

Configuring Destination Grouped Networks (C-Web Interface)

You can configure destination networks in grouped format. For JUNOS ASP policies rules, you must enter destination networks in grouped format.

To configure a grouped destination network in a classify-traffic condition:

1. In the side pane, expand a traffic condition, expand **Destination Network**, and select **Group Network**.
2. Click **Create**, enter information as described in the Help text in the main pane, and click **Apply**.
