

Loading and Importing VTA Configurations

You can store your VTA configurations in a directory or in a file on the local host:

- **Directory**—If you store the configurations in a directory, you need to load a configuration before you work on it in VTA Configuration Manager. When you are finished with a configuration, you need to commit the configuration to the directory.

If you loaded the VTA sample data, it is in the following files in the directory:

- */Applications/Bucket*
- */Applications/HostCheck*
- */Applications/Quota*

See Loading a Configuration from a Directory .

- **Local host**—If you store the configurations in files on the local host, you need to import a configuration file before you work on the configuration in VTA Configuration Manager. When you are finished with a configuration, you need to export the configuration to a file.

See Importing a VTA Configuration from a Local File .
