If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

Configuring Graceful Restart Options for RIP and RIPng

To configure the duration of the RIP or RIPng graceful restart period, include the **restart-time** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  (rip | ripng) {
    graceful-restart {
      disable;
      restart-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable RIP or RIPng graceful restart capability, include the **disable** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

Configuring Graceful Restart Options for PIM Sparse Mode

PIM sparse mode continues to forward existing multicast packet streams during a graceful restart, but does not forward new streams until after the restart is complete. After a restart, the routing platform updates the forwarding state with any updates that were received from neighbors and occurred during the restart period. For example, the routing platform relearns the join and prune states of neighbors during the restart, but does not apply the changes to the forwarding table until after the restart.

PIM sparse mode-enabled routing platforms generate a unique 32-bit random number called a generation identifier. Generation identifiers are included by default in PIM hello messages, as specified in the IETF Internet draft *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*. When a routing platform receives PIM hellos containing generation identifiers on a point-to-point interface, Junos OS activates an algorithm that optimizes graceful restart.

Before PIM sparse mode graceful restart occurs, each routing platform creates a generation identifier and sends it to its multicast neighbors. If a PIM sparse mode-enabled routing platform restarts, it creates a new generation identifier and sends it to its neighbors. When a neighbor receives the new identifier, it resends multicast updates to the restarting router to allow it to exit graceful restart efficiently. The restart phase completes when either the PIM state becomes stable or when the restart interval timer expires.

If a routing platform does not support generation identifiers or if PIM is enabled on multipoint interfaces, the PIM sparse mode graceful restart algorithm does not activate, and a default restart timer is used as the restart mechanism.

To configure the duration of the PIM graceful restart period, include the **restart-duration** statement at the **[edit protocols pim graceful-restart]** hierarchy level:

```
[edit]
protocols {
```

```
pim {  
  graceful-restart {  
    disable;  
    restart-duration seconds;  
  }  
}  
routing-options {  
  graceful-restart;  
}
```

To disable PIM sparse mode graceful restart capability, include the **disable** statement at the **[edit protocols pim graceful-restart]** hierarchy level.

NOTE: Multicast forwarding can be interrupted in two ways. First, if the underlying routing protocol is unstable, multicast reverse-path-forwarding (RPF) checks can fail and cause an interruption. Second, because the forwarding table is not updated during the graceful restart period, new multicast streams are not forwarded until graceful restart is complete.

Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols protocol traceoptions flag]** hierarchy level:

```
[edit protocols]  
isis {  
  traceoptions {  
    flag graceful-restart;  
  }  
}  
(ospf | ospf3) {  
  traceoptions {  
    flag graceful-restart;  
  }  
}
```

Nonstop Bridging Concepts

Nonstop bridging uses the same infrastructure as graceful Routing Engine switchover (GRES) to preserve interface and kernel information. However, nonstop bridging also saves Layer 2 Control Protocol (L2CP) information by running the Layer 2 Control Protocol process (l2cpd) on the backup Routing Engine.

NOTE: To use nonstop bridging, you must first enable graceful Routing Engine switchover on your routing (or switching) platform. For more information about graceful Routing Engine switchover, see [“Understanding Graceful Routing Engine Switchover” on page 47](#).

[Figure 1 on page 20](#) shows the system architecture of nonstop bridging and the process a routing (or switching) platform follows to prepare for a switchover.

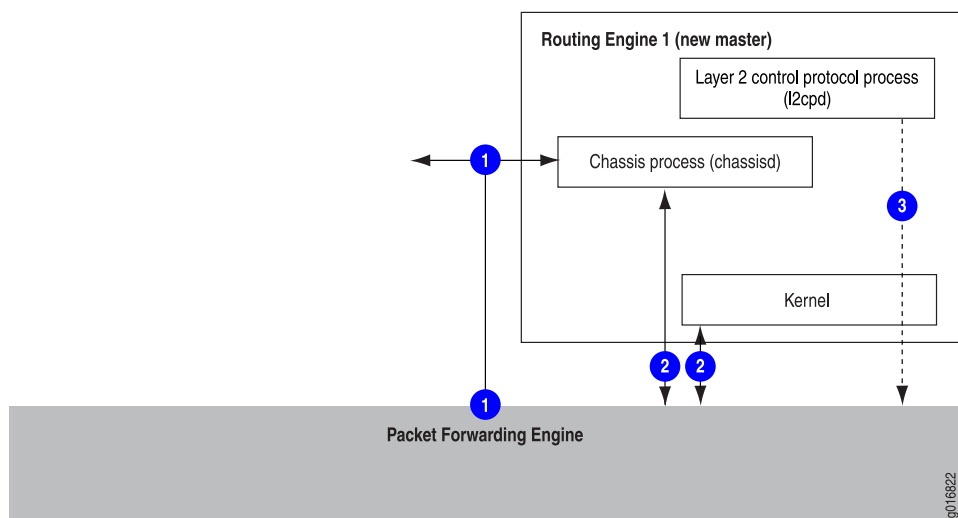

Figure 1: Nonstop Bridging Switchover Preparation Process

The switchover preparation process for nonstop bridging follows these steps:

1. The master Routing Engine starts.
2. The routing platform processes on the master Routing Engine (such as the chassis process [chassisd] and the Layer 2 Control Protocol process [l2cpd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts, including the chassis process (chassisd) and the Layer 2 Control Protocol process (l2cpd).
6. The system determines whether graceful Routing Engine switchover and nonstop bridging have been enabled.
7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. For supported protocols, state information is updated directly between the l2cpds on the master and backup Routing Engines.

Figure 2 on page 21 shows the effects of a switchover on the routing platform.

Figure 2: Nonstop Bridging During a Switchover

The switchover process follows these steps:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master. Because the Layer 2 Control Protocol process (l2cpd) and chassis process (chassisd) are already running, these processes do not need to restart.
3. State information learned from the point of the switchover is updated in the system. Forwarding and bridging are continued during the switchover, resulting in minimal packet loss.

Nonstop Bridging System Requirements

This topic contains the following sections:

- [Platform Support on page 21](#)
- [Protocol Support on page 22](#)

Platform Support

Nonstop bridging is supported on MX Series 3D Universal Edge Routers. Your system must be running Junos OS Release 8.4 or later.

Nonstop bridging is supported on EX Series switches with redundant Routing Engines in a Virtual Chassis or in a Virtual Chassis Fabric.

Nonstop bridging is supported on QFX Series switches in a Virtual Chassis or in a Virtual Chassis Fabric.

For a list of the EX Series switches and Layer 2 protocols that support nonstop bridging, see *EX Series Switch Software Features Overview*.

NOTE: All Routing Engines configured for nonstop bridging must be running the same Junos OS release.

Protocol Support

Nonstop bridging is supported for the following Layer 2 control protocols:

- Spanning Tree Protocol (STP)
- Rapid Spanning Tree Protocol (RSTP)
- Multiple Spanning Tree Protocol (MSTP)
- VLAN Spanning Tree Protocol (VSTP)

Configuring Nonstop Bridging on Switches (CLI Procedure)

NOTE: This task uses switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

You can configure nonstop bridging (NSB) to provide resilience for Layer 2 protocol sessions on a Juniper Networks EX Series switch with multiple Routing Engines or an EX Series or QFX Series switch in a Virtual Chassis or Virtual Chassis Fabric configuration. Limited support for NSB is also provided on QFX5100 and EX4600 standalone switches, but NSB is enabled *only* during an ISSU.

NSB operates by synchronizing all protocol information for NSB-supported Layer 2 protocols between the master and backup Routing Engines. If the switch has a Routing Engine switchover, the NSB-supported Layer 2 protocol sessions remain active because they are already synchronized on the backup Routing Engine. The Routing Engine switchover is transparent to neighbor devices, which do not detect any changes related to the Layer 2 protocol sessions. The neighboring devices and other devices on the network do not, therefore, have to resynchronize their Layer 2 protocol states to respond to the downtime on the switch—a process that adds network overhead and risks disrupting network performance—when a Routing Engine switchover occurs when NSB is enabled.

NOTE: If you are using a QFX5100 or EX4600 standalone switch and you want to use ISSU, configure Graceful Routing Engine switchover (GRES), NSB and nonstop active routing (NSR). You must configure NSB, GRES, and NSR in order to run ISSU. However, GRES, NSB and NSR are enabled *only* during the upgrade. During an ISSU, the Junos OS runs in two separate virtual machines (VMs)—one VM is in the master role acting as the master Routing Engine, and the other VM is in the backup role acting as the backup Routing Engine. The Junos OS is upgraded on the backup VM. After a successful software upgrade, the backup VM then becomes the master VM, and the original master VM is no longer needed and is shut down.

To configure NSB:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```

2. Enable NSB:

```
[edit protocols layer2-control]
user@switch# set nonstop-bridging
```

3. Synchronize configuration changes between the Routing Engines:

```
[edit system]
```

user@switch# **set commit** [synchronize](#)

If you try to commit a configuration that includes NSB without including the **commit synchronize** statement, the commit fails.

NOTE: There is no requirement to start the two Routing Engines simultaneously. If the backup Routing Engine is not up when you use the **commit synchronize** statement, the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine comes online, its configuration is automatically synchronized with that of the master.

BEST PRACTICE: After a graceful Routing Engine switchover, we recommend that you issue the clear interface statistics (*interface-name* | all) command to reset the cumulative values for local statistics on the new master Routing Engine.

Configuring Nonstop Active Routing

- [Nonstop Active Routing Concepts on page 27](#)
- [Nonstop Active Routing System Requirements on page 30](#)
- [Example: Configuring Nonstop Active Routing on Switches on page 41](#)

Nonstop Active Routing Concepts

Nonstop active routing (NSR) uses the same infrastructure as graceful Routing Engine switchover (GRES) to preserve interface and kernel information. However, NSR also saves routing protocol information by running the routing protocol process (rpd) on the backup Routing Engine. By saving this additional information, NSR is self-contained and does not rely on helper routers (or switches) to assist the routing platform in restoring routing protocol information. NSR is advantageous in networks in which neighbor routers (or switches) do not support graceful restart protocol extensions. As a result of this enhanced functionality, NSR is a natural replacement for graceful restart.

If you have NSR configured, it is never valid to issue the **restart routing** command in any form on the NSR master Routing Engine. Doing so results in a loss of protocol adjacencies and neighbors and a drop in traffic.

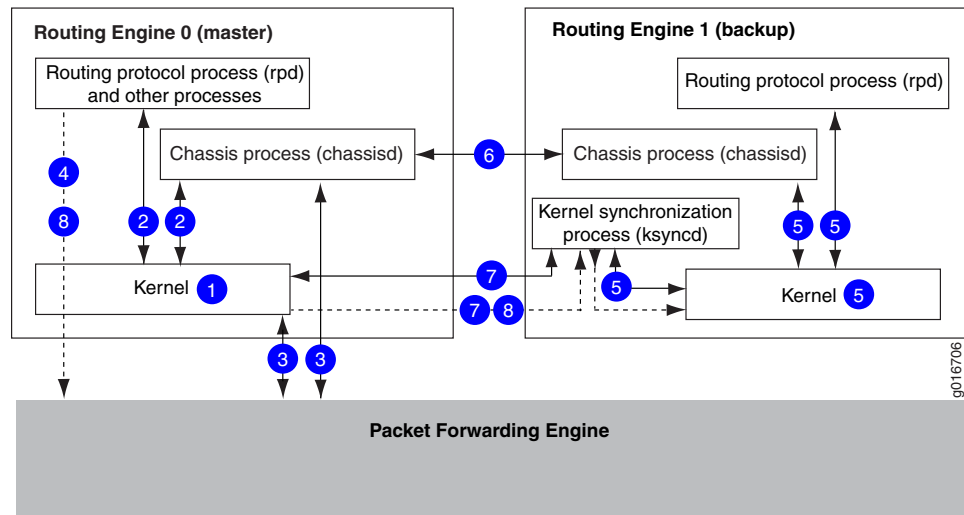

NOTE: To use NSR, you must first enable GRES on your routing (or switching) platform. For more information about GRES, see [“Understanding Graceful Routing Engine Switchover” on page 47](#).

NOTE: Due to its synchronization requirements and logic, NSR/GRES performance is limited by the slowest Routing Engine in the system.

Figure 3 on page 28 shows the system architecture of nonstop active routing and the process a routing (or switching) platform follows to prepare for a switchover.

Figure 3: Nonstop Active Routing Switchover Preparation Process

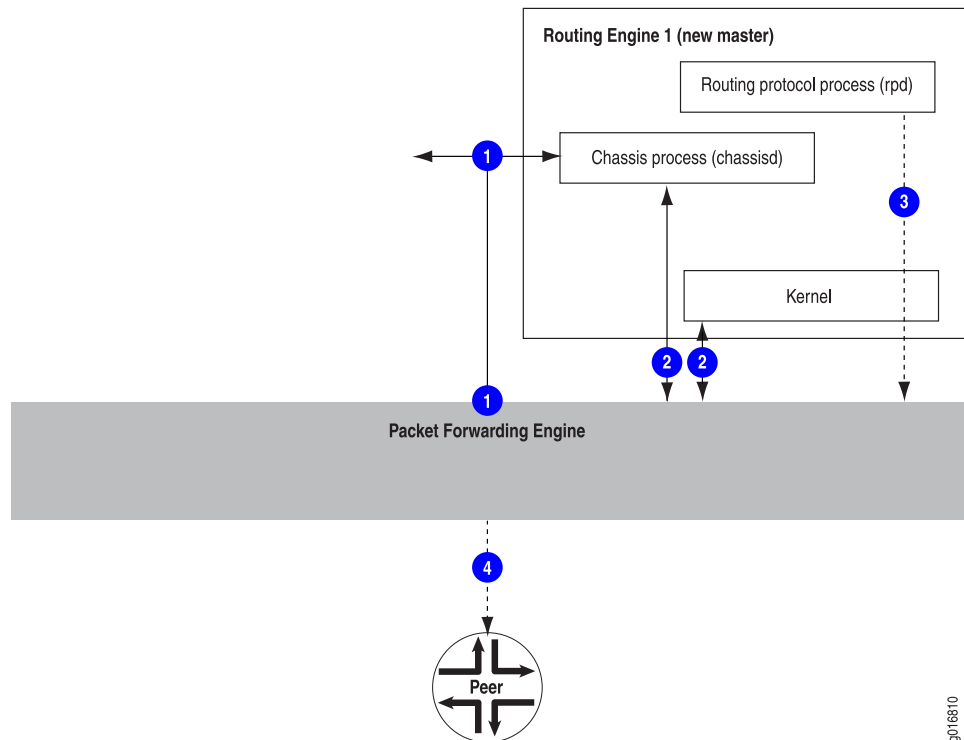

The switchover preparation process for NSR follows these steps:

1. The master Routing Engine starts.
2. The routing (or switching) platform processes on the master Routing Engine (such as the chassis process [chassisd] and the routing protocol process [rpd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts, including the chassis process (chassisd) and the routing protocol process (rpd).
6. The system determines whether graceful Routing Engine switchover and nonstop active routing have been enabled.
7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. For supported protocols, state information is updated directly between the routing protocol processes on the master and backup Routing Engines.

Figure 4 on page 29 shows the effects of a switchover on the routing platform.

Figure 4: Nonstop Active Routing During a Switchover

The switchover process follows these steps:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master. Because the routing protocol process (rpd) and chassis process (chassisd) are already running, these processes do not need to restart.
3. State information learned from the point of the switchover is updated in the system. Forwarding and routing are continued during the switchover, resulting in minimal packet loss.
4. Peer routers (or switches) continue to interact with the routing platform as if no change had occurred. Routing adjacencies and session state relying on underlying routing information are preserved and not reset.

CAUTION: We recommend that you do not restart the routing protocol process (rpd) on master Routing Engine after enabling NSR, as it disrupts the protocol adjacency/peering sessions, resulting in traffic loss.

Nonstop Active Routing Platform and Switching Platform Support

Table 3 on page 30 lists the platforms that support nonstop active routing (NSR).

Table 3: Nonstop Active Routing Platform Support

Platform	Junos OS Release
M10i router	8.4 or later
M20 router	8.4 or later
M40e router	8.4 or later
M120 router	9.0 or later
M320 router	8.4 or later
MX Series routers	9.0 or later
PTX Series Packet Transport Routers	12.1R4 or later

NOTE:

Nonstop active routing (NSR) switchover on PTX series is supported only for the following MPLS and VPN protocols and applications using chained composite next hops:

- Labeled BGP
- Layer 2 VPNs excluding Layer 2 interworking (Layer 2 switching)
- Layer 3 VPNs
- LDP
- RSVP

Table 3: Nonstop Active Routing Platform Support (*continued*)

Platform	Junos OS Release
PTX Series Packet Transport Routers	12.1R4 or later
<p>NOTE:</p> <p>Nonstop active routing (NSR) switchover on PTX series is supported only for the following MPLS and VPN protocols and applications using chained composite next hops:</p> <ul style="list-style-type: none"> • Labeled BGP • Layer 2 VPNs excluding Layer 2 interworking (Layer 2 stitching) • Layer 3 VPNs • LDP • RSVP

TX Plus Matrix router with 3D SIBs	13.1 or later
EX Series switch with dual Routing Engines or in a Virtual Chassis	10.4 or later for EX Series switches
EX Series or QFX Series switches in a Virtual Chassis Fabric	13.2X51-D20 or later for the EX Series and QFX Series switches

NOTE: All Routing Engines configured for nonstop active routing must be running the same Junos OS release.

Nonstop Active Routing Protocol and Feature Support

Table 4 on page 32 lists the protocols that are supported by nonstop active routing.

Table 4: Nonstop Active Routing Protocol and Feature Support

Protocol	Junos OS Release
Aggregated Ethernet interfaces with Link Aggregation Control Protocol (LACP)	9.4 or later
Bidirectional Forwarding Detection (BFD) For more information, see “Nonstop Active Routing BFD Support” on page 34.	8.5 or later
BGP For more information, see “Nonstop Active Routing BGP Support” on page 35.	8.4 or later
Labeled BGP (PTX Series Packet Transport Routers: only)	12.1R4 or later
IS-IS	8.4 or later
LDP	8.4 or later
LDP-based virtual private LAN service (VPLS)	9.3 or later
LDP OAM (operation, administration, and management) features	9.6 or later
LDP (PTX Series Packet Transport Routers only) Nonstop active routing support for LDP includes: <ul style="list-style-type: none"> • LDP unicast transit LSPs • LDP egress LSPs for labeled internal BGP (IBGP) and external BGP (EBGP) • LDP over RSVP transit LSPs • LDP transit LSPs with indexed next hops • LDP transit LSPs with unequal cost load balancing NOTE: Nonstop active routing is not supported for LDP Point-to-Multipoint LSPs and LDP ingress LSPs.	12.3R4 or later
Layer 2 circuits	(on LDP-based VPLS) 9.2 or later (on RSVP-TE LSP) 11.1 or later
Layer 2 VPNs	9.1 or later
Layer 2 VPNs (PTX Series Packet Transport Routers only)	12.1R4 or later
NOTE: Nonstop active routing is not supported for Layer 2 interworking (Layer 2 stitching).	

Table 4: Nonstop Active Routing Protocol and Feature Support (*continued*)

Protocol	Junos OS Release
Layer 3 VPNs (see the first Note after this table for restrictions)	9.2 or later
Nonstop active routing support for Layer 3 VPNs include:	
<ul style="list-style-type: none"> • IPv4 labeled-unicast (ingress or egress) • IPv4-vpn unicast (ingress or egress) • IPv6 labeled-unicast (ingress or egress) • IPv6-vpn unicast (ingress or egress) 	
Layer 3 VPNs (PTX Series Packet Transport Routers only)	12.1R4 or later
Multicast Source Discovery Protocol (MSDP)	12.1 or later
For more information, see “Nonstop Active Routing MSDP Support” on page 39 .	
OSPF/OSPFv3	8.4 or later
Protocol Independent Multicast (PIM)	(for IPv4) 9.3 or later
For more information, see “Nonstop Active Routing PIM Support” on page 36 .	(for IPv6) 10.4 or later
RIP and RIP next generation (RIPng)	9.0 or later
RSVP (PTX Series Packet Transport Routers only)	12.1R4 or later
Nonstop active routing support for RSVP includes:	
<ul style="list-style-type: none"> • Point-to-Multipoint LSPs <ul style="list-style-type: none"> • RSVP Point-to-Multipoint ingress, transit, and egress LSPs using existing non-chained next hop. • RSVP Point-to-Multipoint transit LSPs using composite next hops for Point-to-Multipoint label routes. • Point-to-Point LSPs <ul style="list-style-type: none"> • RSVP Point-to-Point ingress, transit, and egress LSPs using non-chained next hops. • RSVP Point-to-Point transit LSPs using chained composite next hops. 	
RSVP-TE LSP	9.5 or later
For more information, see “Nonstop Active Routing Support for RSVP-TE LSPs” on page 39 .	
VPLS	(LDP-based) 9.1 or later (RSVP-TE-based) 11.2 or later
VRRP	13.2 or later

Table 4: Nonstop Active Routing Protocol and Feature Support (*continued*)

Protocol	Junos OS Release
VRRP	13.2 or later

NOTE: Layer 3 VPN support does not include dynamic GRE tunnels, multicast VPNs, or BGP flow routes.

NOTE: If you configure a protocol that is not supported by nonstop active routing, the protocol operates as usual. When a switchover occurs, the state information for the unsupported protocol is not preserved and must be refreshed using the normal recovery mechanisms inherent in the protocol.

NOTE: On routers that have logical systems configured on them, only the master logical system supports nonstop active routing (NSR). NSR is supported for logical systems.

NOTE: On EX9214 switches, the VRRP master state might change during graceful Routing Engine switchover, even when nonstop active routing is enabled.

Nonstop Active Routing BFD Support

Nonstop active routing supports the Bidirectional Forwarding Detection (BFD) protocol, which uses the topology discovered by routing protocols to monitor neighbors. The BFD protocol is a simple hello mechanism that detects failures in a network. Because BFD is streamlined to be efficient at fast liveness detection, when it is used in conjunction with routing protocols, routing recovery times are improved. With nonstop active routing enabled, BFD session states are not restarted when a Routing Engine switchover occurs.

NOTE: BFD session states are saved only for clients using aggregate or static routes or for BGP, IS-IS, OSPF/OSPFv3, or PIM.

When a BFD session is distributed to the Packet Forwarding Engine, BFD packets continue to be sent during a Routing Engine switchover. If nondistributed BFD sessions are to be kept alive during a switchover, you must ensure that the session failure detection time is greater than the Routing Engine switchover time. The following BFD sessions are not distributed to the Packet Forwarding Engine: multihop sessions, tunnel-encapsulated sessions, and sessions over integrated routing and bridging (IRB) interfaces.

NOTE: BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping. The minimum-interval configuration statement is a BFD liveness detection parameter.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions, and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing is configured, specify a minimum interval of 10 seconds for Routing Engine-based sessions. For distributed BFD sessions with nonstop active routing configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

Nonstop Active Routing BGP Support

Nonstop active routing BGP support is subject to the following conditions:

- You must include the **path-selection external-router-ID** statement at the **[edit protocols bgp]** hierarchy level to ensure consistent path selection between the master and backup Routing Engines during and after the nonstop active routing switchover.
- You must include the **advertise-from-main-vpn-tables** statement at the **[edit protocols bgp]** hierarchy level to prevent BGP sessions from going down when route reflector (RR) or autonomous system border router (ASBR) functionality is enabled or disabled on a routing device that has VPN address families configured.
- BGP session uptime and downtime statistics are not synchronized between the primary and backup Routing Engines during Nonstop Active Routing and ISSU. The backup Routing Engine maintains its own session uptime based on the time when the backup first becomes aware of the established sessions. For example, if the backup Routing Engine is rebooted (or if you run **restart routing** on the backup Routing Engine), the backup's uptime is a short duration, because the backup has just learned about the established sessions. If the backup is operating when the BGP sessions first come up on the primary, the uptime on the primary and the uptime on the backup are almost the same duration. After a Routing Engine switchover, the new master continues from the time left on the standby Routing Engine.
- If the BGP peer in the master Routing Engine has negotiated address-family capabilities that are not supported for nonstop active routing, then the corresponding BGP neighbor state on the backup Routing Engine shows as idle. On switchover, the BGP session is reestablished from the new master Routing Engine.

Only the following address families are supported for nonstop active routing.

NOTE: Address families are supported only on the main instance of BGP. Only unicast is supported on VRF instances.

- inet unicast
 - inet labeled-unicast
 - inet multicast
 - inet6 labeled-unicast
 - inet6 multicast
 - inet6 unicast
 - route-target
 - l2vpn signaling
 - inet6-vpn unicast
 - inet-vpn unicast
 - inet-mdt
 - iso-vpn
- BGP route dampening does not work on the backup Routing Engine when nonstop active routing is enabled.

Nonstop Active Routing Layer 2 Circuit and VPLS Support

Nonstop active routing supports Layer 2 circuit and VPLS on both LDP-based and RSVP-TE-based networks. Nonstop active routing support enables the backup Routing Engine to track the label advertised by Layer 2 circuit and VPLS on the primary Routing Engine, and to use the same label after the Routing Engine switchover.

in Junos OS Release 9.6 and later, nonstop active routing support is extended to the Layer 2 circuit and LDP-based VPLS pseudowire redundant configurations.

Nonstop Active Routing PIM Support

Nonstop active routing supports Protocol Independent Multicast (PIM) with stateful replication on backup Routing Engines. State information replicated on the backup Routing Engine includes information about neighbor relationships, join and prune events, rendezvous point (RP) sets, synchronization between routes and next hops, multicast session states, and the forwarding state between the two Routing Engines.

NOTE: Nonstop active routing for PIM is supported for IPv4 on Junos OS Release 9.3 and later, and for IPv6 on Junos OS Release 10.4 and later. Starting with Release 11.1, Junos OS also supports nonstop active routing for PIM on devices that have both IPv4 and IPv6 configured on them.

To configure nonstop active routing for PIM, include the same statements in the configuration as for other protocols: the **nonstop-routing** statement at the **[edit routing-options]** hierarchy level and the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. To trace PIM nonstop active routing events, include the **flag nsr-synchronization** statement at the **[edit protocols pim traceoptions]** hierarchy level.

NOTE: The **clear pim join**, **clear pim register**, and **clear pim statistics** operational mode commands are not supported on the backup Routing Engine when nonstop active routing is enabled.

Nonstop active routing support varies for different PIM features. The features fall into the following three categories: supported features, unsupported features, and incompatible features.

Supported features:

- Auto-RP

NOTE: Nonstop active routing PIM support on IPv6 does not support auto-RP because IPv6 does not support auto-RP.

- Bootstrap router (BSR)
- Static RPs
- Embedded RP on non-RP IPv6 routers
- Local RP

NOTE: RP set information synchronization is supported for local RP and BSR (on IPv4 and IPv6), autoRP (on IPv4), and embedded RP (on IPv6).

- BFD
- Dense mode
- Sparse mode
- Source-specific multicast (SSM)
- Draft Rosen multicast VPNs (MVPNs)

- Anycast RP (anycast RP set information synchronization and anycast RP register state synchronization on IPv4 and IPv6 configurations)
- Flow maps
- Unified ISSU
- Policy features such as neighbor policy, bootstrap router export and import policies, scope policy, flow maps, and reverse path forwarding (RPF) check policies
- Upstream assert synchronization
- PIM join load balancing

Starting with Release 12.2, Junos OS extends the nonstop active routing PIM support to draft Rosen MVPNs. Nonstop active routing PIM support for draft Rosen MVPNs enables nonstop active routing-enabled devices to preserve draft Rosen MPVN-related information—such as default and data multicast distribution tree (MDT) states—across switchovers. In releases earlier than 12.2, nonstop active routing PIM configuration was incompatible with draft Rosen MPVN configuration.

The backup Routing Engine sets up the default MDT based on the configuration and the information it receives from the master Routing Engine, and keeps updating the default MDT state information.

However, for data MDTs, the backup Routing Engine relies on the master Routing Engine to provide updates when data MDTs are created, updated, or deleted. The backup Routing Engine neither monitors data MDT flow rates nor triggers a data MDT switchover based on variations in flow rates. Similarly, the backup Routing Engine does not maintain the data MDT delay timer or timeout timer. It does not send MDT join TLV packets for the data MDTs until it takes over as the master Routing Engine. After the switchover, the new master Routing Engine starts sending MDT join TLV packets for each data MDT, and also resets the data MDT timers. Note that the expiration time for the timers might vary from the original values on the previous master Routing Engine.

Starting with Release 12.3, Junos OS extends the Protocol Independent Multicast (PIM) nonstop active routing support to IGMP-only interfaces.

In Junos OS releases earlier than 12.3, the PIM joins created on IGMP-only interfaces were not replicated on the backup Routing Engine. Thus, the corresponding multicast routes were marked as pruned (meaning discarded) on the backup Routing Engine. Because of this limitation, after a switchover, the new master Routing Engine had to wait for the IGMP module to come up and start receiving reports to create PIM joins and to install multicast routes. This caused traffic loss until the multicast joins and routes were reinstated.

However, in Junos OS Release 12.3 and later, the multicast joins on the IGMP-only interfaces are mapped to PIM states, and these states are replicated on the backup Routing Engine. If the corresponding PIM states are available on the backup, the multicast routes are marked as forwarding on the backup Routing Engine. This enables uninterrupted traffic flow after a switchover. This enhancement covers IGMPv2, IGMPv3, MLDv1, and MLDv2 reports and leaves.

Unsupported features: You can configure the following PIM features on a router along with nonstop active routing, but they function as if nonstop active routing is not enabled. In other words, during Routing Engine switchover and other outages, their state information is not preserved, and traffic loss is to be expected.

- Internet Group Management Protocol (IGMP) exclude mode
- IGMP snooping

Nonstop active routing is not supported for next-generation MVPNs with PIM provider tunnels. The commit operation fails if the configuration includes both nonstop active routing and next-generation MVPNs with PIM provider tunnels.

Junos OS provides a configuration statement that disables nonstop active routing for PIM only, so that you can activate incompatible PIM features and continue to use nonstop active routing for the other protocols on the router. Before activating an incompatible PIM feature, include the **nonstop-routing disable** statement at the **[edit protocols pim]** hierarchy level. Note that in this case, nonstop active routing is disabled for all PIM features, not just incompatible features.

Nonstop Active Routing MSDP Support

Starting with Release 12.1, Junos OS extends nonstop active routing support to the Multicast Source Discovery Protocol (MSDP).

Nonstop active routing support for MSDP preserves the following MSDP-related information across the switchover:

- MSDP configuration and peer information
- MSDP peer socket information
- Source-active and related information

However, note that the following restrictions or limitations apply to nonstop active routing MSDP support:

- Because the backup Routing Engine learns the active source information by processing the source-active messages from the network, synchronizing of source active information between the master and backup Routing Engines might take up to 60 seconds. So, no planned switchover is allowed within 60 seconds of the initial replication of the sockets.
- Similarly, Junos OS does not support two planned switchovers within 240 seconds of each other.

Junos OS enables you to trace MSDP nonstop active routing events by including the **flag nsr-synchronization** statement at the **[edit protocols msdp traceoptions]** hierarchy level.

Nonstop Active Routing Support for RSVP-TE LSPs

Junos OS extends nonstop active routing support to label-switching routers (LSRs) and Layer 2 Circuits that are part of an RSVP-TE LSP. Nonstop active routing support on LSRs ensures that the master to backup Routing Engine switchover on an LSR remains

transparent to the network neighbors and that the LSP information remains unaltered during and after the switchover.

You can use the **show rsvp version** command to view the nonstop active routing mode and state on an LSR. Similarly, you can use the **show mpls lsp** and **show rsvp session** commands on the standby Routing Engine to view the state recreated on the standby Routing Engine.

The Junos OS nonstop active routing feature is also supported on RSVP point-to-multipoint LSPs. Nonstop active routing support for RSVP point-to-multipoint egress and transit LSPs was added in Junos OS Release 11.4, and for ingress LSPs in Release 12.1. During the switchover, the LSP comes up on the backup Routing Engine that shares and synchronizes the state information with the master Routing Engine before and after the switchover. Nonstop active routing support for point-to-multipoint transit and egress LSPs ensures that the switchover remains transparent to the network neighbors, and preserves the LSP information across the switchover.

However, Junos OS nonstop active routing support for RSVP point-to-multipoint LSPs does not include support for dynamically created point-to-multipoint LSPs, such as VPLS.

Starting with Release 14.1, Junos OS extends nonstop active routing support to the next-generation multicast VPNs.

The **show rsvp session detail** command enables you to check the point-to-multipoint LSP remerge state information (**P2MP LSP re-merge**; possible values are **head**, **member**, and **none**).

However, Junos OS does not support nonstop active routing for the following features:

- Generalized Multiprotocol Label Switching (GMPLS) and LSP hierarchy
- Interdomain or loose-hop expansion LSPs
- BFD liveness detection

Nonstop active routing support for RSVP-TE LSPs is subject to the following limitations and restrictions:

- Detour LSPs are not maintained across a switchover and so, detour LSPs might fail to come back online after the switchover.
- Control plane statistics corresponding to the **show rsvp statistics** and **show rsvp interface detail | extensive** commands are not maintained across Routing Engine switchovers.
- Statistics from the backup Routing Engine are not reported for **show mpls lsp statistics** and **monitor mpls label-switched-path** commands. However, if a switchover occurs, the backup Routing Engine, after taking over as the master, starts reporting statistics. Note that the **clear statistics** command issued on the old master Routing Engine does not have any effect on the new master Routing Engine, which reports statistics, including any uncleared statistics.
- State timeouts might take additional time during nonstop active routing switchover. For example, if a switchover occurs after a neighbor has missed sending two hello

messages to the master, the new master Routing Engine waits for another three hello periods before timing out the neighbor.

- On the RSVP ingress router, if you configure auto-bandwidth functionality, the bandwidth adjustment timers are set in the new master after the switchover. This causes a one-time increase in the length of time required for the bandwidth adjustment after the switchover occurs.
- RSVP ingress LSPs that have BFD liveness detection enabled on them do not come up on the backup Routing Engine during the switchover. Such BFD-enabled LSPs have to be reestablished after the switchover.
- Backup LSPs —LSPs that are established between the point of local repair (PLR) and the merge point after a node or link failure—are not preserved during a Routing Engine switchover.
- When nonstop active routing is enabled, graceful restart is not supported. However, graceful restart helper mode is supported.

- [Example: Configuring Nonstop Active Routing on Switches on page 41](#)

Example: Configuring Nonstop Active Routing on Switches

Nonstop active routing (NSR) provides high availability for Routing Engines by enabling transparent switchover of the Routing Engines without necessitating restart of supported routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbors.

This example describes how to configure nonstop active routing on switches with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration.

- [Requirements on page 41](#)
- [Overview and Topology on page 42](#)
- [Configuration on page 42](#)
- [Verification on page 43](#)
- [Troubleshooting on page 43](#)

Requirements

This example uses the following hardware and software components:

- An EX Series with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration
- Junos OS Release 10.4 or later for EX Series switches

- Junos OS Release 13.2X51-D20 or later for QFX Series switches

Overview and Topology

Configure nonstop active routing on any EX Series with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration. Nonstop active routing is advantageous in networks where neighbor routing devices do not support graceful restart protocol extensions.

The topology used in this example consists of an EX8200 switch with redundant Routing Engines connected to neighbor routing devices that are not configured to support graceful restart of protocols.

Configuration

CLI Quick Configuration To quickly configure nonstop active routing, copy the following commands and paste them into the switch terminal window:

```
[edit]
set chassis redundancy graceful-switchover
set routing-options nonstop-routing
set system commit synchronize
```

Step-by-Step Procedure To configure nonstop active routing on a switch:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```
2. Enable nonstop active routing (by default, nonstop active routing is disabled):

```
[edit routing-options]
user@switch# set nonstop-routing
```
3. Synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch# set commit synchronize
```

NOTE: If the backup Routing Engine is down when you issue the commit, a warning is displayed and the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine comes up, its configuration is automatically synchronized with that of the master. If you subsequently insert or bring up a backup Routing Engine, it automatically synchronizes its configuration with the master Routing Engine configuration.

Results

Check the results of the configuration:

```
[edit]
user@switch# show
chassis {
  redundancy {
    graceful-switchover;
  }
}
routing-options {
  nonstop-routing;
}
system {
  commit synchronize;
}
```

Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That Nonstop Active Routing Is Working Correctly on the Switch on page 43](#)

Verifying That Nonstop Active Routing Is Working Correctly on the Switch

Purpose Verify that nonstop active routing is enabled.

Action Issue the `show task replication` command:

```
user@switch# show task replication
Stateful Replication: Enabled
RE mode: Master
```

Protocol	Synchronization Status
OSPF	Complete
RIP	Complete
PIM	Complete
RSVP	Complete

Meaning This output shows that nonstop active routing (Stateful Replication) is enabled on master routing engine. If nonstop routing is not enabled, instead of the output shown above:

- On the backup routing engine the following error message is displayed: **“error: the routing subsystem is not running.”**
- On the master routing engine, the following output is displayed if nonstop routing is not enabled:

```
Stateful Replication: Disabled
RE mode: Master
```

Troubleshooting

To troubleshoot nonstop active routing, perform these tasks:

- [Investigating Problems with Synchronization of Routing Engines When NSR Is Enabled on page 44](#)

Investigating Problems with Synchronization of Routing Engines When NSR Is Enabled

Problem A protocol loses connectivity with neighbors after a graceful Routing Engine switchover (GRES) occurs with nonstop active routing (NSR) enabled.

Solution Use trace options to help isolate the problem and gather troubleshooting information. Using the information gathered from trace options, you can confirm or eliminate the synchronization of the Routing Engines as the cause of the loss of connectivity for the protocol. See *Tracing Nonstop Active Routing Synchronization Events*.

Understanding Graceful Routing Engine Switchover

This topic contains the following sections:

- [Graceful Routing Engine Switchover Concepts on page 47](#)
- [Effects of a Routing Engine Switchover on page 52](#)

Graceful Routing Engine Switchover Concepts

The graceful Routing Engine switchover (GRES) feature in Junos OS enables a routing platform with redundant Routing Engines to continue forwarding packets, even if one Routing Engine fails. GRES preserves interface and kernel information. Traffic is not interrupted. However, GRES does not preserve the control plane.

NOTE: On T Series routers, TX Matrix routers, and TX Matrix Plus routers, the control plane is preserved in case of GRES with nonstop active routing (NSR), and nearly 75 percent of line rate worth of traffic per Packet Forwarding Engine remains uninterrupted during GRES.

Neighboring routers detect that the router has experienced a restart and react to the event in a manner prescribed by individual routing protocol specifications.

To preserve routing during a switchover, GRES must be combined with either:

- Graceful restart protocol extensions
- Nonstop active routing

Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur.

NOTE: Due to its synchronization requirements and logic, NSR/GRES performance is limited by the slowest Routing Engine in the system.

Mastership switches to the backup Routing Engine if:

- The master Routing Engine kernel stops operating.
- The master Routing Engine experiences a hardware failure.
- The administrator initiates a manual switchover.

NOTE: To quickly restore or to preserve routing protocol state information during a switchover, GRES must be combined with either graceful restart or nonstop active routing, respectively. For more information about graceful restart, see [“Graceful Restart Concepts” on page 9](#). For more information about nonstop active routing, see [“Nonstop Active Routing Concepts” on page 27](#).

If the backup Routing Engine does not receive a keepalive from the master Routing Engine after 2 seconds (4 seconds on M20 routers), it determines that the master Routing Engine has failed and: takes mastership.

The Packet Forwarding Engine:

- Seamlessly disconnects from the old master Routing Engine
- Reconnects to the new master Routing Engine
- Does not reboot
- Does not interrupt traffic

The new master Routing Engine and the Packet Forwarding Engine then become synchronized. If the new master Routing Engine detects that the Packet Forwarding Engine state is not up to date, it resends state update messages.

NOTE: If adjacencies between the restarting router and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the *hold-time* for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

NOTE: Successive Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to **Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset**. Do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the FPCs should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

NOTE: Starting from Junos OS Release 14.2, when you perform GRES on MX Series routers, you must execute the `clear synchronous-ethernet wait-to-restore` operational mode command on the new master Routing Engine to clear the wait-to-restore timer on it. This is because the `clear synchronous-ethernet wait-to-restore` operational mode command clears the wait-to-restore timer only on the local Routing Engine.

NOTE: In a routing matrix with TX Matrix Plus router with 3D SIBs, for successive Routing Engine switchover, events must be a minimum of 900 seconds (15 minutes) apart after both Routing Engines have come up.

GRES must be performed on one line-card chassis (LCC) (of a TX Matrix router with 3D SIBs) at a time to avoid synchronization issues.

NOTE:

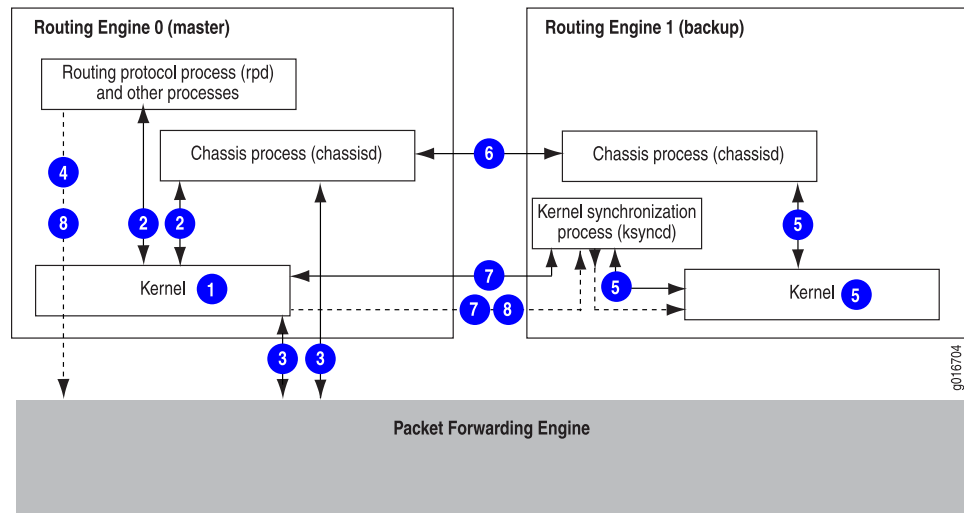

- We do *not* recommend performing a commit operation on the backup Routing Engine when GRES is enabled on the router or switch.
- We do *not* recommend enabling GRES on the backup Routing Engine in *any* scenario.

NOTE: On QFX10000 switches, we strongly recommend that you configure the `nsr-phantom-holdtime seconds` statement at the [edit routing-options] hierarchy level when nonstop routing is enabled with GRES. Doing so helps to prevent traffic loss. When you configure this statement, phantom IP addresses remain in the kernel during a switchover until the specified hold-time interval expires. After the interval expires, these routes are added to the appropriate routing tables. In an Ethernet VPN (EVPN)/VXLAN environment, we recommend that you specify a hold-time value of 300 seconds (5 minutes).

Figure 5 on page 50 shows the system architecture of graceful Routing Engine switchover and the process a routing platform follows to prepare for a switchover.

Figure 5: Preparing for a Graceful Routing Engine Switchover

NOTE: Check GRES readiness by executing both:

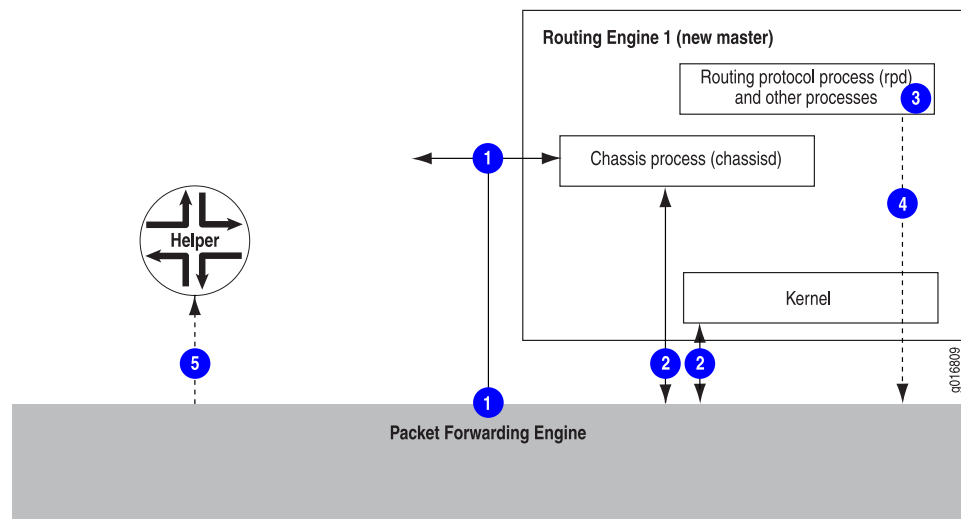

- The **request chassis routing-engine master switch check** command from the master Routing Engine
- The **show system switchover** command from the Backup Routing Engine

The switchover preparation process for GRES is as follows:

1. The master Routing Engine starts.
2. The routing platform processes (such as the chassis process [chassisd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts.
6. The system determines whether GRES has been enabled.
7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. After ksyncd completes the synchronization, all state information and the forwarding table are updated.

Figure 6 on page 51 shows the effects of a switchover on the routing (or switching) platform.

Figure 6: Graceful Routing Engine Switchover Process

When a switchover occurs, the switchover process is as follows:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master.
3. Routing platform processes that are not part of GRES (such as the routing protocol process [rpd]) restart.
4. State information learned from the point of the switchover is updated in the system.
5. If configured, graceful restart protocol extensions collect and restore routing information from neighboring peer *helper* routers.

NOTE: On T Series and M320 routers during GRES, the Switch Interface Boards (SIBs) are taken offline and restarted one by one. This is done to provide the Switch Processor Mezzanine Board (SPMB) that manages the SIB enough time to populate state information for its associated SIB. However, on a fully populated chassis where all FPCs are sending traffic at full line rate, there might be momentary packet loss during the switchover.

NOTE: When GRES is configured and the `restart chassis-control` command is executed on a TX Matrix Plus router with 3D SIBs, we cannot ascertain which Routing Engine becomes the master. This is because the `chassisd` process restarts with the execution of the `restart chassis-control` command. The `chassisd` process is responsible for maintaining and retaining mastership and when it is restarted, the new `chassisd` is processed based on the router or switch load. As a result, any one of the Routing Engines is made the master.

Effects of a Routing Engine Switchover

Table 5 on page 52 describes the effects of a Routing Engine switchover when different features are enabled:

- No high availability features
- Graceful Routing Engine switchover
- Graceful restart
- Nonstop active routing

Table 5: Effects of a Routing Engine Switchover

Feature	Benefits	Considerations
Dual Routing Engines only (no features enabled)	<ul style="list-style-type: none"> • When the switchover to the new master Routing Engine is complete, routing convergence takes place and traffic is resumed. 	<ul style="list-style-type: none"> • All physical interfaces are taken offline. • Packet Forwarding Engines restart. • The standby Routing Engine restarts the routing protocol process (rpd). • All hardware and interfaces are discovered by the new master Routing Engine. • The switchover takes several minutes. • All of the router's adjacencies are aware of the physical (interface alarms) and routing (topology) changes.
GRES enabled	<ul style="list-style-type: none"> • During the switchover, interface and kernel information is preserved. • The switchover is faster because the Packet Forwarding Engines are not restarted. 	<ul style="list-style-type: none"> • The new master Routing Engine restarts the routing protocol process (rpd). • All hardware and interfaces are acquired by a process that is similar to a warm restart. • All adjacencies are aware of the router's change in state.
GRES <i>and</i> nonstop active routing enabled	<ul style="list-style-type: none"> • Traffic is not interrupted during the switchover. • Interface and kernel information are preserved. 	<ul style="list-style-type: none"> • Unsupported protocols must be refreshed using the normal recovery mechanisms inherent in each protocol.

Table 5: Effects of a Routing Engine Switchover (*continued*)

Feature	Benefits	Considerations
GRES and graceful restart enabled	<ul style="list-style-type: none"> Traffic is not interrupted during the switchover. Interface and kernel information are preserved. Graceful restart protocol extensions quickly collect and restore routing information from the neighboring routers. 	<ul style="list-style-type: none"> Neighbors are required to support graceful restart, and a wait interval is required. The routing protocol process (rpd) restarts. For certain protocols, a significant change in the network can cause graceful restart to stop. If adjacencies between the restarting router and the neighboring peer 'helper' routers time out, graceful restart can stop and cause interruptions in traffic.

Graceful Routing Engine Switchover System Requirements

Graceful Routing Engine switchover is supported on all routing (or switching) platforms that contain dual Routing Engines. All Routing Engines configured for graceful Routing Engine switchover must run the same Junos OS release. Hardware and software support for graceful Routing Engine switchover is described in the following sections:

- [Graceful Routing Engine Switchover Platform Support on page 53](#)
- [Graceful Routing Engine Switchover Feature Support on page 54](#)
- [Graceful Routing Engine Switchover DPC Support on page 56](#)
- [Graceful Routing Engine Switchover and Subscriber Access on page 56](#)
- [Graceful Routing Engine Switchover PIC Support on page 56](#)

Graceful Routing Engine Switchover Platform Support

To enable graceful Routing Engine switchover, your system must meet these minimum requirements:

- M20 and M40e routers—Junos OS Release 5.7 or later
- M10i router—Junos OS Release 6.1 or later
- M320 router—Junos OS Release 6.2 or later
- T320 router, T640 router, and TX Matrix router—Junos OS Release 7.0 or later
- M120 router—Junos OS Release 8.2 or later
- MX960 router—Junos OS Release 8.3 or later
- MX480 router—Junos OS Release 8.4 or later (8.4R2 recommended)
- MX240 router—Junos OS Release 9.0 or later
- PTX5000 router—Junos OS Release 12.1X48 or later
- Standalone T1600 router—Junos OS Release 8.5 or later
- Standalone T4000 router—Junos OS Release 12.1R2 or later
- TX Matrix Plus router—Junos OS Release 9.6 or later
- TX Matrix Plus router with 3D SIBs—Junos Release 13.1 or later
- EX Series switches with dual Routing Engines or in a Virtual Chassis — Junos OS Release 9.2 or later for EX Series switches
- QFX Series switches in a Virtual Chassis —Junos OS Release 13.2 or later for the QFX Series
- EX Series or QFX Series switches in a Virtual Chassis Fabric —Junos OS Release 13.2X51-D20 or later for the EX Series and QFX Series switches

For more information about support for graceful Routing Engine switchover, see the sections that follow.

Graceful Routing Engine Switchover Feature Support

Graceful Routing Engine switchover supports most Junos OS features in Release 5.7 and later. Particular Junos OS features require specific versions of Junos OS. See [Table 6 on page 54](#).

Table 6: Graceful Routing Engine Switchover Feature Support

Application	Junos OS Release
Aggregated Ethernet interfaces with Link Aggregation Control Protocol (LACP) and aggregated SONET interfaces	6.2
Asynchronous Transfer Mode (ATM) virtual circuits (VCs)	6.2
Logical systems	6.3
NOTE: In Junos OS Release 9.3 and later, the logical router feature is renamed to logical system.	
Multicast	6.4 (7.0 for TX Matrix router)

Table 6: Graceful Routing Engine Switchover Feature Support (*continued*)

Application	Junos OS Release
Multilink Point-to-Point Protocol (MLPPP) and Multilink Frame Relay (MLFR)	7.0
Automatic Protection Switching (APS)—The current active interface (either the designated working or the designated protect interface) remains the active interface during a Routing Engine switchover.	7.4
Point-to-multipoint Multiprotocol Label Switching MPLS LSPs (transit only)	7.4
Compressed Real-Time Transport Protocol (CRTP)	7.6
Virtual private LAN service (VPLS)	8.2
Ethernet Operation, Administration, and Management (OAM) as defined by IEEE 802.3ah	8.5
Extended DHCP relay agent	8.5
Ethernet OAM as defined by IEEE 802.1ag	9.0
Packet Gateway Control Protocol (PGCP) process (pgcpd) on Multiservices 500 PICs on T640 routers.	9.0
Subscriber access	9.4
Layer 2 Circuit and LDP-based VPLS pseudowire redundant configuration	9.6

The following constraints apply to graceful Routing Engine switchover feature support:

- When graceful Routing Engine switchover and aggregated Ethernet interfaces are configured in the same system, the aggregated Ethernet interfaces must not be configured for fast-polling LACP. When fast polling is configured, the LACP polls time out at the remote end during the Routing Engine mastership switchover. When LACP polling times out, the aggregated link and interface are disabled. The Routing Engine mastership change is fast enough that standard and slow LACP polling do not time out during the procedure. However, note that this restriction does not apply to MX Series Routers that are running Junos OS Release 9.4 or later and have distributed periodic packet management (PPM) enabled—which is the default configuration—on them. In such cases, you can configure graceful Routing Engine switchover and have aggregated Ethernet interfaces configured for fast-polling LACP on the same device.

NOTE: MACSec sessions will flap upon Graceful Routing Engine switchover.

When a graceful Routing Engine switchover occurs, the VRRP state does not change. VRRP is supported by graceful Routing Engine switchover only in the case that PPM delegation is enabled (which is the default).

Graceful Routing Engine Switchover DPC Support

Graceful Routing Engine switchover supports all Dense Port Concentrators (DPCs) on the MX Series 3D Universal Edge Routers running the appropriate version of Junos OS as shown in “[Graceful Routing Engine Switchover Platform Support](#)” on page 53. For more information about DPCs, see the *MX Series DPC Guide*.

Graceful Routing Engine Switchover and Subscriber Access

Graceful Routing Engine switchover currently supports most of the features directly associated with dynamic DHCP and dynamic PPPoE subscriber access. Graceful Routing Engine switchover also supports the unified in-service software upgrade (ISSU) for the DHCP access model and the PPPoE access model used by subscriber access.

Graceful Routing Engine Switchover PIC Support

Graceful Routing Engine switchover is supported on most PICs, except for the services PICs listed in this section. The PIC must be on a supported routing platform running the appropriate version of Junos OS. For information about FPC types, FPC/PIC compatibility, and the initial Junos OS Release in which an FPC supported a particular PIC, see the PIC guide for your router platform.

The following constraints apply to graceful Routing Engine switchover support for services PICs:

- You can include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level on a router with Adaptive Services, Multiservices, and Tunnel Services PICs configured on it and successfully commit the configuration. However, all services on these PICs—except the Layer 2 service packages and extension-provider and SDK applications on Multiservices PICs—are reset during a switchover.

- Graceful Routing Engine switchover is not supported on any Monitoring Services PICs or Multilink Services PICs. If you include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level on a router with either of these PIC types configured on it and issue the **commit** command, the commit fails.
- Graceful Routing Engine switchover is not supported on Multiservices 400 PICs configured for monitoring services applications. If you include the **graceful-switchover** statement, the commit fails.

NOTE: When an unsupported PIC is online, you cannot enable graceful Routing Engine switchover. If graceful Routing Engine switchover is already enabled, an unsupported PIC cannot come online.

Configuring Graceful Routing Engine Switchover

This section contains the following topics:

- [Enabling Graceful Routing Engine Switchover on page 57](#)
- [Configuring Graceful Routing Engine Switchover with Graceful Restart on page 58](#)
- [Synchronizing the Routing Engine Configuration on page 58](#)
- [Verifying Graceful Routing Engine Switchover Operation on page 59](#)

Enabling Graceful Routing Engine Switchover

By default, graceful Routing Engine switchover (GRES) is disabled. To configure GRES, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level.

```
[edit chassis redundancy]
graceful-switchover;
```

When you enable GRES, the command-line interface (CLI) indicates which Routing Engine you are using. For example:

```
{master} [edit]
user@host#
```

To disable GRES, delete the **graceful-switchover** statement from the **[edit chassis redundancy]** hierarchy level.

Configuring Graceful Routing Engine Switchover with Graceful Restart

When using GRES with Graceful Restart, if adjacencies between the Routing Engine and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the *hold-time* for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

Synchronizing the Routing Engine Configuration

NOTE: A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

When you configure GRES, you can bring the backup Routing Engine online after the master Routing Engine is already running. There is no requirement to start the two Routing Engines simultaneously.

Only when you enable the graceful Routing Engine switchover, you can copy the running Junos OS version of the master Routing Engine to the backup Routing Engine.

NOTE: If the system is in ISSU state, you cannot copy the running Junos OS version of the master Router Engine.

You can enable automatic synchronization of the master Routing Engine configuration with the backup Routing Engine by including the events CHASSISD_SNMP_TRAP7 statement at the [edit event-options policy *policy-name*] hierarchy level.

CHASSISD_SNMP_TRAP7 is a system event logging message that the chassis process (chassisd) generates a Simple Network Management Protocol (SNMP) trap with the seven indicated argument-value pairs. An example of an event script to trigger automatic synchronization of master to the backup Routing Engine is as follows:

```
[edit event-options]
policy UPGRADE-BACKUPRE {
  events CHASSISD_SNMP_TRAP7;
  attributes-match {
    CHASSISD_SNMP_TRAP7.value5 matches "Routing Engine";
    CHASSISD_SNMP_TRAP7.trap matches "Fru Online";
    CHASSISD_SNMP_TRAP7.argument5 matches jnxFruName;
  }
  then {
    event-script auto-image-upgrade.slax {
      arguments {
        trap "${$.trap}";
        value5 "${$.value5}";
        argument5 "${$.argument5}";
      }
    }
  }
}
```

```

}
event-script {
file auto-image-upgrade.slax;
}

```

After receiving this event, the event policy on the master Routing Engine is triggered and the image available in the `/var/sw/pkg` path is pushed to the backup Routing Engine upgrade. During script execution, the image is copied to the backup Routing Engine's `/var/sw/pkg` path.

NOTE: If the image is not available in the `/var/sw/pkg` path, the script is terminated with an appropriate syslog message.

If the Routing Engine is running at the Junos OS Release 13.2 or later, the Junos automation scripts is synchronized automatically.

After the master Routing Engine is rebooted, the event script available at the `/usr/libexec/scripts/event/auto-image-upgrade.slax` must be copied to the `/var/db/scripts/event` path.

Verifying Graceful Routing Engine Switchover Operation

To verify whether GRES is enabled on the backup Routing Engine, issue the **show system switchover** command. When the output of the command indicates that the **Graceful switchover** field is set to `On`, GRES is operational. The status of the kernel database and configuration database synchronization between Routing Engines is also provided. For example:

```

Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady state

```

NOTE: You must issue the **show system switchover** command on the backup Routing Engine. This command is not supported on the master Routing Engine.

For more information about the **show system switchover** command, see the [CLI Explorer](#).

- [hold-time](#)

Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis, one member switch is assigned the master role and has the master Routing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up the Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two switches in a Virtual Chassis configuration with mastership priority of 255:

```
[edit]
user@switch# set virtual-chassis member 0 mastership-priority 255
[edit]
user@switch# set virtual-chassis member 1 mastership-priority 255
```

2. Set up graceful Routing Engine switchover:

```
[edit]
user@switch# set chassis redundancy graceful-switchover
```

Commit the configuration.

NOTE: We recommend that you use the `commit synchronize` command to save any configuration changes that you make to a multimember Virtual Chassis.

Resetting Local Statistics

When you enable graceful Routing Engine switchover, the master Routing Engine configuration is copied and loaded to the backup Routing Engine. User files, accounting information, and trace options information are not replicated to the backup Routing Engine.

When a graceful Routing Engine switchover occurs, local statistics such as process statistics and networking statistics are displayed as a cumulative value from the time the process first came online. Because processes on the master Routing Engine can start at different times from the processes on the backup Routing Engine, the statistics on the

two Routing Engines for the same process might differ. After a graceful Routing Engine switchover, we recommend that you issue the **clear interface statistics** (*interface-name* | **all**) command to reset the cumulative values for local statistics. Forwarding statistics are not affected by graceful Routing Engine switchover.

For information about how to use the **clear** command to clear statistics and protocol database information, see the [CLI Explorer](#).

NOTE: The **clear firewall** command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover.

Understanding VRRP

Juniper Networks switches support the Virtual Router Redundancy Protocol (VRRP) and VRRPv3 (for IPv6). This topic covers:

- [Overview of VRRP on page 65](#)
- [Sample VRRP Topology on page 66](#)

Overview of VRRP

Configuring end hosts on your network with static default routes minimizes configuration effort and complexity and reduces processing overhead on the end hosts. When hosts are configured with static routes, the failure of the default gateway normally results in a catastrophic event, isolating all hosts that are unable to detect available alternate paths to their gateway. Using Virtual Router Redundancy Protocol (VRRP) enables you to dynamically provide alternative gateways for end hosts if the primary gateway fails.

VRRP (defined in RFC 3768) provides dynamic failover of IP addresses from one router to another in the event of failure. You can implement VRRP to provide a highly available default path to a gateway without needing to configure dynamic routing or router discovery protocols on end hosts.

Switches configured with VRRP share a virtual IP address, which is the address you configure as the default route on the hosts. At any time, one of the switches is the VRRP master, meaning that it owns the virtual IP address and is the active default gateway. The other devices are backups. The switches dynamically assign master and backup roles based on priorities that you configure (**1 through 255**). If the master fails, the backup switch with the highest priority becomes the master within a few seconds. This is done without any interaction with the hosts.

In VRRP operation, the master sends advertisements to the backup switches at regular intervals. The default interval is 1 second. If the backup switches do not receive an advertisement for a set period, the backup with the highest priority takes over as master within a few seconds and begins forwarding packets. This is done without any interaction with the hosts.

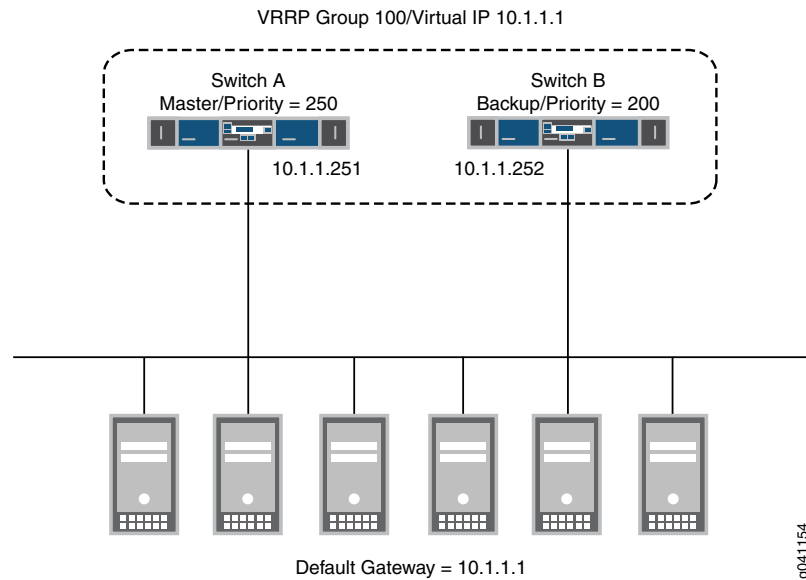

NOTE: Priority 255 cannot be set for routed VLAN interfaces (RVIs).

You can configure two QFabric systems to participate in a VRRP configuration as if they were two standalone switches. One benefit of this configuration is if you use VMware's vMotion, virtual machines can transition between hosts connected to the QFabric systems without updating their default gateway information. For example, a virtual machine running on a host connected to a QFabric system in data center A can transition to a host connected to a QFabric system in data center B without needing to resolve a new gateway IP address and MAC address.

Sample VRRP Topology

[Figure 7 on page 67](#) illustrates a basic VRRP topology. In this example, switches A and B are running VRRP and share the virtual IP address 10.1.1.1. The default gateway for each of the clients is 10.1.1.1.

Figure 7: Basic VRRP Topology

The following illustrates basic VRRP behavior using [Figure 7 on page 67](#) for reference:

1. When any of the servers wants to send traffic out of the LAN, it sends the traffic to the default gateway address of 10.1.1.1. This is a virtual IP address (VIP) owned by VRRP group 100. Because switch A is the master of the group, the VIP is associated with the “real” address 10.1.1.251 on switch A, and traffic from the servers is actually sent to this address. (Switch A is the master because it has been configured with a higher priority value.)
2. If there is a failure on switch A that prevents it from forwarding traffic to or from the servers—for example, if the interface connected to the LAN fails—switch B becomes the master and assumes ownership of the VIP. The servers continue to send traffic to the VIP, but because the VIP is now associated with the “real” address 10.1.1.252 on switch B (because of change of master), the traffic is sent to switch B instead of switch A.
3. If the problem that caused the failure on switch A is corrected, switch A becomes the master again and reasserts ownership of the VIP. In this case, the servers resume sending traffic to switch A.

Notice that no configuration changes are required on the servers for them to switch between sending traffic to switch A and switch B. When the VIP moves between 10.1.1.251 and 10.1.1.252, the change is detected by normal TCP-IP behavior and no configuration or intervention is required on the servers.

Related Documentation

- [Configuring Basic VRRP Support for QFX on page 73](#)
- [Example: Configuring VRRP for Load Sharing on page 68](#)

Example: Configuring VRRP for Load Sharing

If you do not want to dedicate a switch to be a VRRP backup (and therefore leave it idle unless the master fails), you can create a load-sharing configuration in which each participating switch simultaneously acts as a master and a backup.

One reason to use a load-sharing (active-active) configuration is that you are more likely to actively monitor and maintain both switches and notice if a problem occurs on either of them. If you use a configuration in which one switch is only a backup (an active-backup configuration), you might be less likely to pay attention to the backup switch while it is idle. In the worst case, this could lead to the backup switch developing an undetected problem and not being able to perform adequately when a failover occurs.

- [Requirements on page 68](#)
- [Overview and Topology on page 68](#)
- [Configuring VRRP on Both Switches on page 69](#)
- [Verification on page 72](#)

Requirements

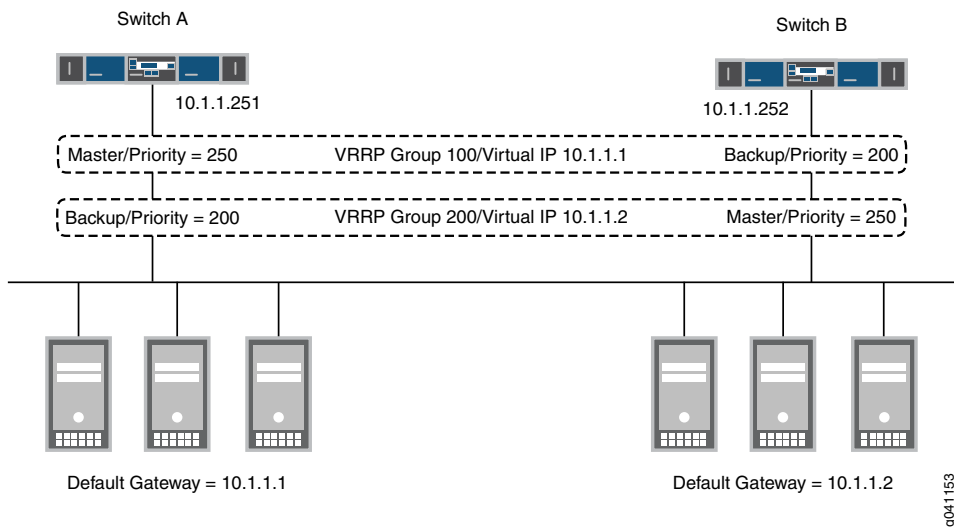

This example uses the following hardware and software components:

- Two switches
- Junos OS Release 11.3 or later
- Static routing or a dynamic routing protocol enabled on both switches.

Overview and Topology

This example uses two VRRP groups, each of which has its own virtual IP address. Devices on the LAN use one of these virtual IP addresses as their default gateway. If one of the switches fails, the other switch takes over for it. In the topology shown in [Figure 8 on page 69](#), for example, Switch A is the master for VRRP group 100. If Switch A fails, Switch B takes over and forwards traffic that the end devices send to the default gateway address 10.1.1.1.

Figure 8: VRRP Load-Sharing Configuration

This example shows a simple configuration to illustrate the basic steps for configuring two switches running VRRP to back each other up. [Table 7 on page 69](#) lists VRRP settings for each switch.

Table 7: Settings for VRRP Load-Sharing Example

Switch A	Switch B
VRRP Group 100: <ul style="list-style-type: none">Interface address: 10.1.1.251VIP: 10.1.1.1Priority: 250	VRRP Group 100: <ul style="list-style-type: none">Interface address: 10.1.1.252VIP: 10.1.1.1Priority: 200
VRRP Group 200: <ul style="list-style-type: none">Interface address: 10.1.1.251VIP: 10.1.1.2Priority: 200	VRRP Group 200: <ul style="list-style-type: none">Interface address: 10.1.1.252VIP: 10.1.1.2Priority: 250

In addition to configuring the two switches as shown, you must configure your end devices so that some of them use one of the virtual IP addresses as their default gateway and the remaining end devices use the other virtual IP address as their default gateway.

Note that if a failover occurs, the remaining switch might be unable to handle all of the traffic, depending on the demand.

Configuring VRRP on Both Switches

CLI Quick Configuration

Enter the following on Switch A:
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 priority 200
```

Enter the following on Switch B:

```
[edit]
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 priority 250
```

Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch A:

1. Create VRRP group 100 on Switch A and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 200
```

Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch B:

1. Create VRRP group 100 on Switch B and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
```

Switch A remains the master for group 100 because it has the highest priority for this group.

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

Switch B becomes the master for group 200 because it has the highest priority for this group.

Results Display the results of the configuration on Switch A:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.251 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 250
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 200
          }
        }
      }
    }
  }
}
```

Display the results of the configuration on Switch B:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.252 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 200
          }
          vrrp-group 200 {
            virtual address 10.1.1.2
            priority 250
          }
        }
      }
    }
  }
}
```

Verification

- [Verifying that VRRP Is Working on Switch A on page 72](#)
- [Verifying that VRRP Is Working on Switch B on page 72](#)

Verifying that VRRP Is Working on Switch A

Purpose Verify that VRRP is active on Switch A and that the master and backup roles are correct.

Action Use the following command to verify that VRRP is active on Switch A and that the switch is master for group 100 and backup for group 200.

```
user@switch> show vrrp
```

Interface Address	State	Group	VR state	Timer	Type
xe-0/0/0.0	up	100	master	A .0327 1c1 10.1.1.251 vip 10.1.1.1	
xe-0/0/0.0	up	200	backup	A .0327 1c1 10.1.1.251 vip 10.1.1.2	

Meaning The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 200 does not arrive before the timer expires, Switch A asserts itself as the master for this group.

Verifying that VRRP Is Working on Switch B

Purpose Verify that VRRP is active on Switch B and that the master and backup roles are correct.

Action Use the following command to verify that VRRP is active on Switch B and that the switch is backup for group 100 and master for group 200.

```
user@switch> show vrrp
```

Interface Address	State	Group	VR state	Timer	Type
xe-0/0/0.0	up	100	backup	A .0327 1c1 10.1.1.252 vip 10.1.1.1	
xe-0/0/0.0	up	200	master	A .0327 1c1 10.1.1.252 vip 10.1.1.2	

Meaning The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 100 does not arrive before the timer expires, Switch B asserts itself as the master for this group.

- Related Documentation**
- [Understanding VRRP on page 65](#)
 - [Configuring Basic VRRP Support for QFX on page 73](#)

Configuring Basic VRRP Support for QFX

To configure basic VRRP support, configure VRRP groups on interfaces by including the **vrrp-group** statement:

```
vrrp-group group-id {
  priority number;
  virtual-address [ addresses ];
}
```

An interface can be a member of multiple VRRP groups.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**

For each interface, you must configure the following:

- Group identifier—Assign a value from 0 through 255. You must use the same identifier for each switch in the VRRP group.
- Priority—Assign a value from 1 through 255. The switch with the highest priority becomes the VRRP master. Assign different priorities to each switch in the VRRP group. If there are two or more switches with the same priority, the switch with the VRRP interface that has the highest IP address becomes the master.
- Virtual IP address—Normally, you configure only one address per group, but you can configure as many as eight addresses. Do not include a prefix length in a virtual IP address. The following considerations apply to configuring a virtual IP address:
 - You must configure the same address on all the switches in the VRRP group.
 - If you configure a virtual IP address to be the same as a physical interface address, the switch with that interface becomes the master for the group. You must configure the priority to be 255, and you must configure preemption by including the **preempt** statement.
 - If the virtual IP address is not the same as the physical interface address, you must ensure that the address does not appear anywhere else in the switch configuration. For example, verify that you do not use this address for another interface (including an aggregated Ethernet interface) or for a static ARP entry.

NOTE: If you enable MAC source address filtering on an interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the `source-address-filter` statement at the `[edit interfaces interface-name]` hierarchy. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 3768. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

Configuring VRRP Authentication (IPv4 Only)

VRRP (IPv4 only) protocol exchanges can be authenticated to guarantee that only trusted switches participate in a VRRP group. By default, VRRP authentication is disabled. You can configure one of the following authentication methods for a group, and each switch in the same group must use the same method:

- Simple authentication—Uses a text password included in the transmitted packet. The receiving switch uses an authentication key (password) to verify the packet.
- Message Digest 5 (MD5) algorithm—Adds an authentication header (AH) to the IP packet that encapsulates the VRRP packet. You create an authentication key that is used to create a hash of the packet, and the hash is stored in the AH. A receiving switch recalculates the hash on the incoming packet and compares the hashes. If they are identical, the packet is valid and is accepted. Otherwise the switch drops the incoming packet.

To enable authentication and specify an authentication method, include the **authentication-type** statement.

authentication-type *authentication*;

authentication can be **simple** or **md5**. The authentication type must be the same for all the switches in the VRRP group.

You can include this statement at the following hierarchy level:

- `[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id]`

If you include the **authentication-type** statement, you can configure a key (password) on each interface by including the **authentication-key** statement:

authentication-key *key*;

key (the password) is an ASCII string. For simple authentication, it can be from 1 through 8 characters long. For MD5 authentication, it can be from 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").

NOTE: The key must be the same for all switches in the VRRP group.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

Configuring the Startup Period for VRRP Operations

Configure the startup-silent period interval to avoid alarms caused by the delay or interruption of the incoming VRRP advertisement packets while an interface is coming online. The period starts when the state of a VRRP interface is changed from down to up. During this period, Master Down Events are ignored.

To configure the startup period for VRRP operations, include the **startup-silent-period** statement at the [edit protocols vrrp] hierarchy level:

```
[edit protocols vrrp]
startup-silent-period seconds;
```

Related Documentation

Configuring the Advertisement Interval for the VRRP Master

By default, the master switch sends VRRP advertisement packets every second to all members of the VRRP group. These packets indicate that the master switch is still operational. If the master switch fails or becomes unreachable, the backup switch with the highest priority value becomes the new master switch.

You can modify the advertisement interval in seconds or in milliseconds; the interval must be the same for all routing platforms in the VRRP group.

This topic contains the following sections:

- [Modifying the Advertisement Interval in Seconds on page 76](#)
- [Modifying the Advertisement Interval in Milliseconds on page 76](#)

Modifying the Advertisement Interval in Seconds

To modify the time, in seconds, between the sending of VRRP advertisement packets, include the **advertise-interval** statement:

```
advertise-interval seconds;
```

The interval can be from 1 through 255 seconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

Modifying the Advertisement Interval in Milliseconds

To modify the time, in milliseconds, between the sending of VRRP advertisement packets, include the **fast-interval** statement:

```
fast-interval milliseconds;
```

The interval can be from 100 through 999 milliseconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

NOTE: Junos OS sets the advertisement interval to 0 in VRRP packets. When you configure VRRP with other vendors' equipment, the **fast-interval** statement works correctly only when the other equipment also has the advertisement interval set to 0 in the VRRP packet. Otherwise, Junos OS interprets other routers' settings as advertisement timer errors.

Configuring VRRP Preemption and Hold Time

- [Configuring VRRP Preemption on page 77](#)
- [Configuring the Preemption Hold Time on page 77](#)
- [Overriding the Hold Time on page 77](#)

Configuring VRRP Preemption

By default, a higher-priority VRRP backup switch preempts a lower-priority master switch. To explicitly enable this behavior, include the following statement:

```
preempt;
```

To prohibit a higher-priority VRRP backup switch from preempting a lower-priority master switch, include the following statement on the lower-priority switch:

```
no-preempt;
```

You can include these statements at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

Configuring the Preemption Hold Time

You can also configure a preemption hold time, which is the number of seconds a higher-priority backup router that has just started up waits before preempting the master router. You might want to configure a hold time so that routing protocols or other Junos OS components converge before preemption occurs.

The hold time is applied only on startup. By default, the hold-time value is 0 seconds, meaning that preemption can occur immediately after the backup router starts up.

To modify the preemption hold-time value, configure the following statement:

```
hold-time seconds;
```

The hold time can be from 0 through 3600 seconds.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address vrrp-group *group-id*] preempt**

Overriding the Hold Time

You can use the **asymmetric-hold-time** statement to configure a VRRP master to fail over to the backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.

When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.

You can include this statement at the following hierarchy level:

- **[edit protocols vrrp]**

- [Configuring Basic VRRP Support for QFX on page 73](#)
- [Example: Configuring VRRP for Load Sharing on page 68](#)

Configuring a Route to Be Tracked

A VRRP master can track a route and dynamically trigger a new master router election if the route becomes unreachable. To enable this behavior, you must configure a cost that will be subtracted from the priority of the master if the tracked route becomes unreachable. The new priority must be less than the priority of one of the backups so that the backup becomes the new master.

To configure a route to be tracked, include the following statements:

```
track {  
    priority-hold-time seconds;  
    route prefix/prefix-length routing-instance default priority-cost priority;  
}
```

You can include these statements at the following hierarchy level:

- `[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id]`

The **prefix** and **prefix-length** values specify the route to be tracked. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority of the master changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **priority-cost** option is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

Related Documentation

- [Understanding VRRP on page 65](#)
- [Configuring Basic VRRP Support for QFX on page 73](#)
- [Example: Configuring VRRP for Load Sharing on page 68](#)
- [Configuring a Logical Interface to Be Tracked on page 78](#)

Configuring a Logical Interface to Be Tracked

VRRP can track whether a logical interface is up, down, or not present, and can change the priority of the switch based on the state of the interface, which might trigger a new master election. VRRP can also track the operational speed of a logical interface and update the priority of the switch when the speed crosses a configured threshold. For each VRRP group, you can track as many as 10 logical interfaces.

When interface tracking is enabled on a switch, you cannot assign the switch a priority of 255 to make it the master for the group.

To configure a logical interface to be tracked, include the following statements:

```
track {
  interface interface-name {
    bandwidth-threshold bits-per-second priority-cost priority;
    priority-cost priority;
  }
  priority-hold-time seconds;
}
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

The interface specified is the interface to be tracked for the VRRP group. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **bandwidth-threshold** statement specifies a threshold for the tracked interface. If the bandwidth of the tracked interface drops below the threshold value, the system subtracts the bandwidth threshold **priority-cost** value from the VRRP priority for the switch. You can create as many as five **bandwidth-threshold** statements for each tracked interface.

The interface **priority-cost** statement is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

WARNING: On a QFabric system, do not apply interface tracking to a multichassis link aggregation group (MC-LAG) that includes an interface belonging to a network Node group device and an interface belonging to a server Node group device. If you do apply interface tracking to an MC-LAG configured in this way, a priority update will not occur if the state of the MC-LAG interface changes.

If you configure tracking for more than one interface, Junos OS subtracts the sum of the priority costs for the tracked interfaces from the VRRP priority if all the tracked interfaces fail. However, if you configure the interface **priority-cost** statement and the bandwidth threshold **priority-cost** statement, they are not added together. The switch uses only one priority cost for a tracked interface, as indicated in [Table 8 on page 80](#):

Table 8: Interface State and Priority Cost Usage

Tracked Interface State	Priority Cost Usage
Down	priority-cost priority
Not down; media speed below one or more bandwidth thresholds	Priority-cost of the lowest applicable bandwidth threshold

You must configure an interface priority cost only if you do not configure any bandwidth thresholds. If you do not configure an interface **priority-cost** value and the interface fails, Junos OS subtracts the bandwidth threshold **priority-cost** value of the lowest bandwidth threshold from the priority of the switch.

Configuring a Backup to Accept Packets Destined for the Virtual IP Address

By default, a switch configured to be a VRRP backup but acting as the master does not process packets sent to the virtual IP address—that is, packets in which the destination address is the virtual IP address. To configure a backup switch to process packets sent to the virtual IP address while it is acting as the master, include the **accept-data** statement on the backup:

```
accept-data;
```

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group] *group-id***

To explicitly prohibit the backup from accepting packets destined for the virtual IP address while acting as master, include the **no-accept-data** statement:

```
no-accept-data;
```

If you include the **accept-data** statement, configure the connected hosts so that they:

- Process gratuitous ARP requests.
- Do not use packets other than ARP replies to update their ARP cache.

This statement is disabled by default. If you enable it, your configuration does not comply with RFC 3768.

To restrict incoming IP packets to ICMP only, you must configure firewall filters to accept only ICMP packets.

However, you can configure the **accept-data | no-accept-data** statement for the group to specify whether the interface should accept packets destined for the virtual IP address.

Troubleshooting VRRP

Problem **Description:** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

Solution Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

Description	Configure graceful restart for OSPF.
Options	<p>disable—Disable graceful restart for OSPF.</p> <p>helper-disable (standard restart-signaling both)—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The standard, restart-signaling, and both options are only supported for OSPFv2. Specify standard to disable helper mode for standard graceful restart (based on RFC 3623). Specify restart-signaling to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify both to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p>Default: Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p>no-strict-lsa-checking—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p>

NOTE: The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both statements at the same time, the routing device displays a warning message when you enter the **show protocols (ospf | ospf3)** command.

notify-duration seconds—Estimated time needed to send out purged grace LSAs over all the interfaces.

Range: 1 through 3600 seconds

Default: 30 seconds

restart-duration seconds—Estimated time needed to reacquire a full OSPF neighbor from each area.

Range: 1 through 3600 seconds

Default: 180 seconds

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

helper-disable (OSPF)

Syntax	<code>helper-disable < both restart-signaling standard >;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> protocols ospf graceful-restart], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols ospf graceful-restart], [edit protocols ospf graceful-restart], [edit routing-instances <i>routing-instance-name</i> protocols ospf graceful-restart]
Release Information	Statement introduced before Junos OS Release 7.4. Options both , restart-signaling , and standard introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Disable helper mode for graceful restart. When helper mode is disabled, a router cannot help a neighboring router that is attempting to restart. The last committed statement takes precedence over the previously configured statement.
Default	Helper mode is enabled by default for OSPF.
Options	both —(Optional) Disable helper mode for both standard and restart signaling-based graceful restart. restart-signaling —(Optional) Disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813).
	<div>  <p>NOTE: Restart signaling-based helper mode is not supported for OSPFv3 configurations.</p> </div>
	standard —(Optional) Disable helper mode for standard graceful restart (based on RFC 3623).
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> Configuring Routing Protocols Graceful Restart on page 10 Configuring Graceful Restart for MPLS-Related Protocols

no-strict-lsa-checking

Syntax	no-strict-lsa-checking;
Hierarchy Level	[edit protocols (ospf ospf3) graceful-restart]
Release Information	Statement introduced in Junos OS Release 8.5. Statement introduced in Junos OS Release 12.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router or switch.
Default	By default, LSA checking is enabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

[graceful-switchover](#)

Syntax	<code>graceful-switchover;</code>
Hierarchy Level	[edit chassis redundancy]
Release Information	Statement introduced in Junos OS Release 9.2 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series.
Description	For switches with more than one Routing Engine, including those in a Virtual Chassis or a Virtual Chassis Fabric, configure the master Routing Engine to switch over gracefully to a backup Routing Engine without interruption to packet forwarding.
Default	Graceful Routing Engine switchover (GRES) is disabled.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Example: Configuring Nonstop Active Routing on Switches on page 41• Configuring Graceful Routing Engine Switchover on page 57• Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure) on page 60• Configuring Nonstop Active Routing on Switches• Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)

nsr-phantom-holdtime

Syntax	<code>nsr-phantom-holdtime seconds;</code>
Hierarchy Level	[edit routing-options]
Release Information	Statement introduced in Junos OS Release 15.1x53-D60 for QFX10000 switches.
Description	<p>Specify to hold phantom IP addresses, that is, prevent these routes from being added to routing tables, for a specified period of time. During this hold-time interval, these routes are maintained in the kernel. After the hold time expires, the routes are added to the routing tables.</p> <p>We strongly recommend that you configure this statement before you perform a graceful Routing Engine switchover (GRES) when nonstop routing (NSR) is enabled. Doing so prevents traffic loss because routes are added to the routing tables after the hold-time interval expires, but before they are deleted from the kernel during a switchover.</p>
Options	<p>seconds—Specify the interval of time to prevent phantom IP addresses from being added to the routing tables. After this interval expires, the routes are added to the routing tables.</p> <div><div></div><div>BEST PRACTICE: In an EVPN/VXLAN environment with NSR and GRES enabled, the recommended hold-time value is 300 (5 minutes)</div></div> <p>Range: 0 through 10000</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

CHAPTER 10

Configuration Statements (Nonstop Bridging and Routing)

- [nonstop-bridging on page 109](#)
- [nonstop-routing on page 110](#)
- [synchronize on page 111](#)
- [traceoptions on page 113](#)

nonstop-bridging

Syntax	nonstop-bridging;
Hierarchy Level	[edit protocols layer2-control]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	For platforms with two Routing Engines, configure a master Routing Engine to switch over gracefully to a backup Routing Engine and preserve Layer 2 Control Protocol (L2CP) information.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Synchronizing the Routing Engine Configuration</i>• <i>Configuring Nonstop Bridging</i>• For information about configuring NSB on EX Series switches that do not support the Enhanced Layer 2 Software (ELS) CLI style, see <i>Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)</i>• For information about configuring NSB on switches that support ELS, see Configuring Nonstop Bridging on Switches (CLI Procedure) on page 23

nonstop-routing

Syntax nonstop-routing;

Hierarchy Level [edit routing-options]

NOTE: Although `nonstop-routing` is also a valid keyword at the `logical-systems` hierarchy level, it is not supported.

Release Information Statement introduced in Junos OS Release 8.4.
Statement introduced in Junos OS Release 10.4 for EX Series switches.
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series switches

Description For routing platforms with two Routing Engines, configure a master Routing Engine to switch over gracefully to a backup Routing Engine and to preserve routing protocol information.

Default disabled

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

synchronize

Syntax	synchronize;
Hierarchy Level	[edit system commit]
Release Information	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 10.4 for EX Series switches.
Description	For devices with multiple Routing Engines only. Configure the commit command to automatically perform a commit synchronize action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the commit command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engine. Each Routing Engine then performs a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines.

NOTE: If you configure the **commit synchronize** statement at the [edit system] hierarchy level and issue a **commit** in the master Routing Engine, the master configuration is automatically synchronized with the backup. However, if the backup Routing Engine is down when you issue the **commit**, the Junos OS displays a warning and commits the candidate configuration in the master Routing Engine. When the backup Routing Engine comes up, its configuration will automatically be synchronized with the master. A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

NOTE: When you configure nonstop active routing (NSR), you must configure the **commit synchronize** statement. Otherwise, the **commit** operation fails.

On the TX Matrix router, synchronization only occurs between the Routing Engines within the same chassis. When synchronization is complete, the new configuration is then distributed to the Routing Engines on the T640 routers. That is, the master Routing Engine on the TX Matrix router distributes the configuration to the master Routing Engine on each T640 router. Likewise, the backup Routing Engine on the TX Matrix router distributes the configuration to the backup Routing Engine on each T640 router.

On the TX Matrix Plus router, synchronization only occurs between the Routing Engines within the switch-fabric chassis and when synchronization is complete, the new configuration is then distributed to the Routing Engines on the line-card chassis (LCC). That is, the master Routing Engine on the TX Matrix Plus router distributes the configuration to the master Routing Engine on each LCC. Likewise, the backup Routing Engine on the TX Matrix Plus router distributes the configuration to the backup Routing Engine on each LCC.

In EX Series Virtual Chassis configurations:

- On EX4200 switches in Virtual Chassis, synchronization occurs between the switch in the master role and the switch in the backup role.
- On EX8200 switches in a Virtual Chassis, synchronization occurs only between the master and backup XRE200 External Routing Engines.

Options **and-quit**—(Optional) Quit configuration mode if the commit synchronization succeeds.

at—(Optional) Time at which to activate configuration changes.

comment—(Optional) Write a message to the commit log.

force—(Optional) Force a commit synchronization on the other Routing Engine (ignore warnings).

scripts—(Optional) Push scripts to the other Routing Engine.

Required Privilege **system**—To view this statement in the configuration.

Level **system-control**—To add this statement to the configuration.

Documentation • *Configuring Multiple Routing Engines to Synchronize Committed Configurations Automatically*

traceoptions

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i> <disable>; } </pre>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-options multicast],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options],</p> <p>[edit routing-instances <i>routing-instance-name</i> routing-options multicast],</p> <p>[edit routing-options],</p> <p>[edit routing-options flow],</p> <p>[edit routing-options multicast]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>nsr-synchronization flag for BGP, IS-IS, LDP, and OSPF added in Junos OS Release 8.4.</p> <p>nsr-synchronization and nsr-packet flags for BFD sessions added in Junos OS Release 8.5.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>nsr-synchronization flag for RIP and RIPng added in Junos OS Release 9.0.</p> <p>nsr-synchronization flag for Layer 2 VPNs and VPLS added in Junos OS Release 9.1.</p> <p>nsr-synchronization flag for PIM added in Junos OS Release 9.3.</p> <p>nsr-synchronization flag for MPLS added in Junos OS Release 10.1.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>nsr-synchronization flag for MSDP added in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3 for ACX Series routers.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple flag statements.</p>
Default	If you do not include this statement, no global tracing operations are performed.
Options	<p>Values:</p> <p>disable—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. We recommend that you place global routing protocol tracing output in the file routing-log.</p>

files *number*—(Optional) Maximum number of trace files. When a trace file named ***trace-file*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

Range: 2 through 1000 files

Default: 10 files

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization**—Nonstop active routing synchronization
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: ***xk*** to specify KB, ***xm*** to specify MB, or ***xg*** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 128 KB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege Level routing and trace—To view this statement in the configuration.
routing-control and trace-control—To add this statement to the configuration.

failover-delay

Syntax	<code>failover-delay <i>milliseconds</i>;</code>
Hierarchy Level	[edit protocols vrrp]
Release Information	Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1x53-D20 for the OCX Series.
Description	<p>If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).</p> <p>If you configure a failover delay, the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.</p>
Options	<i>milliseconds</i> —Specify the failover delay time, in milliseconds. Range: 50 through 2000
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Troubleshooting VRRP on page 83• show vrrp on page 186

fast-interval

Syntax	<code>fast-interval milliseconds;</code>

traceoptions

Syntax traceoptions {
 file <filename> <files number> <match *regular-expression*> <microsecond-stamp>
 <size size> <world-readable | no-world-readable>;
 flag *flag*;
 no-remote-trace;
 }

Hierarchy Level [edit protocols vrrp]

Release Information Statement introduced in Junos OS Release 11.3 for the QFX Series.
 Statement introduced in Junos OS Release 14.1x53-D20 for the OCX Series.

Description Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.

To specify more than one tracing operation, include multiple **flag** statements.

By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory **/var/log**.

NOTE: The traceoptions statement is not supported on a QFabric system.

Default If you do not include this statement, no VRRP-specific tracing operations are performed.

Options **filename** *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, VRRP tracing output is placed in the file **vrrpd**.

files *number*—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.

Range: 0 through 4,294,967,296 files

Default: 3 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the VRRP-specific tracing options:

- **all**—All VRRP tracing operations
- **database**—Database changes
- **general**—General events

- **interfaces**—Interface changes
- **normal**—Normal events
- **packets**—Packets sent and received
- **state**—State transitions
- **timer**—Timer events

match *regex*—(Optional) Refine the output to include only those lines that match the given regular expression.

microsecond-stamp—(Optional) Provide a timestamp with microsecond granularity.

no-world-readable—Restrict users from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through the maximum file size supported on your routing platform

Default: 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

world-readable—Allow users to read the log file.

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

virtual-address

Syntax	<code>virtual-address [<i>addresses</i>];</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i> <i>vrrp-group group-id</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1x53-D20 for the OCX Series.
Description	Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv4 or IPv6 group. You can configure up to eight addresses.
Options	<i>addresses</i> —Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface's physical address, the interface becomes the master virtual router for the group.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Basic VRRP Support</i> • Configuring Basic VRRP Support for QFX on page 73

vrrp-group

Syntax	<pre> vrrp-group <i>group-id</i> { (accept-data no-accept-data); advertise-interval <i>seconds</i>; advertisements-threshold <i>number</i>; authentication-key <i>key</i>; authentication-type <i>authentication</i>; fast-interval <i>milliseconds</i>; (preempt no-preempt) { hold-time <i>seconds</i>; } priority <i>number</i>; track { interface <i>interface-name</i> { bandwidth-threshold <i>bits-per-second</i> priority-cost <i>priority</i>; priority-cost <i>priority</i>; } priority-hold-time <i>seconds</i>; route <i>prefix/prefix-length</i> <i>routing-instance instance-name</i> priority-cost <i>priority</i>; } virtual-address [<i>addresses</i>]; vrrp-inherit-from <i>vrrp-group</i>; } </pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet address <i>address</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS 11.3 for the QFX Series. Statement introduced in Junos OS Release 14.1x53-D20 for the OCX Series.
Description	Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 group. As of Junos OS Release 13.2, VRRP nonstop active routing (NSR) is enabled only when you configure the nonstop-routing statement at the [edit routing-options] or [edit logical system <i>logical-system-name</i> routing-options hierarchy level.
Options	<p>group-id—VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the source-address-filter statement. MAC addresses ranging from 00:00:5e:00:53:00 through 00:00:5e:00:53:ff are reserved for VRRP, as defined in RFC 2338. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p>Range: 0 through 255</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

CHAPTER 12

Operational Mode Commands (Graceful Restart)

- [Verifying Graceful Restart Operation on page 141](#)
- [show bgp neighbor](#)
- [show log](#)
- [show \(ospf | ospf3\) overview](#)

Verifying Graceful Restart Operation

This topic contains the following sections:

- [Graceful Restart Operational Mode Commands on page 141](#)
- [Verifying BGP Graceful Restart on page 142](#)
- [Verifying IS-IS and OSPF Graceful Restart on page 142](#)
- [Verifying CCC and TCC Graceful Restart on page 143](#)

Graceful Restart Operational Mode Commands

To verify proper operation of graceful restart, use the following commands:

- **show bgp neighbor** (for BGP graceful restart)
- **show log** (for IS-IS and OSPF/OSPFv3 graceful restart)
- **show (ospf | ospfv3) overview** (for OSPF/OSPFv3 graceful restart)
- **show rsvp neighbor detail** (for RSVP graceful restart—helper router)
- **show rsvp version** (for RSVP graceful restart—restarting router)
- **show ldp session detail** (for LDP graceful restart)
- **show connections** (for CCC and TCC graceful restart)
- **show route instance detail** (for Layer 3 VPN graceful restart and for any protocols using graceful restart in a routing instance)
- **show route protocol l2vpn** (for Layer 2 VPN graceful restart)

For more information about these commands and a description of their output fields, see the [CLI Explorer](#).

Verifying BGP Graceful Restart

To view graceful restart information for BGP sessions, use the **show bgp neighbor** command:

```
user@PE1> show bgp neighbor 192.0.2.10
Peer: 192.0.2.10+179 AS 64496 Local: 192.0.2.5+1106 AS 64496
  Type: Internal    State: Established    Flags: <>
  Last State: OpenConfirm    Last Event: RecvKeepAlive
  Last Error: None
  Export: [ static ]
  Options:<Preference LocalAddress HoldTime GracefulRestart Damping PeerAS Refresh>

  Local Address: 192.168.5.1 holdtime: 90 Preference: 170
  IPsec SA Name: hope
  Number of flaps: 0
  Peer ID: 192.0.2.10    Local ID: 192.0.2.5    Active Holdtime: 90
  Keepalive Interval: 30
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Restart time configured on the peer: 180
  Stale routes from peer are kept for: 180
  Restart time requested by this peer: 300
  NLRI that peer supports restart for: inet-unicast
  NLRI that peer saved forwarding for: inet-unicast
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Table inet.0 Bit: 10000
  RIB State: restart is complete
  Send state: in sync
  Active prefixes: 0
  Received prefixes: 0
  Suppressed due to damping: 0
  Last traffic (seconds): Received 19    Sent 19    Checked 19
  Input messages: Total 2    Updates 1    Refreshes 0    Octets 42
  Output messages: Total 3    Updates 0    Refreshes 0    Octets 116
  Output Queue[0]: 0
```

Verifying IS-IS and OSPF Graceful Restart

To view graceful restart information for IS-IS and OSPF, configure traceoptions (see [“Tracking Graceful Restart Events” on page 16](#)).

Here is the output of a traceoptions log from an OSPF restarting router:

```
Oct 8 05:20:12 Restart mode - sending grace lsas
Oct 8 05:20:12 Restart mode - estimated restart duration timer triggered
Oct 8 05:20:13 Restart mode - Sending more grace lsas
```

Here is the output of a traceoptions log from an OSPF helper router:

```
Oct 8 05:20:14 Helper mode for neighbor 192.0.2.5
Oct 8 05:20:14 Received multiple grace lsa from 192.0.2.5
```

Verifying CCC and TCC Graceful Restart

To view graceful restart information for CCC and TCC connections, use the **show connections** command. The following example assumes four remote interface CCC connections between CE1 and CE2:

```
user@PE1> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)
UN -- uninitialized
NP -- not present
WE -- wrong encapsulation
DS -- disabled
Dn -- down
-> -- only outbound conn is up
<- -- only inbound conn is up
Up -- operational
RmtDn -- remote CCC down
Restart -- restarting

Legend for connection types
if-sw: interface switching
rmt-if: remote interface switching
lsp-sw: LSP switching

Legend for circuit types
intf -- interface
tlsp -- transmit LSP
rlsp -- receive LSP
```

CCC Graceful restart : Restarting

Connection/Circuit	Type	St	Time last up	# Up trans
CE1-CE2-0	rmt-if	Restart	-----	0
fe-1/1/0.0	intf	Up		
PE1-PE2-0	tlsp	Up		
PE2-PE1-0	rlsp	Up		
CE1-CE2-1	rmt-if	Restart	-----	0
fe-1/1/0.1	intf	Up		
PE1-PE2-1	tlsp	Up		
PE2-PE1-1	rlsp	Up		
CE1-CE2-2	rmt-if	Restart	-----	0
fe-1/1/0.2	intf	Up		
PE1-PE2-2	tlsp	Up		
PE2-PE1-2	rlsp	Up		
CE1-CE2-3	rmt-if	Restart	-----	0
fe-1/1/0.3	intf	Up		
PE1-PE2-3	tlsp	Up		
PE2-PE1-3	rlsp	Up

Output Fields Table 9 on page 145 describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 9: show bgp neighbor Output Fields

Field Name	Field Description
Peer	Address of the BGP neighbor. The address is followed by the neighbor port number.
AS	AS number of the peer.
Local	Address of the local routing device. The address is followed by the peer port number.
Type	Type of peer: Internal or External .
State	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer. • route reflector client—The BGP session is established with a route reflector client.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Flags	<p>Internal BGP flags:</p> <ul style="list-style-type: none"> • Aggregate Label—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • CleanUp—The peer session is being shut down. • Delete—This peer has been deleted. • Idled—This peer has been permanently idled. • ImportEval—At the last commit operation, this peer was identified as needing to reevaluate all received routes. • Initializing—The peer session is initializing. • SendRtn—Messages are being sent to the peer. • Sync—This peer is synchronized with the rest of the peer group. • RSync—This peer in the backup Routing Engine is synchronized with the BGP peer in the master Routing Engine for nonstop active routing. • TryConnect—Another attempt is being made to connect to the peer. • Unconfigured—This peer is not configured. • WriteFailed—An attempt to write to this peer failed.
Last state	<p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer.
Last event	<p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Closed—The BGP session closed. • ConnectRetry—The transport protocol connection failed, and BGP is trying again to connect. • HoldTime—The session ended because the hold timer expired. • KeepAlive—The local routing device sent a BGP keepalive message to the peer. • Open—The local routing device sent a BGP open message to the peer. • OpenFail—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • RecvKeepAlive—The local routing device received a BGP keepalive message from the peer. • RecvNotify—The local routing device received a BGP notification message from the peer. • RecvOpen—The local routing device received a BGP open message from the peer. • RecvUpdate—The local routing device received a BGP update message from the peer. • Start—The peering session started. • Stop—The peering session stopped. • TransportError—A TCP error occurred.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Last error	<p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Cease—An error occurred, such as a version mismatch, that caused the session to close. • Finite State Machine Error—In setting up the session, BGP received a message that it did not understand. • Hold Time Expired—The session's hold time expired. • Message Header Error—The header of a BGP message was malformed. • Open Message Error—A BGP open message contained an error. • None—No errors occurred in the BGP session. • Update Message Error—A BGP update message contained an error.
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.
Options	<p>Configured BGP options:</p> <ul style="list-style-type: none"> • AddressFamily—Configured address family: inet or inet-vpn. • AdvertiseBGPStatic—Configured BGP static routes are advertised. • AuthKeyChain—Authentication key change is enabled. • DropPathAttributes—Certain path attributes are configured to be dropped from neighbor updates during inbound processing. • GracefulRestart—Graceful restart is configured. • HoldTime—Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent. • IgnorePathAttributes—Certain path attributes are configured to be ignored in neighbor updates during inbound processing. • Local Address—Address configured with the local-address statement. • LLGR—BGP long-lived graceful restart capability is configured. • LLGRHelperDisabled—BGP long-lived graceful restart is completely disabled for a neighbor. • Multihop—Allow BGP connections to external peers that are not on a directly connected network. • NLRI—Configured MBGP state for the BGP group: multicast, unicast, or both if you have configured nlri any. • Peer AS—Configured peer autonomous system (AS). • Preference—Preference value configured with the preference statement. • Refresh—Configured to refresh automatically when the policy changes. • Rib-group—Configured routing table group.
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Peer does not support LLGR Restarter or Receiver functionality	BGP neighbor does not support long-lived graceful restart (LLGR) restarter mode completely.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Peer does not support LLGR Restarter functionality	BGP neighbor does not support long-lived graceful restart (LLGR) restarter mode for any family.
Authentication key change	(appears only if the authentication-keychain statement has been configured) Name of the authentication keychain enabled.
Authentication algorithm	(appears only if the authentication-algorithm statement has been configured) Type of authentication algorithm enabled: hmac or md5 .
Address families configured	Names of configured address families for the VPN.
BGP-Static Advertisement Policy	Name of the bgp static policy that is configured on the peer.
Local Address	Address of the local routing device.
Remove-private options	Options associated with the remove-private statement.
Holdtime	Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: <ul style="list-style-type: none"> • TrafficStatistics—Collection of statistics for labeled-unicast traffic is enabled.
Traffic statistics	Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> • Options—Options configured for collecting statistics about labeled-unicast traffic. • File—Name and location of statistics log files. • size—Size of all the log files, in bytes. • files—Number of log files.
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the preference statement.
Outbound Timer	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the out-delay parameter is configured to a non-zero value.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Group index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Peer index	Index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time that the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which direct EBGp peering is established.
NLRI and times for LLGR configured on peer	<p>Names of address families and stale time for BGP long-lived graceful restart configured on the BGP peer or neighbor.</p> <p>Times are displayed using the routing protocol daemon (rpd) %#OT format:</p> <p><weeks>w<days>d <hours>:<minutes>:<seconds></p> <p>Zero leading elements are omitted, for example, a value less than one week do not include the weeks.</p>
NLRI and times that peer supports LLGR Restarter for	<p>Names of address families and stale time that the BGP peer supports for restarter mode for BGP long-lived graceful restart.</p> <p>Times are displayed using the routing protocol daemon (rpd) %#OT format:</p> <p><weeks>w<days>d <hours>:<minutes>:<seconds></p> <p>Zero leading elements are omitted, for example, a value less than one week do not include the weeks.</p>
NLRI that peer saved LLGR forwarding for	Name of the address family for which the BGP peer saved BGP long-lived graceful restart forwarding.
Graceful Restart Details	Amount of time that is remaining until LLGR expires and the time remaining on the GR stale timer, along with RIB details, are displayed while LLGR receiver mode is active (a peer that negotiated LLGR has disconnected and not yet reconnected)
NLRI we are holding stale routes for	Names of address families (NLRIs) for which that stale routes are held or preserved when BGP graceful restart receiver mode is active for a neighbor.
Time until end-of-rib is assumed for stale routes	<p>Amount of time remaining on the stale timer until which end-of-RIB (EoR) markers are assumed when BGP graceful restart receiver mode is active for a neighbor.</p> <p>Time is displayed in Coordinated Universal Time (UTC) format (YYYY-MM-DD-HH:MM:SS). Note that the stale timer display ('Time until end-of-rib is assumed') is also present when a session is active, but the neighbor as not yet sent all of the end-of-rib indications.</p>
Time until stale routes are deleted or become long-lived stale	Amount of time up to which stale routes are deleted or become long-lived stale routes when BGP graceful restart receiver mode is active for a neighbor.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
NLRI for restart configured on peer	Names of address families configured for restart.
NLRI advertised by peer	Address families supported by the peer: unicast or multicast .
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the end-of-rib marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as 1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
NLRIs for which peer can receive multiple paths	<p>Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.</p> <p>Possible value is inet-unicast.</p>
NLRIs for which peer can send multiple paths: inet-unicast	<p>Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.</p> <p>Possible value is inet-unicast.</p>
Table inet.number	<p>Information about the routing table:</p> <ul style="list-style-type: none"> • RIB State—BGP is in the graceful restart process for this routing table: restart is complete or restart in progress. • Bit—Number that represents the entry in the routing table for this peer. • Send state—State of the BGP group: in sync, not in sync, or not advertising. • Active prefixes—Number of prefixes received from the peer that are active in the routing table. • Received prefixes—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • Accepted prefixes—Total number of prefixes from the peer that have been accepted by a routing policy. • Suppressed due to damping—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	<p>Information about dropped path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count.
Input ignored path attributes	<p>Information about ignored path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count.

Table 9: show bgp neighbor Output Fields (*continued*)

Field Name	Field Description
Output queue	<p>Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.</p> <p>It also specifies the routing table name and the NLRI that the table was advertised through, in the format (<i>routing table name, NLRI</i>).</p> <p>NOTE: The output queue of routing tables that are not advertised, will only show up at extensive output level.</p>
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.
Filter Updates rcv	<p>(orf option only) Number of outbound-route filters received for each configured address family.</p> <p>NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.</p>
Immediate	<p>(orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.</p> <p>NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.</p>
Filter	(orf option only) Type of prefix filter received: prefix-based or extended-community .
Received filter entries	(orf option only) List of received filters displayed.
seq	(orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(orf option only) Address for the prefix entry that matches the filter.
minlength	(orf option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(orf option only) Maximum prefix length, in bits, required to match this prefix.
match	(orf option only) For this prefix match, whether to permit or deny route updates.

Sample Output

show bgp neighbor

```

user@host > show bgp neighbor

Syntax (TX Matrix Router)	<pre>show log <all-lcc lcc number scc> <filename user <username>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <i>device-type (device-id device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.

NOTE: On MX Series routers, modifying a configuration to replace a service interface with another service interface is treated as a catastrophic event. When you modify a configuration, the entire configuration associated with the service interface—including NAT pools, rules, and service sets—is deleted and then re-created for the newly specified service interface. If there are active sessions associated with the service interface that is being replaced, these sessions are deleted and the NAT pools are then released, which leads to the generation of the NAT_POOL_RELEASE system log messages. However, because NAT pools are already deleted as a result of the catastrophic configuration change and no longer exist, the NAT_POOL_RELEASE system log messages are not generated for the changed configuration.

Options none—List all log files.

<all-lcc | lcc *number* | scc>—(Routing matrix only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace *number* with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).

device-type—(QFabric system only) (Optional) Display log messages for only one of the following device types:

- **director-device**—Display logs for Director devices.
- **infrastructure-device**—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).
- **interconnect-device**—Display logs for Interconnect devices.
- **node-device**—Display logs for Node devices.

NOTE: If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

(device-id | device-alias)—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include **username**, display logging information about the specified user.

Required Privilege Level trace

show (ospf | ospf3) overview

List of Syntax	Syntax on page 165 Syntax (EX Series Switch and QFX Series) on page 165
Syntax	<pre>show (ospf ospf3) overview <brief extensive> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show (ospf ospf3) overview <brief extensive> <instance <i>instance-name</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>realm option introduced in Junos OS Release 9.2.</p> <p>Database protection introduced in Junos 10.2.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
Description	Display Open Shortest Path First (OSPF) overview information.
Options	<p>none—Display standard information about all OSPF neighbors for all routing instances.</p> <p>brief extensive—(Optional) Display the specified level of output.</p> <p>instance <i>instance-name</i>—(Optional) Display all OSPF interfaces under the named routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>realm (ipv4-multicast ipv4-unicast ipv6-multicast)—(Optional) (OSPFv3 only) Display information about the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.</p>
Required Privilege Level	view
List of Sample Output	show ospf overview on page 167 show ospf overview (With Database Protection) on page 168 show ospf3 overview (With Database Protection) on page 168 show ospf overview extensive on page 168
Output Fields	<p>Table 10 on page 166 lists the output fields for the show ospf overview command. Output fields are listed in the approximate order in which they appear.</p>

Table 10: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Topology	Topology identifier.	All levels
Prefix export count	Number of prefixes exported into OSPF.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: Current , Warning (threshold), and Allowed .	All levels
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: Current and Allowed .	All levels
Restart	Graceful restart capability: enabled or disabled .	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels

Table 10: show ospf overview Output Fields (*continued*)

Field name	Field Description	Level of Output
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): enabled or disabled .	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): enabled or disabled .	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: enabled or disabled .	All levels
Trace options	OSPF-specific trace options.	extensive
Trace file	Name of the file to receive the output of the tracing operation.	extensive
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: Normal Stub , Not Stub , or Not so Stubby Stub .	All levels
Authentication Type	Type of authentication: None , Password , or MD5 .	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

CHAPTER 13

Operational Mode Commands (Graceful Switchover)

- `show system switchover`
- `show task replication`

show system switchover

List of Syntax	Syntax on page 172 Syntax (TX Matrix Router) on page 172 Syntax (TX Matrix Plus Router) on page 172 Syntax (MX Series Router) on page 172
Syntax	show system switchover
Syntax (TX Matrix Router)	show system switchover <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system switchover <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system switchover <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 13.2X51-D20 for QFX Series switches.
Description	Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

NOTE: Issue the `show system switchover` command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine, because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the `show system switchover` command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the `show system switchover` command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the `show system switchover` command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 or T4000 routers in the routing matrix.

Options **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix Plus router and the T1600 or T4000 routers configured in the routing matrix.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all connected T1600 or T4000 LCCs.

Note that in this instance, packets get dropped. The LCCs perform GRES on their own chassis (GRES cannot be handled by one particular chassis for the entire router) and synchronization is not possible as the LCC plane bringup time varies for each LCC. Therefore, when there is traffic on these planes, there may be a traffic drop.

all-members—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router.

Additional Information If you issue the **show system switchover** command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.

Likewise, if you issue the **show system switchover** command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 or T4000 backup Routing Engines that are connected to it.

If you issue the **show system switchover** command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays a message that this command is not applicable on this member of the Virtual Chassis.

Output Fields [Table 11 on page 174](#) describes the output fields for the **show system switchover** command. Output fields are listed in the approximate order in which they appear.

Table 11: show system switchover Output Fields

Field Name	Field Description
Graceful switchover	Display graceful Routing Engine switchover status: <ul style="list-style-type: none"> • On—Indicates graceful-switchover is specified for the routing-options configuration command. • Off—Indicates graceful-switchover is not specified for the routing-options configuration command.
Configuration database	State of the configuration database: <ul style="list-style-type: none"> • Ready—Configuration database has synchronized. • Synchronizing—Configuration database is synchronizing. Displayed when there are updates within the last 5 seconds. • Synchronize failed—Configuration database synchronize process failed.

Table 11: show system switchover Output Fields (*continued*)

Field Name	Field Description
Kernel database	<p>State of the kernel database:</p> <ul style="list-style-type: none"> • Ready—Kernel database has synchronized. This message implies that the system is ready for GRES. • Synchronizing—Kernel database is synchronizing. Displayed when there are updates within the last 5 seconds. • Version incompatible—The primary and standby Routing Engines are running incompatible kernel database versions. • Replication error—An error occurred when the state was replicated from the primary Routing Engine. Inspect Steady State for possible causes, or notify Juniper Networks customer support.
Peer state	<p>Routing Engine peer state:</p> <p>This field is displayed only when ksyncd is running in multichassis mode (LCC master).</p> <ul style="list-style-type: none"> • Steady State—Peer completed switchover transition. • Peer Connected—Peer in switchover transition.
Switchover	<p>Switchover status (output of master switch check command):</p> <ul style="list-style-type: none"> • Ready—Message for system being switchover ready. • error: Command aborted. Not ready for mastership switch, try after xxx secs.

Sample Output

show system switchover (Backup Routing Engine - Ready)

```
user@host> show system switchover
Graceful switchover: On
