

Configuring Initialization Scripts (C-Web Interface)

When the SAE establishes a connection with a policy server, it runs an initialization script to customize the setup of the connection.

To configure initialization scripts for the SAE:

1. Click **Configure**, expand **Shared > SAE > Configuration > Driver**, and then click **Scripts**.

The Scripts pane appears.

2. Click the **Create** button.
3. In the Pcomm box, enter the information as described in the Help text in the main pane, and click **Apply**. For the JPS, we recommend setting this value to **amlorPublisher**.

The script is run when the connection between a policy server and the SAE is established and again when the connection is dropped.
