

Understanding SRC CLI Command Modes

The SRC CLI has two modes:

- Operational mode—Provides commands to monitor and troubleshoot system status.
- Configuration mode—Provides commands and configuration statements to define properties for the SRC software. The statements appear in a hierarchy which groups related properties.

In configuration mode, you view and change a working configuration, called the *candidate configuration*. This configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the *active configuration*. The software does not implement the changes in a candidate configuration until you commit them, which activates the configuration in the SRC software.
