

Synchronizing Data on a Juniper Networks Database (SRC CLI)

You can initialize a Juniper Networks database with data from a neighbor. This process takes the following actions on the database to be initialized:

- Removes any existing data
- Copies data from the system on which the **request system ldap community initialize neighbor** command is run

To replace data on a neighbor database (for example, neighbor1):

- On the system that contains the source database to be replicated:

```
user@host> request system ldap community initialize neighbor neighbor1
```
