## address-assignment (Address-Assignment Pools)

---

**Syntax**    address-assignment {  
              abatedUtilization *percentage*;  
              abatedUtilization-v6 *percentage*;  
              highUtilization *percentage*;  
              highUtilization-v6 *percentage*;  
              neighbor-discovery-router-advertisement *ndra-pool-name*;  
              pool *pool-name* {  
                  family *family* {  
                      dhcp-attributes {  
                          protocol-specific *attributes*;  
                      }  
                      host *hostname* {  
                          hardware-address *mac-address*;  
                          ip-address *ip-address*;  
                      }  
                      network *ip-prefix* / <*prefix-length*>;  
                      prefix *ipv6-prefix*;  
                      range *range-name* {  
                          high *upper-limit*;  
                          low *lower-limit*;  
                          prefix-length *prefix-length*;  
                      }  
                  }  
                  link *pool-name*;  
              }  
          }

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 9.0.  
Support for LNS on MX Series routers introduced in Junos OS Release 11.4. Not all subordinate statements are supported for L2TP LNS on MX Series routers.

**Description**    Configure address-assignment pools that can be used by different client applications.

**Options**    *pool-name*—Name assigned to an address-assignment pool.

The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description              | Configure an Ascend-Data-Filter that the dynamic profile applies to a subscriber session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                  | <p><b>counter</b>—Enable a counter that increments each time the Ascend-Data-Filter rule is used. Typically used for testing purposes.</p> <p><b><i>precedence</i></b>—Precedence value that sets the order in which dynamic service filters are applied on the interface. The lower the precedence value, the higher the precedence that is given. The precedence setting is used in conjunction with the precedence settings of all dynamic service filters configured (not only Ascend-Data-Filters) on the same interface to establish the order. For example, the order also includes any configured <b>input <i>filter-name</i> precedence <i>precedence</i></b> and <b>output <i>filter-name</i> precedence <i>precedence</i></b> statements.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 0</p> <p><b><i>rule-value</i></b>—Ascend-Data-Filter rule. You can specify either a Junos predefined variable that maps the Ascend-Data-Filter actions to Junos filter functionality or you can manually configure the Ascend-Data-Filter rule. The router supports two predefined variables depending on family type: <b>\$junos-adf-rule-v4</b> for family <b>inet</b> and <b>\$junos-adf-rule-v6</b> for family <b>inet6</b>.</p> |

| <b>Description</b>              | Specify a recommended shaping rate to be applied to downstream or upstream traffic on an interface. For ANCP interfaces, these configured rates are used as the default values for the Juniper VSAs Downstream-Calculated-QoS-Rate (26-141) and Upstream-Calculated-QoS-Rate (26-142) if the router has not received and processed the attributes from the access node. For L2TP, the rates are configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, these speeds are sent to the LNS in the ICCN message as AVP 24 (downstream) and AVP 38 (upstream), respectively. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Specify for all static subscribers or for a group of static subscribers that the router merge (chain) subscriber (client) attributes such as firewall filters and CoS attributes or replace them when multiple subscriber sessions exist on the same underlying VLAN. The group version of this statement overrides the global version.</p> <p>This statement is not supported for IP demux subscriber interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>                  | By default, multiple subscribers cannot be on the same logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>merge</b>—Aggregate the attributes of multiple subscribers for the logical interface.</p> <p><b>replace</b>—Replace the entire logical interface whenever a new client logs in to the network using the same VLAN logical interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Override the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server. The use of this option causes the DHCP relay agent to perform one of the following actions, depending on how it is configured:</p> <ul style="list-style-type: none"> <li>• If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.</li> <li>• If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | Configure how many attempts are made to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>         | <p>For a single-rate two-color policer, configure the bandwidth limit as a number of bits per second. Single-rate two-color policing uses the single token bucket algorithm to measure traffic-flow conformance to a two-color policer rate limit.</p> <p>Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with <b>low</b> packet loss priority (PLP) and then passed through the interface.</p> <p>Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.</p> <div style="margin-top: 20px;">  <p><b>NOTE:</b> This statement specifies the bandwidth limit as an absolute number of bits per second. Alternatively, for single-rate two-color policers only, you can use the <code>bandwidth-percent <i>percentage</i></code> statement to specify the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate.</p> </div> <p>Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.</p> <p>Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.</p> |

| <b>Description</b>         | For a single-rate two-color policer, configure the bandwidth limit as a percentage value. Single-rate two-color policing uses the <i>single token bucket algorithm</i> to measure traffic-flow conformance to a two-color policer rate limit.<br><br>Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with <b>low</b> packet loss priority and then passed through the interface.<br><br>Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface. |

**NOTE:** This statement specifies the bandwidth limit as a percentage of either the physical interface port speed or the configured logical interface shaping rate. Alternatively, you can use the `bandwidth-limit bps` statement to specify the bandwidth limit as an absolute number of bits per second.

The function of the bandwidth limit is extended by the burst size (configured using the `burst-size-limit bytes` statement) to allow bursts of traffic up to a limit based on the overall traffic load:

- When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.
- During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.

Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.

Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower

priority. You apply a hierarchical policer to ingress Layer 2 traffic to allows bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.

**Options** *percentage*—Traffic rate as a percentage of either the physical interface media rate or the logical interface configured shaping rate. You can configure a shaping rate on a logical interface by using class-of-service statement.

**NOTE:** You cannot rate-limit based on bandwidth percentage for aggregate, tunnel, and software interfaces. The bandwidth percentage policer cannot be used for forwarding table filters. Bandwidth percentage policers can only be used for interface-specific filters.

**Range:** 0 through 100

**Default:** None.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Support at the [edit <code>dynamic-profiles ... if-exceeding</code> ] hierarchy level introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | <p>For a single-rate two-color policer, configure the burst size as a number of bytes. The burst size allows for short periods of traffic bursting (back-to-back traffic at average rates that exceed the configured bandwidth limit). Single-rate two-color policing uses the <i>single token bucket algorithm</i> to measure traffic-flow conformance to a two-color policer rate limit.</p> <p>Traffic at the interface that conforms to the bandwidth limit is categorized green. Traffic that exceeds the specified rate is also categorized as green provided that sufficient tokens remain in the single token bucket. Packets in a green flow are implicitly marked with <b>low</b> packet loss priority and then passed through the interface.</p> <p>Traffic that exceeds the specified rate when insufficient tokens remain in the single token bucket is categorized red. Depending on the configuration of the two-color policer, packets in a red traffic flow might be implicitly discarded; or the packets might be re-marked with a specified forwarding class, a specified PLP, or both, and then passed through the interface.</p> <p>The burst size extends the function of the bandwidth limit (configured using either the <b>bandwidth-limit bps</b> statement or the <b>bandwidth-percent percentage</b> statement) to allow bursts of traffic up to a limit based on the overall traffic load:</p> <ul style="list-style-type: none"><li>• When a single-rate two-color policer is applied to the input or output traffic at an interface, the initial capacity for traffic bursting is equal to the number of bytes specified by this statement.</li><li>• During periods of relatively low traffic (traffic that arrives at or departs from the interface at overall rates below the token arrival rate), unused tokens accumulate in the bucket, but only up to the configured token bucket depth.</li></ul> <p>Single-rate two-color policing allows bursts of traffic for short periods, whereas single-rate and two-rate three-color policing allows more sustained bursts of traffic.</p> <p>Hierarchical policing is a form of two-color policing that applies different policing actions based on whether the packets are classified for expedited forwarding (EF) or for a lower priority. You apply a hierarchical policer to ingress Layer 2 traffic to allow bursts of EF traffic for short period and bursts of non-EF traffic for short periods, with EF traffic always taking precedence over non-EF traffic.</p> |

**Options** *bytes*—Burst size limit in bytes. The minimum recommended value is the maximum transmission unit (MTU) of the IP packets being policed. You can specify the value either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

**Range:** 1500 through 100,000,000,000

**Default:** None

**Required Privilege Level** firewall—To view this statement in the configuration.  
firewall-control—To add this statement to the configuration.

**Hierarchy Level**    [edit services]

**Release Information**    Statement introduced in Junos OS Release 10.4.

**Description**    Configure the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

The remaining statements are explained separately.

**Required Privilege Level**    services—To view this statement in the configuration.  
                                  services—control—To add this statement to the configuration.

| <b>Description</b>              | Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | Restores the original client configuration when reconfiguration fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## client

**Syntax**

```

client client-name {
 chap-secret chap-secret;
 group-profile profile-name;
 ike {
 allowed-proxy-pair {
 remote remote-proxy-address local local-proxy-address;
 }
 pre-shared-key (ascii-text character-string | hexadecimal hexadecimal-digits);
 ike-policy policy-name;
 interface-id string-value;
 }
 l2tp {
 interface-id interface-id;
 lcp-renegotiation;
 local-chap;
 maximum-sessions-per-tunnel number;
 multilink {
 drop-timeout milliseconds;
 fragment-threshold bytes;
 }
 ppp-authentication (chap | pap);
 ppp-profile profile-name;
 shared-secret shared-secret;
 }
 pap-password pap-password;
 ppp {
 cell-overhead;
 encapsulation-overhead bytes;
 framed-ip-address ip-address;
 framed-pool framed-pool;
 idle-timeout seconds;
 interface-id interface-id;
 keepalive seconds;
 primary-dns primary-dns;
 primary-wins primary-wins;
 secondary-dns secondary-dns;
 secondary-wins secondary-wins;
 }
 user-group-profile profile-name;
}

```

**Hierarchy Level** [edit access *profile* *profile-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for MX Series routers introduced in Junos OS Release 11.4. Not all subordinate statements are supported for L2TP LNS on MX Series routers.

**Description** Configure the peer identity.

**Options** *client-name*—A peer identity. For L2TP clients, you can use a special name to configure a default client. This client enables the LNS to accept any LAC to establish the

session. On M Series routers, use \* for the default client configuration. On MX Series routers, use **default**.

The remaining statements are explained separately.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Configure DHCP local server to use option 60 and option 82 information to uniquely identify DHCP subscribers when primary subscriber identification fails. The statement always uses the <b>option60-and-option82</b> option. Specifying the option has no effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Configure DHCP relay to use option 60 and option 82 information to uniquely identify DHCP subscribers when primary subscriber identification fails. The statement always uses the <b>option60-and-option82</b> option. Specifying the option has no effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Description              | <p>For a three-color policer, configure the way preclassified packets are metered. In color-aware mode, the local router can assign a higher packet loss priority, but cannot assign a lower packet loss priority.</p> <p>For example, suppose an upstream router assigned medium-high packet loss priority to a packet because the packet exceeded the committed information rate on the upstream router interface.</p> <ul style="list-style-type: none"><li>• If the local router applies color-aware policing to the packet, the router <i>cannot</i> change the packet loss priority to low, even if the packet conforms to the configured committed information route on the local router interface.</li><li>• If the local router applies color-blind policing to the packet, the router <i>can</i> change the packet loss priority to low if the packet conforms to the configured committed information route on the local router interface.</li></ul> |
|                          | <div> <b>NOTE:</b> A color-aware policer cannot be applied to Layer 2 traffic.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Default                  | If you omit the <b>color-aware</b> statement, the default behavior is color-aware mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>For a three-color policer, configure the way preclassified packets are metered. In color-blind mode, the local router ignores the preclassification of packets and can assign a higher or lower packet loss priority.</p> <p>For example, suppose an upstream router assigned medium-high packet loss priority to a packet because the packet exceeded the committed information rate on the upstream router interface.</p> <ul style="list-style-type: none"> <li>• If the local router applies color-aware policing to the packet, the router <i>cannot</i> change the packet loss priority to low, even if the packet conforms to the configured committed information route on the local router interface.</li> </ul> <div style="margin-top: 10px;">  <p><b>NOTE:</b> A color-aware policer cannot be applied to Layer 2 traffic.</p> </div> <ul style="list-style-type: none"> <li>• If the local router applies color-blind policing to the packet, the router <i>can</i> change the packet loss priority to low if the packet conforms to the configured committed information route on the local router interface.</li> </ul> |
| <b>Default</b>                  | If you omit the <b>color-blind</b> statement, the default behavior is color-aware mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>         | For a three-color policer, configure the committed burst size (CBS) as a number of bytes.                                                                                                                                                                                                                                                                                                                 |

**NOTE:** When you include the **committed-burst-size** statement in the configuration, you must also include the **committed-information-rate** statement at the same hierarchy level.

In three-color policing, a committed information rate (CIR) defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green.

During periods of average traffic rates below the CIR, any unused bandwidth capacity accumulates up to a maximum amount defined by the CBS. Short periods of bursting traffic (back-to-back traffic at averages rates that exceed the CIR) are also categorized as green provided that unused bandwidth capacity is available.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policers use a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red, based on the **excess-burst-size** statement included in the policer configuration.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits. Nonconforming traffic is categorized as yellow or red based on the **peak-information-rate** and **peak-burst-rate** statements included in the policer configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 7.4.<br>Support at the [edit <code>dynamic-profiles ... single-rate</code> ] and [edit <code>dynamic-profiles ... two-rate</code> ] hierarchy levels introduced in Junos OS Release 11.4.                                                                                                                                                      |
| <b>Description</b>         | For a three-color policer, configure the committed information rate as a number of bits per second. The committed information rate (CIR) is the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions.                                                                                                                              |

**NOTE:** When you include the `committed-information-rate` statement in the configuration, you must also include the `committed-burst-size` statement at the same hierarchy level.

In three-color policing, a CIR defines the guaranteed bandwidth for traffic arriving at or departing from the interface under normal line conditions. A flow of traffic at an average rate that conforms to the CIR is categorized green.

During periods of average traffic rates below the CIR, any unused bandwidth capacity accumulates up to a maximum amount defined by the committed burst size (CBS). Short periods of bursting traffic (back-to-back traffic at averages rates that exceed the CIR) are also categorized as green provided that unused bandwidth capacity is available.

Traffic that exceeds both the CIR and the CBS is considered nonconforming.

Single-rate three-color policers use a *dual token bucket algorithm* to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red, based on the **excess-burst-size** statement included in the policer configuration.

Two-rate three-color policers use a *dual-rate dual token bucket algorithm* to measure traffic against two rate limits. Nonconforming traffic is categorized as yellow or red based on the **peak-information-rate** and **peak-burst-rate** statements included in the policer configuration.

**Options** `bps`—Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation `k` (1000), `m` (1,000,000), or `g` (1,000,000,000).

**Range:** 32,000 through 40,000,000,000 bps

**Required Privilege Level** firewall—To view this statement in the configuration.  
firewall-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                          |
| <b>Description</b>              | Specify the characters that the router uses to separate usernames from domain names.                                                                                                                                    |
| <b>Default</b>                  | The @ character.                                                                                                                                                                                                        |
| <b>Options</b>                  | <b><i>delimiter-character</i></b> —One or more characters used as delimiters. You can specify a maximum of eight delimiters. You cannot use the semicolon (;) as a delimiter. Do not include spaces between characters. |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                         |

## demux0 (Dynamic Interface)

```
Syntax demux0 {
 unit logical-unit-number {
 demux-options {
 underlying-interface interface-name
 }
 family family {
 access-concentrator name;
 address address;
 demux-source {
 source-prefix;
 }
 duplicate-protection;
 dynamic-profile profile-name;
 filter {
 input filter-name;
 output filter-name;
 }
 mac-validate (loose | strict):
 max-sessions number;
 max-sessions-vsa-ignore;
 service-name-table table-name
 short-cycle-protection <lockout-time-min minimum-seconds lockout-time-max
 maximum-seconds>;
 unnumbered-address interface-name <preferred-source-address address>;
 }
 filter {
 input filter-name;
 output filter-name;
 }
 vlan-id number;
 }
 }
```

**Hierarchy Level** [edit [dynamic-profiles profile-name interfaces](#)]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Configure the logical demultiplexing (demux) interface in a dynamic profile.  
  
The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Configure a logical demultiplexing (demux) source address for a subscriber in a dynamic profile.                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <b>source-address</b> —Either the specific source address you want to assign to the subscriber interface or the source address variable. For IPv4, specify <code>\$junos-subscriber-ip-address</code> ; for IPv6, specify <code>\$junos-subscriber-ipv6-address</code> ). The source address for the interface is dynamically supplied by DHCP when the subscriber accesses the router. |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                 |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Configuring Dynamic Subscriber Interfaces Using IP Demux Interfaces in Dynamic Profiles on page 539</a></li><li>• For information about static IP demux interfaces, see the <a href="#">Junos OS Network Interfaces Configuration Guide</a></li></ul>                                                                               |

## demux-source (Dynamic Underlying Interface)

|                            |                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>demux-source <i>family</i>;</code>                                                                                       |
| <b>Hierarchy Level</b>     | [edit <a href="#">dynamic-profiles interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> ]      |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                  |
| <b>Description</b>         | Configure the logical demultiplexing (demux) source family type on the IP demux underlying interface within a dynamic profile. |

**NOTE:** The IP demux interface feature currently supports only Fast Ethernet, Gigabit Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet underlying interfaces.

|                                 |                                                                                                                                                                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <i>family</i> —Protocol family: <ul style="list-style-type: none"> <li>• <b>inet</b>—Internet Protocol version 4 suite</li> <li>• <b>inet6</b>—Internet Protocol version 6 suite</li> </ul> |
| <b>Required Privilege Level</b> | <i>interface</i> —To view this statement in the configuration.<br><i>interface-control</i> —To add this statement to the configuration.                                                     |

## destination (Diameter Network Element)

|                                 |                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>destination realm <i>realm-name</i> &lt;host <i>hostname</i>&gt;;</code>                                                                                                                                 |
| <b>Hierarchy Level</b>          | [edit <a href="#">diameter network-element</a> <i>element-name</i> <a href="#">forwarding route</a> <i>dne-route-name</i> ]                                                                                    |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                  |
| <b>Description</b>              | Associate the route with all hosts of the specified realm or with a specific host of the specified realm. Together with the function and metric, defines a route reachable through a Diameter network element. |
| <b>Options</b>                  | <b>host <i>hostname</i></b> —(Optional) Name of the destination host associated with the route.<br><br><b>realm <i>realm-name</i></b> —Name of the destination realm associated with the route.                |
| <b>Required Privilege Level</b> | <b>admin</b> —To view this statement in the configuration.<br><b>admin-control</b> —To add this statement to the configuration.                                                                                |

| Release Information      | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | <p>Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router and enable the router to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.</p> <p>The DHCP local server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can configure dynamic profile and authentication support on a global basis or for a specific group of interfaces.</p> <p>The DHCP local server also supports the use of Junos address-assignment pools or external authorities, such as RADIUS, to provide the client address and configuration information.</p> <p>The extended DHCP local server is incompatible with the DHCP server on J Series routers and so is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the <b>[edit forwarding-options helpers]</b> hierarchy level, cannot both be enabled on the router at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.</p> <p>The <b>dhcpcv6</b> stanza configures the router to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.</p> |

| <b>Description</b>              | <p>Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the router and enable the router to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.</p> <p>DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.</p> <p>The extended DHCP and DHCPv6 relay agent options configured with the <b>dhcp-relay</b> and <b>dhcpv6</b> statements are incompatible with the DHCP/BOOTP relay agent options configured with the <b>bootp</b> statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router at the same time.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | <p>Configure DHCPv6 local server options on the router and enable the router to function as a server for the DHCP protocol for IP version 6 (IPv6). The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access and accounting.</p> <p>The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | <p>Configure DHCPv6 relay options on the router and enable the router to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request and reply packets between a DHCPv6 client and a DHCPv6 server.</p> <p>The DHCPv6 relay agent server is fully compatible with the extended DHCP local server and DHCP relay agent. However, the options configured with the <b>dhcpv6</b> statement are incompatible with the DHCP/BOOTP relay agent options configured with the <b>bootp</b> statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot be enabled on the router at the same time.</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the LAC to use only the silent failover method when resynchronizing with the peer LNS in the event of LAC failover. This command prevents the default behavior, wherein the LAC first attempts to use the failover protocol and then falls back on the silent failover method. This configuration can be useful when routers that act as the LNS are configured for silent failover or incorrectly negotiate use of the failover protocol even though they do not support it. |

**Release Information**    Statement introduced in Junos OS Release 9.0.

**Description**    Drop (discard) DHCP client packets when you use the DHCP vendor class identifier option (option 60) in DHCP packets to forward client traffic to specific DHCP servers.

To drop DHCP client packets that contain an option 60 string that matches the ASCII or hexadecimal match string and match criteria (exact match or partial match) that you specify, include the **drop** statement at the [edit forwarding-options dhcp-relay relay-option-60 **vendor-option** (equals | starts-with) (ascii *match-string* | hexadecimal *match-hex*)] hierarchy level.

To drop DHCP client packets that contain an option 60 string that does *not* match the ASCII or hexadecimal match string and match criteria (exact match or partial match)

that you specify, include the **drop** statement at the **[edit forwarding-options dhcp-relay relay-option-60 vendor-option]** hierarchy level.

| <b>Description</b>         | <p>Within the drop-profile map, specify the name of the drop profile to use for random early detection (RED) for a specific packet-loss priority (PLP) level and protocol type. A drop profile maps a fill level (fullness of a queue) to a drop probability (probability that a packet will be dropped). When a packet arrives, RED checks the queue fill level. If the fill level corresponds to a nonzero drop probability, the RED algorithm determines whether to drop the arriving packet.</p> <p>You enable RED by applying a drop profile to a scheduler.</p> <p>You configure drop profiles statically (at the <b>[edit class-of-service drop-profiles]</b> hierarchy level).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Attach a PPPoE dynamic profile to an underlying Ethernet interface. This underlying interface is configured with either the <b>encapsulation ppp-over-ether</b> statement or the <b>family pppoe</b> statement; the two statements are mutually exclusive. When the router creates a dynamic PPPoE logical interface on the underlying interface, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.</p>                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b><i>profile-name</i></b>—Name of a previously configured PPPoE dynamic profile, up to 64 characters in length, defined at the [edit dynamic-profiles <i>profile-name</i> interfaces pp0] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.<br>Support for MLPPP on LSQ interfaces introduced in Junos OS Release 10.2                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Specify the dynamic profile that is attached to the interface. On the MX Series routers, this statement is currently supported on PPPoE interfaces only. On the M120 and M320 routers, this statement is supported for MLPPP bundles only on LSQ interfaces on Adaptive Services PICs and Multiservices PICs.                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>dynamic-profile</b> statement at the [edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>] hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>dynamic-profile</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>profile-name</i></b> —Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.<br>Support at the [edit logical-systems <i>logical-system-name</i> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instances-name</i> ...], and [edit routing-instances <i>routing-instances-name</i> ...] hierarchy levels introduced in Junos OS Release 9.5.                                                                         |
| <b>Description</b>              | Define the list of interfaces on which the home agent service can be enabled. The system accepts registration requests only if it is on one of these interfaces. Include the statement once for each interface to be enabled.                                                                                                                                                                                             |
| <b>Options</b>                  | <i>interface-name</i> —Interface on which the home agent can be enabled.                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | Dynamic interface configuration of the logical link-layer encapsulation type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-ccc-vc-mux</b>—Use ATM virtual circuit (VC) multiplex encapsulation on circuit cross-connect (CCC) circuits. When you use this encapsulation type, you can configure the <b>ccc</b> family only.</p> <p><b>atm-cisco-nlpid</b>—Use Cisco ATM network layer protocol ID (NLPID) encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-mlppp-llc</b>—For ATM2 IQ interfaces only, use Multilink Point-to-Point Protocol (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a link services or voice services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p><b>atm-nlpid</b>—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-ppp-llc</b>—For ATM2 IQ interfaces only, use PPP over AAL5 LLC encapsulation.</p> <p><b>atm-ppp-vc-mux</b>—For ATM2 IQ interfaces only, use PPP over ATM AAL5 multiplex encapsulation.</p> <p><b>atm-snap</b>—Use ATM subnetwork attachment point (SNAP) encapsulation.</p> <p><b>atm-tcc-snap</b>—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.</p> <p><b>atm-tcc-vc-mux</b>—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the <b>tcc</b> family only.</p> <p><b>atm-vc-mux</b>—Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>ether-over-atm-llc</b>—For interfaces that carry IPv4 traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.</p> |

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, as per *Multiprotocol Interconnect over Frame Relay* (RFC 2427 [1490]).

**ether-vpls-over-ppp**—For E1, T1, E3, T3 and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over PPP encapsulation to support Bridged Ethernet over PPP encapsulated TDM interfaces for VPLS applications.

**ethernet**—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**extended-vlan-vpls**—Use extended virtual LAN (VLAN) VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only. J Series routers do not support **frame-relay-ppp** encapsulation.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting unlike media. When you use this encapsulation type, you can configure the **tcc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with **flexible-frame-relay** encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect unlike media. The physical interface must be configured with **flexible-frame-relay** encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—For underlying Ethernet interfaces on J Series Services routers, use PPP over Ethernet encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface. You also use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 Series routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with Trio MPC/MIC interfaces.

**ppp-over-ether-over-atm-llc**—For underlying ATM interfaces on J Series Services routers only, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible ethernet services, and bridging enabled, and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

The EBS allows for moderate periods of bursting traffic that exceeds both the committed information rate (CIR) and the committed burst size (CBS).                                     |
| <div style="display: flex; align-items: flex-start;"> <div style="margin-right: 10px;">  </div> <div> <p><b>NOTE:</b> When you include the <code>excess-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>committed-information-rate</code> statements at the same hierarchy level.</p> </div> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                           |
| <p>Traffic that exceeds both the CIR and the CBS is considered nonconforming.</p> <p>Single-rate three-color policing uses a <i>dual token bucket algorithm</i> to measure traffic against a single rate limit. Nonconforming traffic is categorized as yellow or red based on the <b>excess-burst-size</b> statement included in the policer configuration.</p> <p>During periods of traffic that conforms to the CIR, any unused portion of the guaranteed bandwidth capacity accumulates in the first token bucket, up to the maximum number of bytes defined by the CBS. If any accumulated bandwidth capacity overflows the first bucket, the excess accumulates in a second token bucket, up to the maximum number of bytes defined by the EBS.</p> <p>A nonconforming traffic flow is categorized yellow if its size conforms to bandwidth capacity accumulated in the first token bucket. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</p> <p>A nonconforming traffic flow is categorized red if its size exceeds the bandwidth capacity accumulated in the second token bucket. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</p> |                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p><b>bytes</b>—Number of bytes. **Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
Options **downstream-calculated-qos-rate**, **dsl-forum-attributes**, and **upstream-calculated-qos-rate** introduced in Junos OS Release 11.4.

**Description** Configure the router or switch to exclude the specified attributes from the specified type of RADIUS message.

Not all attributes are available in all types of RADIUS messages. By default, the router or switch includes the specified attributes in RADIUS Access-Request, Acct-On, Acct-Off, Acct-Start, and Acct-Stop messages.

**Options** RADIUS attribute type—RADIUS attribute or Juniper Networks VSA number and name.

- **accounting-authentic**—RADIUS attribute 45, Acct-Authentic.

- **accounting-delay-time**—RADIUS attribute 41, Acct-Delay-Time.
- **accounting-session-id**—RADIUS attribute 44, Acct-Session-Id.
- **accounting-terminate-cause**—RADIUS attribute 49, Acct-Terminate-Cause.
- **called-station-id**—RADIUS attribute 30, Called-Station-Id.
- **calling-station-id**—RADIUS attribute 31, Calling-Station-Id.
- **class**—RADIUS attribute 25, Class.
- **dhcp-gi-address**—Juniper VSA 26-57, DHCP-GI-Address.
- **dhcp-mac-address**—Juniper VSA 26-56, DHCP-MAC-Address.
- **dhcp-options**—Juniper VSA 26-55, DHCP-Options.
- **downstream-calculated-qos-rate**—Juniper VSA 26-141
- **dsl-forum-attributes**—DSL Forum VSA as described in RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*
- **event-timestamp**—RADIUS attribute 55, Event-Timestamp.
- **framed-ip-address**—RADIUS attribute 8, Framed-IP-Address.
- **framed-ip-netmask**—RADIUS attribute 9, Framed-IP-Netmask.
- **input-filter**—Juniper VSA 26-10, Ingress-Policy-Name.
- **input-gigapackets**—Juniper VSA 26-42, Acct-Input-Gigapackets.
- **input-gigawords**—RADIUS attribute 52, Acct-Input-Gigawords.
- **interface-description**—Juniper VSA 26-53, Interface-Desc.
- **nas-identifier**—RADIUS attribute 32, NAS-Identifier.
- **nas-port**—RADIUS attribute 5, NAS-Port.
- **nas-port-id**—RADIUS attribute 87, NAS-Port-Id.

## exclude (Dynamic MLD Interface)

---

**Syntax** exclude;

**Hierarchy Level** [edit dynamic-profiles *profile-name* protocols **mld interface** *interface-name* **static group** *multicast-group-address*]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Configure the group to operate in exclude mode on the dynamic interface. In exclude mode all sources except the address configured are accepted for the group. By default, the group operates in include mode.

**Required Privilege Level** view-level—To view this statement in the configuration.  
control-level—To add this statement to the configuration.

              }  
          }`

**Hierarchy Level**    [edit [dynamic-profiles profile-name firewall](#)]

**Release Information**    Statement introduced in Junos OS Release 9.6.

**Description**    Configure protocol family information for firewall filters in a dynamic profile.

**Options**    *family*—Protocol family:

- **inet**—Internet Protocol version 4 suite
- **inet6**—Internet Protocol version 6 suite

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring Fast Update Filters on page 859](#)

## family (Dynamic Demux Interface)

**Syntax**    `family family {`  
                   `access-concentrator name;`  
                   `address address;`  
                   `demux-source {`  
                       `source-address;`  
                   `}`  
                   `duplicate-protection;`  
                   `dynamic-profile profile-name;`  
                   `filter {`  
                       `input filter-name;`  
                       `output filter-name;`  
                   `}`  
                   `mac-validate (loose | strict);`  
                   `max-sessions number;`  
                   `max-sessions-vsa-ignore;`  
                   `service-name-table table-name;`  
                   `short-cycle-protection <lockout-time-min minimum-seconds lockout-time-max`  
                       `maximum-seconds>;`  
                   `unnumbered-address interface-name <preferred-source-address address>;`  
                   `}`

**Hierarchy Level**    [edit `dynamic-profiles profile-name interfaces demux0 unit logical-unit-number`]

**Release Information**    Statement introduced in Junos OS Release 9.3.  
                               Option **pppoe** introduced in Junos OS Release 11.2.

**Description**    Configure protocol family information for the logical interface.

**NOTE:** Not all subordinate stanzas are available to every protocol family. See the *Junos OS Configuration Statements and Commands* for details about each protocol family.

**Options**    *family*—Protocol family:

- **inet**—Internet Protocol version 4 suite
- **inet6**—Internet Protocol version 6 suite
- **pppoe**—(MX Series routers with Trio MPCs only) Point-to-Point Protocol over Ethernet

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                   interface-control—To add this statement to the configuration.

## family (Dynamic PPPoE)

```
Syntax family family {
 unnumbered-address interface-name destination address;
 address address;
 service {
 input {
 service-set service-set-name {
 service-filter filter-name;
 }
 post-service-filter filter-name;
 }
 output {
 service-set service-set-name {
 service-filter filter-name;
 }
 }
 }
 filter {
 input filter-name {
 precedence precedence;
 }
 output filter-name {
 precedence precedence;
 }
 }
 }
```

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name* [interfaces](#) pp0 unit "\$junos-interface-unit"]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Configure protocol family information for the logical interface. Only the Internet Protocol version 4 (IPv4) protocol family is currently supported for dynamic PPPoE logical interfaces.

**Options** *family*—Protocol family:

- **inet**—Internet Protocol version 4 suite

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## family (Dynamic Standard Interface)

```
Syntax family family {
 access-concentrator name;
 address address;
 duplicate-protection;
 dynamic-profile profile-name;
 filter {
 adf {
 counter;
 input-precedence precedence;
 output-precedence precedence;
 rule rule-value;
 }
 input filter-name {
 precedence precedence;
 }
 output filter-name {
 precedence precedence;
 }
 }
 max-sessions number;
 max-sessions-vs-a-ignore;
 service {
 input {
 service-set service-set-name {
 service-filter filter-name;
 }
 post-service-filter filter-name;
 }
 output {
 service-set service-set-name {
 service-filter filter-name;
 }
 }
 }
 service-name-table table-name
 short-cycle-protection <lockout-time-min minimum-seconds lockout-time-max
 maximum-seconds>;
 unnumbered-address interface-name <preferred-source-address address>;
 }
```

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name* [interfaces](#) *interface-name* [unit](#) *logical-unit-number*]

**Release Information** Statement introduced in Junos OS Release 9.2.  
Option **pppoe** introduced in Junos OS Release 11.2.

**Description** Configure protocol family information for the logical interface.

**NOTE:** Not all subordinate stanzas are available to every protocol family. See the *Junos OS Configuration Statements and Commands* for details about each protocol family.

**Options**    *family*—Protocol family:

- **inet**—IP version 4 suite
- **inet6**—IP version 6 suite
- **pppoe**—(MX Series routers with Trio MPCs only) Point-to-Point Protocol over Ethernet
- **vpls**—Virtual private LAN service

The remaining statements are explained separately.

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

| <b>Description</b>              | Set the prefix-specific action or policer to operate in <i>filter-specific</i> mode, meaning that a single policer and counter are shared by all filter terms that reference the prefix-specific action or policer. By default, the prefix-specific action or policer operates in <i>term-specific</i> mode, meaning that a separate policer and counter are used for each filter term that references the prefix-specific action or policer.                   |

| <b>Description</b>              | <p>On MX Series 3D Universal Edge Routers only, configure properties for the DPC or MPC and corresponding Packet Forwarding Engines to create tunnel interfaces.</p> <p>Configure a port-mirroring instance for the DPC and its corresponding Packet Forwarding Engines.</p> <p>(MX Series Virtual Chassis only) To configure properties for MPCs in a member router in an MX Series Virtual Chassis configuration, you must specify the router's Virtual Chassis member number <i>before</i> the <b>fpc</b> statement. Specify the member number in the form <b>member member-id</b>, where <b>member-id</b> is 0 or 1. If you do not specify the member number before the <b>fpc</b> statement, the commit operation fails and the software displays an error message indicating that the <b>fpc</b> statement must include the member number for routers in Virtual Chassis mode.</p> |
| <b>Options</b>                  | <p><b>slot-number</b>—Specify the slot number of the DPC.</p> <p><b>Range:</b> 0 through 11</p> <p><b>pic number</b>—Specify the number of the Packet Forwarding Engine. Each DPC includes four Packet Forwarding Engines.</p> <p><b>Range:</b> 0 through 4</p> <p><b>port-instance-name port-mirroring-instance-name-fpc-level</b>—Associate a port-mirroring instance with the DPC and its corresponding PICs. The port-mirroring instance is configured under the <b>[edit forwarding-options port-mirroring]</b> hierarchy level.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                      |

## group (Dynamic IGMP Interface)

**Syntax** For group configuration with a source, use the following syntax:

```
group ip-address {
 source ip-address;
}
```

For group configuration without a source, use the following syntax:

```
group group;
```

**Hierarchy Level** [edit dynamic-profiles *profile-name* protocols **igmp interface** *interface-name* **static**],

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** When configuring with a source address, configure the IGMP multicast group address that receives data on an interface and a source address for certain packets. For configuration without a source address, configure only the IGMP multicast group address that receives data on an interface.

**Options** *ip-address*—Group IP address.

*group*—Name of group.

**NOTE:** You must specify a unique address for each group.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## group (Dynamic MLD Interface)

---

**Syntax**    `group multicast-group-address {  
              exclude;  
              group-count number;  
              group-increment increment;  
              source ip-address {  
                    source-count number;  
                    source-increment increment;  
              }  
          }`

**Hierarchy Level**    [edit dynamic-profiles *profile-name* protocols [mld interface interface-name static](#)]

**Release Information**    Statement introduced in Junos OS Release 10.1.

**Description**    The MLD multicast group address and (optionally) the source address for the multicast group being dynamically configured on an interface.

**Options**    *multicast-group-address*—Address of the group.

.....  
**NOTE:** You must specify a unique address for each group.  
.....

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

## group (Static Subscribers)

**Syntax**

```
group group-name {
 access-profile profile-name;
 dynamic-profile profile-name {
 aggregate-clients (merge | replace);
 }
 authentication {
 password password-string;
 username-include {
 domain-name domain-name;
 interface;
 logical-system-name;
 routing-instance-name;
 user-prefix user-prefix-string;
 }
 }
 interface interface-name <exclude> <upto upto-interface-name>;
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* system services [static-subscribers](#)],  
[edit logical-systems *logical-system-name* routing-instances *routing-instances-name* system  
services [static-subscribers](#)],  
[edit routing-instances *routing-instances-name* system services [static-subscribers](#)],  
[edit system services [static-subscribers](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure a static subscriber group with values that override the values configured at the [\[edit system services static-subscribers\]](#) hierarchy level for subscribers outside the group. Includes the subscriber access and dynamic profiles, the authentication parameters that trigger the Access-Request message to AAA for static subscribers in the group, and the statically configured interfaces that form the group.

**NOTE:** The logical system and routing instance in which the group is configured must match the logical system and routing instance where the static interfaces are configured.

**Options** *group-name*—Name of a group that defines authentication parameters for static subscribers to override the global authentication configuration.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## group-profile (Group Profile)

---

**Syntax**    `group-profile profile-name {  
                  l2tp {  
                    interface-id interface-id;  
                    lcp-renegotiation;  
                    local-chap;  
                    maximum-sessions-per-tunnel number;  
                  }  
                  ppp {  
                    cell-overhead;  
                    encapsulation-overhead bytes;  
                    framed-pool pool-id;  
                    idle-timeout seconds;  
                    interface-id interface-id;  
                    keepalive seconds;  
                    ppp-options {  
                      chap;  
                      pap;  
                    }  
                    primary-dns primary-dns;  
                    primary-wins primary-wins;  
                    secondary-dns secondary-dns;  
                    secondary-wins secondary-wins;  
                  }  
                }  
              }`

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              (MX Series routers only) The **ppp-options** stanza introduced in Junos OS Release 11.4.

**Description**    Configure the group profile.

Only the **idle-timeout** statement, the **keepalive** statement, and the **ppp-options** stanza are supported for L2TP LNS on MX Series routers.

**Options**    *profile-name*—Name assigned to the group profile.

The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Immediately remove the group membership from the interface and suppresses the sending of any group-specific queries for the multicast group when this statement is enabled on a router running IGMP version 2 (IGMPv2), after the router receives a leave group membership message from a host associated with the interface.</p> <p>Suppress the sending of group-and-source queries but rely on the Junos-supported host tracking mechanism to determine whether or not it should remove a particular source group membership from the interface when this statement is enabled on a router running IGMP version 3 (IGMPv3), after the router receives a report with the type BLOCK_OLD_SOURCES.</p> |
|                                 | <div>  <p><b>NOTE:</b> When issuing this command on IGMPv2 interfaces, ensure that the IGMP interface has only one IGMP host connected. If more than one IGMPv2 host is connected to a LAN through the same interface, and one host sends a done message, the router removes all hosts on the interface from the multicast group. The router loses contact with the hosts that are supposed to remain in the multicast group until they send join requests in response to the next general multicast listener query from the router.</p> </div>                                                                          |

| <b>Description</b>              | <p>When this statement is enabled on a router running MLDv1, after the router receives a multicast listener done message from a host associated with the interface, the router immediately removes the group membership from the interface and suppresses the sending of any group-specific queries for the multicast group.</p> <p>When this statement is enabled on a router running MLDv2, after the router receives a report with the type BLOCK_OLD_SOURCES, the router suppresses the sending of group-and-source queries but relies on the Junos-supported host tracking mechanism to determine whether or not it removes a particular source group membership from the interface.</p> |
|                                 | <div><p><b>NOTE:</b> Use this statement only on MLD interfaces to which one MLD host is connected. If more than one MLD host is connected to a LAN through the same interface, and one host sends a done message, the router removes all hosts on the interface from the multicast group. The router loses contact with the hosts that properly remain in the multicast group until they send join requests in response to the router's next general multicast listener query.</p></div>                                                                                                                     |

| Release Information      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description              | <p>For dynamic VLAN interfaces, specify the VLAN ID to rewrite for the inner tag of the final packet.</p> <p>You cannot include the <b>inner-vlan-id</b> statement with the <b>swap</b> statement, <b>swap-push</b> statement, <b>push-push</b> statement, or <b>push-swap</b> statement and the <b>inner-vlan-id</b> statement at the <code>[edit <b>logical-systems</b> <i>logical-system-name</i> <b>interfaces</b> <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> <b>output-vlan-map</b>]</code> hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the <b>inner-vlan-id</b> statement you include at the <code>[edit <b>interfaces</b> <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i>]</code> hierarchy level.</p> |
| Options                  | <p><b>number</b>—VLAN ID number.</p> <p><b>Range:</b> 0 through 4094</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

 [edit system services dhcp-local-server **group** *group-name*],  
 [edit system services dhcp-local-server **dhcpv6 group** *group-name*]

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Options **upto** and **exclude** introduced in Junos OS Release 9.1.

**Description** Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the **interface** *interface-name* statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP relay agent.

**NOTE:** DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see the [Junos OS MX Series 3D Universal Edge Routers Solutions Guide](#).

**Options** **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

***interface-name***—Name of the interface. You can repeat this option multiple times.

***upto-interface-name***—Upper end of the range of interfaces; the lower end of the range is the *interface-name* entry. The interface device name of the ***upto-interface-name*** must be the same as the device name of the ***interface-name***.

The remaining statements are explained separately.

| <b>Description</b>         | <p>Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the <b>interface <i>interface-name</i></b> statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**NOTE:** DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address

assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see the [Junos OS MX Series 3D Universal Edge Routers Solutions Guide](#).

---

**Options**    **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

**interface-name**—Name of the interface. You can repeat this option multiple times.

**overrides**—Override the specified default configuration settings for the interface. The [overrides](#) statement is described separately.

**upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                      interface-control—To add this statement to the configuration.

## interface (Dynamic Router Advertisement)

**Syntax** interface *interface-name* {  
     *current-hop-limit* *number*;  
     *default-lifetime* *seconds*;  
     (*managed-configuration* | *no-managed-configuration*);  
     *max-advertisement-interval* *seconds*;  
     *min-advertisement-interval* *seconds*;  
     (*other-stateful-configuration* | *no-other-stateful-configuration*);  
     *prefix* *prefix* {  
         (*autonomous* | *no-autonomous*);  
         (*on-link* | *no-on-link*);  
         *preferred-lifetime* *seconds*;  
         *valid-lifetime* *seconds*;  
     }  
     *reachable-time* *milliseconds*;  
     *retransmit-timer* *milliseconds*;  
 }

**Hierarchy Level** [edit dynamic-profiles protocols router-advertisement]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Dynamically configure router advertisement properties on an interface. To dynamically configure interface properties, include the *\$junos-interface-name* dynamic variable for the interface name.

**Options** *interface-name*—Name of an interface. Specify the *\$junos-interface-name* dynamic variable or the full, static interface name, including the physical and logical address components.

**NOTE:** Even though you can specify the static interface name when defining the interface, we recommend using dynamic variable when configuring this statement.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a modified version of the interface name is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message. The interface name is modified by replacing the "/" character with the "-" character. For example, ge-0/1/2.50 is converted to ge-0-1-2.50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>         | Set the maximum number of DHCP subscribers per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Set the maximum number of DHCP (or DHCPv6) subscribers per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | <p>Configure extended DHCP tracing operations that can be enabled on a specific interface or group of interfaces.</p> <p>Replaces deprecated <b>interface-traceoptions</b> statements at the [edit forwarding-options dhcp-relay] and [edit system services dhcp-local-server] hierarchy levels.</p> <p>To enable the tracing operation on the specific interfaces, you use the <b>interface <i>interface-name</i> trace</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events</li> <li>• <b>packet</b>—Trace packet and option decoding operations</li> <li>• <b>state</b>—Trace changes in state</li> </ul> <p><b>level</b>—Level of tracing to perform; also known as severity level. You can specify any of the following levels:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match all levels.</li> <li>• <b>error</b>—Match error conditions.</li> <li>• <b>info</b>—Match informational messages.</li> <li>• <b>notice</b>—Match notice messages about conditions requiring special handling.</li> <li>• <b>verbose</b>—Match verbose messages.</li> </ul> |

- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level**    trace—To view this statement in the configuration.  
                                 trace-control—To add this statement to the configuration.

## interfaces (Subscriber Secure Policy)

---

**Syntax**    interfaces *interface-name*;

**Hierarchy Level**    [edit services [radius-flow-tap](#)]

**Release Information**    Statement introduced in Junos OS Release 9.4.

**Description**    Specify tunnel interfaces that are used to send mirrored packets to a mediation device.

**Options**    *interface-name*—Name of the interface.

**Required Privilege Level**    flow-tap—To view this statement in the configuration.  
                                 flow-tap-control—To add this statement to the configuration.

**Related Documentation**    • [Subscriber Secure Policy Overview on page 913](#)

## interfaces (Dynamic CoS Definition)

```
Syntax interfaces {
 interface-name {
 unit logical-unit-number {
 classifiers {
 dscp (classifier-name | default);
 dscp-ipv6 (classifier-name | default);
 ieee-802.1 (classifier-name | default) vlan-tag (inner | outer)
 inet-precedence (classifier-name | default);
 }
 output-traffic-control-profile profile-name;
 rewrite-rules {
 dscp (rewrite-name | default);
 dscp-ipv6 (rewrite-name | default);
 ieee-802.1 (rewrite-name | default) vlan-tag (outer | outer-and-inner);
 inet-precedence (rewrite-name | default);
 }
 }
 }
 }
```

**Hierarchy Level** [edit [dynamic-profiles profile-name class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure interface-specific CoS properties for incoming packets.

**Options** *interface-name*—Either the specific name of the interface you want to assign to the dynamic profile or the interface variable (\$junos-interface-ifd-name). The interface variable is dynamically replaced with the interface the DHCP client accesses when connecting to the router.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit dynamic-profiles *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Define interfaces for dynamic profiles.

**Options** *interface-name*—The interface variable (\$junos-interface-*ifd-name*). The interface variable is dynamically replaced with the interface the DHCP client accesses when connecting to the router.

**NOTE:** Though we do not recommend it, you can also enter the specific name of the interface you want to assign to the dynamic profile.

The remaining statements are explained separately.

| <b>Description</b>              | Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.                                                   |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:</p> <ul style="list-style-type: none"> <li>Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.</li> <li>Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.</li> </ul> |
| <b>Default</b>                  | The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.                                                                                                                                                                                                                                                                                                                                                                     |

```

Hierarchy Level [edit services]

- Release Information** Statement introduced before Junos OS Release 7.4.  
Support for MX Series routers (LAC) and the **disable-calling-number-avp**, **disable-failover-protocol**, **failover-within-preference**, and **weighted-load-balancing** statements introduced in Junos OS Release 10.4.  
Support for LNS on MX Series routers and the **aaa-access-profile**, **dynamic-profile**, **service-device-pool**, and **tos-reflect** statements introduced in Junos OS Release 11.4.
- Description** Configure L2TP services to establish PPP tunnels across a network.  
  
The remaining statements are explained separately.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

- Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.
- Related Documentation**

---

## **l2tp-access-profile**

---

- Syntax** `l2tp-access-profile profile-name;`
- Hierarchy Level** [edit services l2tp **tunnel-group** *name*]
- Release Information** Statement introduced before Junos OS Release 7.4.  
Support for MX Series routers introduced in Junos OS Release 11.4.
- Description** Specify the profile used to validate all L2TP connection requests to the local gateway address.
- Options** *profile-name*—Identifier for the L2TP connection profile.
- Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>(MX Series routers only) Support at the [edit access profile <i>profile-name</i> client <i>client-name</i> l2tp] hierarchy level for L2TP LNS introduced in Junos OS Release 11.4.                                                                                                                 |
| <b>Description</b>              | Configure the L2TP network server (LNS) so it renegotiates the link control protocol (LCP) with the PPP client. When LCP renegotiation is disabled, LNS uses the pre-negotiated LCP parameters between the L2TP access concentrator (LAC) and PPP client to set up the session. When LCP renegotiation is enabled, authentication is also renegotiated. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Provide module redundancy for demux subscribers on aggregated Ethernet bundles configured with targeted distribution. Backup links for a subscriber are chosen on a different EQ DPC or Trio MPC from the primary link, based on the link with the fewest number of subscribers among the links on different modules. If all links are on a single module when this is configured, backup links are not provisioned.</p> <p>By default, link redundancy is provided for the aggregated Ethernet bundle.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.1.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Specify that the logical system name is concatenated with the username during the subscriber authentication process. No logical system name is concatenated if the configuration is in the default logical system. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that the name of the logical system is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                           |
| <b>Description</b>              | Specify a loss priority to which to apply a drop profile in a dynamic profile. The drop profile map sets the drop profile for a specific PLP and protocol type. The inputs for the map are the PLP designation and the protocol type. The output is the drop profile.                   |
| <b>Options</b>                  | <p><b>any</b>—The drop profile applies to packets with any PLP.</p> <p><b>high</b>—The drop profile applies to packets with high PLP.</p> <p><b>medium</b>—The drop profile applies to packets with medium PLP.</p> <p><b>low</b>—The drop profile applies to packets with low PLP.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                      |

## map (Domain Maps)

**Syntax**

```
map domain-map-name {
 aaa-logical-system logical-system-name {
 aaa-routing-instance routing-instance-name;
 }
 aaa-routing-instance routing-instance-name;
 access-profile profile-name;
 address-pool pool-name;
 dynamic-profile profile-name;
 padn destination-address {
 mask destination-mask;
 metric route-metric;
 }
 strip-domain;
 target-logical-system logical-system-name {
 target-routing-instance routing-instance-name;
 }
 target-routing-instance routing-instance-name;
 tunnel-profile profile-name;
}
```

**Hierarchy Level** [edit access [domain](#)]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Specify the domain map to use to map options and parameters to subscriber sessions based on the subscriber domain.

**Options** *domain-map-name*—Name of the domain map. The name is the same as the subscriber domain to which it will apply. For example, for the username `user1@xyz.com`, the domain map name is `xyz.com`.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.</p> <p>The router uses the <b>max-sessions</b> value for a PPPoE service name table entry in conjunction with the <b>max-sessions</b> value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.</p> |
| <b>Options</b>                  | <p><b><i>number</i></b>—Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.</p> <p>For information about scaling values for PPPoE interfaces, access the <i>Subscriber Management Scaling Values (XLS)</i> spreadsheet from the Downloads box on the <i>Junos OS Subscriber Management</i> pathway page for the current release.</p>                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the <b>max-sessions</b> statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.</p>                                                                                                                                                                                                            |
| <b>Default</b>                  | If you do not include the <b>max-sessions-vsa-ignore</b> statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the <b>max-sessions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## mld (Dynamic Profiles)

---

**Syntax**    mld {  
              interface *interface-name* {  
                  disable;  
                  (accounting | no-accounting);  
                  group-policy;  
                  immediate-leave;  
                  oif-map;  
                  passive;  
                  ssm-map *ssm-map-name*;  
                  static {  
                      group *multicast-group-address* {  
                          exclude;  
                          group-count *number*;  
                          group-increment *increment*;  
                          source *ip-address* {  
                              source-count *number*;  
                              source-increment *increment*;  
                          }  
                      }  
                      }  
                  }  
                  version *version*;  
              }  
          }

**Hierarchy Level**    [edit dynamic-profiles *profile-name* protocols]

**Release Information**    Statement introduced in Junos OS Release 10.1.

**Description**    Configure interface-specific MLD values on dynamic interfaces.

**Options**    The statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**    • Enabling MLD

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Check whether the packet has a source address with a corresponding prefix in the routing table. If a corresponding prefix is not found, unicast reverse path forwarding (RPF) loose mode does not accept the packet. Unlike strict mode, loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. |
| <b>Default</b>                  | If you do not include this statement, unicast RPF is in strict mode.                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                     |

## multicast (Dynamic Routing Options)

**Syntax**    multicast {  
                   interface *interface-name* {  
                     no-qos-adjust;  
                   }  
                 }

**Hierarchy Level**    [edit dynamic-profiles *profile-name* **routing-options**],  
                           [edit dynamic-profiles *profile-name* routing-instances *routing-instance-name* **routing-options**]

**NOTE:** You cannot apply a scope policy to a specific routing instance. That is, all scoping policies are applied to all routing instances. However, the **scope** statement does apply individually to a specific routing instance.

**Release Information**    Statement introduced in Junos OS Release 9.6.

**Description**            Dynamically configure interface-specific multicast routing options properties.  
                               The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                       routing-control—To add this statement to the configuration.

## nas-port-type (Subscriber Management)

**Syntax**    `nas-port-type {  
              ethernet {  
                  port-type;  
              }  
          }`

**Hierarchy Level**    [edit access profile *profile-name* radius [options](#)]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Specify the port type used to authenticate subscribers. The router includes the port type in RADIUS attribute 61 (NAS-Port-Type attribute).

**NOTE:** This statement is ignored if the [ethernet-port-type-virtual](#) statement is included in the same access profile.

**Default**    The router uses a port type of **ethernet**.

**Options**    **port-type**—One of the following port types:

- **value**—A value from 0-65535
- **adsl-cap**—Asymmetric DSL, carrierless amplitude phase (CAP) modulation
- **adsl-dmt**—Asymmetric DSL, discrete multitone (DMT)
- **async**—Asynchronous
- **cable**—Cable
- **ethernet**—Ethernet
- **fddi**—Fiber Distributed Data Interface
- **g3-fax**—G.3 Fax
- **hdlc-clear-channel**—HDLC Clear Channel
- **iapp**—Inter-Access Point Protocol (IAPP)
- **isdl**—ISDN DSL
- **isdn-sync**—ISDN Synchronous
- **isdn-v110**—ISDN Async V.110
- **isdn-v120**—ISDN Async V.120
- **piafs**—Personal Handyphone System (PHS) Internet Access Forum Standard
- **sdsl**—Symmetric DSL
- **sync**—Synchronous

- **token-ring**—Token Ring
- **virtual**—Virtual
- **wireless**—Other wireless
- **wireless-1x-ev**—Wireless 1xEV
- **wireless-cdma2000**—Wireless code division multiple access (CDMA) 2000
- **wireless-ieee80211**—Wireless 802.11
- **wireless-umts**—Wireless universal mobile telecommunications system (UMTS)
- **x25**—X.25
- **x75**—X.75
- **xdsl**—DSL of unknown type

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation** [• Configuring RADIUS Server Options for Subscriber Access on page 34](#)  
[• Configuring RADIUS Server Parameters for Subscriber Access on page 28](#)

## neighbor (Associate with ANCP Access Identifier)

---

**Syntax** **neighbor** *ip-address*;

**Hierarchy Level** [edit protocols ancp interfaces interface-set *interface-set-name* **access-identifier** *identifier-string*],  
[edit protocols ancp interfaces *interface-name* **access-identifier** *identifier-string*]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Configure an ANCP neighbor to be monitored.

**Options** *ip-address*—IP address of the ANCP neighbor.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** [• Configuring ANCP on page 974](#)  
[• Associating an Access Node with Subscribers for ANCP Operations on page 976](#)

Hierarchy Level [edit [diameter](#)]

Release Information Statement introduced in Junos OS Release 9.6.

Description Specify the transport layer Diameter configuration. The Diameter network element includes a list of routes reachable through the Diameter instance, associated functions, and prioritized Diameter peers.

Options ***element-name***—Name of the network element.  
The remaining statements are explained separately.

Required Privilege admin—To view this statement in the configuration.  
Level admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Specify user-defined options that are added to client packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>array</b>—An option can include an array of option types.</p> <p><b>id-number</b>—Any whole number. The ID number is used to index the option and must be unique across a DHCP server.</p> <p><b>option-type</b>—Any of the following types: byte, byte-stream, flag, integer, ip-address, short, string, unsigned-integer, or unsigned-short.</p> <p><b>option-value</b>—Value associated with an option. The option value must be compatible with the option type (for example, an On or Off value for a flag type).</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Specify the option 82 that is concatenated with the username during the subscriber authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Specify a list of match criteria used to determine which named address range in the address-assignment pool to use. The extended DHCP local server matches this information to the match criteria specified in the client PDUs. For example, for option 82 match criteria, the server matches the option 82 value in the user PDU to the specified option 82 string and uses the named range associated with the string.</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.<br>Statement introduced in Junos OS Release 9.1 for EX Series switches.                                                                                                                      |
| <b>Description</b>              | Set the order in which the Junos OS tries different accounting methods for client activity. When a client logs in, the software tries the accounting methods in the specified order.                                                       |
| <b>Options</b>                  | <b><i>accounting-method</i></b> —One or more accounting methods. When a client logs in, the software tries the accounting methods in the following order, from first to last. The only valid value is <b>radius</b> for RADIUS accounting. |

| <b>Description</b>              | <p>Prevent ANCP from performing an adjustment on the actual downstream data rate that ANCP receives from the DSLAM for the difference between the customer premise equipment (CPE) protocol overhead and the B-RAS protocol overhead. You include this statement when you want CoS to perform the adjustment on the data rate from the DSLAM according to the overhead accounting configuration in a CoS traffic control profile.</p> <p>When this statement is not configured (the default condition), ANCP makes the traffic rate adjustment according to the configuration of the <b>qos-adjust-line-type</b> statements and reports that rate to CoS. CoS then applies (if configured) the adjustment set by the <b>overhead-accounting</b> statement in the CoS traffic profile.</p> |
|                                 | <div><p><b>NOTE:</b> ANCP reports a traffic rate to CoS only if the qos-adjust statement at the [edit protocols ancp] hierarchy level has been configured.</p></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## overrides (DHCP Relay Agent)

**Syntax**    overrides {  
               allow-snooped-clients;  
               always-write-giaddr;  
               always-write-option-82;  
               client-discover-match <option60-and-option82>;  
               disable-relay;  
               interface-client-limit *number*;  
               layer2-unicast-replies;  
               no-allow-snooped-clients;  
               no-arp;  
               no-bind-on-request;  
               proxy-mode;  
               replace-ip-source-with;  
               send-release-on-delete;  
               trust-option-82;  
           }

**Hierarchy Level**    [edit forwarding-options *dhcp-relay*],  
                           [edit forwarding-options *dhcp-relay dhcpv6*],  
                           [edit forwarding-options *dhcp-relay group group-name*],  
                           [edit forwarding-options *dhcp-relay group group-name interface interface-name*],  
                           [edit forwarding-options *dhcp-relay dhcpv6 group group-name*],

| <b>Description</b>              | For a two-rate three-color policer, configure the peak burst size (PBS) as a number of bytes. The PBS defines the maximum number of bytes of unused peak bandwidth capacity that can be accumulated. The accumulated bandwidth allows for moderate periods of bursting traffic that exceeds the peak information rate (PIR) and the committed burst size (CBS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                 | <div>  <p><b>NOTE:</b> When you include the <code>peak-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>peak-information-rate</code> statements at the same hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                 | <p>Two-rate three-color policers use a <i>dual-rate dual token bucket algorithm</i> to measure traffic against two rate limits.</p> <ul style="list-style-type: none"> <li>• A traffic flow is categorized green if it conforms to both the committed information rate (CIR) and the CBS-bounded accumulation of available committed bandwidth capacity.</li> <li>• A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</li> <li>• A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</li> </ul> |
| <b>Options</b>                  | <p><b>bytes</b>—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 1500 through 100,000,000,000 bytes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

The PIR is the maximum rate for traffic arriving at or departing from the interface under peak line conditions. Traffic that exceeds the committed information rate (CIR) and the committed burst size (CBS) is metered to the PIR. |
| <div>  <p><b>NOTE:</b> When you include the <code>peak-information-rate</code> statement in the configuration, you must also include the <code>committed-information-rate</code> and <code>peak-burst-size</code> statements at the same hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                   |
| <p>Two-rate three-color policers use a <i>dual-rate dual token bucket algorithm</i> to measure traffic against two rate limits.</p> <ul style="list-style-type: none"> <li>• A traffic flow is categorized green if it conforms to both the CIR and the CBS-bounded accumulation of available committed bandwidth capacity.</li> <li>• A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</li> <li>• A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</li> </ul> |                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Configure an aggregate policer for a physical interface. A physical interface policer applies to all the logical interfaces and protocol families configured on a physical interface. As a result, a single physical interface policer can be applied to multiple routing instances because this policer includes all the logical interfaces configured on the physical interface even if they belong to different routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Configure policer rate limits and actions. When included at the [edit <b>firewall</b>] hierarchy level, the <b>policer</b> statement creates a template, and you do not have to configure a policer individually for every firewall filter or interface. To activate a policer, you must include the <b>policer-action</b> modifier in the <b>then</b> statement in a firewall filter term or on an interface.</p>                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b><i>policer-action</i></b>—One or more actions to take:</p> <ul style="list-style-type: none"> <li>• <b>discard</b>—Discard traffic that exceeds the rate limits.</li> <li>• <b>forwarding-class <i>class-name</i></b>—Specify the particular forwarding class.</li> <li>• <b>loss-priority</b>—Set the packet loss priority (PLP) to <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</li> </ul> <p><b><i>policer-name</i></b>—Name that identifies the policer. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b>then</b>—Actions to take on matching packets.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p><b>firewall</b>—To view this statement in the configuration.<br/> <b>firewall-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
