

## Configuring Global Parameters (C-Web Interface)

---

If you change global variables for policies, the change takes effect the next time a service is activated; the change does not take effect for active service sessions.

To create a global parameter:

1. Click **Configure > Policies**, and select **Global Parameters**.
2. In the Create new list, select **Parameter**. Type a name for the new parameter, and click **OK**.
3. Enter information as described in the help text in the main pane, and click **Apply**.

**Related Topics** ■ For valid values of each parameter type, see Overview of Global and Local Parameters.
