This product includes the Envoy SNMP Engine, developed by Epilogue Technology, an Integrated Systems Company. Copyright © 1986-1997, Epilogue Technology Corporation. All rights reserved. This program and its documentation were developed at private expense, and no part of them is in the public domain.

This product includes memory allocation software developed by Mark Moraes, copyright © 1988, 1989, 1993, University of Toronto.

This product includes FreeBSD software developed by the University of California, Berkeley, and its contributors. All of the documentation and software included in the 4.4BSD and 4.4BSD-Lite Releases is copyrighted by the Regents of the University of California. Copyright © 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992, 1993, 1994. The Regents of the University of California. All rights reserved.

GateD software copyright © 1995, the Regents of the University. All rights reserved. Gate Daemon was originated and developed through release 3.0 by Cornell University and its collaborators. Gated is based on Kirton's EGP, UC Berkeley's routing daemon (routed), and DCN's HELLO routing protocol. Development of Gated has been supported in part by the National Science Foundation. Portions of the GateD software copyright © 1988, Regents of the University of California. All rights reserved. Portions of the GateD software copyright © 1991, D. L. S. Associates.

This product includes software developed by Maker Communications, Inc., copyright © 1996, 1997, Maker Communications, Inc.

Juniper Networks, Junos, Steel-Belted Radius, NetScreen, and ScreenOS are registered trademarks of Juniper Networks, Inc. in the United States and other countries. The Juniper Networks Logo, the Junos logo, and JunosE are trademarks of Juniper Networks, Inc. All other trademarks, service marks, registered trademarks, or registered service marks are the property of their respective owners.

Juniper Networks assumes no responsibility for any inaccuracies in this document. Juniper Networks reserves the right to change, modify, transfer, or otherwise revise this publication without notice.

Products made or sold by Juniper Networks or components thereof might be covered by one or more of the following patents that are owned by or licensed to Juniper Networks: U.S. Patent Nos. 5,473,599, 5,905,725, 5,909,440, 6,192,051, 6,333,650, 6,359,479, 6,406,312, 6,429,706, 6,459,579, 6,493,347, 6,538,518, 6,538,899, 6,552,918, 6,567,902, 6,578,186, and 6,590,785.

Revision History  
May 2011—R1 Junos SDK 11.2

The information in this document is current as of the date listed in the revision history.

#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. The Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

## END USER LICENSE AGREEMENT

**READ THIS END USER LICENSE AGREEMENT ("AGREEMENT") BEFORE DOWNLOADING, INSTALLING, OR USING THE SOFTWARE.** BY DOWNLOADING, INSTALLING, OR USING THE SOFTWARE OR OTHERWISE EXPRESSING YOUR AGREEMENT TO THE TERMS CONTAINED HEREIN, YOU (AS CUSTOMER OR IF YOU ARE NOT THE CUSTOMER, AS A REPRESENTATIVE/AGENT AUTHORIZED TO BIND THE CUSTOMER) CONSENT TO BE BOUND BY THIS AGREEMENT. IF YOU DO NOT OR CANNOT AGREE TO THE TERMS CONTAINED HEREIN, THEN (A) DO NOT DOWNLOAD, INSTALL, OR USE THE SOFTWARE, AND (B) YOU MAY CONTACT JUNIPER NETWORKS REGARDING LICENSE TERMS.

1. **The Parties.** The parties to this Agreement are (i) Juniper Networks, Inc. (if the Customer's principal office is located in the Americas) or Juniper Networks (Cayman) Limited (if the Customer's principal office is located outside the Americas) (such applicable entity being referred to herein as "Juniper"), and (ii) the person or organization that originally purchased from Juniper or an authorized Juniper reseller the applicable license(s) for use of the Software ("Customer") (collectively, the "Parties").

2. **The Software.** In this Agreement, "Software" means the program modules and features of the Juniper or Juniper-supplied software, for which Customer has paid the applicable license or support fees to Juniper or an authorized Juniper reseller, or which was embedded by Juniper in equipment which Customer purchased from Juniper or an authorized Juniper reseller. "Software" also includes updates, upgrades and new releases of such software. "Embedded Software" means Software which Juniper has embedded in or loaded onto the Juniper equipment and any updates, upgrades, additions or replacements which are subsequently embedded in or loaded onto the equipment.

3. **License Grant.** Subject to payment of the applicable fees and the limitations and restrictions set forth herein, Juniper grants to Customer a non-exclusive and non-transferable license, without right to sublicense, to use the Software, in executable form only, subject to the following use restrictions:

- a. Customer shall use Embedded Software solely as embedded in, and for execution on, Juniper equipment originally purchased by Customer from Juniper or an authorized Juniper reseller.
- b. Customer shall use the Software on a single hardware chassis having a single processing unit, or as many chassis or processing units for which Customer has paid the applicable license fees; provided, however, with respect to the Steel-Belted Radius or Odyssey Access Client software only, Customer shall use such Software on a single computer containing a single physical random access memory space and containing any number of processors. Use of the Steel-Belted Radius or IMS AAA software on multiple computers or virtual machines (e.g., Solaris zones) requires multiple licenses, regardless of whether such computers or virtualizations are physically contained on a single chassis.
- c. Product purchase documents, paper or electronic user documentation, and/or the particular licenses purchased by Customer may specify limits to Customer's use of the Software. Such limits may restrict use to a maximum number of seats, registered endpoints, concurrent users, sessions, calls, connections, subscribers, clusters, nodes, realms, devices, links, ports or transactions, or require the purchase of separate licenses to use particular features, functionalities, services, applications, operations, or capabilities, or provide throughput, performance, configuration, bandwidth, interface, processing, temporal, or geographical limits. In addition, such limits may restrict the use of the Software to managing certain kinds of networks or require the Software to be used only in conjunction with other specific Software. Customer's use of the Software shall be subject to all such limitations and purchase of all applicable licenses.
- d. For any trial copy of the Software, Customer's right to use the Software expires 30 days after download, installation or use of the Software. Customer may operate the Software after the 30-day trial period only if Customer pays for a license to do so. Customer may not extend or create an additional trial period by re-installing the Software after the 30-day trial period.
- e. The Global Enterprise Edition of the Steel-Belted Radius software may be used by Customer only to manage access to Customer's enterprise network. Specifically, service provider customers are expressly prohibited from using the Global Enterprise Edition of the Steel-Belted Radius software to support any commercial network access services.

The foregoing license is not transferable or assignable by Customer. No license is granted herein to any user who did not originally purchase the applicable license(s) for the Software from Juniper or an authorized Juniper reseller.

4. **Use Prohibitions.** Notwithstanding the foregoing, the license provided herein does not permit the Customer to, and Customer agrees not to and shall not: (a) modify, unbundle, reverse engineer, or create derivative works based on the Software; (b) make unauthorized copies of the Software (except as necessary for backup purposes); (c) rent, sell, transfer, or grant any rights in and to any copy of the Software, in any form, to any third party; (d) remove any proprietary notices, labels, or marks on or in any copy of the Software or any product in which the Software is embedded; (e) distribute any copy of the Software to any third party, including as may be embedded in Juniper equipment sold in the secondhand market; (f) use any 'locked' or key-restricted feature, function, service, application, operation, or capability without first purchasing the applicable license(s) and obtaining a valid key from Juniper, even if such feature, function, service, application, operation, or capability is enabled without a key; (g) distribute any key for the Software provided by Juniper to any third party; (h) use the

Software in any manner that extends or is broader than the uses purchased by Customer from Juniper or an authorized Juniper reseller; (i) use Embedded Software on non-Juniper equipment; (j) use Embedded Software (or make it available for use) on Juniper equipment that the Customer did not originally purchase from Juniper or an authorized Juniper reseller; (k) disclose the results of testing or benchmarking of the Software to any third party without the prior written consent of Juniper; or (l) use the Software in any manner other than as expressly provided herein.

5. **Audit.** Customer shall maintain accurate records as necessary to verify compliance with this Agreement. Upon request by Juniper, Customer shall furnish such records to Juniper and certify its compliance with this Agreement.

6. **Confidentiality.** The Parties agree that aspects of the Software and associated documentation are the confidential property of Juniper. As such, Customer shall exercise all reasonable commercial efforts to maintain the Software and associated documentation in confidence, which at a minimum includes restricting access to the Software to Customer employees and contractors having a need to use the Software for Customer's internal business purposes.

7. **Ownership.** Juniper and Juniper's licensors, respectively, retain ownership of all right, title, and interest (including copyright) in and to the Software, associated documentation, and all copies of the Software. Nothing in this Agreement constitutes a transfer or conveyance of any right, title, or interest in the Software or associated documentation, or a sale of the Software, associated documentation, or copies of the Software.

8. **Warranty, Limitation of Liability, Disclaimer of Warranty.** The warranty applicable to the Software shall be as set forth in the warranty statement that accompanies the Software (the "Warranty Statement"). Nothing in this Agreement shall give rise to any obligation to support the Software. Support services may be purchased separately. Any such support shall be governed by a separate, written support services agreement. TO THE MAXIMUM EXTENT PERMITTED BY LAW, JUNIPER SHALL NOT BE LIABLE FOR ANY LOST PROFITS, LOSS OF DATA, OR COSTS OR PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES, OR FOR ANY SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES ARISING OUT OF THIS AGREEMENT, THE SOFTWARE, OR ANY JUNIPER OR JUNIPER-SUPPLIED SOFTWARE. IN NO EVENT SHALL JUNIPER BE LIABLE FOR DAMAGES ARISING FROM UNAUTHORIZED OR IMPROPER USE OF ANY JUNIPER OR JUNIPER-SUPPLIED SOFTWARE. EXCEPT AS EXPRESSLY PROVIDED IN THE WARRANTY STATEMENT TO THE EXTENT PERMITTED BY LAW, JUNIPER DISCLAIMS ANY AND ALL WARRANTIES IN AND TO THE SOFTWARE (WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE), INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NONINFRINGEMENT. IN NO EVENT DOES JUNIPER WARRANT THAT THE SOFTWARE, OR ANY EQUIPMENT OR NETWORK RUNNING THE SOFTWARE, WILL OPERATE WITHOUT ERROR OR INTERRUPTION, OR WILL BE FREE OF VULNERABILITY TO INTRUSION OR ATTACK. In no event shall Juniper's or its suppliers' or licensors' liability to Customer, whether in contract, tort (including negligence), breach of warranty, or otherwise, exceed the price paid by Customer for the Software that gave rise to the claim, or if the Software is embedded in another Juniper product, the price paid by Customer for such other product. Customer acknowledges and agrees that Juniper has set its prices and entered into this Agreement in reliance upon the disclaimers of warranty and the limitations of liability set forth herein, that the same reflect an allocation of risk between the Parties (including the risk that a contract remedy may fail of its essential purpose and cause consequential loss), and that the same form an essential basis of the bargain between the Parties.

9. **Termination.** Any breach of this Agreement or failure by Customer to pay any applicable fees due shall result in automatic termination of the license granted herein. Upon such termination, Customer shall destroy or return to Juniper all copies of the Software and related documentation in Customer's possession or control.

10. **Taxes.** All license fees payable under this agreement are exclusive of tax. Customer shall be responsible for paying Taxes arising from the purchase of the license, or importation or use of the Software. If applicable, valid exemption documentation for each taxing jurisdiction shall be provided to Juniper prior to invoicing, and Customer shall promptly notify Juniper if their exemption is revoked or modified. All payments made by Customer shall be net of any applicable withholding tax. Customer will provide reasonable assistance to Juniper in connection with such withholding taxes by promptly: providing Juniper with valid tax receipts and other required documentation showing Customer's payment of any withholding taxes; completing appropriate applications that would reduce the amount of withholding tax to be paid; and notifying and assisting Juniper in any audit or tax proceeding related to transactions hereunder. Customer shall comply with all applicable tax laws and regulations, and Customer will promptly pay or reimburse Juniper for all costs and damages related to any liability incurred by Juniper as a result of Customer's non-compliance or delay with its responsibilities herein. Customer's obligations under this Section shall survive termination or expiration of this Agreement.

11. **Export.** Customer agrees to comply with all applicable export laws and restrictions and regulations of any United States and any applicable foreign agency or authority, and not to export or re-export the Software or any direct product thereof in violation of any such restrictions, laws or regulations, or without all necessary approvals. Customer shall be liable for any such violations. The version of the Software supplied to Customer may contain encryption or other capabilities restricting Customer's ability to export the Software without an export license.

12. **Commercial Computer Software.** The Software is "commercial computer software" and is provided with restricted rights. Use, duplication, or disclosure by the United States government is subject to restrictions set forth in this Agreement and as provided in DFARS 227.7201 through 227.7202-4, FAR 12.212, FAR 27.405(b)(2), FAR 52.227-19, or FAR 52.227-14 (ALT III) as applicable.

13. **Interface Information.** To the extent required by applicable law, and at Customer's written request, Juniper shall provide Customer with the interface information needed to achieve interoperability between the Software and another independently created program, on payment of applicable fee, if any. Customer shall observe strict obligations of confidentiality with respect to such information and shall use such information in compliance with any applicable terms and conditions upon which Juniper makes such information available.

14. **Third Party Software.** Any licensor of Juniper whose software is embedded in the Software and any supplier of Juniper whose products or technology are embedded in (or services are accessed by) the Software shall be a third party beneficiary with respect to this Agreement, and such licensor or vendor shall have the right to enforce this Agreement in its own name as if it were Juniper. In addition, certain third party software may be provided with the Software and is subject to the accompanying license(s), if any, of its respective owner(s). To the extent portions of the Software are distributed under and subject to open source licenses obligating Juniper to make the source code for such portions publicly available (such as the GNU General Public License ("GPL") or the GNU Library General Public License ("LGPL")), Juniper will make such source code portions (including Juniper modifications, as appropriate) available upon request for a period of up to three years from the date of distribution. Such request can be made in writing to Juniper Networks, Inc., 1194 N. Mathilda Ave., Sunnyvale, CA 94089, ATTN: General Counsel. You may obtain a copy of the GPL at <http://www.gnu.org/licenses/gpl.html>, and a copy of the LGPL at <http://www.gnu.org/licenses/lgpl.html>.

15. **Miscellaneous.** This Agreement shall be governed by the laws of the State of California without reference to its conflicts of laws principles. The provisions of the U.N. Convention for the International Sale of Goods shall not apply to this Agreement. For any disputes arising under this Agreement, the Parties hereby consent to the personal and exclusive jurisdiction of, and venue in, the state and federal courts within Santa Clara County, California. This Agreement constitutes the entire and sole agreement between Juniper and the Customer with respect to the Software, and supersedes all prior and contemporaneous agreements relating to the Software, whether oral or written (including any inconsistent terms contained in a purchase order), except that the terms of a separate written agreement executed by an authorized Juniper representative and Customer shall govern to the extent such terms are inconsistent or conflict with terms contained herein. No modification to this Agreement nor any waiver of any rights hereunder shall be effective unless expressly assented to in writing by the party to be charged. If any portion of this Agreement is held invalid, the Parties agree that such invalidity shall not affect the validity of the remainder of this Agreement. This Agreement and associated documentation has been written in the English language, and the Parties agree that the English version will govern. (For Canada: Les parties aux présentes confirment leur volonté que cette convention de même que tous les documents y compris tout avis qui s'y rattache, soient rédigés en langue anglaise. (Translation: The parties confirm that this Agreement and all related documentation is and will be in the English language)).

# About This Guide

This preface provides the following guidelines for using the *Junos<sup>®</sup> SDK Applications Configuration Guide*:

- Supported Routing Platforms on page xvii
- Using the Indexes on page xviii
- Documentation Conventions on page xviii
- Documentation Feedback on page xix
- Requesting Technical Support on page xix

## Supported Routing Platforms

---

All applications built using the Junos SDK are supported on the Juniper Networks M Series Multiservice Edge Routers and the MX Series 3D Universal Edge Routers, with the exception that dynamic firewall filters are not supported on M40e routers. The Juniper Networks T320, T640, and T1600 Core Routers fully support these applications as well.

Among the M7i and M10i routers, the **junos\_dfwd** functions (firewall filters) are supported on the following systems:

- M7i router with Enhanced Forwarding Engine
- M10i router with Enhanced Forwarding Engine
- M7i router with integrated Multiservices 100 PIC (available only with the Enhanced Forwarding Engine)

Only applications built using just the RE SDK module of the Junos SDK are supported on the Juniper Networks TX Matrix. The same is true for the Juniper Networks SRX210, SRX240, and SRX650 Services Gateways and the Juniper Networks JCS 1200 Control System.

The libdfwd statistics APIs are not supported on the Multiservices PIC. Also, the libdfwd interface creating a Level II match condition for filters is supported only on the MX Series routers.

The signing server is supported only on Linux-based and FreeBSD-based systems.

In the documentation, the term *Multiservices PIC* is equivalent to the Multiservices Dense Port Concentrator (DPC) on the MX Series routers, unless otherwise noted.

## Using the Indexes

This reference contains two indexes: a complete index that includes topic entries, and an index of statements and commands only.

In the index of statements and commands, an entry refers to a statement summary section only. In the complete index, the entry for a configuration statement or command contains at least two parts:

- The primary entry refers to the statement summary section.
- The secondary entry, *usage guidelines*, refers to the section in a configuration guidelines chapter that describes how to use the statement or command.

## Documentation Conventions

Table 1 on page xviii defines the text and syntax conventions used in this guide.

**Table 1: Text and Syntax Conventions**

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
<b>Fixed-width text like this</b>	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>• Introduces important new terms.</li> <li>• Identifies book names.</li> <li>• Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>• A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li>• <i>Junos OS System Basics Configuration Guide</i></li> <li>• RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
<b>Text like this</b>	Represents names of configuration statements, commands, files, and directories; interface names; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>• To configure a stub area, include the <b>stub</b> statement at the [edit protocols ospf area area-id] hierarchy level.</li> <li>• The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Enclose optional keywords or variables.	<b>stub</b> <default-metric <i>metric</i> >;

Table 1: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  ( <i>string1</i>   <i>string2</i>   <i>string3</i> )
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Enclose a variable for which you can substitute one or more values.	<b>community name members [</b> <b>community-ids ]</b>
Indentation and braces ( { } )	Identify a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
<b>J-Web GUI Conventions</b>		
<b>Bold text like this</b>	Represents J-Web graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net), or fill out the documentation feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract,

or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf> .
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/> .
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>
- Join and participate in the Juniper Networks Community Forum: <http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/> .
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

## CHAPTER 1

# Software Applications on the Junos Platform

This section contains the following topics:

- Introduction to Applications and the Junos SDK on page 1
- Applications in the Junos Architecture on page 3

### Introduction to Applications and the Junos SDK

---

The Junos Software Development Kit (SDK) allows partners of the Junos SDK program to build custom applications that run on the Juniper Networks Junos operating system (OS).

Third-party developers, here called *providers*, can use the Junos SDK to create innovative applications and manipulate existing features of the Junos OS. The term *application*, as used in this guide, refers to an application built by a provider using the Junos SDK. Documentation about the Junos SDK is aimed at one of two audiences: the providers that build the applications and the network administrators who install and configure the applications on their network devices. This guide is for network administrators.

Applications run on either a Routing Engine or a services module and so can be thought of as being either Routing Engine applications or service applications, respectively.

- Routing Engine applications run on the control plane. Typically, these applications perform network management and protocol signaling. They also initiate servers. Positioned on the control plane, Routing Engine applications can coordinate other subsystems and services. A Routing Engine is always present in any device, so these applications are always deployable without the addition of any extra hardware or software.
- Service applications run on the services plane. The services plane is specialized to enable high-performance, customized, and stateful packet processing on the transit or monitored traffic selected for servicing. Service applications may also perform operations similar to Routing Engine applications, but such activities typically supplement packet processing.

On some of the smaller Juniper Networks devices, physical modules do not necessarily plug in to a chassis. Rather a single box contains the necessary hardware. Nonetheless,

applications are still supported in the control and services planes and we continue to use the Routing Engine and services modules terminology.

For more information about the Junos SDK, please contact your account team or visit the Junos SDK website at

<http://www.juniper.net/us/en/products-services/nos/junos/junos-sdk/>.

- Installing Application Packages on page 8

## Applications in the Junos Architecture

The Junos operating system (OS) is a single network operating systems that integrates routing, switching, and security. Most Juniper Networks platforms run the Junos OS and also support applications created using the Junos SDK, referred to in this guide as *applications*.

This topic presents the Junos OS architecture at a high level and in detail where it pertains to building applications. It continues explaining how the architecture fits over the hardware, and what types of applications are best suited to the environments described.

Figure 1: Architecture Summary and Traffic Paths

g039250

The Junos OS is divided into three logical elements: the control plane, the data plane, and the services plane. These main conceptual separations are summarized in Figure 1 on page 3 and described in more detail in the following sections:

- Control Plane on page 4
- Data Plane on page 4
- Services Plane on page 5
- Traffic Types on page 5

## Control Plane

---

The control plane in the Junos OS is a logical element that manages and controls the behavior of the device and the other two planes, the data plane and the services plane. The control plane runs on the Routing Engine. The Routing Engine may be a separate physical module or may be integrated into a device. In some products the Routing Engine cards are hot-swappable physical modules in the chassis. A chassis option for a redundant Routing Engine backing up the master Routing Engine is also available. Applications can take advantage of this redundant Routing Engine to enable their own high availability.

The control plane:

- Has a global view of the device hardware and software
- Exposes the user interface and manages the native Junos OS features

The Routing Engine's key component is the Junos OS. The Junos OS is based on the FreeBSD operating system, an open-source software system. This mature, general-purpose system provides many of the essential functions of an operating system, such as scheduling resources. To transform it into a network operating system, Juniper Networks engineers have extensively modified and hardened it for the specialized requirements of networking.

On the control plane, the Junos kernel, many of the Junos daemons, and some ephemeral utility-style tools launched on demand are run. The daemons and tools that come bundled with the Junos OS are considered part of the Junos OS platform.

Applications for the control plane resemble these daemons and tools. In fact, Juniper Networks employs the Junos SDK APIs internally when building these applications, which then become part of the common platform and Junos OS software bundle. Applications developed using the Junos SDK can programmatically manipulate the states of the platform software and make use of their services in a dynamic way. The daemons that control the Junos OS user interface also allow for programmatic and seamless extensibility of the user interface. You can configure and administer a modified user interface in the same way as you do for applications.

## Data Plane

---

The data plane in the Junos OS is a logical element that spans many aspects of a device's chassis and its modules. The data plane's role is to forward traffic according to the forwarding table, primarily formed through the routing control service on the control plane. The data plane's main extended abilities include switching, filtering, rate limiting, shaping, and other quality-of-service (QoS) functions. These functions are controlled by the control plane.

In the Junos environment, the data plane is collectively referred to and abstracted as the Packet Forwarding Engine. It comprises ASIC-based hardware and software microcode to perform packet processing. Aiming to perform at fast wire speeds and within its hardware resource limits, the Packet Forwarding Engine generally defers stateful packet processing to the services plane. Applications created using the Junos SDK do not run in the data plane, which is tightly bound to the hardware. An application running in the

control or services plane can influence the packet processing mechanism in the data plane, however.

### Services Plane

---

The services plane in the Junos OS is a logical element that can be thought of as an extension to the data plane to perform stateful services and any services non-native to the Packet Forwarding Engine. A classic example of a Junos OS service application is the stateful firewall.

In traditional forwarding devices, the data plane usually handles much of the packet processing and the services plane runs on optionally installable and hot-swappable hardware, which are generically called services modules. The services plane spans the collection of all services modules in a chassis, and a given service application can be deployed on more than one module. For the M Series, T Series, and MX Series routers, the specific modules supporting the services plane are the Multiservices PIC and the Multiservices DPC.

In security and service-oriented devices, the services plane is the primary packet processor, and the data plane merely connects a chassis containing many services modules. While these devices can perform forwarding, they are purpose built and deployed to service traffic in stateful ways implemented in software running on the services modules.

The Junos kernel on a services engine further logically divides packet handling for applications in two sub-planes. Its services plane (data plane extension) is for fast customized transit traffic processing. Its control plane is for traffic termination with the IP stack. The control plane components frequently implement a server or signaling to communicate outside the device or simply to other components on the Routing Engine.

Applications in the services sub-plane of a service module can take on two roles involving inline packet processing: transforming and monitoring. Transforming applications have access to any traffic flowing through the Packet Forwarding Engine that is selected for servicing at the given service module. They can modify, drop, hold, and create entire packets. Monitoring applications work similarly, but the packets they receive are duplicates of some traffic originally transiting the Packet Forwarding Engine. When monitoring is used, the original traffic is not impacted or serviced. The selection and configuration of either packet processing option is application specific. A hybrid application can differentiate and deal with both original and duplicated packets. Sometimes hybrid applications are named *gateways*, and may combine a server or signaling control plane component with a transforming or monitoring services plane component. Many familiar service applications, such as the Junos IPsec service, work with both styles of components.

### Traffic Types

---

Applications deal with two different types of traffic: control traffic and data traffic.

Control traffic is in the control plane. You can classify control traffic as traffic that is either internal to the device entirely (for example, interprocess communication) or, more generally, as traffic destined to or sourced from a device address. Most addresses configured on the device belong to the master Routing Engine. For example all addresses configured on network interfaces for I/O ports and the loop back interface pertain to the Routing Engine, so control traffic destined to those addresses is forwarded to the master

Routing Engine and handled there. The Junos OS also allows the configuration of addresses on interfaces representing a service module. Traffic destined to those addresses is forwarded to and handled on the given service engine's control sub-plane.

Data traffic flows through the data plane. You can classify data traffic that relates especially to any application as the traffic selected for servicing or monitoring. This is the traffic seen in the services plane handled by transforming or monitoring applications. Data traffic naturally flows through the Packet Forwarding Engine as transit traffic, but there are application-specific mechanisms by which it can be selected for steering through the service engine's services plane. On exit, the steered traffic is re-routed and filtered in the Packet Forwarding Engine as if it was entering the device from any I/O interface.

## CHAPTER 2

# Installing and Managing Application Packages

This section includes topics on installing, enabling, managing, and removing applications:

- Application Versions and Compatibility on page 7
- Installing Application Packages on page 8
- Upgrading Application Packages on page 11
- Removing Application Packages on page 12
- Checking Installed Application Packages on page 13
- Upgrading the Junos OS When Applications Are Installed on page 13
- Deploying Service Applications on page 14

### Application Versions and Compatibility

---

Applications created using the Junos SDK provide binary compatibility across the different releases of the Junos OS in a particular release train. For example, all the applications developed using the Junos SDK Release 10.3 are binary compatible with Junos OS releases 10.3R1, 10.3R2, 10.3R3, and so on.

But suppose you have Junos OS Release 11.1 on your device and you use the **request system software add** command to install an application developed using Junos SDK Release 10.4. The Junos OS gracefully refuses any attempt to add the software to the device.

```
user@router> request system software add /var/tmp/jnx-example-10.4I20100917_1456.tgz
Checking compatibility with configuration
Initializing...
Using jbase-11.1B1.6

Verified jbase-11.1B1.6 signed by PackageProduction_11_1_0
Using /var/tmp/jnx-example-10.4I20100917_1456.tgz
Verified jnx-example-10.4I20100917_1456 signed by junipersdk-private-1
WARNING: Package 'jnx_ifinfo' is not compatible with package 'jkernel':
WARNING:   Major version number mismatch
WARNING:   (jnx_ifinfo:10 != jkernel:11)
ERROR: JUNOS version incompatible - source compatibility supported from 11.1 -
11.current_jbase_minor
```

```
ERROR: jnx-example fails requirements check
Installation failed for package '/var/tmp/jnx-example-10.4I20100917_1456.tgz'
```

**NOTE:** It is a general practice that applications created using the Junos SDK are built with a target Junos OS release.

**Related  
Documentation**

- Installing Application Packages on page 8
- Checking Installed Application Packages on page 13

---

## Installing Application Packages

To install an application you install the application package or packages, and then you install the application on the router. An application package consists of binaries and their supplements. Application packages are distributed in a single **.tgz** file, which contains all the necessary resources to run the application.

To install an application on a router, you configure the statements that describe the certificate. These statements include the provider name, the type of certificate, and the scope of application deployment. The provider name identifies the provider of the application to the system and allows application packages from that provider to be installed on the router. Furthermore, each package's embedded certificate contains parameters about the provider's partnership with Juniper Networks: the license type and deployment scope parameters. As with the provider name, these parameters for the package must be allowed by the configuration in order for the package's installation to be allowed.

**NOTE:** If graceful routing engine switchover (GRES), or nonstop active routing (NSR) is enabled when you initiate a software installation, the software does not install properly. Make sure you issue the CLI **delete chassis redundancy** command when prompted. If GRES is enabled, it will be removed with this command. By default, NSR is disabled. If NSR is enabled, remove the **nonstop-routing** statement from the [edit routing-options] hierarchy level to disable it.

To install an application:

1. Go to operational mode of the CLI and install the application package.

```
user@router> request system software add package-name
```

You will see the application package being installed. For example, if your package's filename is **abcapps-11.1\_2011.tgz**.

```
user@router> request system software add abcapps-11.1_2011.tgz
Installing package '/var/home/user/abcapps-11.1_2011.tgz'
...
Verified abcapps-11.1_2011.tgz signed by abc-enggroup
```

```
Adding abcapps...
Available space: 150060 require: 2598
Saving package file in /var/sw/pkg/abcapps-11.1_2011.tgz Saving state
for rollback ...
```

2. Deploy the application on the router.

- a. Go to configuration mode of the CLI.

```
user@router> configure
Entering configuration mode
[edit]
user@router#
```

- b. Go to the **[edit system extensions]** hierarchy level.

```
[edit]
user@router# edit system extensions
[edit system extensions]
```

- c. Configure the provider name, the license type, and the deployment scope associated with the application package. This information is supplied by the application's provider.

**NOTE:** Older certificates have all the certificate information concatenated in the **providers name** statement. These older certificates are still supported, and you can install packages signed with them.

```
[edit system extensions]
user@router# set providers name license-type license deployment-scope
deployment
```

For deployment, there could be a series of values. For example, if **abc** is a provider name issued to a provider with a **commercial** type of license and two deployment scopes, you might issue this command:

```
[edit system extensions]
user@router# set providers abc license-type commercial deployment-scope [
private commercial ]
```

- d. Make other application-specific configuration changes as required by the application's provider. This information should be in documentation developed by the provider.

- e. Commit the changes to the configuration.

```
[edit system extensions]
user@router# top
[edit]
user@router# commit
commit complete
```

- f. Exit the configuration mode.

```
[edit]
user@router# exit
Exiting configuration mode
```

Multiple provider names can be enabled on a router. For example, if **abc** and **xyz** are provider names issued to two providers, then the following configuration enables the router for the applications built by either provider. Notice that a provider can have more than one license and that each license can have multiple deployment scopes:

```
[edit]
system {
  extensions {
    providers {
      abc {
        license-type commercial deployment-scope [ private commercial ];
      }
      xyz {
        license-type juniper deployment-scope private;
        license-type research deployment-scope internal;
      }
    }
  }
}
```

#### Related Documentation

- Upgrading Application Packages on page 11
- Removing Application Packages on page 12
- Checking Installed Application Packages on page 13

## Upgrading Application Packages

You can upgrade to the latest version of an application by reinstalling using the new package name.

Before you reinstall an application package, you need to remove the configuration contributed by that application. See “Displaying and Deleting Configuration for Applications” on page 28 for instructions on removing application-specific configuration.

**NOTE:** If you do not remove the configuration before reinstalling the application package, you will get error messages. You can ignore the error messages. If you prefer not to see the error messages, remove the configuration contributed by the application before reinstalling the application package. Then you can re-add your configuration after you complete the upgrade.

To upgrade an application:

1. Delete configuration contributed by the application. See “Displaying and Deleting Configuration for Applications” on page 28.
2. Reinstall the application.

```
user@router> request system software add new-sdk-package
```

**NOTE:** If graceful routing engine switchover (GRES), or nonstop active routing (NSR) is enabled when you initiate a software installation, the software does not install properly. Make sure you issue the CLI `delete chassis redundancy` command when prompted. If GRES is enabled, it will be removed with this command. By default, NSR is disabled. If NSR is enabled, remove the `nonstop-routing` statement from the `[edit routing-options]` hierarchy level to disable it.

**TIP:** After you have upgraded the software in the device and are satisfied that the new application package is successfully installed and running, take a snapshot to back up the new software to the `/altroot` and `/altconfig` file systems.

```
user@router> request system snapshot
```

After you run the `request system snapshot` command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

- Installing Application Packages on page 8
- Removing Application Packages on page 12
- Checking Installed Application Packages on page 13
- Upgrading the Junos OS When Applications Are Installed on page 13

---

## Removing Application Packages

Before you reinstall an application package, you need to remove the configuration contributed by that application. See “Displaying and Deleting Configuration for Applications” on page 28 for instructions on removing application-specific configuration.

**NOTE:** If you do not remove the configuration before deleting the application package, you will get error messages. You will need to do a commit to fix the configuration database. If you prefer not to see the error messages, remove the configuration contributed by the application before removing the application package.

To remove an application package:

- Delete the application package.

```
user@router>request system software delete package-name
```

- Related Documentation**
- Installing Application Packages on page 8
  - Checking Installed Application Packages on page 13
  - Upgrading Application Packages on page 11
  - Upgrading the Junos OS When Applications Are Installed on page 13

---

## Checking Installed Application Packages

You can get a list of the installed applications, both those created using the Junos SDK and other packages, using the **show version** command.

The following is sample output from the **show version** command:

```
user@router> show version
Hostname: router1
Model: m10i
JUNOS Base OS boot [I20070611_2103]
JUNOS Base OS Software Suite [8.5I20070611_2103]
JUNOS Kernel Software Suite [8.5I20070611_2103]
JUNOS Crypto Software Suite [8.5I20070611_2103]
JUNOS Packet Forwarding Engine Support (M/T Common) [8.5I20070611_2103]
JUNOS Packet Forwarding Engine Support (M7i/M10i) [8.5I20070611_2103]
JUNOS Online Documentation [8.5I20070611_2103]
JUNOS Routing Software Suite [8.5I20070611_2103]
JUNOS SDK Gateway Example Control Component [8.5I20070612_1932]
JUNOS SDK Gateway Example Dataplane Component [8.5I20070612_1932]
JUNOS SDK Gateway Example Management Component [8.5I20070612_1932]
```

The packages at the top of the list in the output are application packages provided by Juniper Networks with the Junos OS. The bottom of the list contains applications created using the Junos SDK. If the application package names do not start with the Junos name, then you can take them to be third-party software. However, Juniper Networks reserves the right to deploy application packages separately under the Junos name.

- Related Documentation**
- Installing Application Packages on page 8
  - Removing Application Packages on page 12
  - Upgrading Application Packages on page 11

---

## Upgrading the Junos OS When Applications Are Installed

When you upgrade the Junos OS release, you will also need to reinstall the applications.

Before you delete an application package, you need to remove the configuration contributed by that application. See “Displaying and Deleting Configuration for Applications” on page 28 for instructions on removing application-specific configuration.

**NOTE:** If you do not remove the configuration before deleting the application package, you will get error messages. You can ignore the error messages. If you prefer not to see the error messages, remove the configuration contributed by the application before removing the application package. Then you can re-add your configuration after you complete the upgrade.

To upgrade the Junos OS when you have applications on your system:

1. Delete configuration contributed by the applications. See “Displaying and Deleting Configuration for Applications” on page 28.
2. Delete the application packages by following the steps described in “Removing Application Packages” on page 12.
3. Install the new version of the Junos OS. For details, see the [Junos OS Installation and Upgrade Guide](#).
4. Reinstall the application created using the Junos SDK on the upgraded or downgraded version by following steps as described in “Installing Application Packages” on page 8.

**NOTE:** If graceful routing engine switchover (GRES), or nonstop active routing (NSR) is enabled when you initiate a software installation, the software does not install properly. Make sure you issue the CLI delete chassis redundancy command when prompted. If GRES is enabled, it will be removed with this command. By default, NSR is disabled. If NSR is enabled, remove the nonstop-routing statement from the [edit routing-options] hierarchy level to disable it.

#### Related Documentation

- Checking Installed Application Packages on page 13

## Deploying Service Applications

There are several configurations that deal with deploying service applications. Most of these configurations are under the [edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider] hierarchy level, shown here:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  control-cores control-number;
  data-cores data-number;
  data-flow-affinity {
    hash-key (layer-3 | layer-4);
  }
  forwarding-db-size size;
  object-cache-size value;
  package package-name;
  policy-db-size size;
  syslog {
```

```

    facility {
        severity;
        destination destination;
    }
}
wired-process-mem-size mem-size;
}

```

Changing any of these settings except for the **syslog** statement causes the PIC to reboot.

Another important configuration is setting up service interfaces. The following topics cover this topic and the other configurations seen in the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level. The first three are mandatory items; the others are optional.

Each of these topics contains only generic information. Check the application-specific documentation developed by your application's provider for the appropriate configuration for your application.

- Configuring Service Interfaces on page 15
- Configuring Packages on the PIC on page 16
- Configuring Control and Data Cores on page 17
- Configuring Packet Distribution Settings on page 17
- Setting the Forwarding Database and Policy Database Sizes on page 18
- Configuring Memory Settings on page 18
- Configuring System Log Messages on page 20

## Configuring Service Interfaces

To be able to configure services on your PIC, you need to configure the service interfaces. You do this by creating service sets and applying them on an interface or interfaces using the **service-set** statement at the **[edit interfaces interface-name unit logical-unit-number family (inet | inet6) service (input | output)]** hierarchy level.

The following example shows configuring a service interface (**fe-0/1/0**) by applying a service set called **Firewall-Set**:

```

[edit]
interfaces {
  fe-0/1/0 {
    unit 0 {
      family inet {
        service {
          input {
            service-set Firewall-Set;
          }
          output {
            service-set Firewall-Set;
          }
        }
      }
      address 10.1.3.2/24;
    }
  }
}

```

```

    }
  }
}

```

For information on how to create the service sets, check your application-specific documentation, or, otherwise, follow instructions in the [Junos OS Services Interfaces Configuration Guide](#).

## Configuring Packages on the PIC

Applications are installed on the Multiservices PIC in one or more packages.

To designate which application package to install on a given PIC, include the **package package-name** option at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level:

```

[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  package package-name;
}

```

Up to eight packages can be installed on a PIC; however, only one data package is allowed per PIC.

**NOTE:** When the extension-provider statement is first configured, the PIC reboots. When any package setting is added or removed, the PIC reboots.

As of Junos OS Release 9.5, a stateful firewall plug-in is provided as part of the jbundle package. To load this plug-in on the PIC, include the **package jservices-sfw** statement at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level.

```

user@router# show chassis
fpc 0;
  pic 0;
    adaptive-services;
      service-package;
        extension-provider;
          control-cores 1;
          data-cores 4;
          object-cache-size 128;
          package jservices-sfw;
          policy-db-size 64;
        }
      }
    }
  }
}

```

**NOTE:** You cannot install both a Junos service package and an application package on the same PIC. However, you can load both the jservices-sfw package and an application package on the same PIC.

## Configuring Control and Data Cores

There are eight cores in a PIC. Some cores, called *control cores*, are dedicated to running control functionality for the application. Cores dedicated to processing data for the application are called *data cores*.

To be able to deploy services on the PIC, you must configure at least one control core.

To configure control and data cores, use the **control-cores** and **data-cores** statements, respectively, at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  control-cores control-number;
  data-cores data-number;
}
```

Whereas you must designate at least one core as a control core, it is advisable you designate, depending on the nature of the application, a minimum of five data cores to achieve good performance. The total number of cores, both control and data cores, that you can dedicate using the **extension-provider** statement ranges from one through eight. Any cores not configured as control or data cores are treated as *user cores*.

**NOTE:** When the **extension-provider** statement is first configured, the PIC reboots. When the number of control or data cores is changed, the PIC reboots.

## Configuring Packet Distribution Settings

As of Junos OS Release 9.5, the Services SDK (a module of the Junos SDK) supports flow affinity behavior for the data CPUs. Flow affinity distribution is based on a hash distribution. Flow affinity is already the default behavior for the control CPUs, but the default behavior for distributing data packets over data cores is in a round-robin fashion.

You can change the default behavior for the data cores from round-robin to flow affinity by adding the **data-flow-affinity** statement at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level.

```
extension-provider {
  data-flow-affinity {
    hash-key (layer-3 | layer-4);
  }
}
```

Some applications may need you to set the **hash-key** statement (consult application-specific documentation). The options for the **hash-key** statement are 3-tuple hashing (source IP, destination IP address, and IP protocol) or 5-tuple hashing (3-tuple plus source and destination TCP or UDP ports). If the **hash-key** statement is not configured, the default value is 5-tuple. There is no need to differentiate the hashing between control and data traffic.

**NOTE:** When the `extension-provider` statement is first configured, the PIC reboots. Either adding or removing the `data-flow-affinity` statement causes the PIC to reboot.

## Setting the Forwarding Database and Policy Database Sizes

The forwarding database provides access to route information such as fast routing look-ups. It will typically have information related to route entries, their associated outgoing interfaces, and autonomous system information. The policy database stores the policies of plug-ins only. Both the forwarding database and the policy database are carved out of object cache. So the sum of both databases must be less than the total object cache.

You control the sizes of the forwarding database and the policy database using the `forwarding-db-size` and the `policy-db-size` statements, respectively, at the `[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]` hierarchy level. Both statements are configured in megabytes (MB). When setting these sizes, be guided by your provider's application-specific documentation.

**NOTE:** Changing either the `forwarding-db-size` or the `policy-db-size` statement causes the PIC to reboot.

**NOTE:** You must enable the `sampling` statement at the `[edit forwarding-options]` hierarchy level for the forwarding database to be created.

## Configuring Memory Settings

Configuring memory can help tune application performance. Two types of memory are provided: object cache and wired process memory. If wired process memory is exhausted, the processes use unwired memory.

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  object-cache-size value;
  wired-process-mem-size mem-size;
}
```

See the following topics for more information on these memory types:

- Object Cache on page 18
- Wired Process Memory on page 19

### Object Cache

Object cache is shared memory. Both the size of the forwarding database and the size of the policy database are taken from object cache. Therefore, the size of object cache must be more than the sum of the sizes of both of these databases.

To configure object cache, specify a value that is a multiple of 128 MB and up to 512 MB for the Multiservices 100 PIC or up to 1280 MB for the Multiservices 400 PIC. However, if you set wired process memory as well, the maximum value for the object cache on the Multiservices 100 PIC is 128 MB and 768 MB on the Multiservices 400 PIC.

The current recommendations when configuring memory settings Multiservices PICs are as follows:

- Do not exceed a policy database size of 64 MB.
- Stay with one rule per term.
- Keep the object cache size high (1280 MB on Multiservices 400 PICs and DPCs and 512 MB on Multiservices 100 PICs).
- Do not configure anything for forwarding database.
- Keep the number of service sets per Multiservices PIC below 1000.

**NOTE:** When the `extension-provider` statement is first configured, the PIC reboots. Changing the object cache size, the policy database size, or the forwarding database size on a running system causes the PIC to reboot.

### Wired Process Memory

Wired process memory, or Big TLB, is memory used by the operating system that is pretty much "off limits" to another application. If wired process memory is exhausted, the processes use unwired memory.

The size of wired process memory is configurable. To reserve Big TLB, configure the `wired-process-mem-size` statement at the `[edit adaptive-services service-package extension-provider]` hierarchy level.

**NOTE:** When the `wired-process-mem-size` statement is first changed, the PIC reboots.

As of Junos OS Release 11.2, the number of processes supported by Big TLB is also configurable. When you configure multiple Big-TLB-supported processes, the physical memory is divided equally among the number of processes that use it. For example, if `mem-size` is 1024 MB and the number of processes (`num-procs`) supported is 8, then each process is allocated 128 MB of physical memory. Thus, the amount of physical memory that is allocated to each process is `mem-size/num-procs`.

To specify the number of processes that use Big TLB, use the `wired-max-processes` statement at the `[edit adaptive-services service-package extension-provider]` hierarchy level. The amount of memory that can be reserved for Big TLB is platform dependent.

The amount of object cache is also dependent on the amount of wired memory. The following table lists details per platform.

Table 2: Wired Memory and Object Cache Combinations in Multiservices PICs

Device	Max. Object Cache (MB)	Max. Wired Memory (MB)	Max. Number of Processes
Multiservices 100 PIC	512	0	0
	0	512	8
Multiservices 400 PIC	1280	0	0
Multiservices 500 PIC	256	1024	8
Multiservices DPC			

## Configuring System Log Messages

To record or view system log messages on a specific PIC, include the **syslog** statement at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number adaptive-services service-package]
extension-provider {
  syslog {
    facility {
      severity;
      destination destination;
    }
  }
}
```

**NOTE:** When the **extension-provider** statement is first configured, the PIC reboots. After that, changing system log settings does not cause the PIC to reboot.

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

For the Junos SDK, there are four values for the **facility** statement that log either actions performed or errors encountered by the following entities:

- **daemon**—Various system processes.
- **external**—Local external applications.
- **kernel**—The PIC kernel.
- **pfe**—The Packet Forwarding Engine.

The **severity** statement has the same values as it does in the native Junos operating system (OS). See Table 3 on page 21 for possible values.

Table 3: Severity Levels for SDK Syslog Messages

Level	Description
<b>any</b>	Include all severity levels.
<b>none</b>	Disable logging of the associated facility to a destination.
<b>emergency</b>	System panic or other condition that causes the routing platform to stop functioning.
<b>alert</b>	Conditions that require immediate correction, such as a corrupted system database.
<b>critical</b>	Critical conditions, such as hard errors.
<b>error</b>	Error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.
<b>warning</b>	Conditions that warrant monitoring.
<b>notice</b>	Conditions that are not errors but might warrant special handling.
<b>info</b>	Events or nonerror conditions of interest.

Enhancements to the existing infrastructure make debugging on the Multiservices PIC easier by giving the user the option of redirecting the log messages to either the Routing Engine (**routing-engine**) or to the console of the PIC (**pic-console**).

The user does not have to specify a destination for the messages; by default all messages go to the **/var/log** directory on the Routing Engine. When the syslog destination is configured to redirect the log messages to the Routing Engine, you can use the **set system syslog** command, a command available in the Junos OS CLI, to override the syslog settings made on the Multiservices PIC.

To record or view system log messages on a specific PIC, include the **syslog** statement. System log information is passed to the Routing Engine and put in the **/var/log** directory.

## CHAPTER 3

# Working with Applications

The following topics describe how to work with applications in a general way. This information does not replace information from application-specific documentation developed by your provider.

- Application Execution on page 23
- Resource Limits Imposed on Applications on page 25
- Application User Interface Extensions on page 28
- Application Health Monitoring on page 30

## Application Execution

---

Application execution includes the following topics. For more information on system processes, see the *Junos OS System Basics Configuration Guide*.

- Verifying the Execution Status of System Processes on page 23
- Disabling a System Process on page 24
- Configuring Application Failure Settings on page 24

## Verifying the Execution Status of System Processes

To see the execution status of system processes, use the **show system processes wide** operational command. The **wide** option is optional, but you must use it to display the provider name of your application.

```
show system processes wide user@host> show system processes wide
PID TT STAT TIME PROVIDER COMMAND
...
9 ?? DL 0:00.01 [pagedaemon]
...
6463 ?? DL 0:00.18 [md9]
6738 ?? S 0:00.44 /usr/sbin/mgd -N
7001 ?? S 0:00.12 jnx /opt/sbin/jnx-exampld -N
7063 ?? Ss 0:00.03 mgd: (mgd) (regress)/dev/ttyp0 (mgd)
```

## Disabling a System Process

You can disable Junos OS processes.

**CAUTION:** Never disable any of the software processes unless instructed to do so by a Customer Support engineer.

To disable a software process:

1. Specify the appropriate process to disable at the **[edit system]** hierarchy level using the **processes** statement.

```
[edit system]
user@router# set processes process-name disable
```

2. You can later go back and similarly enable the process.

```
[edit system]
user@router# set processes process-name enable
```

**TIP:** The *process-name* variable is one of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature.

---

## Configuring Application Failure Settings

For routers or switches with redundant Routing Engines, you can configure the router or switch to switch to backup media that contains a version of the system if a software process fails repeatedly. You can configure the router or switch to fail over to either backup media or the other Routing Engine. When you configure a failover option, the router will try to reboot a few times (within one minute) before going to the failover option you specify.

To configure automatic switchover to backup media if a software process fails:

- Include the **failover** statement at the **[edit system processes *process-name*]** hierarchy level:

```
[edit system]
user@router# set process-name failover (alternate-media | other-routing-engine)
```

**TIP:** The *process-name* variable is one of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature.

## Resource Limits Imposed on Applications

The Junos SDK has four levels of policies to ensure that applications have the minimal impact on the native Junos operating system and system operations. These policies impose limits on the system resources the application uses. Each succeeding policy level overrides the previous level's settings, provided the constraints are within the previous level's settings.

Level I policy is the default global policy generated by Juniper Networks. Level II is a per-provider level policy that enables different resource limits per provider. A Level III policy is implemented in the policy file that providers write for each application package. The Level IV policy is set by you, the administrative user using the **resource-limits** statement at the **[edit system extensions]** hierarchy level.

**NOTE:** This documentation is not application-specific documentation. Features documented in this guide are generic to all applications. Refer to the application-specific documentation developed by your applications' provider for detailed instructions.

- Displaying Resource Limits on page 25
- Restricting Resource Limits on page 26

### Displaying Resource Limits

To display the applied policies, use the **show system processes resource-limits process-name process-ui-name** operational command. The following example configuration, when committed, applies resource limits for an application package `jnx-example` and overrides it with process-level settings for the process `jnx-example-service`:

```
[edit system extensions]
user@router# show
resource-limits {
  package jnx-example {
    resources {
      memory {
        stack-size 4m;
      }
    }
  }
  process jnx-example-service {
    resources {
      file {
        size 4m;
      }
    }
  }
}
```

Using the **show system processes resource-limits process-name** command, the output for `jnx-example-foo-binary`, part of package `jnx-example`, looks like the following output because the package-level settings are applied on it:

```
user@router> show system processes resource-limits process-name jnx-example-foo-binary
Resource Limits:
  Area                Max. allowed  Max. configurable
  memory/stack-size   4MB          8MB
  memory/data-size    32MB         32MB
  memory/resident-set-size 24MB         24MB
  memory/locked-in    16MB         16MB
  cpu/priority         10           10
  file/open            64           64
```

The output for `jnx-example-service` looks like this:

```
user@router> show system processes resource-limits process-name jnx-example-service
Resource Limits:
  Area                Max. allowed  Max. configurable
  file/size           4MB          unlimited
  file/open           64           64
  cpu/priority         10           10
  memory/stack-size   8MB          8MB
  memory/data-size    32MB         32MB
  memory/resident-set-size 24MB         24MB
  memory/locked-in    16MB         16MB
```

For more detail on the **show system processes resource-limits process-name process-ui-name** operational command, see its command summary.

## Restricting Resource Limits

The Level IV policy is set by the administrative user using the **resource-limits** statement at the **[edit system extensions]** hierarchy level.

The limits imposed by a Level IV policy can be configured either by package or by individual processes in the package. Limits defined for individual processes override the limits defined for an entire package. Any limits not set as Level IV limits inherit the limits from Level III if they exist or from Level II.

The following hierarchy shows all the statements for setting resource limits:

```
[edit system extensions]
resource-limits {
  package package-name {
    resources {
      cpu {
        priority number;
        time seconds;
      }
      file {
        core-size bytes;
        open number;
        size bytes;
      }
      memory {
        data-size bytes;
        locked-in bytes;
      }
    }
  }
}
```

```

        resident-set-size bytes;
        socket-buffers bytes;
        stack-size bytes;
    }
}
}
process process-ui-name {
    resources {
        cpu {
            priority number;
            time seconds;
        }
        file {
            core-size bytes;
            open number;
            size bytes;
        }
        memory {
            data-size bytes;
            locked-in bytes;
            resident-set-size bytes;
            socket-buffers bytes;
            stack-size bytes;
        }
    }
}
}

```

If an application exceeds any of the imposed limits, the router logs it. For example, if a process tries to exceed its stack size, the process is terminated and the system generates a core file.

Level IV policies can be more restrictive than previous policy levels, but they cannot ease the limits set by the other levels. If you try to commit a resource limit that is higher (less stringent) than the inherited value, the commit operation fails with the following error message:

```

[edit system extensions resource-limits]
  'process jnx-example-service'
    Limit validation failed for program 'jnx-example-service', resource 'file'
    limit 'open': raising limits defined in role 'Provider_Daemon' is not allowed.
    commit complete

[edit system extensions resource-limits]

```

Level IV policies can be applied either during runtime of the application or before the application gets started. However, if the application was already running when a new limit is applied, the application must be restarted manually in order to allow for the new limits to take effect.

If you delete a resource configuration, the setting goes back to the limits from the assigned role in the manifest file (Level II or Level III).

## Application User Interface Extensions

---

With the Junos SDK, providers can extend the Junos OS user interface. The Junos OS has two configuration mode commands developed using the Junos SDK that help you work with applications. The following topics describe these commands in detail:

- Displaying the Detail for Application Configurations on page 28
- Displaying and Deleting Configuration for Applications on page 28

### Displaying the Detail for Application Configurations

The **show | display detail** command is not new but has been updated to show application package information. The complete form of the command is as follows:

```
show <statement-path> | display detail
```

The **show | display detail** command displays the characteristics, descriptions, and constraints of each configuration statement in the Junos operating system (OS) configuration schema using comment lines. The configuration schema is piped through to the **display detail** command. The **show** command displays the entire user-defined configuration unless it is limited to a particular branch of the configuration scheme by the optional **statement-path** variable.

Generally, the information displayed is help strings and the permission bits required to add or modify the configuration statement. For configuration statements that are defined by an application package, the name of the package that defines the statement is also displayed. If a Junos statement is redefined by an application package, the package name is listed. However, if a configuration statement is defined by the native Junos OS only, no package name is displayed.

### Displaying and Deleting Configuration for Applications

To display or delete the configuration for a specific application package, use the **extension package-name (show | delete)** configuration mode command:

```
extension package-name (show | delete) <section>
```

This command filters for configuration based on the package named in the command, starting at the top of the configuration hierarchy, or, if you use the **section** option, starting at the hierarchy level indicated by the **section** option. The output displays the configuration of all matches.

**NOTE:** Remove all the soon-to-be invalid configurations before removing the application package. See “Removing Application Packages” on page 12.

---

To delete application configuration:

1. Display any configuration specific to the application.

```
[edit]
user@router# extension package-name show
```

2. When you are satisfied that this is the configuration you want to delete, issue the **extension *package-name* delete** command. Use the **section** option to limit the scope of the deletion if needed.

```
[edit]
user@router# extension package-name delete
```

#### NOTE:

#### Matches for the extension show Command

Matches for the **extension *package-name* show** command include those packages whose package names exactly match the value of ***package-name*** as well as those whose names have the same root but may have longer names, similar to a wildcard situation.

The following example shows simplified output illustrating how the **extension *package-name* show** command works. Suppose a router has packageA, packageB, and packageAB installed and you issue the command **extension packageA show**. The output displays configuration for packages with names that not only exactly match packageA but also have roots that match (in this case, packageAB):

```
user@router# extension packageA show
system {
  packageA {
    ....
  }
  packageAB {
    ....
  }
}
```

**Matches for the  
extension delete  
Command**

In contrast, the **extension *package-name* delete** command treats the value of ***package-name*** as a literal. It deletes only configuration contributed by the package whose package name exactly matches the given value.

**NOTE:** A configuration schema defined in any native Junos package is never deleted by the removal of any third-party package.

For more examples of output for the **extension *package-name* (show | delete)** command, see “Example: Displaying and Deleting Configuration Contributed by Applications” on page 33.

---

## Application Health Monitoring

Using the Junos SDK, providers can have their applications request and manage system resources. Some of this resource utilization is persistent across, for example, reboots or the restart of the application. Some system tasks such as deleting a package, disabling and application, or accessing shared resources require that resources be cleaned up by entities other than the application itself. Resources that are known to need cleaning up include the following:

- GENCFG blobs
- SYSV shared memory segments
- SYSV semaphores
- Temporary files

Currently, the **traceoptions** statement is the only CLI statement available for configuring resource cleanup.

To configure tracing operations for resource cleanup operations, include the **traceoptions flag** option for selectively turning the debugging of trace messages on or off:

```
[edit]
system {
  processes {
    resource-cleanup {
      traceoptions {
        file filename files number match regex size size (world-readable |
          no-world-readable);
        flag flag;
        level level;
        no-remote-trace;
      }
    }
  }
}
```

The available flags for the **traceoptions** statement include:

- **all**—Enable all trace option flags.
- **events**—Display process state change and cleanup events.
- **gencfg**—Display GENCFG blobs recorded for cleanup.
- **sysvsem**—Display SYSV semaphores recorded for cleanup.
- **sysvshm**—Display SYSV shared memory segments recorded for cleanup.
- **ui**—Display tracing messages for UI operational commands.

## CHAPTER 4

# Examples

This section contains the examples for working with applications built using the Junos SDK:

- Example: Displaying and Deleting Configuration Contributed by Applications on page 33
- Example: Configuring Separate Resource Limits for a Process on page 34

### Example: Displaying and Deleting Configuration Contributed by Applications

---

In the following example, only the **sdk-backup-server** statement at the **[edit system radius-server 10.1.1.1]** hierarchy level and the **sdk-protocol** statement at the **[edit system protocols]** hierarchy level are contributed by the application package **sdk-pkg1**.

#### Output from show Command

If you use the **show** command at the top of the hierarchy, all configuration is shown.

```
[edit]
user@router# show
system {
  radius-server {
    10.1.1.1 {
      timeout 10;
      sdk-backup-server 10.1.1.2; # Contributed by sdk-pkg1
    }
  }
}
protocols {
  ospf {
    ....
  }
  sdk-protocol { # Contributed by sdk-pkg1
    ....
  }
}
```

#### Output from extension show Command

In contrast, the following is the output from the **extension sdk-pkg1 show** command. Notice that this command selects configurations contributed by and leading to the package named in the command. The **extension sdk-pkg1 show** command filters out the **timeout** and **ospf** commands from the displayed output, which were not contributed by the **sdk-pkg1** package.

```
[edit]
```

```

user@router# extension sdk-pkg1 show
system {
  radius-server {
    10.1.1.1 {
      sdk-backup-server 10.1.1.2;
    }
  }
}
protocols {
  sdk-proto1 {
    ....
  }
}

```

#### Output After the extension delete Command

Continuing with the same example, notice how the configuration changes when the **extension sdk-pkg1 delete** command is used. Using this command, you can delete all user-defined configuration statements related to the sdk-pkg1 package.

#### TIP:

This one command accomplishes the same thing as issuing the following two commands:

- **delete system radius-server 10.1.1.1 sdk-backup-server**
- **delete protocols sdk-proto1**

```

[edit]
user@router# extension sdk-pkg1 delete
[edit]
user@router# show
system {
  radius-server {
    10.1.1.1 {
      timeout 10;
    }
  }
}
protocols {
  ospf {
    ....
  }
}

```

- [Displaying and Deleting Configuration for Applications on page 28](#)

## Example: Configuring Separate Resource Limits for a Process

In this example there are 10 processes in the application package, and the administrative user wants to limit the number of open files and the stack size but does not want to apply the same limits to the jnx-example-service process. To do this, the user must specify

limits for the jnx-example package and for the jnx-example-service process. Any limits not set inherit the Level III limits (if any) or Level II limits (if no Level III limits exist).

```
user@router# show
resource-limits {
  package jnx-example {
    resources {
      file {
        open 8;
      }
      memory {
        stack-size 4m;
      }
    }
  }
  process jnx-example-service {
    resources {
      memory {
        resident-set-size 8m;
      }
    }
  }
}
```

[edit]

```
user@router# commit
```

The **show system processes resource-limits process-name** command output shows a maximum configurable column, which, in the following examples, has been omitted to make room for showing from which policy level the maximum allowed values come from.

```
user@router> show system processes resource-limits process-name jnx-foo-service
Resource Limits
```

Area	Max. allowed	
cpu/priority	10	<-- inherited from Level II
file/open	8	<-- defined in config
memory/data-size	32MB	<-- inherited from Level II
memory/locked-in	16MB	<-- inherited from Level II
memory/resident-set-size	24MB	<-- inherited from Level II
memory/stack-size	4MB	<-- defined in config

The above output is the same for all other programs in the jnx-example package except the jnx-example-service process, for which there is a special configuration. The process-level configuration overrides the package-level configuration.

```
user@router> show system processes resource-limits process-name jnx-example-service
Resource Limits
```

Area	Max. allowed	
cpu/priority	10	<-- inherited from Level II
file/open	64	<-- inherited from Level II
memory/data-size	32MB	<-- inherited from Level II
memory/locked-in	16MB	<-- inherited from Level II
memory/resident-set-size	8MB	<-- defined in config
memory/stack-size	8MB	<-- inherited from Level II

## CHAPTER 5

# Summary of Application Configuration Statements

This chapter provides a reference for each of the configuration statements that relate to configuring applications built by the Junos SDK. The statements are organized alphabetically.

### control-cores

---

<b>Syntax</b>	<code>control-cores control-number;</code>
<b>Hierarchy Level</b>	[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Configure control cores. Any cores not configured as either control or data cores are treated as user cores. When the number of control cores is changed, the PIC reboots.
<b>Options</b>	<b>control-number</b> —Number of control cores. At least one core must be a control core. <b>Range:</b> 1 through 8
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring Control and Data Cores on page 17</li><li>data-cores on page 38</li></ul>

## data-cores

---

<b>Syntax</b>	<code>data-cores <i>data-number</i>;</code>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Configure data cores. Any cores not configured as either data or control cores are treated as user cores. When the number of data cores is changed, the PIC reboots.
<b>Options</b>	<b><i>data-number</i></b> —Number of data cores. Although it is not mandatory to dedicate any cores as data cores, it is advisable, depending on the nature of the application, to dedicate a minimum of five as data cores to achieve good performance. <b>Range:</b> 0 through 7
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring Control and Data Cores on page 17</li><li>control-cores on page 37</li></ul>

## data-flow-affinity

---

<b>Syntax</b>	<code>data-flow-affinity {     hash-key (layer-3   layer-4); }</code>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5.
<b>Description</b>	Enable flow affinity distribution for packets over data CPUs on the PIC. Once enabled, the default behavior distributing data packets changes from a round-robin distribution to a flow affinity distribution based on a hash distribution. Adding or deleting this statement causes the PIC to reboot.  The statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring Packet Distribution Settings on page 17</li></ul>

## destination

---

<b>Syntax</b>	<code>destination <i>destination</i>;</code>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider <b>syslog</b> <i>facility</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1.
<b>Description</b>	<p>Configure where log messages go. By default, all messages go to the <b>/var/log</b> directory on the Routing Engine. Enhancements to the existing infrastructure make debugging on the Multiservices PIC easier by giving the user the option of redirecting log messages. When the <b>syslog destination</b> statement is configured to redirect the log messages, you can use the <b>set system syslog</b> command, a command available in the native Junos OS CLI, to override the syslog settings made on the Multiservices PIC.</p>
<b>Options</b>	<p><b>destination</b>—Choose one of the following options:</p> <ul style="list-style-type: none"><li>• <b>routing-engine</b>—Forward log messages to the Routing Engine.</li><li>• <b>pic-console</b>—Forward log messages to the console of the PIC.</li></ul>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring System Log Messages on page 20</li><li>• extension-provider on page 40</li></ul>

## extension-provider

---

<b>Syntax</b>	<pre>extension-provider {     control-cores <i>control-number</i>;     data-cores <i>data-number</i>;     data-flow-affinity {         hash-key (layer-3   layer-4);     }     forwarding-db-size <i>size</i>;     object-cache-size <i>size</i>;     package <i>package-name</i>;     policy-db-size <i>size</i>;     syslog {         facility {             severity;             destination <i>destination</i>;         }     }     wired-process-mem-size <i>mem-size</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	<p>Configure an application on a PIC. When the <b>extension-provider</b> statement is first configured, the PIC reboots.</p> <p>The statements are explained separately.</p>
<b>Usage Guidelines</b>	See “Configuring Control and Data Cores” on page 17, “Configuring Packet Distribution Settings” on page 17, “Configuring Memory Settings” on page 18, “Configuring Packages on the PIC” on page 16, “Configuring System Log Messages” on page 20.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## extension-service

<b>Syntax</b>	extension-service <i>service-name</i> { <i>provider-specific rules</i> ; }
<b>Hierarchy Level</b>	[edit forwarding-options sampling instance <i>instance-name</i> family (inet  inet6) output] [edit forwarding-options sampling family (inet  inet6) output] [edit services service-set <i>service-set-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Define a customer specific sampling configuration.  Define a service set or traffic monitoring for applications using application-specific configuration guidelines.
	<div>  <p><b>NOTE:</b> If the <code>extension-service</code> statement is specified while configuring a service set, the <code>service-order</code> statement is mandatory.</p> </div>
<b>Options</b>	<p><i>provider-specific rules</i>—Provider-specific subhierarchy for services and service sets. See the application-specific documentation for details.</p> <p><i>service-name</i>—Name of the service.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">service-order on page 55</a></li> <li>• <a href="#">sampling</a></li> </ul>

## extensions

```

Syntax  extensions {
        providers {
            provider-id {
                license-type license deployment-scope [ deployments ];
            }
        }
        resource-limits {
            package package-name {
                resources {
                    cpu {
                        priority number;
                        time seconds;
                    }
                    file {
                        core-size bytes;

                    socket-buffers bytes;
                    stack-size bytes;
                }
            }
        }
    }

```

Hierarchy Level [edit system]

<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	<p>Configure extensions to Junos operating system (OS). You must turn configure the <b>providers <i>provider-id</i></b> statement to enable application packages to be deployed and run on the router.</p> <p>The statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Deploying Applications on the Router</li> </ul>

## forwarding-db-size

<b>Syntax</b>	<code>forwarding-db-size size;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2.
<b>Description</b>	Configure the size of the forwarding database (FDB). When this setting is changed, the PIC reboots.
	<div>  <p><b>NOTE:</b> You need to enable the <b>forwarding-options sampling</b> statement for the FDB to be created.</p> </div>
<b>Options</b>	<p><b>size</b>—Size of the FDB, in megabytes (MB). The size of the FDB and the size of the policy database together must be smaller than the size of the object cache.</p> <p><b>Range:</b> 0 through 12879 MB</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Memory Settings on page 18</li> <li><b>policy-db-size</b> on page 47</li> <li><b>wired-process-mem-size</b> on page 61</li> <li><b>object-cache-size</b> on page 45</li> </ul>

## hash-key

---

<b>Syntax</b>	hash-key (layer-3   layer-4);
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider data-flow-affinity]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	Set the hashing distribution of flow affinity. This is an optional setting. Once the <b>data-flow-affinity</b> statement is enabled, you may need to choose the hashing distribution. Modifying this statement causes the PIC to reboot.
<b>Default</b>	If you do not configure the <b>hash-key</b> statement, the hashing distribution is 5-tuple hashing, or <b>layer-4</b> .
<b>Options</b>	<b>layer-3</b> —3-tuple hashing (source IP address, destination IP address, and IP protocol). <b>layer-4</b> —5-tuple hashing (3-tuple plus source and destination TCP or UDP ports).
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring Packet Distribution Settings on page 17</li><li>extension-provider on page 40</li></ul>

## license-type

---

<b>Syntax</b>	license-type <i>license</i> deployment-scope [ <i>deployments</i> ];
<b>Hierarchy Level</b>	[edit system extensions providers <i>provider-id</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the license type and the scope of application deployment.
<b>Options</b>	<b>license</b> —Type of license. Obtain correct value from the application's provider. <b>deployment</b> —Scope of application deployment. You can configure a set of deployments. Obtain correct value from the application's provider.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Deploying Applications on the Router</li><li>extensions on page 42</li></ul>

## object-cache-size

<b>Syntax</b>	<code>object-cache-size value;</code>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
<b>Description</b>	Configure the size of the object cache. When this setting is changed, the PIC reboots.
<b>Options</b>	<p><b>value</b>—Amount of object cache, in MB. Only values in increments of 128 MB are allowed.</p> <p><b>Range:</b> For Multiservices 100 PIC, range is 128 MB through 512 MB. If the <b>wired-process-mem-size</b> statement at the same hierarchy level has a value of 512 MB, the maximum value for this statement is 128 MB.</p> <p><b>Range:</b> For Multiservices 400 PIC, range is 128 MB through 1280 MB. If the <b>wired-process-mem-size</b> statement at the same hierarchy level has a value of 512 MB, the maximum value for this statement is 512 MB.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Memory Settings on page 18</li> <li><b>forwarding-db-size</b> on page 43</li> <li><b>policy-db-size</b> on page 47</li> <li><b>wired-process-mem-size</b> on page 61</li> </ul>

## package (Loading on PIC)

<b>Syntax</b>	<code>package package-name;</code>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1.
<b>Description</b>	Identify a package to be loaded on the PIC. When a package is added or removed, the PIC reboots.
<b>Options</b>	<p><b>package-name</b>—Name of the package to be loaded on the PIC. There can be up to eight packages loaded on a PIC; however, only one data package is allowed per PIC. An error message is displayed if more than eight packages are specified.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Packages on the PIC on page 16</li> </ul>

## package (Resource Limits)

---

<b>Syntax</b>	<pre>package <i>package-name</i> {   resources {     cpu {       priority <i>number</i>;       time <i>seconds</i>;     }     file {       core-size <i>bytes</i>;       open <i>number</i>;       size <i>bytes</i>;     }     memory {       data-size <i>bytes</i>;       locked-in <i>bytes</i>;       resident-set-size <i>bytes</i>;       socket-buffers <i>bytes</i>;       stack-size <i>bytes</i>;     }   } }</pre>
<b>Hierarchy Level</b>	[edit system extensions resource-limits]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	Set resource limits for an entire package of an application.
<b>Options</b>	<p><b><i>package-name</i></b>—Name of the application package.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Restricting Resource Limits on page 26</li><li>• process on page 48</li><li>• resources on page 54</li><li>• extensions on page 42</li></ul>

## policy-db-size

<b>Syntax</b>	<code>policy-db-size <i>size</i>;</code>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
<b>Description</b>	Configure the size of the policy database. When this setting is changed, the PIC reboots.
	<div>  <p><b>NOTE:</b> At least one data core must be configured to configure the size of the policy database.</p> </div>
<b>Options</b>	<p><b>size</b>—Size of the policy database, in megabytes (MB). The size of the forwarding database and the size of the policy database together must be smaller than the size of the object cache.</p> <p><b>Range:</b> 0 through 1279 MB</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Configuring Memory Settings on page 18</li> <li>forwarding-db-size on page 43</li> <li>object-cache-size on page 45</li> <li>wired-process-mem-size on page 61</li> </ul>

## process

---

**Syntax**    `process process-ui-name {  
              resources {  
                cpu {  
                  priority number;  
                  time seconds;  
                }  
                file {  
                  core-size bytes;  
                  open number;  
                  size bytes;  
                }  
                memory {  
                  data-size bytes;  
                  locked-in bytes;  
                  resident-set-size bytes;  
                  socket-buffers bytes;  
                  stack-size bytes;  
                }  
              }  
            }`

**Hierarchy Level**    [edit system extensions resource-limits]

**Release Information**    Statement introduced in Junos OS Release 9.6.

**Description**    Set resource limits for a process in an application package. Limits defined for individual processes override the limits defined for an entire package.

**Options**    *process-ui-name*—Name of the process.  
  
              The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

**Related Documentation**

- [package \(Resource Limits\) on page 46](#)
- [resources on page 54](#)
- [extensions on page 42](#)

---

## process-monitor

---

<b>Syntax</b>	<pre>process-monitor {   disable;   traceoptions {     file <i>filename</i> files <i>number</i> match <i>regex</i> size <i>size</i> (world-readable   no-world-readable);     flag <i>flag</i>;     level <i>level</i>;     no-remote-trace;   } }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Configure tracing options for the process health monitor (pmond).
<b>Options</b>	<p><b>disable</b>—Disable the health monitor process.</p> <p>The remaining statements are explained separately.</p>
<b>Usage Guidelines</b>	See Verifying the Execution Status of System Processes.
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">traceoptions (Process Monitor) on page 57</a></li></ul>

## providers

---

<b>Syntax</b>	<pre>providers {   provider-id {     license-type license deployment-scope [ deployments ];   } }</pre>
<b>Hierarchy Level</b>	[edit system extensions]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Activate the certificate of the provider of the application and enable the PIC for loading of the application.
<b>Options</b>	<p><b><i>provider-id</i></b>—Provider ID for the application package. The provider ID identifies the provider of the application to the system. The provider ID must be activated on the router to allow the application to be deployed on the router and run.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Deploying Applications on the Router</li></ul>

---

## resource-cleanup

---

<b>Syntax</b>	<pre>resource-cleanup {   disable;   traceoptions {     file <i>filename</i> files <i>number</i> match <i>regex</i> size <i>size</i> (world-readable   no-world-readable);     flag <i>flag</i>;     level <i>level</i>;     no-remote-trace;   } }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Selectively turn on or off the debugging of trace messages for the resource cleanup process.
<b>Options</b>	<p><b>disable</b>—Disable the resource cleanup process.</p> <p>The remaining statements are explained separately.</p>
<b>Usage Guidelines</b>	See “Application Health Monitoring” on page 30.
<b>Required Privilege Level</b>	<p>trace—To view this statement in the configuration.</p> <p>trace-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">traceoptions (Resource Cleanup) on page 59</a></li></ul>

## resource-limits

---

```
Syntax  resource-limits {  
        package package-name {  
            resources {  
                cpu {  
                    priority number;  
                    time seconds;  
                }  
                file {  
                    core-size bytes;  
                    open number;  
                    size bytes;  
                }  
                memory {  
                    data-size bytes;  
                    locked-in bytes;  
                    resident-set-size bytes;  
                    socket-buffers bytes;  
                    stack-size bytes;  
                }  
            }  
        }  
        process process-ui-name {  
            resources {  
                cpu {  
                    priority number;  
                    time seconds;  
                }  
                file {  
                    core-size bytes;  
                    open number;  
                    size bytes;  
                }  
                memory {  
                    data-size bytes;  
                    locked-in bytes;  
                    resident-set-size bytes;  
                    socket-buffers bytes;  
                    stack-size bytes;  
                }  
            }  
        }  
    }
```

**Hierarchy Level** [edit system extensions]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Set resource limits for applications using the command-line interface (CLI). You can set limits for all applications listed in the application package's manifest file or define limits for individual processes in the package. Limits defined for individual processes override the limits defined for an entire package.

The statements are explained separately.

<b>Usage Guidelines</b>	See “Restricting Resource Limits” on page 26.
<b>Required Privilege</b>	admin—To view this statement in the configuration.
<b>Level</b>	admin-control—To add this statement to the configuration.

## resources

---

<b>Syntax</b>	<pre>resources {   cpu {     priority <i>number</i>;     time <i>seconds</i>;   }   file {     core-size <i>bytes</i>;     open <i>number</i>;     size <i>bytes</i>;   }   memory {     data-size <i>bytes</i>;     locked-in <i>bytes</i>;     resident-set-size <i>bytes</i>;     socket-buffers <i>bytes</i>;     stack-size <i>bytes</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit system extensions resource-limits <b>package</b> <i>package-name</i> ], [edit system extensions resource-limits <b>process</b> <i>process-ui-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	Set resource limits for applications.
<b>Options</b>	<p><b>bytes</b>—Maximum size of each file, in kilobytes (KB) or megabytes (MB). <b>Syntax:</b> Where x is some number, use <b>xk</b> to specify KB or <b>xm</b> to specify MB.</p> <p><b>cpu</b>—CPU resources.</p> <ul style="list-style-type: none"><li>• <b>priority <i>number</i></b>—Highest priority number (nice level) at which the process can run.</li><li>• <b>time <i>seconds</i></b>—Maximum amount of CPU time that can be accumulated.</li></ul> <p><b>file</b>—File system resources.</p> <ul style="list-style-type: none"><li>• <b>core-size <i>bytes</i></b>—Maximum size of a core file that can be created.</li><li>• <b>open <i>number</i></b>—Maximum number of simultaneous open files.</li><li>• <b>size <i>bytes</i></b>—Maximum size of a file that can be created.</li></ul> <p><b>memory</b>—Memory resources.</p> <ul style="list-style-type: none"><li>• <b>data-size <i>bytes</i></b>—Maximum size of the data segment.</li><li>• <b>locked-in <i>bytes</i></b>—Maximum number of bytes that can be locked into memory.</li><li>• <b>resident-set-size <i>bytes</i></b>—Maximum amount of private or shared memory at any given moment.</li></ul>

- **socket-buffers bytes**—Maximum amount of physical memory that may be dedicated to the socket buffers.
- **stack-size bytes**—Maximum size of the stack segment.

<b>Usage Guidelines</b>	See “Restricting Resource Limits” on page 26.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">resource-limits on page 52</a></li> <li>• <a href="#">extensions on page 42</a></li> </ul>

## service-order

<b>Syntax</b>	<pre>service-order {   forward-flow [ service-name1 service-name2 ];   reverse-flow [ service-name1 service-name2 ]; }</pre>
<b>Hierarchy Level</b>	[edit services service-set <i>service-set-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Define the order of services in service set to be applied to traffic coming to the PIC.

**NOTE:** If the **extension-service** statement is specified, the **service-order** statement is mandatory.

<b>Options</b>	<p><b>forward-flow</b>—Order of services in service set to be applied in forward flow.</p> <p><b>reverse-flow</b>—Order of services in service set to be applied in reverse flow. If you want the order to be the reverse of that specified for forward flow, this is optional. However, if, for example, you want the order to be the same regardless of direction of flow, you must include this statement. (The exception to this is for the sampling service set type. If a service set is a sampling service set and the reverse-flow service order is not configured, all sampled traffic is considered to be forward traffic.)</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">extension-service on page 41</a></li> </ul>

## syslog

---

Syntax	<pre>syslog {     facility {         severity;         destination destination;     } }</pre>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Release Information	Statement introduced in Junos OS Release 9.2. Options <b>daemon</b> and <b>kernel</b> (for <b>facility</b> ) introduced in Junos OS Release 9.5.
Description	Enable PIC system logging to record or view system log messages on a specific PIC. The system log information is passed to the kernel for logging in the <b>/var/log</b> directory.
Options	<p><b>facility</b>—Group of messages that are either generated by the same software process or concern a similar condition or activity. Possible values include the following: <b>daemon</b>, <b>external</b>, <b>kernel</b>, and <b>pfe</b>.</p> <p><b>severity</b>—Classification of effect on functioning. Possible values are the following options:</p> <ul style="list-style-type: none"><li>• <b>any</b>—Include all severity levels.</li><li>• <b>none</b>—Disable logging of the associated facility to a destination.</li><li>• <b>emergency</b>—System panic or other condition that causes the routing platform to stop functioning.</li><li>• <b>alert</b>—Conditions that require immediate correction, such as a corrupted system database.</li><li>• <b>critical</b>—Critical conditions, such as hard errors.</li><li>• <b>error</b>—Error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.</li><li>• <b>warning</b>—Conditions that warrant monitoring.</li><li>• <b>notice</b>—Conditions that are not errors but might warrant special handling.</li><li>• <b>info</b>—Events or nonerror conditions of interest.</li></ul> <p>The remaining statement is explained separately.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• Configuring System Log Messages on page 20</li></ul>

## traceoptions (Process Monitor)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> files <i>number</i> match <i>regex</i> size <i>size</i> (world-readable   no-world-readable);     flag <i>flag</i>;     level <i>level</i>;     no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit system processes <b>process-monitor</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Enable tracing options for the process health monitor (pmond).
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the <b>file</b> statement, you must specify a filename.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>flag <i>flag</i></b>—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Enable all trace options flags.</li> <li>• <b>events</b>—Trace process state change and cleanup events.</li> <li>• <b>gencfg</b>—Trace GENCFG blobs recorded for cleanup.</li> <li>• <b>module</b>—Trace module code.</li> <li>• <b>sysvsem</b>—Trace SYSV semaphores recorded for cleanup.</li> <li>• <b>sysvshm</b>—Trace SYSV shared memory segments recorded for cleanup.</li> <li>• <b>tracking</b>—Trace tracking code.</li> <li>• <b>ui</b>—Trace user interface operations.</li> </ul> <p><b>level <i>level</i></b>—Specify the level of debugging output:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match all levels.</li> <li>• <b>error</b>—Match error conditions.</li> <li>• <b>info</b>—Match informational messages.</li> <li>• <b>notice</b>—Match conditions that warrant special handling (but are not errors).</li> <li>• <b>verbose</b>—Match verbose messages.</li> </ul>

- **warning**—Match warning messages.

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files *number*** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable | no-world-readable**—(Optional). Grant all users permission to read log files, or restrict the permission only to the **root** user and users who have the Junos **maintenance** permission.

**Usage Guidelines** See Verifying the Execution Status of System Processes.

**Required Privilege** trace—To view this statement in the configuration.  
**Level** trace-control—To add this statement to the configuration.

## traceoptions (Resource Cleanup)

<b>Syntax</b>	<pre> traceoptions {     file <i>filename</i> files <i>number</i> match <i>regex</i> size <i>size</i> (world-readable   no-world-readable);     flag <i>flag</i>;     level <i>level</i>;     no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit system processes resource-cleanup]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Enable debugging tracing for resource cleanup process.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the <b>file statement</b>, you must specify a filename.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>flag <i>flag</i></b>—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Enable all trace options flags.</li> <li>• <b>events</b>—Trace process state change and cleanup events.</li> <li>• <b>gencfg</b>—Trace GENCFG blobs recorded for cleanup.</li> <li>• <b>module</b>—Trace module code.</li> <li>• <b>sysvsem</b>—Trace SYSV semaphores recorded for cleanup.</li> <li>• <b>sysvshm</b>—Trace SYSV shared memory segments recorded for cleanup.</li> <li>• <b>tracking</b>—Trace tracking code.</li> <li>• <b>ui</b>—Trace user interface operations.</li> </ul> <p><b>level <i>level</i></b>—Specify the level of debugging output:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match all levels.</li> <li>• <b>error</b>—Match error conditions.</li> <li>• <b>info</b>—Match informational messages.</li> <li>• <b>notice</b>—Match conditions that warrant special handling (but are not errors).</li> <li>• <b>verbose</b>—Match verbose messages.</li> </ul>

- **warning**—Match warning messages.

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files *number*** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable | no-world-readable**—(Optional). Grant all users permission to read log files, or restrict the permission only to the **root** user and users who have the Junos **maintenance** permission.

**Usage Guidelines** See “Application Health Monitoring” on page 30.

**Required Privilege Level** **trace**—To view this statement in the configuration.  
**trace-control**—To add this statement to the configuration.

---

## wired-max-processes

---

**Syntax** **wired-max-processes *num-procs***;

**Hierarchy Level** [edit chassis fpc *slot-number* pic *slot-number* adaptive-services service-package extension-provider]

**Release Information** Statement introduced in Junos Release 11.4.

**Description** Configure the number of processes that use wired process memory. Performance can degrade if a process uses memory beyond its Big TLB memory. If this setting is changed, the PIC will reboot.

**Options** ***num-procs***—Number of processes that use the reserved wired process memory.  
**Range:** 1 through 8

**Required Privilege Level** **interface**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

**Related Documentation**

- Configuring Memory Settings on page 18
- **wired-process-mem-size** on page 61
- **forwarding-db-size** on page 43
- **object-cache-size** on page 45
- **policy-db-size** on page 47

## wired-process-mem-size

---

<b>Syntax</b>	wired-process-mem-size <i>mem-size</i> ;
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
<b>Description</b>	Configure the size of the reserved wired process memory. You can also configure object cache. If this setting is changed, the PIC reboots.
<b>Options</b>	<b>megabytes</b> —Size of the reserved wired process memory, in MB. The only size you can set for this statement is 512 MB. <b>Default:</b> 512 MB <b>Range:</b> 0 through 512 MB
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• Configuring Memory Settings on page 18</li><li>• forwarding-db-size on page 43</li><li>• object-cache-size on page 45</li><li>• policy-db-size on page 47</li><li>• wired-max-processes on page 60</li></ul>

## CHAPTER 6

# Command Reference

Operational mode commands show you the current status of the router interfaces, chassis, protocols, and system information and are used to monitor and troubleshoot configurations.

The operational commands described here are relevant to the configuration of Junos SDK-built applications. For native Junos OS operational commands, see the Junos OS command references.

## show extension-provider system connections

<b>Syntax</b>	show extension-provider system connections <extensive> <inet   inet6> <interface> <show-routing-instances>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	Show connection activity on the extension provider PIC. This command functions similarly to <b>show system connections</b> command.
<b>Options</b>	<p><b>extensive</b>—(Optional) Display exhaustive system process information.</p> <p><b>inet   inet6</b>—(Optional) Display IPv4 connections or IPv6 connections, respectively.</p> <p><b>interface</b>—(Optional) Display the name of the extension provider interface.</p> <p><b>show-routing-instances</b>—(Optional) Display routing instances.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p>show extension-provider system connections on page 64</p> <p>show extension-provider system connections extensive interface on page 65</p> <p>show extension-provider system connections inet on page 65</p> <p>show extension-provider system connections inet6 on page 65</p> <p>show extension-provider system connections interface on page 65</p> <p>show extension-provider system connections show-routing-instances on page 66</p> <p>show extension-provider system connections show-routing-instances interface inet6 on page 66</p>
<b>Output Fields</b>	For a description of the output fields, see the output fields table for the <b>show system connections</b> command in the <i>Junos System Basics and Services Command Reference</i> .

JUNOS SDK JNX-FLOW Dataplane Component [9.2I20080801_1059]
Description:
JUNOS SDK JNX-FLOW Data Component Package
Copyright (c) 1996-2008, Juniper Networks, Inc.
All rights reserved.
Software version:      9.2I20080801_1059
This package contains SDK JNX-FLOW dataplane component
Interface: ms-0/2/0
Information for jmpsdk:
Comment:

```

```
JUNOS MPSDK Base OS boot [9.2R1.3]
Description:
JUNOS MPSDK Base OS
Copyright (c) 1996-2008, Juniper Networks, Inc.
All rights reserved.
Software version:      9.2R1.3
This package contains the MPSDK base operating system components.

## show extension-provider system processes

<b>Syntax</b>	show extension-provider system processes <brief   detail   extensive> <interface> <wide>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	Show system process table on the extension provider PIC.
<b>Options</b>	<b>brief   detail   extensive</b> —(Optional) Display the specified level of output.  <b>interface</b> —(Optional) Name of the extension provider interface.  <b>wide</b> —(Optional) Display information even if it is wider than 80 columns.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	show extension-provider system processes on page 69 show extension-provider system processes brief on page 70 show extension-provider system processes detail on page 70 show extension-provider system processes extensive on page 71 show extension-provider system processes interface on page 71 show extension-provider system processes wide on page 72 show extension-provider system processes wide detail on page 72
<b>Output Fields</b>	For a description of the output fields, see the output fields table for the <b>show system processes</b> command in the <i>Junos System Basics and Services Command Reference</i> .

## Sample Output

```

show extension-provider system processes user@host> show extension-provider system processes
Interface: ms-0/0/0
  PID  TT  STAT      TIME  COMMAND
   0  ??  WLS      0:00.00 [swapper]

show extension-provider system processes interface
The output for the show extension-provider system processes interface command is
identical to that for the show extension-provider system processes command except that
the output for the former is for the specified interface only and the output for the latter
is for all ms interfaces. For sample output, see show extension-provider system processes
on page 69.

## show extension-provider system uptime

<b>Syntax</b>	show extension-provider system uptime <interface>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	Show uptime on the extension provider PIC.
<b>Options</b>	<b>interface</b> —(Optional) Name of the extension provider interface.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	show extension-provider system uptime on page 73 show extension-provider system uptime interface on page 73
<b>Output Fields</b>	For a description of the output fields, see the output fields table for the <b>show system uptime</b> command in the <i>Junos System Basics and Services Command Reference</i> .

## Sample Output

```

show extension-provider system uptime
user@host> show extension-provider system uptime
Interface: ms-0/0/0
  5:08PM up 26 mins, 0 users, load averages: 0.09, 0.06, 0.04
Interface: ms-0/2/0
  5:08PM up 26 mins, 0 users, load averages: 0.15, 0.03, 0.01

show extension-provider system uptime interface
user@host> show extension-provider system uptime interface ms-0/2/0
Interface: ms-0/2/0
  5:08PM up 26 mins, 0 users, load averages: 0.15, 0.03, 0.01
interface
```

## show extension-provider system virtual-memory

<b>Syntax</b>	show extension-provider system virtual-memory <interface>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	Show kernel dynamic memory usage on the extension provider PIC. Display the usage of Junos kernel memory listed first by size of allocation and then by type of usage.
<b>Options</b>	<b>interface</b> —(Optional) Name of the extension provider interface.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<b>show extension-provider system virtual-memory on page 74</b> <b>show extension-provider system virtual-memory interface on page 75</b>
<b>Output Fields</b>	For a description of the output fields, see Table 4 on page 74. Output fields are listed in the approximate order in which they appear.

**Table 4: show extension-provider system virtual-memory Output Fields**

Field	Field Description
Size (unlabeled)	Memory block size in bytes.
Type(s) (unlabeled)	Kernel modules that are using the memory blocks. For a definition of each type, see a FreeBSD book.
<b>interrupt</b>	Type of interrupt: <ul style="list-style-type: none"> <li><b>total</b>—Total number of interrupts for each type.</li> <li><b>rate</b>—Interrupt rate.</li> </ul>
<b>Total</b>	Total of all interrupts.

## Sample Output

```

show extension-provider system virtual-memory
user@host> show extension-provider system virtual-memory
Interface: ms-0/0/0
  916976 cpu context switches
193097320 device interrupts
  43468 software interrupts
    0 traps
199882 system calls
  78 kernel threads created
  2416 fork() calls
    0 vfork() calls
    0 rfork() calls

## show system processes health

<b>Syntax</b>	show system processes health <process-name <i>name</i>   pid <i>pid</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Display the resource utilization (health), of all the SDK applications currently running. You can display health information about one specific process by specifying either the process name or the process ID (PID).
<b>Options</b>	<p><b>process-name <i>name</i></b>—(Optional) Display health information about the process identified by the process name.</p> <p><b>pid <i>pid</i></b>—(Optional) Display health information about the process identified by the PID.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p>show system processes health on page 78</p> <p>show system processes health pid on page 78</p> <p>show system processes health process-name on page 79</p>
<b>Output Fields</b>	For a description of the output fields, see Table 5 on page 77. Output fields are listed in the approximate order in which they appear.

**Table 5: show system processes health Output Fields**

Field Name	Field Description
<b>PID</b>	Process ID, a number that identifies the process.
<b>Provider</b>	Provider prefix. A string that identifies the provider of the SDK application.
<b>Parent process</b>	Process ID of the process that spawned the process in question.
<b>Child processes</b>	Process ID of the process that is launched from the process in question: <ul style="list-style-type: none"> <li>• Process ID for child process—A number that identifies the child process.</li> <li>• Name of child process—A string that identifies the child process.</li> </ul>
<b>CPU accumulated</b>	Maximum amount of CPU time that can be accumulated.
<b>Heartbeat</b>	A regular signal sent from a router to indicate that the router is up and running: <ul style="list-style-type: none"> <li>• <b>Interval</b>—Number of seconds between heartbeats.</li> <li>• <b>Allowed misses</b>—Number of missed heartbeats allowed before the application restarts.</li> <li>• <b>Last seen</b>—Time in seconds when the last heartbeat occurred.</li> <li>• <b>Total misses</b>—Number of heartbeats missed so far.</li> </ul>

Table 5: show system processes health Output Fields (*continued*)

Field Name	Field Description
<b>Resource utilization</b>	<p>How memory is divided:</p> <ul style="list-style-type: none"> <li>• <b>Area</b>—Segment of memory.</li> <li>• <b>Current</b>—Current size of memory segment.</li> <li>• <b>Max. allowed</b>—Maximum size allowed for memory segment.</li> <li>• <b>data size</b>—Current and maximum sizes of data segment.</li> <li>• <b>open files</b>—Number of currently open files and the maximum allowed.</li> <li>• <b>resident set size</b>—Current and maximum size of resident set segment.</li> <li>• <b>shared memory size</b>—The amount of shared memory the process is using.</li> <li>• <b>stack size</b>—Current and maximum sizes of stack segment.</li> </ul>

## Sample Output

**show system  
processes health**

```

user@host> show system processes health
PID: 10075 (jnx-flow-mgmt)
Provider: jnx
Parent process: 1 (init)
CPU accumulated: 0 seconds
Resource utilization:
  Area          Current  Max. allowed
  data size      7KB      32MB
  open files     20       64
  resident set size 12KB     24MB
  shared memory size 4KB
  stack size     2KB      8MB
PID: 420 (jnx-exampled)
Provider: jnx
Parent process: 1 (init)
Child processes: 1
  PID    Process name
  421    jnx-exampled
CPU accumulated: 21 seconds
Heartbeat:
  Interval:      1s
  Allowed misses: 5
  Last seen:     1s ago (0 missed)
  Total misses:  2
Resource utilization:
  Area          Current  Max. allowed
  data size      24KB     16MB
  open files     23       128
  resident set size 1532KB   24MB
  shared memory size 43KB
  stack size     8KB      8MB

```

**show system  
processes health pid**

The output for the **show system processes health pid *pid*** command is identical to that for the **show system processes health** command except that health information is displayed for only the process specified by the PID. For sample output, see **show system processes health** on page 78.

**show system processes health *process-name*** The output for the **show system processes health *process-name*** name command is identical to that for the **show system processes health** command except that health information is displayed for only the process named. For sample output, see **show system processes health** on page 78.

## show system processes providers

---

<b>Syntax</b>	show system processes providers
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Display information about software processes that are running on the router. The output is similar to that of the <b>show system processes extensive</b> command, but this command displays only provider processes (that is, only external processes). Also, this command's output has an extra column labeled <b>PROVIDER</b> to display the provider prefix.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	show system processes providers on page 80
<b>Output Fields</b>	For a description of the output fields, see the output fields table for the <b>show system processes</b> command in the <i>Junos System Basics and Services Command Reference</i> . This table explains all the fields except for <b>PROVIDER</b> which is for the string that is the provider prefix for the SDK application running the process.

## Sample Output

<b>show system processes providers</b>	<pre>user@host&gt; show system processes providers last pid: 7014; load averages: 0.19, 0.09, 0.05 up 0+00:57:29 12:54:45 54 processes: 1 running, 53 sleeping Mem: 101M Active, 105M Inact, 31M Wired, 132M Cache, 69M Buf, 369M Free Swap: 1536M Total, 1536M Free   PID USERNAME PROVIDER PRI NICE  SIZE   RES STATE   TIME  WCPU COMMAND  7001 root      jnx       96   0 3240K 2700K select 0:00 0.00% jnx-exampled</pre>
--	--

## show system processes resource-limits process-name

<b>Syntax</b>	show system processes resource-limits process-name <i>process-ui-name</i>
<b>Release Information</b>	Command introduced in Junos OS Release 9.6.
<b>Description</b>	Display the resource limits of a process in an SDK package.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	show system processes resource-limits process-name on page 82 show system processes resource-limits process-name brief on page 82 show system processes resource-limits process-name detail on page 82
<b>Output Fields</b>	For a description of the output fields, see Table 6 on page 81. Output fields are listed in the approximate order in which they appear.

**Table 6: show system processes resource-limits process-name Output Fields**

Field Name	Field Description
<b>Provider-ID</b>	Process ID, a number that identifies the process.
<b>Provider-prefix</b>	Provider prefix. A string that identifies the provider of the SDK application.
<b>Area</b>	Segment of memory.
<b>Max. allowed</b>	Current value of the limits applied in the kernel (effective limit).
<b>Max. configurable</b>	Maximum value the administrator can set for the limit in the configuration.
<b>cpu/priority</b>	Highest priority number (nice level) process can run at.
<b>cpu/time</b>	Maximum amount of CPU time that can be accumulated.
<b>file/core-size</b>	Maximum size of a core file that can be created.
<b>file/open</b>	Maximum number of simultaneous open files.
<b>file/size</b>	Maximum size of a file that can be created.
<b>memory/data size</b>	Maximum size of data segment.
<b>memory/locked-in</b>	Maximum number of bytes that can be locked into memory.
<b>memory/resident set size</b>	Maximum size of resident set.

Table 6: show system processes resource-limits process-name Output Fields (*continued*)

Field Name	Field Description
memory/stack-size	Maximum size of stack segment.
memory/socket-buffers	Maximum amount of physical memory that may be dedicated to the socket buffers.

### Sample Output

```

show system processes resource-limits process-name user@host> show system processes resource-limits process-name jnx-example-service
processes Resource Limits
resource-limits Area Max. allowed Max. configurable
process-name cpu/priority 10 10
file/open 16 64
memory/data-size 32MB 32MB
memory/locked-in 16MB 16MB
memory/resident-set-size 8MB 24MB
memory/stack-size 4MB 8MB

show system The output for the show system processes resource-limits process-name
processes jnx-example-service brief command is the same as for the show system processes
resource-limits resource-limits process-name jnx-example-service command.
process-name brief

show system user@host> show system processes resource-limits process-name jnx-example-service detail
processes Provider-ID: 0x8000
resource-limits Provider-prefix: jnx
process-name detail Resource Limits
Area Max. allowed Max. configurable
cpu/priority 10 10
cpu/time unlimited unlimited
file/size unlimited unlimited
file/open 16 64
file/core-size unlimited unlimited
memory/data-size 32MB 32MB
memory/locked-in 16MB 16MB
memory/resident-set-size 8MB 24MB
memory/stack-size 4MB 8MB
memory/socket-buffers unlimited unlimited

```

## show system resource-cleanup processes

<b>Syntax</b>	show system resource-cleanup processes <detail>
<b>Release Information</b>	Command introduced in Junos OS Release 9.3. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the list of processes that have been registered for resource cleanup services.
<b>Options</b>	<b>detail</b> —(Optional) Display the list of processes that have been registered for resource clean up services, along with the resources that have been requested for clean up.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<b>show system resource-cleanup processes on page 83</b> <b>show system resource-cleanup processes detail on page 83</b>
<b>Output Fields</b>	For a description of the output fields, see Table 7 on page 83. Output fields are listed in the approximate order in which they appear.

**Table 7: show system resource-cleanup processes Output Fields**

Field Name	Field Description
<b>PID</b>	Process ID, a number that identifies a process.
<b>Process name</b>	String that identifies the process.
<b>Resources to clean</b>	Resources that have been registered to be cleaned up.

## Sample Output

```

show system resource-cleanup processes user@host> show system resource-cleanup processes
PID      Process name      Resources to clean
420      jnx-exampled      GENCFG, SYSV shared memory

show system resource-cleanup processes detail user@host> show system resource-cleanup processes detail
PID      Process name      Resources to clean
420      jnx-exampled      GENCFG blob major ID 0x8000, minor ID 0x0000
                        SYSV shared memory ID 65536, key 1108955839
                        SYSV shared memory ID 65537, key 1108955837

```
