

## **Additional SRC-VTA Configuration Script Tasks**

---

The VTA configuration script configures the components that it finds and accesses on each host. However, depending on your configuration and the components you use, such as the type of database and J2EE application server, you may need to manually configure some of the components or the configuration. This topic provides a complete list of the configuration procedures related to the SRC-VTA and explains which procedures the VTA configuration script completes. It includes:

- Configuring the J2EE Application Server
- Configuring the J2EE Application Server
- Configuring VTA Services and Policies
- Configuring Subscribers and Subscriptions to VTA Services
- Accessing the J2EE Application Server's Client Libraries
- Specifying How the SRC-VTA Loads Configurations from the Directory
- Configuring the SAE to Send Tracking Events to the SRC-VTA
- Specifying Tracking Plug-Ins for Enterprise Subscribers on JUNOS Routing Platforms
