The information in this document is current as of the date on the title page.

YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Introduction	1
SNMP Overview	1
Example: Retrieving VRF VPN Information Using SNMP	1

Introduction

This document describes how to retrieve and interpret Layer 3 VPN routing and forwarding information by using SNMP.

SNMP Overview

SNMP enables users to monitor network devices from a central location. Many network management systems (NMS) are based on SNMP, and support for this protocol is a key feature of most network devices.

The Juniper Networks® Junos® operating system supports SNMP on many different Juniper Networks platforms. The Junos OS includes an onboard SNMP agent that provides remote management applications with access to detailed information about the devices on the network.

A typical SNMP implementation contains three components:

- Managed devices – Such as routers and switches.
- SNMP agent – Process that resides on a managed device and communicates with the NMS.
- NMS – A combination of hardware and software used to monitor and administer the network; network device that runs SNMP manager software. Also referred to as an SNMP manager.

The SNMP agent exchanges network management information with the SNMP manager (NMS). The agent responds to requests for information and actions from the manager. The SNMP manager collects information about network connectivity, activity, and events by polling managed devices.

SNMP implementation in the Junos OS uses a master SNMP agent (known as the SNMP process or `snmpd`) that resides on the managed device. Various subagents reside on different modules of the Junos OS as well (such as the Routing Engine), and these subagents are managed by the `snmpd`.

Related Documentation

- Configuring SNMP on Devices Running Junos OS

Example: Retrieving VRF VPN Information Using SNMP

This example describes how to retrieve and interpret Layer 3 VPN routing and forwarding information by using SNMP and includes the following sections:

- [Requirements on page 2](#)
- [Overview on page 2](#)

- [Configuration on page 2](#)
- [Verifying VRF VPN Information by Using SNMP on page 2](#)

Requirements

The routers used in this example are Juniper Networks M Series Multiservice Edge Routers, T Series Core Routers, and MX Series 3D Universal Edge Routers. The network management system (NMS) is a workstation running the UNIX operating system with the standard SNMP application available in UNIX.

SNMP applications are preinstalled on Linux and Solaris OS versions of UNIX. SNMP applications are available in open source code and can be installed on any operating system, including Windows systems. Network management applications, such as IBM Tivoli, provide their own SNMP tools.

Overview

This example shows how to retrieve virtual private network (VPN) routing and forwarding (VRF) information using SNMP to display management information base (MIB) objects.

In [Figure 1 on page 2](#):

- Provider edge (PE) routers PE1 and PE2 are configured with a VRF routing instance named **jnpri3vpn**.
- Customer edge (CE) routers CE1 and CE2 communicate across the VPN service using subnetwork 192.1.1.0.

Figure 1: VRF VPN Example Topology

9040549

Configuration

The network is preconfigured with a VRF VPN named **jnpri3vpn** and uses the interfaces and IP addresses shown in [Figure 1 on page 2](#). This example describes how to retrieve the VPN configuration and status information by using SNMP.

Verifying VRF VPN Information by Using SNMP

To confirm the configuration of the VRF VPN, perform these tasks:

- [Display the MPLS VPN MIB on page 3](#)
- [Display the VPN Interface Index Information on page 4](#)
- [Display the VRF Route Table Information on page 5](#)

- [Display the Interface Name for an Interface Index on page 12](#)
- [Display the Interface Index for Interfaces Configured for a VRF Routing Instance on page 12](#)

Display the MPLS VPN MIB

Purpose Retrieve and display a table of information describing the VRF routing instance and the associated attributes on a PE router.

Action To display the VRF routing instance information, use the **snmpwalk** command on a network management station. Specify the SNMP read community string, the router IP address, and the MIB object identifier (OID) to identify which portion of the object identifier space is searched using SNMP GET NEXT requests. In the following example, the SNMP read community string is **petblr**, the IP address is **116.197.178.2**, and the MIB OID is **mplsVpnMIB**. For more information about the **snmpwalk** command, see the man pages on your workstation.

NOTE: The IP address specified in the **snmpwalk** command can be the **fxp0** Ethernet console port, the **lo0.0** loopback interface, or any transit interface that is configured to respond to SNMP requests. By default, all interfaces are configured to respond to SNMP requests.

```
user@host_shell>snmpwalk -v1 -c petblr 116.197.178.2 mplsVpnMIB
```

```
MPLS-VPN-MIB::mplsVpnConfiguredVrfs.0 = Gauge32: 1
MPLS-VPN-MIB::mplsVpnActiveVrfs.0 = Gauge32: 1
MPLS-VPN-MIB::mplsVpnConnectedInterfaces.0 = Gauge32: 2
MPLS-VPN-MIB::mplsVpnNotificationEnable.0 = INTEGER: false(2)
MPLS-VPN-MIB::mplsVpnVrfConfMaxPossibleRoutes.0 = Gauge32: 0
MPLS-VPN-MIB::mplsVpnVrfConfRouteMaxThreshTime.0 = Gauge32: 0 seconds
MPLS-VPN-MIB::mplsVpnVrfVpnId."jnpr13vpn" = ""
MPLS-VPN-MIB::mplsVpnVrfDescription."jnpr13vpn" = STRING: jnpr13vpn
MPLS-VPN-MIB::mplsVpnVrfRouteDistinguisher."jnpr13vpn" = STRING: "1234:1"
MPLS-VPN-MIB::mplsVpnVrfCreationTime."jnpr13vpn" = Timeticks: (114092600) 13 days, 4:55:26.00
MPLS-VPN-MIB::mplsVpnVrfOperStatus."jnpr13vpn" = INTEGER: up(1)
MPLS-VPN-MIB::mplsVpnVrfActiveInterfaces."jnpr13vpn" = Gauge32: 2
MPLS-VPN-MIB::mplsVpnVrfAssociatedInterfaces."jnpr13vpn" = Gauge32: 2
MPLS-VPN-MIB::mplsVpnVrfConfMidRouteThreshold."jnpr13vpn" = Gauge32: 0
MPLS-VPN-MIB::mplsVpnVrfConfHighRouteThreshold."jnpr13vpn" = Gauge32: 0
MPLS-VPN-MIB::mplsVpnVrfConfMaxRoutes."jnpr13vpn" = Gauge32: 0
MPLS-VPN-MIB::mplsVpnVrfConfLastChanged."jnpr13vpn" = Timeticks: (114095300) 13 days, 4:55:53.00
MPLS-VPN-MIB::mplsVpnVrfConfRowStatus."jnpr13vpn" = INTEGER: active(1)
MPLS-VPN-MIB::mplsVpnVrfConfStorageType."jnpr13vpn" = INTEGER: readOnly(5)
MPLS-VPN-MIB::mplsVpnVrfRouteTarget."jnpr13vpn".0.both = STRING: "1234:1"
MPLS-VPN-MIB::mplsVpnVrfRouteTargetDescr."jnpr13vpn".0.both = STRING:
MPLS-VPN-MIB::mplsVpnVrfRouteTargetRowStatus."jnpr13vpn".0.both = INTEGER: active(1)
MPLS-VPN-MIB::mplsVpnVrfPerfRoutesAdded."jnpr13vpn" = Counter32: 19
MPLS-VPN-MIB::mplsVpnVrfPerfRoutesDeleted."jnpr13vpn" = Counter32: 0
MPLS-VPN-MIB::mplsVpnVrfPerfCurrNumRoutes."jnpr13vpn" = Gauge32: 19
```

Meaning In the sample output:

- The **mplsVpnVrfDescription** MIB object shows **jnprl3vpn** as the description of the VRF routing instance configured on the router. If the description is not configured, the MIB object displays the VRF name by default.
- The **mplsVpnVrfRouteDistinguisher** MIB object shows **1234:1** as the route distinguisher for this VPN.
- The **mplsVpnVrfOperStatus** MIB object shows **(up)1** as the operational status of the VRF routing instance.
- The **mplsVpnVrfRouteTarget** MIB object shows **1234:1** as the route target for this VPN.

Another way to display the VRF routing instance information is to use the **show snmp mib** command and specify the MPLS VPN MIB table (**mplsVpnMIB**).

For more information about the MIB objects shown in this sample output, see *draft-ietf-ppvpn-mpls-vpn-mib-05.txt*, *MPLS/BGP Virtual Private Network Management Information Base Using SMIv2*.

Display the VPN Interface Index Information

Purpose Retrieve and display a table of VRF routing instance interface information on a PE router.

Action To display the VRF routing instance interface information, use the **show snmp mib** command. Specify the **walk** option, specify the **jnxVpnMIB** VPN interface MIB table, and to display the information in a more user-friendly format, specify the **ascii** option.

```
user@PE1> show snmp mib walk jnxVpnMIB ascii
```

```
jnxVpnConfiguredVpns.0 = 1
jnxVpnActiveVpns.0 = 1
jnxVpnNextIfIndex.0 = 0
jnxVpnNextPwIndex.0 = 0
jnxVpnNextRTIndex.0 = 0
jnxVpnRowStatus.2."jnprl3vpn" = 1
jnxVpnStorageType.2."jnprl3vpn" = 5
jnxVpnDescription.2."jnprl3vpn" = jnprl3vpn
jnxVpnIdentifierType.2."jnprl3vpn" = 5
jnxVpnIdentifier.2."jnprl3vpn" = 5-1234:1
jnxVpnConfiguredSites.2."jnprl3vpn" = 0
jnxVpnActiveSites.2."jnprl3vpn" = 0
jnxVpnLocalAddresses.2."jnprl3vpn" = 0
jnxVpnTotalAddresses.2."jnprl3vpn" = 0
jnxVpnAge.2."jnprl3vpn" = 31000
jnxVpnIfRowStatus.2."jnprl3vpn".518 = 1
jnxVpnIfRowStatus.2."jnprl3vpn".536 = 1
jnxVpnIfStorageType.2."jnprl3vpn".518 = 5
jnxVpnIfStorageType.2."jnprl3vpn".536 = 5
jnxVpnIfAssociatedPw.2."jnprl3vpn".518 = 0
jnxVpnIfAssociatedPw.2."jnprl3vpn".536 = 0
jnxVpnIfProtocol.2."jnprl3vpn".518 = 0
jnxVpnIfProtocol.2."jnprl3vpn".536 = 0
jnxVpnIfInBandwidth.2."jnprl3vpn".518 = 0
jnxVpnIfInBandwidth.2."jnprl3vpn".536 = 0
jnxVpnIfOutBandwidth.2."jnprl3vpn".518 = 0
```

```
jnxVpnIfOutBandwidth.2."jnpr13vpn".536 = 0
jnxVpnIfStatus.2."jnpr13vpn".518 = 5
jnxVpnIfStatus.2."jnpr13vpn".536 = 5
jnxVpnRTRowStatus.2."jnpr13vpn".1 = 1
jnxVpnRTStorageType.2."jnpr13vpn".1 = 5
jnxVpnRTType.2."jnpr13vpn".1 = 6
jnxVpnRT.2."jnpr13vpn".1 = 1234:1
jnxVpnRTFunction.2."jnpr13vpn".1 = 3
```

Meaning In the sample output:

- The **jnxVpnDescription** MIB object shows the description of the VRF routing instance. In this example, the description is the name of the VRF routing instance.
- The **jnxVpnIfRowStatus** MIB object shows the operational status of the VRF routing instance interfaces. The last index in the table identifies the interface index (ifIndex) of the interface. In this example, the highlighted interface indexes are **518** and **536**.

The following MIB object definitions are from the enterprise-specific MIB files supplied by Juniper Networks. The MIB object description can be useful in understanding the meaning and purpose of a MIB object. The following sample definitions are provided for your reference.

```
jnxVpnIfEntry OBJECT-TYPE
    SYNTAX      JnxVpnIfEntry
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
        "Entry containing information about a particular VPN
         interface."
    INDEX { jnxVpnIfVpnType, jnxVpnIfVpnName, jnxVpnIfIndex }
    ::= { jnxVpnIfTable 1 }
```

```
jnxVpnIfIndex OBJECT-TYPE
    SYNTAX      Unsigned32
    MAX-ACCESS  accessible-for-notify
    STATUS      current
    DESCRIPTION
        "The index of this interface in the VPN. Each interface
         in the VPN is given a unique index. The RowStatus says
         whether a given interface (i.e., a row in this table)
         is valid or not. Note: this index MUST NOT be zero."
    ::= { jnxVpnIfEntry 3 }
```

Supported MIBs are described in the *Junos OS SNMP MIBs and Traps Reference*. Juniper Networks enterprise-specific MIBs can be downloaded from http://www.juniper.net/techpubs/en_US/release-independent/junos/mibs/mibs.html.

For more information about the **show snmp mib** command, see the *Junos OS System Basics and Services Command Reference*.

Display the VRF Route Table Information

Purpose Retrieve and display a table of information describing the VRF routing table on a PE router.

Action To display the VRF routing table information, use the **snmpwalk** command on a network management station. Specify the name of the VRF routing instance and the SNMP read community string in the format **vrfname@communitystring**. Also specify the router IP address and the MIB OID. In the following example, the routing instance is **jnp13vpn**, the SNMP read community string is **petblr**, the IP address is **116.197.178.2**, and the OID is **1.3.6.1.2.1.4**.

```
user@host_shell>snmpwalk -v1 -c jnp13vpn@petblr 116.197.178.2 1.3.6.1.2.1.4
```

```

```

Meaning In the sample output:

- The **IP-MIB::ipNetToMediaPhysAddress.518.8.8.8.9** MIB object shows the Ethernet MAC address of the interface that has IP address **8.8.8.9**, and is directly connected to the interface with interface index **518**.
- The **IP-MIB::ipNetToMediaNetAddress.518.8.8.8.9** MIB object shows the IP address of the interface directly connected to the interface with interface index **518**.
- The **IP-FORWARD-MIB::ipCidrRouteDest.192.1.1.3.255.255.255.255.0.8.8.8.9** MIB object shows there is a route to reach IP address **192.1.1.3**, which is the address configured on the loopback interface (**lo0**) of Router CE1.

- The **IP-FORWARD-MIB::ipCidrRouteNextHop.192.1.1.3.255.255.255.255.0.8.8.8.9** MIB object shows the next hop for reaching IP address **192.1.1.3** through the interface with interface index **518**.
- The **IP-FORWARD-MIB::ipCidrRouteIfIndex.1.1.1.0.255.255.255.0.0.8.8.8.9** MIB object shows the interface index for the interface used to reach IP subnetwork **1.1.1.0**.
- The **IP-FORWARD-MIB::ipCidrRouteIfIndex.8.8.8.0.255.255.255.0.0.0.0.0.0** MIB object shows the interface index for the interface used to reach IP subnetwork **8.8.8.0**.
- The **IP-FORWARD-MIB::ipCidrRouteIfIndex.192.1.1.3.255.255.255.255.0.8.8.8.9** MIB object shows the interface index for the interface used to reach IP address **192.1.1.3**.

Display the Interface Name for an Interface Index

Purpose	Retrieve and display the interface name for a given interface index.
Action	To display the interface name for a given interface index, use the show snmp mib command and specify the interface index number: user@PE2> show snmp mib get ifName.518 ifName.518 = ge-1/0/1.0
Meaning	In the sample output, interface index 518 is identified as the ge-1/0/1.0 interface.

Display the Interface Index for Interfaces Configured for a VRF Routing Instance

Purpose	Retrieve and display the interface index for a given VRF routing instance.
Action	To display the interface index for a given VRF routing instance, use the snmpwalk command on a network management station. Specify the name of the VRF routing instance and the SNMP read community string in the format vrfname@communitystring . Also specify the IP address of the router and the MIB object identifier (OID). In the following example, the routing instance name is jnprl3vpn , the SNMP read community string is petblr , the IP address is 116.197.178.2 , and the MIB OID is 1.3.6.1.2.1.2 . user@host_shell>snmpwalk -v1 -c jnprl3vpn@petblr 116.197.178.2 1.3.6.1.2.1.2 Did not find 'ifIndex' in module RFC1213-MIB (D:\usr\share\snmp\mibs/rfc1215.mib) Did not find 'egpNeighAddr' in module RFC1213-MIB (D:\usr\share\snmp\mibs/rfc1215.mib) Did not find 'sysName' in module RFC1213-MIB (D:\usr\share\snmp\mibs/mib-ex2500-priv.txt) Did not find 'sysLocation' in module RFC1213-MIB (D:\usr\share\snmp\mibs/mib-ex2500-priv.txt) Did not find 'sysContact' in module RFC1213-MIB (D:\usr\share\snmp\mibs/mib-ex2500-priv.txt) Did not find 'ifIndex' in module RFC1213-MIB (D:\usr\share\snmp\mibs/mib-ex2500-priv.txt) IF-MIB::ifNumber.0 = INTEGER: 59 IF-MIB::ifIndex.4 = INTEGER: 4 IF-MIB::ifIndex.516 = INTEGER: 516 IF-MIB::ifIndex.518 = INTEGER: 518 IF-MIB::ifIndex.536 = INTEGER: 536 IF-MIB::ifDescr.4 = STRING: lsi IF-MIB::ifDescr.516 = STRING: ge-1/0/1

```

Meaning In the sample output:

- Interface index **516** is physical interface **ge-1/0/1**.
- Interface index **518** is logical interface **ge-1/0/1.0**.
- Interface index **536** is label-switched interface **lsi.512**
