

Configuring the URL for an Enterprise Service Portal

The way you deploy the enterprise service portals depends on your Web application server. See the documentation for your Web application server for information about the deployment.

By default, the name of the WAR file determines the URL that you use to access the enterprise service portal. For example, if the name of the WAR files is *entmgr.war*, the URL for the enterprise service portal is `http:// <host> : <port> /entmgr`.

- <host> —Name or IP address of the machine on which you install the enterprise service portal
- <port> —TCP/UDP port for HTTP traffic

If you want use a different URL, you must modify the relevant configuration file for your Web application server. For information about this task, see the documentation for your Web application server.
