

Authenticating Registered Username/Password Pairs

You can specify whether the application programming interface (API) method `registerLoginCredentials` authenticates the registered username/password or creates the registration without authentication. You should enable this setting if your authentication server does not allow authentication while a session for the authenticated username is active.

Use the following configuration statement to specify whether or not registered username/password pairs are authenticated:

```
shared sae configuration login-registration {  
    registration-authentication;  
}
```

To specify whether or not registered username/password pairs are authenticated:

1. From configuration mode, access the subscriber sessions statement.

```
user@host# edit shared sae configuration login-registration
```

2. Enable or disable whether registered username/password pairs are authenticated.

```
[edit shared sae configuration login-registration]  
user@host# set registration-authentication
```

3. (Optional) Verify your configuration.

```
[edit shared sae configuration login-registration]  
user@host# show  
registration-authentication;
```
