This product includes the Envoy SNMP Engine, developed by Epilogue Technology, an Integrated Systems Company. Copyright © 1986-1997, Epilogue Technology Corporation. All rights reserved. This program and its documentation were developed at private expense, and no part of them is in the public domain.

This product includes memory allocation software developed by Mark Moraes, copyright © 1988, 1989, 1993, University of Toronto.

This product includes FreeBSD software developed by the University of California, Berkeley, and its contributors. All of the documentation and software included in the 4.4BSD and 4.4BSD-Lite Releases is copyrighted by the Regents of the University of California. Copyright © 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992, 1993, 1994. The Regents of the University of California. All rights reserved.

GateD software copyright © 1995, the Regents of the University. All rights reserved. Gate Daemon was originated and developed through release 3.0 by Cornell University and its collaborators. Gated is based on Kirton's EGP, UC Berkeley's routing daemon (routed), and DCN's HELLO routing protocol. Development of Gated has been supported in part by the National Science Foundation. Portions of the GateD software copyright © 1988, Regents of the University of California. All rights reserved. Portions of the GateD software copyright © 1991, D. L. S. Associates.

This product includes software developed by Maker Communications, Inc., copyright © 1996, 1997, Maker Communications, Inc.

## How to Use This Guide

---

Complete documentation for the EX Series product family is provided on webpages at [http://www.juniper.net/techpubs/en\\_US/release-independent/information-products/pathway-pages/ex-series/product/index.html](http://www.juniper.net/techpubs/en_US/release-independent/information-products/pathway-pages/ex-series/product/index.html). We have selected content from these webpages and created a number of EX Series guides that collect related topics into a book-like format so that the information is easy to print and easy to download to your local computer.

Software features for EX Series switches are listed by platform and by Junos OS release in a standalone document. See [EX Series Switch Software Features Overview](#)

The release notes are at [http://www.juniper.net/techpubs/en\\_US/junos11.2/information-products/topic-collections/release-notes/11.2/junos-release-notes-11.2.pdf](http://www.juniper.net/techpubs/en_US/junos11.2/information-products/topic-collections/release-notes/11.2/junos-release-notes-11.2.pdf).

## Downloading Software

You can download Junos OS for EX Series switches from the Download Software area at <http://www.juniper.net/customers/support/> . To download the software, you must have a Juniper Networks user account. For information about obtaining an account, see <http://www.juniper.net/entitlement/setupAccountInfo.do>.

## Documentation Symbols Key

Notice Icons		
Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
Text and Syntax Conventions		
Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces important new terms.</li> <li>Identifies book names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS System Basics Configuration Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
Plain text like this	Represents names of configuration statements, commands, files, and directories; IP addresses; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols <b>ospf area area-id</b>] hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Enclose optional keywords or variables.	<b>stub</b> <default-metric <i>metric</i> >;

Text and Syntax Conventions		
Convention	Description	Examples
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  <i>(string1   string2   string3)</i>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Enclose a variable for which you can substitute one or more values.	<b>community name members [ community-ids ]</b>
Indentation and braces ( { } )	Identify a level in the configuration hierarchy.	<b>[edit]</b> routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
<b>J-Web GUI Conventions</b>		
<b>Bold text like this</b>	Represents J-Web graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
<b>&gt;</b> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. Send e-mail to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net) with the following:

- Document URL or title
- Page number if applicable
- Software version
- Your name and company

## Requesting Technical Support

---

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf> .
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/> .
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>
- Join and participate in the Juniper Networks Community Forum: <http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/> .
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html> .

## Junos OS CoS for EX Series Switches Overview

---

When a network experiences congestion and delay, some packets must be dropped. Junos operating system (Junos OS) class of service (CoS) divides traffic into classes to which you can apply different levels of throughput and packet loss when congestion occurs. This allows packet loss to happen according to rules that you configure.

For interfaces that carry IPv4, IPv6, and MPLS traffic, you can configure Junos OS CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP), IP precedence, 802.1p, or EXP CoS bits of packets egressing out of an interface, thus allowing you to tailor packets for the remote peers' network requirements. See [“Understanding Using CoS with MPLS Networks on EX Series Switches” on page 27](#) for more information about CoS for MPLS networks.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue.

In designing CoS applications, you must give careful consideration to your service needs and thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because Juniper Networks EX Series Ethernet Switches implement CoS in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet-forwarding and switching performance.

**NOTE:** CoS policies can be enabled or disabled on each interface of an EX Series switch. Also, each physical and logical interface on the switch can have custom CoS rules associated with it. When CoS is used in an MPLS network, there are some additional restrictions. See [“Understanding Using CoS with MPLS Networks on EX Series Switches” on page 27](#).

---

- [How Junos OS CoS Works on page 4](#)
- [Default CoS Behavior on EX Series Switches on page 5](#)

## How Junos OS CoS Works

Junos OS CoS works by examining traffic entering at the edge of your network. The switches classify traffic into defined service groups to provide the special treatment of traffic across the network. For example, voice traffic can be sent across certain links, and data traffic can use other links. In addition, the data traffic streams can be serviced differently along the network path. As the traffic leaves the network at the far edge, you can rewrite the traffic to meet the policies of the targeted peer.

To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings then dictate which packets are transmitted first to the next downstream switch. Switches at

the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.

Figure 1 on page 5 represents the network scenario of an enterprise. Switch A is receiving traffic from various network nodes such as desktop computers, servers, surveillance cameras, and VoIP telephones. As each packet enters, Switch A examines the packet's CoS settings and classifies the traffic into one of the groupings defined by the enterprise. This definition allows Switch A to prioritize resources for servicing the traffic streams it receives. Switch A might alter the CoS settings of the packets to better match the enterprise's traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packets according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can rewrite the CoS bits of the packets before transmitting them.

Figure 1: Packet Flow Across the Network

## Default CoS Behavior on EX Series Switches

If you do not configure any CoS settings on the switch, the software performs some CoS functions to ensure that user traffic and protocol packets are forwarded with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

## Understanding Junos OS CoS Components for EX Series Switches

---

This topic describes the Juniper Networks Junos operating system (Junos OS) class-of-service (CoS) components for Juniper Networks EX Series Ethernet Switches:

- [Code-Point Aliases on page 6](#)
- [Policers on page 6](#)
- [Classifiers on page 6](#)
- [Forwarding Classes on page 7](#)
- [Tail Drop Profiles on page 7](#)
- [Schedulers on page 7](#)
- [Rewrite Rules on page 7](#)

### Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

### Policers

Policers limit traffic of a certain class to a specified bandwidth and *burst size*. Packets exceeding the policer limits can be discarded. You define policers with filters that can be associated with input interfaces.

For more information about policers, see [Understanding the Use of Policers in Firewall Filters](#).

**NOTE:** You can configure policers to discard packets that exceed the rate limits. If you want to configure CoS parameters such as **loss-priority** and **forwarding-class**, you must use firewall filters.

### Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. In Juniper Networks Junos operating system (Junos OS), *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examines the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, and IEEE 802.1p value.
- Multifield traffic classifiers—Examines multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With

multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

## Forwarding Classes

Forwarding classes group the packets for transmission. Based on forwarding classes, you assign packets to output queues. Forwarding classes affect the forwarding, scheduling, and marking policies applied to packets as they transit a switch. By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and network control. For EX Series switches, 16 forwarding classes are supported, providing granular classification capability.

## Tail Drop Profiles

Drop profile is a mechanism that defines parameters that allow packets to be dropped from the network. Drop profiles define the meanings of the loss priorities. When you configure drop profiles you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the queue used to store packets in relation to the total amount that has been allocated for that specific queue.

Loss priorities set the priority of dropping a packet. Loss priority affects the scheduling of a packet without affecting the packet's relative ordering. You can use the loss priority setting to identify packets that have experienced congestion. Typically you mark packets exceeding some service level with a high loss priority.

## Schedulers

Each switch interface has multiple queues assigned to store packets. The switch determines which queue to service based on a particular method of scheduling. This process often involves determining which type of packet should be transmitted before another. You can define the priority, bandwidth, delay buffer size, and tail drop profiles to be applied to a particular queue for packet transmission.

A scheduler map associates a specified forwarding class with a scheduler configuration. You can associate up to four user-defined scheduler maps with the interfaces.

## Rewrite Rules

A *rewrite rule* sets the appropriate CoS bits in the outgoing packet, thus allowing the next downstream device to classify the packet into the appropriate service group. Rewriting, or marking, outbound packets is useful when the switch is at the border of a network and must alter the CoS values to meet the policies of the targeted peer.

**NOTE:** Rewrite rules are applied when the packets are routed. Rewrite rules are not applied when the packets are forwarded.

Egress firewall filters can also assign forwarding class and loss priority so that the packets are rewritten based on forwarding class and loss priority.

## Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs), IP precedence, and IEEE 802.1 bits to associate incoming packets with a particular CoS servicing level. On a switch, you can assign a meaningful name or alias to the CoS values and use this alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure user-defined classifiers in terms of alias names. If the value of an alias changes, it alters the behavior of any classifier that references it.

You can configure code-point aliases for the following type of CoS markers :

- dscp—Handles incoming IPv4 packets.
- ieee-802.1—Handles Layer 2 CoS.
- inet-precedence—Handles incoming IPv4 packets. IP precedence mapping requires only the upper three bits of the DSCP field.

This topic covers:

- [Default Code-Point Aliases on page 8](#)

### Default Code-Point Aliases

## Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. There are two general types of classifiers:

- Behavior aggregate (BA) classifiers
- Multifield (MF) classifiers

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification. If the two classification results conflict, the MF classification result overrides the BA classification result.

**NOTE:** When a source media access control (MAC) address is learned, the frame that contains the source MAC address is always sent out on queue 0 while egressing from the network interface, irrespective of the classifier applied to the ingress interface.

On Juniper Networks EX8200 Ethernet Switches, you can specify BA classifiers for bridged multdestination traffic and IP multdestination traffic. The BA classifier for multicast packets is applied to all interfaces on the EX8200 switch.

**NOTE:** EX8200 switches implement the on-demand allocation of memory space for ternary content addressable memory (TCAM) so that when additional TCAM space is required for CoS classifiers, it is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers to use memory space that exceeds the available TCAM space that includes both the free and unused space.

This topic describes:

- [Behavior Aggregate Classifiers on page 11](#)
- [Multifield Classifiers on page 13](#)

### Behavior Aggregate Classifiers

The behavior aggregate classifier maps a CoS value to a forwarding class and loss priority. The forwarding class determines the output queue. The loss priority is used by a scheduler to control packet discard during periods of congestion.

There are three types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ

- IP precedence bits
- IEEE 802.1p CoS bits

BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore core devices, which handle high traffic volumes, are normally configured to perform BA classification.

### Default Behavior Aggregate Classification

Juniper Networks Junos operating system (Junos OS) automatically assigns implicit default classifiers to all logical interfaces based on the type of interface. [Table 2 on page 12](#) lists different types of interfaces and the corresponding implicit default classifiers.

**Table 2: Default BA Classification**

Type of Interface	Default BA Classification
Trunk interface	<b>ieee8021p-default</b>
Layer 3 interface (IPv4)	<b>dscp-default</b>
Layer 3 interface (IPv6)	<b>dscp-ipv6-default</b>
Access interface	Untrusted
Routed VLAN interface (RVI)	No default classification

When you explicitly associate a classifier with a logical interface, you are in effect overriding the implicit default classifier with an explicit classifier.

On Juniper Networks EX3200 and EX4200 Ethernet Switches, you can apply classifier rules for each interface. [Table 3 on page 12](#) describes the different classifier types you can configure on Layer 2 and Layer 3 interfaces.

**Table 3: Allowed BA Classification**

Type of Interface	Allowed BA Classification
Layer 2 interface	IEEE 802.1p, IP Precedence, DSCP, DSCP IPv6
Layer 3 interface (IPv4)	IEEE 802.1p, IP Precedence, DSCP
Layer 3 interface (IPv6)	IEEE 802.1p, IP Precedence, DSCP IPv6

You can configure all the allowed classifier types on the same logical interface or on different logical interfaces. If you need to apply all classifier rules on the same logical interface, configure the classifier rules allowed for both IPv4 and IPv6 on the logical interface.

If you have not explicitly associated a classifier with a logical interface, the default classifiers are assigned and classification works as follows:

- If the logical interface is configured with an IPv4 address, DSCP classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP classifier.
- If the logical interface is configured with an IPv6 address, DSCP IPv6 classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP IPv6 classifier.

**NOTE:** On EX8200 switches, only one classifier of type DSCP and of type IEEE 802.1p can be applied to an interface.

You can configure routed VLAN interfaces (RVIs) to classify packets. After you do this, the User Priority (UP) bits in the incoming packets are rewritten according to the default IEEE 802.1p rewrite rule, except on EX8200 switches. On EX8200 switches, you must explicitly assign the default IEEE 802.1p rewrite rule to RVIs.

**NOTE:** By default, all BA classifiers classify traffic into either the best-effort forwarding class or the network-control forwarding class.

## Multifield Classifiers

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of DSCP or IP precedence support in end-user applications. On an edge switch, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, any classifier performs matching operations on the selected fields against a configured value.

## Understanding CoS Forwarding Classes

---

Class-of-Service (CoS) forwarding classes can be thought of as output queues. In effect, the result of classifying packets is the identification of an output queue for a particular packet. For a classifier to assign an output queue to a packet, it must associate the packet with one of the following forwarding classes:

- best-effort (be)—Provides no service profile. Loss priority is typically not carried in a CoS value.
- expedited-forwarding (ef)—Provides a low loss, low latency, low jitter, assured bandwidth, end-to-end service.
- assured-forwarding (af)—Provides a group of values you can define and includes four subclasses: AF1, AF2, AF3, and AF4, each with two drop probabilities: low and high.
- network-control (nc)—Supports protocol control and thus is typically high priority.
- multicast best-effort (mcast-be)—Provides no service profile for multicast packets.
- multicast expedited forwarding (mcast-ef)—Supports high-priority multicast packets.
- multicast assured-forwarding (mcast-af)—Provides two drop profiles; high, and low, for multicast packets.

**NOTE:** The forwarding classes multicast expedited-forwarding, multicast assured-forwarding, and multicast best-effort are applicable only to Juniper Networks EX8200 Ethernet Switches.

Juniper Networks EX Series Ethernet Switches support up to 16 forwarding classes, thus allowing granular packet classification. For example, you can configure multiple classes of expedited forwarding (EF) traffic such as EF, EF1, and EF2.

EX Series switches support up to eight output queues. Therefore, if you configure more than eight forwarding classes, you must map multiple forwarding classes to single output queues. On EX8200 Virtual Chassis, you can configure only eight forwarding classes and you can assign only one forwarding class to each output queue.

**NOTE:** On EX8200 Virtual Chassis, the queue number seven carries Virtual Chassis port (VCP) traffic and can also carry high-priority user traffic.

This topic describes:

- [Default Forwarding Classes on page 14](#)

## Default Forwarding Classes

[Table 4 on page 15](#) shows the four default forwarding classes defined for unicast traffic, and [Table 5 on page 15](#) shows the three default forwarding classes defined for multicast traffic.

**NOTE:** The default forwarding classes for multicast traffic are applicable only to EX8200 switches.

You can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. However, because CoS configurations can be quite complicated, we recommend that you avoid altering the default class names or queue number associations.

**Table 4: Default Forwarding Classes for Unicast Traffic**

Forwarding Class Name	Comments
best-effort (be)	The software does not apply any special CoS handling to packets with 000000 in the DiffServ field. This is a backward compatibility feature. These packets are usually dropped under congested network conditions.
expedited-forwarding (ef)	The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end-to-end for packets in this service class. The software accepts excess traffic in this class, but in contrast to the assured forwarding class, the out-of-profile expedited-forwarding class packets can be forwarded out of sequence or dropped.
assured-forwarding (af)	<p>The software offers a high level of assurance that the packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define.</p> <p>The software accepts excess traffic, but it applies a tail drop profile to determine that excess packets are dropped, and not forwarded.</p> <p>Two drop probabilities (low and high) are defined for this service class.</p>
network-control (nc)	<p>The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.)</p> <p>Typically, these packets represent routing protocol hello or keep alive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard for these packets.</p>

**Table 5: Default Forwarding Classes for Multicast Traffic**

Forwarding Class Name	Comments
multicast best-effort (mcast-be)	The software does not apply any special CoS handling to multicast packets. These packets are usually dropped under congested network conditions.
multicast expedited-forwarding (mcast-ef)	The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end-to-end for multicast packets in this service class. The software accepts excess traffic in this class, but in contrast to the multicast assured forwarding class, out-of-profile multicast expedited-forwarding class packets can be forwarded out of sequence or dropped.

Table 5: Default Forwarding Classes for Multicast Traffic (*continued*)

Forwarding Class Name	Comments
multicast assured-forwarding (mcast-af)	<p>The software offers a high level of assurance that the multicast packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define.</p> <p>The software accepts excess traffic, but it applies a tail drop profile to determine if the excess packets are dropped and not forwarded.</p> <p>Two drop probabilities (low and high) are defined for this service class.</p>

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. If you commit such a configuration, the commit fails and a message displays that states the number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that is displayed in the default configuration for a queue number is that of the forwarding class currently associated with that queue.

## Understanding CoS Tail Drop Profiles

Tail drop profile is a congestion management mechanism that allows switch to drop arriving packets when queue buffers become full or begin to overflow.

Tail drop profiles define the meanings of the loss priorities. When you configure tail drop profiles you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the memory used to store packets in relation to the total amount that has been allocated for that specific queue.

The queue fullness defines the delay-buffer bandwidth, which provides packet buffer space to absorb burst traffic up to the specified duration of delay. Once the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the tail of the buffer.

On Juniper Networks EX Series Ethernet Switches, drop probability is implicitly set to **100 percent** and it cannot be modified.

You specify drop probabilities in the drop profile section of the CoS configuration hierarchy and reference them in each scheduler configuration.

By default, if you do not configure any drop profile, tail drop profile is in effect and functions as the primary mechanism for managing congestion. In the default tail drop profile, when the fill level is 0 percent, the drop probability is 0 percent. When the fill level is 100 percent, the drop probability is 100 percent.

**NOTE:** The default drop profile associated with the packets whose loss priority is low cannot be modified. You can configure custom drop profile only for those packets whose loss priority is high.

## Understanding CoS Schedulers

---

You use class-of-service (CoS) schedulers to define the properties of output queues on Juniper Networks EX Series Ethernet Switches. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues, packet schedulers, and tail drop processes that operate according to this mapping.

This topic describes:

- [Default Schedulers on page 18](#)
- [Transmission Rate on page 19](#)
- [Scheduler Buffer Size on page 19](#)
- [Priority Scheduling on page 19](#)
- [Scheduler Drop-Profile Maps on page 20](#)
- [Scheduler Maps on page 20](#)

### Default Schedulers

Each forwarding class has an associated scheduler priority. On EX Series switches other than Juniper Networks EX8200 Ethernet switches, only two forwarding classes, best-effort (queue 0) and network-control (queue 7) are used in the default configuration. On EX8200 switches three forwarding classes—best-effort (queue 0), multicast best-effort (queue 2), and network-control (queue 7)—are used in the default configuration.

By default on EX Series switches other than EX8200 switches, the best-effort forwarding class (queue 0) receives 95 percent of the bandwidth and the buffer space for the output link, and the network-control forwarding class (queue 7) receives 5 percent. The default drop profile causes the buffer to fill completely and then to discard all incoming packets until it has free space. On EX8200 switches, by default, the best-effort forwarding class (queue 0) receives 75 percent of the bandwidth, the multicast best-effort forwarding class (queue 2) receives 20 percent, and the network-control forwarding class (queue 7) receives 5 percent of the bandwidth and buffer space for the output link.

The expedited-forwarding (queue 5) and assured-forwarding (queue 1) classes have no scheduler because no resources are assigned to queue 5 and queue 1, by default. However, you can manually configure resources for the expedited-forwarding and assured-forwarding classes.

Also by default, each queue can exceed the assigned bandwidth if additional bandwidth is available from other queues. When a forwarding class does not fully use the allocated transmission bandwidth, the remaining bandwidth can be used by other forwarding classes if they have a traffic load that exceeds their allocated bandwidth.

## Transmission Rate

Transmission-rate control determines the actual traffic bandwidth from each forwarding class you configure. The transmission rate is specified in bits per second. Each queue is allocated some portion of the bandwidth of the interface. This bandwidth can be a fixed value, such as 1 megabit per second (Mbps), a percentage of the total available bandwidth, or the rest of the available bandwidth. In case of congestion, a configured transmission rate is guaranteed for the queue. Transmission-rate control allows you to ensure that each queue receives the bandwidth appropriate to its level of service.

## Scheduler Buffer Size

To control congestion at the output stage, you can configure the delay-buffer bandwidth by using the **buffer-size** configuration statement. The delay-buffer bandwidth provides packet buffer space to absorb burst traffic up to the specified duration of delay. Once the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the tail of the buffer.

On EX Series switches other than EX8200 switches, the default scheduler transmission rates for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent of the total available bandwidth. The default buffer-size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent of the total available buffer. On EX8200 switches, the default scheduler transmission rates for queues 0 through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent of the total available bandwidth, and the default **buffer-size** percentages for queues 0 through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent of the total available buffer.

For each scheduler on EX Series switches other than EX8200 switches, you can configure the buffer size as one of the following:

- The exact buffer size.
- A percentage of the total buffer.
- The remaining buffer available. The remainder is the buffer percentage that is not assigned to other queues. For example, if you assign 40 percent of the delay buffer to queue 0, allow queue 2 to keep the default allotment of 20 percent, allow queue 7 to keep the default allotment of 5 percent, and assign the remainder to queue 3, then queue 3 uses 35 percent of the delay buffer.

On EX8200 switches, you can configure the buffer size as a temporal value (in microseconds), percentage of the total buffer, or the remaining buffer available.

## Priority Scheduling

Priority scheduling determines the order in which an interface transmits traffic from the queues, thus ensuring that queues containing important traffic are provided better access to the interface.

Priority scheduling is accomplished through a procedure in which the scheduler examines the priority of the queue. The Juniper Networks Junos operating system (Junos OS) supports two levels of transmission priority:

- **Low**—The scheduler determines whether the individual queue is within its defined bandwidth profile. This binary decision, which is re-evaluated on a regular time cycle, compares the amount of data transmitted by the queue against the bandwidth allocated to it by the scheduler. When the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out of profile when the amount of traffic that it transmits is larger than the queue's allocated limit. An out-of-profile queue is transmitted only if bandwidth is available. Otherwise, it is buffered.

A queue from a set of queues is selected based on the shaped deficit weighted round robin (SDWRR) algorithm, which operates within the set.

- **Strict-high**—A strict-high priority queue receives preferential treatment over a low-priority queue. Unlimited bandwidth is assigned to a strict-high priority queue. Queues are scheduled according to the queue number, starting with the highest queue, 7, with decreasing priority down through queue 0. Traffic in higher-numbered queues is always scheduled prior to traffic in lower-numbered queues. In other words, in case of two high-priority queues, the queue with the higher queue number is processed first.

Packets in low-priority queues are transmitted only when strict-high priority queues are empty.

## Scheduler Drop-Profile Maps

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type. The inputs for a drop-profile map are the PLP and the protocol type. The output is the drop profile.

## Scheduler Maps

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map and then associate the scheduler map with an output interface.

If you configure more than the supported number of scheduler maps on a switch or for a port group in a line card, an error is logged in the system log (syslog). On any interface in a port group on a line card or on a switch, if you configure a scheduler map that causes the number of scheduler maps for that port group to exceed the maximum number supported, the default scheduler map is bound to that interface. We recommend that you check the system log for errors (if any) after the commit operation to verify that you have not configured more than the maximum permitted number of scheduler maps.

[Table 6 on page 21](#) shows the number of scheduler maps supported for each port group in a switch or line card.

Table 6: Support for Scheduler Maps on Switches and Line Cards

Switch/Line Card	Number of Port Groups	Port Grouping Details	Number of Scheduler Maps Supported for Each Port Group
EX2200-24T and EX2200-24P switches	1	Ports 0–23 and 4 uplink SFP ports form a port group	5

## Understanding CoS Two-Color Marking

Networks police traffic by limiting the input or output transmission rate of a class of traffic on the basis of user-defined criteria. Policing traffic allows you to control the maximum rate of traffic sent or received on an interface and to partition a network into multiple priority levels or classes of service.

Policers require you to apply limits to the traffic flow and set a consequence for packets that exceed these limits—usually a higher loss priority, so that packets exceeding the policer limits are discarded first.

Juniper Networks EX Series Ethernet Switches support a single-rate two-color marking type of policer, which is a simplified version of Single-Rate-Three-Color marking, defined in RFC 2697, *A Single Rate Three Color Marker*. This type of policer meters traffic based on the configured committed information rate (CIR) and committed burst size (CBS).

The single-rate two-color marker meters traffic and marks incoming packets depending on whether they are smaller than the committed burst size (CBS)—marked green—or exceed it—marked red.

The single-rate two-color marking policer operates in color-blind mode. In this mode, the policer's actions are not affected by any previous marking or metering of the examined packets. In other words, the policer is “blind” to any previous coloring a packet might have had.

## Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. This topic describes how to use rewrite rules to alter the CoS settings. It covers:

This topic covers:

- [How Rewrite Rules Work on page 23](#)
- [Default Rewrite Rule on page 24](#)

### How Rewrite Rules Work

Rewrite rules set the value of the CoS bits within a packet's header. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header. For rewrites to occur, rewrite rules must be explicitly assigned to an interface. Only tagged

Layer 3 interfaces and tagged routed VLAN interfaces (RVIs) automatically rewrite packets by using the default IEEE 802.1p rewrite rule. Multiple rewrite rules of different types can be assigned to a single interface.

**NOTE:** On Juniper Networks EX8200 Ethernet Switches, tagged Layer 3 interfaces and tagged RVIs do not automatically rewrite packets using the default IEEE 802.1p rewrite rule. You must explicitly assign the IEEE 802.1p rewrite rule to these interfaces for rewrites to occur.

Also, only one rewrite rule of each type can be assigned to any interface on an EX8200 switch.

In effect, the rewrite rule performs the opposite function of the behavior aggregate (BA) classifier, which is used when the packet enters the switch. As the packet leaves the switch, the final CoS action is generally the application of a rewrite rule.

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an edge switch to meet the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

**NOTE:** When an IP precedence rewrite rule is active, bits 3, 4, and 5 of the type-of-service (ToS) byte are always reset to zero when code points are rewritten.

## Default Rewrite Rule

To define a rewrite rule on an interface, you can either create your own rewrite rule and enable it on the interface or enable a default rewrite rule. See [“Defining CoS Rewrite Rules \(CLI Procedure\)”](#) on page 80.

[Table 7 on page 25](#) shows the default rewrite-rule mappings. These are based on the default bit definitions of Differentiated Services code point (DSCP), IEEE 802.1p, and IP precedence values and the default forwarding classes. You can configure multiple CoS rewrite rules for DSCP, IP precedence and IEEE 802.1p.

**NOTE:** By default, rewrite rules are not assigned to an interface. You must explicitly assign a user-defined or system-defined rewrite rule to an interface for the rewrites to occur.

When the CoS values of a packet match the forwarding class and packet-loss-priority (PLP) values, the switch rewrites markings on the packet based on the rewrite table.

Table 7: Default Packet Header Rewrite Mappings

Map from Forwarding Class	PLP Value	Map to DSCP/IEEE 802.1p/IP Precedence Value
expedited-forwarding	low	ef
expedited-forwarding	high	ef
assured-forwarding	low	af11
assured-forwarding	high	af12 (DSCP)
best-effort	low	be
best-effort	high	be
network-control	low	nc1/cs6
network-control	high	nc2/cs7

## Understanding Port Shaping and Queue Shaping for CoS on EX Series Switches

If the amount of traffic on a switch's network interface is more than the maximum bandwidth allowed on the interface, it leads to congestion. Port shaping and queue shaping can be used to manage the excess traffic and avoid congestion. Port shaping defines the maximum bandwidth allocated to a port, while queue shaping defines a limit on excess-bandwidth usage per queue.

This topic covers:

- [Port Shaping on page 25](#)
- [Queue Shaping on page 25](#)

### Port Shaping

Port shaping enables you to shape the aggregate traffic through a port or channel to a rate that is less than the line or port rate.

### Queue Shaping

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-priority queue so that the strict-priority queue

does not lock out (or starve) low-priority queues. Similarly, for any queue, you can configure queue shaping.

## Understanding Junos OS EZQoS for CoS Configurations on EX Series Switches

Junos operating system (Junos OS) EZQoS on Juniper Networks EX Series Ethernet Switches eliminates the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

Junos OS CoS allows you to divide traffic into classes and offer various levels of throughput and packet loss when congestion occurs. You can use CoS to ensure that different types of traffic (voice, video, and data) get the bandwidth and consideration they need to meet user expectations and business objectives.

Configuring CoS requires careful consideration of your service needs and thorough planning and design to ensure consistency across all switches in a CoS domain. To configure CoS manually, you must define and fine-tune all CoS components such as classifiers, rewrite rules, forwarding classes, schedulers, and scheduler-maps and then apply these components to the interfaces. Therefore, configuring CoS can be a fairly complex and time-consuming task.

EZQoS works by automatically assigning preconfigured values to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name. You can change the preconfigured values of these parameters to suit your particular application needs.

For using EZQoS, you must identify which switch ports are being used for a specific application (such as VoIP, video, and data) and manually apply the corresponding application-specific EZQoS template to these switch ports.

**NOTE:** Currently, we provide an EZQoS template for configuring CoS for VoIP.

---

**NOTE:** We recommend that you do not use the term EZQoS for defining a classifier.

## Understanding Using CoS with MPLS Networks on EX Series Switches

---

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. See *EX Series Switch Software Features Overview* for a complete list of the Junos OS MPLS features that are supported on specific EX Series switches.

Juniper Networks EX Series Ethernet Switches support Differentiated Service Code Point (DSCP) or IP precedence and IEEE 802.1p CoS classifiers on the customer-edge interfaces of the ingress provider edge (PE) switch. DSCP or IP precedence classifiers are used for Layer 3 packets. IEEE 802.1p is used for Layer 2 packets.

When a packet enters a customer-edge interface of the ingress PE switch, the switch associates the packet with a particular CoS servicing level prior to putting the packet onto the label-switched path (LSP). The switches within the LSP utilize the CoS value set at the ingress PE switch. The CoS value that was embedded in the DSCP, IP precedence, or IEEE 802.1p classifier is translated and encoded in the MPLS header by means of the EXP or experimental bits.

EX Series switches enable a default EXP classifier and a default EXP rewrite rule. You can configure a custom EXP classifier and a custom EXP rewrite rule if you prefer. However, the switch supports only one type of EXP classifier (default or custom) and only one EXP rewrite rule (default or custom).

You do not bind the EXP classifier or the EXP rewrite rule to individual interfaces. The switch automatically and implicitly applies the default or the custom EXP classifier and the default or the custom EXP rewrite rule to the appropriate MPLS-enabled interfaces. Because rewrite rules affect only egress interfaces, the switch applies the EXP rewrite rule only to those MPLS interfaces that are transmitting MPLS packets (not to the MPLS interfaces that are receiving the packets).

This topic includes:

- [Guidelines for Using CoS Classifiers on CCCs on page 27](#)
- [Using CoS Classifiers with IP over MPLS on page 28](#)
- [Default Classifiers and Default Rewrite Rules on page 28](#)
- [EXP Rewrite Rules on page 28](#)
- [Policer on page 29](#)
- [Schedulers on page 29](#)

### Guidelines for Using CoS Classifiers on CCCs

When you are configuring CoS for MPLS over circuit cross-connect (CCC), there are some additional guidelines, as follows:

- You *must* explicitly bind a CoS classifier to the CCC interface on the ingress PE switch.
- You *cannot* use more than one type of DSCP/IP precedence and not more than one type of IEEE 802.1p classifier on the CCC interfaces. Thus, if you configure one CCC

interface to use DSCP1, you cannot configure another CCC interface to use DSCP2. Likewise, if you configure one CCC interface to use IEEE1, you cannot configure another CCC interface on the same switch to use IEEE2. All the CCC interfaces on the switch must use the same DSCP classifier and the same type of IEEE 802.1p classifier.

- You *cannot* configure one CCC interface as DSCP and another CCC interface as IP precedence, because these classifier types overlap.
- You *can* configure one CCC interface as DSCP and another CCC interface as IEEE 802.1p.
- You *can* configure one CCC interface as both DSCP and IEEE 802.1p. If you configure a CCC interface with both these classifiers, the DSCP classifier is used for routing Layer 3 packets and the IEEE 802.1p classifier is used for routing Layer 2 packets.

**NOTE:** You can define multiple types of DSCP, IP precedence, and IEEE 802.1p on the switch and use the different classifier types for the non-CCC interfaces on the switch.

---

## Using CoS Classifiers with IP over MPLS

When you are configuring CoS for IP over MPLS, the customer-edge interface uses the CoS configuration that has been set up for the switch as the default. You do not have to bind a classifier to the customer-edge interface in this case. There are no restrictions regarding using multiple types of DSCP, IP precedence, and IEEE 802.1p on the same switch.

- You can modify the CoS classifier for a particular interface, but it is not required.
- You can configure one interface as DSCP1 and another as DSCP2 and another as IP precedence, and so forth.

## Default Classifiers and Default Rewrite Rules

The default classifiers support only two forwarding classes, **best-effort** and **network-control**, and use only two queues, 0 and 7. However, EX Series switches support up to sixteen forwarding classes and eight queues. To use the additional forwarding classes and queues, create a custom classifier. To modify the code point and loss priority for a specific forwarding class, configure a rewrite rule on the switch. The default rewrite rule for EXP is enabled in the default configuration. However, the default rewrite rules for the other classifiers are not enabled in the default configuration. You can display the default classifier mappings and default rewrite mappings by entering the **show class-of-service** command on the switch.

## EXP Rewrite Rules

When traffic passes from the customer-edge interface to an MPLS interface, the DSCP, IP precedence, or IEEE 802.1p CoS classifier is translated into the EXP bits within the MPLS header. You cannot disable the default EXP rewrite rule, but you can configure your own custom EXP classifier and a custom EXP rewrite rule. You cannot bind the EXP

classifier to individual MPLS interfaces; the switch applies it globally to all the MPLS-enabled interfaces on the switch.

Only one EXP rewrite rule (either default or custom) is supported on a switch. The switch applies it to all the MPLS-enabled egress interfaces.

## Policer

Policing helps to ensure that the amount of traffic forwarded through an LSP never exceeds the requested bandwidth allocation. During periods of congestion (when the total rate of queuing packets exceeds the rate of transmission), any new packets being sent to an interface can be dropped because there is no place to store them. You should configure a policer on the ingress PE switch:

- If you are using MPLS with CCC, you bind the policer to the LSP. You cannot bind a policer to a CCC interface.
- If you are using IP over MPLS, you bind the policer to the **inet-family** customer-edge interface. You cannot bind a policer to the LSP when you are using IP over MPLS.

## Schedulers

The schedulers for using CoS with MPLS are the same as for the other CoS configurations on EX Series switches. Default schedulers are provided for **best-effort** and **network-control** forwarding classes. If you are using **assured-forwarding**, **expedited-forwarding**, or other custom forwarding classes, we recommend that you configure a scheduler to support that forwarding class. See “[Understanding CoS Schedulers](#)” on page 18.

## Understanding CoS Queues on EX8200 Line Cards That Include Oversubscribed Ports

Some line cards available for Juniper Networks EX8200 Ethernet Switches include oversubscribed ports that are combined in logical port groups that share bandwidth. These oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth. You might need to configure CoS queues differently for oversubscribed ports than for line-rate ports.

This topic describes:

- [Oversubscribed Ports on Line Cards on page 30](#)
- [EX8200 Line Cards That Include Oversubscribed Ports on page 30](#)
- [Ingress Queueing on page 31](#)
- [Egress Queues on page 32](#)

### Oversubscribed Ports on Line Cards

Oversubscribed ports on a line card are grouped into logical port groups. A port group collectively supports a certain bandwidth.

An EX8200 switch supports different line cards that provide line-rate and oversubscribed ports. Based on your requirement, you can choose the appropriate line card for an EX8200 switch. Line cards are field-replaceable units (FRUs) that can be installed in the line card slots in an EX8200 switch. In a line-rate EX8200 line card, each port in the line card supports the same amount of bandwidth and a single port can utilize that complete bandwidth. In an oversubscribed line card, a group of ports collectively support a certain total bandwidth and each port in that group can use either a portion or all of the available bandwidth. However, the total utilization of bandwidth by the ports in the group cannot exceed the bandwidth available for that group.

Because the port groups share bandwidth, class-of-service (CoS) ingress and egress queues are handled differently for these shared-bandwidth ports in logical port groups than they are for ports that individually support line-rate bandwidth. Some EX8200 line cards combine both port types, those that share bandwidth across port groups and those that individually support line-rate bandwidth.

### EX8200 Line Cards That Include Oversubscribed Ports

[Table 8 on page 30](#) lists EX8200 line cards that include oversubscribed ports in logical port groups.

**Table 8: EX8200 Line Cards That Include Oversubscribed Ports**

Line Card Model	Name	Number of Oversubscribed Ports/Port Connector
EX8200-40XS	40-port SFP+	40 oversubscribed 10-gigabit SFP+ ports

Table 8: EX8200 Line Cards That Include Oversubscribed Ports (*continued*)

Line Card Model	Name	Number of Oversubscribed Ports/Port Connector
EX8200-2XS-40P	40-port PoE+ with 4-port SFP and 2-port SFP+	40 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors, four small form-factor pluggable (SFP) ports (in which you can install 1-gigabit SFP transceivers) and two SFP+ ports
EX8200-2XS-40T	40-port RJ-45 with 4-port SFP and 2-port SFP+	40 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors, four SFP ports (in which you can install 1-gigabit small form-factor pluggable (SFP) transceivers) and two SFP+ ports
EX8200-48PL	48-port PoE+ 20 Gbps	48 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors
EX8200-48TL	48-port RJ-45 20 Gbps	48 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors

## Ingress Queueing

Classification of packets occurs in two phases for the oversubscribed ports in the port groups.

- [Preclassification of Packets and Port Ingress Queueing on page 31](#)
- [Full Classification of Packets and Fabric Ingress Queueing on page 32](#)

### Preclassification of Packets and Port Ingress Queueing

Packets entering ports are forwarded to one of the ingress queues. The ingress queues schedule traffic from ports into the Packet Forwarding Engine.

The ingress queues are:

- **Low-priority queue**—Each interface in the line card has one low-priority queue. Traffic on these queues is scheduled using the shaped deficit weighted round-robin (SDWRR) algorithm, with each interface's queue having equal weight.
- **High-priority queue**—A set of interfaces in the line card shares a single high-priority queue. Traffic on this queue is scheduled by strict-high priority. The switch always sends critical network control packets on the high-priority queue.
- **Line-rate priority queue**—The packets entering line-rate ports are forwarded to this queue. Traffic on this queue is scheduled by strict priority and is always given higher priority than the traffic on the high-priority queue. This queue is used only in the following oversubscribed line cards for an EX8200 switch:
  - EX8200-2XS-40P
  - EX8200-2XS-40T

For the purpose of port ingress queuing on oversubscribed ports, packets are classified only by behavior aggregate (BA) classification. To control the ingress queue (high priority or low priority) to which packets are sent, configure a BA classifier on the physical port and specify switch fabric priorities for the forwarding classes. On EX8200 switches, fabric priority determines the priority of packets ingressing the switch fabric. For the EX8200-40XS line card, fabric priority also determines the priority of packets ingressing the port group.

By default, the fabric priority for all forwarding classes is low. To direct packets belonging to a forwarding class to the high-priority ingress queue, set the fabric priority to high for that class.

Critical network-control packets and line-rate packets are handled differently from other packets. Instead of using the BA classifier to classify critical network-control packets, the switch always sends critical network packets to the high-priority queue. The line-rate packets are always sent to the line-rate priority queue. This difference in handling of network-control packets and line-rate packets ensures that these packets are not dropped because of congestion on the shared-bandwidth ports.

### **Full Classification of Packets and Fabric Ingress Queuing**

---

When packets (apart from line-rate and critical network-control packets) from an oversubscribed port reach the Packet Forwarding Engine, it performs full packet classification, along with other actions, such as multifield (MF) classification, traffic policing, and storm control. It then schedules and queues the packets for ingressing the fabric. The fabric priority associated with the forwarding class determines whether packets are sent to the low priority or high-priority ingress queues.

## **Egress Queues**

Each EX Series switch interface supports eight egress CoS queues. You can map up to 16 forwarding classes to these queues.

In the EX8200-40XS line card, all interfaces in a port group share a single set of eight egress queues at the Packet Forwarding Engine. Egress traffic is fanned out from the Packet Forwarding Engine queues to the corresponding queues for the individual ports. For this reason, the interfaces in a port group must share the same scheduler map configuration. If you configure different scheduler map configurations for the different interfaces in a port group, an error is logged in the system log and the default scheduler map is used for all ports in the port group.

## Understanding Priority-Based Flow Control

---

Priority-based flow control (PFC), IEEE standard 802.1Qbb, is a link-level flow control mechanism. The flow control mechanism is similar to that used by IEEE 802.3x Ethernet PAUSE, but it operates on individual priorities. Instead of pausing all traffic on a link, PFC allows you to selectively pause traffic according to its class.

This topic describes:

- [Reliability of Packet Delivery in Standard Ethernet Networks and in Layer 2 Networks on page 33](#)
- [Calculations for Buffer Requirements When Using PFC PAUSE on page 33](#)
- [How PFC and Congestion Notification Profiles Work on page 34](#)

### Reliability of Packet Delivery in Standard Ethernet Networks and in Layer 2 Networks

Standard Ethernet does not guarantee that a packet injected into the network will arrive at its intended destination. Reliability is provided by upper-layer protocols. Generally, a network path consists of multiple hops between the source and destination. A problem arises when transmitters send packets faster than receivers can accept them. When receivers run out of available buffer space to hold incoming flows, they silently drop additional incoming packets. This problem is generally resolved by upper-layer protocols that detect the drops and request retransmission.

Applications that require reliability in Layer 2 must have flow control that includes feedback from a receiver to a sender regarding buffer availability. Using IEEE 802.3x Ethernet PAUSE control frames, a receiver can generate a MAC control frame and send a PAUSE request to a sender when a specified threshold of receiver buffer has been filled in order to prevent buffer overflow. Upon receiving a PAUSE frame, the sender stops transmissions of any new packets until the receiver has sufficient buffer space to accept them again. The disadvantage of using Ethernet PAUSE is that it operates on the entire link, which might be carrying multiple traffic flows. Some traffic flows do not need flow control in Layer 2, because they are carrying applications that rely on upper-layer protocols for reliability. PFC enables you to configure Layer 2 flow control selectively for the traffic that requires it, such as Fibre Channel over Ethernet (FCoE) traffic, without impacting other traffic on the link. You can also enable PFC for other traffic types, such as iSCSI.

### Calculations for Buffer Requirements When Using PFC PAUSE

Receivers must ensure that a PFC PAUSE frame is sent while there is sufficient receive buffer to absorb the data that might continue to be received while the system is responding to the PFC PAUSE.

When you calculate buffer requirements, consider the following factors:

- Processing and queuing delay of the PFC PAUSE—In general, the time to detect the lack of sufficient buffer space and to transmit the PFC PAUSE is negligible. However, delays can occur if the switch detects reduced buffer space occurs just as the transmitter is beginning to transmit a maximum length frame.
- Propagation delay across the media—The delay amount depends on the length and speed of the physical link.
- Response time to the PFC PAUSE frame
- Propagation delay across the media on the return path

**NOTE:** We recommend that you configure at least 20 percent of the buffer size for the queue that is using PFC and that you do not specify the exact option.

## How PFC and Congestion Notification Profiles Work

PFC is triggered when the incoming frame has a User Priority (UP) field that matches the three-bit pattern specified for the PFC congestion notification profile, which you have configured. [Table 9 on page 34](#) shows the one-to-one mapping between the UP field of an IEEE 802.1Q tagged frame, the traffic class, and the egress queue. In addition to setting a PFC congestion notification profile on an ingress port, you must set a forwarding class to match the priority specified in the PFC congestion notification profile and to forward the frame to the appropriate queue.

Juniper Networks EX Series Ethernet Switches support up to 6 traffic classes and allow you to associate those classes with 6 different congestion notification profiles. (The switches support up to 16 forwarding classes. )

**Table 9: Input for PFC Congestion Notification Profile and Mapping to Traffic Class and Egress Queue**

UP Field of IEEE-802.1Q Tagged Frame	Traffic Class	Egress Queue
000	TC 0	queue 0
001	TC 1	queue 1
010	TC 2	queue 2
011	TC 3	queue 3
100	TC 4	queue 4
101	TC 5	queue 5

## CHAPTER 2

# Examples: CoS Configuration

- [Example: Configuring CoS on EX Series Switches on page 37](#)
- [Example: Combining CoS with MPLS on EX Series Switches on page 52](#)

### Example: Configuring CoS on EX Series Switches

---

Configure class of service (CoS) on your switch to manage traffic so that when the network experiences congestion and delay, critical applications are protected. Using CoS, you can divide traffic on your switch into classes and provide various levels of throughput and packet loss. This is especially important for traffic that is sensitive to jitter and delay, such as voice traffic.

This example shows how to configure CoS on a single EX Series switch in the network.

- [Requirements on page 37](#)
- [Overview and Topology on page 37](#)
- [Configuration on page 40](#)
- [Verification on page 50](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One Juniper Networks EX3200 switch

### Overview and Topology

This example uses the topology shown in [Figure 2 on page 38](#).

Figure 2: Topology for Configuring CoS

The topology for this configuration example consists of one EX Series switch at the access layer.

The EX Series access switch is configured to support VLAN membership. Switch ports **ge-0/0/0** and **ge-0/0/1** are assigned to the **voice-vlan** for two VoIP phones. Switch port **ge-0/0/2** is assigned to the **camera-vlan** for the surveillance camera. Switch ports **ge-0/0/3**, **ge-0/0/4**, **ge-0/0/5**, and **ge-0/0/6** are assigned to the **server-vlan** for the servers hosting various applications such as those provided by Citrix, Microsoft, Oracle, and SAP.

Table 10 on page 39 shows the VLAN configuration components.

Table 10: Configuration Components: VLANs

VLAN Name	VLAN ID	VLAN Subnet and Available IP Addresses	VLAN Description
voice-vlan	10	192.168.1.0/32 192.168.1.1 through 192.168.1.11  192.168.1.12 is the subnet's broadcast address.	Voice VLAN used for employee VoIP communication.
camera-vlan	20	192.168.1.13/32 192.168.1.14 through 192.168.1.20  192.168.1.21 is the subnet's broadcast address.	VLAN for the surveillance cameras.
server-vlan	30	192.168.1.22/32 192.168.1.23 through 192.168.1.35  192.168.1.36 is the subnet's broadcast address.	VLAN for the servers hosting enterprise applications.

Ports on the EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. [Table 11 on page 39](#) shows the switch interfaces that are assigned to the VLANs and the IP addresses for devices connected to the switch ports:

Table 11: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

Interfaces	VLAN Membership	IP Addresses	Port Devices
ge-0/0/0, ge-0/0/1	voice-vlan	192.168.1.1 through 192.168.1.2	Two VoIP telephones.
ge-0/0/2	camera-vlan	192.168.1.14	Surveillance camera.
ge-0/0/3, ge-0/0/4, ge-0/0/5, ge-0/0/6	server-vlan	192.168.1.23 through 192.168.1.26	Four servers hosting applications such as those provided by Citrix, Microsoft, Oracle, and SAP.

**NOTE:** This example shows how to configure CoS on a single EX Series switch. This example does not consider across-the-network applications of CoS in which you might implement different configurations on ingress and egress switches to provide differentiated treatment to different classes across a set of nodes in a network.

## Configuration

### CLI Quick Configuration

To quickly configure CoS, copy the following commands and paste them into the switch terminal window:

```
[edit]
set class-of-service forwarding-classes class app queue-num 5
set class-of-service forwarding-classes class mail queue-num 1
set class-of-service forwarding-classes class db queue-num 2
set class-of-service forwarding-classes class erp queue-num 3
set class-of-service forwarding-classes class video queue-num 4
set class-of-service forwarding-classes class best-effort queue-num 0
set class-of-service forwarding-classes class voice queue-num 6
set class-of-service forwarding-classes class network-control queue-num 7
set firewall family ethernet-switching filter voip_class term voip from source-address 192.168.1.1/32
set firewall family ethernet-switching filter voip_class term voip from source-address 192.168.1.2/32
set firewall family ethernet-switching filter voip_class term voip from protocol udp
set firewall family ethernet-switching filter voip_class term voip from source-port 2698
set firewall family ethernet-switching filter voip_class term voip then forwarding-class voice
loss-priority low
set firewall family ethernet-switching filter voip_class term network_control from precedence
[net-control internet-control]
set firewall family ethernet-switching filter voip_class term network_control then forwarding-class
network-control loss-priority low
set firewall family ethernet-switching filter voip_class term best_effort_traffic then

set class-of-service schedulers nc-sched buffer-size percent 5
set class-of-service schedulers nc-sched priority strict-high
set class-of-service schedulers nc-sched transmit-rate percent 5
set class-of-service schedulers be-sched buffer-size percent 35
set class-of-service schedulers be-sched priority low
set class-of-service schedulers be-sched transmit-rate percent 35
set class-of-service scheduler-maps ethernet-cos-map forwarding-class voice scheduler
voice-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class video scheduler
video-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class app scheduler app-sched

```

```

set class-of-service scheduler-maps ethernet-cos-map forwarding-class mail scheduler mail-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class db scheduler db-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class erp scheduler erp-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class network-control
scheduler nc-sched
set class-of-service scheduler-maps ethernet-cos-map forwarding-class best-effort scheduler
be-sched
set class-of-service interfaces ge-0/0/20 scheduler-map ethernet-cos-map

```

### Step-by-Step Procedure

To configure and apply CoS:

1. Configure one-to-one mapping between eight forwarding classes and eight queues:

```

[edit class-of-service]
user@switch# set forwarding-classes class app queue-num 5
user@switch# set forwarding-classes class mail queue-num 1
user@switch# set forwarding-classes class db queue-num 2
user@switch# set forwarding-classes class erp queue-num 3
user@switch# set forwarding-classes class video queue-num 4
user@switch# set forwarding-classes class best-effort queue-num 0
user@switch# set forwarding-classes class voice queue-num 6
user@switch# set forwarding-classes class network-control queue-num 7

```

2. Define the firewall filter **voip\_class** to classify the VoIP traffic:

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class

```

3. Define the term **voip**:

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class term voip from
source-address 192.168.1.1/32
user@switch# set family ethernet-switching filter voip_class term voip from
source-address 192.168.1.2/32
user@switch# set family ethernet-switching filter voip_class term voip protocol udp
user@switch# set family ethernet-switching filter voip_class term voip source-port
2698
user@switch# set family ethernet-switching filter voip_class term voip then
forwarding-class voice loss-priority low

```

4. Define the term **network\_control**:

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class term network_control from
precedence [net-control internet-control]
user@switch# set family ethernet-switching filter voip_class term network_control then
forwarding-class network-control loss-priority low

```

5. Define the term **best\_effort\_traffic** with no match conditions:

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class term best_effort_traffic
then forwarding-class best-effort loss-priority low

```

6. Apply the firewall filter **voip\_class** as an input filter to the interfaces for the VoIP phones:

```

[edit interfaces]
user@switch# set ge-0/0/0 description phone1-voip-ingress-port
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input voip_class
user@switch# set ge-0/0/1 description phone2-voip-ingress-port

```

- ```

user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input voip_class

```
7. Define the firewall filter **video\_class** to classify the video traffic:
 

```

[edit firewall]
user@switch# set family ethernet-switching filter video_class

```
  8. Define the term **video**:
 

```

[edit firewall]
user@switch# set family ethernet-switching filter video_class term video from
source-address 192.168.1.14/32
user@switch# set family ethernet-switching filter video_class term video protocol udp
user@switch# set family ethernet-switching filter video_class term video source-port
2979
user@switch# set family ethernet-switching filter video_class term video then
forwarding-class video loss-priority low

```
  9. Define the term **network\_control** (for the **video\_class** filter):
 

```

[edit firewall]
user@switch# set family ethernet-switching filter video_class term network_control
from precedence [net-control internet-control]
user@switch# set family ethernet-switching filter video_class term network_control
then forwarding-class network-control loss-priority low

```
  10. Define the term **best\_effort\_traffic** (for the **video\_class** filter):
 

```

[edit firewall]
user@switch# set family ethernet-switching filter video_class term best_effort_traffic
then forwarding-class best-effort loss-priority low

```
  11. Apply the firewall filter **video\_class** as an input filter to the interface for the surveillance camera:
 

```

[edit interfaces]
user@switch# set ge-0/0/2 description video-ingress-port
user@switch# set ge-0/0/2 unit 0 family ethernet-switching filter input video_class

```
  12. Define the firewall filter **app\_class** to classify the application server traffic:
 

```

[edit firewall]
user@switch# set family ethernet-switching filter app_class

```
  13. Define the term **app**:
 

```

[edit firewall]
user@switch# set family ethernet-switching filter app_class term app from
source-address 192.168.1.23/32
user@switch# set family ethernet-switching filter app_class term app protocol tcp
user@switch# set family ethernet-switching filter app_class term app source-port [1494
2512 2513 2598 2897]
user@switch# set family ethernet-switching filter app_class term app then
forwarding-class app loss-priority low

```
  14. Define the term **mail**:
 

```

[edit firewall]
user@switch# set family ethernet-switching filter app_class term mail from
source-address 192.168.1.24/32
user@switch# set family ethernet-switching filter app_class term mail protocol tcp
user@switch# set family ethernet-switching filter app_class term mail source-port [25
143 389 691 993 3268 3269]

```

```
user@switch# set family ethernet-switching filter app_class term mail then forwarding-class mail loss-priority low
```

15. Define the term **db**:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term db from source-address 192.168.1.25/32
user@switch# set family ethernet-switching filter app_class term db protocol tcp
user@switch# set family ethernet-switching filter app_class term db source-port [1521 1525 1527 1571 1810 2481]
user@switch# set family ethernet-switching filter app_class term db then forwarding-class db loss-priority low
```

16. Define the term **erp**:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term erp from source-address 192.168.1.26/32
user@switch# set family ethernet-switching filter app_class term erp protocol tcp
user@switch# set family ethernet-switching filter app_class term erp source-port [3200 3300 3301 3600]
user@switch# set family ethernet-switching filter app_class term erp then forwarding-class erp loss-priority low
```

17. Define the term **network\_control** (for the **app\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term network_control from precedence [net-control internet-control]
user@switch# set family ethernet-switching filter app_class term network_control then forwarding-class network-control loss-priority low
```

18. Define the term **best\_effort\_traffic** (for the **app\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term best_effort_traffic then forwarding-class best-effort loss-priority low
```

19. Apply the firewall filter **app\_class** as an input filter to the interfaces for the servers hosting applications:

```
[edit interfaces]
user@switch# set ge-0/0/3 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/4 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/5 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input app_class
```

20. Configure schedulers:

```
[edit class-of-service]
user@switch# set schedulers voice-sched buffer-size percent 10
user@switch# set schedulers voice-sched priority strict-high
user@switch# set schedulers voice-sched transmit-rate percent 10
user@switch# set schedulers video-sched buffer-size percent 15
user@switch# set schedulers video-sched priority low
user@switch# set schedulers video-sched transmit-rate percent 15
user@switch# set schedulers app-sched buffer-size percent 10
user@switch# set schedulers app-sched priority low
user@switch# set schedulers app-sched transmit-rate percent 10
user@switch# set schedulers mail-sched buffer-size percent 5
user@switch# set schedulers mail-sched priority low
```

```

user@switch# set schedulers mail-sched transmit-rate percent 5
user@switch# set schedulers db-sched buffer-size percent 10
user@switch# set schedulers db-sched priority low
user@switch# set schedulers db-sched transmit-rate percent 10
user@switch# set schedulers erp-sched buffer-size percent 10
user@switch# set schedulers erp-sched priority low
user@switch# set schedulers erp-sched transmit-rate percent 10
user@switch# set schedulers nc-sched buffer-size percent 5
user@switch# set schedulers nc-sched priority strict-high
user@switch# set schedulers nc-sched transmit-rate percent 5
user@switch# set schedulers be-sched buffer-size percent 35
user@switch# set schedulers be-sched priority low
user@switch# set schedulers be-sched transmit-rate percent 35

```

21. Assign the forwarding classes to schedulers with the scheduler map **ethernet-cos-map**:

```

[edit class-of-service]
user@switch# set scheduler-maps ethernet-cos-map forwarding-class voice scheduler
voice-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class video scheduler
video-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class app scheduler
app-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class mail scheduler
mail-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class db scheduler
db-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class erp scheduler
erp-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class network-control
scheduler nc-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class best-effort
scheduler be-sched

```

22. Associate the scheduler map with the outgoing interface:

```

[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map

```

**Results** Display the results of the configuration:

```

user@switch# show firewall

firewall family ethernet-switching {
  filter voip_class {
    term voip {
      from {

}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues on page 50](#)
- [Verifying That the Forwarding Classes Have Been Assigned to Schedulers on page 51](#)
- [Verifying That the Scheduler Map Has Been Applied to the Interface on page 52](#)

### Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues

**Purpose** Verify that the following forwarding classes **app**, **db**, **erp**, **mail**, **video**, and **voice** have been defined and mapped to queues.

**Action** user@switch> **show class-of-service forwarding-class**

| Forwarding class | ID | Queue |
|------------------|----|-------|
| app              | 0  | 5     |
| db               | 1  | 2     |
| erp              | 2  | 3     |
| best-effort      | 3  | 0     |
| mail             | 4  | 1     |
| voice            | 5  | 6     |
| video            | 6  | 4     |
| network-control  | 7  | 7     |

**Meaning** This output shows that the forwarding classes have been defined and mapped to appropriate queues.

## Verifying That the Forwarding Classes Have Been Assigned to Schedulers

**Purpose** Verify that the forwarding classes have been assigned to schedulers.

**Action** user@switch> show class-of-service scheduler-map

```
Scheduler map: ethernet-cos-map, Index: 2
  Scheduler: voice-sched, Forwarding class: voice, Index: 22
    Transmit rate: 5 percent, Rate Limit: none, Buffer size: 15 percent,
    Priority: Strict-high
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
      High          TCP      1      <default-drop-profile>

  Scheduler: video-sched, Forwarding class: video, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
      High          TCP      1      <default-drop-profile>

  Scheduler: app-sched, Forwarding class: app, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
      High          TCP      1      <default-drop-profile>

  Scheduler: mail-sched, Forwarding class: mail, Index: 22
    Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
    Priority: low
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
      High          TCP      1      <default-drop-profile>

  Scheduler: db-sched, Forwarding class: db, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
      High          TCP      1      <default-drop-profile>

  Scheduler: erp-sched, Forwarding class: erp, Index: 22
    Transmit rate: 10 percent, Rate Limit: none, Buffer size: 10 percent,
    Priority: low
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
      High          TCP      1      <default-drop-profile>

  Scheduler: be-sched, Forwarding class: best-effort, Index: 20
    Transmit rate: 35 percent, Rate Limit: none, Buffer size: 35 percent,
    Priority: low
    Drop profiles:
      Loss priority  Protocol  Index  Name
      High          non-TCP   1      <default-drop-profile>
```

```

High          TCP          1    <default-drop-profile>

Scheduler: nc-sched, Forwarding class: network-control, Index: 22
Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
Priority: Strict-high
Drop profiles:
  Loss priority  Protocol  Index  Name
  High          non-TCP   1      <default-drop-profile>
  High          TCP       1      <default-drop-profile>

```

**Meaning** This output shows that the forwarding classes have been assigned to schedulers.

### Verifying That the Scheduler Map Has Been Applied to the Interface

**Purpose** Verify that the scheduler map has been applied to the interface.

```

Action  user@switch> show class-of-service interface
...
Physical interface: ge-0/0/20, Index: 149
Queues supported: 8, Queues in use: 8
Scheduler map: ethernet-cos-map, Index: 43366
Input scheduler map: <default>, Index: 3
...

```

**Meaning** This output shows that the scheduler map (**ethernet-cos-map**) has been applied to the interface (**ge-0/0/20**).

## Example: Combining CoS with MPLS on EX Series Switches

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. The CoS value is included within the MPLS label, which is passed through the network, enabling end-to-end CoS across the network.

MPLS services are often used to ensure better performance for low-latency applications such as VoIP and other business-critical functions. These applications place specific demands on a network for successful transmission. CoS gives you the ability to control

the mix of bandwidth, delay, jitter, and packet loss while taking advantage of the MPLS labeling mechanism.

This example shows how to configure CoS on an MPLS network that is using a unidirectional circuit cross-connect (CCC) from the ingress provider edge (PE) switch to the egress PE switch. for the customer-edge interface of the ingress provider edge (PE) switch. It describes adding the configuration of CoS components to the ingress PE switch, the egress PE switch, and the core provider switches of the existing MPLS network. Because of the unidirectional configuration, the DSCP classifier needs to be configured only on the ingress PE switch.

- [Requirements on page 53](#)
- [Overview and Topology on page 53](#)
- [Configuring the Local PE Switch on page 55](#)
- [Configuring the Remote PE Switch on page 57](#)
- [Configuring the Provider Switch on page 58](#)
- [Verification on page 59](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 10.1 or later for EX Series switches
- Three EX Series switches

Before you configure CoS with MPLS, be sure you have:

Configured an MPLS network with two PE switches and one provider switch. See Example: Configuring MPLS on EX Series Switches. This example assumes that an MPLS network has been configured using a cross circuit-connect (CCC).

## Overview and Topology

This example describes adding custom classifiers and custom rewrite rules to switches in an MPLS network that is using MPLS over CCC.

It is a unidirectional configuration. Therefore, you need to configure custom classifiers and custom rewrite rules as follows:

- On the ingress PE switch: custom DSCP classifier and custom EXP rewrite rule
- On the egress PE switch: custom EXP classifier
- On the provider switch: customer EXP classifier and custom EXP rewrite rule

**NOTE:** You can also configure schedulers and shapers as needed. If you are using assured-forwarding, expedited-forwarding, or other custom forwarding classes, we recommend that you configure a scheduler to support that forwarding class. See [“Defining CoS Schedulers \(CLI Procedure\)” on page 74](#).

The example creates a custom DSCP classifier (**dscp1**) on the ingress PE switch and binds this classifier to the CCC interface. It includes configuration of a policer on the ingress PE switch. The policer is applied as a filter on the label-switched path (LSP) **lsp\_to\_pe2\_ge1** (created in Example: Configuring MPLS on EX Series Switches) to ensure that the amount of traffic forwarded through the LSP never exceeds the requested bandwidth allocation.

This example creates a custom EXP rewrite rule (**exp1**) on the ingress PE switch, specifying a loss-priority and code point to be used for the expedited-forwarding class as the packet travels through the LSP. The switch applies this custom rewrite rule on the core interfaces **ge-0/0/5.0** and **ge-0/0/6.0**, which are the egress interfaces for this switch.

[Table 12 on page 54](#) shows the CoS configuration components added to the ingress PE switch.

**Table 12: CoS Configuration Components on the Ingress PE Switch**

| Property                                           | Settings                                | Description                                                                                                                                             |

| Core interfaces                                    | <b>ge-0/0/5.0</b> and <b>ge-0/0/6.0</b> | Interfaces that transmit MPLS packets to other switches within the MPLS network.<br><br>The EXP rewrite rule is applied implicitly to these interfaces. |

[Table 13 on page 54](#) shows the CoS configuration components added to the egress PE switch in this example.

**Table 13: CoS Configuration Components of the Egress PE Switch**

| Property                             | Settings         | Description                   |
|--------------------------------------|------------------|-------------------------------|
| Remote provider edge switch hardware | EX Series switch | PE-2                          |
| Custom EXP classifier                | <b>exp1</b>      | Name of custom EXP classifier |

Table 13: CoS Configuration Components of the Egress PE Switch (*continued*)

| Property                | Settings                         | Description                                                                                                                                                                    |
|-------------------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customer-edge interface | <b>ge-0/0/1.0</b>                | Interface that transmits packets from this network to devices outside the network. No CoS classifier is specified for this interface. A scheduler can be specified.            |
| Core interfaces         | <b>ge-0/0/7.0 and ge-0/0/8.0</b> | Core interfaces on PE-2 that receive MPLS packets from the provider switch. The EXP classifier is enabled by default on the switch and applied implicitly to these interfaces. |

Table 14 on page 55 shows the MPLS configuration components used for the provider switch in this example.

Table 14: CoS Configuration Components of the Provider Switch

| Property                                                                        | Settings                         | Description                                                                                                                                                                                         |
|---------------------------------------------------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Provider switch hardware                                                        | EX Series switch                 | Transit switch within the MPLS network configuration.                                                                                                                                               |
| Custom EXP classifier                                                           | <b>exp1</b>                      | Name of the custom EXP classifier.                                                                                                                                                                  |
| Custom EXP rewrite rule                                                         | <b>e1</b>                        | Name of the custom EXP rewrite rule.                                                                                                                                                                |
| Core interfaces receiving packets from other MPLS switches.                     | <b>ge-0/0/5.0 and ge-0/0/6.0</b> | Interfaces that connect the provider switch to the ingress PE switch (PE-1). The EXP classifier is enabled by default on the switch and applied implicitly to these interfaces.                     |
| Core interfaces transmitting packets to other switches within the MPLS network. | <b>ge-0/0/7.0 and ge-0/0/8.0</b> | Interfaces that transmit packets to the egress PE (PE-2). The EXP rewrite rule is applied implicitly on these interfaces. Schedulers can also be specified and will be applied to these interfaces. |

## Configuring the Local PE Switch

**CLI Quick Configuration** To quickly configure a custom DSCP classifier, custom EXP rewrite rule, and a policer on the local PE switch, copy the following commands and paste them into the switch terminal window of PE-1:

```
[edit]
set class-of-service classifiers dscp dscp1 import default
set class-of-service classifiers dscp dscp1 forwarding-class expedited-forwarding loss-priority
low code-points 000111
set class-of-service rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low
code-point 111
set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
set firewall policer mypolicer if-exceeding bandwidth-limit 500m
```

```

set firewall policer mypolicer if-exceeding burst-size-limit 33553920
set firewall policer mypolicer then discard
set firewall family any filter myfilter term t1 then policer mypolicer
set protocols mpls label-switched-path lsp_to_pe2_ge1 to 127.1.1.3 policing filter myfilter

```

### Step-by-Step Procedure

To configure a custom DSCP classifier, custom EXP rewrite rule, and a policer on the ingress PE switch:

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

```

[edit class-of-service]
user@switch# set classifiers dscp dscp1 import default

```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

```

[edit class-of-service]
user@switch# set classifiers dscp dscp1 forwarding-class expedited-forwarding
loss-priority low code-points 000111

```

3. Specify the values for the custom EXP rewrite rule, e1:

```

[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111

```

4. Bind the DSCP classifier to the CCC interface:

```

[edit ]
user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1

```

5. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the LSP:

```

[edit firewall]
set policer mypolicer if-exceeding bandwidth-limit 500m

```

6. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

```

[edit firewall policer]
set mypolicer if-exceeding burst-size-limit 33553920

```

7. Discard traffic that exceeds the rate limits for this policer:

```

[edit firewall policer]
set mypolicer then discard

```

8. To reference the policer, configure a filter term that includes the policer action:

```

[edit firewall]
user@switch# set family any filter myfilter term t1 then policer mypolicer

```

9. Apply the filter to the LSP:

```

[edit protocols mpls]
set label-switched-path lsp_to_pe2_ge1 policing filter myfilter

```

**Results** Display the results of the configuration:

```
[edit]
```

```

user@switch# show
class-of-service {
  classifiers {
    dscp dscp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 000111;
      }
    }
  }
  interfaces {
    ge-0/0/1 {
      unit 0 {
        classifiers {
          dscp dscp1;
        }
      }
    }
  }
  rewrite-rules {
    exp e1 {
      forwarding-class expedited-forwarding {
        loss-priority low code-point 111;
      }
    }
  }
  firewall {
    family any {
      filter myfilter {
        term t1 {
          then policer mypolicer;
        }
      }
    }
    policer mypolicer {
      if-exceeding {
        bandwidth-limit 500m;
        burst-size-limit 33553920;
      }
      then discard;
    }
  }
}

```

## Configuring the Remote PE Switch

**CLI Quick Configuration** To quickly configure a custom EXP classifier on the remote PE switch, copy the following commands and paste them into the switch terminal window of PE-2:

```

[edit]
set class-of-service classifiers exp exp1 import default
set class-of-service classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low
code-points 010

```

- Step-by-Step Procedure** To configure a custom EXP classifier on the egress PE switch:
1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:  

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```
  2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:  

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show
class-of-service {
  classifiers {
    exp exp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 010;
      }
    }
  }
}
```

## Configuring the Provider Switch

**CLI Quick Configuration** To quickly configure a custom EXP classifier and a custom EXP rewrite rule on the provider switch, copy the following commands and paste them into the switch terminal window of the provider switch:

```
[edit]
set class-of-service classifiers exp exp1 import default
set class-of-service classifiers exp exp1 forwarding-class expedited-forwarding loss-priority low
code-points 010
set class-of-service rewrite-rules exp e1 forwarding-class expedited-forwarding loss-priority low
code-point 111
```

- Step-by-Step Procedure** To configure a custom EXP classifier and a custom EXP rewrite rule on the provider switch:
1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:  

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```
  2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:  

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```
  3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show
class-of-service {
  classifiers {
    exp exp1 {
      import default;
      forwarding-class expedited-forwarding {
        loss-priority low code-points 010;
      }
    }
  }
  rewrite-rules {
    exp e1 {
      forwarding-class expedited-forwarding {
        loss-priority low code-point 111;
      }
    }
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Policer Firewall Filter Is Operational on page 59](#)
- [Verifying That the CoS Classifiers Are Going to the Right Queue on page 59](#)
- [Verifying the CoS Forwarding Table Mapping on page 62](#)
- [Verifying the Rewrite Rules on page 63](#)

### Verifying That the Policer Firewall Filter Is Operational

**Purpose** Verify the operational state of the policer that is configured on the ingress PE switch.

|               |                            |         |  |
|---------------|----------------------------|---------|--|
| <b>Action</b> | user@switch> show firewall |         |  |
|               | Filter: myfilter           |         |  |
|               | Policers:                  |         |  |
|               | Name                       | Packets |  |
|               | mypolicer-t1               | 0       |  |

**Meaning** This output shows that the firewall filter **mypolicer** has been created.

### Verifying That the CoS Classifiers Are Going to the Right Queue

**Purpose** Verify that the CoS classifiers are going to the right queue.

**Action** user@switch> show class-of-service forwarding-table classifier

Classifier table index: 7, # entries: 64, Table type: DSCP

| Entry # | Code point | Forwarding-class # | PLP |
|---------|------------|--------------------|-----|
| 0       | 000000     | 0                  | 0   |
| 1       | 000001     | 0                  | 0   |
| 2       | 000010     | 0                  | 0   |
| 3       | 000011     | 0                  | 0   |
| 4       | 000100     | 0                  | 0   |
| 5       | 000101     | 0                  | 0   |

| 61 | 111101 | 3 | 0 |
| 62 | 111110 | 3 | 0 |
| 63 | 111111 | 3 | 0 |

**Meaning** This output shows that a new DSCP classifier has been created, index **9346**, on the ingress PE switch (PE-1).

#### Verifying the CoS Forwarding Table Mapping

**Purpose** For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.

**Action** `user@switch>show class-of-service forwarding-table classifier mapping`

Table Index/

| Interface  | Index | Q num | Table type |
|------------|-------|-------|------------|
| ge-0/0/1.0 | 92    | 9346  | DSCP       |

**Meaning** The results show that the new DSCP classifier, index number **9346**, is bound to interface **ge-0/0/1.0**.

### Verifying the Rewrite Rules

**Purpose** Display mapping of the queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.

**Action** `user@switch>show class-of-service forwarding-table rewrite-rule`

Rewrite table index: 31, # entries: 4, Table type: DSCP

| FC# | Low bits | State   | High bits | State   |
|-----|----------|---------|-----------|---------|
| 0   | 000000   | Enabled | 000000    | Enabled |
| 1   | 101110   | Enabled | 101110    | Enabled |
| 2   | 001010   | Enabled | 001100    | Enabled |
| 3   | 110000   | Enabled | 111000    | Enabled |

Rewrite table index: 34, # entries: 4, Table type: IEEE 802.1

| FC# | Low bits | State   | High bits | State   |
|-----|----------|---------|-----------|---------|
| 0   | 000      | Enabled | 001       | Enabled |
| 1   | 010      | Enabled | 011       | Enabled |
| 2   | 100      | Enabled | 101       | Enabled |
| 3   | 110      | Enabled | 111       | Enabled |

Rewrite table index: 35, # entries: 4, Table type: IPv4 precedence

| FC# | Low bits | State   | High bits | State   |
|-----|----------|---------|-----------|---------|
| 0   | 000      | Enabled | 000       | Enabled |
| 1   | 101      | Enabled | 101       | Enabled |
| 2   | 001      | Enabled | 001       | Enabled |
| 3   | 110      | Enabled | 111       | Enabled |

Rewrite table index: 9281, # entries: 1, Table type: EXP

| FC# | Low bits | State   | High bits | State    |
|-----|----------|---------|-----------|----------|
| 1   | 111      | Enabled | 000       | Disabled |

**Meaning** This output shows that a new EXP classifier with the index number **9281** has been created.

## Configuring CoS (J-Web Procedure)

---

The Class of Service Configuration pages allow you to configure the Junos CoS components. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level

for each queue. After defining the CoS components you must assign classifiers to the required physical and logical interfaces.

Using the Class of Service Configuration pages, you can configure various CoS components individually or in combination to define particular CoS services.

To configure CoS components :

1. In the J-Web interface, select **Configure>Class of Service**.
2. On the Class of Service Configuration page, select one of the following options depending on the CoS component that you want to define. Enter information into the pages as described in the respective table:
  - To define or edit CoS value aliases, select **CoS Value Aliases** .
  - To define or edit forwarding classes and assign queues, select **Forwarding Classes**.
  - To define or edit classifiers, select **Classifiers** .
  - To define or edit rewrite rules, select **Rewrite Rules**.
  - To define or edit schedulers, select **Schedulers**.
  - To define or edit virtual channel groups, select **Interface Associations**.
3. Click **Apply** after completing configuration on any Configuration page.

## Defining CoS Code-Point Aliases (J-Web Procedure)

You can use the J-Web interface to define CoS code-point aliases on an EX Series switch. By defining aliases you can assign meaningful names to a particular set of bit values and refer to them when configuring CoS components.

To define CoS code-point aliases:

1. Select **Configure > Class of Service > CoS Value Aliases**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one:

- **Add**—Adds a code-point alias. Enter information into the code point alias page as described in [Table 15 on page 67](#).
- **Edit**—Modifies an existing code-point alias. Enter information into the code point alias page as described in [Table 15 on page 67](#).
- **Delete**—Deletes an existing code-point alias.

[Table 15 on page 67](#) describes the related fields.

**Table 15: CoS Value Aliases Configuration Fields**

| Field                 | Function                                                                                                                                           | Your Action                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Code point name       | Specifies the name for a code-point—for example, <b>af11</b> or <b>be</b> .                                                                        | Enter a name.                                                                                                                                                                                                                                                                                                    |
| Code point type       | Specifies a code-point type. The code-point type can be DSCP or IP precedence.                                                                     | Select a value.                                                                                                                                                                                                                                                                                                  |
| Code point value bits | Specifies the CoS value for which an alias is defined.<br><br>Changing this value alters the behavior of all classifiers that refer to this alias. | To specify a CoS value, type it in the appropriate format: <ul style="list-style-type: none"> <li>• For DSCP CoS values, use the format xxxxxx, where x is 1 or 0—for example, <b>101110</b>.</li> <li>• For IP precedence CoS values, use the format xxx, where x is 1 or 0—for example, <b>111</b>.</li> </ul> |

## Defining CoS Code-Point Aliases (CLI Procedure)

---

You can use code-point aliases to streamline the process of configuring CoS features on your EX Series switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- DSCP—Handles incoming IPv4 packets.
- IEEE 802.1p—Handles Layer 2 CoS.
- Inet precedence—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

To configure a code-point alias for a specified CoS marker type (**dscp**), assign an alias (**my1**) to the code-point (**110001**):

```
[edit class-of-service code-point-aliases]  
user@switch# set dscp my1 110001
```

## Defining CoS Classifiers (CLI Procedure)

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate (BA) classifier—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, or IEEE 802.1p value.
- Multifield (MF) classifier—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

**NOTE:** Juniper Networks EX8200 Ethernet Switches implement the on-demand ternary content addressable memory (TCAM) allocation of memory so that when additional TCAM space is required for CoS, the space is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers beyond the available TCAM space that includes both the free and unused space.

The following example describes how to configure a BA classifier (**ba-classifier**) as the default DSCP map and apply it to either a specific Gigabit Ethernet interface or to all the Gigabit Ethernet interfaces on the switch. The BA classifier assigns loss priorities, as shown in [Table 16 on page 69](#), to incoming packets in the four forwarding classes.

You can use the same procedure to set MF classifiers (except that you would use firewall filter rules).

**Table 16: BA-classifier Loss Priority Assignments**

| Forwarding Class | For CoS Traffic Type         | ba-classifier Assignment                |
|------------------|------------------------------|-----------------------------------------|
| <b>be</b>        | Best-effort traffic          | High-priority code point: <b>000001</b> |
| <b>ef</b>        | Expedited-forwarding traffic | High-priority code point: <b>101110</b> |
| <b>af</b>        | Assured-forwarding traffic   | High-priority code point: <b>001100</b> |
| <b>nc</b>        | Network-control traffic      | High-priority code point: <b>110001</b> |

To configure a DSCP BA classifier named **ba-classifier** as the default DSCP map:

- Associate code point **000001** with forwarding class **be** and loss priority **high**:  
[edit class-of-service classifiers]

```
user@switch# set dscp ba-classifier import default forwarding-class be loss-priority
high code-points 000001
```

- Associate code point **101110** with forwarding class **ef** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class ef loss-priority high code-points
101110
```

- Associate code point **001100** with forwarding class **af** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class af loss-priority high code-points
001100
```

- Associate code point **110001** with forwarding class **nc** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class nc loss-priority high code-points
110001
```

- Apply the classifier to a specific interface or to all Gigabit Ethernet interfaces on the switch.

- To apply the classifier to a specific interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/0 unit 0 classifiers dscp ba-classifier
```

- To apply the classifier to all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set ge-* unit * classifiers dscp ba-classifier
```

## Defining CoS Classifiers (J-Web Procedure)

You can use the J-Web interface to define CoS classifiers on an EX Series switch. Classifiers examine the CoS value or alias of an incoming packet and assign the packet a level of service by setting its forwarding class and loss priority.

To define CoS classifiers:

1. Select **Configure > Class of Service > Classifiers**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. Click one:

- **Add**—Adds a classifier. Enter information into the classifier page as described in [Table 17 on page 71](#).
- **Edit**—Modifies an existing classifier. Enter information into the classifier page as described in [Table 17 on page 71](#).
- **Delete**—Deletes an existing classifier.

**Table 17: Classifiers Configuration Fields**

| Field              | Function                                                                                               | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Classifier Name    | Specifies the name for a classifier.                                                                   | To name a classifier, type the name—for example, <b>ba-classifier</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Classifier Type    | Specifies the type of classifier: <b>dscp</b> , <b>ieee-802.1</b> , or <b>inet-precedence</b> .        | Select a value from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Code Point Mapping | Sets the forwarding classes and the packet loss priorities (PLPs) for specific CoS values and aliases. | <p>To add a code point mapping:</p> <ol style="list-style-type: none"> <li>Click <b>Add</b>.</li> <li>Select the code point.</li> <li>Select a forwarding class from the following list: <ul style="list-style-type: none"> <li><b>expedited-forwarding</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped.</li> <li><b>best-effort</b>—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined.</li> <li><b>assured-forwarding</b>—Provides high assurance for packets within the specified service profile. Excess packets are dropped.</li> <li><b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> </li> <li>Select the loss priority. <p>To assign a loss priority, select one:</p> <ul style="list-style-type: none"> <li><b>high</b>—Packet has a high loss priority.</li> <li><b>low</b>—Packet has a low loss priority.</li> </ul> </li> </ol> |

## Defining CoS Forwarding Classes (CLI Procedure)

Forwarding classes allow you to group packets for transmission. Based on forwarding classes, you assign packets to output queues.

By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and network control. EX Series switches support up to 16 forwarding classes.

You can configure forwarding classes in one of the following ways:

- Using **class** statement—You can configure up to 16 forwarding classes and you can map multiple forwarding classes to single queue.
- Using **queue** statement—You can configure up to 8 forwarding classes and you can map one forwarding class to one queue.

This example uses the **class** statement to configure forwarding classes.

To configure CoS forwarding classes, map the forwarding classes to queues:

```
[edit class-of-service forwarding-classes]
user@switch# set class be queue-num 0
user@switch# set class ef queue-num 1
user@switch# set class af queue-num 2
user@switch# set class nc queue-num 3
user@switch# set class ef1 queue-num 4
user@switch# set class ef2 queue-num 5
user@switch# set class af1 queue-num 6
user@switch# set class nc1 queue-num 7
```

## Defining CoS Forwarding Classes (J-Web Procedure)

You can define CoS forwarding classes on an EX Series switch using the J-Web interface. Assigning a forwarding class to a queue number affects the scheduling and marking of a packet as it transits a switch.

To define forwarding classes:

1. Select **Configure > Class of Service > Forwarding Classes**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one:

- **Add**—Adds a forwarding class. Enter information into the forwarding class page as described in [Table 18 on page 73](#).
- **Edit**—Modifies an existing forwarding class. Enter information into the forwarding class page as described in [Table 18 on page 73](#).
- **Delete**—Deletes an existing forwarding class.

**Table 18: Forwarding Classes Configuration Fields**

| Field                           | Function                                                                                                                                                                                                                                               | Your Action                                                                                             |

## Defining CoS Schedulers (CLI Procedure)

---

You use schedulers to define the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the tail drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues and packet schedulers that operate according to this mapping.

You can associate up to four user-defined scheduler maps with the interfaces.

This topic describes:

- [Configuring CoS Schedulers on page 74](#)
- [Assigning Scheduler Maps to Interfaces on a 40-port SFP+ Line Card on page 75](#)

## Configuring CoS Schedulers

To configure CoS schedulers:

1. Create a scheduler (**be-sched**) and assign it a priority:

```
[edit class-of-service schedulers]
user@switch# set be-sched priority low
```

2. Configure a scheduler map (**be-map**) that associates the scheduler (**be-sched**) with the forwarding class (**best-effort**):

```
[edit class-of-service scheduler-maps]
user@switch# set be-map forwarding-class best-effort scheduler be-sched
```

3. Assign the scheduler map (**be-map**) to one or more Ethernet interfaces:

- To assign the scheduler map to one interface (**ge-0/0/1**):

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/1 scheduler-map be-map
```

- To assign the scheduler map to more than one interface by using a wildcard (all Gigabit Ethernet interfaces):

```
[edit class-of-service interfaces]
user@switch# set ge-* scheduler-map be-map
```

## Assigning Scheduler Maps to Interfaces on a 40-port SFP+ Line Card

For interfaces on a 40-port SFP+ line card, you use the same procedure to configure CoS schedulers as you do for other interfaces. However, you must assign the same scheduler map to all the interfaces in a port group.

When you assign a scheduler map to one interface in a port group, you do not need to assign the scheduler map to the remaining interfaces. The switch automatically uses that scheduler map for the interfaces in the port group when you bring the interfaces up.

If you assign different scheduler maps to different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, an error is logged to the system log. When you bring an interface in the port group up, the default scheduler map is used. If you assign a scheduler map to an interface that is down that is different from the scheduler map being used by the currently operating interfaces in a port group, the default scheduler map is used by all interfaces in a port group, even the currently operating ones, when you bring the interface up.

To change the scheduler map assigned to a port group:

1. Delete the current scheduler map from the interfaces (**xe-0/0/1** and **xe-0/0/2**) it is currently assigned to:

```
[edit class-of-service interfaces]
user@switch# delete xe-0/0/1 scheduler-map
```

```
[edit class-of-service interfaces]
user@switch# delete xe-0/0/2 scheduler-map
```

2. Assign the new scheduler map (**ef-map**) to at least one interface in the port group:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/1 scheduler-map ef-map
```

## Defining CoS Schedulers (J-Web Procedure)

You can use the J-Web interface to define CoS schedulers on an EX Series switch. Using schedulers, you can assign attributes to queues and thereby provide congestion control for a particular class of traffic. These attributes include the amount of interface bandwidth, memory buffer size, transmit rate, and schedule priority.

To configure schedulers:

1. Select **Configure > Class of Service > Schedulers**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one:

- **Add**—Adds a scheduler. Enter information into the schedulers page as described in [Table 19 on page 76](#).
- **Edit**—Modifies an existing scheduler. Enter information into the schedulers page as described in [Table 19 on page 76](#).
- **Delete**—Deletes an existing scheduler.

**Table 19: Schedulers Configuration Page**

| Field               | Function                                                                                                                                                                                                                                                                                                                                                              | Your Action                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Defining CoS Scheduler Maps (J-Web Procedure)

You can use the J-Web interface to configure CoS scheduler maps on an EX Series switch.

To configure scheduler maps:

1. Select **Configure > Class of Service > Scheduler Maps**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. Click one:

- **Add**—Adds a scheduler map. Enter information into the scheduler map page as described in [Table 20 on page 78](#).
- **Edit**—Modifies an existing scheduler map. Enter information into the scheduler map page as described in [Table 20 on page 78](#).
- **Delete**—Deletes an existing scheduler map.

**Table 20: Scheduler Maps Configuration Fields**

| Field              | Function                                                                                                                                                                                                | Your Action                                                                                                                                                                                                                                          |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scheduler Map Name | Specifies the name for a scheduler map.                                                                                                                                                                 | To name a map, type the name—for example, <b>be-scheduler-map</b> .                                                                                                                                                                                  |
| Scheduler Mapping  | <p>Allows you to associate a preconfigured scheduler with a forwarding class.</p> <p>After scheduler maps have been applied to an interface, they affect the hardware queues and packet schedulers.</p> | <p>To associate a scheduler with a forwarding class, locate the forwarding class and select the scheduler in the box next to it.</p> <p>For example, for the <b>best-effort</b> forwarding class, select the configured scheduler from the list.</p> |

## Defining CoS Drop Profiles (J-Web Procedure)

You can use the J-Web interface to define CoS drop profiles on EX4500 and EX8200 switches.

To configure CoS drop profiles:

1. Select **Configure > Class of Service > Drop Profile**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. Click one:

- **Add**—Adds a drop profile. Enter information into the drop profiles page as described in [Table 21 on page 79](#).
- **Edit**—Modifies an existing drop file. Enter information into the drop profiles page as described in [Table 21 on page 79](#).
- **Delete**—Deletes an existing drop profile.

**Table 21: Drop Profiles Configuration parameters**

| Field               | Function                                                                                                                                                                                                                                                                                                                                                                                                                                         | Your Action                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Drop Profile Name   | Specifies the name for a drop profile.                                                                                                                                                                                                                                                                                                                                                                                                           | Type the name.                                                                                                                                                                                                                                                                                                                                                           |
| Drop profile graph  | Specifies the drop profile graph type                                                                                                                                                                                                                                                                                                                                                                                                            | Select one: <b>Segmented</b> or <b>Interpolated</b> .                                                                                                                                                                                                                                                                                                                    |
| Drop profile values | <p>Specifies values for the following two parameters of the drop profile: the queue fill level and the drop probability.</p> <p>The queue fill level represents a percentage of the memory used to store packets in relation to the total amount that has been allocated for that specific queue.</p> <p>The drop probability is a percentage value that correlates to the likelihood that an individual packet is dropped from the network.</p> | <p>To add new values:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Enter the fill level.</li> <li>3. Enter the drop probability.</li> <li>4. Click <b>OK</b>.</li> </ol> <p>To edit an existing value, click <b>Edit</b> and modify the fill level and drop probability.</p> <p>To delete a value, select it and click <b>Delete</b>.</p> |

## Configuring CoS Tail Drop Profiles (CLI Procedure)

Tail drop is a simple and effective traffic congestion avoidance mechanism. When you apply this mechanism to manage congestion, packets are dropped when the output queue is full.

To configure CoS tail-drop profiles, create a drop profile name (**be-dp**) and assign a fill level (**25**):

```
[edit class-of-service drop-profiles]
user@switch# set be-dp fill-level 25
```

## Defining CoS Rewrite Rules (CLI Procedure)

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an EX Series switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and a code point, thus creating a rewrite table. After the rewrite rule is created, enable it on an interface. You can also apply an existing rewrite rule on an interface.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the rewrite rule and then apply the new rule.

**NOTE:** Custom rewrite-rule bindings are implemented through filters. And custom rewrite rules cannot be bound to routed VLAN interfaces (RVIs).

To create rewrite rules and enable them on interfaces:

- To create an 802.1p rewrite rule named customup-rw in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low
code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high
code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority low
code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority high
code-point 011
```

```

user@switch# set ieee-802.1 customup-rw forwarding-class ef loss-priority low
code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef loss-priority high
code-point 101
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority low
code-point 110
user@switch# set ieee-802.1 customup-rw forwarding-class nc loss-priority high
code-point 111

```

- To enable an 802.1p rewrite rule named customup-rw on a Layer 2 interface:

```

[edit]
user@switch# set class-of-service interfaces ge-0/0/0 unit 0 rewrite-rules ieee-802.1
customup-rw

```

- To enable an 802.1p rewrite rule named customup-rw on all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical-interface (unit) number:

```

[edit]
user@switch# set class-of-service interfaces ge-* unit * rewrite-rules customup-rw

```

## Defining CoS Rewrite Rules (J-Web Procedure)

You can use the J-Web interface to define CoS rewrite rules. Use the rewrite rules to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule.

To define rewrite rules:

1. Select **Configure > Class of Service > Rewrite Rules**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one:

- **Add**—Adds a rewrite rule. Enter information into the rewrite rule page as described in [Table 22 on page 82](#).
- **Edit**—Modifies an existing rewrite rule. Enter information into the rewrite rule page as described in [Table 22 on page 82](#).

- **Delete**—Deletes an existing rewrite rule.

Table 22: Rewrite Rules Configuration Page Summary

| Field              | Function                                                                                                                                                 | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rewrite Rule Name  | Specifies the name for the rewrite rule.                                                                                                                 | To name a rule, type the name—for example, <b>rewrite-dscps</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Rewrite rule type  | Specifies the type of rewrite rule: <b>dscp</b> , <b>ieee-802.1</b> , or <b>inet-precedence</b> .                                                        | Select a value from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

- [Example: Configuring CoS on EX Series Switches on page 37](#)

## Assigning CoS Components to Interfaces (CLI Procedure)

After you have defined the following CoS components, you must assign them to logical or physical interfaces.

- Forwarding classes—Assign only to logical interfaces.
- Classifiers—Assign only to logical interfaces.
- Scheduler maps—Assign to either physical or logical interfaces.
- Rewrite rules—Assign to either physical or logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wild cards.

To assign CoS components to interfaces:

To assign CoS components to a single interface, associate a CoS component (for example a scheduler map named **ethernet-cos-map**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
```

To assign a CoS component to multiple interfaces, associate a CoS component (for example, a rewrite rule named **customup-rw**) to all Gigabit Ethernet interfaces on the switch, use wild characters for the interface name and logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set ge-* unit * rewrite-rules ieee-802.1 customup-rw
```

## Assigning CoS Components to Interfaces (J-Web Procedure)

After you have defined CoS components on an EX Series switch, you must assign them to logical or physical interfaces. You can use the J-Web interface to assign scheduler maps to physical or logical interfaces and to assign forwarding classes or classifiers to logical interfaces.

To assign CoS components to interfaces:

1. Select **Configure > Class of Service > Assign to Interface**.

**NOTE:** After you make changes to the configuration in this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. To configure interface association, select an interface from the list and click **Edit**.
3. Select one:
  - **Associate system default scheduler map**—Associates the interface with the default scheduler map.
  - **Select the scheduler map**—Associates the interface with a configured scheduler map. Select the scheduler map from the list.

**NOTE:** On the 40-port SFP+ line card for EX8200 switches, the J-Web interface does not allow you to commit your changes unless you assign the same scheduler map or the default scheduler map to all interfaces in a port group.

4. Click **OK**.
5. To manage a CoS service assignment on a logical interface, click one:
  - **Add**—Adds a CoS service to a logical interface on a specified physical interface. Enter information as described in [Table 23 on page 84](#).
  - **Edit**—Modifies a CoS service assignment to a logical interface. Enter information as described in [Table 23 on page 84](#).
  - **Delete**—Deletes the CoS service assignment to a logical interface.

**Table 23: Assigning CoS Components to Logical Interfaces**

| Field            | Function                                                                                                                                                              | Your Action                                                                                                                                              |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unit             | Specifies the name of a logical interface. Allows you to assign CoS components while configuring a logical interface on a physical interface at the same time.        | Type the interface name.<br><br>To assign CoS services to all logical interfaces configured on this physical interface, type the wildcard character (*). |
| Forwarding Class | Assigns a predefined forwarding class to incoming packets on a logical interface.                                                                                     | To assign a forwarding class to an interface, select the forwarding class.                                                                               |
| Classifiers      | Allows you to apply classification maps to a logical interface. Classifiers assign a forwarding class and loss priority to an incoming packet based on its CoS value. | To assign a classification map to an interface, select an appropriate classifier for each CoS value type used on the interface.                          |

Table 23: Assigning CoS Components to Logical Interfaces (*continued*)

| Field         | Function                                                                                                                                                                                                                                           | Your Action                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Rewrite Rules | Allows you to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule. | To assign rewrite rules to the interface, select the appropriate rewrite rule for each CoS value type used on the interface. |

## Configuring Junos OS EZQoS for CoS (CLI Procedure)

You use Junos OS EZQoS on EX Series switches to eliminate the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

When you configure EZQoS on EX Series switches, preconfigured values are assigned to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name.

**NOTE:** Currently, we provide an EZQoS template for configuring CoS for VoIP applications. The EZQoS VoIP template is stored in `/etc/config/ezqos-voip.conf`.

To configure EZQoS using the CLI:

1. Load the EZQoS configuration file (`/etc/config/ezqos-voip.conf`):

```
[edit]
user@switch# load merge /etc/config/ezqos-voip.conf
```

2. Apply the EZQoS group (`ezqos-voip`):

```
[edit]
user@switch# set apply-groups ezqos-voip
```

3. Apply the DSCP classifier (`ezqos-dscp-classifier`) to a Gigabit Ethernet interface (`ge-0/0/0`):

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/0 unit 0 classifiers dscp ezqos-dscp-classifier
```

4. Apply the scheduler map (`ezqos-voip-sched-maps`) to a Gigabit Ethernet interface (`ge-0/0/1`):

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/1 scheduler-map ezqos-voip-sched-maps
```

## Configuring CoS on an MPLS Provider Edge Switch Using IP Over MPLS (CLI Procedure)

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. This topic describes configuring CoS components on a provider edge (PE) switch that is using IP Over MPLS.

This task describes how to create a custom DSCP classifier and a custom EXP rewrite rule on the ingress PE switch. It includes configuring a policer firewall filter and applying it to the customer-edge interface of the ingress PE switch. The policer firewall filter ensures that the amount of traffic forwarded through the MPLS tunnel never exceeds the requested bandwidth allocation.

For this procedure, we assume that the switch has already been configured for MPLS. See [Configuring MPLS on Provider Edge Switches Using IP Over MPLS \(CLI Procedure\)](#).

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

```
[edit class-of-service]
user@switch#set classifiers dscp dscp1 import default
```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch#set classifiers dscp dscp1 forwarding-class expedited-forwarding
loss-priority low code-points 000111
```

3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

4. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the customer-edge-interface:

```
[edit firewall]
set policer mypolicer if-exceeding bandwidth-limit 500m
```

5. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

```
[edit firewall policer]
set mypolicer if-exceeding burst-size-limit 33553920
```

6. Discard traffic that exceeds the rate limits for this policer:

```
[edit firewall policer]
set mypolicer then discard
```

7. To reference the policer, configure a filter term that includes the policer action:

```
[edit firewall]
user@switch# set family inet filter myfilter term t1 then policer mypolicer
```

8. Apply the filter to the customer-edge interface:

```
[edit interfaces]
user@switch# set ge-2/0/3 unit 0 family inet address 121.121.121.1/16 policing filter
myfilter
```

**NOTE:** You can also configure schedulers and shapers as needed. See [“Defining CoS Schedulers \(CLI Procedure\)” on page 74](#).

## Configuring CoS on an MPLS Provider Edge Switch Using Circuit Cross-Connect (CLI Procedure)

You can use class of service (CoS) within MPLS networks to prioritize certain types of traffic during periods of congestion. This topic describes configuring CoS components on provider edge (PE) switch that is using MPLS over circuit-cross connect (CCC).

**NOTE:** If you are using MPLS with CCC, you can use only one type of DSCP/IP precedence and only one type of IEEE 802.1p on the CCC interfaces.

This procedure creates a custom DSCP classifier and a custom EXP rewrite rule on the ingress PE. It also enables a policer on the label-switched path (LSP) of the ingress PE to ensure that the amount of traffic forwarded through the LSP never exceeds the requested bandwidth allocation.

1. Import the default DSCP classifier classes to the custom DSCP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers dscp dscp1 import default
```

2. Add the expedited-forwarding class to this custom DSCP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch# set classifiers dscp dscp1 forwarding-class expedited-forwarding
loss-priority low code-points 000111
```

3. Specify the values for the custom EXP rewrite rule, **e1**:

```
[edit class-of-service]
```

```
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

4. Bind the DSCP classifier to the CCC interface:

```
[edit ]
user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifier dscp1
```

5. Specify the number of bits per second permitted, on average, for the firewall policer, which will later be applied to the LSP:

```
[edit firewall]
set policer mypolicer if-exceeding bandwidth-limit 500m
```

6. Specify the maximum size permitted for bursts of data that exceed the given bandwidth limit for this policer:

```
[edit firewall policer]
set mypolicer if-exceeding burst-size-limit 33553920
```

7. Discard traffic that exceeds the rate limits for this policer:

```
[edit firewall policer]
set mypolicer then discard
```

8. To reference the policer, configure a filter term that includes the policer action:

```
[edit firewall]
user@switch# set family any filter myfilter term t1 then policer mypolicer
```

9. Apply the filter to the LSP:

```
[edit protocols mpls]
set label-switched-path lsp_to_pe2_ge1 policing filter myfilter
```

**NOTE:** You can also configure schedulers and shapers as needed. See [“Defining CoS Schedulers \(CLI Procedure\)” on page 74](#).

## Configuring CoS Traffic Classification for Ingress Queuing on Oversubscribed Ports on EX8200 Line Cards (CLI Procedure)

EX8200 switches provide certain line cards that include oversubscribed ports. These ports are logically grouped into a port group and each port group share a certain fixed bandwidth. Because oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth, configuring CoS queues is different for oversubscribed ports than for line-rate ports.

Packets arriving on an oversubscribed port in a line card are directed to a high-priority, low priority, or line-rate queue. These queues are used for scheduling traffic from the port into the Packet Forwarding Engine. The fabric priority associated with the packet's forwarding class determines which queue the packet is sent to. The forwarding class of the packet in turn is determined by the behavior aggregate (BA) classifier assigned to the port. By default, the fabric priority of all forwarding classes is low. Thus all packets, with the exception of critical network packets and line-rate packets, are sent to the low-priority ingress queue by default. The critical network packets and line-rate packets do not need a BA classifier as they are always sent on the high-priority and line-rate queues, respectively.

This procedure describes how you can direct traffic into the high-priority ingress queue and thus avoid congestion at the port group.

To direct traffic to the high-priority ingress queue for a port group:

1. Create the BA classifier for the forwarding class:

```
[edit class-of-service]
user@switch# set classifiers classifier-type classifier-name
forwarding-class class-name loss-priority level code-points code-point
```

2. Assign a queue number and fabric priority to the forwarding class:

```
[edit class-of-service]
user@switch# set forwarding-classes class class-name queue-num number
priority level
```

3. Assign the BA classifier to the physical interface:

```
[edit class-of-service]
user@switch# set interfaces interface-name unit 0
classifiers classifier-type classifier-name
```

For example, to direct voice traffic to the high-priority ingress queue for interface xe-1/0/2:

```
[edit class-of-service]
user@switch# set classifiers dscp dscp1 forwarding-class cos-voice
loss-priority low code-points ef
```

```
[edit class-of-service]
user@switch# set forwarding-classes class cos-voice queue-num 5 priority high
```

```
[edit class-of-service]
user@switch# set interfaces xe-1/0/2 unit 0 classifiers dscp dscp1
```

**NOTE:** You must use a BA classifier to classify traffic for ingress queuing. Multifield (MF) classification and port classification (that is, assigning a forwarding class to the interface) are not supported for classifying traffic for ingress queuing. The BA classifier must be assigned to a physical interface, not a Layer 3 tagged interface or a routed VLAN interface (RVI).

## Configuring CoS on Provider Switches of an MPLS Network (CLI Procedure)

---

You can add class-of-service (CoS) components to your MPLS networks on EX Series switches to achieve end-to-end Differentiated Services to match your specific business requirements. The configuration of CoS components on the provider switches is the same regardless of whether the provider edge (PE) switches are using MPLS over CCC or IP over MPLS.

This task shows how to configure a custom EXP classifier and custom EXP rewrite rule on the provider switch.

1. Import the default EXP classifier classes to the custom EXP classifier that you are creating:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 import default
```

2. Add the expedited-forwarding class to this custom EXP classifier, specifying a loss priority and code point:

```
[edit class-of-service]
user@switch# set classifiers exp exp1 forwarding-class expedited-forwarding loss-priority
low code-points 010
```

3. Specify the values for the custom EXP rewrite rule, e1:

```
[edit class-of-service]
user@switch# set rewrite-rules exp e1 forwarding-class expedited-forwarding
loss-priority low code-point 111
```

**NOTE:** You can also configure schedulers and shapers as needed. See “Defining CoS Schedulers (CLI Procedure)” on page 74.

## Monitoring CoS Forwarding Classes

- Purpose** View the current assignment of class-of-service (CoS) forwarding classes to queues on the switch.
- Action** To monitor CoS forwarding classes in the J-Web interface, select **Monitor > Class of Service > Forwarding Classes**.
- To monitor CoS forwarding classes in the CLI, enter the following CLI command:
- ```
show class-of-service forwarding-class
```
- Meaning** [Table 25 on page 93](#) summarizes key output fields for CoS forwarding classes.

Table 25: Summary of Key CoS Forwarding Class Output Fields

Field	Values
<b>Forwarding Class</b>	<p>Names of forwarding classes assigned to queue numbers. The following are the default forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value.</li> <li>• <b>expedited-forwarding</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.</li> <li>• <b>assured-forwarding</b>—Provides high assurance for packets within specified service profile. Excess packets are dropped.</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> <p>EX8200 switches have the following additional default forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>mcast-be</b>—Provides no special CoS handling of packets.</li> <li>• <b>mcast-ef</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.</li> <li>• <b>mcast-af</b>—Provides high assurance for packets within the specified service profile. Excess packets are dropped.</li> </ul>
<b>Queue</b>	<p>Queue number corresponding to the forwarding class name. The default forwarding classes are assigned as follows:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—0</li> <li>• <b>expedited-forwarding</b>—5</li> <li>• <b>assured-forwarding</b>—1</li> <li>• <b>network-control</b>—7</li> <li>• <b>mcast-be</b>—2</li> <li>• <b>mcast-ef</b>—4</li> <li>• <b>mcast-af</b>—6</li> </ul>
<b>Fabric Priority</b>	<p>(EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b>. The fabric priority determines the priority of packets ingressing the switch fabric.</p>

## Monitoring Interfaces That Have CoS Components

- Purpose** Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.
- Action** To monitor interfaces that have CoS components in the J-Web interface, select **Monitor > Class of Service > Interface Association**.

To monitor interfaces that have CoS components in the CLI, enter the following command:

**show class-of-service interface *interface***

**Meaning** [Table 26 on page 94](#) summarizes key output fields for CoS interfaces.

**Table 26: Summary of Key CoS Interfaces Output Fields**

Field	Values	Additional Information
Interface	Name of a physical interface to which CoS components are assigned.	To display names of logical interfaces configured on this physical interface, click the plus sign (+).
Scheduler Map	Name of the scheduler map associated with this interface.	
Queues Supported	Number of queues you can configure on the interface.	
Queues in Use	Number of queues currently configured.	
Logical Interface	Name of a logical interface on the physical interface to which CoS components are assigned.	
Object	Category of an object—for example, <b>classifier</b> , <b>scheduler-map</b> , or <b>rewrite</b> .	
Name	Name that you have given to an object—for example, <b>ba-classifier</b> .	
Type	Type of an object—for example, <b>dscp</b> for a classifier.	
Index	Index of this interface or the internal index of a specific object.	

**Related Documentation**

## Monitoring CoS Rewrite Rules

**Purpose** Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action** To monitor CoS rewrite rules in the J-Web interface, select **Monitor > Class of Service > Rewrite Rules**.

To monitor CoS rewrite rules in the CLI, enter the following command:

```
show class-of-service rewrite-rules
```

**Meaning** [Table 27 on page 95](#) summarizes key output fields for CoS rewrite rules.

**Table 27: Summary of Key CoS Rewrite Rules Output Fields**

Field	Values	Additional Information
Rewrite Rule Name	Names of rewrite rules.	
CoS Value Type	Rewrite rule type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 DiffServ traffic.</li> <li>• <b>exp</b>—For MPLS traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> <li>• <b>inet-precedence</b>—For IPv4 traffic.</li> </ul>	To display forwarding classes, loss priorities, and rewritten CoS values, click the plus sign (+).
Index	Internal index for this particular rewrite rule.	
Forwarding Class	Forwarding class that is used to determine CoS values for rewriting in combination with loss priority.	Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting.
Loss Priority	Loss priority that is used to determine CoS values for rewriting in combination with forwarding class.	
Rewrite CoS Value To	Value that the CoS value is rewritten to.

## Monitoring CoS Scheduler Maps

- Purpose** Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.
- Action** To monitor CoS scheduler maps in the J-Web interface, select **Monitor > Class of Service > Scheduler Maps**.
- To monitor CoS scheduler maps in the CLI, enter the following CLI command:
- ```
show class-of-service scheduler-map
```

**Meaning** [Table 28 on page 96](#) summarizes key output fields for CoS scheduler maps.

Table 28: Summary of Key CoS Scheduler Maps Output Fields

| Field             | Values                                                                                                                                                                                                                                                                                                                                                                                                         | Additional Information                |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| Scheduler Map     | Name of a scheduler map.                                                                                                                                                                                                                                                                                                                                                                                       | For details, click the plus sign (+). |
| Index             | Index of a specific object—scheduler maps, schedulers, or drop profiles.                                                                                                                                                                                                                                                                                                                                       |                                       |
| Scheduler Name    | Name of a scheduler.                                                                                                                                                                                                                                                                                                                                                                                           |                                       |
| Forwarding Class  | Forwarding classes this scheduler is assigned to.                                                                                                                                                                                                                                                                                                                                                              |                                       |
| Transmit Rate     | Configured transmit rate of the scheduler in bits per second (bps). The rate value can be either of the following: <ul style="list-style-type: none"> <li>A percentage—The scheduler receives the specified percentage of the total interface bandwidth.</li> <li><b>remainder</b>— The scheduler receives the remaining bandwidth of the interface after bandwidth allocation to other schedulers.</li> </ul> |                                       |
| Buffer Size       | Delay buffer size in the queue or the amount of transmit delay (in milliseconds). The buffer size can be either of the following: <ul style="list-style-type: none"> <li>A percentage—The buffer is a percentage of the total buffer allocation.</li> <li><b>remainder</b>—The buffer is sized according to what remains after other scheduler buffer allocations.</li> </ul>                                  |                                       |
| Priority          | Scheduling priority of a queue: <ul style="list-style-type: none"> <li><b>strict-high</b>—Packets in this queue are transmitted first.</li> <li><b>low</b>—Packets in this queue are transmitted last.</li> </ul>                                                                                                                                                                                              |                                       |
| Drop Profiles     | Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.                                                                                                                                                                                                                                                                                                               |                                       |
| Loss Priority     | Packet loss priority corresponding to a drop profile.                                                                                                                                                                                                                                                                                                                                                          |                                       |
| Protocol          | Transport protocol corresponding to a drop profile.                                                                                                                                                                                                                                                                                                                                                            |                                       |
| Drop Profile Name | Name of the drop profile.                                                                                                                                                                                                                                                                                                                                                                                      |                                       |
| Index             | Index of a specific object—scheduler maps, schedulers, or drop profiles.                                                                                                                                                                                                                                                                                                                                       |                                       |

## Monitoring CoS Value Aliases

**Purpose** Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP, IEEE 802.1p, and IPv4 precedence bits.

**Action** To monitor CoS value aliases in the J-Web interface, select **Monitor > Class of Service > CoS Value Aliases**.

To monitor CoS value aliases in the CLI, enter the following command:

```
show class-of-service code-point-aliases
```

**Meaning** [Table 29 on page 97](#) summarizes key output fields for CoS value aliases.

**Table 29: Summary of Key CoS Value Alias Output Fields**

| Field           | Values                                                                                                                                                                                                                                                                                                                                       | Additional Information                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| CoS Value Type  | Type of the CoS value: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Examines Layer 3 packet headers for IP packet classification.</li> <li>• <b>ieee-802.1</b>—Examines Layer 2 packet headers for packet classification.</li> <li>• <b>inet-precedence</b>—Examines Layer 3 packet headers for IP packet classification.</li> </ul> | To display aliases and bit patterns, click the plus sign (+). |
| CoS Value Alias | Name given to a set of bits—for example, <b>af11</b> is a name for <b>001010</b> bits.                                                                                                                                                                                                                                                       |                                                               |
| CoS Value       | Set of bits associated with an alias.                                                                                                                                                                                                                                                                                                        |                                                               |

## Monitoring CoS Drop Profiles

**Purpose** Use the monitoring functionality to view data point information for each CoS random early detection (RED) drop profile on the EX8200 switch.

**Action** To monitor CoS RED drop profiles in the J-Web interface, select **Monitor > Class of Service > RED Drop Profiles**.

To monitor CoS RED drop profiles in the CLI, enter the following CLI command:

```
show class-of-service drop-profile
```

**Meaning** [Table 30 on page 98](#) summarizes the key output fields for CoS RED drop profiles.

**Table 30: Summary of the Key Output Fields for CoS Red Drop Profiles**

| Field                 | Values                                                                                                                                                                                                                                                                                                                                            | Additional Information                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| RED Drop Profile Name | <p>Name of the RED drop profile.</p> <p>A drop profile consists of pairs of values between 0 and 100, one for queue buffer fill level and the other for drop probability, that determine the relationship between a buffer's fullness and the likelihood it will drop packets.</p>                                                                | To display profile values, click the plus sign (+).                                                |
| Graph RED Profile     | Links to a graph of a RED curve that the system uses to determine the drop probability based on queue buffer fullness.                                                                                                                                                                                                                            | The x axis represents the queue buffer fill level, and the y axis represents the drop probability. |
| Type                  | <p>Type of a specific drop profile:</p> <ul style="list-style-type: none"> <li>• <b>interpolated</b>—The two coordinates (x and y) of the graph are interpolated to produce a smooth profile.</li> <li>• <b>segmented</b>—The two coordinates (x and y) of the graph are represented by line fragments to produce a segmented profile.</li> </ul> |                                                                                                    |
| Index                 | Internal index of this drop profile.                                                                                                                                                                                                                                                                                                              |                                                                                                    |
| Fill Level            | Percentage fullness of a buffer queue. This value is the x coordinate of the RED drop profile graph.                                                                                                                                                                                                                                              |                                                                                                    |
| Drop Probability      | Drop probability of a packet corresponding to a specific queue buffer fill level. This value is the y coordinate of the RED drop profile graph.                                                                                                                                                                                                   |                                                                                                    |

### Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in an EX8200 Switch

**Problem** After you configure a scheduler map on an interface on the 40-port SFP+ line card, you notice one or both of the following:

- All packets are being dropped on a class-of-service queue configured on the interface.
- A message in the system log states that the interface is using the default scheduler map, not the scheduler map you configured. For example:

```
Sep 19 21:26:50 hostname cosd[907]: COSD_SCHED_MAP_GROUP_CONFLICT:
Interface xe-5/0/15 cannot be bound to scheduler-map m1. It will be bound
to
default scheduler-map
```

**Cause** The ports in a 40-port SFP+ line card are divided into eight groups, each group comprising five ports. The ports in a port group share 10 gigabits of bandwidth. Because the port groups share bandwidth, only one scheduler map can be active at a time in a port group. If you configure different scheduler maps for different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, default scheduler map becomes the active scheduler map for all interfaces in the port group, and messages in the system log report that the default scheduler map is in use for the affected interfaces. If the default scheduler map does not define a queue, all traffic is dropped on that queue.

**Solution** Check your CoS configuration for the interfaces in the port group. If you have different scheduler maps assigned to different interfaces in the port group:

1. Delete the scheduler map configuration for all interfaces in the port group.
2. Determine the scheduler map that you want all interfaces in the port group to use.
3. Assign that scheduler map to at least one interface in the port group. The remaining interfaces in the port group will adopt this scheduler map.

**BEST PRACTICE:** To prevent confusion and future configuration conflicts, explicitly assign the scheduler map to each interface in the port group.

4. After you commit the configuration, verify that the scheduler map is the active scheduler map for the interfaces in the port group by using the **show class-of-service forwarding-table scheduler-map** command.

---

## Troubleshooting a CoS Classifier Configuration for a TCAM Space Error

---

**Problem** When a CoS classifier configuration exceeds the amount of available ternary content addressable memory (TCAM) space, the switch returns the following system log message:

```
<number_of_rules_being_added> rules for <filter_name> class <filter_class> will  
not be installed, key: <bind_point>. no space in tcam db(<shared_pool_information>)
```

The switch returns this message during the commit operation if the number of classifiers defined in the CoS configuration or the number of bind points (interfaces) to which classifiers are bound causes the CoS configuration to exceed the amount of available TCAM space. However, the commit operation for the CoS configuration is completed in the CLI module.

**Solution** When a CoS configuration exceeds the amount of available TCAM table space, you must either define fewer classifiers or bind them to fewer interfaces, or both, so that the space requirements for the CoS configuration do not exceed the available space in TCAM.

To delete classifier definitions and bind points in a CoS configuration, and to apply a new CoS classifier definition to fewer bind points:

1. Delete either the CoS classifier definition or the bind points:

- To delete the CoS classifier definition:

- For behavioral classifiers:

```
[edit class-of-service]
user@switch# delete classifier dscp dl
```

- For multifield classifiers:

```
[edit]
user@switch# delete interfaces ge-3/0/2 unit 0 family ethernet-switching filter input ipacl
```

This command deletes a multifield classifier defined for a port. Similarly, you can delete a multifield classifier defined for a VLAN or router.

You can also delete terms defined in a single multifield classifier:

```
[edit]
user@switch# delete firewall family inet filter f1 term t1
```

In both these examples (for behavioral and multifield classifiers), the assumption is that too many classifier definitions resulted in the error message.

- To delete the bind points:

```
[edit class-of-service]
user@switch# delete class-of-service interfaces ge-0/0/0
user@switch# delete class-of-service interfaces ge-0/0/1
user@switch# delete class-of-service interfaces ge-0/0/2
user@switch# delete class-of-service interfaces ge-0/0/3
user@switch# delete class-of-service interfaces ge-0/0/4
user@switch# delete class-of-service interfaces ge-0/0/5
user@switch# delete class-of-service interfaces ge-0/0/6
user@switch# delete class-of-service interfaces ge-0/0/7
user@switch# delete class-of-service interfaces ge-0/0/8
```

Here the assumption is that too many bind points (nine) in the configuration resulted in the error message.

2. Commit the operation:

```
[edit]
user@switch# commit
```

3. Define fewer classifiers in the CoS configuration or bind classifiers to fewer interfaces, or both, so that the CoS classifier configuration does not exceed the amount of available TCAM space on the switch:

- To define CoS classifiers:
- For behavioral classifiers:

```
[edit]
```

```

user@switch# set class-of-service classifiers dscp d2 forwarding-class fc1 loss-priority
low code-points 000001
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc2 loss-priority
low code-points 000010
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc3 loss-priority
low code-points 000011
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc4 loss-priority
low code-points 000100
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc5 loss-priority
low code-points 000101
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc6 loss-priority
low code-points 000110
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc7 loss-priority
low code-points 000111

```

- For multifield Classifiers:

```

[edit]
user@switch# set firewall family inet filter f1 term t1 from protocol tcp
user@switch# set firewall family inet filter f1 term t1 then loss-priority high
user@switch# set firewall family inet filter f1 term t1 then forwarding-class best-effort
user@switch# set firewall family inet filter f1 term t2 from protocol udp
user@switch# set firewall family inet filter f1 term t2 then loss-priority high
user@switch# set firewall family inet filter f1 term t2 then forwarding-class
assured-forwarding
user@switch# set firewall family inet filter f1 term t3 from source-port ssh
user@switch# set firewall family inet filter f1 term t3 then loss-priority low
user@switch# set firewall family inet filter f1 term t3 then forwarding-class fc8
user@switch# set class-of-service forwarding-classes best-effort, assured-forwarding,
fc8

```

- To bind classifiers to fewer interfaces:

```

[edit]
user@switch# set class-of-service interfaces ge-0/0/0 unit 0 classifiers dscp d2
user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifiers dscp d2
user@switch# set class-of-service interfaces ge-0/0/2 unit 0 forwarding-class
best-effort
user@switch# set class-of-service interfaces ge-0/0/3 unit 0 forwarding-class
assured-forwarding
user@switch# set class-of-service interfaces ge-0/0/4 unit 0 forwarding-class fc8

```

4. Commit the operation:

```

[edit]
user@switch# commit

```

5. Check system log for an error message. If an error message is not logged, then your classifier configuration has not exceeded the TCAM space limit.

If an error message is logged, then repeat this procedure by defining fewer classifiers or binding classifiers to fewer bind points.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Configure up to 16 forwarding classes with multiple forwarding classes mapped to single queues. If you want to configure up to eight forwarding classes with one-to-one mapping to output queues, use the <b>queue</b> statement instead of the <b>class</b> statement at the <a href="#">[edit class-of-service forwarding-classes]</a> hierarchy level.</p> <p>On EX8200 switches, you can assign a fabric priority to a forwarding class. The fabric priority determines scheduling priority of packets ingressing the switch fabric. In addition, for interfaces on the 40-port SFP+ line card, the fabric priority determines whether packets are sent to the high or low priority queue for ingressing the port group. The primary use of this option is to prevent high priority input traffic from being dropped due to congestion on the port group of a 40-port SFP+ line card.</p> |
| <b>Options</b>                  | <p><b><i>class-name</i></b>—Name of forwarding class.</p> <p><b>priority (<i>high</i>   <i>low</i>)</b>—(Optional) (EX8200 switches only) Fabric priority.<br/> <b>Values:</b> <i>high</i> or <i>low</i><br/> <b>Default:</b> <i>low</i></p> <p><b>queue-num <i>queue-number</i></b>—Output queue number.<br/> <b>Range:</b> 0 through 7</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure class-of-service (CoS) parameters on EX Series switches.

The remaining statements are explained separately.

**Default** If you do not configure any CoS features, the default CoS settings are used.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## family

---

**Syntax**

```
family {
  ethernet {
    broadcast forwarding-class-name;
  }
  inet {
    classifiers{
      (dscp | ieee-802.1 | inet-precedence) classifier-name;
    }
  }
}
```

**Hierarchy Level** [edit [class-of-service multi-destination](#)]

**Release Information** Statement introduced in Junos OS Release 9.5 for EX Series switches.

**Description** Specify the multidestination traffic family.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interfaces

```
Syntax interfaces {
    interface-name {
        congestion-notification-profile profile-name {
            input {
                ieee-802.1 {
                    code-point up-bits pfc;
                }
            }
        }
        scheduler-map map-name;
        unit logical-unit-number {
            forwarding-class class-name;
            classifiers {
                (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
            }
        }
    }
}
```

**Hierarchy Level** [edit [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure interface-specific class-of-service (CoS) properties for incoming packets.

**Options** *interface-name*—Name of the interface.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## multi-destination

---

**Syntax**    multi-destination {  
              family {  
                  ethernet {  
                    broadcast forwarding-class-name;  
                  }  
                  inet {  
                    classifiers {  
                      (dscp | ieee-802.1 | inet-precedence) classifier-name;  
                    }  
                  }  
              }  
              scheduler-map map-name;  
          }

**Hierarchy Level**    [edit [class-of-service](#)]

**Release Information**    Statement introduced in Junos OS Release 9.5 for EX Series switches.

**Description**    Define the CoS configuration for multidestination traffic.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>List of Sample Output</b>    | <a href="#">show class-of- service on page 139</a><br><a href="#">show class-of-service rewrite-rule on page 142</a>                                                                                                                                                                                                                                                                                                                                                             |
| <b>Output Fields</b>            | <a href="#">Table 31 on page 138</a> lists the output fields for the <b>show class-of-service</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                               |

**Table 31: show class-of-service Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Forwarding class</b> | The forwarding class configuration: <ul style="list-style-type: none"> <li>• <b>Forwarding class</b>—Name of the forwarding class.</li> <li>• <b>ID</b>—Forwarding class ID.</li> <li>• <b>Queue</b>—Queue number.</li> <li>• <b>Fabric Priority</b>—(EX8200 switches only) Fabric priority: either <b>high</b> or <b>low</b>. The fabric priority determines which CoS ingress queues packets are sent to.</li> </ul> | All levels      |
| <b>Code point type</b>  | The type of code-point alias: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Aliases for DiffServ code point (DSCP) values.</li> <li>• <b>ieee-802.1</b>—Aliases for IEEE 802.1p values.</li> <li>• <b>inet-precedence</b>—Aliases for IP precedence values.</li> <li>• <b>exp</b>—Aliases for experimental (EXP) values.</li> </ul>                                                                             | All levels      |
| <b>Alias</b>            | Names given to CoS values.                                                                                                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>Bit pattern</b>      | Set of bits associated with an alias.                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>Classifier</b>       | Name of the classifier.                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |

Table 31: show class-of-service Output Fields (*continued*)

| Field Name                | Field Description                                                                               | Level of Output |
|---------------------------|-------------------------------------------------------------------------------------------------|-----------------|
| <b>Code point</b>         | Code-point values.                                                                              | All levels      |
| <b>Loss priority</b>      | Loss priority assigned to specific CoS values and aliases of the classifier.                    | All levels      |
| <b>Rewrite rule</b>       | Name of the rewrite-rule.                                                                       | All levels      |
| <b>Drop profile</b>       | Name of the drop profile.                                                                       | All levels      |
| <b>Type</b>               | Type of drop profile. EX Series switches support only the <b>discrete</b> type of drop profile. | All levels      |
| <b>Fill level</b>         | Percentage of queue buffer fullness of high packets beyond which high packets are dropped.      | All levels      |
| <b>Scheduler</b>          | Name of the scheduler.                                                                          | All levels      |
| <b>Transmit rate</b>      | Transmission rate of the scheduler.                                                             | All levels      |
| <b>Buffer size</b>        | Delay buffer size in the queue.                                                                 | All levels      |
| <b>Drop profiles</b>      | Drop profiles configured for the specified scheduler.                                           | All levels      |
| <b>Protocol</b>           | Transport protocol corresponding to the drop profile.                                           | All levels      |
| <b>Name</b>               | Name of the drop profile.                                                                       | All levels      |
| <b>Queues supported</b>   | Number of queues that can be configured on the interface.                                       | All levels      |
| <b>Queues in use</b>      | Number of queues currently configured.                                                          | All levels      |
| <b>Physical interface</b> | Name of the physical interface.                                                                 | All levels      |
| <b>Scheduler map</b>      | Name of the scheduler map.                                                                      | All levels      |
| <b>Index</b>              | Internal index of a specific object.                                                            | All levels      |

## Sample Output

```

show class-of- service  user@switch> show class-of-service
Forwarding class          ID      Queue
best-effort               0       0
expedited-forwarding      1       5
assured-forwarding        2       1
network-control           3       7

Code point type: dscp
Alias      Bit pattern
af11      001010

```

```

af12          001100

| <b>Output Fields</b>            | Table 35 on page 149 describes the output fields for the <b>show class-of-service forwarding-class</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                   |

**Table 35: show class-of-service forwarding-class Output Fields**

| Field Name               | Field Description                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding class</b>  | Name of forwarding class.                                                                                                                                            |
| <b>ID</b>                | Forwarding class identifier.                                                                                                                                         |
| <b>Queue</b>             | CoS queue mapped to the forwarding class.                                                                                                                            |
| <b>Policing priority</b> | Not supported on EX Series switches or the QFX Series and can be ignored.                                                                                            |
| <b>Fabric priority</b>   | (EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b> . Determines the priority of packets ingressing the switch fabric. |

## Sample Output

```

show class-of-service forwarding-class  user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Policing priority
best-effort           0       0       normal

```

|                      |   |   |        |
|----------------------|---|---|--------|
| expedited-forwarding | 1 | 5 | normal |
| assured-forwarding   | 2 | 1 | normal |
| network-control      | 3 | 7 | normal |

## Sample Output

```
show class-of-service forwarding-class
forwarding-class (EX8200 Switch)
user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue  Fabric priority
best-effort           0        0      low
expedited-forwarding  1        5      low
assured-forwarding    2        1      low
network-control       3        7      low
mcast-be              4        2      low
mcast-ef              5        4      low
mcast-af              6        6      low
```

## Sample Output

```
show class-of-service forwarding-class (QFX Series)
user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue  Policing priority
best-effort           0        0      normal
fcoe                  1        1      normal
no-loss               2        2      normal
network-control       3        3      normal
mcast-be              8        8      normal
mcast-ef              9        9      normal
mcast-af             10       10      normal
mcast-nc             11       11      normal
```

## show class-of-service interface

|                                 |                                                                                                                                                                                                                                                             |

**Table 36: show class-of-service interface Output Fields**

| Field Name                       | Field Description                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface               | Name of a physical interface.                                                                                                                                                                                                                                                          |
| Index                            | Index of this interface or the internal index of this object.                                                                                                                                                                                                                          |
| Dedicated Queues                 | Status of dedicated queues configured on an interface. Supported on Trio MPC/MIC interfaces on MX Series routers only.                                                                                                                                                                 |
| Queues supported                 | Number of queues you can configure on the interface.                                                                                                                                                                                                                                   |
| Queues in use                    | Number of queues currently configured.                                                                                                                                                                                                                                                 |
| Total non-default queues created | Number of queues created in addition to the default queues. Supported on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                 |
| Shaping rate                     | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not both. Therefore, the <b>Shaping rate</b> field is displayed for the physical interface or the logical interface, but not both. |
| Scheduler map                    | Name of the output scheduler map associated with this interface.                                                                                                                                                                                                                       |
| Input shaping rate               | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                       |

Table 36: show class-of-service interface Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input scheduler map</b>     | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                        |
| <b>Chassis scheduler map</b>   | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                     |
| <b>Rewrite</b>                 | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                    |
| <b>Classifier</b>              | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                          |
| <b>Forwarding-class-map</b>    | Name of the forwarding map associated with this interface.                                                                                                                                                                                                                            |
| <b>Congestion-notification</b> | Congestion notification state, <b>enabled</b> or <b>disabled</b> (QFX Series only).                                                                                                                                                                                                   |
| <b>Logical interface</b>       | Name of a logical interface.                                                                                                                                                                                                                                                          |
| <b>Shaping rate</b>            | Maximum transmission rate on the logical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not both. Therefore, the <b>Shaping rate</b> field is displayed for the physical interface or the logical interface, but not both. |
| <b>Object</b>                  | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , or <b>Translation Table</b> (for IQE PICs only).                                                                                               |
| <b>Name</b>                    | Name of an object.                                                                                                                                                                                                                                                                    |
| <b>Type</b>                    | Type of an object: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>ieee-802.1</b> , <b>ip</b> , or <b>inet-precedence</b> .                                                                                                                                                          |

## show pfe statistics traffic cpu

**Syntax** `show pfe statistics traffic cpu <fpc fpc-slot>`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** (On EX8200 switches only) Display count of multidestination packets ingressing from the physical interface to the CPU.

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**Options** `none`—Displays the count of packets ingressing from all the physical interfaces (line cards) to the CPU.

`fpc fpc-slot`—(Optional) Displays the count of packets ingressing from the physical interface, referred to by the slot number, to the CPU.

On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are **0** through **7** on the EX8208 switch and **0** through **15** on the EX8216 switch.

**Required Privilege Level** `view`

## show pfe statistics traffic egress-queues

**Syntax** `show pfe statistics traffic egress-queues <fpc fpc-slot>`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** (On EX8200 switches only) Display count of multidestination packets dropped on egress ports when the egress queues are oversubscribed due to multidestination traffic.

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**Options** `none`—Displays count of packets dropped on egress ports of all physical interfaces (line cards) when egress queues are oversubscribed due to multidestination traffic.

`fpc fpc-slot`—(Optional) Displays count of packets dropped on egress ports of the physical interface (line card) referred to by the slot number.

**NOTE:** On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are 0 through 7 on the EX8208 switch and 0 through 15 on the EX8216 switch.

**Output Fields** [Table 39 on page 161](#) lists the output fields for the `show pfe statistics traffic egress-queues` command. Output fields are listed in the approximate order in which they appear.

**Table 39: show pfe statistics traffic egress-queues Output Fields**

| Field Name           | Field Description                                                             |
|----------------------|-------------------------------------------------------------------------------|
| Tail-dropped packets | Number of arriving packets dropped because the output queue buffers are full. |

## Sample Output

```
show pfe statistics      user@switch> show pfe statistics traffic egress-queues fpc 4
traffic egress-queues   Tail-dropped packets :                0
fpc 4 (EX8208 Switch)
```

## show pfe statistics traffic multicast

**Syntax** `show pfe statistics traffic multicast <fpc fpc-slot dev-number>`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** (On EX8200 switches only) Display class-of-service (CoS) queue information for multdestination traffic on a physical interface (line card).

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**NOTE:** To view statistical information for unicast traffic, use the `show interfaces queue` command.

**Options** `fpc fpc-slot dev-number`—(Optional) Displays class-of-service (CoS) queue information for multdestination traffic on the physical interface (line card) referred to by the slot number and device number.

**NOTE:** On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values for the FPC slot number are 0 through 7 on the EX8208 switch and 0 through 15 on the EX8216 switch. The value for the device number ranges from 0–5, where 0–4 values correspond to the statistics only from that specific device and the value 5 corresponds to the combined statistics from all the devices in the FPC.

**Required Privilege Level** view
