

Installing the SRC-VTA and Running the Configuration Script

For information about the SRC-VTA software, see SRC Application Library Software.

To install each VTA:

1. Install the Solaris packages for the SRC-VTA (see Installing SRC Application Packages) on hosts that support JBoss.
2. Run the VTA configuration script on each SRC-VTA host. The script configures JBoss for the SRC-VTA, installs JBoss client libraries, and loads sample data. To invoke the script, access the folder */opt/UMC/conf/vta*, and run the **load** command.

```
cd /opt/UMC/conf/vta  
./load
```

3. On each host, restart JBoss and the SAE.
4. Configure the SRC-VTA and associated components (see Additional SRC-VTA Configuration Script Tasks and Running VTA Configuration Manager).
