## Overview of Source Class Usage

Source class usage (SCU) is a logical extension of the destination class usage (DCU) concept. DCU was created so that Juniper Networks customers could count on a per-interface basis how much traffic was sent to specified prefixes. [Figure 1 on page 3](#) shows a service provider edge (PE) router diagram.

Figure 1: DCU/SCU Concept

The Fast Ethernet interfaces contain inbound traffic from customers, and the SONET/SDH interfaces are connected to outbound public network prefixes. With DCU configured on the Fast Ethernet interfaces, you can track how much traffic is sent to a specific prefix in the core of the network originating from one of the specified interfaces (in this case, the Fast Ethernet interfaces).

However, DCU limits your ability to keep track of traffic moving in the reverse direction. It can account for all traffic that arrives on a core interface and heads toward a specific customer, but it cannot count traffic that arrives on a core interface from a specific prefix. For example, DCU can process cumulative traffic headed toward interface **fe-0/0/0**, but cannot differentiate between traffic coming only from **10.3.0.0/16** and traffic coming from all prefixes.

You can track source-based traffic by using SCU, which allows you to monitor the amount of traffic originating from a specific prefix. With this feature, usage can be tracked and customers can be billed for the traffic they receive.

## Guidelines for Configuring SCU

---

When you enable SCU or DCU, keep the following information in mind:

- In Junos OS Release 5.6 and later for M Series routers only, you can use a source class or a destination class as a match condition in a firewall filter. To configure, include the **destination-class** or **source-class** statement at the **[edit firewall filter *firewall-name* term *term-name* from]** hierarchy level. For more information about firewall filters, see the *Junos Policy Framework Configuration Guide*.
- You can assign up to 126 source classes and 126 destination classes.
- A source or destination class is applied to a packet only once during the routing table lookup. When a network prefix matches a class-usage policy, SCU is assigned to packets first; DCU is assigned only if SCU has not been assigned. Be careful when using both class types, since misconfiguration can result in uncounted packets. The following example explores one potential mishap:

A packet arrives on a router interface configured for both SCU and DCU. The packet's source address matches an SCU class, and its destination matches a DCU class. Consequently, the packet is subjected to a source lookup and is marked with the SCU class. The DCU class is ignored. As a result, the packet is forwarded to the outbound interface with only the SCU class still intact.

However, the outbound interface lacks an SCU configuration. When the packet is ready to leave the router, the router detects that the output interface is not configured for SCU and the packet is not counted by SCU. Likewise, even though the prefix matched the DCU prefix, the DCU counters do not increment because DCU was superseded by SCU at the inbound interface.

To solve this problem, make sure you configure both the inbound and outbound interfaces completely or configure only one class type per interface per direction.

- Classes cannot be mapped to directly connected prefixes configured on local interfaces. This is true for DCU and SCU classes.
- If you use multiple terms within a single policy, you only need to configure the policy name and apply it to the forwarding table once. This makes it easier to change options within your terms without having to reconfigure the main policy.

- Execute command line interface (CLI) **show** commands and accounting profiles at the desired outbound interface to track SCU traffic. SCU counters increment at the SCU **output** interface.
- Apply your classes to the inbound and outbound interfaces by means of the **input** and **output** SCU interface parameters.
- On M320 and T Series routers, the source and destination classes are not carried across the platform fabric. For these routers, SCU and DCU accounting is performed before the packet enters the fabric and DCU is performed before output filters are evaluated.
- If an output filter drops traffic on M Series routers other than the M120 router and M320 router, the dropped packets are excluded from DCU statistics. If an output filter drops traffic on M320 and T Series routers, the dropped packets are included in DCU statistics.

## CHAPTER 2

# System Requirements

- [System Requirements for SCU on page 7](#)

### System Requirements for SCU

---

To implement SCU, your system must meet these requirements:

- Junos OS Release 8.2 or later for M120 and MX Series router support
- Junos OS Release 6.2 or later for IPv6 SCU
- Junos OS Release 5.6 or later to use a source class or a destination class as a match condition in a firewall filter
- Junos OS Release 5.4 or later for IPv4 SCU
- Three Juniper Networks M Series, MX Series, or T Series routers for basic SCU and five routers for SCU with Layer 3 VPNs. One router acts as a source class usage transit router, and the other routers are used to generate traffic or participate in the Layer 3 VPN.
- For M Series and T Series routers, a Tunnel Services PIC for SCU with Layer 3 VPNs

## CHAPTER 3

# Glossary

- [Terms and Acronyms for SCU on page 9](#)

## Terms and Acronyms for SCU

---

### D

<b>destination address (DA)</b>	The IP address of a device intended as the receiver for a packet. This address is included in the IP header and is the main address analyzed by the router during routing table lookups and DCU.
<b>destination class usage (DCU)</b>	A method of grouping certain types of traffic and monitoring these groups through CLI <b>show</b> commands, accounting profiles, or SNMP. DCU uses a destination address lookup when determining group membership. For more information about DCU, see the <i>Junos Policy Framework Configuration Guide</i> .

### S

<b>source address (SA)</b>	The IP address of a device sending a packet. This address is included in the IP header and is analyzed by the router for a variety of services, including source-based filtering, policing, class of service (CoS), and SCU.
<b>source class usage (SCU)</b>	A method of grouping certain types of traffic and monitoring these groups through CLI <b>show</b> commands, accounting profiles, or SNMP. SCU uses a source address lookup when determining group membership. For more information about SCU, see the <i>Junos Policy Framework Configuration Guide</i> .

## CHAPTER 4

# Configuration Overview

- [Roadmap for Configuring SCU on page 13](#)
- [Roadmap for Configuring SCU with Layer 3 VPNs on page 13](#)

### Roadmap for Configuring SCU

---

To configure source class usage (SCU), you must:

1. Create a routing policy that includes prefix route filters that indicate the IPv4 or IPv6 source addresses to monitor. See [“Configuring Route Filters and Source Classes in a Routing Policy” on page 15](#).
2. Apply the filters to the forwarding table. See [“Applying the Policy to the Forwarding Table” on page 16](#).
3. Enable accounting on the inbound and outbound interfaces. See [“Enabling Accounting on Inbound and Outbound Interfaces” on page 16](#).

#### Related Documentation

- [Overview of Source Class Usage on page 3](#)
- [System Requirements for SCU on page 7](#)
- [Example: SCU Configuration on page 25](#)

### Roadmap for Configuring SCU with Layer 3 VPNs

---

SCU can be implemented over regular interfaces; it is also used in combination with Layer 3 VPNs. When you view SCU traffic on an ingress provider edge (PE) router, use the standard procedure outlined in [“Roadmap for Configuring SCU” on page 13](#). However, when you enable packet counting for Layer 3 VPNs at the egress point of the MPLS tunnel, you need to take some additional steps, as follows:

1. Configure SCU on the virtual loopback tunnel (vt) interface of the egress PE router. See [“Configuring Input SCU on the vt Interface of the Egress PE Router” on page 19](#).
2. Map the SCU-enabled input interface of that router to the virtual routing and forwarding (VRF) instance. See [“Mapping the SCU-Enabled vt Interface to the VRF Instance” on page 20](#).

3. Configure SCU on the output interface of the egress router. See [“Configuring SCU on the Output Interface” on page 20](#).
4. Configure an accounting profile and associate the source class with that accounting profile. You can also specify the filename for the data capture, a class usage profile name, and an interval indicating how often you want the SCU information to be saved. See [“Associating an Accounting Profile with SCU Classes” on page 21](#).

**NOTE:** SCU is not supported over Layer 2 VPNs.

---

- [System Requirements for SCU on page 7](#)
- [Example: SCU with Layer 3 VPNs Configuration on page 33](#)

## CHAPTER 5

# Basic Configuration Steps

- [Configuring Route Filters and Source Classes in a Routing Policy on page 15](#)
- [Applying the Policy to the Forwarding Table on page 16](#)
- [Enabling Accounting on Inbound and Outbound Interfaces on page 16](#)

### Configuring Route Filters and Source Classes in a Routing Policy

---

Begin configuring SCU by creating prefix route filters in a policy statement. These prefixes indicate the IPv4 or IPv6 source addresses to monitor. Within the policy statement, you must define and name the source classes attached to the filters.

```
[edit policy-options]
policy-statement policy-name {
  term term-name {
    from {
      route-filter address/prefix;
    }
    then source-class class-name;
  }
}
```

An alternate configuration method, using the **forwarding-class** policy action, is even more flexible. It allows your IPv4 or IPv6 route filters to apply to an SCU profile, a DCU profile, or both simultaneously. Additionally, if you have only one term, you can implement the **from** and **then** statements at the **[edit policy-options policy-statement *policy-name*]** hierarchy level.

```
[edit policy-options]
policy-statement policy-name {
  from {
    route-filter 105.15.0.0/16 orlonger;
  }
  then forwarding-class class-name;
}
```

A third option is the existing DCU parameter of **destination-class**. For more information on DCU, see the *Junos Policy Framework Configuration Guide*.

- [Overview of Source Class Usage on page 3](#)

- [System Requirements for SCU on page 7](#)
- [Roadmap for Configuring SCU on page 13](#)
- [Example: SCU Configuration on page 25](#)

## Applying the Policy to the Forwarding Table

---

Next, apply the policy you created to the forwarding table. When you apply the policy, the network prefixes you defined are marked with the appropriate source class.

```
[edit routing-options]
forwarding-table {
  export policy-name;
}
```

### Related Documentation

- [Overview of Source Class Usage on page 3](#)
- [System Requirements for SCU on page 7](#)
- [Roadmap for Configuring SCU on page 13](#)
- [Example: SCU Configuration on page 25](#)

## Enabling Accounting on Inbound and Outbound Interfaces

---

Unlike DCU, which only requires implementation on a single interface, accounting for SCU must be enabled on two interfaces: the inbound and outbound physical or logical interfaces traversed by the source class. You must define explicitly the two interfaces on which SCU monitored traffic is expected to arrive and depart. This is because SCU performs two lookups in the routing table: a source address (SA) and a destination address (DA) lookup. In contrast, DCU only has a single destination address lookup. By specifying the addresses involved in the additional SCU SA lookup, you minimize the performance impact on your router.

An individual SCU interface can be configured as an input interface, an output interface, or both. SCU can be enabled in an IPv4 (**family inet**) or IPv6 (**family inet6**) network. To configure SCU accounting, include the **source-class-usage** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) accounting]** hierarchy level:

```
[edit]
interfaces {
  interface-name {
    unit unit-number {
      family (inet | inet6) {
        accounting {
          source-class-usage {
            (input | output | input output);
          }
          destination-class-usage;
        }
      }
    }
  }
}
```

```
    }  
  }  
}
```

After the full SCU configuration is enabled, every packet arriving on an SCU input interface is subjected to an SA-based lookup and then a DA-based lookup. In addition, an individual set of counters for every configured SCU class is maintained by the router on a per-interface and per-protocol family basis.

**Related  
Documentation**

- Source Class Usage
- [Overview of Source Class Usage on page 3](#)
- [System Requirements for SCU on page 7](#)
- [Roadmap for Configuring SCU on page 13](#)
- [Example: SCU Configuration on page 25](#)

## CHAPTER 6

# Configuring SCU with Layer 3 VPNs

- [Configuring Input SCU on the vt Interface of the Egress PE Router on page 19](#)
- [Mapping the SCU-Enabled vt Interface to the VRF Instance on page 20](#)
- [Configuring SCU on the Output Interface on page 20](#)
- [Associating an Accounting Profile with SCU Classes on page 21](#)
- [Verifying Your SCU Accounting Profile on page 22](#)

## Configuring Input SCU on the vt Interface of the Egress PE Router

---

To enable SCU in a Layer 3 VPN, configure source class usage on the virtual loopback tunnel (**vt**) interface of the egress PE router that is either configured for or equipped with a Tunnel PIC. The interface is equivalent to the inbound SCU interface, so use the **input** statement at the **[edit interfaces vt-interface-number unit 0 family inet accounting source-class-usage]** hierarchy level:

```
[edit]
interfaces {
  vt-0/3/0 {
    unit 0 {
      family inet {
        accounting {
          source-class-usage {
            input;
          }
        }
      }
    }
  }
}
```

### Related Documentation

- [System Requirements for SCU on page 7](#)
- [Roadmap for Configuring SCU with Layer 3 VPNs on page 13](#)
- [Example: SCU with Layer 3 VPNs Configuration on page 33](#)

## Mapping the SCU-Enabled vt Interface to the VRF Instance

---

Next, include the VPN loopback tunnel interface in the desired VRF instance at the **[edit routing-instances *routing-instance-name*]** hierarchy level:

```
[edit]
routing-instances {
  routing-instance-name {
    instance-type vrf;
    interface at-2/1/1.0;
    interface vt-0/3/0.0;
    route-distinguisher 10.250.14.225:100;
    vrf-import import-policy-name;
    vrf-export export-policy-name;
    protocols {
      bgp {
        group to-r4 {
          local-address 10.20.253.1;
          peer-as 400;
          neighbor 10.20.253.2;
        }
      }
    }
  }
}
```

### Related Documentation

## Configuring SCU on the Output Interface

---

Since VPN traffic enters the egress router through the VPN loopback tunnel interface, you still need to determine the exit interface for this traffic. To complete your SCU configuration, configure the output version of source class usage on the exit interface of your egress router:

```
[edit interfaces]
at-1/1/0 {
  unit 0 {
    family inet {
      accounting {
        source-class-usage {
          output;
        }
      }
    }
  }
}
```

```
}

```

#### Related Documentation

- [System Requirements for SCU on page 7](#)
- [Roadmap for Configuring SCU with Layer 3 VPNs on page 13](#)
- [Example: SCU with Layer 3 VPNs Configuration on page 33](#)

## Associating an Accounting Profile with SCU Classes

Once your source classes are defined, implemented on the inbound and outbound interfaces, and applied to the forwarding table, you are ready to associate the source class with an accounting profile. Configure the accounting profile at the **[edit accounting-options class-usage-profile]** hierarchy level. You can associate either an SCU source class or a DCU destination class with the accounting profile. You can also specify the filename for the data capture, a class usage profile name, and an interval (in minutes) indicating how often you want the SCU information to be saved to the file.

```
[edit]
accounting-options {
  file filename;
  class-usage-profile profile-name {
    file filename;
    interval minutes;
    source-classes {
      source-class-name;
    }
    destination-classes {
      destination-class-name;
    }
  }
}
```

**NOTE:** SCU accounting occurs on the outbound interface before output filter processing. If an SCU-marked packet is discarded in the router, the SCU counters can indicate more traffic than actually exists. You must use filter counters or traceoptions logs to ensure that all packets dropped by the SCU filter are recorded. If logged, you can subtract the discarded packets from the SCU counter tallies and calculate the true traffic profile.

Because DCU accounting occurs after the filtering process, DCU is unaffected by this disclaimer.

---

## Verifying Your SCU Accounting Profile

---

**Purpose** To view the results of the SCU accounting profile you created.

**Action** Navigate to the `/var/log` directory of your router. It should contain the designated class usage profile log. The layout of an SCU profile looks like this:

`profile_name,epoch-timestamp,interface-name,source-class-name,packet-count,byte-count`

An example of the actual output from a profile looks like this:

```
scu_profile,980313078,ge-1/0/0.0,gold,82,6888
scu_profile,980313078,ge-1/0/0.0,silver,164,13776
scu_profile,980313078,ge-1/0/0.0,bronze,0,0
scu_profile,980313678,ge-1/0/0.0,gold,82,6888
scu_profile,980313678,ge-1/0/0.0,silver,246,20664
scu_profile,980313678,ge-1/0/0.0,bronze,0,0
```

To view the parameters of your SCU accounting profile, you can use the **show accounting-options class-usage-profile *scu-profile-name*** command.

### Example: SCU Configuration

Figure 2: SCU Topology Diagram

Figure 2 on page 25 shows a basic SCU configuration with three routers. Source routers A and B use loopback addresses as the prefixes to be monitored. Most of the configuration tasks and actual monitoring occurs on transit Router SCU.

Begin your configuration on Router A. The loopback address on Router A contains the origin of the prefix that is to be assigned to source class A on Router SCU. However, no SCU processing happens on this router. Therefore, configure Router A for basic OSPF routing and include your loopback interface and interface **so-0/0/2** in the OSPF process.

```
Router A: [edit]
interfaces {
  so-0/0/2 {
    unit 0 {
      family inet {
        address 10.255.50.2/24;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
```

```

        address 10.255.192.10/32;
    }
}
}
protocols {
    ospf {
        area 0.0.0.0 {
            interface so-0/0/2.0;
            interface lo0.0;
        }
    }
}

```

Router SCU handles the bulk of the activity in this example. On Router SCU, enable source class usage on the inbound and outbound interfaces at the **[edit interfaces *interface-name* unit *unit-number* family inet accounting]** hierarchy level. Make sure you specify the expected traffic: input, output, or, in this case, both.

Next, configure a route filter policy statement that matches the prefixes of the loopback addresses from routers A and B. Include statements in the policy that classify packets from Router A in one group named **scu-class-a** and packets from Router B in a second class named **scu-class-b**. Notice the efficient use of a single policy containing multiple terms.

Last, apply the policy to the forwarding table.

```

Router SCU [edit]
interfaces {
    so-0/0/1 {
        unit 0 {
            family inet {
                accounting {
                    source-class-usage {
                        input;
                        output;
                    }
                }
            }
            address 10.255.50.1/24;
        }
    }
    so-0/0/3 {
        unit 0 {
            family inet {
                accounting {
                    source-class-usage {
                        input;
                        output;
                    }
                }
            }
            address 10.255.10.3/24;
        }
    }
}

```

```

lo0 {
  unit 0 {
    family inet {
      address 10.255.6.111/32;
    }
  }
}
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/1.0;
      interface so-0/0/3.0;
    }
  }
}
routing-options {
  forwarding-table {
    export scu-policy;
  }
}
policy-options {
  policy-statement scu-policy {
    term 0 {
      from {
        route-filter 10.255.192.0/24 orlonger;
      }
      then source-class scu-class-a;
    }
    term 1 {
      from {
        route-filter 10.255.165.0/24 orlonger;
      }
      then source-class scu-class-b;
    }
  }
}

```

Complete the configuration tasks on Router B. Just as Router A provides a source prefix, Router B's loopback address matches the prefix assigned to **scu-class-b** on Router SCU. Again, no SCU processing happens on this router, so configure Router B for basic OSPF routing and include your loopback interface and interface **so-0/0/4** in the OSPF process.

**Router B:** [edit]

```

interfaces {
  so-0/0/4 {
    unit 0 {
      family inet {
        address 10.255.10.4/24;
      }
    }
  }
}
lo0 {
  unit 0 {
    family inet {
      address 10.255.165.226/32;
    }
  }
}

```

```

    }
  }
}
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/4.0;
      interface lo0.0;
    }
  }
}
}

```

## Verifying Your Work

To verify that SCU is functioning properly, use the following commands:

- **show interfaces *interface-name* statistics**
- **show interfaces *interface-name* (extensive | detail)**
- **show route (extensive | detail)**
- **show interfaces source-class *source-class-name* *interface-name***
- **clear interface *interface-name* statistics**

You should always verify SCU statistics at the outbound SCU interface on which you configured the **output** statement. You can perform the following three steps to check the functionality of SCU:

1. Clear all counters on your SCU-enabled router and verify that they are empty.
2. Send a ping from one edge router to another edge router to generate SCU traffic across the SCU-enabled router.
3. Verify that the counters are incrementing correctly on the outbound interface.

The following section shows the output of these commands as used with the configuration example.

```
user@scu> clear interfaces statistics all
```

```
user@scu> show interfaces so-0/0/1.0 statistics
```

```

Logical interface so-0/0/1.0 (Index 4) (SNMP ifIndex 119)

## Example: SCU in a Layer 3 VPN Configuration

Figure 3: SCU in a Layer 3 VPN Topology Diagram

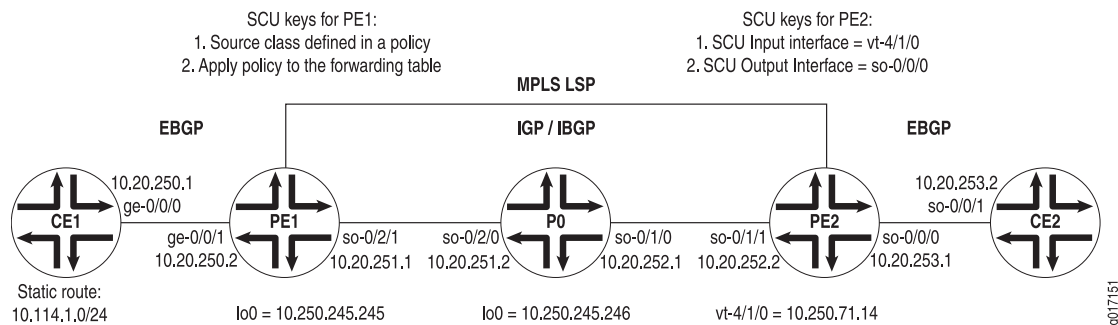

Figure 3 on page 33 displays a Layer 3 VPN topology. CE1 and CE2 are customer edge (CE) routers connected by a VPN through provider routers PE1, P0, and PE2. EBGP is established between routers CE1 and PE1, IBGP connects routers PE1 and PE2 over an IS-IS/MPLS/LDP core, and a second EBGP connection flows between routers PE2 and CE2.

On Router CE1, begin your VPN by setting up an EBGP connection to PE1. Install a static route of 10.114.1.0/24 and advertise this route to your EBGP neighbor.

**Router CE1**

```

[edit]
interfaces {
  ge-0/0/0 {
    unit 0 {

```

```
        family inet {
            address 10.20.250.1/30;
        }
    }
}
routing-options {
    static {
        route 10.114.1.0/24 reject;
    }
    autonomous-system 100;
}
protocols {
    bgp {
        group to-pe1 {
            local-address 10.20.250.1;
            export inject-direct;
            peer-as 300;
            neighbor 10.20.250.2;
        }
    }
}
policy-options {
    policy-statement inject-direct {
        term 1 {
            from {
                protocol static;
                route-filter 10.114.1.0/24 exact;
            }
            then accept;
        }
        term 2 {
            from protocol direct;
            then accept;
        }
    }
}
```

On PE1, complete the EBGp connection to CE1 through a VRF routing instance. Set an export policy for your VRF instance that puts BGP traffic into a community, and an import policy that accepts like community traffic from your VPN neighbor. Lastly, configure an IBGP relationship to Router PE2 that runs over an IS-IS, MPLS, and LDP core.

```
Router PE1 [edit]
interfaces {
    ge-0/0/1 {
        unit 0 {
            family inet {
                address 10.20.250.2/30;
            }
        }
    }
    so-0/2/1 {
        unit 0 {
            family inet {

          neighbor 10.20.250.1;
        }
      }
    }
  }
}
```

On P0, connect the IBGP neighbors located at PE1 and PE2. Remember to include VPN-related protocols (MPLS, LDP, and IGP) on all interfaces.

```
Router P0 [edit]
interfaces {
  so-0/1/0 {
    unit 0 {
      family inet {
        address 10.20.252.1/30;
      }
      family iso;
      family mpls;
    }
  }

  interface all;
}
ldp {
  interface all;
}
}

```

On PE2, complete the IBGP relationship to Router PE1. Establish an EBGp connection to CE2 through a VRF routing instance. Set an export policy for the VRF instance that places BGP traffic into a community, and an import policy that accepts like community traffic from the VPN neighbor. Next, establish a policy that adds the static route from CE1 to a source class called **GOLD1**. Also, export this SCU policy into the forwarding table. Finally, set your **vt** interface as the SCU input interface and establish the CE-facing interface **so-0/0/0** as the SCU output interface.

```

        }
        then accept;
    }
}
}

```

## Verifying Your Work

To verify that SCU is functioning properly in the Layer 3 VPN, use the following commands:

- **show interfaces *interface-name* statistics**
- **show interfaces source-class *source-class-name* *interface-name***
- **show interfaces *interface-name* (extensive | detail)**
- **show route (extensive | detail)**
- **clear interface *interface-name* statistics**

You should always verify SCU statistics at the outbound SCU interface on which you configured the **output** statement. To check SCU functionality, follow these steps:

1. Clear all counters on your SCU-enabled router and verify they are empty.
2. Send a ping from the ingress CE router to the second CE router to generate SCU traffic across the SCU-enabled VPN route.
3. Verify that the counters are incrementing correctly on the outbound interface.

The following section shows the output of these commands used with the configuration example.

```
user@pe2> clear interfaces statistics all
```

```
user@pe2> show interfaces so-0/0/0.0 statistics
```

```
Logical interface so-0/0/0.0 (Index 6) (SNMP ifIndex 113)
```

```
Flags: Point-To-Point SNMP-Traps Encapsulation: PPP
```

```
Protocol inet, MTU: 4470
```

	Source class	Packets	Bytes
GOLD1	0	0	

Addresses, Flags: Is-Preferred Is-Primary

```
user@pe2> show interfaces source-class GOLD1 so-0/0/0.0
```

```
Protocol inet
```

	Source class	Packets	Bytes
GOLD1	0	0	

```
user@ce1> ping 10.20.253.2 source 10.114.1.1 rapid count 10000
```

```
user@scu> show interfaces source-class GOLD1 so-0/0/0.0
```

```
Protocol inet
```

	Source class	Packets	Bytes
GOLD1	20000	1680000	

```
user@scu> show interfaces so-0/0/0.0 statistics
```

```
Logical interface so-0/0/0.0 (Index 6) (SNMP ifIndex 113)
```

```
Flags: Point-To-Point SNMP-Traps Encapsulation: PPP
```

```
Protocol inet, MTU: 4470
```

	Source class	Packets	Bytes
GOLD1	20000	1680000	

Addresses, Flags: Is-Preferred Is-Primary  
Destination: 10.20.253/24, Local: 10.20.253.1

## CHAPTER 8

# Commands

## clear interfaces statistics

---

<b>Syntax</b>	clear interfaces statistics (all   <i>interface-name</i> )
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Set interface statistics to zero. If you issue the <b>clear interfaces statistics <i>interface-name</i></b> command and then perform a graceful Routing Engine switchover, the interface statistics are not cleared on the new master. Reissue the command to clear the interface statistics again.
<b>Options</b>	<b>all</b> —Set statistics on all interfaces to zero.  <b><i>interface-name</i></b> —Set statistics on a particular interface to zero.
<b>Required Privilege Level</b>	clear
<b>List of Sample Output</b>	<a href="#">clear interfaces statistics on page 46</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

clear interfaces statistics	user@host> clear interfaces statistics
--------------------------------	--

## show accounting profile

<b>Syntax</b>	<code>show accounting profile <i>profile-name</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display accounting profile information.
<b>Options</b>	<i>profile-name</i> —Name of the accounting profile.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show accounting profile (Interface) on page 48</a> <a href="#">show accounting profile (Filter) on page 49</a> <a href="#">show accounting profile (Destination Class) on page 49</a> <a href="#">show accounting profile (Routing Engine) on page 50</a>
<b>Output Fields</b>	Table 1 on page 47 lists the output fields for the <b>show accounting profile</b> command. Output fields are listed in the approximate order in which they appear.

**Table 1: show accounting profile Output Fields**

Field Name	Field Description
<b>Profile</b>	Name of the accounting profile.
<b>Sampling interval</b>	Configured interval, in minutes, for statistic collection.
<b>Profile Usage Count</b>	Number of items configured for collecting accounting statistics.
<b><i>file information</i></b>	Information about the accounting profile log, including: <ul style="list-style-type: none"> <li>• <b>File</b>—Name of accounting profile log. If no name is explicitly provided, the name of the accounting profile is used. All statistics files are placed in the <code>/var/log</code> directory.</li> <li>• <b>maximum size</b>—Configured size. When the size is exceeded, the log file closes and a new log file opens.</li> <li>• <b>maximum number</b>—Configured maximum number of log files.</li> <li>• <b>bytes written</b>—Number of bytes written to the log file.</li> </ul>
<b>Transfer Interval</b>	Length of time (in minutes) the file remains open, receiving statistics before it is closed, transferred, and rotated. When either the time or the file size is exceeded, the file is closed and a new one opened, whether or not a transfer site is specified.
<b>Next Scheduled Transfer</b>	Time at which the next transfer occurs.

Table 1: show accounting profile Output Fields (*continued*)

Field Name	Field Description
Column Labels	<p>Names of sampled statistics. This list varies depending on the configuration:</p> <ul style="list-style-type: none"> <li><b>profile-layout</b>—List of data fields reported, in the order they appear in the output.</li> <li><b>epoch-timestamp</b>—Number of seconds since the epoch.</li> <li><b>interfaces</b>—(For interface, filter, and destination class profiles) Name of the interfaces on which the filter is applied.</li> <li><b>filter-name</b>—(For filter profiles) Name of the filter.</li> <li><b>counter-name</b>—(For filter profiles) Name of the counter.</li> <li><b>packet-count</b>—(For filter and destination class profiles) Number of packets for the counter.</li> <li><b>byte-count</b>—(For filter and destination class profiles) Number of bytes for the counter.</li> <li><b>input-bytes</b>—(For interface profiles) Input bytes.</li> <li><b>input-errors</b>—(For interface profiles) Generic input error packets.</li> <li><b>input-multicast</b>—(For interface profiles) Input packets arriving by multicast.</li> <li><b>input-packets</b>—(For interface profiles) Input packets.</li> <li><b>input-unicast</b>—(For interface profiles) Input unicast packets.</li> <li><b>output-bytes</b>—(For interface profiles) Output bytes.</li> <li><b>output-errors</b>—(For interface profiles) Generic output error packets.</li> <li><b>output-multicast</b>—(For interface profiles) Output packets sent by multicast.</li> <li><b>output-packets</b>—(For interface profiles) Output packets.</li> <li><b>output-unicast</b>—(For interface profiles) Output unicast packets.</li> <li><b>no-proto</b>—(For interface profiles) Packets for unsupported protocol.</li> <li><b>snmp-index</b>—(For interface profiles) SNMP index.</li> <li><b>destination-class-name</b>—(For destination class profiles) Configured destination class name.</li> <li><b>host name</b>—(For Routing Engine profiles) Hostname for the router.</li> <li><b>date-yyyyymmdd</b>—(For Routing Engine profiles) Date.</li> <li><b>timeofday-hhmmss</b>—(For Routing Engine profiles) Time of day.</li> <li><b>uptime</b>—(For Routing Engine profiles) Time since the last reboot, in seconds.</li> <li><b>cpu1min</b>—(For Routing Engine profiles) Average system load over the last 1 minute.</li> <li><b>cpu5min</b>—(For Routing Engine profiles) Average system load over the last 5 minutes.</li> <li><b>cpu15min</b>—(For Routing Engine profiles) Average system load over the last 15 minutes.</li> </ul>
Interface name	Name of the interface configured for this accounting profile.
Filter name	Name of the filter configured for this accounting profile.
routing-engine-stats	Routing Engine accounting profile.
Next Scheduled Collection	Time for next collection of statistics for the named interface.

## Sample Output

```

show accounting profile (Interface) user@host> show accounting profile if_prof
                                     Profile if_prof

## show interfaces source-class

<b>Syntax</b>	<code>show interfaces source-class</code> ( <code>all</code>   <i>destination-class-name</i> <i>logical-interface-name</i> )
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <code>all</code> option introduced in Junos OS Release 8.0.
<b>Description</b>	Display information about interfaces grouped by source class.
<b>Options</b>	<p><code>all</code>—Display information about all configured source classes.</p> <p><i>source-class-name</i>—Name of a logical grouping of prefixes that count packets having the source address matching those prefixes.</p> <p><i>interface-name</i>—Name of a logical interface.</p>
<b>Additional Information</b>	For interfaces that carry IPv4, IPv6, or Multiprotocol Label Switching (MPLS) traffic, you can maintain packet counts based on the entry and exit points for traffic passing through your network. Entry and exit points are identified by source and destination prefixes grouped into sets defined as source classes and destination classes. For more information, see the <a href="#">Junos OS Network Interfaces Configuration Guide</a> .
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show interfaces source-class all on page 52</a>
<b>Output Fields</b>	<a href="#">Table 2 on page 51</a> lists the output fields for the <code>show interfaces source-class</code> command. Output fields are listed in the approximate order in which they appear.

**Table 2: show interfaces source-class Output Fields**

Field Name	Field Description
<b>Logical interface</b>	Name of the logical interface.
<b>Source class</b>	Source class usage (SCU) counters per class for this interface.
<b>Packets</b>	Packets going to designated user-selected prefixes.
<b>Bytes</b>	Bytes going to designated user-selected prefixes.

## Sample Output

```
show interfaces user@host> show interfaces source-class all
source-class all Logical interface so-0/1/0.0
```

Source class	Packets (packet-per-second)	Bytes (bits-per-second)
gold	1928095	161959980
	( 889)	( 597762)
bronze	0	0
	( 0)	( 0)
silver	0	0

## show interfaces statistics

<b>Syntax</b>	<code>show interfaces statistics <i>interface-name</i></code> <code>&lt;detail&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches..
<b>Description</b>	Display static interface statistics, such as errors.
	<div>  <p><b>NOTE:</b> When the <code>show interfaces statistics</code> command is executed on an interface that is configured on T4000 Type 5 FPC, the <i>IPv6 transit statistics</i> field displays:</p> <ul style="list-style-type: none"> <li>• Total statistics (sum of transit and local statistics) at the physical interface level</li> <li>• Transit statistics at the logical interface level</li> </ul> </div>
<b>Options</b>	<i>interface-name</i> —Name of an interface.  <i>detail</i> —(Optional) Display detail output.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear interfaces statistics on page 46</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show interfaces statistics (Fast Ethernet) on page 54</a> <a href="#">show interfaces statistics (Gigabit Ethernet PIC—Egress) on page 54</a> <a href="#">show interfaces statistics detail (Aggregated Ethernet) on page 56</a> <a href="#">show interfaces statistics detail (Aggregated Ethernet—Ingress) on page 57</a> <a href="#">show interfaces statistics detail (Aggregated Ethernet—Egress) on page 58</a> <a href="#">show interfaces statistics (SONET/SDH) on page 60</a> <a href="#">show interfaces statistics (Aggregated SONET/SDH—Ingress) on page 61</a> <a href="#">show interfaces statistics (Aggregated SONET/SDH—Egress) on page 62</a> <a href="#">show interfaces statistics (PTX Series Packet Transport Switches) on page 63</a>
<b>Output Fields</b>	Output from both the <code>show interfaces <i>interface-name</i> detail</code> and the <code>show interfaces <i>interface-name</i> extensive</code> commands include all the information displayed in the output from the <code>show interfaces statistics</code> command. For more information, see the particular interface type in which you are interested. For information about destination class and source class statistics, see the “Destination Class Field” section and the “Source Class Field” section under Common Output Fields Description. For information about the input errors and output errors, see Fast Ethernet and Gigabit Ethernet Counters.

## Sample Output

```

show interfaces statistics (Fast Ethernet)
user@host> show interfaces fe-1/3/1 statistics
Physical interface: fe-1/3/1, Enabled, Physical link is Up
Interface index: 144, SNMP ifIndex: 1042
Description: ford fe-1/3/1
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
CoS queues : 4 supported, 4 maximum usable queues
Current address: 00:90:69:93:04:dc, Hardware address: 00:90:69:93:04:dc
Last flapped : 2006-04-18 03:08:59 PDT (00:01:24 ago)
Statistics last cleared: Never
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
Input errors: 0, Output errors: 0
Active alarms : None
Active defects : None
Logical interface fe-1/3/1.0 (Index 69) (SNMP ifIndex 50)
Flags: SNMP-Traps Encapsulation: ENET2
Protocol inet, MTU: 1500
Flags: Is-Primary, DCU, SCU-in

## show route

<b>Syntax</b>	show route <all> <destination-prefix> <logical-system (all   <i>logical-system-name</i> )> <private>
<b>Syntax (EX Series Switches)</b>	show route <all> <destination-prefix> <private>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>private</b> option introduced in Junos OS Release 9.5. <b>private</b> option introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Display the active entries in the routing tables.
<b>Options</b>	<p><b>none</b>—Display brief information about all active entries in the routing tables.</p> <p><b>all</b>—(Optional) Display information about all routing tables, including private, or internal, routing tables.</p> <p><b>destination-prefix</b>—(Optional) Display active entries for the specified address or range of addresses.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>private</b>—(Optional) Display information only about all private, or internal, routing tables.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route on page 66</a> <a href="#">show route destination-prefix on page 67</a> <a href="#">show route extensive on page 67</a>
<b>Output Fields</b>	<a href="#">Table 3 on page 64</a> describes the output fields for the <b>show route</b> command. Output fields are listed in the approximate order in which they appear.

Table 3: show route Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, <b>inet.0</b> ).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 3: show route Output Fields (*continued*)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>
<i>destination-prefix</i>	<p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
[ <i>protocol, preference</i> ]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>
<i>weeks:days hours:minutes:seconds</i>	<p>How long the route been known (for example, 2w4d 13:11:14, or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).</p>
<i>metric</i>	<p>Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.</p>

Table 3: show route Output Fields (*continued*)

Field Name	Field Description
<b>localpref</b>	Local preference value included in the route.
<b>from</b>	Interface from which the route was received.
<b>AS path</b>	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
<b>to</b>	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
<b>via</b>	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).</li> </ul>
