

Installing VTA Configuration Manager

VTA Configuration Manager is a Web application that lets you use a Web browser to configure the SRC-VTA. To install VTA Configuration Manager:

1. Copy the *vtaconfig.war* file from the archive file to the *jboss/server/default/deploy* folder.
2. If you have not run the VTA configuration script, copy the *roles.properties* and *users.properties* files from */opt/UMC/conf/vta* to your *jboss/server/default/conf* folder.
3. In the *roles.properties* file, add the following property.

admin=VTA_Admin

VTA_Admin is used as the login username for VTA Configuration Manager. You can configure a different login username; however, you cannot change “= VTA_Admin.”

4. In the *users.properties* file, add the following property.

admin=secret

where secret is the password used to log in to VTA Configuration Manager.
