

Configuring Classify-Traffic Conditions

You create classify-traffic conditions in JUNOS policy rules, in JUNOS ASP and JUNOS filter policy rules, and in PCMM policy rules.

The available configuration statements change depending on the type of policy rule that holds the condition and on the type of protocol that you specify.

To configure a classify-traffic condition, do the following:

1. Create a classify-traffic condition.
 - Creating a Classify-Traffic Condition
2. Configure source networks. You can configure source networks in one of two formats.
 - Configuring Source Networks
 - Configuring Source Grouped Networks
3. Configure destination networks. You can configure destination networks in one of two formats.
 - Configuring Destination Networks
 - Configuring Destination Grouped Networks
4. Configure protocol conditions. The type of protocol condition that you use depends on your configuration.
 - To configure protocol conditions that do not include ports, see:
 - Configuring Protocol Conditions
 - To configure protocol conditions that include ports, see:
 - Configuring Protocol Conditions with Ports
 - To configure protocol conditions in which the protocol that you specify is a parameter, see:
 - Configuring Protocol Conditions with Parameters
 - To configure protocol conditions in which the protocol is TCP, see:
 - Configuring TCP Conditions
 - To configure protocol conditions in which the protocol is ICMP, see:
 - Configuring ICMP Conditions
 - To configure protocol conditions in which the protocol is IGMP, see:
 - Configuring IGMP Conditions
 - To configure protocol conditions in which the protocol is IPSec, see:
 - Configuring IPSec Conditions
 - To configure a ToS byte condition, see:

- Configuring ToS Byte Conditions

5. For JUNOS filter policies, configure a JUNOS filter condition. See:
 - Configuring JUNOS Filter Conditions
6. For JUNOS secondary input policies, configure a traffic match condition for the packet flow. See:
 - Configuring JUNOS Secondary Input Policy Conditions
7. For the stateful firewall and NAT policies, configure an application protocol condition. See:
 - Configuring Application Protocol Conditions

NOTE: PCMM classifiers support only the following classifiers:

- Source and destination IP addresses
- Network protocol
- Source or destination port
- Type-of-service (ToS) byte and ToS mask

The policy engine ignores all other values.
