| <b>Description</b>              | Specify user-defined options that are added to client packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>array</b>—An option can include an array of option types.</p> <p><b>id-number</b>—Any whole number. The ID number is used to index the option and must be unique across a DHCP server.</p> <p><b>option-type</b>—Any of the following types: byte, byte-stream, flag, integer, ip-address, short, string, unsigned-integer, or unsigned-short.</p> <p><b>option-value</b>—Value associated with an option. The option value must be compatible with the option type (for example, an On or Off value for a flag type).</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Specify the option 82 that is concatenated with the username during the subscriber authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Specify a list of match criteria used to determine which named address range in the address-assignment pool to use. The extended DHCP local server matches this information to the match criteria specified in the client PDUs. For example, for option 82 match criteria, the server matches the option 82 value in the user PDU to the specified option 82 string and uses the named range associated with the string.</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Prevent ANCP from performing an adjustment on the actual downstream data rate that ANCP receives from the DSLAM for the difference between the customer premise equipment (CPE) protocol overhead and the B-RAS protocol overhead. You include this statement when you want CoS to perform the adjustment on the data rate from the DSLAM according to the overhead accounting configuration in a CoS traffic control profile.</p> <p>When this statement is not configured (the default condition), ANCP makes the traffic rate adjustment according to the configuration of the <b>qos-adjust-line-type</b> statements and reports that rate to CoS. CoS then applies (if configured) the adjustment set by the <b>overhead-accounting</b> statement in the CoS traffic profile.</p> |
|                                 | <div>  <p><b>NOTE:</b> ANCP reports a traffic rate to CoS only if the qos-adjust statement at the [edit protocols ancp] hierarchy level has been configured.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Override the default configuration settings for the extended DHCP relay agent. Specifying the <b>overrides</b> statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p> <p>The following statements are supported at both the <b>[edit ... dhcp-relay]</b> and <b>[edit ... dhcpv6]</b> hierarchy levels. All other statements are supported at the <b>dhcp-relay</b> hierarchy levels only.</p> <ul style="list-style-type: none"> <li>• <b>allow-snooped-clients</b></li> <li>• <b>interface-client-limit</b></li> <li>• <b>no-allow-snooped-clients</b></li> <li>• <b>no-bind-on-request</b></li> <li>• <b>send-release-on-delete</b></li> </ul> |

The remaining statements are explained separately.

| Release Information      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Specify the password that is sent to AAA for user login for all static subscribers on interfaces configured at the [edit system services static-subscribers interface] hierarchy level, or for the subscribers in a specified group. The group version of the statement takes precedence over the global version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Options                  | <p><b>password-string</b>—String that defines the password.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | For a two-rate three-color policer, configure the peak burst size (PBS) as a number of bytes. The PBS defines the maximum number of bytes of unused peak bandwidth capacity that can be accumulated. The accumulated bandwidth allows for moderate periods of bursting traffic that exceeds the peak information rate (PIR) and the committed burst size (CBS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                 | <div>  <p><b>NOTE:</b> When you include the <code>peak-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>peak-information-rate</code> statements at the same hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                 | <p>Two-rate three-color policers use a <i>dual-rate dual token bucket algorithm</i> to measure traffic against two rate limits.</p> <ul style="list-style-type: none"> <li>• A traffic flow is categorized green if it conforms to both the committed information rate (CIR) and the CBS-bounded accumulation of available committed bandwidth capacity.</li> <li>• A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</li> <li>• A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</li> </ul> |
| <b>Options</b>                  | <p><b>bytes</b>—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 1500 through 100,000,000,000 bytes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | For a two-rate three-color policer, configure the peak information rate (PIR) as a number of bits per second. The PIR is the maximum rate for traffic arriving at or departing from the interface under peak line conditions. Traffic that exceeds the committed information rate (CIR) and the committed burst size (CBS) is metered to the PIR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                 | <div>  <p><b>NOTE:</b> When you include the <code>peak-information-rate</code> statement in the configuration, you must also include the <code>committed-information-rate</code> and <code>peak-burst-size</code> statements at the same hierarchy level.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                                 | <p>Two-rate three-color policers use a <i>dual-rate dual token bucket algorithm</i> to measure traffic against two rate limits.</p> <ul style="list-style-type: none"> <li>• A traffic flow is categorized green if it conforms to both the CIR and the CBS-bounded accumulation of available committed bandwidth capacity.</li> <li>• A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</li> <li>• A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</li> </ul> |
| <b>Options</b>                  | <p><b>bps</b>—Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 32,000 through 40,000,000,000 bps</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | <p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## pic (M Series, MX Series, and T Series Routers)

```
Syntax pic pic-number {
 cel {
 el port-number {
 channel-group group-number timeslots slot-number;
 }
 }
 ct3 {
 port port-number {
 tl link-number {
 channel-group group-number timeslots slot-number;
 }
 }
 }
 framing (sdh | sonet);
 idle-cell format {
 itu-t;
 payload-pattern payload-pattern-byte;
 }
 inline-services {
 bandwidth (1g | 10g);
 }
 max-queues-per-interface (8 | 4);
 no-concatenate;
 }
```

**Hierarchy Level** [edit chassis fpc *slot-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure properties for an individual PIC.

**Options** *pic-number*—Slot number in which the PIC is installed.

**Range:** 0 through 3

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## pool (Address-Assignment Pools)

**Syntax**

```
pool pool-name {
 family family {
 dhcp-attributes {
 [protocol-specific attributes]
 }
 host hostname {
 hardware-address mac-address;
 ip-address ip-address;
 }
 network ip-prefix / <prefix-length>;
 prefix ipv6-prefix;
 range range-name {
 high upper-limit;
 low lower-limit;
 prefix-length prefix-length;
 }
 }
 link pool-name;
}
```

**Hierarchy Level** [edit access [address-assignment](#)]

**Release Information** Statement introduced in Junos OS Release 9.0.

**Description** Configure the name of an address-assignment pool.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *pool-name*—Name assigned to the address-assignment pool.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Hierarchy Level** [edit [dynamic-profiles profile-name interfaces](#)]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Configure the dynamic PPPoE logical interface in a dynamic profile. When the router creates a dynamic PPPoE logical interface on an underlying Ethernet interface configured with PPPoE (**ppp-over-ether**) encapsulation, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

The remaining statements are explained separately.

## ppp-subscriber-services

---

|                            |                                                                                 |
|----------------------------|---------------------------------------------------------------------------------|
| <b>Syntax</b>              | ppp-subscriber-services (disable   enable);                                     |
| <b>Hierarchy Level</b>     | [edit chassis]                                                                  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 10.2.                                  |
| <b>Description</b>         | Enable dynamic PPP subscriber services on non-PPPoE interfaces on certain PICs. |

**NOTE:** When you include this statement, the relevant PICs restart. This action disrupts subscribers already logged in through those PICs. You can confirm completion of the restart by issuing the `show chassis pic fpc-slot slot-number pic-slot slot-number` command.

| <b>Description</b>         | <p>Add a prefix to the base option 82 Agent Circuit ID information in DHCP packets destined for a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name. Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to configure DHCPv6 support.</p> <p>If you include only the hostname, only the logical system name, or only the routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with stacked virtual LANs (S-VLANs) is one of the following:</p> <pre> <i>host-name</i>:(fe   ge)-<i>fpc/pic/port:svlan-id-vlan-id</i> <i>logical-system-name</i>:(fe   ge)-<i>fpc/pic/port:svlan-id-vlan-id</i> <i>routing-instance-name</i>:(fe   ge)-<i>fpc/pic/port:svlan-id-vlan-id</i> </pre> <p>If you include both the logical system name and the routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs is as follows:</p> <pre> <i>logical-system-name;routing-instance-name</i>:(fe   ge)-<i>fpc/pic/port:svlan-id-vlan-id</i> </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

If you include the hostname, logical system name, and routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs is as follows:

```
host-name/logical-system-name;routing-instance-name:(fe |
ge)-fpc/pic/port:svlan-id-vlan-id
```

For Fast Ethernet or Gigabit Ethernet interfaces that use virtual LANs (VLANs) but not S-VLANs, only the **vlan-id** value appears in the Agent Circuit ID format. For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs or S-VLANs, neither the **vlan-id** value nor the **svlan-id** value appears.

**Options** *prefix*—Any combination of the following:

- **host-name**—Prepend the hostname of the router configured with the **host-name** statement at the **[edit system]** hierarchy level to the Agent Circuit ID information.
- **logical-system-name**—Prepend the name of the logical system to the Agent Circuit ID information.
- **routing-instance-name**—Prepend the name of the routing instance to the Agent Circuit ID information.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit dynamic-profiles *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.  
Support at the [edit dynamic-profiles *profile-name* protocols mld] and [edit dynamic-profiles *profile-name* protocols router-advertisement] hierarchy levels introduced in Junos OS Release 10.1.

**Description** Enable IGMP on the router. IGMP must be enabled for the router to receive multicast packets.

**Default** IGMP is disabled on the router. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).

The statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Enable DHCP relay proxy mode on the extended DHCP relay. Proxy mode supports all extended DHCP relay functionality.</p> <p>The extended DHCP relay proxy is not supported for the J Series routers DHCP server. Also, you cannot configure both the DHCP relay proxy and the extended DHCP local server on the same interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | For dynamic VLAN interfaces, specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag. If you include the <b>push</b> statement in the configuration, you must also include the pop statement at the [edit <a href="#">dynamic-profiles</a> <i>profile-name</i> <a href="#">interfaces</a> <i>interface-name</i> <a href="#">unit</a> <i>logical-unit-number</i> <a href="#">output-vlan-map</a> ] hierarchy level. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | The client is deleted when a RADIUS-initiated disconnect is received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | Rapid commit support is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Description              | <p>Configure the extended DHCP relay agent to use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers, or to drop selected DHCP client packets. This feature is useful in network environments where DHCP clients access services provided by multiple vendors and DHCP servers.</p> <p>You can use the <b>relay-option-60</b> statement and its subordinate statements at the <b>[edit forwarding-options dhcp-relay]</b> hierarchy level to configure option 60 support globally, or at the <b>[edit forwarding-options dhcp-relay group <i>group-name</i>]</b> hierarchy level to configure option 60 support for a named group of interfaces. You can also configure option 60 support for the extended DHCP relay agent on a per logical system and per routing instance basis.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.<br/>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Release Information      | Statement introduced in Junos OS Release 8.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description              | <p>Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.</p> <p>If you enable insertion of option 82 information in DHCP packets, you must specify at least the <b>circuit-id</b> statement to include the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option.</p> <p>You can use the <b>relay-option-82</b> statement and its subordinate statements at the [edit forwarding-options <a href="#">dhcp-relay</a>] hierarchy level to control insertion of option 82 information globally, or at the [edit forwarding-options dhcp-relay <a href="#">group group-name</a>] hierarchy level to control insertion of option 82 information for a named group of interfaces.</p> <p>To restore the default behavior (option 82 information is not inserted into DHCP packets), use the <b>delete relay-option-82</b> statement.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Relay DHCP client packets to the specified group of extended DHCP relay servers when you use the DHCP vendor class identifier option (option 60) in DHCP packets to forward client traffic to specific DHCP servers.</p> <p>If the option 60 string received in the DHCP client packet matches the ASCII or hexadecimal match string and match criteria (exact match or partial match) that you specify, the extended DHCP relay agent relays the client packets to the specified group of servers configured with the <b>server-group</b> statement at the [edit forwarding-options dhcp-relay] hierarchy level. A server group can contain multiple server addresses and can map to more than one ASCII or hexadecimal match string.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | Configure the replay protection method. The Identification field enables the home agent to verify that a registration message has been recently generated by the mobile node, rather than replayed by an attacker from a previous registration. You can specify a timestamp tolerance for the mobile node, which causes the request to be rejected if the tolerance is exceeded, or you can specify that the tolerance be taken from the value configured on the home agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>                  | If you do not configure the replay protection method, then the timestamp tolerance is taken from the home agent by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                  |
| <b>Description</b>              | (M120, M320, and MX Series routers) Configure the number of requests the router can send per second to all configured RADIUS servers collectively. By limiting the flow of requests from the router to the RADIUS servers, you can prevent the RADIUS servers from being flooded with requests. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Use in conjunction with the <b>dynamic-profile</b> statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>routing-instance</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>routing-instance</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>routing-instance-name</i></b> —Name of the routing instance in which the router instantiates the dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.1.</p> <p>Support at the [edit ... <a href="#">dhcpv6</a>] hierarchy levels introduced in Junos OS Release 11.4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Specify that the routing instance name is concatenated with the username during the subscriber authentication process. No routing instance name is concatenated if the configuration is in the default routing instance. Use the statement at the [edit ... <a href="#">dhcpv6</a> ] hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## routing-instances

---

**Syntax** `routing-instances routing-instance-name {  
    interface interface-name;  
}`

**Hierarchy Level** [edit **dynamic-profiles**],

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Dynamically configure an additional routing entity for a router.

**Options** *routing-instance-name*—The routing instance variable (\$junos-routing-instance). The routing instance variable is dynamically replaced with the routing instance the accessing client uses when connecting to the router.

The remaining statement is explained separately.

**NOTE:** Though we do not recommend it, you can also enter a specific name for the routing instance, a maximum of 31 characters.

The **interface** statement is described separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- Configuring a Dynamic Profile for use by a Retailer in the DHCPv4 Solution

## routing-options (Dynamic Profiles)

---

**Syntax**

```
routing-options {
 access {
 route prefix {
 next-hop next-hop;
 metric route-cost;
 preference route-distance;
 tag route-tag;
 }
 }
 access-internal {
 route subscriber-ip-address {
 qualified-next-hop underlying-interface {
 mac-address address;
 }
 }
 }
 multicast {
 interface interface-name {
 no-qos-adjust;
 }
 }
}
```

**Hierarchy Level** [edit [dynamic-profiles profile-name](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure protocol-independent routing properties in a dynamic profile.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## rule

---

**Syntax**     `rule rule-name {  
                  match-direction (input | output | input-output);  
                  term term-name {  
                    from {  
                      application [junos-http, junos-https, junos-httpproxy];  
                      destination-address address <except>;  
                      destination-prefix-list list-name <except>;  
                    }  
                    then {  
                      accept;  
                      rewrite {  
                        destination-address address;  
                        destination-port port;  
                      }  
                      syslog;  
                    }  
                  }  
                }`

**Hierarchy Level**     [edit services [captive-portal-content-delivery](#)]

**Release Information**     Statement introduced in Junos OS Release 10.4.

**Description**     Specify the rule the router uses when applying this service.

**Options**     *rule-name*—Identifier for the collection of terms that constitute this rule.  
  
                  The remaining statements are explained separately.

**Required Privilege Level**     services—To view this statement in the configuration.  
                                  services—control—To add this statement to the configuration.

| <b>Description</b>              | Send a release message to the DHCP (or DHCPv6) server whenever DHCP relay or relay proxy deletes a client. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | Define the filter to be applied to traffic before it is accepted for service processing. Configuration of a service filter is optional; if you include the <b>service-set</b> statement without a <b>service-filter</b> definition, the router software assumes that the match condition is true and selects the service set for processing automatically. Only the Internet Protocol version 4 (IPv4) protocol family is currently supported for dynamic PPPoE logical interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.5.</p> <p>Support at the [edit <i>dynamic-profiles profile-name interfaces pp0 unit "\$junos-interface-unit" family family service input</i>] and [edit <i>dynamic-profiles profile-name interfaces pp0 unit "\$junos-interface-unit" family family service output</i>] hierarchy levels introduced in Junos OS Release 10.1.</p>                                                                                                                                                  |
| <b>Description</b>              | <p>Define one or more service sets in a dynamic profile. Service sets are applied to an interface. If you define multiple service sets, the router software evaluates the filters in the order in which they appear in the configuration. Only the Internet Protocol version 4 (IPv4) protocol family is currently supported for dynamic PPPoE logical interfaces.</p>                                                                                                                                                           |

| <b>Description</b>              | Configure a shaping rate for a logical interface or a scheduler. The sum of the shaping rates for all logical interfaces on the physical interface can exceed the physical interface bandwidth. This practice is known as oversubscription of the peak information rate (PIR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>rate</b>—Peak rate in bits per second (bps). You can specify the value as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).<br/> <b>Range:</b> 1000 through 160,000,000,000 bps</p> <p><b>predefined-variable</b>—One of the following Junos predefined variables. The variable is replaced with a value obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.</p> <ul style="list-style-type: none"> <li><b>\$junos-cos-shaping-rate</b>—Variable for the shaping rate that is specified for the logical interface. Use this variable at the [edit <a href="#">dynamic-profiles profile-name class-of-service traffic-control-profiles profile-name</a>] hierarchy level.</li> <li><b>\$junos-cos-scheduler-shaping-rate</b>—Variable for the shaping rate that is specified for a scheduler. Use this variable at the [edit <a href="#">dynamic-profiles profile-name class-of-service schedulers scheduler-name</a>] hierarchy level.</li> </ul> <p><b>burst-size bytes</b>—(Optional) Maximum burst size, in bytes.<br/> <b>Range:</b> 0 through 1,000,000,000</p> <p><b>\$junos-cos-shaping-rate-burst</b>—(Optional) Variable for the burst-size that is specified for the shaping rate. Use this variable at the [edit <a href="#">dynamic-profiles profile-name class-of-service traffic-control-profile</a>] hierarchy level.</p> |

| <b>Description</b>              | Configure the router to temporarily prevent (lock out) a failed or short-lived (also known as short-cycle) PPPoE subscriber session from reconnecting for a default or configurable period of time. You can optionally override the default lockout time, 1 through 300 seconds (5 minutes), by specifying the minimum lockout time and maximum lockout time as part of the <b>short-cycle-protection</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>lockout-time-min <i>minimum-seconds</i></b>—(Optional) Minimum lockout time for failed or short-lived PPPoE subscriber sessions. The <i>minimum-seconds</i> value must be less than or equal to the <i>maximum-seconds</i> value. Setting <i>minimum-seconds</i> and <i>maximum-seconds</i> to the same value causes the lockout time to become fixed at that value.</p> <p><b>Range:</b> 1 through 86400 (24 hours)</p> <p><b>Default:</b> 1</p> <p><b>lockout-time-max <i>maximum-seconds</i></b>—(Optional) Maximum lockout time for failed or short-lived PPPoE subscriber sessions. The <i>maximum-seconds</i> value must be equal to or greater than the <i>minimum-seconds</i> value. Setting <i>maximum-seconds</i> and <i>minimum-seconds</i> to the same value causes the lockout time to become fixed at that value.</p> <p><b>Range:</b> 1 through 86400 (24 hours)</p> <p><b>Default:</b> 300 (5 minutes)</p>                                                 |

| Description              | <p>Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>                  | Accept solicit messages from clients that do not support reconfiguration and permit them to bind.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Configure the subscriber identification to be used in a PTSP partition. You can configure the subscriber identification only in a RADIUS partition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b><i>subscriber-identification</i></b>—String of user-defined characters or a RADIUS attribute type that is supported by the PTSP application. To enable subscriber identification for the specified RADIUS attribute, you may configure the following RADIUS attributes:</p> <ul style="list-style-type: none"> <li>• <code>\$attribute-1\$</code>—User-Name</li> <li>• <code>\$attribute-4\$</code>—NAS-IP-Address</li> <li>• <code>\$attribute-5\$</code>—NAS-Port</li> <li>• <code>\$attribute-8\$</code>—Framed-IP-Address</li> <li>• <code>\$attribute-32\$</code>—NAS-Identifier</li> <li>• <code>\$attribute-87\$</code>—NAS-Port-ID</li> </ul> <p>When configuring subscriber identification, you must precede the "\$" with a slash (\) to enable the CLI interface to process and store the variable correctly.</p> |
|                                 | <div>  <p><b>NOTE:</b> The IP address is formatted in dotted decimal notation—for example, 192.168.1.1. All the other numeric values are converted to a string of characters.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Define terms for fast update filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>action</b>—(Optional) An action to take if conditions match. If you do not specify an action, the packets that match the conditions in the <b>from</b> statement are accepted.</p> <p><b>action-modifiers</b>—(Optional) One or more actions to perform on a packet.</p> <p><b>from</b>—(Optional) Match packet fields to values. If not included, all packets are considered to match and the actions and action modifiers in the <b>then</b> statement are taken.</p> <p><b>match-conditions</b>—One or more conditions to make a match.</p> <p><b>only-at-create</b>—(Optional) Specify that the term is added only when the fast update filter is first created. No subsequent changes can be made to the term in the filter. Use this option only for terms that do not include subscriber-specific data in their match conditions, such as common or default terms (for example, counting the default drop packets).</p> <p><b>term-name</b>—Name that identifies the term. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b>then</b>—(Optional) Actions to take on matching packets. If not included and a packet matches all the conditions in the <b>from</b> statement, the packet is accepted.</p> |

## term (Captive Portal Content Delivery)

**Syntax**

```
term term-name {
 from {
 application [application-name];
 destination-address address <except>;
 destination-prefix-list list-name <except>;
 }
 then {
 action;
 action-modifiers;
 }
}
```

**Hierarchy Level** [edit [services](#) captive-portal-content-delivery [rule](#) *rule-name*]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Define the captive-portal-content-delivery term properties.

**Options** *term-name*—Identifier for the term.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, <i>Authentication for DHCP Messages</i>, section 4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure the LNS to reflect the IP ToS value in the inner IP header to the outer IP header. When CoS rewrite rules are also configured ([ <b>edit class-of-service interfaces</b> <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> <b>rewrite-rules</b> ]), the rewrite is performed only on the inner IP ToS; the outer IP TOS value is not affected. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                             |

| <b>Description</b>         | Configure tracing options for the general authentication service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>address-assignment</b>—Trace address-assignment pool events</li><li>• <b>all</b>—Trace all tracing operations</li><li>• <b>configuration</b>—Trace configuration events</li><li>• <b>framework</b>—Trace authentication framework events</li><li>• <b>gx-plus</b>—Trace Gx-Plus events</li><li>• <b>jsrc</b>—Trace JSRC events</li><li>• <b>ldap</b>—Trace LDAP authentication events</li><li>• <b>local-authentication</b>—Trace local authentication events</li><li>• <b>radius</b>—Trace RADIUS authentication events</li></ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to</p> |

indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Required Privilege</b> | trace—To view this statement in the configuration.        |
| <b>Level</b>              | trace-control—To add this statement to the configuration. |

| <b>Description</b>         | Define tracing operations for ANCP processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. Include the <b>disable</b> option after a flag to disable tracing for that flag. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li><li>• <b>config</b>—Trace configuration events.</li><li>• <b>cos</b>—Trace class-of-service events.</li><li>• <b>general</b>—Trace general flow.</li><li>• <b>packet</b>—Trace ANCP packet transmit and receive operations.</li><li>• <b>process</b>—Trace process internals.</li><li>• <b>protocol</b>—Trace protocol events.</li><li>• <b>restart</b>—Trace process restart flow</li><li>• <b>routing-socket</b>—Trace routing socket events.</li><li>• <b>session</b>—Trace connection events and flow.</li><li>• <b>startup</b>—Trace ANCP startup events and flow.</li><li>• <b>subscriber</b>—Trace subscriber events.</li><li>• <b>timer</b>—Trace timer processing.</li></ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> |

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## traceoptions (Captive Portal Content Delivery)

---

**Syntax** traceoptions {  
    file *filename* <files *number*> <match *regular-expression*> <size *size*> <world-readable |  
        no-world-readable>;  
    flag configuration;  
    flag general;  
    flag gres;  
    flag rtsock;  
    flag statistics;  
    flag "all";  
    no-remote-trace;  
}

**Hierarchy Level** [edit [servicescaptive-portal-content-delivery](#)]

**Release Information** Statement introduced in Junos OS Release 10.4.  
Support at the [edit [services captive-portal-content-delivery](#)] hierarchy level introduced in Junos OS Release 10.4.

**Description** Define tracing operations for captive-portal-content-delivery processes.

**Options** file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. Ensure that filenames are unique for each logical system or routing instance in which Mobile IP is configured.

**NOTE:** Global messages (common to all logical systems and routing instances) are always saved in **/var/log/mipd**. Messages that are specific to a logical system or routing instance are never saved in **/var/log/mipd**. If you do not configure a trace filename for a logical system or routing instance, then nothing is traced for that entity.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace home agent state machine operations.
- **general**—Trace general operations.
- **gres**—Trace graceful routing switchover operations.
- **rtsock**—Trace routing socket operations.
- **statistics**—Trace statistics operations.

**Required Privilege Level**    trace—To view this statement in the configuration.  
                                      trace-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>     | [edit system processes dhcp-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | <p>Define global tracing operations for extended DHCP local server and extended DHCP relay agent processes.</p> <p>Replaces deprecated <b>traceoptions</b> statements at the [edit forwarding-options dhcp-relay] and [edit system services dhcp-local-server] hierarchy levels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all events.</li><li>• <b>auth</b>—Trace authentication events.</li><li>• <b>database</b>—Trace database events.</li><li>• <b>fwd</b>—Trace firewall process events.</li><li>• <b>general</b>—Trace miscellaneous events.</li><li>• <b>ha</b>—Trace high availability-related events.</li><li>• <b>interface</b>—Trace interface operations.</li><li>• <b>io</b>—Trace I/O operations.</li><li>• <b>packet</b>—Trace packet and option decoding operations.</li><li>• <b>performance</b>—Trace performance measurement operations.</li><li>• <b>profile</b>—Trace profile operations.</li><li>• <b>rpd</b>—Trace routing protocol process events.</li></ul> |

- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database events.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

**level**—Level of tracing to perform; also known as severity level. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access, allowing only the user **root** and users who have the Junos OS **maintenance** permission to access the trace files.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Required Privilege</b> | trace—To view this statement in the configuration.        |
| <b>Level</b>              | trace-control—To add this statement to the configuration. |

|                              |                                                                |

| <b>Hierarchy Level</b>     | [edit system processes diameter-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Define tracing options for Diameter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations</li><li>• <b>application</b>—Trace Diameter application interface events</li><li>• <b>configuration</b>—Trace configuration events</li><li>• <b>daemon</b>—Trace Diameter daemon level events</li><li>• <b>diameter-instance</b>—Trace Diameter instance events</li><li>• <b>dne</b>—Trace Diameter network element events</li><li>• <b>framework</b>—Trace Diameter framework events</li><li>• <b>memory-management</b>—Trace memory management events</li><li>• <b>messages</b>—Trace Diameter messages</li><li>• <b>node</b>—Trace Diameter node events</li><li>• <b>peer</b>—Trace Diameter peer events</li></ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Match all levels.</li><li>• <b>error</b>—Match error conditions.</li></ul> |

- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## traceoptions (L2TP)

---

**Syntax**    `traceoptions {  
          debug-level level;  
          file filename <files number> <match regular-expression > <size maximum-file-size>  
                  <world-readable | no-world-readable>;  
          filter {  
            protocol name;  
            user-name username;  
          }  
          flag flag;  
          interfaces interface-name {  
            debug-level level;  
            flag flag;  
          }  
          level (all | error | info | notice | verbose | warning);  
          no-remote-trace;  
          }`

**Hierarchy Level**    [edit services [l2tp](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Define tracing operations for L2TP processes.

**Options**    **debug-level *level***—Trace level for PPP, L2TP, RADIUS, and UDP; this option does not apply to L2TP on MX Series routers:

- **detail**—Trace detailed debug information.
- **error**—Trace error information.
- **packet-dump**—Trace packet decoding information.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

**files *number***—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**filter protocol *name***—Additional filter for the specified protocol; this option does not apply to L2TP on MX Series routers:

- **l2tp**
- **ppp**
- **radius**
- **udp**

**filter user-name** *username*—Additional filter for the specified username; this option does not apply to L2TP on MX Series routers.

**flag** *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace configuration events.
- **events**—Trace interface events.
- **general**—Trace general events.
- **gres**—Trace GRES events.
- **init**—Trace daemon initialization.
- **ipc-rx**—Trace IPC receive events.
- **ipc-tx**—Trace IPC transmit events.
- **memory**—Trace memory management code.
- **message**—Trace message processing code.
- **packet-error**—Trace packet error events.
- **parse**—Trace parsing events.
- **protocol**—Trace L2TP events.
- **receive-packets**—Trace received L2TP packets.
- **routing-process**—Trace routing process interactions.
- **routing-socket**—Trace routing socket events.
- **session-db**—Trace session database interactions.
- **states**—Trace state machine events.
- **timer**—Trace timer events.
- **transmit-packets**—Trace transmitted L2TP packets.
- **tunnel**—Trace tunnel events.

**interfaces *interface-name***—Apply L2TP traceoptions to a specific services interface. This option does not apply to L2TP on MX Series routers.

- **debug-level *level***—Trace level for the interface; this option does not apply to L2TP on MX Series routers:
  - **detail**—Trace detailed debug information.
  - **error**—Trace error information.
  - **extensive**—Trace all PIC debug information.
- **flag *flag***—Tracing operation to perform for the interface. This option does not apply to L2TP on MX Series routers. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:
  - **all**—Trace everything.
  - **ipc**—Trace L2TP Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
  - **packet-dump**—Dump each packet content based on debug level.
  - **protocol**—Trace L2TP, PPP, and multilink handling.
  - **system**—Trace packet processing on the PIC.

**level**—Specify level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

|                              |                                                                                                                                                               |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege</b>    | trace—To view this statement in the configuration.                                                                                                            |
| <b>Level</b>                 | trace-control—To add this statement to the configuration.                                                                                                     |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.3.<br>Support at the <code>[edit logical-systems <i>logical-system-name</i> ...]</code> , <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instances-name</i> ...]</code> , and <code>[edit routing-instances <i>routing-instances-name</i> ...]</code> hierarchy levels introduced in Junos OS Release 9.5. |
| <b>Description</b>         | Define tracing operations for Mobile IP processes.                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <b>file <i>filename</i></b> — Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code> . Ensure that filenames are unique for each logical system or routing instance in which Mobile IP is configured.                                                                       |

**NOTE:** Global messages (common to all logical systems and routing instances) are always saved in `/var/log/mipd`. Messages that are specific to a logical system or routing instance are never saved in `/var/log/mipd`. If you do not configure a trace filename for a logical system or routing instance, then nothing is traced for that entity.

**files *number***—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **authentication**—Trace authentication operations.
- **binding**—Trace bindings.

- **event**—Trace events.
- **ha-fsm**—Trace home agent state machine operations.
- **home-agent**—Trace home agent operations.
- **interface-database**—Trace interface database operations.
- **packet**—Trace packet decoding operations.
- **protocol**—Trace protocol operations.
- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database events.
- **signal**—Trace signal operations.
- **subscriber**—Trace subscriber events.
- **timer**—Trace timer events.
- **trace**—Trace changes in tracing.
- **tunnel**—Trace tunneling operations.
- **user-interface**—Trace user interface events.

**level**—Specify level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **size***k* to specify KB, **size***m* to specify MB, or **size***g* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Description</b>         | Define tracing operations for PTSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>peer</b>—Trace SRC peer events.</li> <li>• <b>pic</b>—Trace PIC events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>session</b>—Trace session events.</li> </ul> <p><b>disable</b>—Disable this trace flag.</p> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> |

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Define tracing operations for static subscriber processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>authentication</b>—Trace authentication events.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>gres</b>—Trace GRES events.</li> <li>• <b>profile</b>—Trace dynamic profile events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>statistics</b>—Trace statistics events.</li> <li>• <b>subscriber</b>—Trace subscriber events.</li> </ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match all levels.</li> </ul> |

- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                                 |                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | trace—To view this statement in the configuration.                                                                 |
|                                 | trace-control—To add this statement to the configuration.                                                          |

| <b>Description</b>         | Define tracing operations for subscriber management interface processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>issu</b>—Trace unified ISSU events.</li> <li>• <b>server</b>—Trace server events.</li> <li>• <b>session-db</b>—Trace session database interactions.</li> <li>• <b>ui</b>—Trace user interface events.</li> </ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> <p><b>Syntax:</b> <b>sizek</b> to specify KB, <b>sizem</b> to specify MB, or <b>sizeg</b> to specify GB</p> <p><b>Range:</b> 10240 through 1073741824</p> <p><b>Default:</b> 128 KB</p> |

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege** trace—To view this statement in the configuration.  
**Level** trace-control—To add this statement to the configuration.

| <b>Description</b>         | Define tracing operations for subscriber management session database replication processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>mirror</b>—Trace mirroring events.</li> <li>• <b>replication</b>—Trace database replication events.</li> <li>• <b>server</b>—Trace server events.</li> <li>• <b>session-db</b>—Trace session database interactions.</li> <li>• <b>ui</b>—Trace user interface events.</li> </ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to</p> |

indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

## traffic-control-profiles (Dynamic CoS Definition)

---

**Syntax** `traffic-control-profiles profile-name {  
    adjust-minimum rate;  
    delay-buffer-rate (percent percentage | rate);  
    excess-rate (percent percentage | proportion value | percent $junos-cos-excess-rate);  
    excess-rate-high (percent percentage | proportion value);  
    excess-rate-low (percent percentage | proportion value);  
    guaranteed-rate (percent percentage | rate) <burst-size bytes>;  
    overhead-accounting (frame-mode | cell-mode) <bytes byte-value>;  
    scheduler-map map-name;  
    shaping-rate (percent percentage | rate | predefined-variable) <burst-size bytes>;  
}`

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name* [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure traffic shaping and scheduling profiles.

**Options** *profile-name*—Name of the traffic-control profile.  
  
The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | Specify the transmit rate or percentage for a scheduler in a dynamic profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 5, 0, 0, 0, and 0 percent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>rate</b>—Transmission rate, in bps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).<br/><b>Range:</b> 3200 through 160,000,000,000 bps</p> <p><b>percent <i>percentage</i></b>—Percentage of transmission capacity. A percentage of zero drops all packets in the queue.<br/><b>Range:</b> 0 through 100 percent</p> <p><b>remainder</b>—Use remaining rate available.</p> <p><b>\$junos-cos-scheduler-tx</b>—Junos predefined variable that is replaced with the transmission rate obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.</p> <p><b>exact</b>—(Optional) Enforce the exact transmission rate. Under sustained congestion, a rate-controlled queue that goes into negative credit fills up and eventually drops packets. Make sure this value never exceeds the rate-controlled amount.</p> <p><b>rate-limit</b>—(Optional) Limit the transmission rate to the rate-controlled amount during congestion. In contrast to the <b>exact</b> option, when there is no congestion, the scheduler with the <b>rate-limit</b> option shares unused bandwidth above the rate-controlled amount.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Enable processing of DHCP client packets that have a gateway IP address (giaddr) of 0 (zero) and contain option 82 information. By default, the DHCP relay agent treats such packets as if they originated at an untrusted source, and drops them without further processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## tunnel-group

---

**Syntax**    `tunnel-group group-name {  
          aaa-access-profile profile-name;  
          dynamic-profile profile-name;  
          hello-interval seconds;  
          hide-avps;  
          l2tp-access-profile profile-name;  
          local-gateway address address;  
          maximum-send-window packets;  
          ppp-access-profile profile-name;  
          receive-window packets;  
          retransmit-interval seconds;  
          service-device-pool pool-name;  
          service-interface interface-name;  
          syslog {  
              host hostname {  
                  services severity-level;  
                  facility-override facility-name;  
                  log-prefix prefix-value;  
              }  
          }  
          tos-reflect;  
          tunnel-timeout seconds;  
          }`

**Hierarchy Level**    [edit services [l2tp](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Specify the L2TP tunnel properties.

.....  
**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.  
.....

**Options**    *group-name*—Identifier for the tunnel group.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure a two-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), peak information rate (PIR), and peak burst size (PBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the PIR or the PBS are assigned medium-high loss priority (yellow). Packets that exceed the PIR and the PBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Specify the method that determines the connection speed values speed sent from the LAC to the LNS in Incoming-Call-Connected (ICCN) messages. The transmit connect speed is sent in (Tx) Connect Speed BPS AVP 24 and the receive speed is sent in Rx Connect Speed AVP 38.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | advisory                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>advisory</b>—Speeds are derived from the recommended (advisory) shaping rate configured on the PPPoE logical interface underlying the subscriber interface. AVP 24 is the downstream rate. AVP 38 is the upstream rate and is sent only when the recommended upstream rate differs from the downstream rate. If the advisory speed is not configured on the underlying interface, then the speed is set to 1 Gbps and sent in both AVP 24 and AVP 38.</p> <p><b>dsl-forum</b>—Speeds are derived from the DSL Forum PPPoE IA tags. AVP 24 is the value of Actual-Data-Rate-Downstream (VSA 26-129). AVP 38 is the value of Actual-Data-Rate-Upstream (26-130), and is sent only when the VSA values differ.</p> |

## unit (Dynamic Demux Interface)

**Syntax**

```

unit logical-unit-number {
 demux-options {
 underlying-interface interface-name
 }
 family family {
 access-concentrator name;
 address address;
 demux-source {
 source-address;
 }
 duplicate-protection;
 dynamic-profile profile-name;
 filter {
 input filter-name;
 output filter-name;
 }
 mac-validate (loose | strict):
 max-sessions number;
 max-sessions-vsa-ignore;
 service-name-table table-name
 short-cycle-protection <lockout-time-min minimum-seconds lockout-time-max
 maximum-seconds>;
 unnumbered-address interface-name <preferred-source-address address>;
 }
 filter {
 input filter-name;
 output filter-name;
 }
}
vlan-id number;

```

**Hierarchy Level** [edit **dynamic-profiles** *profile-name* **interfaces** **demux0**]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Configure a dynamic logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** **logical-unit-number**—Either the specific unit number of the interface or the unit number variable (**\$junos-interface-unit**). The variable is used to specify the unit of the interface when a new demux interface is dynamically created. The static unit number variable is dynamically replaced with the unit number that DHCP supplies when the subscriber logs in.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | In a dynamic profile, configure a logical unit number for the dynamic PPPoE logical interface. You must configure a logical interface to be able to use the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <b>logical-unit-number</b> —Variable used to specify the unit number when the PPPoE logical interface is dynamically created. In the <b>unit logical-unit-number</b> statement for dynamic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

PPPoE logical interfaces, you must use the predefined variable **\$junos-interface-unit** in place of *logical-unit-number*. The **\$junos-interface-unit** predefined variable is dynamically replaced with the unit number supplied by the router when the subscriber logs in.

The remaining statements are explained separately.

**Hierarchy Level** [edit **dynamic-profiles** *profile-name* **interfaces** *interface-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** ***logical-unit-number***—Either the specific unit number of the interface you want to assign to the dynamic profile or the static unit number variable (***\$junos-underlying-interface-unit***). The static unit number variable is dynamically replaced with the client unit number when the client session begins. The client unit number is specified by the DHCP client when it accesses the subscriber network.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## unnumbered-address (Dynamic Profiles)

---

| Description              | <p>For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the <b>\$junos-loopback-interface-address</b> predefined variable.</p> <p>You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Options                  | <p><b>interface-name</b>—Name of the interface from which the local address is derived. Use the <b>\$junos-loopback-interface</b> dynamic variable to dynamically apply a loopback interface. The loopback interface used is based on the routing instance of the subscriber. The specified interface must have a logical unit number and a configured IP address, and must not be an unnumbered interface.</p> <p><b>preferred-source-address address</b>—Secondary IP address of the donor loopback interface. Use the <b>\$junos-preferred-source-address</b> dynamic variable to dynamically apply a preferred source address to the unnumbered Ethernet interface. When you use the dynamic variable, the address that is selected resides in the same network as the IP address of the subscriber. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.</p> <p>Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## user-group-profile

---

- Syntax** `user-group-profile profile-name;`
- Hierarchy Level** `[edit access profile profile-name]`
- Release Information** Statement introduced before Junos OS Release 7.4.
- Description** Apply a configured PPP group profile to PPP users.
- Options** *profile-name*—Name of a PPP group profile configured at the `[edit access group-profile profile-name]` hierarchy level.
- Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a string is included as the beginning of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <b><i>user-prefix-string</i></b> —String that begins the username. The string can include the following characters: a through z, A through Z, 0 through 9, "-", or ".".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

                              forwarding-options dhcp-relay ...],  
                          [edit routing-instances *routing-instance-name* forwarding-options dhcp-relay ...]

**Release Information**    Statement introduced in Junos OS Release 9.1.  
                              Support at the [\[edit ... dhcpv6\]](#) hierarchy levels introduced in Junos OS Release 11.4.

**Description**    Configure the username that the router passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router accesses the local authentication service only and does not use external authentication services, such as RADIUS. Use the statement at the [\[edit...dhcpv6\]](#) hierarchy levels to configure DHCPv6 support.

The following statements are not supported in the DHCPv6 hierarchy levels:

- **mac-address**
- **option-60**
- **option-82**

The following statements are supported in the DHCPv6 hierarchy levels only:

- **relay-agent-interface-id**
- **relay-agent-remote-id**
- **relay-agent-subscriber-id**

The remaining statements are explained separately.

| <b>Description</b>         | <p>Configure the match criteria when you use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers. The extended DHCP relay agent compares the option 60 vendor-specific strings received in DHCP client packets against the match criteria that you specify. If there is a match, you can define certain actions for the associated DHCP client packets.</p> <p>The <b>vendor-option</b> statement enables you to specify either an exact, left-to-right match (with the <b>equals</b> statement) or a partial match (with the <b>starts-with</b> statement), and configure either an ASCII match string (with the <b>ascii</b> statement) or a hexadecimal match string (with the <b>hexadecimal</b> statement).</p> <p>You can configure an unlimited number of match strings. Match strings do not support the use of wildcard attributes.</p>                                                                       |
| <b>Options</b>             | <p><b>equals</b>—Use exact, left-to-right match of the ASCII or hexadecimal match string with the option 60 string.</p> <p><b>starts-with</b>—Use partial match of the ASCII or hexadecimal match string with the option 60 string. The option 60 string can contain a superset of the ASCII or hexadecimal match string, provided that the leftmost characters of the option 60 string entirely match the characters in the configured match string. When you use</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

the **starts-with** statement, the longest match rule applies; that is, the router matches the string "test123" before it matches the string "test".

**ascii *match-string***—ASCII match string of 1 through 255 alphanumeric characters.

**hexadecimal *match-hex***—Hexadecimal match string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

The remaining statements are explained separately.

## version (Dynamic IGMP Interface)

|                            |                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>version version;</code>                                                                                    |
| <b>Hierarchy Level</b>     | [edit dynamic-profiles <i>profile-name</i> protocols <b>igmpinterface</b> <i>interface-name</i> ]                |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2.                                                                    |
| <b>Description</b>         | Specify the version of IGMP.                                                                                     |
| <b>Options</b>             | <p><b>version</b>—IGMP version number.</p> <p><b>Range:</b> 1, 2, or 3</p> <p><b>Default:</b> IGMP version 2</p> |

**NOTE:** Routers running different versions of IGMP negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version.

If you have already configured the router to use IGMP version 1 and then configure it to use IGMP version 2, the router continues to use IGMP version 1 for up to 6 minutes and then uses IGMP version 2.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2.                                                                                                                                                  |
| <b>Description</b>         | For Fast Ethernet and Gigabit Ethernet interfaces and aggregated Ethernet interfaces configured for VPLS, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface. |

.....

**NOTE:** For Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet interfaces supporting VPLS, the Junos OS supports a subset of the IEEE 802.1Q standard for channelizing an Ethernet interface into multiple logical interfaces, allowing many hosts to be connected to the same Gigabit Ethernet switch, but preventing them from being in the same routing or bridging domain.

| <b>Description</b>              | Specify that the router chooses among multiple tunnels that share the same preference level by considering the maximum sessions configured per tunnel. The tunnel configured with the highest maximum number of sessions in the preference level has the highest weight. This tunnel is selected until the maximum number of sessions for the tunnel is reached. Then the router selects the tunnel with the next higher weight to establish connections until that tunnel's maximum session limit is reached, and so on. |

| <b>Hierarchy Level</b>          | [edit access address-assignment pool <i>pool-name</i> family inet <a href="#">dhcp-attributes</a> ]                                  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0.                                                                                        |
| <b>Description</b>              | Specify one or more NetBIOS name servers (NBNS) that the client uses to resolve NetBIOS names. This is equivalent to DHCP option 44. |
| <b>Options</b>                  | <i>ipv4-address</i> —IP address of each NetBIOS name server; add them to the configuration in order of preference.                   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                      |

# Index of Statements and Commands

## A

|                                               |                  |
|-----------------------------------------------|------------------|
| aaa-access-profile statement                  |                  |
| L2TP LNS.....                                 | 1099             |
| aaa-logical-system statement                  |                  |
| domain maps.....                              | 1100             |
| aaa-routing-instance statement                |                  |
| domain maps.....                              | 1100             |
| abated-utilization statement                  |                  |
| address-assignment pools.....                 | 1101             |
| abated-utilization-v6 statement               |                  |
| address-assignment pools.....                 | 1101             |
| access profile                                |                  |
| session options.....                          | 100              |
| access profile statements                     |                  |
| session-options.....                          | 1578             |
| access statement                              |                  |
| dynamic profiles.....                         | 1102             |
| access-concentrator statement.....            | 1103             |
| access-identifier statement                   |                  |
| ANCP.....                                     | 1104             |
| access-internal statement                     |                  |
| dynamic profiles.....                         | 1105             |
| access-profile statement                      |                  |
| domain maps.....                              | 1106             |
| static subscribers.....                       | 1107             |
| access-type statement                         |                  |
| Mobile IP.....                                | 1108             |
| accounting statement                          |                  |
| access profile.....                           | 1109             |
| dynamic IGMP                                  |                  |
| interface.....                                | 1109             |
| dynamic MLD interface.....                    | 1110             |
| accounting-order statement                    |                  |
| service accounting.....                       | 1110             |
| accounting-port statement.....                | 1111             |
| accounting-server statement.....              | 1111             |
| accounting-session-id-format statement.....   | 1112             |
| accounting-stop-on-access-deny statement..... | 1112             |
| accounting-stop-on-failure statement.....     | 1113             |
| action statement.....                         | 1114             |
| active-server-group statement                 |                  |
| DHCP relay agent.....                         | 1115             |
| address statement                             |                  |
| Diameter base protocol                        |                  |
| peer.....                                     | 1117             |
| transport.....                                | 1117             |
| interface.....                                | 1116             |
| tunnels                                       |                  |
| LAC.....                                      | 1118             |
| LNS.....                                      | 1118             |
| address-assignment pools                      |                  |
| abated-utilization.....                       | 1101             |
| abated-utilization-v6.....                    | 1101             |
| high-utilization.....                         | 1313             |
| high-utilization-v6.....                      | 1313             |
