Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- M Series
- T Series
- MX Series
- J Series

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the CLI User Guide.

Documentation Conventions

Table 1 on page ix defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 2 on page ix defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies book names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS System Basics Configuration Guide</i> RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Enclose optional keywords or variables.	stub <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Enclose a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identify a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
J-Web GUI Conventions		
Bold text like this	Represents J-Web graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>

- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

PART 1

Overview

- [Stateful Firewall on page 3](#)

CHAPTER 1

Stateful Firewall

- [Loading the Stateful Firewall Plug-In on page 3](#)

Loading the Stateful Firewall Plug-In

As of Junos OS Release 9.5, a stateful firewall plug-in is provided as part of the jbundle package. To load this plug-in on the PIC, include the **package jservices-sfw** statement at the **[edit chassis fpc slot-number pic slot-number adaptive-services service-package extension-provider]** hierarchy level. For example:

```
user@host# show chassis
fpc 0 {
  pic 2 {
    adaptive-services {
      service-package {
        extension-provider {
          control-cores 1;
          data-cores 7;
          object-cache-size 512;
          package jservices-sfw; #Loads stateful firewall plug-in.
          policy-db-size 64;
        }
      }
    }
  }
}
```

You can load both the **jservices-sfw** package and a Junos SDK application package on the same PIC.

The following example demonstrates the stateful firewall plug-in coexisting with a provider's plug-in:

```
[edit]
services {
  service-set sset {
    stateful-firewall-rules rule1;
    interface-service {
      service-interface ms-0/0/0;
    }
    extension-service customer-plugin;
    service-order {
      forward-flow [ stateful-firewall customer-plugin ];
    }
  }
}
```

```
}
stateful-firewall {
  rule rule1 {
    match-direction input-output;
    term term1 {
      from {
        applications junos-ftp;
      }
      then {
        accept;
      }
    }
  }
  rule rule2 {
    match-direction input;
    term term1 {
      from {
        source-address {
          192.1.1.2/32;
        }
      }
      then {
        reject;
        syslog;
      }
    }
  }
}
```

The following stateful firewall operational commands support the **ms-** interface:

- **show services stateful-firewall flows**—Display stateful firewall flow table entries.
- **show services stateful-firewall statistics**—Display stateful firewall statistics. For this command, only rule and ALG statistics are given. In the extensive option, other statistics appear but do not populate correctly; those values are all zeroes.
- **clear services stateful-firewall flows**—Remove established flows from the flow table.

The commands are described in the Junos OS Operational Mode Commands.

PART 2

Configuration

- [Configuration Tasks on page 7](#)
- [Configuration Statements on page 9](#)

CHAPTER 2

Configuration Tasks

- [Configuring Memory for the Stateful Firewall Plug-In on page 7](#)
- [Configuring rsh, rlogin, rexec for Stateful Firewall on page 7](#)

Configuring Memory for the Stateful Firewall Plug-In

When configuring the stateful firewall internal plug-in, some questions remain regarding the upper limit to specify for the **policy-db-size**, **object-cache-size**, and **forwarding-db-size** statements when the application needs to use a large number of rules, causing the total memory required to approach the size of the object cache configured. The following limits, which are specific to the stateful firewall configuration, await additional review:

- Maximum number of terms (with one rule per term) per service set: 1200
- Maximum number of service sets per Multiservices PIC: 4000 (Juniper Networks M Series Multiservice Edge Routers and T Series Core Routers), 6000 (Juniper Networks MX Series 3D Universal Edge Routers and M120 Multiservice Edge Routers)
- Maximum object cache size: 1280 MB (Multiservices 400 PICs and DPCs), 512 MB (Multiservices 100 PICs)
- Maximum policy database size: Still to be determined.

If the policy database is set too small, an error message is logged in the router message file even though the commit may appear to be successful. It is necessary to check the logs to make sure that no message file error is found to be sure that the stateful firewall commit was indeed successful. The remedial action is to increase the size of the policy database.

Related Documentation

- [extension-provider on page 12](#)

Configuring rsh, rlogin, rexec for Stateful Firewall

Some implementations of the rsh, rlogin, rexec mechanism require the remote host to authenticate the request by opening a separate TCP session to port 113 on the client host. By default, the stateful firewall does not allow this authentication flow to go through.

To open the authentication flow, include the **applications junos-ident** statement at the **[edit services stateful-firewall rule *rule-name* term *term-name* from]** hierarchy level:

```
[edit]
services {
  stateful-firewall {
    rule rule1 {
      term term1 {
        from {
          (source-address | destination-address);
          applications junos-ident;
        }
        then {
          accept;
        }
      }
    }
  }
}
```

To allow Kerberos-enabled rsh, rlogin, rexec through the stateful firewall, configure the following additional applications and include them in the stateful firewall terms:

```
[edit]
applications {
  application test-kerberos-kshell {
    Protocol tcp;
    destination-port kshell;
  }
  application test-kerberos-klogin {
    protocol tcp;
    destination-port klogin;
  }
}

services {
  stateful-firewall {
    rule rule1 {
      term term1 {
        from {
          applications [kerberos-klogin kerberos-kshell];
        }
        then {
          accept;
        }
      }
    }
  }
}
```

CHAPTER 3

Configuration Statements

control-cores

Syntax	<code>control-cores control-number;</code>
Hierarchy Level	<code>[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]</code>
Release Information	Statement introduced in Junos OS Release 9.0.
Description	Configure control cores. Any cores not configured as either control or data cores are treated as user cores. When the number of control cores is changed, the PIC reboots.
Options	control-number —Number of control cores. At least one core must be a control core. Range: 1 through 8
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">Configuring Control and Data Coresdata-cores on page 10

data-cores

Syntax	<code>data-cores <i>data-number</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]</code>
Release Information	Statement introduced in Junos OS Release 9.0.
Description	Configure data cores. Any cores not configured as either data or control cores are treated as user cores. When the number of data cores is changed, the PIC reboots.
Options	<p><i>data-number</i>—Number of data cores. Although it is not mandatory to dedicate any cores as data cores, it is advisable, depending on the nature of the application, to dedicate a minimum of five as data cores to achieve good performance.</p> <p>Range: 0 through 7</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">Configuring Control and Data Corescontrol-cores on page 9

data-flow-affinity

Syntax	<pre>data-flow-affinity { hash-key (layer-3 layer-4); }</pre>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	<p>Enable flow affinity distribution for packets over data CPUs on the PIC. Once enabled, the default behavior distributing data packets changes from a round-robin distribution to a flow affinity distribution based on a hash distribution. Adding or deleting this statement causes the PIC to reboot.</p> <p>The statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">Configuring Packet Distribution Settings

destination (Chassis)

Syntax	<code>destination <i>destination</i>;</code>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider syslog facility]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	Configure where log messages go. By default, all messages go to the <code>/var/log</code> directory on the Routing Engine. Enhancements to the existing infrastructure make debugging on the Multiservices PIC easier by giving the user the option of redirecting log messages. When the syslog destination statement is configured to redirect the log messages, you can use the set system syslog command, a command available in the native Junos OS CLI, to override the syslog settings made on the Multiservices PIC.
Options	<p>destination—Choose one of the following options:</p> <ul style="list-style-type: none"> routing-engine—Forward log messages to the Routing Engine. pic-console—Forward log messages to the console of the PIC.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring System Log Messages extension-provider on page 12

extension-provider

Syntax	<pre>extension-provider { control-cores <i>control-number</i>; data-cores <i>data-number</i>; data-flow-affinity { hash-key (layer-3 layer-4); } forwarding-db-size <i>size</i>; object-cache-size <i>size</i>; package <i>package-name</i>; policy-db-size <i>size</i>; syslog { facility { severity; destination <i>destination</i>; } } wired-process-mem-size <i>mem-size</i>; }</pre>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package]
Release Information	Statement introduced in Junos OS Release 9.0.
Description	<p>Configure an application on a PIC. When the extension-provider statement is first configured, the PIC reboots.</p> <p>The statements are explained separately.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Control and Data Cores• Configuring Packet Distribution Settings• Configuring Memory Settings• Configuring Packages on the PIC• Configuring System Log Messages

forwarding-db-size

Syntax	forwarding-db-size <i>size</i> ;
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Release Information	Statement introduced in Junos OS Release 9.2.
Description	Configure the size of the forwarding database (FDB). When this setting is changed, the PIC reboots.
<div>  <p>NOTE: You need to enable the <code>forwarding-options sampling</code> statement for the FDB to be created.</p> </div>	
Options	<p>size—Size of the FDB, in megabytes (MB). The size of the FDB and the size of the policy database together must be smaller than the size of the object cache.</p> <p>Range: 0 through 12879 MB</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring Memory Settings policy-db-size on page 16 wired-process-mem-size on page 18 object-cache-size on page 15

hash-key (Chassis)

Syntax	hash-key (layer-3 layer-4);
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider data-flow-affinity]
Release Information	Statement introduced in Junos OS Release 10.2.
Description	Set the hashing distribution of flow affinity. This is an optional setting. Once the data-flow-affinity statement is enabled, you may need to choose the hashing distribution. Modifying this statement causes the PIC to reboot.
Default	If you do not configure the hash-key statement, the hashing distribution is 5-tuple hashing, or layer-4 .
Options	layer-3 —3-tuple hashing (source IP address, destination IP address, and IP protocol). layer-4 —5-tuple hashing (3-tuple plus source and destination TCP or UDP ports).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">Configuring Packet Distribution Settingsextension-provider on page 12

object-cache-size

Syntax	<code>object-cache-size <i>value</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]</code>
Description	Configure the size of the object cache. When this setting is changed, the PIC reboots.
Options	<p>value—Amount of object cache, in MB. Only values in increments of 128 MB are allowed.</p> <p>Range: For Multiservices 100 PIC, range is 128 MB through 512 MB. If the wired-process-mem-size statement at the same hierarchy level has a value of 512 MB, the maximum value for this statement is 128 MB.</p> <p>Range: For Multiservices 400 PIC, range is 128 MB through 1280 MB. If the wired-process-mem-size statement at the same hierarchy level has a value of 512 MB, the maximum value for this statement is 512 MB.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

package (Loading on PIC)

Syntax	<code>package <i>package-name</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]</code>
Release Information	Statement introduced in Junos OS Release 9.1.
Description	Identify a package to be loaded on the PIC. When a package is added or removed, the PIC reboots.
Options	<p>package-name—Name of the package to be loaded on the PIC. There can be up to eight packages loaded on a PIC; however, only one data package is allowed per PIC. An error message is displayed if more than eight packages are specified.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring Packages on the PIC

policy-db-size

Syntax	<code>policy-db-size <i>size</i>;</code>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Description	Configure the size of the policy database. When this setting is changed, the PIC reboots.
	<div> NOTE: At least one data core must be configured to configure the size of the policy database.</div>
Options	<p>size—Size of the policy database, in megabytes (MB). The size of the forwarding database and the size of the policy database together must be smaller than the size of the object cache.</p> <p>Range: 0 through 1279 MB</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Memory Settings• forwarding-db-size on page 13• object-cache-size on page 15• wired-process-mem-size on page 18

syslog (Chassis)

Syntax	<pre> syslog { facility { severity; destination destination; } } </pre>
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package <i>extension-provider</i>]
Release Information	<p>Statement introduced in Junos OS Release 9.2.</p> <p>Options daemon and kernel (for facility) introduced in Junos OS Release 9.5.</p>
Description	Enable PIC system logging to record or view system log messages on a specific PIC. The system log information is passed to the kernel for logging in the /var/log directory.
Options	<p>facility—Group of messages that are either generated by the same software process or concern a similar condition or activity. Possible values include the following: daemon, external, kernel, and pfe.</p> <p>severity—Classification of effect on functioning. Possible values are the following options:</p> <ul style="list-style-type: none"> • any—Include all severity levels. • none—Disable logging of the associated facility to a destination. • emergency—System panic or other condition that causes the routing platform to stop functioning. • alert—Conditions that require immediate correction, such as a corrupted system database. • critical—Critical conditions, such as hard errors. • error—Error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels. • warning—Conditions that warrant monitoring. • notice—Conditions that are not errors but might warrant special handling. • info—Events or nonerror conditions of interest. <p>The remaining statement is explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring System Log Messages

wired-process-mem-size

Syntax	wired-process-mem-size <i>mem-size</i> ;
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> adaptive-services service-package extension-provider]
Description	Configure the size of the reserved wired process memory. You can also configure object cache. If this setting is changed, the PIC reboots.
Options	megabytes —Size of the reserved wired process memory, in MB. The only size you can set for this statement is 512 MB. Default: 512 MB Range: 0 through 512 MB
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Memory Settings• forwarding-db-size on page 13• object-cache-size on page 15• policy-db-size on page 16• wired-max-processes

CHAPTER 4

Stateful Firewall Operational Mode Commands

clear services stateful-firewall flows (SDK)

Syntax	clear services stateful-firewall flows <interface <i>interface-name</i> >
Release Information	For routers running Junos SDK applications, support for ms- interfaces added in Junos OS Release 9.5.
Description	Remove established flows from the flow table.
Options	none —Clear all stateful firewall flows. interface <i>interface-name</i> —(Optional) Clear stateful firewall flows for the named interface.
Required Privilege Level	clear
Output Fields	There is no output for this command.

show services stateful-firewall flows (SDK)

Syntax	show services stateful-firewall flows <interface <i>interface-name</i> >
Release Information	For routers running Junos SDK applications, support for ms- interfaces added in Junos OS Release 9.5.
Description	Display stateful firewall flow table entries.
Options	none —Display standard information about all stateful firewall flows. interface <i>interface-name</i> —(Optional) Display information about the named interface.
Required Privilege Level	view
List of Sample Output	show services stateful-firewall flows on page 23
Output Fields	Table 3 on page 23 lists the output fields for the show services stateful-firewall flows command. Output fields are listed in the approximate order in which they appear.

Table 3: show services stateful-firewall flows Output Fields

Field	Field Description
Interface	Interface ID.
Service set	Name of service set.
Flow	Protocol used for the flow.
State	Status of the flow.
Dir	Direction of the flow: input (I) and output (O).
Frm count	Number of frames in the flow.

Sample Output

```

show services stateful-firewall flows
user@host> show services stateful-firewall flows
Interface: ms-2/2/0, Service ser: sset1
Flow Stats Dir Frm count
TCP 192.1.1.2.37822 -> 192.2.1.2.21 Watch I 16
TCP 192.2.1.2.21 -> 192.1.1.2.37822 Watch O 13
TCP 192.1.1.2.37822 -> 192.2.1.2.40598 Unknown I 2
TCP 192.2.1.2.40598 -> 192.1.1.2.37822 Unknown O 1

```

show services stateful-firewall statistics (SDK)

Syntax	show services stateful-firewall statistics <extensive>
Release Information	For routers running Junos SDK applications, support for ms- interfaces added in Junos OS Release 9.5.
Description	Display only rule statistics or rule and application-level gateway (ALG) statistics.
Options	<p>none—Display standard information about all stateful firewall statistics. For Multiservices interfaces, standard information is only rule statistics.</p> <p>extensive—(Optional) Display the extensive level of output. For Multiservices interfaces, the extensive level gives just rule and ALG statistics. Other statistics shown do not populate correctly and show all zeros.</p>
Required Privilege Level	view
List of Sample Output	show services stateful-firewall statistics on page 24
Output Fields	Table 4 on page 24 lists the output fields for the show services stateful-firewall statistics command. Output fields are listed in the approximate order in which they appear.

Table 4: show services stateful-firewall statistics Output Fields

Field	Field Description
Interface	Interface ID.
Service set	Name of service set.
Accept	Number of flows accepted.
Discard	Number of flows discarded.
Reject	Number of flows rejected.
Errors	Number of errors.

Sample Output

```

show services stateful-firewall statistics
user@host> show services stateful-firewall statistics
Interface Service set Accept Discard Reject Errors
ms-5/1/0    sset1         1      1      0      0

```
