

## dhcp-external duplicate-mac-address

---

**Syntax** [ no ] dhcp-external duplicate-mac-address

**Release Information** Command introduced in JUNOS Release 9.3.0.

**Description** Configures the DHCP external server application to use a combination of the MAC address and the gateway IP address (giaddr) to uniquely identify DHCP clients attached to the router. This behavior is also referred to as *duplicate MAC mode*. The **no** version restores the default behavior, also known as *unique MAC mode*, which uses only the MAC address to uniquely identify DHCP clients.

**Mode** Global Configuration
