

Overview of Managing Subscriber Accounts with VTA Portals

We provide two sample portals that manage subscriber accounts. One is an administrator portal that administrators can use to manage VTA subscriber accounts. The second is a subscriber portal that subscribers can use to manage their own accounts. Before you can use these portals, you need to configure the Web applications for the SRC-VTA (see [Configuring Web Applications for the SRC-VTA](#)).

The sample portals run inside the J2EE application server and use the VTA core's NIC proxy.

To customize the portals to operate outside the VTA's J2EE application server, you must:

- Develop a way to connect them to the VTA's remote account and session manager interfaces.
- If the software automatically logs in subscribers with their current IP addresses (JUNOS only), configure NIC proxies for the client (see [Configuring NIC Proxies for the VTA](#)).
