

Initializing Logging

You must initialize logging only if you want to view the logging information produced by the NIC proxy.

To enable the application to initialize logging:

- Call the following method:

```
Log.init(configMgr, configNameSpace);
```

- `configMgr`—Instance of the configuration manager, the value returned from the `getConfigMgr()` method
- `configNameSpace`—String that specifies the configuration namespace where you defined the logging properties
 - If you define the logging properties in the bootstrap file, specify the root namespace, “/” .

```
Log.init(configMgr, "/");
```

- If you define the logging properties in the directory, specify the namespace relative to the property `Config.net.juniper.smgmt.lib.config.staticConfigDN`, which you configure in the bootstrap file.

```
Log.init(configMgr, "/Applications/Quota");
```
