YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

CHAPTER 1

Multiple Instances for Label Distribution Protocol Concepts and Reference Materials

This section contains the following topics:

- [Multiple Instances for Label Distribution Protocol Overview on page 3](#)
- [Multiple Instances for Label Distribution Protocol System Requirements on page 4](#)
- [Multiple Instances for Label Distribution Protocol Terms and Acronyms on page 5](#)

Multiple Instances for Label Distribution Protocol Overview

Versions of Junos OS earlier than Release 5.3 support multiple VPN routing and forwarding (VRF) instances of Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Protocol Independent Multicast (PIM), and Routing Information Protocol (RIP). Junos OS Release 5.4 and later adds support for multiple instances of the Label Distribution Protocol (LDP).

This support allows LDP to be used to advertise labels in a carrier-of-carriers scenario from a core provider edge (PE) router to a customer carrier edge (CE) router. This is especially useful when the carrier customer is a basic Internet service provider (ISP) and wants to restrict full Internet routes to its PE routers. By using LDP instead of BGP, the carrier customer shields its other internal routers from the Internet at large.

Multiple-instance LDP is also useful when a carrier customer wants to provide Layer 2 VPN or Layer 3 VPN services to its customers.

Using multiple-instance LDP lets you circumvent one of the requirements of RFC 3107: the need to run full-mesh internal BGP (IBGP) within the carrier customer's autonomous system (AS). When you use multiple-instance LDP, full-mesh IBGP is unnecessary.

In [Figure 1 on page 4](#), the customer carrier in AS 21 can configure one instance of LDP for all routers in AS 21 instead of using full-mesh IBGP.

Figure 1: Carrier-of-Carriers Example

In general, if there are a limited number of customer carrier sites and few internal routes in the customer carrier AS, it is simpler and quicker to use LDP than to configure a full IBGP mesh.

An instance of LDP operates essentially in the same way as a master instance. Each instance of LDP must be enabled on all the desired interfaces and a separate set of LDP data structures is maintained for each instance. Instance information includes a set of LDP interfaces, neighbors, sessions, and databases.

For more information about carrier-of-carriers VPNs, see the *Junos VPNs Configuration Guide*.

For more information about LDP, see the *Junos MPLS Applications Configuration Guide*.

Multiple Instances for Label Distribution Protocol System Requirements

To implement the multiple-instance LDP feature, your system must meet these minimum requirements:

- Junos OS Release 8.2 for support on MX Series routers.
- Junos OS Release 5.4 or later for support on M Series and T Series routers.
- Two Juniper Networks M Series, MX Series, or T Series routers for basic multiple-instance LDP; and a minimum of four Juniper Networks routers to act as PE routers in a carrier-of-carriers network.

Multiple Instances for Label Distribution Protocol Terms and Acronyms

C

carrier-of-carriers VPN A VPN that transports data traffic between two or more telecommunications carrier sites across a core provider network. The core provider becomes a carrier for the customer carrier, which, in turn, provides Internet or VPN services to end customers. For more information about carrier-of-carriers VPNs, see the *Junos VPNs Configuration Guide*.

L

Label Distribution Protocol (LDP) A protocol used to distribute labels in an MPLS-enabled network. For more information about LDP, see the *Junos MPLS Applications Configuration Guide*.

V

VPN routing and forwarding (VRF) instance A unique routing table created to maintain VPN routing and forwarding information. One routing table is created per instance, which keeps prefix information and data private from other instances. For more information about VRF instances, see the *Junos VPNs Configuration Guide*.

CHAPTER 2

Multiple Instances for Label Distribution Protocol Configuration Example

This section contains the following topic:

- [Example: Configuring Multiple-Instance LDP on page 7](#)

Example: Configuring Multiple-Instance LDP

The master LDP instance is configured at the **[edit protocols]** hierarchy level.

You can configure a specific instance of LDP by using the **ldp** statement at the **[edit routing-instances *routing-instance-name* protocols]** hierarchy level. This creates an instance of LDP for the particular VRF routing instance. You must specify all the required VRF statements and apply export and import policies to your LDP instance for the configuration to commit properly.

Most of the LDP hierarchy levels available in a master instance are also available for specific instances of LDP. However, the **no-forwarding** option does not work in a VRF-based instance of LDP.

Figure 2: Multiple-Instance LDP Topology Diagram

Figure 2 on page 8 shows an example of a carrier-of-carriers network. CE3 and CE4 are end customer CE routers residing in AS 100. The VPN provider in AS 200 has three types of routers: PE3 and PE4 are PE routers that connect to the end customer, CE1 and CE2 act as the intermediate carrier CE routers, and P2 and P3 are internal transit routers. PE1 and PE2 in AS 300 are PE routers servicing the intermediate VPN provider, and P0 and P1 are transit routers for the top-tier carrier.

To make this configuration work, you must complete three major tasks:

1. Configure external BGP between the VPN customer CE and the VPN provider PE.
2. Configure internal BGP using the VPN family between both pairs of PE routers (one IBGP connection between PE1 and PE2 and a second IBGP connection between Router PE3 and Router PE4).
3. Establish LDP and Interior Gateway Protocol (IGP) connections on all remaining links. This example uses OSPF as the IGP, but you can use the IGP of your choice.

Information supporting this carrier-of-carriers multiple-instance LDP example is summarized in Table 1 on page 8 and Table 2 on page 9.

Table 1: Multiple-Instance LDP Example—Routing Protocol Summary

Connection	Protocols
CE3 - PE3	EBGP family inet
PE3 - P2 - CE1	OSPF and LDP

Table 1: Multiple-Instance LDP Example—Routing Protocol Summary (*continued*)

Connection	Protocols
CE1 - PE1	OSPF and LDP
PE1 - P0 - P1 - PE2	OSPF and LDP
PE1 - PE2	IBGP family inet-vpn
PE2 - CE2	OSPF and LDP
CE2 - P3 - PE4	OSPF and LDP
PE4 - CE4	EBGP family inet
PE3 - PE4	IBGP family inet-vpn

Table 2: Multiple-Instance LDP Example—Loopback Addresses

Router	Loopback Address
PE1	10.255.255.171
PE2	10.255.255.172
P0	10.255.255.173
P1	10.255.255.174
P2	10.255.255.175
P3	10.255.255.176
PE3	10.255.255.177
PE4	10.255.255.178
CE1	10.255.255.179
CE2	10.255.255.180
CE3	10.255.255.181 10.49.100.1
CE4	10.255.255.182 10.49.200.1

Your configuration tasks start at Router CE3 and move router by router through the first part of the VPN provider network, into the carrier AS, through the second VPN provider cluster of AS 200, and end at the second VPN customer Router CE4.

Since Router CE3 is the first customer router, configure EBGP between Router CE3 and the connected VPN provider Router PE3. You must also advertise your loopback address into BGP with a routing policy to allow IP reachability with Router CE4.

```
Router CE3 [edit]
interfaces {
  so-1/2/0 {
    description "to pe3 so-1/2/0";
    unit 0 {
      family inet {
        address 192.255.198.14/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 10.255.255.181/32;
        address 10.49.100.1/32;
      }
    }
  }
}
routing-options {
  static {
    route 10.49.100.0/24 reject;
    route 10.49.101.0/24 reject;
  }
  autonomous-system 100;
}
protocols {
  bgp {
    group provider {
      type external;
      export static-to-bgp;
      peer-as 200;
      neighbor 192.255.198.13;
    }
  }
}
policy-options {
  policy-statement static-to-bgp {
    term 1 {
      from {
        protocol static;
        route-filter 10.49.100.0/24 exact;
        route-filter 10.49.101.0/24 exact;
      }
      then accept;
    }
    term 2 {
```

```

        from protocol direct;
        then accept;
    }
    term 3 {
        then reject;
    }
}
}

```

On Router PE3, the configuration tasks are more involved. You need to complete the EBGP connection to Router CE3 in a VRF instance, enable MPLS and LDP on the interface pointing toward the VPN provider Router CE1, and configure a master instance of IBGP to reach Router PE4 at the far edge of AS 200.

Finally, set up an outbound VRF policy that places all BGP traffic and directly connected interfaces into a BGP community and an inbound VRF policy that accepts similar BGP community traffic from Router PE4.

```

Router PE3 [edit]
interfaces {

      }  
      interface t3-0/1/0.0;  
    }  
  }  
  ldp {  
    interface t3-0/1/0.0;  
    interface so-1/2/0.0;  
  }  
}
```

On core carrier Router PE1, configure a master instance for OSPF, LDP, MPLS, and IBGP (with the **family inet-vpn** option) to connect the router to neighbor Router PE2. Next, implement multiple-instance LDP by establishing a secondary instance. Enable LDP and OSPF in this instance for Router PE1 to communicate with Router CE1. MPLS is not required in the secondary instance.

Finally, set up an outbound VRF policy that places all LDP traffic coming from Router CE1 into a BGP community, an export policy that sends this community traffic to Router PE2, and an inbound VRF policy that accepts similar BGP community traffic from Router PE2. This step tunnels the VPN provider's LDP traffic into the carrier's BGP session.

```

Core carrier Router PE2 is a mirror image of Router PE1. First, configure a master instance for OSPF, LDP, MPLS, and IBGP (with the **family inet-vpn** option) to connect Router PE2 to neighbor Router PE1. Next, implement multiple-instance LDP by establishing a secondary instance. Enable LDP and OSPF in this instance for Router PE2 to communicate with Router CE2. MPLS is not required in the secondary instance.

Finally, set up an outbound VRF policy that places all LDP traffic coming from Router CE2 into a BGP community, an export policy that sends this community traffic to Router PE1, and an inbound VRF policy that accepts similar BGP community traffic from Router PE1. This step tunnels the VPN provider's LDP traffic into the carrier's BGP session.

```

        address 10.255.255.176/32;
      }
    }
  }
}
routing-options {
  autonomous-system 200;
}
protocols {
  ospf {
    area 0.0.0.0 {
```

```

        interface t3-0/0/3.0;
        interface t1-0/1/1.0;
        interface lo0.0 {
            passive;
        }
    }
    ldp {
        interface t3-0/0/3.0;
        interface t1-0/1/1.0;
    }
}

```

On Router PE4, complete the IBGP connection initiated on Router PE3 to connect the edge routers in AS 200. Also, enable LDP and MPLS on the **t1-0/0/1** interface pointing toward the VPN provider Router CE2 and establish an EBGP connection to Router CE4 through use of a VRF instance.

Finally, set up an outbound VRF policy that places all BGP traffic and directly connected interfaces into a BGP community and an inbound VRF policy that accepts similar BGP community traffic from Router PE3.

```

Router PE4 [edit]
interfaces {
    t3-0/0/3 {
        description to ce4 t3-0/0/3";

Verifying Your Work

To verify the proper operation of your multiple-instance LDP configuration, use the following commands:

- **show ldp database**
- **show ldp interface**
- **show ldp neighbor**
- **show ldp path**
- **show ldp route**
- **show ldp session**
- **show ldp statistics**

The display output for these commands is the same as in previous Junos OS Releases, except for one difference. An instance name can now be used as an argument.

If you include an instance name with these commands, you display information for the specified LDP instance. For example, the command **show ldp neighbor instance crockett** shows all the LDP neighbors for a VRF instance named **crockett**. Conversely, **show ldp neighbor** without an instance name displays the LDP neighbors associated with the master instance.

The following sections show the output of these commands used with the configuration example:

- [Router CE3 Status on page 27](#)
- [Router PE3 Status on page 27](#)
- [Router CE1 Status on page 29](#)
- [Router PE1 Status on page 30](#)

- [Router PE2 Status on page 32](#)
- [Router CE2 Status on page 37](#)
- [Router PE4 Status on page 38](#)
- [Router CE4 Status on page 40](#)
