

Automatic Login of Subscribers

By using a NIC with the SRC-VTA, you can enable subscribers who connect to the SRC network through a JUNOS router to log in through the VTA Web portals. The NIC must map the subscriber's IP address to one of the following values:

- Subscriber's login name
- Subscriber's DN
- Name of the interface and VR to which the subscriber connects

The value to which this NIC maps the subscriber's IP address depends on the information that identifies subscribers in your SRC configuration.

If subscribers connect to the network through a JUNOS routing platform or you choose not implement this NIC with a JUNOS router, you can provide subscribers with access to this information through another method, such as a central login page where subscribers can enter their usernames and passwords.
