

## Chapter 14

# Policy Examples Created with Policy Editor

This chapter gives examples of policies that service providers can use to provide Internet access and to deploy different types of services. The examples in this chapter are created with Policy Editor. To see these examples created with the SRC CLI, see *Chapter 13, Policy Examples Created with the SRC CLI*.

Topics in this chapter include:

- Example: Creating Access Policies for Subscribers on page 381
- Example: Providing Tiered Internet Services with Policing on page 385
- Example: Providing Premium Services on page 391

### Example: Creating Access Policies for Subscribers

---

In this example, the service provider manages an interface on the router. The interface is associated with a subscriber. The access policy is a default policy that supports various types of subscribers and interfaces. Some examples are DHCP, static IP subscribers, and PPP subscribers.

The default policy installed on the interface sets the context of other services that the subscriber will activate later. The default policy can restrict subscriber access to the network or provide a default access. You can also use the default policy to create a walled garden effect by sending subscribers to the SSP server and requiring them to activate a service before they can access other services in the system. (The term walled garden is used to describe an environment in which a service provider limits a subscriber's access to Web content and services.)

The precedence of the policy rules in default policies is very important. When the related service is activated, the service policy needs a high priority (low value) so that the service policy is used instead of the default policy.

### Types of Policies

The policy used for access depends on the type of services that it will be used for. Generally, policies with filter, forward, rate-limit or policer, and next-hop actions are used.

## Sample Access Policies

This section contains examples of access policies for DHCP subscribers and PPP subscribers. In both of these examples, there are two content providers. Traffic destined for the content provider networks is sent to the residential portal by using a next-hop action that forwards traffic to the virtual IP address of the SSP. (See *Using the Next-Hop Action with the Captive Portal on page 340.*)

Traffic to the SSP has a high priority and is not affected by other service policies. This way, the subscriber can always access the SSP. Traffic from the network is forwarded without any restrictions.

### DHCP Policy Group

Figure 32 shows a summary of the access policy for DHCP subscribers.

**Figure 32: DHCP Policy Group**

PL	DIR	PR	PRI	STA	CONDITIONS						ACTIONS
					CLA	SRC	DST	SVC	TOS	ARB	ACT
in	input	forward-to-SSP	200	<input type="checkbox"/>	ssp	any	virtual_ipA address/0. 0.0.0	any	any	any	Forward

```

**Example: Providing Tiered Internet Services with Policing**

In this scenario, the service provider offers three tiered Internet services to its subscribers:

- Gold, which provides a bandwidth of up to 5 Mbps.
- Silver, which provides a bandwidth of up to 1 Mbps.
- Bronze, which provides a bandwidth of up to 64 Kbps.

One of the tiered Internet services controls the traffic at a given time. Accounting data is collected for the tiered services.

A default policy is needed to establish the context of the tiered service. The subscriber has an IP interface in the network; the access point has a default policy that prevents the subscriber from using a tiered Internet service until the service is activated.

**Types of Policies**

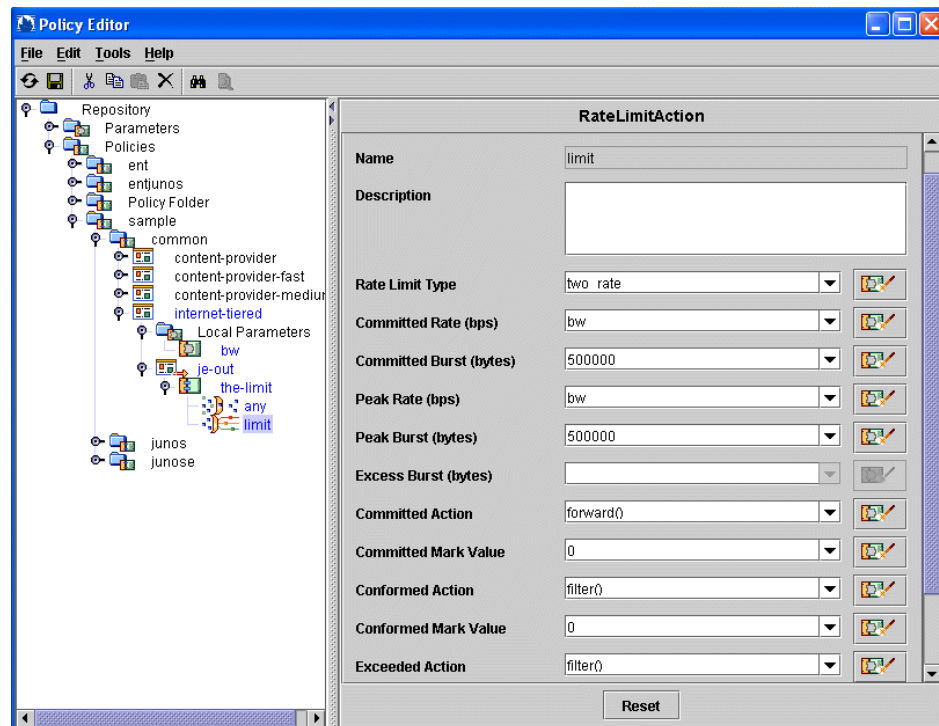

JUNOSe policies use the rate-limit action to control bandwidth, and JUNOS policies use the policer action to control bandwidth. You could also use QoS conditions and scheduler actions to provide tiered Internet services.

### Sample JUNOSe Rate-Limiting Policy

The sample JUNOSe policy has a local parameter `bw`, which is used in the rate-limit action both on input and output directions.

In this example, the committed action is forward, whereas the conformed and exceeded actions are set to filter.

**Figure 34: Rate-Limit Action for Tiered Internet Service**

The following information shows the configuration details of the Internet tiered policy group for JUNOSe routers.

policyGroupName=internet-tiered, ou=common, ou=sample, o=Policies, o=umc

#### Local Parameter

name=bw, defaultValue=5000000, parameterType=rate

***PolicyList je-out***

```

name=je-out
policyRoles=JUNOSE
applicability=output

```

```

PolicyRule: name=the-limit
            priority=600
            type=JUNOSE
            accountingRule=true
ClassifyTrafficCondition

            rateLimitType=two_rate
            committedRate=bw
            committedBurst=500000
            peakRate=bw
            peakBurst=500000
            committed=Forward
            conformed=Filter
            exceeded=Filter

```

***PolicyList je-in***

```

name=je-in
policyRoles=JUNOSE
applicability=input

```

```

PolicyRule: name=the-limit
            Priority=600
            type=JUNOSE
            accountingRule=true
ClassifyTrafficCondition
RateLimit Action
            rateLimitType=two_rate
            committedRate=bw
            committedBurst=500000
            peakRate=bw
            peakBurst=500000
            committed=Forward
            conformed=Filter
            exceeded=Filter

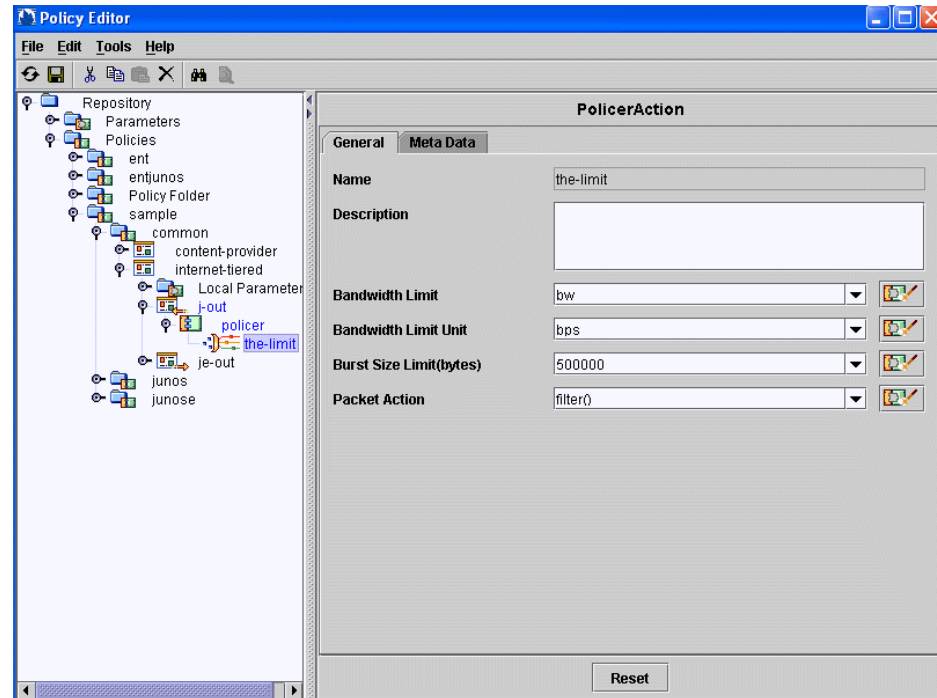

```

## Sample JUNOS Policer Policy

The sample JUNOS policy has a local parameter bw, which is used in the policer action both on input and output directions.

In this example, packets that exceed the bandwidth limit are filtered.

**Figure 35: Policer Action for Tiered Internet Service**

The following information shows the configuration details of the Internet tiered policy group for JUNOS routing platforms.

policyGroupName=internet-tiered,ou=common,ou=sample,o=Policies,o=umc

### Local Parameter

name=bw, defaulttValue=5000000, parameterType=rate

### PolicyList j-out

```
name=j-out
policyRoles=JUNOS
applicability=output
```

```
PolicyRule: name=the-limit
priority=600
type=JUNOS
accountingRule=true
Policer Action
bandwidthLimit=bw
Burst=500000
packetAction=filter
```

**PolicyList j-in**

```
name=j-in
policyRoles=JUNOS
applicability=input
```

```
Policer Action
bandwidthLimit=bw
burst=500000
packetAction=filter
```

**Defining the Tiered Internet Services**

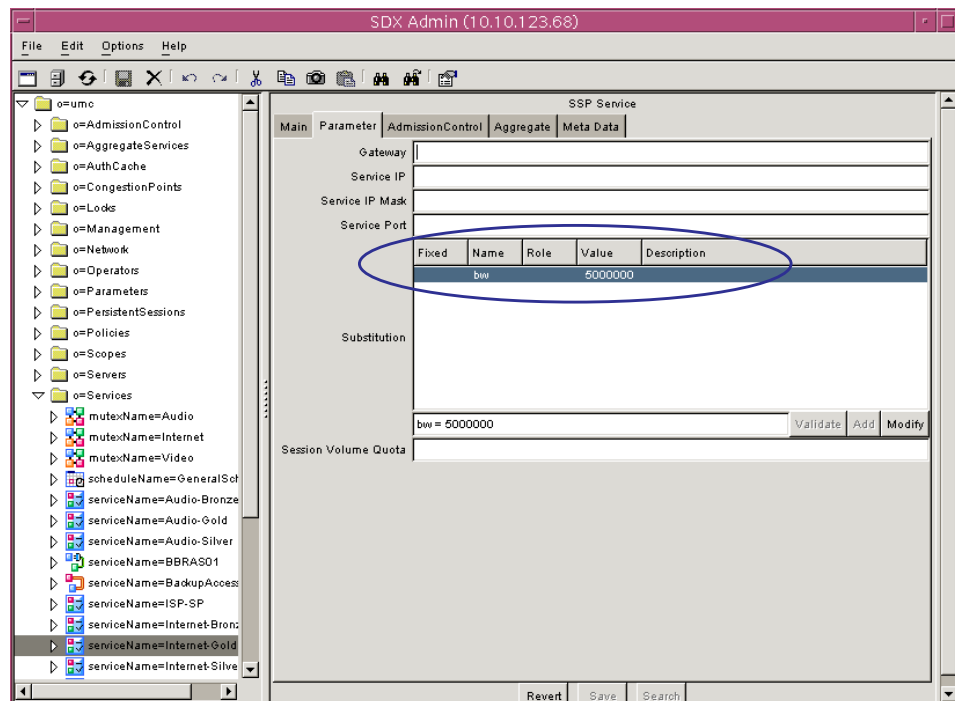

You need to create three value-added (SSP) services—Gold, Silver, and Bronze.

As shown in Figure 36, assign to the new service one of the Internet-tiered policy groups that we created in the last section.

**Figure 36: Sample Value-Added Service for Internet Gold Service**

For each service, define a substitution value for the bw parameter. For the Gold service, the bw value is 5 Mbps; for the Silver service, the bw value is 1 Mbps; and for the Bronze service, the bw value is 64 Kbps. Figure 37 shows how the substitution value is configured for the Gold service.

**Figure 37: Parameter Pane of Internet Gold Service****Internet-Gold Service**

```

serviceName=Internet-Gold,o=Services,o=umc
policyGroupName:internet-tiered,ou=common,ou=sample,o=Policies,o=umc
substitution:
    bw=5000000

```

**Internet-Silver Service**

```

serviceName=Internet-Silver,o=Services,o=umc
policyGroupName:internet-tiered,ou=common,ou=sample,o=Policies,o=umc
substitution:
    bw=1000000

```

**Internet-Bronze Service**

```

serviceName=Internet-Bronze,o=Services,o=umc
policyGroupName:internet-tiered,ou=common,ou=sample,o=Policies,o=umc
substitution:
    bw=64000

```

## Example: Providing Premium Services

---

This scenario shows how service providers can offer premium services, such as video on demand, video conferencing, and voice over IP (VoIP). These types of services are turned on for short periods of time while the premium service is being used.

In this example, two content providers provide premium services. One provides a music service, and the other provides a news service.

### Types of Policies

The policy used for premium services depends on the type of service being used. Generally, policies with filter, forward, rate-limit or policer actions, and QoS features are used.

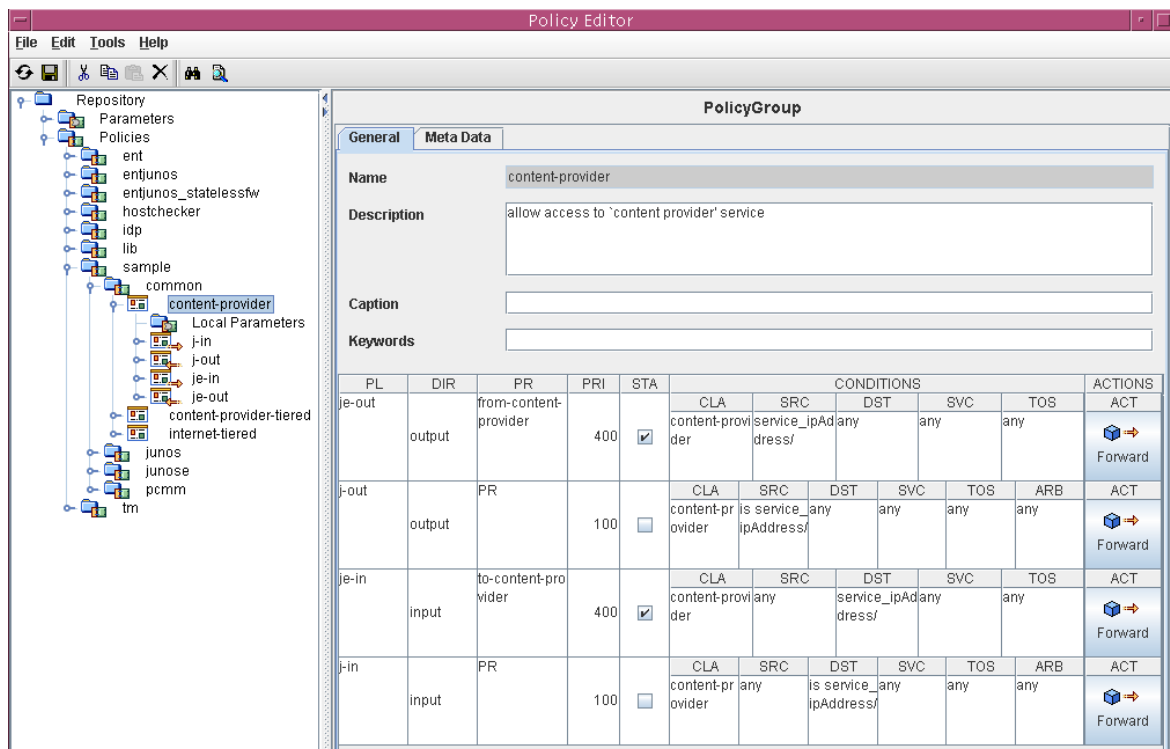

The policy rules in premium services typically have a higher priority (smaller precedence number) than other services and default policies. In this case, the policy rules in the content provider service policies have a priority of 400. The default policy rule has a priority of 500.

The default policy uses the next-hop action to send all traffic destined for the networks of these content providers to the SSP (see *Sample Access Policies* on page 382). When the content provider service is activated, the forward action is taken for packets destined for the content provider network.

## Sample JUNOS and JUNOSe Content Provider Policies

The sample content provider policy group includes policy lists for both JUNOS and JUNOSe policies. Figure 38 shows a summary of the content provider policy group.

**Figure 38: Premium Service Policy Group**

The following information shows the configuration details of the premium service policy group shown in Figure 38.

policyGroupName=content-provider,ou=common,ou=sample,o=Policies,o=umc

### PolicyList je-out

```

ClassifyTrafficCondition
  DestinationNetwork:
    ipAddress=service_ipAddress
    ipMask=service_ipMask
    ipOperation=is

```

```

Forward Action

```

## Defining the Premium Services

You need to create two value-added (SSP) services—one for the news service and one for the music service. As shown in Figure 39, assign to the new service- the content-provider policy group that we created in the last section.

**Figure 39: Sample Value-Added News Service**

For each service, define a substitution value for the service\_ipAddress and service\_ipMask parameters. (See Figure 40.) Note that each content provider has a different service\_ipAddress parameter.

**Figure 40: Parameter Pane of News Service**

## Music Service

The music service is provided by the XYZ company, which is a content provider.

```
serviceName=Music,o=Services,o=umc
policyGroupName: content-provider,ou=common,ou=sample,o=Policies,o=umc
substitution:
  service_ipAddress=10.20.30.0
  service_ipMask=255.255.255.0
```

## News Service

The news service is provided by the ABC company, which is a content provider.

```
serviceName=News,o=Services,o=umc
policyGroupName: content-provider,ou=common,ou=sample,o=Policies,o=umc
substitution:
  service_ipAddress=10.20.40.0
  service_ipMask=255.255.255.0
```
