YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- MX Series

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page xiii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xiii defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	<pre>user@host> show chassis alarms</pre> <p>No alarms currently active</p>
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	<p>Configure the machine's domain name:</p> <pre>[edit] root@# set system domain-name domain-name</pre>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the <code>[edit protocols ospf area area-id]</code> hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast <i>(string1 string2 string3)</i>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [community-ids]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	<pre>[edit] routing-options { static { route default { nexthop <i>address</i>; retain; } } }</pre>
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page at the Juniper Networks Technical Documentation site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

Understanding Port Security

Ethernet LANs are vulnerable to attacks such as address spoofing (forging) and Layer 2 denial of service (DoS) on network devices. Port security features help protect the access ports on your device against the loss of information and productivity that such attacks can cause.

The Juniper Networks Junos operating system (Junos OS) provides features to help secure ports on a device. Ports can be categorized as either trusted or untrusted. You apply policies appropriate to each category to protect ports against various types of attacks.

Basic port security features are enabled in the device's default configuration. You can configure additional features with minimal configuration steps.

Depending on the particular feature, you can configure the feature either on VLANs or bridge domain interfaces.

Port security features supported on switching devices are:

- DHCP snooping—Filters and blocks ingress Dynamic Host Configuration Protocol (DHCP) server messages on untrusted ports; builds and maintains a database of DHCP lease information, which is called the DHCP snooping database.

NOTE: DHCP snooping is not enabled in the default configuration of the switching device. DHCP snooping is enabled on a VLAN or bridge domain. The details of enabling DHCP snooping depend on the particular device.

- DHCPv6 snooping—DHCP snooping for IPv6.

- DHCP option 82—Also known as the DHCP Relay Agent Information option. This DHCPv4 feature helps protect the switching device against attacks such as spoofing of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- DHCPv6 option 37—Option 37 is the remote ID option for DHCPv6 and is used to insert information about the network location of the remote host into DHCPv6 packets. You enable option 37 on a VLAN.

NOTE: DHCPv6 snooping with option 37 is not supported on the MX Series.

- DHCPv6 option 18—Option 18 is the circuit ID option for DHCPv6 and is used to insert information about the client port into DHCPv6 packets. This option includes other details that can be optionally configured, such as the prefix and the interface description.
- DHCPv6 option 16—Option 16 is the vendor ID option for DHCPv6 and is used to insert information about the vendor of the client hardware into DHCPv6 packets.
- Dynamic ARP inspection (DAI)—Prevents Address Resolution Protocol (ARP) spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made on the basis of the results of those comparisons. You enable DAI on a VLAN.
- IPv6 neighbor discovery inspection—Prevents IPv6 address spoofing attacks. Neighbor discovery requests and replies are compared against entries in the DHCPv6 snooping database, and filtering decisions are made on the basis of the results of those comparisons. You enable neighbor discovery inspection on a VLAN.
- IP source guard—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. With IP source guard enabled, the source IP address in the packet sent from an untrusted access interface is validated against the DHCP snooping database. If the packet cannot be validated, it is discarded. You enable IP source guard on a VLAN or bridge domain.

NOTE: IP source guard is not supported on the QFX Series.

- IPv6 source guard—IP source guard for IPv6.

NOTE: IPv6 source guard is not supported on the QFX Series.

- MAC limiting—Protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You can enable MAC limiting on an interface.
- MAC move limiting—(Not supported on EX9200) Tracks MAC movement and detects MAC spoofing on access ports. You enable this feature on a VLAN or bridge domain.

- Persistent MAC learning—Also known as sticky MAC. Persistent MAC learning enables interfaces to retain dynamically learned MAC addresses across switch reboots. You enable this feature on an interface.
- Trusted DHCP server—Configuring the DHCP server on a trusted port protects against rogue DHCP servers sending leases. You enable this feature on an interface (port). By default, access ports are untrusted, and trunk ports are trusted. (Access ports are the switch ports that connect to Ethernet endpoints such as user PCs and laptops, servers, and printers. Trunk ports are the switch ports that connect an Ethernet switch to other switches or to routers.)

Understanding DAI for Port Security

Dynamic ARP inspection (DAI) protects switching devices against ARP spoofing.

DAI inspects Address Resolution Protocol (ARP) packets on the LAN and uses the information in the DHCP snooping database on the switch to validate ARP packets and to protect against ARP spoofing (also known as ARP poisoning or ARP cache poisoning). ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons. When an attacker tries to use a forged ARP packet to spoof an address, the switch compares the address with entries in the database. If the media access control (MAC) address or IP address in the ARP packet does not match a valid entry in the DHCP snooping database, the packet is dropped.

ARP packets are sent to the Routing Engine and are rate-limited to protect the switching device from CPU overload.

- [Address Resolution Protocol on page 6](#)
- [ARP Spoofing on page 6](#)
- [Dynamic ARP Inspection on page 6](#)
- [Prioritizing Inspected Packets on page 7](#)

Address Resolution Protocol

Sending IP packets on a multi-access network requires mapping an IP address to an Ethernet MAC address.

Ethernet LANs use ARP to map MAC addresses to IP addresses.

The switching device maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

ARP Spoofing

ARP spoofing is one way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the LAN. Instead of the switching device sending traffic to the proper network device, it sends the traffic to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker's machine, the attacker receives all the traffic from the switch that must have gone to another device. The result is that traffic from the switching device is misdirected and cannot reach its proper destination.

One type of ARP spoofing is gratuitous ARP, which is when a network device sends an ARP request to resolve its own IP address. In normal LAN operation, gratuitous ARP messages indicate that two devices have the same MAC address. They are also broadcast when a network interface card (NIC) in a device is changed and the device is rebooted, so that other devices on the LAN update their ARP caches. In malicious situations, an attacker can poison the ARP cache of a network device by sending an ARP response to the device that directs all packets destined for a certain IP address to go to a different MAC address instead.

To prevent MAC spoofing through gratuitous ARP and through other types of spoofing, the switches examine ARP responses through DAI.

Dynamic ARP Inspection

DAI examines ARP requests and responses on the LAN and validates ARP packets. The switch intercepts ARP packets from an access port and validates them against the DHCP snooping database. If no IP-MAC entry in the database corresponds to the information in the ARP packet, DAI drops the ARP packet and the local ARP cache is not updated with the information in that packet. DAI also drops ARP packets when the IP address in the packet is invalid. ARP probe packets are not subjected to dynamic ARP inspection. The switch always forwards such packets.

Junos OS for EX Series switches and the QFX Series uses DAI for ARP packets received on access ports because these ports are untrusted by default. Trunk ports are trusted by default, and therefore ARP packets bypass DAI on them.

You configure DAI for each VLAN, not for each interface (port). By default, DAI is disabled for all VLANs.

If you set an interface to be a DHCP trusted port, it is also trusted for ARP packets.

**NOTE:**

- If your switching device is an EX Series switch and uses Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, see *Enabling a Trusted DHCP Server (CLI Procedure)* for information about configuring an access interface to be a DHCP trusted port.
- If your switching device is an EX Series switch and is *not* using Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, see *Enabling a Trusted DHCP Server (CLI Procedure)* for information about configuring an access interface to be a DHCP trusted port.

For packets directed to the switching device to which a network device is connected, ARP queries are broadcast on the VLAN. The ARP responses to those queries are subjected to the DAI check.

For DAI, all ARP packets are trapped to the Packet Forwarding Engine. To prevent CPU overloading, ARP packets destined for the Routing Engine are rate-limited.

If the DHCP server goes down and the lease time for an IP-MAC entry for a previously valid ARP packet runs out, that packet is blocked.

Prioritizing Inspected Packets

NOTE: Prioritizing inspected packets is not supported on the QFX Series and the EX4600 switch.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DAI packets for a specified VLAN. This type of configuration places inspected packets for that VLAN in the egress queue, that you specify, ensuring that the security procedure does not interfere with the transmission of high-priority traffic.

Understanding DHCP Option 82 for Port Security on Switching Devices

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect Juniper Networks EX Series Ethernet Switches and MX Series 3D Universal Edge Routers against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Hosts on untrusted access interfaces on an Ethernet LAN switching device send requests for IP addresses to access the Internet. The switching device forwards or relays these requests to DHCP servers, and the servers send offers for IP address leases in response. Attackers can use these messages to penetrate the network by address spoofing.

Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client. The Junos OS implementation of DHCP option 82 supports RFC 3046, *DHCP Relay Agent Information Option*, at <http://tools.ietf.org/html/rfc3046>.

This topic covers:

- [DHCP Option 82 Processing on page 8](#)
- [Suboption Components of Option 82 on page 9](#)
- [Switching Device Configurations That Support Option 82 on page 10](#)
- [DHCPv6 Options on page 11](#)

DHCP Option 82 Processing

If DHCP option 82 is enabled on a VLAN or bridge domain, then when a network device—a DHCP client—that is connected to the VLAN or bridge domain on an untrusted interface sends a DHCP request, the switching device inserts information about the client's network location into the packet header of that request. The switching device then sends the request to the DHCP server. The DHCP server reads the option 82 information in the packet header and uses it to implement the IP address or another parameter for the client. See “[Suboption Components of Option 82](#)” on page 9 for more information about option 82.

**NOTE:**

- If your switching device is an EX Series switch and uses Junos OS with Enhanced Layer 2 Software (ELS) configuration style, you can enable DHCP option 82 only for a specific VLAN. See *Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)*.
- If your switching device is an EX Series switch and does *not* use Junos OS with Enhanced Layer 2 Software (ELS) configuration style, you can enable DHCP option 82 either for a specific VLAN or for all VLANs. See *Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)*.

If option 82 is enabled on a VLAN or bridge domain, the following sequence of events occurs when a DHCP client sends a DHCP request:

1. The switching device receives the request and inserts the option 82 information in the packet header.
2. The switching device forwards (or relays) the request to the DHCP server.
3. The server uses the DHCP option 82 information to formulate its reply and sends a response to the switching device. It does not alter the option 82 information.
4. The switching device strips the option 82 information from the response packet.
5. The switching device forwards the response packet to the client.

NOTE: To use the DHCP option 82 feature, you must ensure that the DHCP server is configured to accept option 82. If the DHCP server is not configured to accept option 82, then when it receives requests containing option 82 information, it does not use the information for setting parameters and it does not echo the information in its response message.

Suboption Components of Option 82

Option 82 as implemented on a switching device comprises the suboptions circuit ID, remote ID, and vendor ID. These suboptions are fields in the packet header:

- circuit ID—Identifies the circuit (interface or VLAN) on the switching device on which the request was received. The circuit ID contains the interface name and VLAN name, with the two elements separated by a colon—for example, ge-0/0/10:vlan1, where ge-0/0/10 is the interface name and vlan1 is the VLAN name. If the request packet is received on a Layer 3 interface, the circuit ID is just the interface name—for example, ge-0/0/10.

Use the prefix option to add an optional prefix to the circuit ID. If you enable the prefix option, the hostname for the switching device is used as the prefix; for example, device1:ge-0/0/10:vlan1, where device1 is the hostname.

You can also specify that the interface description be used rather than the interface name or that the VLAN ID be used rather than the VLAN name.

- remote ID—Identifies the remote host. See *remote-id* for details.
- vendor ID—Identifies the vendor of the host. If you specify the **vendor-id** option but do not enter a value, the default value Juniper is used. To specify a value, you type a character string.

Switching Device Configurations That Support Option 82

Switching device configurations that support option 82 are:

- [Switching Device, DHCP Clients, and the DHCP Server Are on the Same VLAN or Bridge Domain on page 10](#)
- [Switching Device Acts as a Relay Agent on page 10](#)

Switching Device, DHCP Clients, and the DHCP Server Are on the Same VLAN or Bridge Domain

If the switching device, the DHCP clients, and the DHCP server are all on the same VLAN or bridge domain, the switching device forwards the requests from the clients on untrusted access interfaces to the server on a trusted interface. See [Figure 1 on page 10](#).

Figure 1: DHCP Clients, Switching Device, and the DHCP Server Are All on the Same VLAN or Bridge Domain

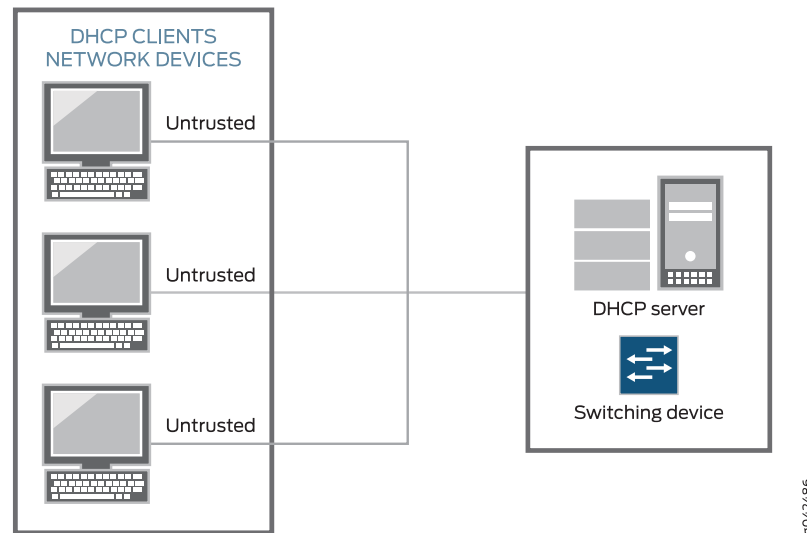

Switching Device Acts as a Relay Agent

The switching device functions as a relay agent (extended relay server) when the DHCP clients or the DHCP server is connected to the switching device through a Layer 3 interface. On the switching device, these interfaces are configured as routed VLAN interfaces (RVIs).

Figure 2 on page 11 illustrates a scenario for the switching device acting as an extended relay server; in this instance, the switching device relays requests to the server.

Figure 2: Switching Device Acting as an Extended Relay Server

DHCPv6 Options

NOTE: MX Series routers do not support DHCPv6.

DHCPv6 provides several options that can be used to insert information into the DHCPv6 request packets that are relayed to a server from a client. These options are equivalent to the sub-options of DHCP option 82.

- Option 37—Identifies the remote host. Option 37 is equivalent to the **remote-id** sub-option of DHCP option 82.
- Option 18—Identifies the interface on which the DHCP request packet was received from the client. Option 18 is equivalent to the **circuit-id** sub-option of DHCP option 82.
- Option 16—Identifies the vendor of the hardware on which the client is hosted. Option 16 is equivalent to the **vendor-id** sub-option of DHCP option 82.

DHCPv6 options are not enabled automatically when DHCPv6 snooping is enabled on a VLAN. They must be configured using the **dhcpv6-options** statement.

Understanding DHCP Snooping for Port Security

DHCP snooping enables the switching device, which can be either a switch or a router, to monitor DHCP messages received from untrusted devices connected to the switching device. When DHCP snooping is enabled on a VLAN, the system examines DHCP messages sent from untrusted hosts associated with the VLAN and extracts their IP addresses and lease information. This information is used to build and maintain the DHCP snooping database. Only hosts that can be verified using this database are allowed access to the network.

- [DHCP Snooping Basics on page 12](#)
- [DHCP Snooping Process on page 13](#)
- [DHCPv6 Snooping on page 14](#)
- [Rapid Commit for DHCPv6 on page 14](#)
- [DHCP Server Access on page 15](#)
- [Static IP Address Additions to the DHCP Snooping Database on page 18](#)
- [Snooping DHCP Packets That Have Invalid IP Addresses on page 18](#)
- [Prioritizing Snooped Packets on page 19](#)

DHCP Snooping Basics

The Dynamic Host Configuration Protocol (DHCP) allocates IP addresses dynamically, *leasing* addresses to devices so that the addresses can be reused when no longer needed. Hosts and end devices that require IP addresses obtained through DHCP must communicate with a DHCP server across the LAN.

DHCP snooping acts as a guardian of network security by keeping track of valid IP addresses assigned to downstream network devices by a trusted DHCP server (the server is connected to a trusted network port).

By default, all trunk ports on the switch are trusted and all access ports are untrusted for DHCP snooping.

When DHCP snooping is enabled, the lease information from the switching device is used to create the DHCP snooping table, also known as the binding table. The table shows the IP-MAC binding, as well as the lease time for the IP address, type of binding, VLAN name and interface for each host.

NOTE: DHCP snooping is disabled in the default configuration of the switching device. You must explicitly enable DHCP snooping by setting `examine-dhcp` at the `[edit ethernet-switching-options secure-access-port]` hierarchy level.

Entries in the DHCP snooping database are updated in these events:

- When a DHCP client releases an IP address (sends a DHCPRELEASE message). In this event, the associated mapping entry is deleted from the database.

- If you move a network device from one VLAN to another. In this event, typically the device needs to acquire a new IP address. Therefore, its entry in the database, including its VLAN ID, is updated.
- When the lease time (timeout value) assigned by the DHCP server expires. In this event, the associated entry is deleted from the database.

TIP: By default, the IP-MAC bindings are lost when the switching device is rebooted and DHCP clients (the network devices, or hosts) must reacquire bindings. However, you can configure the bindings to persist by setting the `dhcp-snooping-file` statement to store the database file either locally or remotely.

You can configure the switching device to snoop DHCP server responses from particular VLANs only. This prevents spoofing of DHCP server messages.

You configure DHCP snooping per VLAN, not per interface (port). DHCP snooping is disabled by default on switching devices.

DHCP Snooping Process

The basic process of DHCP snooping consists of the following steps:

NOTE: When DHCP snooping is enabled for a VLAN, all DHCP packets sent from the network devices in that VLAN are subjected to DHCP snooping. The final IP-MAC binding occurs when the DHCP server sends DHCPACK to the DHCP client.

1. The network device sends a DHCPDISCOVER packet to request an IP address.
2. The switching device forwards the packet to the DHCP server.
3. The server sends a DHCPOFFER packet to offer an address. If the DHCPOFFER packet is from a trusted interface, the switching device forwards the packet to the DHCP client.
4. The network device sends a DHCPREQUEST packet to accept the IP address. The switching device adds an IP-MAC placeholder binding to the database. The entry is considered a placeholder until a DHCPACK packet is received from the server. Until then, the IP address could still be assigned to some other host.
5. The server sends a DHCPACK packet to assign the IP address or a DHCPNAK packet to deny the address request.
6. The switching device updates the DHCP snooping database according to the type of packet received:
 - If the switching device receives a DHCPACK packet, it updates lease information for the IP-MAC bindings in its database.
 - If the switching device receives a DHCPNAK packet, it deletes the placeholder.

NOTE: The DHCP snooping database is updated only after the DHCPREQUEST packet has been sent.

For general information about the messages that the DHCP client and DHCP server exchange during the assignment of an IP address for the client, see the *Junos OS Administration Library for Routing Devices*.

DHCPv6 Snooping

DHCPv6 snooping is the equivalent of DHCP snooping for IPv6. The process for DHCPv6 snooping is similar to that for DHCP snooping, but uses different names for the messages exchanged between the client and server to assign IPv6 addresses. [Table 3 on page 14](#) shows DHCPv6 messages and their DHCP equivalents.

Table 3: DHCPv6 Messages and Equivalent DHCPv4 Messages

Sent by	DHCPv6 Messages	Equivalent DHCP Messages
Client	SOLICIT	DHCPDISCOVER
Server	ADVERTISE	DHCPOFFER
Client	REQUEST, RENEW, REBIND	DHCPREQUEST
Server	REPLY	DHCPACK/DHCPNAK
Client	RELEASE	DHCPRELEASE
Client	INFORMATION-REQUEST	DHCPINFORM
Client	DECLINE	DHCPDECLINE
Client	CONFIRM	none
Server	RECONFIGURE	DHCPFORCERENEW
Client	RELAY-FORW, RELAY-REPLY	none

Rapid Commit for DHCPv6

DHCPv6 provides for a Rapid Commit option (DHCPv6 option 14), which, when supported by the server and set by the client, shortens the exchange from a four-way relay to a two-message handshake. For more information about enabling the Rapid Commit option, see *Enabling DHCPv6 Rapid Commit Support*.

In the rapid commit process:

1. The DHCPv6 client sends out a SOLICIT message that contains a request that rapid assignment of address, prefix, and other configuration parameters be preferred.

2. If the DHCPv6 server supports rapid assignment, it responds with a REPLY message, which contains the assigned IPv6 address and prefix and other configuration parameters.

DHCP Server Access

You can configure a switching device's access to the DHCP server in three ways:

- [Switching Device, DHCP Clients, and DHCP Server Are All on the Same VLAN on page 15](#)
- [Switching Device Acts as DHCP Server on page 16](#)
- [Switching Device Acts as Relay Agent on page 17](#)

Switching Device, DHCP Clients, and DHCP Server Are All on the Same VLAN

When the switching device, DHCP clients, and DHCP server are *all members of the same VLAN*, the DHCP server can be connected to the switching device in one of two ways:

- The server is directly connected to the same switching device as the one connected to the DHCP clients (the hosts, or network devices, that are requesting IP addresses from the server). The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. See [Figure 3 on page 15](#).
- The server is connected to an intermediary switching device (Switching Device 2). The DHCP clients are connected to Switching Device 1, which is connected through a trunk port to Switching Device 2. Switching Device 2 is being used as a transit device. The VLAN is enabled for DHCP snooping to protect the untrusted access ports. The trunk port is configured by default as a trusted port. As shown in [Figure 4 on page 16](#), ge-0/0/11 is a trusted trunk port.

Figure 3: DHCP Server Connected Directly to a Switching Device

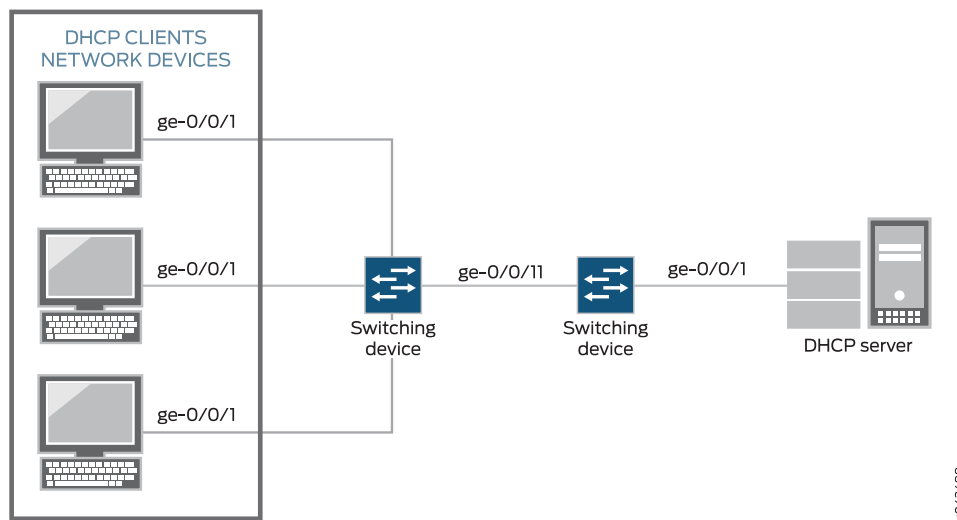

Figure 4: DHCP Server Connected Directly to Switching Device 2, with Switching Device 2 Connected to Switching Device 1 Through a Trusted Trunk Port

Switching Device Acts as DHCP Server

NOTE: The switching device acting as a DHCP server is not supported on the QFX Series.

The switching device itself is configured as a DHCP server; this is known as a *local configuration*. See [Figure 5 on page 17](#).

Figure 5: Switching Device Is the DHCP Server

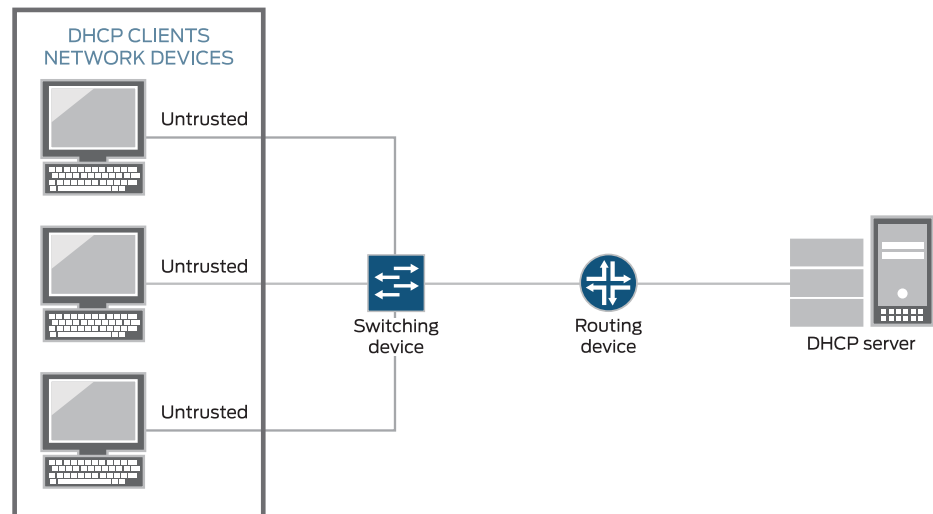

Switching Device Acts as Relay Agent

The switching device functions as a relay agent when the DHCP clients or the DHCP server is connected to the device through a Layer 3 interface. The Layer 3 interfaces on the switching device are configured as routed VLAN interfaces (RVIs), which are also known as integrated routing and bridging (IRB) interfaces. The trunk interfaces are trusted by default.

These two scenarios illustrate the switching device acting as a relay agent:

- The DHCP server and clients are in different VLANs.
- The switching device is connected to a router that is in turn connected to the DHCP server. See [Figure 6 on page 18](#).

Figure 6: Switching Device Acting as Relay Agent Through Router to DHCP Server

8042487

Static IP Address Additions to the DHCP Snooping Database

You can add specific static IP addresses to the database as well as have the addresses dynamically assigned through DHCP snooping. To add static IP addresses, you supply the IP address, the MAC address of the device, the interface on which the device is connected, and the VLAN with which the interface is associated. No lease time is assigned to the entry. The statically configured entry never expires.

Snooping DHCP Packets That Have Invalid IP Addresses

If you enable DHCP snooping on a VLAN and then devices on that VLAN send DHCP packets that request invalid IP addresses, these invalid IP addresses are stored in the DHCP snooping database until they are deleted when their default timeout is reached. To eliminate this unnecessary consumption of space in the DHCP snooping database, the switching device drops the DHCP packets that request invalid IP addresses, preventing the snooping of these packets. The invalid IP addresses are:

- 0.0.0.0
- 128.0.x.x
- 191.255.x.x
- 192.0.0.x
- 223.255.255.x
- 224.x.x.x
- 240.x.x.x to 255.255.255.255

Prioritizing Snooped Packets

NOTE: Prioritizing snooped packets is not supported on the QFX Series and the EX4600 switch.

You can use class-of-service (CoS) forwarding classes and queues to prioritize DHCP snooped packets for a specified VLAN. This type of configuration places the DHCP snooped packets for that VLAN in a specified egress queue, so that the security procedure does not interfere with the transmission of high-priority traffic. For additional information, see *Example: Using CoS Forwarding Classes to Prioritize Snooped Packets in Heavy Network Traffic*.

Understanding Trusted DHCP Servers for Port Security

Any interface on the switching device that connects to a DHCP server can be configured as a trusted port. Configuring a DHCP server on a trusted port protects against rogue DHCP servers sending leases.

Ensure that the DHCP server interface is physically secure—that is, that access to the server is monitored and controlled at the site—before you configure the port as trusted.

CHAPTER 2

Configuration Examples

- [Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers on page 23](#)

Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers

This example describes how to enable IP source guard and Dynamic ARP Inspection (DAI) on a specified bridge domain to protect the device against spoofed IP/MAC addresses and ARP spoofing attacks. When you enable either IP source guard or DAI, the configuration automatically enables DHCP snooping for the same bridge domain.

- [Requirements on page 23](#)
- [Overview and Topology on page 23](#)
- [Configuration on page 26](#)
- [Verification on page 26](#)

Requirements

This example uses the following hardware and software components:

- One MX Series router
- Junos OS Release 14.1
- A DHCP server to provide IP addresses to network devices on the device

Before you configure IP source guard to prevent IP/MAC spoofing or DAI to mitigate ARP spoofing attacks, be sure you have:

- Connected the DHCP server to the device.
- Configured the bridge domain to which you are adding DHCP security features. See *Configuring the Bridge Domain*.

Overview and Topology

Ethernet LAN devices are vulnerable to attacks on security that involve spoofing (forging) of source MAC addresses or source IP addresses. These spoofed packets are sent from hosts connected to untrusted access interfaces on the device. IP source guard checks

the IP source address and MAC source address in a packet sent from a host attached to an untrusted access interface on the device against entries stored in the DHCP snooping database. If IP source guard determines that the packet header contains an invalid source IP address or source MAC address, it ensures that the device does not forward the packet—that is, the packet is discarded.

Another type of security attack is ARP spoofing (also known as ARP poisoning or ARP cache poisoning). ARP-spoofing is a way to initiate man-in-the-middle attacks. The attacker sends an ARP packet that spoofs the MAC address of another device on the bridge domain. Instead of the device sending traffic to the proper network device, it sends it to the device with the spoofed address that is impersonating the proper device. If the impersonating device is the attacker's machine, the attacker receives all the traffic from the device that should have gone to another device. The result is that traffic from the device is misdirected and cannot reach its proper destination.

NOTE: When DAI is enabled, the device logs the number of invalid ARP packets that it receives on each interface, along with the sender's IP and MAC addresses. You can use these log messages to discover ARP spoofing on the network.

This example shows how to configure these important port security features on a device that is connected to a DHCP server. The setup for this example includes the bridge domain **employee-bdomain** on the switching device. [Figure 7 on page 25](#) illustrates the topology for this example.

NOTE: The trunk interface connecting to the DHCP server interface is a trusted port by default.

Figure 7: Switching Device Network Topology for Basic Port Security

The components of the topology for this example are shown in [Table 4 on page 25](#).

Table 4: Components of the Port Security Topology

Properties	Settings
Device hardware	One MX Series router
Bridge-domain name and ID	employee-bdomain , tag 20
Bridge-domain subnets	192.0.2.16/28 192.0.2.17 through 192.0.2.30 192.0.2.31 is the subnet's broadcast address
Interfaces in employee-bdomain	ge-0/0/1, ge-0/0/2, ge-0/0/3, ge-0/0/8
Interface connecting to DHCP server	ge-0/0/8

In this example, the device has already been configured as follows:

- All access ports are untrusted, which is the default setting.
- The trunk port (ge-0/0/8) is trusted, which is the default setting.
- The bridge-domain (**employee-bdomain**) has been configured to include the specified interfaces.

Configuration

CLI Quick Configuration To quickly configure IP source guard and DAI (and thereby, also automatically configure DHCP snooping to protect the device against IP spoofing and ARP attacks), copy the following commands and paste them into the device terminal window:

```
[edit]
set bridge-domains employee-bdomain forwarding-options dhcp-security ip-source-guard
set bridge-domains employee-bdomain forwarding-options dhcp-security arp-inspection
```

Step-by-Step Procedure To configure IP source guard and DAI (and thereby, also automatically configure DHCP snooping) on the bridge domain:

1. Configure IP source guard on the bridge domain:

```
[edit bridge-domains employee-bdomain forwarding-options dhcp-security]
user@device# set ip-source-guard
```

2. Enable DAI on the bridge domain:

```
[edit bridge-domains employee-bdomain forwarding-options dhcp-security]
user@device# set arp-inspection
```

Results Check the results of the configuration:

```
user@device> show bridge-domains employee-bdomain forwarding-options
employee-bdomain {
  forwarding-options {
    dhcp-security {
      arp-inspection;
      ip-source-guard;
    }
  }
}
```

Verification

Confirm that the configuration is working properly.

- [Verifying That DHCP Snooping Is Working Correctly on the Device on page 26](#)
- [Verifying That IP Source Guard Is Working on the Bridge Domain on page 27](#)
- [Verifying That DAI Is Working Correctly on the Device on page 27](#)

Verifying That DHCP Snooping Is Working Correctly on the Device

Purpose Verify that DHCP snooping is working on the device.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the device.

Display the DHCP snooping information when the port on which the DHCP server connects to the device is trusted. The following output results when requests are sent from the MAC addresses and the server has provided the IP addresses and leases:

user@device> `show dhcp-security binding`

IP Address	MAC Address	Vlan	Expires	State	Interface
192.0.2.17	00:05:85:3A:82:77	employee-vlan	86265	BOUND	ge-0/0/1.0
192.0.2.18	00:05:85:3A:82:79	employee-vlan	86265	BOUND	ge-0/0/1.0
192.0.2.19	00:05:85:3A:82:80	employee-vlan	86287	BOUND	ge-0/0/2.0
192.0.2.20	00:05:85:3A:82:81	employee-vlan	86287	BOUND	ge-0/0/2.0
192.0.2.21	00:05:85:3A:82:83	employee-vlan	86287	BOUND	ge-0/0/2.0
192.0.2.22	00:05:85:27:32:88	employee-vlan	86254	BOUND	ge-0/0/3.0

Meaning When the interface on which the DHCP server connects to the device has been set to trusted, the output (see preceding sample) shows, for the assigned IP address, the device's MAC address, the VLAN name, and the time, in seconds, remaining before the lease expires.

Verifying That IP Source Guard Is Working on the Bridge Domain

Purpose Verify that IP source guard is enabled and working on the bridge domain.

Action Send some DHCP requests from network devices (here they are DHCP clients) connected to the device. View the IP source guard information for the data bridge domain.

user@device> `show dhcp-security binding ip-source-guard`

IP Address	MAC Address	Vlan	Expires	State	Interface
192.0.2.17	00:05:85:3A:82:77	employee-vlan	86265	BOUND	ge-0/0/1.0
192.0.2.18	00:05:85:3A:82:79	employee-vlan	86265	BOUND	ge-0/0/1.0
192.0.2.19	00:05:85:3A:82:80	employee-vlan	86287	BOUND	ge-0/0/2.0
192.0.2.20	00:05:85:3A:82:81	employee-vlan	86287	BOUND	ge-0/0/2.0
192.0.2.21	00:05:85:3A:82:83	employee-vlan	86287	BOUND	ge-0/0/2.0
192.0.2.22	00:05:85:27:32:88	employee-vlan	86254	BOUND	ge-0/0/3.0

Meaning The IP source guard database table contains the VLANs and bridge domains enabled for IP source guard.

Verifying That DAI Is Working Correctly on the Device

Purpose Verify that DAI is working on the device.

Action Send some ARP requests from network devices connected to the device.

Display the DAI information:

```
user@device> show dhcp-security arp inspection statistics
```

```
ARP inspection statistics:
```

Interface	Packets received	ARP inspection pass	ARP inspection failed
ge-0/0/1.0	7	5	2
ge-0/0/2.0	10	10	0
ge-0/0/3.0	12	12	0

Meaning The sample output shows the number of ARP packets received and inspected per interface, with a listing of how many packets passed and how many failed the inspection on each interface. The device compares the ARP requests and replies against the entries in the DHCP snooping database. If a MAC address or IP address in the ARP packet does not match a valid entry in the database, the packet is dropped.

Configuring Port Security for MX Series Routers (CLI Procedure)

Ethernet LANs are vulnerable to attacks such as address spoofing and Layer 2 denial of service (DoS) on network devices. The Dynamic Host Configuration Protocol (DHCP) port security features help protect the access ports on the device against the loss of information and productivity that can result from such attacks.

The following port security features are supported for DHCPv4 and MX Series routers:

- DHCP snooping
- DAI (dynamic ARP inspection)
- IP source guard
- DHCP option 82

DHCP snooping is disabled in the default configuration. There is no explicit configuration for enabling DHCP snooping. However, if you configure any other port security features for a bridge domain at the `[edit vlans vlan-name forwarding-options dhcp-security]` or the `[edit bridge-domain bridge-domain-name forwarding-options dhcp-security]` hierarchy level, then DHCP snooping is automatically enabled on that bridge domain.

DAI, neighbor discovery inspection, IP source guard, and DHCP option 82 are configured per bridge domain. You must configure a bridge domain prior to configuring these DHCP port security features. See *Configuring a Bridge Domain*.

The DHCP port security features that you specify for the bridge domain apply to all included interfaces. However, you can create a specific group of access interfaces within the bridge domain to have different attributes, such as:

- Specifying a specific interface to have a static IP-MAC address (`static-ip`).
- Specifying an access interface to act as a trusted interface to a DHCP server (`trusted`)
- Specifying a specific interface not to transmit DHCP (`no-option82`)

NOTE:

- If you configure any of these DHCP port security features—including configuring a group of access interfaces—for a specific bridge domain, the software automatically enables DHCP snooping for that bridge domain.
- If you explicitly disable DHCP snooping by setting `no-dhcp-snooping` for a specific bridge domain, the software automatically disables any other DHCP port security features for that bridge domain.

NOTE: Trunk interfaces are trusted by default. However, on an MX Series router, you can override this default behavior and set a trunk interface as `untrusted`.

For additional details, see:

- [Enabling Dynamic ARP Inspection on MX Series Routers \(CLI Procedure\) on page 32](#)
- [Configuring IP Source Guard on MX Series Routers \(CLI Procedure\) on page 31](#)
- [Setting Up DHCP Option 82 on an MX Series Router \(CLI Procedure\) on page 36](#)

You can override the general port security settings for the bridge domain by configuring a group of access interfaces within it. For details, see:

- [Configuring Static IP Addresses for DHCP Bindings on Access Ports for MX Series Routers \(CLI Procedure\) on page 32](#)
- [Enabling a Trusted DHCP Server on an MX Series Router \(CLI Procedure\) on page 33](#)

**Related
Documentation**

- [Understanding Port Security on page 3](#)
- [Understanding DHCP Snooping for Port Security on page 12](#)

Configuring IP Source Guard on MX Series Routers (CLI Procedure)

You can use the IP source guard access port security feature on MX Series routers to mitigate the effects of source IP address spoofing and source MAC address spoofing. If IP source guard determines that a host connected to an access interface has sent a packet with an invalid source IP address or source MAC address in the packet header, then IP source guard ensures that the switching device does not forward the packet—that is, the packet is discarded.

To configure IP source guard on a specific bridge-domain by using the CLI:

- Configure the IP source guard on a bridge domain:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security]
user@device# set ip-source-guard (MX Series)
```

To configure IP source guard at the routing instance level by using the CLI:

- Configure the IP source guard at the routing instance level:

```
[edit routing-instances ri-name bridge-domains bridge-domain-name
forwarding-options dhcp-security]
user@device# set ip-source-guard (MX Series)
```

**Related
Documentation**

- [ip-source-guard \(MX Series\) on page 53](#)

Configuring Static IP Addresses for DHCP Bindings on Access Ports for MX Series Routers (CLI Procedure)

You can add static (fixed) IP addresses and bind them to fixed MAC addresses in the DHCP snooping database. These bindings are labeled as *static* in the database, while those bindings that have been added through the process of DHCP snooping are labeled *dynamic*.

To configure a static IP address/MAC address binding in the DHCP snooping database, you must first create a group of access interfaces under **[edit bridge-domains *bridge-domain-name* forwarding-options dhcp-security]**. Creating this group automatically enables DHCP snooping, which is a prerequisite for creating the DHCP snooping database. The following procedure shows the configuration in two steps, but it can be done in one. You can then configure a specific interface within the group to have a static IP address that is bound to a fixed MAC address. If you want to have multiple static IP addresses, configure additional interfaces within the same group.

To configure a static IP address and MAC address binding in the DHCP snooping database:

1. Create a group by including an access interface:

```
[edit bridge-domains bd-name forwarding-options dhcp-security]
user@device# set group group-name interface interface-name
```

2. Configure a static IP address:

```
[edit bridge-domains bd-name forwarding-options dhcp-security]
user@device# set group group-name interface interface-name static-ip ip-address
mac mac-address
```

- Related Documentation**
- [show dhcp-security binding on page 79](#)
 - [Understanding DHCP Snooping for Port Security on page 12](#)

Enabling Dynamic ARP Inspection on MX Series Routers (CLI Procedure)

Dynamic ARP inspection (DAI) protects switching devices against ARP spoofing. DAI inspects ARP packets on the LAN and uses the information in the DHCP snooping database on the switching devices to validate ARP packets and to protect against ARP cache poisoning.

Before you can enable DAI on a bridge domain, you must configure a bridge domain. See *Configuring a Bridge Domain*.

- To enable DAI on a VLAN by using the CLI:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security]
user@device# set arp-inspection
```

- Related Documentation**

- [Understanding DAI for Port Security on page 5](#)

Enabling a Trusted DHCP Server on an MX Series Router (CLI Procedure)

You can configure any interface on a switching device that connects to a DHCP server as a trusted interface (port). Configuring a DHCP server on a trusted interface protects against rogue DHCP servers sending leases.

By default, all access interfaces are untrusted, and all trunk interfaces are trusted. However, you can override the default setting for access interfaces by configuring a group of access interfaces within a bridge domain, specifying an interface to belong to that group, and then configuring the group as trusted.

Before you can configure a trusted DHCP server, you must configure a bridge domain. See *Example Step: Configuring Bridge Domains*.

To configure an untrusted access interface as a trusted interface for a DHCP server by using the CLI :

1. Configure a group within a bridge domain with a specific access interface:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
user@device# set group group-name interface interface-name
```

2. Configure that group as **trusted** to make the specified interface contained within the group a trusted interface:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security group
group-name]
user@device# set overrides trusted
```

Configuring Persistent Bindings in the DHCP or DHCPv6 Snooping Database to Improve Network Performance (CLI Procedure)

NOTE: This task uses Junos OS for MX Series routers and EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure)*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

By default, IP-MAC address bindings in the DHCP snooping database do not persist through device reboots. You can improve network performance by configuring the IP-MAC address bindings in the DHCP snooping database to persist through reboots so that the table does not need to be rebuilt after rebooting. Do this by configuring a storage location for the DHCP snooping database file, where you must specify how frequently the device writes the database entries into the DHCP snooping database file.

.....

NOTE: You can also configure persistent bindings for IPv6 addresses and MAC addresses on devices that support DHCPv6 snooping.

DHCPv6 is not supported on the MX Series routers.

.....

The DHCP snooping database of IP-MAC bindings is created when you enable any of the port security features for a specific VLAN or bridge domain in either of the following hierarchy levels:

- [edit vlans *vlan-name* forwarding-options dhcp-security]
- [edit bridge-domains *bridge-domain-name* forwarding-options dhcp-security]

On devices that support DHCPv6, enabling any port security features will automatically enable DHCPv6 snooping. DHCP snooping and DHCPv6 snooping are not enabled by default.

To configure a *local* storage location for the DHCP snooping database file:

- For DHCP snooping:

```
[edit system processes]
user@device# set dhcp-service dhcp-snooping-file local-pathname write-interval seconds
```

For example:

```
[edit system processes]
user@device# set dhcp-service dhcp-snooping-file /var/tmp/test.log write-interval 60
```

- For DHCPv6 snooping:

```
[edit system processes]
user@device# set dhcp-service dhcpv6-snooping-file local-pathname write-interval seconds
```

For example:

```
[edit system processes]
user@device# set dhcp-service dhcpv6-snooping-file /var/tmp/test.log write-interval 60
```

To configure a *remote* storage location for IP-MAC bindings, use **tftp://ip-address** or **ftp://hostname/path** as the remote URL or the local pathname for the storage location of the DHCP or DHCPv6 snooping database file:

- For DHCP snooping:

```
[edit system processes]
user@device# set dhcp-service dhcp-snooping-file remote_url write-interval seconds
```

For example:

```
[edit system processes]
user@device# set dhcp-service dhcp-snooping-file tftp://@14.1.2.1 write-interval 60
```

- For DHCPv6 snooping:

```
[edit system processes]
user@device# set dhcp-service dhcpv6-snooping-file remote_url write-interval seconds
```

For example:

```
[edit system processes]
user@device# set dhcp-service dhcpv6-snooping-file tftp://@14.1.2.1 write-interval 60
```

Setting Up DHCP Option 82 on an MX Series Router (CLI Procedure)

You can use DHCP option 82, also known as the DHCP relay agent information option, to help protect the switching device against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.

You can configure the DHCP option 82 feature in two topologies:

- The switching device, DHCP clients, and DHCP server are all on the same bridge domain. The switching device forwards the clients' requests to the server and forwards the server's responses to the clients. This topic describes this configuration.
- The switching device functions as a relay agent when the DHCP clients or the DHCP server are connected to the switching device through a Layer 3 interface. On the switching device, these interfaces are configured as integrated routing and bridging (IRB) interfaces. The switching device relays the clients' requests to the server and then forwards the server's responses to the clients.

Before you configure DHCP option 82 on the switching device, perform these tasks:

- Connect and configure the DHCP server.

NOTE: Your DHCP server must be configured to accept DHCP option 82. If the server is not configured for DHCP option 82, the server does not use the DHCP option 82 information in the requests sent to it when it formulates its reply messages.

- Configure a bridge domain on the switching device and associate the interfaces on which the clients and the server connect, to the switch with that bridge domain.. See *Example Step: Configuring Bridge Domains*.

To configure DHCP option 82:

1. Specify DHCP option 82 for the bridge domain that you configured:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security]
user@device# setoption-82
```

NOTE: If you want to enable DHCP option 82 on all bridge domains, you must configure it separately for each specific bridge domain.

The remaining steps are optional.

2. Configure the prefix for the circuit ID suboption to include the hostname or the routing instance name for the bridge domain:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
```

```
user@device# set circuit-id prefix (host-name | routing-instance-name)
```

3. Specify that the circuit ID suboption value contains the interface description rather than the interface name (the default):

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set circuit-id use-interface-description
```

4. Specify that the circuit ID suboption value contains the VLAN ID rather than the VLAN name (the default):

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set circuit-id use-vlan-id
```

5. Specify that the remote ID suboption is included in the DHCP option 82 information:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set remote-id
```

NOTE: If you do not specify a keyword after **remote-id**, the default value for the **remote-id** suboption is the interface name.

6. Specify that the remote ID suboption is the hostname of the switch:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set remote-id host-name
```

7. Specify that the remote ID suboption value contains the interface description:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set remote-id use-interface-description
```

8. Specify that the remote ID suboption value contains a character string:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set remote-id use-string mystring
```

9. Configure a vendor ID suboption:

- To use the default value (the default value is **Juniper**), do not type a character string after the **vendor-id** option keyword:

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set vendor-id
```

- To configure it so that the vendor ID suboption value contains a character string value that you specify rather than **Juniper** (the default):

```
[edit bridge-domains bridge-domain-name forwarding-options dhcp-security
option-82]
user@device# set vendor-id use-string mystring
```

arp-inspection (MX Series)

Syntax	arp-inspection;
Hierarchy Level	[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]
Release Information	Statement introduced in Junos OS Release 14.1 for the MX Series.
Description	<p>Perform dynamic ARP inspection (DAI).</p> <p>DAI can only be configured for a specific bridge domain, not for a list or a range of bridge domain names.</p> <p>DHCP snooping is automatically enabled on the specified VLAN or bridge domain.</p>
Default	Disabled.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Enabling Dynamic ARP Inspection on MX Series Routers (CLI Procedure) on page 32• Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers on page 23

bridge-domains

Syntax	<pre> bridge-domains <i>bridge-domain-name</i>; bridge-options { interface <i>interface-name</i> { static-mac <i>mac-address</i>; action-priority <i>number</i>; } interface-mac-limit <i>limit</i>; mac-statistics; mac-table-size <i>limit</i>; no-mac-learning; } community-vlans <i>number number</i>; isolated-vlan <i>vlan-id</i> description; domain-type bridge; enable-mac-move-action; forwarding-options interface <i>interface-name</i>; mcae-mac-flush; mcae-mac-synchronize; multicast-snooping-options; no-irb-layer-2-copy; no-local-switching; protocols routing-interface <i>routing-interface-name</i>; service-id <i>number</i>; vlan-id (all none <i>number</i>); vlan-id-list [<i>vlan-id-numbers</i>]; vlan-tags outer <i>number</i> inner <i>number</i>; </pre>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> bridge-domains <i>bridge-domain-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>], [edit routing-instances <i>routing-instance-name</i>] </pre>
Release Information	<p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>Support for the no-irb-layer-2-copy statement added in Junos OS Release 10.2.</p> <p>Support for enable-mac-move-action and action-priority added in Junos OS Release 13.2.</p> <p>Support for service-id statement added in Junos OS Release 13.2.</p> <p>Support for forwarding-options statement added in Junos OS Release 14.1.</p> <p>Support for community-vlans and isolated-vlan statements added in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.</p>
Description	(MX Series routers only) Configure a domain that includes a set of logical ports that share the same flooding or broadcast characteristics in order to perform Layer 2 bridging.
Options	<i>bridge-domain-name</i> —Name of the bridge domain.

NOTE: Bridge domain names cannot include a forward slash (/).

The remaining statements are explained separately.

Hierarchy Level [edit [bridge-domains](#) *bridge-domain-name* [forwarding-options](#) dhcp-security]

Release Information Statement introduced in Junos OS Release 14.1 for the MX Series.

Description Configure port security features on the switching device. DHCP snooping is enabled automatically if you configure any of the following port security features within this hierarchy:

- Dynamic ARP inspection (DAI)
- IP source guard
- DHCP option 82
- Static IP

The remaining statements are explained separately.

Options	<i>mac-address</i> —Value (in hexadecimal format) of the address assigned to this device.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Enabling Dynamic ARP Inspection on MX Series Routers (CLI Procedure) on page 32• Configuring IP Source Guard on MX Series Routers (CLI Procedure) on page 31• Setting Up DHCP Option 82 on an MX Series Router (CLI Procedure) on page 36• Configuring Static IP Addresses for DHCP Bindings on Access Ports for MX Series Routers (CLI Procedure) on page 32

dhcp-service

Syntax	<pre>dhcp-service { dhcp-snooping-file (<i>local_pathname</i> <i>remote_URL</i>); write-interval <i>interval</i>; }</pre>
Hierarchy Level	[edit system processes]
Release Information	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 14.1 for MX Series routers.
Description	<p>Enable DHCP services on the device. DHCP services automate network-parameter assignment to network devices. The DHCP service process is enabled by default. However, by default, IP-MAC bindings in the DHCP snooping database do not persist through device reboots. You can improve performance after rebooting by configuring the IP-MAC bindings to persist, by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

ip-source-guard (MX Series)

Syntax	<code>ip-source-guard;</code>
Hierarchy Level	<code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code>
Release Information	Hierarchy level <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 14.1 for the MX Series.
Description	<p>Perform IP source guard checking on packets sent from access interfaces. Validate source IP addresses and source MAC addresses on all bridge domains or on the specified bridge domain or bridge domain range. Forward packets with valid addresses and drop those with invalid addresses.</p> <ul style="list-style-type: none"> • ip-source-guard—Enable IP source guard checking. <p>If you configure IP source guard at the <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> hierarchy level:</p> <ul style="list-style-type: none"> • IP source guard can be configured only for a specific bridge domain, not for a list or range of bridge domains. • DHCP snooping is automatically enabled.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring IP Source Guard on MX Series Routers (CLI Procedure) on page 31 • Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers on page 23

mac

Syntax	<code>mac mac-address;</code>
Hierarchy Level	<ul style="list-style-type: none"> For platforms with Enhanced Layer 2 Software (ELS): <code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security group <i>group-name</i> interface <i>interface-name</i> static-ip <i>ip-address</i>]</code> For platforms without ELS: <code>[edit ethernet-switching-options secure-access-port interface (all <i>interface-name</i>) static-ip <i>ip-address</i> vlan <i>vlan-name</i>]</code> For MX Series platforms: <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security group <i>group-name</i> interface <i>interface-name</i> static-ip <i>ip-address</i>]</code>
Release Information	<p>Statement introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Hierarchy level <code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 13.2X50-D10. (See <i>Getting Started with Enhanced Layer 2 Software</i> for information about ELS.)</p> <p>Hierarchy level <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 14.1 for the MX Series.</p>
Description	Configure the media access control (MAC) address or hardware address of the device connected to the specified interface.
Options	<i>mac-address</i> —Value (in hexadecimal format) of the address assigned to this device.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) Configuring Static IP Addresses for DHCP and DHCPv6 Bindings on Access Ports (CLI Procedure) Configuring Static IP Addresses for DHCP Bindings on Access Ports for MX Series Routers (CLI Procedure) on page 32

no-dhcp-snooping

Syntax	no-dhcp-snooping;
Hierarchy Level (EX Series, QFX Series)	[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]
Hierarchy Level (MX Series)	[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]
Release Information	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX series. Hierarchy level [edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security] introduced in Junos OS Release 14.1 for the MX Series.
Description	Disable DHCP snooping for the specified VLAN or bridge domain.

NOTE: Explicitly disabling DHCP snooping also disables any other port security features that you have enabled under [edit vlans *vlan-name* forwarding-options **dhcp-security**], including dynamic ARP inspection (DAI) and IP source guard for the specified VLAN or bridge domain.

There is no configuration statement that explicitly enables DHCP snooping.

Default DHCP snooping is not enabled.

NOTE: Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style and MX Series routers do not have a configuration statement that explicitly enables DHCP snooping.

DHCP snooping is enabled automatically by Junos OS if any of the following is configured at the [edit vlans *vlan-name* forwarding-options dhcp-security] hierarchy level for EX Series switches or at the [edit bridge-domains *bridge-domain-name* forwarding-options **dhcp-security**] for MX Series routers:

- DAI
- IP source guard
- Static IP
- DHCP option 82

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

no-option82

Syntax	no-option82;
Hierarchy Level (EX Series, QFX Series)	[edit vlans <i>vlan-name</i> forwarding-options dhcp-security group <i>group-name</i> overrides]
Hierarchy Level (MX Series)	[edit bridge-domains <i>bridge-domain-name</i> forwarding-options group group group-name overrides]
Release Information	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX series. Statement introduced in Junos OS Release 14.1 for the MX Series.
Description	Configure a specific group of one or more access interfaces within the VLAN or bridge domain <i>not</i> to transmit DHCP option 82 information, even if the VLAN or bridge domain is configured to use option 82.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• option-82 on page 57• Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)• Understanding DHCP Option 82 for Port Security on Switching Devices on page 8• Understanding DHCP Snooping for Port Security on page 12

option-82

Syntax	<pre> option-82 { circuit-id { prefix (host-name routing-instance-name); use-interface-description; use-vlan-id; } remote-id { host-name; mac; use-interface-description; use-string string; } vendor-id { use-string string; } } </pre>
Hierarchy Level (EX Series, QFX Series)	[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]
Hierarchy Level (MX Series)	[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]
Release Information	<p>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p> <p>Statement introduced in Juos OS Release 14.1 for the MX Series.</p>
Description	<p>Have the device insert DHCP option 82 (also known as the DHCP relay agent information option) information in the DHCP request packet header of a DHCP request that it receives from a DHCP client connected to one of its interfaces before it forwards or relays that DHCP request to a DHCP server. The server uses the option 82 information, which provides details about the circuit and host the request came from. However, in formulating the reply, the server does not make any changes to the option 82 information in the packet header. The device receives the reply and then removes the DHCP option 82 information before forwarding the reply to the client.</p> <p>The remaining statements are explained separately.</p>
Default	Insertion of DHCP option 82 information is not enabled.
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)</i> • no-option82 on page 56 • Understanding DHCP Option 82 for Port Security on Switching Devices on page 8 • Understanding DHCP Snooping for Port Security on page 12

use-string

Syntax	<code>use-string <i>string</i>;</code>
For Platforms with Enhanced Layer 2 Software (ELS)	<code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security option-82 remote-id]</code>
For Platforms Without ELS	<code>[edit ethernet-switching-options secure-access-port vlan (all <i>vlan-name</i>) dhcp-option82 remote-id],</code> <code>[edit forwarding-options helpers bootp dhcp-option82 remote-id] ,</code> <code>[edit forwarding-options helpers bootp interface <i>interface-name</i> dhcp-option82 remote-id]</code>
For MX Series Platforms	<code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security option-82 circuit-id]</code>
Release Information	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Hierarchy level <code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 13.2X50-D10. (See <i>Getting Started with Enhanced Layer 2 Software</i> for information about ELS.) Hierarchy level <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 14.1 for the MX Series.
Description	Use a string rather than the MAC address of the host system (the default) in the remote ID value in the DHCP option 82 information.
Options	<i>string</i> —Character string used as the remote ID value. Range: 1–255 characters
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Setting Up DHCP Option 82 on an MX Series Router (CLI Procedure) on page 36 • Understanding DHCP Option 82 for Port Security on Switching Devices on page 8 • <i>Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server</i> • <i>Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server</i> • <i>Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)</i> • <i>Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure)</i> • <i>Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)</i>

- RFC 3046, *DHCP Relay Agent Information Option*, at <http://tools.ietf.org/html/rfc3046>

use-vlan-id

Syntax	<code>use-vlan-id;</code>
For Platforms with Enhanced Layer 2 Software (ELS)	<code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security option-82 circuit-id]</code>
For Platforms Without ELS	<code>[edit forwarding-options helpers bootp dhcp-option82-circuit-id],</code> <code>[edit forwarding-options helpers bootp interface <i>interface-name</i> dhcp-option82-circuit-id]</code>
For MX Series Platforms	<code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security option-82 circuit-id]</code>
Release Information	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Hierarchy level <code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 13.2X50-D10. (See <i>Getting Started with Enhanced Layer 2 Software</i> for information about ELS.) Hierarchy level <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 14.1 for the MX Series.
Description	Use the VLAN ID rather than the VLAN name (the default) in the circuit ID or remote ID value in the DHCP option 82 information.

NOTE: The `use-vlan-id` statement is mutually exclusive with the `use-interface-description` and `no-vlan-interface-name` statements.

The `use-vlan-id` statement only applies to interfaces in a bridge domain. The format of the Agent Circuit ID or Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces is as follows:

```
(fe | ge)-fpc/pic/port.subunit:svlan_id-vlan_id
```

NOTE: The `subunit` is required and used to differentiate the interface for remote systems, and `svlan_id-vlan_id` represents the VLANs associated with the bridge domain.

Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server</i> • <i>Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server</i>

- RFC 3046, *DHCP Relay Agent Information Option*, at <http://tools.ietf.org/html/rfc3046>

vendor-id

Syntax	vendor-id <string>;
For Platforms with Enhanced Layer 2 Software (ELS)	[edit vlans <i>vlan-name</i> forwarding-options dhcp-security option-82]
For Platforms Without ELS	[edit ethernet-switching-options secure-access-port vlan (all <i>vlan-name</i>) dhcp-option82], [edit forwarding-options helpers bootp dhcp-option82], [edit forwarding-options helpers bootp interface <i>interface-name</i> dhcp-option82]
For MX Series Platforms	[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security option-82]
Release Information	Statement introduced in Junos OS Release 9.3 for EX Series switches. Statement introduced in Junos OS Release 11.3 for the QFX Series. Hierarchy level [edit vlans <i>vlan-name</i> forwarding-options dhcp-security] introduced in Junos OS Release 13.2X50-D10. (See <i>Getting Started with Enhanced Layer 2 Software</i> for information about ELS.) Hierarchy level [edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security] introduced in Junos OS Release 14.1 for the MX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Insert a vendor ID in the DHCP option 82 information in a DHCP request packet header before forwarding or relaying the request to a DHCP server.
Default	If vendor-id is not explicitly configured for DHCP option 82, then no vendor ID is set.
Options	string —(Optional) A single string that designates the vendor ID. Range: 1–255 characters Default: If you specify vendor-id with no string value, then the default vendor ID Juniper Networks is configured.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Setting Up DHCP Option 82 on an MX Series Router (CLI Procedure) on page 36 • <i>Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server</i> • <i>Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server</i> • <i>Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure)</i>

write-interval

Syntax	<code>write-interval seconds;</code>
For Platforms with Enhanced Layer 2 Software (ELS)	[edit system processes dhcp-service dhcp-snooping-file], [edit system processes dhcp-service dhcpv6-snooping-file]
For Platforms Without ELS	[edit ethernet-switching-options secure-access-port dhcp-snooping-file], [edit ethernet-switching-options secure-access-port dhcpv6-snooping-file]
For MX Series Platforms	[edit system processes dhcp-service dhcp-snooping-file]
Release Information	<p>Statement introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Support at the [edit system processes dhcp-service dhcp-snooping-file] hierarchy level introduced in Junos OS Release 13.2X50-D10.</p> <p>Support at the [edit system processes dhcp-service dhcpv6-snooping-file] hierarchy level introduced in Junos OS Release 13.2X51-D20.</p> <p>Statement introduced in Junos OS Release 14.1 for the MX Series.</p> <p>Support at the [edit ethernet-switching-options secure-access-port dhcpv6-snooping-file] hierarchy level introduced in Junos OS Release 14.1X53-D10 for EX Series switches.</p>
Description	<p>Specify how frequently the device writes the database entries from memory into the DHCP snooping database file.</p> <ul style="list-style-type: none"> If you are configuring write-interval at the [edit ethernet-switching-options secure-access-port dhcp-snooping-file] or the [edit ethernet-switching-options secure-access-port dhcpv6-snooping-file] hierarchy level, see <i>Making IP-MAC Bindings in the DHCP Snooping Database Persistent (CLI Procedure)</i>. If you are configuring write-interval at the [edit system processes dhcp-service dhcp-snooping-file] or the [edit system processes dhcp-service dhcpv6-snooping-file] hierarchy level, see “Configuring Persistent Bindings in the DHCP or DHCPv6 Snooping Database to Improve Network Performance (CLI Procedure)” on page 33.
Options	<p>seconds—Value in seconds.</p> <p>Range: 60 through 86,400 seconds.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

CHAPTER 5

Operational Commands

- `clear arp`
- `clear dhcp-security binding`
- `show dhcp-security arp inspection statistics`
- `show dhcp-security binding`
- `show dhcp-security binding ip-source-guard`

clear arp

Syntax	<code>clear arp</code> <code><all></code> <code><hostname <i>hostname</i>></code> <code><interface <i>interface-name</i>></code> <code><logical-system <i>logical-system-name</i>></code> <code><vpn <i>vpn</i>></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 14.1 for the MX Series. all option introduced in Junos OS Release 14.2.
Description	Remove entries from the Address Resolution Protocol (ARP) table for the current CLI view. To clear entries for a specific logical system, you must first enter the set cli logical-system <i>logical-system-name</i> command, and then issue the clear arp command.
Options	none all —(Optional) Clear all entries from the ARP table. Both clear arp and clear arp all function identically. hostname <i>hostname</i> —(Optional) Clear only the specified host entry from the ARP table. interface <i>interface-name</i> —(Optional) Clear entries only for the specified interface from the ARP table. logical-system <i>logical-system-name</i> —(Optional) Clear entries for only the specified logical system from the ARP table (only available in main router context). vpn <i>vpn</i> —(Optional) Clear entries from the ARP table for the specified virtual private network (VPN).
Required Privilege Level	clear

clear dhcp-security binding

Syntax	<code>clear dhcp-security binding</code> <code><interface <i>interface-name</i>></code> <code><ip-address <i>ip-address</i>></code> <code><statistics></code> <code><vlan <i>vlan-name</i>></code>
Release Information	Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Command introduced in Junos OS Release 14.1 for the MX Series.
Description	Clear the DHCP snooping database information.
Options	<p>interface <i>interface-name</i>—(Optional) Clear DHCP snooping database information for the specified interface.</p> <p>ip-address <i>ip-address</i>—(Optional) Clear DHCP snooping database information for the specified IP address.</p> <p>statistics—(Optional) Clear all DHCP snooping database statistics.</p> <p>vlan <i>vlan-name</i>—(Optional) Clear DHCP snooping database information for the specified VLAN.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show dhcp-security binding on page 79• <i>Example: Configuring IP Source Guard and Dynamic ARP Inspection to Protect the Switch from IP Spoofing and ARP Spoofing</i>• Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers on page 23• Understanding Port Security on page 3

show dhcp-security arp inspection statistics

Syntax	show dhcp-security arp inspection statistics
Release Information	Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Command introduced in Junos OS Release 14.1 for the MX Series.
Description	Display Address Resolution Protocol (ARP) inspection statistics.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show dhcp-security binding on page 79 • clear dhcp-security binding on page 76 • clear interfaces statistics • Example: Configuring IP Source Guard and Dynamic ARP Inspection to Protect the Switch from IP Spoofing and ARP Spoofing • Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers on page 23 • Understanding Port Security on page 3
List of Sample Output	show dhcp-security arp inspection statistics on page 77
Output Fields	<p>Table 5 on page 77 lists the output fields for the show dhcp-security arp inspection statistics command. Output fields are listed in the approximate order in which they appear.</p> <p>The IP source guard database table shows the untrusted access interfaces in VLANs that have been enabled for IP source guard. The entries include the VLAN 802.1Q tag IDs if there are any, and the IP addresses and MAC addresses that are bound to one another.</p>

Table 5: show dhcp-security arp inspection statistics Output Fields

Field Name	Field Description	Level of Output
Interface	Interface on which ARP inspection has been applied.	All levels
Packets received	Total number of packets that underwent ARP inspection.	All levels
ARP inspection pass	Total number of packets that passed ARP inspection.	All levels
ARP inspection fail	Total number of packets that failed ARP inspection.	All levels

Sample Output

show dhcp-security arp inspection statistics

```
user@device> show dhcp-security arp inspection statistics
```

Interface	Packets received	ARP inspection pass	ARP inspection fail
ge-0/0/30.0	7	7	0
ge-0/0/4.0	3	3	0
ge-0/0/6.0	72	4	68

show dhcp-security binding

Syntax	<pre>show dhcp-security binding <interface <i>interface-name</i>> <ip-address <i>ip-address</i>> <ip-source-guard <i>ip-sg-name</i>> <statistics> <vlan <i>vlan-name</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Command introduced in Junos OS Release 14.1 for the MX Series.</p>
Description	Display the DHCP snooping database information.
Options	<p>interface <i>interface-name</i>—(Optional) Display the DHCP snooping database information for an interface.</p> <p>ip-address <i>ip-address</i>—(Optional) Display the DHCP snooping database information for an IP address.</p> <p>vlan <i>vlan-name</i>—(Optional) Display the DHCP snooping database information for a VLAN.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show dhcp-security binding ip-source-guard on page 82 • clear dhcp-security binding on page 76 • <i>Example: Configuring IP Source Guard and Dynamic ARP Inspection to Protect the Switch from IP Spoofing and ARP Spoofing</i> • Example: Configuring IP Source Guard and Dynamic ARP Inspection on MX Series Routers on page 23 • Understanding Port Security on page 3
List of Sample Output	<p>show dhcp-security binding on page 80</p> <p>show dhcp-security binding interface on page 80</p> <p>show dhcp-security binding ip-address on page 80</p> <p>show dhcp-security binding vlan on page 81</p>
Output Fields	<p>Table 6 on page 79 lists the output fields for the show dhcp-security binding command. Output fields are listed in the approximate order in which they appear.</p>

Table 6: show dhcp-security binding Output Fields

Field Name	Field Description	Level of Output
IP Address	IP address of the network device; bound to the MAC address.	All levels
MAC address	MAC address of the network device; bound to the IP address.	All levels

Table 6: show dhcp-security binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
VLAN	VLAN name of the network device whose MAC address is shown.	All levels
Expires	The time, in seconds, remaining before the lease of the IP address to the MAC address expires. This field is 0 for static entries.	All levels
State	Specifies whether the IP address is: <ul style="list-style-type: none"> BOUND: Leased to the MAC address for a limited period of time. STATIC: Attached to a fixed MAC address. 	All levels
Interface	Interface address (port).	All levels

Sample Output

show dhcp-security binding

```
user@device> show dhcp-security binding
```

IP address	MAC address	Vlan	Expires	State	Interface
