

Configuring HTTP Redirect Actions (SRC CLI)

Use the following statements to configure policy actions to redirect Web traffic to a specified URL.

```
policies group name list name rule name http-redirect name {  
    subscriber-url "\"http:// URL \";  
    description description ;  
}
```

The type of action that you can create depends on the type of policy rule. See Policy Information Model.

To configure an HTTP redirect action in a policy rule to specify that Web traffic be sent to a specified URL:

1. From configuration mode, enter the HTTP redirect action configuration. For example, to name the HTTP redirect action residential-portal:

```
[edit]  
user@host# edit policies group http list http-list rule redirect http-redirect  
residential-portal
```

2. Specify the destination URL to which traffic will be redirected. For example, to redirect the traffic to www.new.com:

```
[edit policies group http list http-list rule redirect http-redirect residential-portal]  
user@host# subscriber-url "\"http://www.new.com\""
```
