

Creating SRC License Usage Reports (SRC CLI)

Create a report to compare the maximum number of concurrent active SAE service sessions in use since the last report with the number of sessions allowed by the server license.

The SRC software generates a report at the beginning of each month. You can create a new report at any time. If you configured reports to be sent through e-mail, the SRC software sends a report after you create it.

To create a license usage report:

```
user@host> request license usage-report
```

Generated Usage Report
