

dhcp-external duplicate-mac-address

Syntax [no] dhcp-external duplicate-mac-address

Release Information Command introduced in JUNOS Release 9.3.0.

Description Configures the DHCP external server application to use a combination of the MAC address and the gateway IP address (giaddr) to uniquely identify DHCP clients attached to the router. This behavior is also referred to as *duplicate MAC mode*. The **no** version restores the default behavior, also known as *unique MAC mode*, which uses only the MAC address to uniquely identify DHCP clients.

Mode Global Configuration
