

Configuring Exception Application Actions (SRC CLI)

Use the following statements to configure policy actions that specify exceptions to a rule to identify the client application that is a destination for packets.

```
policies group name list name rule name exception-application name {  
    application-type application-type ;  
    description description ;  
}
```

The type of action that you can create depends on the type of policy rule. See Policy Information Model.

To configure an exception action in a policy rule to specify that traffic be sent to a client application:

1. From configuration mode, enter the exception application action configuration. For example, to name the exception application action my-http-application:

```
[edit]  
user@host# edit policies group http-policy list http-list rule redirect  
exception-application my-http-application
```

2. Specify the application type, such as HTTP for Web traffic.

```
[edit policies group http-policy list http-list rule redirect exception-application  
my-http-application]  
user@host# set application-type http
```
