Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Clear Simple Network Management Protocol (SNMP) statistics.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show snmp statistics on page 1148
List of Sample Output	clear snmp statistics on page 1123
Output Fields	See show snmp statistics for an explanation of output fields.

Sample Output

clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,
    Too bigs: 0, No such names: 0, Bad values: 0,
    Read onlys: 0, General errors: 0,
    Total request varbinds: 8, Total set varbinds: 0,
    Get requests: 0, Get nexts: 8, Set requests: 0,
    Get responses: 0, Traps: 0,
    Silent drops: 0, Proxy drops 0
  Output:
    Packets: 2298, Too bigs: 0, No such names: 0,
    Bad values: 0, General errors: 0,
    Get requests: 0, Get nexts: 0, Set requests: 0,
    Get responses: 8, Traps: 2290

user@host> clear snmp statistics

user@host> show snmp statistics
SNMP statistics:

request snmp spoof-trap

Syntax	request snmp spoof-trap <trap> variable-bindings <object> <instance> <value>
Release Information	Command introduced in Junos OS Release 8.2. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Spoof (mimic) the behavior of a Simple Network Management Protocol (SNMP) trap.
Options	<trap> —Name of the trap to spoof. variable-bindings <object> <instance> <value> —(Optional) List of variables and values to include in the trap. Each variable binding is specified as an object name, the object instance, and the value (for example, ifIndex[14] = 14). Enclose the list of variable bindings in quotation marks (" ") and use a comma to separate each object name, instance, and value definition (for example, variable-bindings "ifIndex[14] = 14, ifAdminStatus[14] = 1, ifOperStatus[14] = 2"). Objects included in the trap definition that do not have instances and values specified as part of the command are included in the trap and spoofed with automatically generated instances and values. <dummy name> —A dummy trap name to display the list of available traps. Question mark (?) —Question mark? to display possible completions.
Required Privilege Level	request
List of Sample Output	request snmp spoof-trap (with Variable Bindings) on page 1125 request snmp spoof-trap (Illegal Trap Name) on page 1125 request snmp spoof-trap (Question Mark ?) on page 1129

Sample Output

**request snmp
spooof-trap (with
Variable Bindings)**

```
user@host> request snmp spooof-trap linkUp variable-bindings "ifIndex[14] = 14, ifAdminStatus[14]
= 1, ifOperStatus[14] = 2"
Spooof trap request result: trap sent successfully
```

**request snmp
spooof-trap (Illegal
Trap Name)**

```
user@host> request snmp spooof-trap xx
Spooof trap request result: trap not found
```

```

show snmp health-monitor

Syntax	<code>show snmp health-monitor</code> <code><alarms <detail>> <logs></code>
Release Information	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display information about Simple Network Management Protocol (SNMP) health monitor alarms and logs.
Options	none —Display information about all health monitor alarms and logs. alarms <detail> —(Optional) Display detailed information about health monitor alarms. logs —(Optional) Display information about health monitor logs.
Required Privilege Level	view
List of Sample Output	show snmp health-monitor on page 1133 show snmp health-monitor alarms detail on page 1134
Output Fields	Table 130 on page 1130 describes the output fields for the show snmp health-monitor command. Output fields are listed in the approximate order in which they appear.

Table 130: show snmp health-monitor Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels
Variable description	Description of the health monitor object instance being monitored.	All levels
Variable name	Name of the health monitor object instance being monitored.	All levels
Value	Current value of the monitored variable in the most recent sample interval.	All levels

Table 130: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the alarm or event entry:</p> <ul style="list-style-type: none"> Alarms: <ul style="list-style-type: none"> active—Entry is fully configured and activated. falling threshold crossed—Value of the variable has crossed the lower threshold limit. rising threshold crossed—Value of the variable has crossed the upper threshold limit. under creation—Entry is being configured and is not yet activated. startup—Alarm is waiting for the first sample of the monitored variable. object not available—Monitored variable of that type is not available to the health monitor agent. instance not available—Monitored variable's instance is not available to the health monitor agent. object type invalid—Monitored variable is not a numeric value. object processing errored—An error occurred when the monitored variable was processed. unknown—State is not one of the above. 	All levels
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.	detail
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of absolute value or delta value .	detail
Startup alarm	<p>Alarm that might be sent when this entry is first activated, depending on the following criteria:</p> <ul style="list-style-type: none"> Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is either falling alarm or rising or falling alarm. Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is rising alarm. Value of the alarm is between the thresholds. 	detail
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has monitor prepended to it.	detail
Creator	Mechanism by which the entry was configured (Health Monitor).	detail
Sample interval	Time period between samples (in seconds).	detail
Rising threshold	Upper limit threshold value as a percentage of the maximum possible value.	detail

Table 130: show snmp health-monitor Output Fields (*continued*)

Field Name	Field Description	Level of Output
Falling threshold	Lower limit threshold value as a percentage of the maximum possible value.	detail
Rising event index	Event triggered when the rising threshold is crossed.	detail
Falling event index	Event triggered when the falling threshold is crossed.	detail

Sample Output

show snmp inform-statistics

Syntax	show snmp inform-statistics
Release Information	Command introduced in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display information about Simple Network Management Protocol (SNMP) inform requests.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show snmp inform-statistics on page 1139
Output Fields	Table 131 on page 1138 describes the output fields for the show snmp inform-statistics command. Output fields are listed in the approximate order in which they appear.

Table 131: show snmp inform-statistics Output Fields

Field Name	Field Description
Target Name	Name of the device configured to receive and respond to SNMP informs.
Address	IP address of the target device.
Sent	Number of informs sent to the target device and acknowledged by the target device.
Pending	Number of informs held in memory pending a response from the target device.
Discarded	Number of informs discarded after the specified number of retransmissions to the target device were attempted.
Timeouts	Number of informs that did not receive an acknowledgement from the target device within the timeout specified.
Probe Failures	Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address).

Sample Output

`show snmp`
`inform-statistics`

```
user@host> show snmp inform-statistics
Inform Request Statistics:
Target Name: TA1_v3_md5_none Address: 172.17.20.184
Sent: 176, Pending: 0
Discarded: 0, Timeouts: 0, Probe Failures: 0
Target Name: TA2_v3_sha_none Address: 192.168.110.59
Sent: 0, Pending: 4
Discarded: 84, Timeouts: 0, Probe Failures: 258
Target Name: TA5_v2_none Address: 172.17.20.184
Sent: 0, Pending: 0
Discarded: 2, Timeouts: 10, Probe Failures: 0
```

show snmp mib

Syntax	<code>show snmp mib (get get-next walk) (ascii decimal) <i>object-id</i></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>ascii and decimal options introduced in Junos OS Release 9.6.</p> <p>ascii and decimal options introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.
Options	<p>get—Retrieve and display one or more SNMP object values.</p> <p>get-next—Retrieve and display the next SNMP object values.</p> <p>walk—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p>ascii—Display the SNMP object's string indices as an ASCII-key representation.</p> <p>decimal—Display the SNMP object values in the decimal (default) format. The decimal option is the default option for this command. Therefore, issuing the show snmp mib (get get-next walk) decimal object-id and the show snmp mib (get get-next walk) object-id commands display the same output.</p> <p>object-id—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as interfaces). When entering multiple objects, enclose the objects in quotation marks.</p>
Required Privilege Level	snmp—To view this statement in the configuration.
List of Sample Output	<p>show snmp mib get on page 1142</p> <p>show snmp mib get (Multiple Objects) on page 1142</p> <p>show snmp mib get (Layer 2 Policer) on page 1142</p> <p>show snmp mib get-next on page 1142</p> <p>show snmp mib get-next (Specify an OID) on page 1142</p> <p>show snmp mib walk on page 1142</p> <p>show snmp mib walk (QFX Series) on page 1142</p> <p>show snmp mib walk decimal on page 1142</p> <p>show snmp mib walk (ASCII) on page 1142</p> <p>show snmp mib walk (Multiple Indices) on page 1142</p> <p>show snmp mib walk decimal (Multiple Indices) on page 1143</p>
Output Fields	<p>Table 132 on page 1141 describes the output fields for the show snmp mib command. Output fields are listed in the approximate order in which they appear.</p>

Table 132: show snmp mib Output Fields

Field Name	Field Description
<i>name</i>	Object name and numeric instance value.
<i>object value</i>	Object value. The Junos OS translates OIDs into the corresponding object names.

Sample Output

.....
```

show snmp rmon

Syntax	<code>show snmp rmon</code> <code><alarms <brief detail> events <brief detail> logs></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display information about Simple Network Management Protocol (SNMP) Remote Monitoring (RMON) alarms and events.
Options	<p>none—Display information about all RMON alarms and events.</p> <p>alarms—(Optional) Display information about RMON alarms.</p> <p>brief detail—(Optional) Display brief or detailed information about RMON alarms or events.</p> <p>events—(Optional) Display information about RMON events.</p> <p>logs—(Optional) Display information about RMON monitoring logs.</p>
Required Privilege Level	view
List of Sample Output	show snmp rmon on page 1147 show snmp rmon alarms detail on page 1147 show snmp rmon events detail on page 1147
Output Fields	Table 133 on page 1144 describes the output fields for the show snmp rmon command. Output fields are listed in the approximate order in which they appear.

Table 133: show snmp rmon Output Fields

Field Name	Field Description	Level of Output
Alarm Index	Alarm identifier.	All levels

Table 133: show snmp rmon Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the alarm or event entry:</p> <p>Alarms:</p> <ul style="list-style-type: none"> • active—Entry is fully configured and activated. • falling threshold crossed—Value of the variable has crossed the lower threshold limit. • rising threshold crossed—Value of the variable has crossed the upper threshold limit. • under creation—Entry is being configured and is not yet activated. • startup—Alarm is waiting for the first sample of the monitored variable. • object not available—Monitored variable of that type is not available to the SNMP agent. • instance not available—Monitored variable's instance is not available to the SNMP agent. • object type invalid—Monitored variable is not a numeric value. • object processing errored—An error occurred when the monitored variable was processed. • unknown—State is not one of the above. <p>Events:</p> <ul style="list-style-type: none"> • active—Entry has been fully configured and activated. • under creation—Entry is being configured and is not yet activated. • unknown—State is not one of the above. 	All levels
Variable name	Name of the SNMP object instance being monitored.	All levels
Event Index	Event identifier.	All levels
Type	<p>Type of notification made when an event is triggered. It can be one of the following:</p> <ul style="list-style-type: none"> • log—A system log message is generated and an entry is made to the log table. • snmptrap—An SNMP trap is sent to the configured destination. • log and trap—A system log message is generated, an entry is made to the log table, and an SNMP trap is sent to the configured destination. • none—Neither log nor trap will be sent. 	detail
Last Event	Date and time of the last event. It has the format <i>yyyy-mm-dd hh:mm:ss timezone</i> .	brief
Community	Identifies the trap group used for sending the SNMP trap.	detail
Variable OID	Object ID to which the variable name is resolved. The format is x.x.x.x.	detail
Sample type	Method of sampling the monitored variable and calculating the value to compare against the upper and lower thresholds. It can have the value of absolute value or delta value .	detail

Table 133: show snmp rmon Output Fields (*continued*)

Field Name	Field Description	Level of Output
Startup alarm	<p>Alarm that might be sent when this entry is first activated, depending on the following criteria:</p> <ul style="list-style-type: none"> Alarm is sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is either rising alarm or rising or falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is either falling alarm or rising or falling alarm. Alarm is <i>not</i> sent when one of the following situations exists: <ul style="list-style-type: none"> Value of the alarm is above or equal to the rising threshold and the startup type is falling alarm. Value of the alarm is below or equal to the falling threshold and the startup type is rising alarm. Value of the alarm is between the thresholds. 	detail
Owner	Name of the entry configured by the user. If the entry was created through the CLI, the owner has monitor prepended to it.	detail
Creator	Mechanism by which the entry was configured (CLI or SNMP).	detail
Sample interval	Time period between samples (in seconds).	detail
Rising threshold	Upper limit threshold value configured by the user.	detail
Falling threshold	Lower limit threshold value configured by the user.	detail
Rising event index	Event triggered when the rising threshold is crossed.	detail
Falling event index	Event triggered when the falling threshold is crossed.	detail
Current value	Current value of the monitored variable in the most recent sample interval.	detail

show snmp statistics

Syntax	show snmp statistics
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear snmp statistics on page 1122
List of Sample Output	show snmp statistics on page 1151
Output Fields	Table 134 on page 1148 describes the output fields for the show snmp statistics command. Output fields are listed in the approximate order in which they appear.

Table 134: show snmp statistics Output Fields

Field Name	Field Description
Input	<p>Information about received packets:</p> <ul style="list-style-type: none"> • Packets(snmplnPkts)—Total number of messages delivered to the SNMP entity from the transport service. • Bad versions—(snmplnBadVersions) Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version. • Bad community names—(snmplnBadCommunityNames) Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity. • Bad community uses—(snmplnBadCommunityUses) Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message. • ASN parse errors—(snmplnASNParseErrs) Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. • Too big—(snmplnTooBig) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of tooBig. • No such names—(snmplnNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName. • Bad values—(snmplnBadValues) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of badValue. • Read only—(snmplnReadOnly) Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of readOnly. Only incorrect implementations of SNMP generate this error.

Table 134: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> • General errors—(snmpInGenErrs) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of genErr. • Total requests varbinds—(snmpInTotalReqVars) Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP GetRequest and GetNext PDUs. • Total set varbinds—(snmpInSetVars) Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP SetRequest PDUs. • Get requests—(snmpInGetRequests) Total number of SNMP GetRequest PDUs that have been accepted and processed by the SNMP entity. • Get nexts—(snmpInGetNexts) Total number of SNMP GetNext PDUs that have been accepted and processed by the SNMP entity. • Set requests—(snmpInSetRequests) Total number of SNMP SetRequest PDUs that have been accepted and processed by the SNMP entity. • Get responses—(snmpInGetResponses) Total number of SNMP GetResponse PDUs that have been accepted and processed by the SNMP entity. • Traps—(snmpInTraps) Total number of SNMP traps generated by the SNMP entity. • Silent drops—(snmpSilentDrops) Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests. • Proxy drops—(snmpProxyDrops) Total number of GetRequest, GetNextRequest, GetBulkRequest, SetRequests, and InformRequest PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned. • Commit pending drops—Number of SNMP packets for Set requests dropped because of a previous pending SNMP Set request on the committed configuration. • Throttle drops—Number of SNMP packets for any requests dropped reaching the throttle limit.

Table 134: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> • Unknown security models—(snmpUnknownSecurityModels) Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine. • Invalid messages—(snmpInvalidMsgs) Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message. • Unknown pdu handlers—(snmpUnknownPDUHandlers) Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type. • Unavailable contexts—(snmpUnavailableContexts) Number of requests received for a context that is known to the SNMP engine, but is currently unavailable. • Unknown contexts—(snmpUnknownContexts) Total number of requests received for a context that is unknown to the SNMP engine. • Unsupported security levels—(usmStatsUnsupportedSecLevels) Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable). • Not in time windows—(usmStatsNotInTimeWindows) Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window. • Unknown user names—(usmStatsUnknownUserNames) Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine. • Unknown engine ids—(usmStatsUnknownEngineIDs) Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine. • Wrong digests—(usmStatsWrongDigests) Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value. • Decryption errors—(usmStatsDecryptionErrors) Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.

Table 134: show snmp statistics Output Fields (*continued*)

Field Name	Field Description
Output	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> • Packets—(snmpOutPkts) Total number of messages passed from the SNMP entity to the transport service. • Too big—(snmpOutTooBigs) Total number of SNMP PDUs generated by the SNMP entity with an error status field of tooBig. • No such names—(snmpOutNoSuchNames) Total number of SNMP PDUs delivered to the SNMP entity with an error status field of noSuchName. • Bad values—(snmpOutBadValues) Total number of SNMP PDUs generated by the SNMP entity with an error status field of badValue. • General errors—(snmpOutGenErrs) Total number of SNMP PDUs generated by the SNMP entity with an error status field of genErr. • Get requests—(snmpOutGetRequests) Total number of SNMP GetRequest PDUs generated by the SNMP entity. • Get nexts—(snmpOutGetNexts) Total number of SNMP GetNext PDUs generated by the SNMP entity. • Set requests—(snmpOutSetRequests) Total number of SNMP SetRequest PDUs generated by the SNMP entity. • Get responses—(snmpOutGetResponses) Total number of SNMP GetResponse PDUs generated by the SNMP entity. • Traps—(snmpOutTraps) Total number of SNMP traps generated by the SNMP entity.

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the Simple Network Management Protocol version 3 (SNMPv3) operating configuration.
Options	<p>none—Display all of the SNMPv3 operating configuration.</p> <p>access—(Optional) Display SNMPv3 access information.</p> <p>brief detail—(Optional) Display brief or detailed information about SNMPv3 access information.</p> <p>community—(Optional) Display SNMPv3 community information.</p> <p>general—(Optional) Display SNMPv3 general information.</p> <p>groups—(Optional) Display SNMPv3 security-to-group information.</p> <p>notify <filter>—(Optional) Display SNMPv3 notify and, optionally, notify filter information.</p> <p>target <address parameters>—(Optional) Display SNMPv3 target and, optionally, either target address or target parameter information.</p> <p>users—(Optional) Display SNMPv3 user information.</p>
Additional Information	To edit the default display of the show snmp v3 command, specify options in the show statement at the [edit snmp v3] hierarchy level.
Required Privilege Level	view
List of Sample Output	show snmp v3 on page 1154
Output Fields	Table 135 on page 1153 describes the output fields for the show snmp v3 command. Output fields are listed in the approximate order in which they appear.

Table 135: show snmp v3 Output Fields

Field Name	Field Description
Access control	<p>Information about access control:</p> <ul style="list-style-type: none"> • Group—Group name for which the configured access privileges apply. The group, together with the context prefix and the security model and security level, forms the index for this table. • Context prefix—SNMPv3 context for which the configured access privileges apply. • Security model/level—Security model and security level for which the configuration access privileges apply. • Read view—Identifies the MIB view applied to SNMPv3 read operations. • Write view—Identifies the MIB view applied to SNMPv3 write operations. • Notify view—Identifies the MIB view applied to outbound SNMP notifications.
Engine	<p>Information about local engine configuration:</p> <ul style="list-style-type: none"> • Local engine ID—Identifier that uniquely and unambiguously identifies the local SNMPv3 engine. • Engine boots—Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed. • Engine time—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • Max msg size—Maximum message size the sender can accommodate.
Engine ID	<p>Information about engine ID:</p> <ul style="list-style-type: none"> • Local engine ID—Identifier that uniquely and unambiguously identifies the local SNMPv3 engine. • Engine boots—Number of times the local SNMPv3 engine has rebooted or reinitialized since the engine ID was last changed. • Engine time—Number of seconds since the local SNMPv3 engine was last rebooted or reinitialized. • Max msg size—Maximum message size the sender can accommodate. • Engine ID—SNMPv3 engine ID associated with each user. • User—SNMPv3 user. • Auth/Priv—Authentication and encryption algorithm available for use by each user. • Storage—Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status. • Status—Status of the conceptual row. Only rows with an active status are used by the SNMPv3 engine.
Group name	Name of the group to which this entry belongs.
Security model	Identifies the security model context for the security name.
Security name	Used with the security model; identifies a specific security name instance. Each security model/security name combination can be assigned to a specific group.
Storage type	Indicates whether a user is saved to the configuration file (nonvolatile) or not (volatile). Applies only to users with active status.
Status	Status of the conceptual row. Only rows with active status are used by the SNMPv3 engine.

Sample Output

show snmp v3

```

user@host> show snmp v3
Local engine ID: 80 00 0a 4c e04 31 32 33 34
Engine boots:      38
Engine time:       64583 seconds
Max msg size:      2048 bytes

Engine ID: local
  User              Auth/Priv  Storage  Status
  user1             md5/des   nonvolatile active
  user2             sha/none  nonvolatile active
  user3             none/none nonvolatile active

Engine ID: 81 00 0a 4c 04 64 64 64 64
  User              Auth/Priv  Storage  Status
  UNEW             md5/none  nonvolatile active
Group name          Security Security  Storage  Status
                   model   name      type
g1                  usm     user1     nonvolatile active
g2                  usm     user2     nonvolatile active
g3                  usm     user3     nonvolatile active

Access control:

```

System Software Operational Mode Commands

Table 136 on page 1155 summarizes the command-line interface (CLI) commands you can use to perform and monitor system software management functions. Commands are listed in alphabetical order.

Table 136: System Software Operational Mode Commands

Task	Command
Clear the Address Resolution Protocol (ARP) table.	<code>clear arp</code>
Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.	<code>clear dhcp server binding</code>
Clear all extended DHCP local server statistics.	<code>clear dhcp server statistics</code>
Clear DHCP statistics	<code>clear dhcp statistics</code>
Clear the binding state from the client table on the DHCPv6 local server.	<code>clear dhcpv6 server binding</code>
Clear all DHCPv6 local server statistics.	<code>clear dhcpv6 server statistics</code>
Clear AAA statistics.	<code>clear network-access aaa statistics</code>
Log out AAA subscribers and clear the AAA subscriber statistics.	<code>clear network-access aaa subscriber</code>
Clear a pending commit operation.	<code>clear system commit</code>
Clear a pending system halt or reboot.	<code>clear system reboot</code>
(J Series routers only) Remove obsolete IP address bindings on a Dynamic Host Configuration Protocol (DHCP) server.	<code>clear system services dhcp binding</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
(J Series routers only) Clear IP addresses from the DHCP server conflicts list.	<code>clear system services dhcp conflict</code>
(J Series routing routers only) Clear DHCP server statistics.	<code>clear system services dhcp statistics</code>
Enter configuration mode.	<code>configure</code>
Execute an operation (op) script.	<code>op</code>
Force lease renewal for DHCPv4 clients.	<code>request dhcp server reconfigure</code>
Initiate reconfiguration processing for DHCPv6 clients.	<code>request dhcpv6 server reconfigure</code>
Send messages to users currently logged in to the router.	<code>request message</code>
Force the router to send backed-up accounting data immediately.	<code>request network-access aaa replay pending-accounting-stops</code>
Activate a dynamic subscriber service.	<code>request network-access aaa subscriber add session-id</code>
Deactivate a dynamic subscriber service.	<code>request network-access aaa subscriber delete session-id</code>
Modify a predefined variable applied to a current subscriber.	<code>request network-access aaa subscriber modify session-id</code>
On a router with two Routing Engines, specify a tty connection for login.	<code>request routing-engine login</code>
Resets the state of an interface group on which static subscribers were forcibly logged out.	<code>request services static-subscribers login group</code>
Forces static subscribers on the interfaces in the group to be logged out.	<code>request services static-subscribers login interface</code>
Resets the state of an interface on which a static subscriber was forcibly logged out.	<code>request services static-subscribers logout group</code>
Forces static subscriber on the interface to be logged out.	<code>request services static-subscribers logout interface</code>
Collect information for customer support.	<code>request support information</code>
Delete an existing rescue configuration.	<code>request system configuration rescue delete</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Save the most recently committed configuration as the rescue configuration.	<code>request system configuration rescue save</code>
(J Series routers only) Upgrade or downgrade firmware.	<code>request system firmware</code>
Stop the routing software.	<code>request system halt</code>
Add a license key.	<code>request system license add</code>
Delete a license key.	<code>request system license delete</code>
(J Series routers only) Save installed license keys to a file or URL.	<code>request system license save</code>
Log out a user from the configuration database.	<code>request system logout</code>
Abort a previously scheduled partition request.	<code>request system partition abort</code>
Schedule the hard disk for partitioning.	<code>request system partition hard-disk</code>
Power off the routing software.	<code>request system power-off</code>
Reboot the routing software.	<code>request system reboot</code>
Install or upgrade an AI-Scripts (jais) package.	<code>request system scripts add</code>
Convert an Extensible Stylesheet Language Transformations (XSLT) script to Stylesheet Language, Alternative syntax (SLAX), or convert a SLAX script to XSLT.	<code>request system scripts convert</code>
Delete an AI-Scripts (jais) package.	<code>request system scripts delete</code>
Show active AI-Scripts (jais) package.	<code>request system scripts event-scripts</code>
Roll back to most recent installation of AI-Scripts (jais) package.	<code>request system scripts rollback</code>
Back up the file systems on the router.	<code>request system snapshot</code>
(M320 router, T320 router, and T640 router only) Abort a unified in-service software upgrade (ISSU).	<code>request system software abort</code>
Install software bundles or packages onto the router.	<code>request system software add</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Remove software bundles or packages from the router.	<code>request system software delete</code>
(J Series routers only) Delete the backup Junos OS file (if it exists) to free up compact flash drive space.	<code>request system software delete-backup</code>
(M320 router, T320 router, and T640 router only) Perform a unified ISSU.	<code>request system software in-service-upgrade</code>
MX Series 3D Universal Edge Routers	<code>request system software in-service-upgrade (MX Series 3D Universal Edge Routers)</code>
Roll back to a previously installed version.	<code>request system software rollback</code>
Check candidate software compatibility against the current configuration.	<code>request system software validate</code>
Free storage space on the router by rotating log files and deleting unnecessary files.	<code>request system storage cleanup</code>
Perform a compatibility check to ensure that the software and hardware components and the configuration on the device support unified ISSU. The request system software validate in-service-upgrade command enables you to detect any compatibility issues before actually issuing the request system software in-service upgrade command to initiate unified ISSU.	<code>request system software validate-in-service-upgrade</code>
Restart a Junos OS process.	<code>restart</code>
Display all statistics for all pending accounting stop requests.	<code>show accounting pending-accounting-stops</code>
Display the contents of the ARP table.	<code>show arp</code>
Display the current running system configuration.	<code>show configuration</code>
Display the address bindings in the client table on the extended DHCP local server.	<code>show dhcp server binding</code>
Display extended DHCP local server statistics.	<code>show dhcp server statistics</code>
Display DHCP statistics	<code>show dhcp statistics</code>
Display the address bindings in the client table on the extended DHCPv6 local server.	<code>show dhcpv6 server binding</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Display extended DHCPv6 local server statistics.	<code>show dhcpv6 server statistics</code>
Display DHCPv6 statistics	<code>show dhcpv6 statistics</code>
Display Domain Name System (DNS) hostname information.	<code>show host</code>
Display the state of the RADIUS Acct-On response.	<code>show network-access aaa accounting</code>
Display RADIUS server status and information.	<code>show network-access aaa radius-servers</code>
Display AAA statistics.	<code>show network-access aaa statistics</code>
Display AAA authentication statistics.	<code>show network-access aaa statistics authentication</code>
Display the number of pending accounting stop requests.	<code>show network-access aaa statistics pending-accounting-stops</code>
Display information about AAA subscribers.	<code>show network-access aaa subscribers</code>
Display information about AAA subscriber sessions.	<code>show network-access aaa subscribers session-id</code>
Display state information for address-assignment pools.	<code>show network-access address-assignment pool</code>
Display information for domain maps.	<code>show network-access domain-map</code>
Display Network Time Protocol (NTP) peers.	<code>show ntp associations</code>
Display variables returned by NTP peers.	<code>show ntp status</code>
Display Information about static subscriber sessions.	<code>show static-subscribers sessions</code>
Display information about active subscribers.	<code>show subscribers</code>
Display summary information about active subscribers.	<code>show subscribers summary</code>
Display the Synchronous Ethernet ESMC statistics.	<code>show synchronous-ethernet esmc statistics</code>
Display the Synchronous Ethernet ESMC transmit interface details.	<code>show synchronous-ethernet esmc transmit</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Display information about the global configuration for Synchronous Ethernet chassis synchronization.	<code>show synchronous-ethernet global-information</code>
Show system alarms.	<code>show system alarms</code>
Display state and checksum values for files in a file system.	<code>show system audit</code>
(J Series routers only) Display autoinstallation status information.	<code>show system autoinstallation status</code>
Display boot messages.	<code>show system boot-messages</code>
Display system memory and buffer usage information.	<code>show system buffers</code>
Display the list of processes that have been registered for resource cleanup services.	<code>show system resource-cleanup processes</code>
Display information about a pending commit operation.	<code>show system commit</code>
Display directory and number of files queued for archival transfer.	<code>show system configuration archival</code>
Display information about the rescue configuration.	<code>show system configuration rescue</code>
Display information about active IP sockets on the Routing Engine.	<code>show system connections</code>
Display directory usage information.	<code>show system directory-usage</code>
(J Series routers only) Display system firmware information.	<code>show system firmware</code>
Display a list of installed licenses.	<code>show system license</code>
Display system-wide memory distribution and usage including the Junos OS kernel, software processes, and memory disks.	<code>show system memory</code>
Display dynamic hostname to IP address mappings.	<code>show system name-resolution</code>
Display software processes running on the router.	<code>show system processes</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Display statistics about queues on interfaces.	<code>show system queues</code>
Display any pending system reboots or halts.	<code>show system reboot</code>
View or compare previous configurations.	<code>show system rollback</code>
(J Series routers only) Display client binding information.	<code>show system services dhcp binding</code>
(J Series routers only) Display DHCP client-detected conflicts for IP addresses.	<code>show system services dhcp conflict</code>
(J Series routers only) Display global configuration settings for a DHCP server.	<code>show system services dhcp global</code>
(J Series routers only) Display IP address pools defined for a DHCP server.	<code>show system services dhcp pool</code>
(J Series routers only) Display statistics associated with a DHCP server.	<code>show system services dhcp statistics</code>
Display information about a Session and Resource Control (SRC) client.	<code>show system services service-deployment</code>
Display information about the backup software that located in the <code>/altroot</code> and <code>/altconfig</code> file systems.	<code>show system snapshot</code>
Display Junos OS extensions.	<code>show system software</code>
Display system-wide protocol-related statistics.	<code>show system statistics</code>
Display system-wide Address Resolution Protocol (ARP) statistics.	<code>show system statistics arp</code>
Display system-wide Connectionless Network Service (CLNS) statistics.	<code>show system statistics clns</code>
Display system-wide End System-to-Intermediate System (ES-IS) statistics.	<code>show system statistics esis</code>
Display system-wide Internet Control Message Protocol (ICMP) statistics.	<code>show system statistics icmp</code>
Display system-wide ICMP version 6 statistics.	<code>show system statistics icmp6</code>
Display system-wide Internet Group Management Protocol (IGMP) statistics.	<code>show system statistics igmp</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Display system-wide IPv4 statistics.	<code>show system statistics ip</code>
Display system-wide IPv6 statistics.	<code>show system statistics ip6</code>
Display system-wide Multiprotocol Label Switching (MPLS) statistics.	<code>show system statistics mpls</code>
Display system-wide Reliable Datagram Protocol (RDP) statistics.	<code>show system statistics rdp</code>
Display system-wide Transmission Control Protocol (TCP) statistics.	<code>show system statistics tcp</code>
Display system-wide Trivial Network Protocol (TNP) statistics.	<code>show system statistics tnp</code>
Display system-wide Trivial User Datagram Protocol (TUDP) statistics.	<code>show system statistics tudp</code>
Display system-wide User Datagram Protocol (UDP) statistics.	<code>show system statistics udp</code>
Display system-wide Virtual Private LAN Services (VPLS) statistics.	<code>show system statistics vpls</code>
Display statistics about the amount of free disk space in the router's file systems.	<code>show system storage</code>
View configurations of the primary and secondary Routing Engines.	<code>show system switchover</code>
Display the current time and information about how long the router, router software, and routing protocols have been running.	<code>show system uptime</code>
Display complete subscriber management database summary information.	<code>show system subscriber-management summary</code>
Display users currently logged in to the router.	<code>show system users</code>
Display Junos kernel memory usage.	<code>show system virtual-memory</code>
Display routing protocol tasks on the Routing Engine.	<code>show task</code>
Display I/O statistics for routing protocol tasks on the Routing Engine.	<code>show task io</code>
Display memory utilization for routing protocol tasks on the Routing Engine.	<code>show task memory</code>

Table 136: System Software Operational Mode Commands (*continued*)

Task	Command
Display whether or not graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) are configured on the router.	show task replication
Display the hostname and version information about the software running on the router.	show version
Display the hostname and version information about the software running on the master and backup Routing Engines.	show version invoke-on
Create a UNIX-level shell.	start shell
Verify authd-lite subscriber AAA configuration.	test aaa authd-lite user
Verify DHCP subscriber AAA configuration.	test aaa dhcp user
Verify PPP subscriber AAA configuration.	test aaa ppp user
Verify the syntax of a configuration file.	test configuration

NOTE: For information about the request system certificate add and show system certificate commands, see IP Security Operational Mode Commands.

NOTE: For information about how to configure system software parameters, see the Junos OS System Basics Configuration Guide.

For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Baseline Network Operations Guide*.

clear arp

Syntax	<code>clear arp</code> <code><hostname <i>hostname</i>></code> <code><logical-system <i>logical-system-name</i>></code> <code><vpn <i>vpn</i>></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Remove entries from the Address Resolution Protocol (ARP) table for the current CLI view. To clear entries for a specific logical system, you must first enter the set cli logical-system <i>logical-system-name</i> command, and then issue the clear arp command.
Options	none —Clear all entries from the ARP table. hostname <i>hostname</i> —(Optional) Clear the specified host entry only. logical-system <i>logical-system-name</i> —(Optional) Clear entries for the specified logical system; only available in main router context. vpn <i>vpn</i> —(Optional) Clear entries from the ARP table for the specified virtual private network (VPN).
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• set cli logical-system on page 975• show arp on page 1318
List of Sample Output	clear arp on page 1164 clear arp logical-system ls1 on page 1164
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear arp	<pre>user@host> clear arp 192.168.71.254 deleted 192.168.65.46 deleted 192.168.64.10 deleted 10.0.12.14 deleted 10.0.17.14 deleted</pre>
clear arp logical-system ls1	<pre>user@host> clear arp logical-system ls1 192.168.71.254 deleted 192.168.65.46 deleted 192.168.64.10 deleted 10.0.12.14 deleted 10.0.17.14 deleted</pre>

clear dhcp server binding

Syntax `clear dhcp server binding`
`<address>`
`<all>`
`<interface interface-name>`
`<interfaces-vlan>`
`<interfaces-wildcard>`
`<logical-system logical-system-name>`
`<routing-instance routing-instance-name>`

Release Information Command introduced in Junos OS Release 9.0.
Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

Description Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.

Options *address*—(Optional) Clear the binding state for the DHCP client, using one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

all—(Optional) Clear the binding state for all DHCP clients.

interface interface-name—(Optional) Clear the binding state for DHCP clients on the specified interface.

NOTE: This option clears all bindings whose initial login requests were received over the specified interface. Dynamic demux login requests are not received over the dynamic demux interface, but rather the underlying interface of the dynamic demux interface. To clear a specific dynamic demux interface, use the *ip-address* or *mac-address* options.

interfaces-vlan—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

interfaces-wildcard—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (*).

logical-system logical-system-name—(Optional) Clear the binding state for DHCP clients on the specified logical system.

routing-instance routing-instance-name—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Clearing DHCP Bindings for Subscriber Access • show dhcp server binding on page 1327
List of Sample Output	clear dhcp server binding <ip-address> on page 1167 clear dhcp server binding all on page 1167 clear dhcp server binding interface on page 1167 clear dhcp server binding <interfaces-vlan> on page 1167 clear dhcp server binding <interfaces-wildcard> on page 1167
Output Fields	See show dhcp server binding for an explanation of output fields.

Sample Output

clear dhcp server binding <ip-address>

The following sample output displays the address bindings in the DHCP client table on the extended DHCP local server before and after the **clear dhcp server binding** command is issued.

```
user@host> show dhcp server binding
```

```
2 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

IP address	Hardware address	Type	Lease expires at
100.20.32.1	90:00:00:01:00:01	active	2007-01-17 11:38:47 PST
100.20.32.3	90:00:00:02:00:01	active	2007-01-17 11:38:41 PST

```
user@host> clear dhcp server binding 10.20.32.1
```

```
user@host> show dhcp server binding
```

```
1 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

IP address	Hardware address	Type	Lease expires at
100.20.32.3	90:00:00:02:00:01	active	2007-01-17 11:38:41 PST

clear dhcp server binding all

The following command clears all DHCP local server bindings:

```
user@host> clear dhcp server binding all
```

clear dhcp server binding interface

The following command clears DHCP local server bindings on a specific interface:

```
user@host> clear dhcp server binding interface fe-0/0/2
```

clear dhcp server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP local server bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp server binding ae0
```

clear dhcp server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP local server bindings over a specific interface:

```
user@host> clear dhcp server binding ge-1/0/0.*
```

clear dhcp server statistics

Syntax	<code>clear dhcp server statistics</code> <code><interface <i>interface-name</i>></code> <code><logical-system <i>logical-system-name</i>></code> <code><routing-instance <i>routing-instance-name</i>></code>
Release Information	Command introduced in Junos OS Release 9.0.
Description	Clear all extended Dynamic Host Configuration Protocol (DHCP) local server statistics.
Options	<p>logical-system <i>logical-system-name</i>—(Optional) Clear the statistics for DHCP clients on the specified logical system. If you do not specify a logical system, statistics are cleared for the default logical system.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Clear the statistics for DHCP clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.</p>
Required Privilege Level	view
List of Sample Output	clear dhcp server statistics on page 1169
Output Fields	See show dhcp server statistics for an explanation of output fields.

Sample Output

clear dhcp server statistics

The following sample output displays the extended DHCP local server statistics before and after the **clear dhcp server statistics** command is issued.

```
user@host> show dhcp server statistics
Packets dropped:
  Total                  0

Messages received:
  BOOTREQUEST           89163

```

clear dhcp statistics

Syntax	<code>clear dhcp statistics</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 11.3.
Description	Clear all extended Dynamic Host Configuration Protocol (DHCP) statistics.
Options	<code>interface <i>interface-name</i></code> —(Optional) Clear the statistics for DHCP clients on the specified interface. If you do not specify an interface, statistics are cleared for the default interface.
Required Privilege Level	view
List of Sample Output	clear dhcp statistics on page 1170
Output Fields	See show dhcp statistics for an explanation of output fields.

Sample Output

`clear dhcp statistics` `user@host> clear dhcp statistics`

clear dhcpv6 server binding

Syntax	<pre>clear dhcpv6 server binding <address> <all> <interface interface-name> <interfaces-vlan> <interfaces-wildcard> <logical-system logical-system-name> <routing-instance routing-instance-name></pre>
Release Information	<p>Command introduced in Junos OS Release 9.6.</p> <p>Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.</p>
Description	Clear the binding state of a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client from the client table on the extended DHCPv6 local server.
Options	<p>address—(Optional) Clear the binding state for the DHCPv6 client, using one of the following entries:</p> <ul style="list-style-type: none"> • <i>CID</i>—The specified Client ID (CID). • <i>ipv6-prefix</i>—The specified IPv6 prefix. • <i>session-id</i>—The specified session ID. <p>all—(Optional) Clear the binding state for all DHCPv6 clients.</p> <p>interface interface-name—(Optional) Clear the binding state for DHCPv6 clients on the specified interface.</p> <p>interfaces-vlan—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.</p> <p>interfaces-wildcard—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (*).</p> <p>logical-system logical-system-name—(Optional) Clear the binding state for DHCPv6 clients on the specified logical system.</p> <p>routing-instance routing-instance-name—(Optional) Clear the binding state for DHCPv6 clients on the specified routing instance.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • Clearing DHCP Bindings for Subscriber Access • show dhcpv6 server binding on page 1337
List of Sample Output	<p>clear dhcpv6 server binding all on page 1172</p> <p>clear dhcpv6 server binding <ipv6-prefix> on page 1172</p>

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear dhcpv6 server
binding all`

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

`clear dhcpv6 server
binding <ipv6-prefix>`

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

`clear dhcpv6 server
binding interface`

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

`clear dhcpv6 server
binding
<interfaces-vlan>`

The following command uses the *interfaces-vlan* option to clear all DHCPv6 local server bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 server binding interface ae0
```

`clear dhcpv6 server
binding
<interfaces-wildcard>`

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```

clear dhcpv6 server statistics

Syntax	clear dhcpv6 server statistics <interface <i>interface-name</i> > <logical-system <i>logical-system-name</i> > <routing-instance <i>routing-instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.6.
Description	Clear all extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.
Options	<p>logical-system <i>logical-system-name</i>—(Optional) Clear the statistics for DHCPv6 clients on the specified logical system. If you do not specify a logical system, statistics are cleared for the default logical system.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Clear the statistics for DHCPv6 clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.</p>
Required Privilege Level	clear

clear system reboot

Syntax	clear system reboot <both-routing-engines>
Syntax (EX Series Switches)	clear system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	clear system reboot <both-routing-engines> <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	clear system reboot <both-routing-engines> <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (QFX Series)	clear system reboot <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.
Options	<p>none—Clear all pending system software reboots or halts.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.</p> <p>both-routing-engines—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix</p>

Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

infrastructure *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

node-group *name*—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

scc—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace *number* with 0.

configure

Syntax	<code>configure</code> <code><dynamic></code> <code><exclusive></code> <code><private></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Enter configuration mode. When this command is entered without any optional keywords, everyone can make configuration changes and commit all changes made to the configuration.
Options	<p>none—Enter configuration mode.</p> <p>dynamic—(Optional) Configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database. As a result, the time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can then reference these policies and policy objects in routing policies you configure in the standard database.</p> <p>exclusive—(Optional) Lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot change the configuration.</p> <p>private—(Optional) Allow multiple users to edit different parts of the configuration at the same time and to commit only their own changes, or to roll back without interfering with one another's changes. You cannot commit changes in configure private mode when another user is in configure exclusive mode.</p>
Additional Information	For more information about the different methods of entering configuration mode and the restrictions that apply, see the Junos OS System Basics Configuration Guide.
Required Privilege Level	<code>configure</code>

request dhcp server reconfigure

Syntax `request dhcp server reconfigure (all | address | interface interface-name | logical-system logical-system-name | routing-instance routing-instance-name)`

Release Information Command introduced in Junos OS Release 10.0.

Description Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the **clear dhcp server binding** command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a **forcerenew** message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the **forcerenew** message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the **clear-on-abort** statement to configure the client to be cleared when reconfiguration fails.

Options **all**—Initiate reconfiguration for all DHCP clients.

address—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.

interface *interface-name*—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).

NOTE: You cannot use the **interface *interface-name*** option with the **request dhcp server reconfigure** command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.

logical-system *logical-system-name*—Initiate reconfiguration for all DHCP clients on the specified logical system.

routing-instance *routing-instance-name*—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.

Syntax (TX Matrix Plus Router)	request routing-engine login (backup master other-routing-engine re0 re1) <lcc <i>number</i> > <sfc <i>number</i> >
Syntax (MX Series Router)	request routing-engine login (backup master other-routing-engine re0 re1) <all-members> <local> <member <i>member-id</i> >
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>psd and rsd options added in Junos OS Release 9.1. These options are available from the Root System Domain (RSD). An RSD is supported on a T320 router or T640 or T1600 router that is interconnected with the JCS1200 platform.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p>
Description	On a router with two Routing Engines, specify a tty connection for login.
Options	<p>backup—Log in to the backup Routing Engine.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, log in to a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, log in to a specific router (or line-card chassis) that is connected to the TX Matrix router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>master—Log in to the master Routing Engine.</p> <p>other-routing-engine—Log in to the other Routing Engine.</p>

psd *n*—(RSD only) Log in to the specified Protected System Domain (PSD). Replace *n* with a value from 1 to 31. A PSD is accessible from a T320 router or a T640 or T1600 router that is interconnected with the JCS1200 platform. When you log in to a PSD, you are required to provide user authentication.

re0—Log in to the Routing Engine in slot 0.

re1—Log in to the Routing Engine in slot 1.

all-members—(MX Series routers only) (Optional) Log in to all members of the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Log in to the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Log in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

rsd—(RSD only) Log in to the RSD (as opposed to a PSD). A T320 router or a T640 or T1600 router that is interconnected with the JCS1200 platform can be configured as an RSD.

sfc *number*—(TX Matrix Plus routers only) Log in to the specified Routing Engine on the TX Matrix Plus router (or switch-fabric chassis):

- **backup**—Log in to the backup Routing Engine.
- **master**—Log in to the master Routing Engine.
- **re0**—Log in to the Routing Engine in slot 0.
- **re1**—Log in to the Routing Engine in slot 1.

Additional Information For more information about PSDs, RSDs, and the JCS1200 platform, see the *Junos OS Protected System Domain Configuration Guide*.

request services static-subscribers login group

Syntax	request services static-subscribers login group <i>group-name</i>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Resets the state of an interface group on which static subscribers were forcibly logged out by the request services static-subscribers logout group command. This action enables static subscriber to login on the interfaces in the group.
Options	group <i>group-name</i> —Group of static subscriber interfaces on which static subscribers have been created.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Resetting the State of an Interface Group for Static Subscriber Login request services static-subscribers logout group on page 1205
List of Sample Output	request services static-subscribers login group on page 1203
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
request services
static-subscribers login
group          user@host> request services static-subscribers login group boston
```

request services static-subscribers login interface

Syntax	<code>request services static-subscribers login interface <i>interface-name</i></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Resets the state of an interface on which a static subscriber was forcibly logged out by the <code>request services static-subscribers logout interface</code> command. This action enables a static subscriber to login on the interface.
Options	<code>interface <i>interface-name</i></code> —Static interface on which a static subscriber has been created.

request support information

Syntax	request support information
Syntax (EX Series Switch and MX Series Router)	request support information <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	request support information <all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	request support information <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display all configuration data for the system, including data hidden with the apply-flags omit command. Issue this command before contacting customer support, and then include the command output in your support request. Output from this command varies somewhat, depending on which platform you issue the command from. However, the command always executes a series of show commands, with the appropriate information for your device automatically included.
Options	<p>all-chassis—(TX Matrix and TX Matrix Plus routers) (Optional) Display system information for all chassis.</p> <p>all-lcc—(TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system information for all chassis for all T1600 or T4000 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p>all-members—(EX Series switches and MX Series routers) (Optional) Display system information for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers) (Optional) On a TX Matrix router, display system information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage information for a specific router that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX Series switches and MX Series routers) (Optional) Display system information for the local Virtual Chassis member.

member *member-id*—(EX Series switches and MX Series routers) (Optional) Display system information for the specified member of the Virtual Chassis configuration. On EX Series switches, replace *member-id* with a value appropriate for that Virtual Chassis configuration. On MX Series routers, replace *member-id* with a value of 0 or 1.

scc—(TX Matrix routers) (Optional) Display system information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers) (Optional) Display system information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information The **show** commands issued as a result of this command vary depending on which platform you issue the command from. Output is always appropriate for the device. For example, [Table 140 on page 1208](#) lists the **show** commands that are called when you issue **request support information** on an MX Series router.

Table 140: Sample show Commands Called by the request information support command on an MX Series Router

show chassis alarms no-forwarding	show pfe statistics traffic
show chassis environment no-forwarding	show route summary
show chassis firmware no-forwarding	show system boot-messages no-forwarding
show chassis fpc detail	show system buffer no-forwarding
show chassis hardware detail no-forwarding	show system core-dumps no-forwarding
show chassis hardware extensive no-forwarding	show system processes extensive no-forwarding
show chassis routing-engine no-forwarding	show system queues no-forwarding
show configuration except SECRET-DATA	show system statistics no-forwarding
show interfaces extensive no-forwarding	show system storage no-forwarding
show krt queue	show system uptime no-forwarding
show krt state	show system virtual-memory no-forwarding

Table 140: Sample show Commands Called by the request information support command on an MX Series Router (*continued*)

show pfe statistics error	show version detail no-forwarding
	<p>The no-forwarding option ensures that all mgd processes associated with the show command are properly halted if you break into the output (Ctrl+C) while the command is still running.</p>
<p>Required Privilege Level</p>	<p>maintenance</p>

request system configuration rescue delete

Syntax	request system configuration rescue delete
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Delete an existing rescue configuration.
	<div> NOTE: The [edit system configuration] hierarchy is not available on QFabric systems.</div>
Options	This command has no options.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• request system configuration rescue save on page 1215• request system software rollback on page 1288• show system commit on page 1427
List of Sample Output	request system configuration rescue delete on page 1214
Output Fields	This command produces no output.

Sample Output

```
request system  
configuration rescue  
delete
```

```
user@host> request system configuration rescue delete
```

request system configuration rescue save

Syntax	request system configuration rescue save
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Save the most recently committed configuration as the rescue configuration so that you can return to it at any time by using the rollback command.
	<div>  <p>NOTE: The [edit system configuration] hierarchy is not available on QFabric systems.</p> </div>
Options	This command has no options.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • request system software delete on page 1265 • request system software rollback on page 1288 • show system commit on page 1427
List of Sample Output	request system configuration rescue save on page 1215
Output Fields	This command produces no output.

Sample Output

request system firmware

Syntax	<code>request system firmware (<i>upgrade</i> <i>downgrade</i>) (<i>fpc</i> <<i>slot slot-number</i>> <i>pic</i> <<i>assembly-id assembly-id</i>> <<i>fpc-slot fpc-slot-number</i>> <<i>partnumber partnumber</i>> <<i>pic-slot pic-slot-number</i>> <<i>tag tag</i>>)</code>
Release Information	Command introduced in Junos OS Release 7.4.
Description	(J Series routers only) Upgrade or downgrade firmware on a Physical Interface Modules (PIM).
Options	<p>fpc—Flexible PIM concentrator (FPC).</p> <p>slot <i>slot-number</i>—(Optional) Location of the FPC to upgrade or downgrade.</p> <p>pic—Physical interface card (PIC).</p> <p>assembly-id <i>assembly-id</i>—(Optional) Component assembly identifier.</p> <p>fpc-slot <i>fpc-slot-number</i>—(Optional) Physical location of the PIC to upgrade or downgrade.</p> <p>partnumber <i>partnumber</i>—(Optional) Part number of the component to upgrade or downgrade.</p> <p>pic-slot <i>pic-slot-number</i>—(Optional) Location of the PIC to upgrade or downgrade.</p> <p>tag <i>tag</i>—(Optional) Firmware release number.</p>
Required Privilege Level	maintenance
List of Sample Output	request system firmware upgrade on page 1216
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>request system firmware upgrade</code>	<code>user@host> request system configuration firmware upgrade fpc</code>
--	--

request system halt

Syntax	request system halt <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash disk removable-compact-flash usb)> <message " <i>text</i> ">
Syntax (EX Series Switches)	request system halt <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine> <slice <i>slice</i> >
Syntax (PTX Series)	request system halt <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash disk)> <message " <i>text</i> ">
Syntax (TX Matrix Router)	request system halt <all-lcc lcc <i>number</i> scc> <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash disk)> <message " <i>text</i> ">
Syntax (TX Matrix Plus Router)	request system halt <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <at <i>time</i> > <both-routing-engines> <other-routing-engine> <in <i>minutes</i> > <media (compact-flash disk)> <message " <i>text</i> ">
Syntax (MX Series Router)	request system halt <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> >

	<pre> <local> <media (external internal)> <member <i>member-id</i>> <message "text"> <other-routing-engine> </pre>
Syntax (QFX Series)	<pre> request system halt <all-members> <at <i>time</i>> <director-device <i>director-device-id</i>> <in <i>minutes</i>> <local> <media > <member <i>member-id</i>> <message "text"> <slice <i>slice</i>> </pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>other-routing-engine option introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>director-device option introduced for QFabric systems in Junos OS Release 12.2.</p>
Description	<p>Stop the router or switch software.</p>
	<div>  <p>NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, use the member option from the Node group CLI. You cannot issue this command from the QFabric CLI.</p> </div>
Options	<p>none—Stop the router or switch software immediately.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.</p> <p>all-members—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.</p> <p>at <i>time</i> —(Optional) Time at which to stop the software, specified in one of the following ways:</p> <ul style="list-style-type: none"> now—Stop the software immediately. This is the default. +<i>minutes</i>—Number of minutes from now to stop the software.

- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

both-routing-engines—(Optional) Halt both Routing Engines at the same time.

director-device *director-device-id*—(QFabric systems only) Halt a specific Director device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

in *minutes*—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

media (*compact-flash* | *disk* | *removable-compact-flash* | *usb*)—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

media (*external* | *internal*)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping the software.

other-routing-engine—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

sfc number—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

slice slice—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

NOTE: If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

Required Privilege Level maintenance

List of Sample Output

- [request system halt on page 1222](#)
- [request system halt \(In 2 Hours\) on page 1222](#)
- [request system halt \(Immediately\) on page 1222](#)
- [request system halt \(At 1:20 AM\) on page 1222](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

request system halt (Immediately)

```
user@host> request system halt at now
```

request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yyymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

request system license add

Syntax	<code>request system license add (<i>filename</i> terminal)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Add a license key.
Options	<i>filename</i> —License key from a file or URL. Specify the filename or the URL where the key is located. <i>terminal</i> —License key from the terminal.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Adding New Licenses (CLI Procedure)

Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
request system license save user@host> request system license save ftp://user@host/license.conf
```

request system logout

Syntax	<code>request system logout (pid <i>pid</i> terminal <i>terminal</i> user <i>username</i>) <all></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Log out users from the router or switch and the configuration database. If a user held the configure exclusive lock, this command clears the exclusive lock.
Options	all —(Optional) Log out all sessions owned by a particular PID, terminal session, or user. (On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.) pid <i>pid</i> —Log out the user session using the specified management process identifier (PID). The PID type must be management process. terminal <i>terminal</i> —Log out the user for the specified terminal session. user <i>username</i> —Log out the specified user.
Required Privilege Level	configure

`request system logout` `user@host> request system logout user tammy all`
Connection closed by foreign host.

request system partition abort

Syntax	request system partition abort
Syntax (TX Matrix Router)	request system partition abort <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	request system partition abort <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	request system partition abort <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Terminate a previously scheduled storage media partition operation. If the command is issued between the time of a partition request and a reboot, the partition request is aborted and the storage media is not affected.
Options	<p>all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Abort a previously scheduled partition operation for all chassis.</p> <p>all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, abort a previously scheduled partition operation on all T640 routers (line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, abort a previously scheduled partition operation on all routers (line-card chassis) connected to the TX Matrix Plus router.</p> <p>all-members—(MX Series routers only) (Optional) Abort a previously scheduled partition operation for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix Plus router, abort a previously scheduled partition operation on a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, abort a previously scheduled partition operation on a specific router that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Abort a previously scheduled partition operation for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Abort a previously scheduled partition operation for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Abort a previously scheduled partition operation on the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Abort a previously scheduled partition operation on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

partition abort**

```
user@host> request system partition abort
The hard disk is no longer scheduled to be partitioned.
```

request system partition hard-disk

Syntax	request system partition hard-disk
Syntax (TX Matrix Router)	request system partition hard-disk <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	request system partition hard-disk <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	request system partition hard-disk <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Set up the hard disk for partitioning. After this command is issued, the hard disk is partitioned the next time the system is rebooted. When the hard disk is partitioned, the contents of /altroot and /altconfig are saved and restored. All other data on the hard disk is at risk of being lost.
Options	<p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Schedule a partition of the hard disk for all routers in the chassis at its next reboot.</p> <p>all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, schedule a partition of the hard disk on all T640 routers connected to the TX Matrix router at their next reboot. On a TX Matrix Plus router, schedule a partition of the hard disk on all connected LCCs.</p> <p>all-members—(MX Series routers only) (Optional) Schedule a partition of the hard disk for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix Plus router, schedule a partition of the hard disk on a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, schedule a partition of the hard disk on a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Schedule a partition of the hard disk for the local member of the Virtual Chassis.

member *member-id*—(MX Series routers only) (Optional) Schedule a partition of the hard disk for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Schedule a partition of the hard disk on the T640 router connected to the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Schedule a partition of the hard disk on the connected T1600 or T4000 LCCs connected to the TX Matrix Plus router. Replace *number* with 0.

Additional Information To immediately partition the hard disk, use the **request system reboot** command. To cancel the partition request, use the **request system partition abort** command.

<slice *slice*>

Release Information Command introduced in Junos OS Release 8.0.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Power off the software.

NOTE: When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the **member** option. You cannot issue this command from the QFabric CLI.

Options **none**—Power off the router or switch software immediately.

all-chassis—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.

all-lcc—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.

at time—(Optional) Time at which to power off the software, specified in one of the following ways:

- **now**—Power off the software immediately. This is the default.
- **+minutes**—Number of minutes from now to power off the software.
- **yymmddhhmm**—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to power off the software.

both-routing-engines—(Optional) Power off both Routing Engines at the same time.

in minutes—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +minutes** option.

lcc number—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

media (external | internal)—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace **member-id** with a value from 0 through 9. For an MX Series Virtual Chassis, replace **member-id** with a value of 0 or 1.

message "text"—(Optional) Message to display to all system users before powering off the software.

other-routing-engine—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

scc—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

sfc number—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

slice *slice*—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

Syntax (MX Series Router)	request system reboot <all-members> <at <i>time</i> > <both-routing-engines> <in <i>minutes</i> > <local> <media (external internal)> <member <i>member-id</i> > <message " <i>text</i> "> <other-routing-engine>
Release Information	Command introduced before Junos OS Release 7.4.

Option **other-routing-engine** introduced in Junos OS Release 8.0.

Command introduced in Junos OS Release 9.0 for EX Series switches.

Option **sfc** introduced for the TX Matrix Plus router in Junos OS Release 9.6.

Option **both-routing-engines** introduced in Junos OS Release 12.1.

Description Reboot the software.

Options **none**—Reboot the software immediately.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.

all-members—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.

at time—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- **+minutes**—Number of minutes from now to reboot the software.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.

both-routing-engines—(Optional) Reboot both Routing Engines at the same time.

in minutes—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

media (compact-flash | disk | removable-compact-flash | usb)—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

media (external | internal)—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

message "*text*"—(Optional) Message to display to all system users before stopping or rebooting the software.

other-routing-engine—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

partition—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

scc—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

sfc *number*—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace ***number*** with 0.

slice *slice*—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

Additional Information Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

NOTE: Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc number**, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

NOTE: To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

Required Privilege Level maintenance

List of Sample Output

[request system reboot on page 1239](#)
[request system reboot \(at 2300\) on page 1239](#)
[request system reboot \(in 2 Hours\) on page 1239](#)
[request system reboot \(Immediately\) on page 1239](#)
[request system reboot \(at 1:20 AM\) on page 1239](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request system reboot user@host> **request system reboot**
Reboot the system ? [yes,no] (no)

request system reboot (at 2300) user@host> **request system reboot at 2300 message ?Maintenance time!?**
Reboot the system ? [yes,no] (no) **yes**

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00

request system reboot (in 2 Hours) The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

request system reboot (Immediately) user@host> **request system reboot at now**

request system reboot (at 1:20 AM) To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

user@host> **request system reboot at 06060120**
request system reboot at 120
Reboot the system at 120? [yes,no] (no) **yes**

request system scripts add

Syntax `request system scripts add <package-name>`
 `<no-copy>`
 `<unlink>`

Release Information Command introduced before Junos OS Release 9.0.

Description CLI command to install AI-Script (jais) packages on Juniper Networks devices.

Options **no-copy**—Don't save a copy of the jais package file.

`user@host> request system scripts add no-copy <package-name>`

.....
NOTE: If you use the no-copy option during the jais installation, the jais package cannot be rolled back.
.....

unlink—Remove the package after successful installation.

`user@host> request system scripts add unlink <package-name>`

Required Privilege Level maintenance

request system scripts convert

Syntax	request system scripts convert (slax-to-xslt xslt-to-slax) source <i>source/filename</i> destination <i>destination/<filename></i> <partial> <version (1.0 1.1)>
Release Information	Command introduced in Junos OS Release 8.2. Command introduced in Junos OS Release 9.0 for EX Series switches. partial and version options added in Junos OS Release 12.2.
Description	Convert an Extensible Stylesheet Language Transformations (XSLT) script to Stylesheet Language, Alternative syntax (SLAX), or convert a SLAX script to XSLT.
Options	<p>destination <i>destination/<filename></i>—Specify a destination for the converted file.</p> <p>Optionally, you can specify a filename for the converted file. If you do not specify a filename, the software assigns one automatically. The default destination filename is SLAX-Conversion-Temp or slax-temp depending on the Junos OS release, with a randomly generated, five-character, alpha-numeric extension. For example, the software converts a source file called test.xml to slax-temp.kWwQk. The software converts a source file called test1.slax to slax-temp.zN61h.</p> <p>partial—(Optional) Convert partial script input.</p> <p>slax-to-xslt—Convert a SLAX script to XSLT.</p> <p>source <i>source/filename</i>—Specify a source file that you want to convert.</p> <p>version—(Optional) Specify the SLAX version listed in the version statement of the generated script for XSLT-to-SLAX conversions. Acceptable values are 1.0 and 1.1. The default is 1.1.</p> <p>xslt-to-slax—Convert an XSLT script to SLAX.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> Converting Scripts Between SLAX and XSLT
List of Sample Output	request system scripts convert slax-to-xslt on page 1242 request system scripts convert xslt-to-slax on page 1242
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

**request system scripts
convert slax-to-xslt**

```
user@host> request system scripts convert slax-to-xslt source /var/db/scripts/op/script1.slax
destination /var/db/scripts/op
conversion complete
```

**request system scripts
convert xslt-to-slax**

```
user@host> request system scripts convert xslt-to-slax source /var/db/scripts/commit/script1.xml
destination /var/db/scripts/commit partial version 1.0
conversion complete
```

request system scripts delete

Syntax	<code>request system scripts delete <package-name></code>
Release Information	Command introduced before Junos OS Release 9.0.
Description	CLI command to delete AI-Script (jais) packages on Juniper Networks devices.
Options	No options are available.
Required Privilege Level	maintenance

request system snapshot

Syntax	request system snapshot <partition>
Syntax (ACX Series Routers)	request system snapshot <media <i>type</i> > <partition>
Syntax (EX Series Switches)	request system snapshot <all-members local member <i>member-id</i> > <media <i>type</i> > <partition> <re0 re1 routing-engine <i>routing-engine-id</i> > <slice alternate>
Syntax (J Series Routers)	request system snapshot <as-primary> <config-size <i>size</i> > <data-size <i>size</i> > <factory> <media <i>type</i> > <partition> <root-size <i>size</i> > <swap-size <i>size</i> >
Syntax (MX Series Routers)	request system snapshot <all-members> <config-partition> <local> <member <i>member-id</i> > <partition> <root-partition>
Syntax (TX Matrix Routers)	request system snapshot <all-chassis all-lcc lcc <i>number</i> scc> <config-partition> <partition> <root-partition>
Syntax (TX Matrix Plus Routers)	request system snapshot <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <config-partition> <partition> <root-partition>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 12.2 for ACX Series switches. Options <config-partition> and <root-partition> introduced in Junos OS Release 13.1 for M, MX, T, TX Series switches.

- Description**
- On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to /altroot, and /config is backed up to /altconfig. The root and /config file systems are on the router's flash drive, and the /altroot and /altconfig file systems are on the router's hard drive.
 - On the switch, take a snapshot of the files currently used to run the switch—the complete contents of the root (/), /altroot, /config, /var, and /var-tmp directories, which include the running Junos OS, the active configuration, and log files.

CAUTION: After you run the `request system snapshot` command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

Options The specific options available depend upon the router or switch:

none—Back up the currently running software as follows:

- On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to /altroot, and /config is backed up to /altconfig. The root and /config file systems are on the router's flash drive, and the /altroot and /altconfig file systems are on the router's hard drive.
- On the switch, take a snapshot of the files currently used to run the switch and copy them to the media that the switch did not boot from. If the switch is booted from internal media, the snapshot is copied to external (USB) media. If the switch is booted from external (USB) media, the snapshot is copied to internal media.
 - If the snapshot destination is external media but a USB flash drive is not connected, an error message is displayed.
 - If the automatic snapshot procedure is already in progress, the command returns the following error: **Snapshot already in progress. Cannot start manual snapshot.** For additional information about the automatic snapshot feature, see Understanding Resilient Dual-Root Partitions on Switches.

all-chassis | all-lcc | lcc number —(TX Matrix and TX Matrix Plus router only) (Optional)

- **all-chassis**—On a TX Matrix router, archive data and executable areas for all Routing Engines in the chassis. On a TX Matrix Plus router, archive data and executable areas for all Routing Engines in the chassis.
- **all-lcc**—On a TX Matrix router, archive data and executable areas for all T640 routers (or line-card chassis) connected to a TX Matrix router. On a TX Matrix Plus router, archive data and executable areas for all routers (or line-card chassis) connected to a TX Matrix Plus router.
- **lcc number**—On a TX Matrix router, archive data and executable areas for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a

TX Matrix Plus router, archive data and executable areas for a specific router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

all-members | local | member *member-id*—(EX Series switch Virtual Chassis and MX Series routers only) (Optional) Specify where to place the snapshot (archive data and executable areas) in a Virtual Chassis:

- **all-members**—Create a snapshot (archive data and executable areas) for all members of the Virtual Chassis.
- **local**—Create a snapshot (archive data and executable areas) on the member of the Virtual Chassis that you are currently logged into.
- **member *member-id***—Create a snapshot (archive data and executable areas) for the specified member of the Virtual Chassis.

as-primary—(J Series routers only) (Optional) Create a snapshot that can be used to replace the medium in the primary compact flash drive. This option can be used on the removable compact flash only. The option copies the default files that were loaded on the primary compact flash drive when it was shipped from the factory, plus the rescue configuration if one has been set. This option is useful if you have multiple routers and want to use the same software and configuration on each router. After a boot device is created as a primary compact flash drive, it can operate in only a primary compact flash drive slot. This option causes the boot medium to be partitioned.

config-partition—(M, MX, T, TX Series routers only) Create a snapshot of the configuration partition only and store it onto the default **/altconfig** on the hard disk device or an **/altconfig** on a USB device.

config-size *size*—(J Series routers only) (Optional) Specify the size of the config partition, in megabytes. The default value is 10 percent of physical memory on the boot partition. The config partition is mounted on **/config**, and the configuration files are stored in this partition. This option causes the boot medium to be partitioned.

data-size *size*—(J Series routers only) (Optional) Specify the size of the data partition, in megabytes. The default value is 0 MB. The data partition is mounted on **/data**. This space is not used by the router, and can be used for extra storage. This option causes the boot medium to be partitioned.

factory—(J Series routers only) (Optional) Copy only default files that were loaded on the primary compact flash drive when it was shipped from the factory, plus the rescue configuration if one has been set. After the boot medium is created with the factory option, it can operate in only the primary compact flash drive.

media type—(J Series routers and EX Series switches only)(Optional) Specify the boot device the software is copied to:

- **compact-flash**—Copy software to the primary compact flash drive.
- **external**—(Switches only) Copy software to an external mass storage device, such as a USB flash drive. If a USB drive is not connected, the switch displays an error message.
- **internal**—(Switches only) Copy software to an internal flash drive.
- **removable-compact-flash**—Copy software to the removable compact flash drive.
- **usb**—(ACX Series, M320, T640, MX960, and J Series routers only) Copy software to the device connected to the USB port.

partition—(Optional) Repartition the flash drive before a snapshot occurs. If the partition table on the flash drive is corrupted, the **request system snapshot** command fails and reports errors. The partition option is only supported for restoring the software image from the hard drive to the flash drive.

(Routers only) You cannot issue the request system snapshot command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the Junos OS System Basics Configuration Guide.

(EX Series switches only) If the snapshot destination is the media that the switch did not boot from, you must use the **partition** option.

re0 | re1 | routing-engine routing-engine-id—(EX6200 and EX8200 switches only) Specify where to place the snapshot in a redundant Routing Engine configuration.

- **re0**—Create a snapshot on Routing Engine 0.
- **re1**—Create a snapshot on Routing Engine 1.
- **routing-engine routing-engine-id**—Create a snapshot on the specified Routing Engine.

root-partition—(M, MX, T, TX Series routers only) Create a snapshot of the root partition only and store it onto the default **/altroot** on the hard disk device or an **/altroot** on a USB device.

root-size size—(J Series routers only) (Optional) Specify the size of the root partition, in megabytes. The default value is one-third of the physical memory minus the config, data, and swap partitions. The root partition is mounted on **/** and does not include configuration files. This option causes the boot medium to be partitioned.

slice alternate—(EX Series switches only) (Optional) Take a snapshot of the active root partition and copy it to the alternate slice on the boot media.

scc—(TX Matrix router only) (Optional) Archive data and executable areas for a TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Archive data and executable areas for a TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

swap-size *size*—(J Series router only) (Optional) Specify the size of the swap partition, in megabytes. The default value is one-third of the physical memory on a boot medium larger than 128 MB, or 0 MB on a smaller boot device. The swap partition is used for swap files and software failure memory snapshots. Software failure memory snapshots are saved to the boot medium only if it is specified as the dump device in the system dump-device configuration hierarchy. This option causes the boot medium to be partitioned.

- Additional Information**
- (Routers only) Before upgrading the software on the router, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.
 - (Routers only) You cannot issue the **request system snapshot** command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the Junos OS System Basics Configuration Guide
 - (TX Matrix and TX Matrix Plus router only) On a routing matrix, if you issue the **request system snapshot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are backed up. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are backed up.

```

Release Information Command introduced before Junos OS Release 7.4.
best-effort-load and **unlink** options added in Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
set [*package-name package-name*] option added in Junos OS Release 11.1 for EX Series switches.
set [*package-name package-name*] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

NOTE: On EX Series switches, the **set [*package-name package-name*]** option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the **set [*package-name package-name*]** option allows you to install multiple software packages and software add-on packages at the same time.

Description Install a software package or bundle on the router or switch.

Options ***package-name***—Location from which the software package or bundle is to be installed.
 For example:

- ***/var/tmp/package-name***—For a software package or bundle that is being installed from a local directory on the router or switch.
- ***protocol://hostname/pathname/package-name***—For a software package or bundle that is to be downloaded and installed from a remote location. Replace ***protocol*** with one of the following:

- **ftp**—File Transfer Protocol.
Use **ftp://hostname/pathname/package-name**. To specify authentication credentials, use **ftp://<username>:<password>@hostname/pathname/package-name**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
- **http**—Hypertext Transfer Protocol.
Use **http://hostname/pathname/package-name**. To specify authentication credentials, use **http://<username>:<password>@hostname/pathname/package-name**. If a password is required and you omit it, you are prompted for it.
- **scp**—Secure copy (available only for Canada and U.S. version).
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use **scp://<username>:<password>@hostname/pathname/package-name**.

**NOTE:**

- The **pathname** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the **scp** protocol in the request system software add command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support **scp**.
Use the file copy command to copy the software package or bundle from the remote location to the **/var/tmp** directory on the hard disk:
file copy scp://source/package-name /var/tmp
Then install the software package or bundle using the request system software add command:
request system software add /var/tmp/package-name
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the **unlink** option to achieve the same effect and allow the installation to be completed.

best-effort-load—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

component all—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

delay-restart—(Optional) Install a software package or bundle, but do not restart software processes.

force—(Optional) Force the addition of the software package or bundle (ignore warnings).

lcc *number* —(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

member *member-id*—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace *member-id* with a value of 0 or 1.

partition —(QFX3500 switches only) (Optional) Format and repartition the media before installation.

scc—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router. Replace *number* with 0.

no-copy—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

no-validate—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

re0 | re1—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

reboot—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

set [*package-name package-name*]—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the

same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

set [*package-name package-name*]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

unlink—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the **unlink** option to remove the software package from this directory after a successful upgrade is completed.

validate—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

Additional Information

NOTE: The **request system snapshot** command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, **jkernel**, last. Add the operating system package, **jkernel**, first and the routing software package, **jroute**, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add package-name** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same

command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add *package-name*** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

request system software delete

Syntax	request system software delete <i>software-package</i> <force> <reboot> <set [<i>package-name package-name</i>]>
Syntax (TX Matrix Router)	request system software delete <i>software-package</i> <force> <lcc <i>number</i> scc> <reboot> <set [<i>package-name package-name</i>]>
Syntax (TX Matrix Plus Router)	request system software delete <i>software-package</i> <force> <lcc <i>number</i> sfc <i>number</i> > <reboot> <set [<i>package-name package-name</i>]>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Option set [<i>package-name package-name</i>] added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways. Option reboot introduced in Junos OS Release 12.3.
Description	Remove a software package or bundle from the router or switch.
<div style="display: flex; align-items: center;">  <div style="margin-left: 10px;"> <p>CAUTION: Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.</p> </div> </div>	
Options	<p><i>software-package</i>—Software package or bundle name. You can delete any or all of the following software bundles or packages:</p> <ul style="list-style-type: none"> • jbase—(Optional) Junos base software suite • jcrypto—(Optional, in domestic version only) Junos security software • jdocs—(Optional) Junos online documentation file • jkernel—(Optional) Junos kernel software suite • jpfe—(Optional) Junos Packet Forwarding Engine support • jroute—(Optional) Junos routing software suite • junos—(Optional) Junos base software

NOTE: On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

force—(Optional) Ignore warnings and force removal of the software.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

scc—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

set [package-name package-name]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc number—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace *number* with 0.

Additional Information Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the /altroot and /altconfig file systems (on routers) or the /, /altroot, /config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

request system software delete-backup

Syntax	request system software delete-backup
Release Information	Command introduced before Junos OS Release 7.4.
Description	(J Series router only) Delete the backup Junos OS file (if it exists) to free up CompactFlash card space. After running this command, you can no longer use the request system software rollback command to revert to the earlier version of the Junos OS.
Options	This command has no options.
Required Privilege Level	maintenance
List of Sample Output	request system software delete-backup on page 1269
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>request system software delete-backup</code>	<pre>user@host> request system software delete-backup Delete backup system software package [yes,no] (no) yes</pre>
--	--

request system software in-service-upgrade

Syntax	<code>request system software in-service-upgrade <i>package-name</i></code> <code><no-old-master-upgrade></code> <code><reboot></code>
Release Information	Command introduced in Junos OS Release 9.0.
Description	Perform a unified in-service software upgrade (ISSU). A unified ISSU enables you to upgrade from one Junos OS Release to another with no disruption on the control plane and with minimal disruption of traffic. A unified ISSU is only supported by dual Routing Engine platforms. In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled.
Options	<p><i>package-name</i>—Location from which the software package or bundle is to be installed. For example:</p> <ul style="list-style-type: none">• <i>/var/tmp/package-name</i>—For a software package or bundle that is being installed from a local directory on the router.• <i>protocol://hostname/pathname/package-name</i>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <i>protocol</i> with one of the following:<ul style="list-style-type: none">• ftp—File Transfer Protocol• http—Hypertext Transfer Protocol• scp—Secure copy (available only for Canada and U.S. version) <p>no-old-master-upgrade—(Optional) When the no-old-master-upgrade option is included, after the backup Routing Engine is rebooted with the new software package and a switchover occurs to make it the new master Routing Engine, the former master (new backup) Routing Engine will not be upgraded to the new software. In this case, you must manually upgrade the former master (new backup) Routing Engine. If you do not include the no-old-master-upgrade option, the system will automatically upgrade the former master Routing Engine.</p> <p>reboot—(Optional) When the reboot option is included, the former master (new backup) Routing Engine is automatically rebooted after being upgraded to the new software. When the reboot option is not included, you must manually reboot the former master (new backup) Routing Engine using the request system reboot command.</p>
Additional Information	<p>The following conditions apply to unified ISSUs:</p> <ul style="list-style-type: none">• Unified ISSUs are supported on M120 and M320 routers, MX Series routers, T320 routers, and T640 routers only.• Unsupported PICs are restarted during a unified ISSU. For information about supported PICs, see the Junos OS High Availability Configuration Guide.

- Unsupported protocols will experience packet loss during a unified ISSU. For information about supported protocols, see the Junos OS High Availability Configuration Guide.
- During a unified ISSU, you cannot bring any PICs online or offline.

For more information, see the Junos OS High Availability Configuration Guide.

Connection to host closed.

request system software in-service-upgrade (MX Series 3D Universal Edge Routers)

Syntax	<code>request system software in-service-upgrade <i>package-name</i></code> <code><no-copy></code> <code><no-old-master-upgrade></code> <code><reboot></code> <code><unlink></code>
Release Information	Command introduced in Junos OS Release 11.2.
Description	<p>Perform a unified in-service software upgrade (unified ISSU). Unified ISSU enables you to upgrade from one Junos OS release to another with no disruption on the control plane and with minimal disruption of traffic. Unified ISSU is supported only by dual Routing Engine platforms. In addition, graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) must be enabled.</p>
Options	<p><i>package-name</i>—Location from which the software package or bundle is to be installed. For example:</p> <ul style="list-style-type: none"> • <i>/var/tmp/package-name</i>— For a software package or bundle that is being installed from a local directory on the router. • <i>protocol://hostname/pathname/package-name</i>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <i>protocol</i> with one of the following: <ul style="list-style-type: none"> • ftp—File Transfer Protocol • http—Hypertext Transfer Protocol • scp—Secure copy (available only for Canada and U.S. version) <p>no-copy—(Optional) When the no-copy option is included, copies of package files are not saved on the Packet Forwarding Engine.</p> <p>no-old-master-upgrade—(Optional) When the no-old-master-upgrade option is included, after the backup Routing Engine is rebooted with the new software package and a switchover occurs to make it the new master Routing Engine, the former master (new backup) Routing Engine is not upgraded to the new software. In this case, you must manually upgrade the former master (new backup) Routing Engine. If you do not include the no-old-master-upgrade option, the system automatically upgrades the former master Routing Engine.</p> <p>reboot—(Optional) When the reboot option is included, the former master (new backup) Routing Engine is automatically rebooted after being upgraded to the new software. When the reboot option is not included, you must manually reboot the former master (new backup) Routing Engine using the request system reboot command.</p> <p>unlink—(Optional) When the unlink option is included, the package is removed from /var/home whether the installation is successful or unsuccessful.</p>

Additional Information The following conditions apply to unified ISSUs:

- Unified ISSUs are supported on MX Series 3D Universal Edge Routers.
- Unsupported PICs are restarted during a unified ISSU. For information about supported PICs, see the Junos OS High Availability Configuration Guide.
- Unsupported protocols will experience packet loss during a unified ISSU. For information about supported protocols, see the Junos OS High Availability Configuration Guide.
- During a unified ISSU, you cannot bring any PICs online or offline.

For more information, see the Junos OS High Availability Configuration Guide.

List of Sample Output [request system software in-service-upgrade reboot on page 1276](#)

Output Fields When you enter this command, you are provided feedback about the status of your request.

Sample Output

`request system software`

```
{master}  
user@host> request system software in-service-upgrade  
/var/tmp/jinstall-11.2B2.1-domestic-signed.tgz reboot
```

**in-service-upgrade
reboot**

```

request system software rollback

Syntax	request system software rollback
Syntax (EX Series Switches)	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
Syntax (TX Matrix Router)	request system software rollback <lcc <i>number</i> scc> <reboot>
Syntax (TX Matrix Plus Router)	request system software rollback <lcc <i>number</i> sfc <i>number</i> > <reboot>
Syntax (MX Series Router)	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command behavior changed in Junos OS Release 12.1.</p> <p>Option reboot introduced in Junos OS Release 12.3.</p>
Description	<p>For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful request system software add command.</p> <p>As of Junos OS 12.1 and greater, revert to the last known good state before the most recent request system software (add delete) command. For example, using rollback in Junos OS 12.1 after using request system software add restores the system to a known good state prior to using the add command. Similarly, using rollback in Junos OS 12.1 after using request system software delete restores the system to a known good state prior to using the delete command.</p> <p>A software rollback fails if any required package (or a jbundle package containing the required package) cannot be found in /var/sw/pkg.</p> <p><i>Additional Information</i></p> <ul style="list-style-type: none">On M Series and T Series routers, if request system software add <jinstall> reboot was used for the previous installation, then request system software rollback has no effect. In this case, use jinstall to reinstall the required package.

- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.

Options **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

member member-id—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

none—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

reboot—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

scc—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

Required Privilege Level maintenance

request system software validate

Syntax	request system software validate <i>package-name</i> <set [<i>package-name package-name</i>]>
Syntax (TX Matrix Router)	request system software validate <i>package-name</i> <lcc <i>number</i> scc> <set [<i>package-name package-name</i>]>
Syntax (TX Matrix Plus Router)	request system software validate <i>package-name</i> <lcc <i>number</i> sfc <i>number</i> > <set [<i>package-name package-name</i>]>
Syntax (MX Series Router)	request system software validate <i>package-name</i> <member <i>member-id</i> > <set [<i>package-name package-name</i>]>
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. set [<i>package-name package-name</i>] option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.
Description	Validate candidate software against the current configuration of the router.
Options	<p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>member <i>member-id</i>—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace <i>member-id</i> with a value of 0 or 1.</p> <p><i>package-name</i>—Name of the software bundle or package to test.</p>

scc—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

set [package-name package-name]—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

sfc number—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

Additional Information By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

```

request system software validate-in-service-upgrade

Syntax	<code>request system software validate in-service-upgrade <i>package-name</i></code>
Release Information	Command introduced in Junos OS Release 9.6
Description	Perform a compatibility check to ensure that the software and hardware components and the configuration on the device support unified ISSU. The request system software validate in-service-upgrade command enables you to detect any compatibility issues before actually issuing the request system software in-service upgrade command to initiate unified ISSU.
Options	<p><i>package-name</i>—Location from which the software package or bundle is to be installed. For example:</p> <ul style="list-style-type: none"> • <i>/var/tmp/package-name</i>—For a software package or bundle that is being installed from a local directory on the router. • <i>protocol://hostname/pathname/package-name</i>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <i>protocol</i> with one of the following: <ul style="list-style-type: none"> • ftp—File Transfer Protocol • http—Hypertext Transfer Protocol • scp—Secure copy (available only for Canada and U.S. version)
Additional Information	<p>Unified ISSU is supported on M120, M320, M10i (with Enhanced Compact Forwarding Engine Board), MX Series, T320, T640, T1600, and TX Matrix routers only.</p> <p>For more information, see the Junos OS High Availability Configuration Guide.</p>
Required Privilege Level	view

request system storage cleanup

Syntax	request system storage cleanup <dry-run>
Syntax (EX Series Switches)	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
Syntax (MX Series Router)	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
Syntax (QFX Series)	request system storage cleanup <component (<i>serial number</i> <i>UUID</i> all)> <director-group <i>name</i> > <dry-run> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <name-tag <i>name-tag</i> > <node-group <i>name</i> > <prune> <qfabric (component <i>name</i>) dry-run name-tag repository> <repository (core log)>
Release Information	Command introduced in Junos OS Release 7.4. dry-run option introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.
Options	all-members —(EX4200 switches and MX Series routers only) (Optional) Delete files on all members of the Virtual Chassis configuration. component (<i>UUID</i> <i>serial number</i> all) —(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system. director-group <i>name</i> —(QFabric systems only) (Optional) Delete files on the Director group. dry-run —(Optional) List files proposed for deletion (without deleting them). infrastructure <i>name</i> —(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Delete files on the Interconnect device.

local—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

name-tag *name-tag*—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

node-group *name*—(QFabric systems only) (Optional) Delete files on the Node group.

prune—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

qfabric component *name*—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

repository (*core* | *log*)—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

Additional Information If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

Required Privilege Level maintenance

[request system storage cleanup qfabric component all \(QFabric Systems\) on page 1307](#)

Output Fields [Table 141 on page 1300](#) describes the output fields for the **request system storage cleanup** command. Output fields are listed in the approximate order in which they appear.

Table 141: request system storage cleanup Output Fields

Field Name	Field Description
List of files to delete:	Shows list of files available for deletion.
Size	Size of the core-dump file.
Date	Last core-dump file modification date and time.
Name	Name of the core-dump file.
Directory to delete:	Shows list of directories available for deletion.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the core repository, and the log files are located in the log repository. The default Repository scope is shared since both the core and log repositories are shared by all of the QFabric system devices.
Repository head:	Name of the top-level repository location.
Repository name:	Name of the repository: core or log .
Creating list of debug artifacts to be removed under:	Shows location of files available for deletion.
List of debug artifacts to be removed under:	Shows list of files available for deletion.

Description	Restart a Junos OS process.
	
<p>CAUTION: Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.</p>	
Options	none—Same as gracefully .

- adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.
- all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.
- all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all routers connected to the TX Matrix Plus router.
- all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.
- all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).
- ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.
- application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
- audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.
- auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.
- autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.
- captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.
- ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.
- chassis-control**—(Optional) Restart the chassis management process.
- class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
- clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

database-replication—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

datapath-trace-service—(Optional) Restart the packet path tracing process.

dhcp—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

dhcp-service—(Optional) Restart the Dynamic Host Configuration Protocol process.

dialer-services—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

diameter-service—(Optional) Restart the diameter process.

disk-monitoring—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

dls—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

dot1x-protocol—(EX Series switches only) (Optional) Restart the port-based network access control process.

dynamic-flow-capture—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

ethernet-switching—(EX Series switches only) (Optional) Restart the Ethernet switching process.

event-processing—(Optional) Restart the event process (eventd).

fibre-channel—(QFX Series only) (Optional) Restart the Fibre Channel process.

firewall—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

gracefully—(Optional) Restart the software process.

iccp-service—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

immediately—(Optional) Immediately restart the software process.

interface-control—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

ipsec-key-management—(Optional) Restart the IPsec key management process.

isdn-signaling—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

kernel-replication—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Restart the Layer 2 address flooding and learning process.

l2cpd-service—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

l2tp-service—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

l2tp-universal-edge—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

lACP—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

license-service—(EX Series switches only) (Optional) Restart the feature license management process.

link-management— (TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

lldpd-service—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

local—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

local-policy-decision-function— (Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

mac-validation— (Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member *member-id*—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

mib-process—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

moundd-service—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

mpls-traceroute—(Optional) Restart the MPLS Periodic Traceroute process.

mspd—(Optional) Restart the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

network-access-service—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

nfsd-service—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

packet-triggered-subscribers—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Restart the Peer Selection Service process.

pgcp-service—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

pgm—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

pic-services-logging—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

pki-service—(Optional) Restart the PKI Service process.

ppp—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

pppoe—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

protected-system-domain-service—(Optional) Restart the Protected System Domain (PSD) process.

redundancy-interface-process—(Optional) Restart the ASP redundancy process.

remote-operations—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

root-system-domain-service—(Optional) Restart the Root System Domain (RSD) service.

routing—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

routing <logical-system *logical-system-name*>—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

sampling—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

sdk-service—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

sfc *number*—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

service-deployment—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

services—(Optional) Restart a service.

services pgcp gateway *gateway-name*—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

sflow-service—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

snmp—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

soft—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

static-subscribers—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

statistics-service—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

subscriber-management—(Optional) Restart the Subscriber Management process.

subscriber-management-helper—(Optional) Restart the Subscriber Management Helper process.

tunnel-oamd—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

usb-control—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

vrrp—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

web-management—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

Required Privilege Level reset

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
restart interfaces
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

show arp

Syntax	<pre>show arp <expiration-time> <logical-system <i>logical-system-name</i>> <no-resolve> <vpn <i>vpn-name</i>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>expiration-time option added in Junos OS Release 8.1.</p> <p>logical-system and vpn options added in Junos OS Release 10.1.</p>
Description	Display all entries in the Address Resolution Protocol (ARP) table. To display entries for a particular logical system only, first enter the set cli logical-system <i>logical-system-name</i> command, and then enter the show arp command.
Options	<p>none—Display the entries in the ARP table.</p> <p>expiration-time—(Optional) Display the amount of time, in seconds, until each ARP entry is set to expire.</p> <p>logical-system <i>logical-system-name</i>—(Optional) Display ARP entries for the specified logical system; only available on the main router context.</p> <p>no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.</p> <p>vpn <i>vpn-name</i>—(Optional) Display entries in the ARP table for the specified virtual private network's (VPN) routing table.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear arp on page 1164 • set cli logical-system on page 975
List of Sample Output	<p>show arp on page 1319</p> <p>show arp no-resolve on page 1319</p> <p>show arp expiration-time on page 1319</p>
Output Fields	Table 142 on page 1318 describes the output fields for the show arp command. Output fields are listed in the approximate order in which they appear.

Table 142: show arp Output Fields

Field Name	Field Description
MAC Address	Media access control (MAC) address that corresponds to the IP address.
Address	IP address that corresponds to the hostname.

Table 142: show arp Output Fields (*continued*)

Field Name	Field Description
Name	Hostname.
Interface	Interface name.
Flags	(no-resolve option only) Indicates how mappings between IP and MAC addresses are defined: <ul style="list-style-type: none"> • Permanent—Static mapping. • Permanent and published—Static mapping that is published. • None—Dynamic mapping.
TTE	(expiration-time option only) Amount of time, in seconds, until ARP entry is set to expire.

show configuration

Syntax	<code>show configuration</code> <code><statement-path></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the configuration that currently is running on the router or switch, which is the last committed configuration.
Options	<p>none—Display the entire configuration.</p> <p>statement-path—(Optional) Display one of the following hierarchies in a configuration. (Each statement-path option has additional suboptions not described here. See the appropriate configuration guide or EX Series switch documentation for more information.)</p> <ul style="list-style-type: none">• access—Network access configuration.• access-profile—Access profile configuration.• accounting-options—Accounting data configuration.• applications—Applications defined by protocol characteristics.• apply-groups—Groups from which configuration data is inherited.• chassis—Chassis configuration.• chassis network-services—Current running mode.• class-of-service—Class-of-service configuration.• diameter—Diameter base protocol layer configuration.• ethernet-switching-options—(EX Series switch only) Ethernet switching configuration.• event-options—Event processing configuration.• firewall—Firewall configuration.• forwarding-options—Options that control packet sampling.• groups—Configuration groups.• interfaces—Interface configuration.• jsrc—JSRC partition configuration.• jsrc-partition—JSRC partition configuration.• logical-systems—Logical system configuration.• poe—(EX Series switch only) Power over Ethernet configuration.• policy-options—Routing policy option configuration.• protocols—Routing protocol configuration.

- **routing-instances**—Routing instance configuration.
- **routing-options**—Protocol-independent routing option configuration.
- **security**—Security configuration.
- **services**—Service PIC applications configuration.
- **snmp**—Simple Network Management Protocol configuration.
- **system**—System parameters configuration.
- **virtual-chassis**—(EX Series switch only) Virtual Chassis configuration.
- **vlan**—(EX Series switch only) VLAN configuration.

Additional Information The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text **ACCESS-DENIED** is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the secret permission bit is not set for your user account, the text **SECRET-DATA** is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

Likewise, when you issue the **show configuration** command with the **| display set** pipe option to view the configuration as **set** commands, those portions of the configuration that you do not have permissions to view are substituted with the text **ACCESS-DENIED**.

show dhcp server binding

Syntax	<pre>show dhcp server binding <address> <brief detail summary> <interface interface-name> <interfaces-vlan> <interfaces-wildcard> <logical-system logical-system-name> <routing-instance routing-instance-name></pre>
Release Information	<p>Command introduced in Junos OS Release 9.0.</p> <p>Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.</p>
Description	Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol (DHCP) local server.
Options	<p>address—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:</p> <ul style="list-style-type: none"> • <i>ip-address</i>—The specified IP address. • <i>mac-address</i>—The specified MAC address. • <i>session-id</i>—The specified session ID. <p>brief detail summary—(Optional) Display the specified level of output about active client bindings. The default is brief, which produces the same output as show dhcp server binding.</p> <p>interface interface-name—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p>interfaces-vlan—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.</p> <p>interfaces-wildcard—(Optional) The set of interfaces on which to show the binding state information. This option supports the use of the wildcard character (*).</p> <p>logical-system logical-system-name—(Optional) Display information about active client bindings for DHCP clients on the specified logical system.</p> <p>routing-instance routing-instance-name—(Optional) Display information about active client bindings for DHCP clients on the specified routing instance.</p>
Required Privilege Level	view

Output Fields [Table 145 on page 1328](#) lists the output fields for the **show dhcp server binding** command. Output fields are listed in the approximate order in which they appear.

Table 145: show dhcp server binding Output Fields

Field Name	Field Description	Level of Output
<i>number</i> clients, (<i>number</i> init, <i>number</i> bound, <i>number</i> selecting, <i>number</i> requesting, <i>number</i> renewing, <i>number</i> releasing)	Summary counts of the total number of DHCP clients and the number of DHCP clients in each state.	summary
IP address	IP address of the DHCP client.	brief detail
Session Id	Session ID of the subscriber session.	brief detail
Hardware address	Hardware address of the DHCP client.	brief detail
Expires	Number of seconds in which lease expires.	brief detail
State	State of the address binding table on the extended DHCP local server: <ul style="list-style-type: none"> • BOUND—Client has active IP address lease. • FORCERENEW—Client has received forcerenew message from server. • INIT—Initial state. • RELEASE—Client is releasing IP address lease. • RENEWING—Client sending request to renew IP address lease. • REQUESTING—Client requesting a DHCP server. • SELECTING—Client receiving offers from DHCP servers. 	brief detail
Interface	Interface on which the request was received.	brief

Table 145: show dhcp server binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
Lease Expires	Date and time at which the client's IP address lease expires.	detail
Lease Expires in	Number of seconds in which lease expires.	detail
Lease Start	Date and time at which the client's IP address lease started.	detail
Last Packet Received	Date and time at which the router received the last packet.	detail
Incoming Client Interface	Client's incoming interface.	detail
Client Interface Svlan Id	S-VLAN ID of the client's incoming interface.	detail
Client Interface Vlan Id	VLAN ID of the client's incoming interface.	detail
Demux Interface	Name of the IP demultiplexing (demux) interface.	detail
Server IP Address or Server Identifier	IP address of DHCP server.	detail
Server Interface	Interface of DHCP server.	detail
Client Pool Name	Name of address pool used to assign client IP address lease.	detail
ACI Interface Set Name	Internally generated name of the dynamic agent circuit identifier (ACI) interface set.	detail
ACI Interface Set Index	Index number of the dynamic ACI interface set.	detail
ACI Interface Set Session ID	Identifier of the dynamic ACI interface set entry in the session database.	detail

Sample Output

show dhcp server statistics

Syntax	show dhcp server statistics <logical-system <i>logical-system-name</i>> <routing-instance <i>routing-instance-name</i>>
Release Information	Command introduced in Junos OS Release 9.0.
Description	Display extended Dynamic Host Configuration Protocol (DHCP) local server statistics.
Options	logical-system <i>logical-system-name</i> —(Optional) Display information about extended DHCP local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system. routing-instance <i>routing-instance-name</i> —(Optional) Display information about extended DHCP local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• clear dhcp server statistics on page 1168
List of Sample Output	show dhcp server statistics on page 1334
Output Fields	Table 146 on page 1333 lists the output fields for the show dhcp server statistics command. Output fields are listed in the approximate order in which they appear.

Table 146: show dhcp server statistics Output Fields

Field Name	Field Description
Packets dropped	<p>Number of packets discarded by the extended DHCP local server because of errors. Only nonzero statistics appear in the Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.</p> <ul style="list-style-type: none"> • Total—Total number of packets discarded by the extended DHCP local server • Authentication—Number of packets discarded because they could not be authenticated • Bad hardware address—Number of packets discarded because an invalid hardware address was specified • Bad opcode—Number of packets discarded because an invalid operation code was specified • Bad options—Number of packets discarded because invalid options were specified • Dynamic profile—Number of packets discarded due to dynamic profile information • Invalid server address—Number of packets discarded because an invalid server address was specified • No available addresses—Number of packets discarded because there were no addresses available for assignment • No interface match—Number of packets discarded because they did not belong to a configured interface • No routing instance match—Number of packets discarded because they did not belong to a configured routing instance • No valid local address—Number of packets discarded because there was no valid local address • Packet too short—Number of packets discarded because they were too short • Read error—Number of packets discarded because of a system read error • Send error—Number of packets that the extended DHCP local server could not send
Messages received	<p>Number of DHCP messages received.</p> <ul style="list-style-type: none"> • BOOTREQUEST—Number of BOOTP protocol data units (PDUs) received • DHCPDECLINE—Number of DHCP PDUs of type DECLINE received • DHCPDISCOVER—Number of DHCP PDUs of type DISCOVER received • DHCPINFORM—Number of DHCP PDUs of type INFORM received • DHCPRELEASE—Number of DHCP PDUs of type RELEASE received • DHCPREQUEST—Number of DHCP PDUs of type REQUEST received

show dhcpv6 server binding

Syntax	<pre>show dhcpv6 server binding <address> <brief detail summary> <interface interface-name> <interfaces-vlan> <interfaces-wildcard> <logical-system logical-system-name> <routing-instance routing-instance-name></pre>
Release Information	<p>Command introduced in Junos OS Release 9.6.</p> <p>Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.</p>
Description	Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.
Options	<p>address—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"> • <i>CID</i>—The specified Client ID (CID). • <i>ipv6-prefix</i>—The specified IPv6 prefix. • <i>session-id</i>—The specified session ID. <p>brief detail summary—(Optional) Display the specified level of output about active client bindings. The default is brief, which produces the same output as show dhcpv6 server binding.</p> <p>interface interface-name—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p>interfaces-vlan—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p>interfaces-wildcard—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p>logical-system logical-system-name—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.</p> <p>routing-instance routing-instance-name—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Clearing DHCP Bindings for Subscriber Access • clear dhcpv6 server binding on page 1171

Output Fields [Table 148 on page 1338](#) lists the output fields for the **show dhcpv6 server binding** command. Output fields are listed in the approximate order in which they appear.

Table 148: show dhcpv6 server binding Output Fields

Field Name	Field Description	Level of Output
<i>number clients</i> , (<i>number init</i> , <i>number bound</i> , <i>number selecting</i> , <i>number requesting</i> , <i>number renewing</i> , <i>number releasing</i>)	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	summary
Prefix	Client's DHCPv6 prefix, or prefix used to support multiple address assignment.	brief detail
Session Id	Session ID of the subscriber session.	brief detail
Expires	Number of seconds in which lease expires.	brief detail
State	State of the address binding table on the extended DHCPv6 local server: <ul style="list-style-type: none"> • BOUND—Client has active IP address lease. • INIT—Initial state. • RECONFIGURE—Server has sent reconfigure message to client. • RELEASE—Client is releasing IP address lease. • RENEWING—Client sending request to renew IP address lease. • REQUESTING—Client requesting a DHCPv6 server. • SELECTING—Client receiving offers from DHCPv6 servers. 	brief detail
Interface	Interface on which the DHCPv6 request was received.	brief
Client IPv6 Address	Client's IPv6 address.	detail
Client IPv6 Prefix	Client's IPv6 prefix.	detail
Client DUID	Client's DHCP Unique Identifier (DUID).	brief detail
Lease expires	Date and time at which the client's IP address lease expires.	detail

Table 148: show dhcpv6 server binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
Lease expires in	Number of seconds in which lease expires.	detail
Preferred Lease Expires	Date and UTC time at which the client's IPv6 prefix expires. .	detail
Preferred Lease Expires in	Number of seconds at which client's IPv6 prefix expires.	detail
Lease Start	Date and time at which the client's address lease was obtained.	detail
Incoming Client Interface	Client's incoming interface.	detail
Server IP Address	IP address of DHCPv6 server.	detail
Server Interface	Interface of DHCPv6 server.	detail
Client Pool Name	Address pool used to assign IPv6 address.	detail
Client Prefix Pool Name	Address pool used to assign IPv6 prefix.	detail
Client Id length	Length of the DHCPv6 client ID, in bytes.	detail
Client Id	ID of the DHCPv6 client.	detail

show dhcpv6 server statistics

Syntax	show dhcpv6 server statistics <logical-system <i>logical-system-name</i>> <routing-instance <i>routing-instance-name</i>>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.
Options	<p>logical-system <i>logical-system-name</i>—(Optional) Display information about extended DHCPv6 local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Display information about extended DHCPv6 local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.</p>
Required Privilege Level	view

show network-access aaa radius-servers

Syntax	show network-access aaa radius-servers <detail>
Release Information	Command introduced in Junos OS Release 12.1.
Description	Display RADIUS server status and information.
Options	detail —(Optional) Display detailed level of information.
Required Privilege Level	view
List of Sample Output	show network-access aaa radius-servers on page 1352 show network-access aaa radius-servers detail on page 1352
Output Fields	Table 151 on page 1349 lists the output fields for the show network-access aaa radius-servers command. Output fields are listed in the approximate order in which they appear.

Table 151: show network-access aaa radius-servers Output Fields

Field Name	Field Description	Level of Output
Profile	Name of the profile associated with the RADIUS server. A RADIUS server can be associated with more than one profile.	All levels
Server address	IP address of the RADIUS server.	All levels
Authentication port	RADIUS server authentication port number.	All levels
Accounting port	RADIUS server accounting port number.	All levels
Status	<p>RADIUS server status, UP or DOWN.</p> <p>If status is DOWN, the Status field includes the number of seconds configured by the revert-interval statement. When a RADIUS server is unreachable and marked as DOWN, the router waits until the revert interval expires before attempting to reconnect to the RADIUS server.</p> <p>NOTE: If only one RADIUS server is configured, the server status is never marked as DOWN. If the RADIUS server is disconnected, the router continues to attempt to contact the server and displays a status of UP for the server.</p>	All levels
RADIUS servers	Details for specific RADIUS server, identified by IP address.	Detail
Authentication requests	Number of authentication requests received by the authentication server.	Detail

Table 151: show network-access aaa radius-servers Output Fields (*continued*)

Field Name	Field Description	Level of Output
Authentication rollover requests	Number of requests coming into the server as a result of the previous server timing out.	Detail
Authentication retransmissions	Number of retransmissions.	Detail
Accepts	Number of authentication requests accepted by the authentication server.	Detail
Rejects	Number of authentication requests rejected by the authentication server.	Detail
Challenges	Number of authentication requests challenged by the authentication server.	Detail
Authentication malformed responses	Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
Authentication bad authenticators	Number of responses in which the authenticator is incorrect for the authentication request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
Authentication requests pending	Number of authentication requests waiting for a response.	Detail
Authentication request timeouts	Number of times an authentication request to the server timed out.	Detail
Authentication unknown responses	Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.	Detail
Authentication packets dropped	Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail
Accounting start requests	Number of accounting start requests received.	Detail
Accounting interim requests	Number of accounting interim requests received.	Detail
Accounting stop requests	Number of accounting stop requests received.	Detail
Accounting rollover requests	Number of requests coming into the server as a result of the previous server timing out.	Detail

Table 151: show network-access aaa radius-servers Output Fields (*continued*)

Field Name	Field Description	Level of Output
Accounting retransmissions	Number of retransmissions.	Detail
Accounting start responses	Number of accounting start responses sent by the server.	Detail
Accounting interim responses	Number of accounting interim responses sent by the server.	Detail
Accounting stop responses	Number of accounting stop responses sent by the server.	Detail
Accounting malformed responses	Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
Accounting bad authenticators	Number of responses in which the authenticator is incorrect for the accounting request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
Accounting requests pending	Number of accounting requests waiting for a response.	Detail
Accounting request timeouts	Number of accounting requests to the accounting server that timed out.	Detail
Accounting unknown responses	Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.	Detail
Accounting packets dropped	Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail

Sample Output

show network-access aaa statistics

Syntax	<pre>show network-access aaa statistics <accounting> <address-assignment (client pool <i>pool-name</i>)> <dynamic-requests> <radius></pre>
Release Information	<p>Command introduced in Junos OS Release 9.1.</p> <p>Option address-assignment introduced in Junos OS Release 10.0.</p> <p>Option radius introduced in Junos OS Release 11.4.</p>
Description	Display AAA accounting, address-assignment, dynamic request statistics, and RADIUS settings and statistics.
Options	<p>accounting—(Optional) Display AAA accounting statistics.</p> <p>address-assignment (client pool <i>pool-name</i>)—(Optional) Display AAA address-assignment client and pool statistics.</p> <p>dynamic-requests—(Optional) Display AAA dynamic requests.</p> <p>radius— (Optional) Display RADIUS settings and statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show network-access aaa statistics accounting on page 1355</p> <p>show network-access aaa statistics address-assignment client on page 1355</p> <p>show network-access aaa statistics address-assignment pool on page 1355</p> <p>show network-access aaa statistics dynamic-requests on page 1355</p> <p>show network-access aaa statistics radius on page 1355</p>
Output Fields	Table 152 on page 1353 lists the output fields for the show network-access aaa statistics command. Output fields are listed in the approximate order in which they appear.

Table 152: show network-access aaa statistics Output Fields

Field Name	Field Description
Requests received	<ul style="list-style-type: none"> Number of accounting requests generated by the AAA framework. Number of dynamic requests received from the external server.
Accounting Response failures	Number of accounting requests not acknowledged (NAK) by the accounting server.
Accounting Response Success	Number of accounting requests acknowledged by the accounting server.
Requests timedout	Number of accounting requests to the accounting server that timed out.
Client	Client type; for example, DHCP, Mobile IP, PPP.

Table 152: show network-access aaa statistics Output Fields (*continued*)

Field Name	Field Description
Out of Memory	Number of times an address was not given to the client due to memory issues.
No Matches	Number of times there were no network matches for the pool.
Pool Name	Name of the address-assignment pool for this client.
Out of Addresses	Number of times there were no available addresses in the pool.
Address total	Number of addresses in the pool.
Addresses in use	Number of addresses in use.
Address Usage (percent)	Percentage of total addresses in use.
processed successfully	Number of dynamic requests processed successfully by the AAA framework.
errors during processing	Number of dynamic requests that resulted in processing errors by the AAA framework.
Link Name	Name of the secondary address-assignment pool to which the primary pool is linked.
Pool Usage	Percentage of allocated addresses in the specified address pool.
silently dropped	Number of dynamic requests dropped by the AAA framework due to multiple back-to-back or duplicate requests.
RADIUS Server	IP address of the RADIUS server to which the router is sending requests.
Profile	Name of the RADIUS profile associated with the RADIUS server. A RADIUS server can be associated with more than one RADIUS profile.
Configured	Configured maximum number of outstanding requests from the router to the RADIUS server for a specific profile. An outstanding request is a request to which the RADIUS server has not yet responded. The range of values is 0 through 2000 outstanding requests. The default value is 1000.
Current	Current number of outstanding requests from the router to the RADIUS server for a specific profile. An outstanding request is a request to which the RADIUS server has not yet responded.
Peak	Highest number of outstanding requests from the router to the RADIUS server for a specific profile at any point in time since the router was started or since the counter was last cleared. NOTE: If the value of this field is equal to the value of the Configured field, you may want to increase the value of the Configured field.
Exceeded	Number of times that the router attempted to send requests to the RADIUS server in excess of the configured maximum value for a specific profile. NOTE: If the value of this field is nonzero, you may want to increase the value of the Configured field.

show network-access aaa statistics authentication

Syntax	show network-access aaa statistics authentication <detail>
Release Information	Command introduced in Junos OS Release 9.1. Option detail introduced in Junos OS Release 12.1.
Description	Display AAA authentication statistics.
Options	detail —(Optional) Displays detailed information about authentication.
Required Privilege Level	view
List of Sample Output	show network-access aaa statistics authentication on page 1358 show network-access aaa statistics authentication detail on page 1358
Output Fields	Table 153 on page 1356 lists the output fields for the show network-access aaa statistics authentication command. Output fields are listed in the approximate order in which they appear.

Table 153: show network-access aaa statistics authentication Output Fields

Field Name	Field Description	Level of Output
Requests received	Number of authentication requests received from clients.	All levels
Multistack requests	Number of authentication requests for dual-stack subscribers.	All levels
Accepts	Number of authentication requests accepted by the authentication server.	All levels
Rejects	Number of authentication requests rejected by the authentication server.	All levels
Challenges	Number of authentication requests challenged by the authentication server.	All levels
Requests timed out	Number of authentication requests that timed out.	All levels
RADIUS authentication failures	Number of RADIUS authentication requests that have failed.	Detail
Queue request deleted	Number of queue requests that have been deleted.	Detail
Malformed reply	Number of malformed replies received from the RADIUS authentication server.	Detail

Table 153: show network-access aaa statistics authentication Output Fields (continued)

Field Name	Field Description	Level of Output
No server configured	Number of authentication requests that failed because no authentication server is configured.	Detail
Access Profile configuration not found	Number of authentication requests that failed because no access profile is configured.	Detail
Unable to create client record	Number of times that the router is unable to create the client record for the authentication request.	Detail
Unable to create client request	Number of times that the router is unable to create the client request for the authentication request.	Detail
Unable to build authentication request	Number of times that the router is unable to build the authentication request.	Detail
No server found	Number of requests to the authentication server that have timed out; the server is then considered to be down.	Detail
Unable to create handle	Number of authentication requests that have failed because of an internal allocation failure.	Detail
Unable to queue request	Number of times the router was unable to queue the request to the authentication server.	Detail
Invalid credentials	Number of times the router did not have proper authorization to access the authentication server.	Detail
Malformed request	Number of times the router request to the authentication server is malformed.	Detail
License unavailable	Number of times the router did not have a license to access the authentication server.	Detail
Redirect requested	Number of authentication requests that have been redirected based on routing instance.	Detail
Internal failure	Number of internal failures.	Detail
Local authentication failures	Number of times local authentication failed.	Detail
LDAP lookup failures	Number of times the LDAP lookup operation failed.	Detail

Sample Output

Output Fields	Table 154 on page 1359 lists the output fields for the show network-access aaa subscribers command. Output fields are listed in the approximate order in which they appear.

Table 154: show network-access aaa subscribers Output Fields

Field Name	Field Description
Challenge requests	Number of authentication requests challenged by the authentication server for this subscriber.
Challenge responses	Number of challenge responses sent by the subscriber to the authentication server.
START sent successfully	Number of accounting start requests generated by the AAA framework for this subscriber.
START send failures	Number of accounting start requests that failed to make it to the accounting server for this subscriber.
START ack received	Number of accounting start requests acknowledged by the accounting server for this subscriber.
INTERIM sent successfully	Number of accounting interim requests generated by the AAA framework for this subscriber.

Table 154: show network-access aaa subscribers Output Fields (*continued*)

Field Name	Field Description
INTERIM send failures	Number of accounting interim requests that failed to make it to the accounting server for this subscriber.
INTERIM ack received	Number of accounting interim requests acknowledged by the accounting server for this subscriber.
Requests received	Number of reauthentication requests received by the authentication server.
Successful responses	Number of successful reauthentication requests granted by the authentication server.
Aborts handled	Number of reauthentication requests aborted by the authentication server.
Service name	Name of the subscriber service.
Creation requests	Number of requests to create the service.
Deletion requests	Number of requests to delete the service.
Request timeouts	Number of times the service request was timed out.
Client type	Type of client; for example, DHCP, Mobile IP, PPP.
Session-ID	ID of the subscriber session.
Session uptime	How long the session has been up, in <i>HH:MM:SS</i> .
Accounting	Status of accounting, and type of accounting if accounting is on.

Output Fields	Table 155 on page 1362 lists the output fields for the show network-access aaa subscribers session-id command. Output fields are listed in the approximate order in which they appear.

Table 155: show network-access aaa subscribers session-id Output Fields

Field Name	Field Description	Level of Output
Type and Client type	Type of client.	All levels
Accounting	Status of accounting, and type of accounting if accounting is on.	brief
Service type	Type of accounting: volume , time , volume+time , or na .	brief
Quota	Quota for service: volume (in Mbps) or time (seconds).	brief
Username	Name of the user logged in to the session.	detail
Stripped username	Username after the domain has been removed.	detail

Table 155: show network-access aaa subscribers session-id Output Fields (*continued*)

Field Name	Field Description	Level of Output
Logical system/Routing instance and AAA Logical system/Routing instance	Name of the routing instance, logical system name, or both used for the session.	All levels
Target Logical system/Routing instance	Logical system/routing instance to which the session is mapped.	detail
Access-profile	Access profile used for AAA services for the session.	detail
Session ID	ID of the subscriber session. The session ID value displayed under Service name is the service session ID.	detail
Accounting Session ID	ID of the accounting session (RADIUS attribute 44). The ID appears in decimal or description format, as specified by the accounting-session-id-format statement.	detail
Multi Accounting Session ID	Bundle ID for MLPPP sessions. Acct-Multi-Session-Id (RADIUS attribute 50) uses the value of the session database bundle session ID to enable RADIUS to link together multiple related sessions. The value of this field is zero when no MLPPP sessions exist.	detail
IP Address	IP address of the subscriber.	detail
Authentication State	State of the subscriber authentication session: AuthInit , AuthStart , AuthChallenge , AuthRedirect , AuthClntRespWait , AuthAcctVolStatsAckWait , AuthAcctStopAckWait , AuthServCreateRespWait , AuthLogoutStart , AuthStateActive , AuthClntLogoutRespWait , AuthProfileUpdateWait , AuthProvisionRespWait , AuthProvisionServiceCreationWait	detail
Gx-Plus Provisioning State	State of Gx-Plus provisioning: <ul style="list-style-type: none"> ignored—Subscriber has no IPv4 address or NAS-Port-ID. in-progress—Provisioning is in progress. logout—Subscriber logout is in progress. logout-done—Logout response has been received. response-received—Provisioning response has been received. 	detail

Table 155: show network-access aaa subscribers session-id Output Fields (*continued*)

Field Name	Field Description	Level of Output
Accounting State	State of the subscriber accounting session: Acc-Init , Acc-Start-Sent , Imm-Update-Stats-Pending , Acc-Interim-Sent , Acc-Stop-Stats-Pending , Acc-Stop-Sent , Acc-Stop-On-Fail-Deny-Sent , Acc-Stop-Ackd	detail
Provisioning-type	Provisioning type for this session: <ul style="list-style-type: none"> gx-plus—Subscriber service uses Gx-Plus provisioning. jsrc—Subscriber service uses JSRC provisioning. none—Provisioning is not enabled. 	detail
Service name	Name of the attached service or policy. <ul style="list-style-type: none"> For RADIUS-activated and CLI-activated services, displays the full activation string for the service. If the activation string includes service parameters, then both the service name and service parameters are displayed. For JSRC-activated policies—displays the policy name. 	All levels
Service State	State of the service provided in the subscriber session.	detail
Session uptime	How long the session has been up, in <i>HH:MM:SS</i> .	All levels
Accounting status	Status of the accounting configuration for the service, on or off , and the type of accounting, time or volume+time . Configured in RADIUS Service-Statistics VSA [26-69].	detail
Service accounting session ID	ID of the service accounting session; RADIUS Acct-Session-Id attribute (44). The ID appears in decimal or description format, as specified by the accounting-session-id-format statement.	detail
Service accounting state	State of the service accounting session: Acc-Init , Acc-Start-Sent , Imm-Update-Stats-Pending , Acc-Interim-Sent , Acc-Stop-Stats-Pending , Acc-Stop-Sent , Acc-Stop-On-Fail-Deny-Sent , Acc-Stop-Ackd	detail
Accounting interim interval	Amount of time between interim accounting updates for this service, in seconds; RADIUS Service-Interim-Acct-Interval VSA [26-140] or Diameter Acct-Interim-Interval AVP (85).	detail

show ntp associations

Syntax	<code>show ntp associations</code> <code><no-resolve></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display Network Time Protocol (NTP) peers and their state.
Options	none —Display NTP peers and their state. no-resolve —(Optional) Suppress symbolic addressing.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show ntp status on page 1370
List of Sample Output	show ntp associations on page 1369
Output Fields	Table 157 on page 1368 describes the output fields for the show ntp associations command. Output fields are listed in the approximate order in which they appear.

Table 157: show ntp associations Output Fields

Field Name	Field Description
remote	Address or name of the remote NTP peer.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0 .
st	Stratum of the remote peer.
t	Type of peer: b (broadcast), l (local), m (multicast), or u (unicast).
when	When the last packet from the peer was received.
poll	Polling interval, in seconds.
reach	Reachability register, in octal.
delay	Current estimated delay of the peer, in milliseconds.
offset	Current estimated offset of the peer, in milliseconds.
disp	Current estimated dispersion of the peer, in milliseconds.

Table 157: show ntp associations Output Fields (*continued*)

Field Name	Field Description
<i>peer-name</i>	<p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> • space—Discarded because of a high stratum value or failed sanity checks. • x—Designated "falseticker" by the intersection algorithm. • .—Culled from the end of the candidate list. • — —Discarded by the clustering algorithm. • +—Included in the final selection set. • #—Selected for synchronization, but the distance exceeds the maximum. • *—Selected for synchronization. • o—Selected for synchronization, but the packets-per-second (pps) signal is in use.

show ntp status

Syntax	<code>show ntp status</code> <code><no-resolve></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the values of internal variables returned by Network Time Protocol (NTP) peers.
Options	none —Display the values of internal variables returned by NTP peers. no-resolve —(Optional) Suppress symbolic addressing.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show ntp associations on page 1368
List of Sample Output	show ntp status on page 1371
Output Fields	Table 158 on page 1370 describes the output fields for the show ntp status command. Output fields are listed in the approximate order in which they appear.

Table 158: show ntp status Output Fields

Field Name	Field Description
status	System status word, a code representing the status items listed.
leap_none	Indicates a normal synchronized state with no leap seconds imminent. Other options could be leap_add_sec , leap_del_sec , or leap_alarm , indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
sync_ntp	Indicates the current synchronization source, in this case, an NTP server. Other options include sync_alarm and sync_unspec , both indicating that the router has not been synched.
x events	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
event_peer/strat_chg	Describes the most recent event, in this case, the stratum of the peer server changed.
version	A detailed description of the version of NTP being used.
processor	Indicates the current hardware platform and version of the processor.
system	Detailed description of the name and version of the operating system in use.
leap	The number of leap seconds in use.

Table 158: show ntp status Output Fields (*continued*)

Field Name	Field Description
stratum	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
precision	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
rootdelay	The total roundtrip delay to the primary reference source, in seconds.
rootdispersion	The maximum error relative to the primary reference source, in seconds.
peer	An identification number of the peer in use.
refid	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.
reftime	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
poll	The NTP broadcast message polling interval, in seconds.
clock	The current time on the local router clock.
state	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
offset	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
frequency	The frequency of the clock.
jitter	Indicates the magnitude of jitter, in milliseconds, between several time queries.
stability	A measure of how well this clock can maintain a constant frequency.

Sample Output

show ntp status

show static-subscribers sessions

Syntax	show static-subscribers sessions <group <i>group-name</i> > <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display information about the subscriber sessions for all static subscribers, all static subscribers on an interface group, or a single subscriber on an interface.
Options	<p><i>group-name</i>—(Optional) Display session information for static subscribers on all interfaces in the specified group.</p> <p><i>interface-name</i>—(Optional) Display session information for the static subscriber on the specified in the specified group.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Subscribers on Static Interfaces Overview
List of Sample Output	show static-subscribers sessions on page 1373 show static-subscribers sessions group on page 1373 show static-subscribers sessions interface on page 1373
Output Fields	Table 159 on page 1372 lists the output fields for the show static-subscribers sessions command. Output fields are listed in the approximate order in which they appear.

Table 159: show static-subscribers sessions Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	None specified
State	State of the static subscriber session: <ul style="list-style-type: none"> authenticating—Subscriber is being authenticated. activating client—Client is being activated. activating services—Subscriber services are being activated. deactivating client—Client is being deactivated. deactivating services—Subscriber services are being deactivated. initializing—Process is initializing. logged in—Subscriber is logged in to the interface. logged out—Subscriber is logged out of the interface. processing statistics—Session statistics are being processed. terminating session—Subscriber session is being terminated. 	None specified
Group	Name of the interface group to which the interface belongs.	None specified

Table 159: show static-subscribers sessions Output Fields (*continued*)

Field Name	Field Description	Level of Output
User Name	Username used for the static subscriber. Can be the interface name.	None specified

show subscribers

Syntax `show subscribers`
 `<detail | extensive | terse>`
 `<aci-interface-set-name aci-interface-set-name>`
 `<address address>`
 `<agent-circuit-identifier agent-circuit-identifier-substring>`
 `<client-type client-type>`
 `<count>`
 `<interface interface>`
 `<logical-system logical-system>`
 `<mac-address mac-address>`
 `<physical-interface physical-interface-name>`
 `<profile-name profile-name>`
 `<routing-instance routing-instance>`
 `<stacked-vlan-id stacked-vlan-id>`
 `<subscriber-state subscriber-state>`
 `<user-name user-name>`
 `<vlan-id vlan-id>`

Release Information Command introduced in Junos OS Release 9.3.
 Command introduced in Junos OS Release 9.3 for EX Series switches.
 client-type, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.
 count option usage with other options introduced in Junos OS Release 10.2.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.
 The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.

Description Display information for active subscribers.

Options **detail | extensive | terse**—(Optional) Display the specified level of output.

aci-interface-set-name—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as `aci-1003-ge-1/0/0.4001`, and not the actual ACI value found in the DHCP or PPPoE control packets.

address—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, `192.168.17.1`). If you specify the IP address as a prefix with a netmask (for example, `192.168.17.1/32`), the router displays a message that the IP address is invalid, and rejects the command.

agent-circuit-identifier-substring—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

client-type—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

count—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the **count** option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, or **vlan-id** options.

id—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the **show subscribers extensive** or the **show subscribers interface extensive** commands.

interface—(Optional) Display subscribers whose interface matches the specified interface.

logical-system—(Optional) Display subscribers whose logical system matches the specified logical system.

mac-address—(Optional) Display subscribers whose MAC address matches the specified MAC address.

physical-interface-name—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

profile-name—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

routing-instance—(Optional) Display subscribers whose routing instance matches the specified routing instance.

subscriber-state—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

user-name—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

vlan-id—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

stacked-vlan-id—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

NOTE: Due to display limitations, logical system and routing instance output values are truncated when necessary.

Output Fields [Table 160 on page 1376](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

Table 160: show subscribers Output Fields

Field Name	Field Description
User Name	Name of subscriber.
Type	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
IP Address	Subscriber IPv4 address.
IP Netmask	Subscriber IP netmask.

Table 160: show subscribers Output Fields (*continued*)

Field Name	Field Description
Primary DNS Address	IP address of primary DNS server.
Secondary DNS Address	IP address of secondary DNS server.
Primary WINS Address	IP address of primary WINS server.
Secondary WINS Address	IP address of secondary WINS server.
IPv6 Address	Subscriber IPv6 address, or multiple addresses.
IPv6 Prefix	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
IPv6 User Prefix	IPv6 prefix obtained through ND/RA.
IPv6 Address Pool	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
IPv6 Network Prefix Length	Length of the network portion of the IPv6 address.
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.
Interface	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface. The * character indicates a continuation of addresses for the same session.
Interface Type	Whether the subscriber interface is Static or Dynamic .
Interface Set	Internally generated name of the dynamic ACI interface set used by the subscriber session.
Interface Set Type	Interface type of the ACI interface set: Dynamic . This is the only ACI interface set type currently supported.
Interface Set Session ID	Identifier of the dynamic ACI interface set entry in the session database.
Underlying Interface	Name of the underlying interface for the subscriber session.
Dynamic Profile Name	Dynamic profile used for the subscriber.
Dynamic Profile Version	Version number of the dynamic profile used for the subscriber.
MAC Address	MAC address associated with the subscriber.

Table 160: show subscribers Output Fields (*continued*)

Field Name	Field Description
State	Current state of the subscriber session (Init , Configured , Active , Terminating , Tunneled).
VLAN Id	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
Agent Remote ID	Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
DHCP Relay IP Address	IP address used by the DHCP relay agent.
Login Time	Date and time at which the subscriber logged in.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.
IPv6 Interface Address	Address assigned by the Framed-Ipv6-Prefix AAA attribute.

Table 160: show subscribers Output Fields (*continued*)

Field Name	Field Description
IPv6 Framed Interface Id	Interface ID assigned by the Framed-Interface-Id AAA attribute.
ADF IPv4 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv4 Output Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv6 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
ADF IPv6 Output Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
Family	Family that is active for the subscriber session—inet, inet6 or both inet and inet6.
IPv4 Input Filter Name	Name assigned to the IPv4 input filter (client or service session).
IPv4 Output Filter Name	Name assigned to the IPv4 output filter (client or service session).
IPv6 Input Filter Name	Name assigned to the IPv6 input filter (client or service session).
IPv6 Output Filter Name	Name assigned to the IPv6 output filter (client or service session).
IFL Input Filter Name	Name assigned to the logical interface input filter (client or service session).
IFL Output Filter Name	Name assigned to the logical interface output filter (client or service session).

show subscribers summary

Syntax	<pre>show subscribers summary < detail extensive terse> <count> physical-interface <i>physical-interface-name</i> <all logical-system <i>logical-system</i> pic port routing-instance <i>routing-instance</i> slot></pre>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display summary information for subscribers.
Options	<p>detail extensive terse—(Optional) Display the specified level of output.</p> <p>count—(Optional) Display the count of total subscribers and active subscribers for any specified option.</p> <p>logical-system—(Optional) Display subscribers whose logical system matches the specified logical system.</p> <p>physical-interface-name—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers whose physical interface matches the specified physical interface, by subscriber state, client type and LS:RI.</p> <p>pic—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by PIC number and the total number of subscribers.</p> <p>port—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by port number and the total number of subscribers.</p> <p>routing-instance—(Optional) Display subscribers whose routing instance matches the specified routing instance.</p> <p>slot—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by FPC slot number and the total number of subscribers.</p>
	<div>  <p>NOTE: Due to display limitations, logical system and routing instance output values are truncated when necessary.</p> </div>
Required Privilege Level	view

Output Fields Table 161 on page 1394 lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

Table 161: show subscribers Output Fields

Field Name	Field Description
Subscribers by State	<p>Number of subscribers summarized by state. The summary information includes the following:</p> <ul style="list-style-type: none"> • Init—Number of subscriber currently in the initialization state. • Configured—Number of configured subscribers. • Active—Number of active subscribers. • Terminating—Number of subscribers currently terminating. • Terminated—Number of terminated subscribers. • Total—Total number of subscribers for all states.
Subscribers by Client Type	<p>Number of subscribers summarized by client type. Client types can include DHCP, L2TP, PPP, PPPOE, STATIC-INTERFACE, and VLAN. Also displays the total number of subscribers for all client types (Total).</p>
Subscribers by LS:RI	<p>Number of subscribers summarized by logical system:routing instance (LS:RI) combination. Also displays the total number of subscribers for all LS:RI combinations (Total).</p>
Interface	<p>Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.</p> <p>The * character indicates a continuation of addresses for the same session.</p> <p>For aggregated Ethernet interfaces, the output of the summary (pic port slot) options prefixes the interface name with ae0:.</p>
Count	<p>Count of subscribers displayed for each PIC, port, or slot when those options are specified with the summary option. For an aggregated Ethernet configuration, the total subscriber count does not equal the sum of the individual PIC, port, or slot counts, because each subscriber can be in more than one aggregated Ethernet link.</p>
Total Subscribers	<p>Total number of subscribers for all physical interfaces, all PICS, all ports, or all LS:RI slots.</p>
IP Address/VLAN ID	<p>Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i></p>
User Name	<p>Name of subscriber.</p>
LS:RI	<p>Logical system and routing instance associated with the subscriber.</p>

show synchronous-ethernet esmc statistics

Syntax	<pre>show synchronous-ethernet esmc statistics <brief interface <i>interface-name</i>> <detail interface <i>interface-name</i>> < interface <i>interface-name</i>> < interface <i>interface-name</i> (brief detail)></pre>
Release Information	Command introduced in Junos OS Release 11.2R4 for MX Series 3D Universal Edge Routers.
Description	(MX5, MX10, MX40, MX80, MX80-T, MX240, MX480, and MX960 routers only) Display the Synchronous Ethernet ESMC statistics.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • Synchronous Ethernet Overview • Configuring an External Clock Synchronization Interface for MX Series Routers • request chassis synchronization mode on page 224 • show synchronous-ethernet global-information on page 1400 • show synchronous-ethernet esmc transmit on page 1399
Output Fields	Table 162 on page 1398 lists the output fields for the <code>show synchronous-ethernet esmc statistics</code> command. Output fields are listed in the approximate order in which they appear.

Table 162: show synchronous-ethernet esmc statistics Output Fields

Field Name	Field Description
Interface Name	<code>interface-slot/pic/port</code> —Displays the name of the interface for which the ESMC statistics are displayed.
Transmit Count	<code>number</code> —Displays the number of ESMC packets transmitted.
Receive Count	<code>number</code> —Displays the number of ESMC packets received.

Sample Output

```
user@host# show synchronous-ethernet esmc statistics
ESMC statistics:
Interface Name      Transmit Count      Receive Count
ge-1/0/4            3540                0
ge-1/0/2            3539                0
ge-1/2/4            3540                0
```

show synchronous-ethernet esmc transmit

Syntax	show synchronous-ethernet esmc transmit <brief interface <i>interface-name</i> > <detail interface <i>interface-name</i> > < interface <i>interface-name</i> > < interface <i>interface-name</i> (brief detail)>
Release Information	Command introduced in Junos OS Release 11.2R4 for MX80 3D Universal Edge Routers.
Description	(MX5, MX10, MX40, MX80, MX80-T, MX240, MX480, and MX960 routers only) Display the Synchronous Ethernet ESMC transmit interface details.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • Synchronous Ethernet Overview • Configuring an External Clock Synchronization Interface for MX Series Routers • request chassis synchronization mode on page 224 • show synchronous-ethernet global-information on page 1400 • show synchronous-ethernet esmc statistics on page 1398
Output Fields	Table 163 on page 1399 lists the output fields for the show synchronous-ethernet esmc transmit detail command. Output fields are listed in the approximate order in which they appear.

Table 163: show synchronous-ethernet esmc transmit detail Output Fields

Field Name	Field Description
Interface name	interface-slot/pic/port —Displays the name of the interface for which the ESMC transmit details are displayed.
Status	string —Displays the ESMC transmit interface status details.

Sample Output

```

user@host# show synchronous-ethernet esmc transmit detail
ESMC Transmit interface details:
  Interface name: ge-1/0/4           Status: ESMC Tx (QL SSU-A/SSM 0x4)
  Interface name: ge-1/0/2           Status: ESMC Tx (QL DNU/SSM 0xf)
  Interface name: ge-1/2/4           Status: ESMC Tx (QL SSU-A/SSM 0x4)

```

show synchronous-ethernet global-information

Syntax	show synchronous-ethernet global-information <brief>
Release Information	Command introduced in Junos OS Release 11.2R4 for MX80-T, MX5, MX10, MX40, MX240, MX480, and MX960 routers.
Description	(MX5, MX10, MX40, MX80, MX80-T, MX240, MX480, and MX960 routers only) Display information about the global configuration for Synchronous Ethernet chassis synchronization.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • Synchronous Ethernet Overview • Configuring an External Clock Synchronization Interface for MX Series Routers • request chassis synchronization mode on page 224 • show synchronous-ethernet esmc statistics on page 1398 • show synchronous-ethernet esmc transmit on page 1399
Output Fields	Table 164 on page 1400 lists the output fields for the show synchronous-ethernet global-information command. Output fields are listed in the approximate order in which they appear.

Table 164: show synchronous-ethernet global-information Output Fields

Field Name	Field Description
Network option	(option-1(EEC1) option-2(EEC2))—Displays the network option configuration, either option-1(EEC1) or option-2(EEC2).
Clock mode	(free-run auto-select)—Displays the configured mode of operation. The clock source can be either from the free-run local oscillator or from an external qualified clock. The default is auto-select mode.
QL mode	(enable disable)—Displays the configured quality level mode configuration. The default is disable.
Switchover mode	(revertive non-revertive)—Displays the configured synchronization clock switching mode. The default mode is revertive.
Config change holdover	seconds—Displays the time interval to wait before selecting the new clock source during a configuration change. The default value is 30 seconds.
Switchover holdover	seconds—Displays the time interval to wait before selecting the new clock source during switchover. The default value is 30 seconds.
Reboot holdover	seconds—Displays the time interval to wait before selecting the new clock source during reboot. The default value is 120 seconds.

Sample Output

```
user@host# show synchronous-ethernet global-information
Global Configuration:

Network option      : option-1(EEC1)
Clock mode         : Auto-select
QL mode            : Disabled
Switchover mode     : Revertive
Config change holdover : 15 seconds
Switchover holdover  : 30 seconds
Reboot holdover     : 120 seconds
```

show system alarms

Syntax	show system alarms
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display active system alarms.
Options	This command has no options.
Additional Information	System alarms are preset. They include a configuration alarm that appears when no rescue configuration alarm is set and a license alarm that appears when a software feature is configured and no valid license is configured for the feature. For more information about system alarms, see the Junos OS System Basics Configuration Guide. In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.
Required Privilege Level	admin
List of Sample Output	show system alarms on page 1402 show system alarms (Fan Tray) on page 1402 show system alarms (QFX Series) on page 1402

Sample Output

```
show system alarms      user@host> show system alarms
2 alarms currently active
Alarm time              Class    Description
2005-02-24 17:29:34 UTC  Minor   IPsec VPN tunneling usage requires a
license
2005-02-24 17:29:34 UTC  Minor   Rescue configuration is not sent
```

```
show system alarms      user@host> show system alarms
(Fan Tray)              4 alarms currently active
Alarm time              Class    Description
2010-11-11 20:27:38 UTC Major    Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC Minor    Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC Major    Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC Major    Side Fan Tray 0 Failure
```

```
show system alarms      user@switches> show system alarms
(QFX Series)            2 alarms currently active
Alarm time Class Description
2005-02-24 17:29:34 UTC Minor Rescue configuration is not sent
```

show system audit

Syntax	show system audit <root-only>
Syntax (EX Series Switch and MX Series Router)	show system audit <all-members> <local> <member <i>member-id</i> > <root-only>
Syntax (TX Matrix Router)	show system audit <all-lcc lcc <i>number</i> scc> <root-only>
Syntax (TX Matrix Plus Router)	show system audit <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <root-only>
Syntax (QFX Series)	show system audit <infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i> root-only>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the state and checksum values for file systems.
Options	<p>none—Display the state and checksum values for all file systems.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.</p> <p>all-members—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

infrastructure *name*—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

local—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

member *member-id*—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

root-only—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

scc—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information To redirect the output to a file, issue the following command:

ssh *device-name* 'show system audit root-only' > *output-file*

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Required Privilege Level admin

show system autoinstallation status

Syntax	show system autoinstallation status
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command supported in Junos OS Release 12.2 for ACX Series Universal Access Routers.
Description	(ACX Series routers, J Series routers, and EX Series switches only) Display autoinstallation status information.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> ACX Series Autoinstallation Overview Before You Begin Autoinstallation on an ACX Series Universal Access Router Autoinstallation Configuration of ACX Series Universal Access Routers USB Autoinstallation on ACX Series Routers Verifying Autoinstallation on ACX Series Universal Access Routers autoinstallation
List of Sample Output	show system autoinstallation status on page 1412
Output Fields	Table 165 on page 1411 describes the output fields for the show system autoinstallation status command. Output fields are listed in the approximate order in which they appear.

Table 165: show system autoinstallation status Output Fields

Field Name	Field Description
Autoinstallation status	<p>Display autoinstallation status information:</p> <ul style="list-style-type: none"> Last committed file—File last committed for autoinstallation configuration. Configuration server of last committed file—IP address or URL of the server configured to retrieve configuration information for the last committed configuration file. Interface—Interface configured for autoinstallation. <ul style="list-style-type: none"> Name—Name of the interface. State—Interface state. Address acquisition—Display IP address acquired and protocol used for acquisition upon startup. <ul style="list-style-type: none"> Protocol—Protocol used for acquisition: BOOTP/DHCP or RARP. Acquired address—IP address acquired from the DHCPserver.

Sample Output

```
show system
autoinstallation status

user@host> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 0.0.0.0
Interface:
  Name: ge-0/0/1
  State: None
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

show system boot-messages

Syntax	show system boot-messages
Syntax (EX Series Switches)	show system boot-messages <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system boot-messages <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system boot-messages <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system boot-messages <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system boot-messages infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
Options	<p>none—Display all boot time messages.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.</p> <p>infrastructure <i>name</i>—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to</p>

a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display boot time messages on the Node group.

scc—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system buffers

Syntax	show system buffers
Syntax (EX Series)	show system buffers <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system buffers <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system buffers <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system buffers <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system buffers <infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i> root-only (infrastructure <i>name</i> interconnect-device <i>name</i> node-group <i>name</i>)>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
Options	none —Show all buffer statistics. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis. all-members —(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration. infrastructure <i>name</i> —(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Show buffer statistics for the Node group

sfc—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

List of Sample Output	show system buffers on page 1424 show system buffers scc (TX Matrix Router) on page 1424 show system buffers sfc (TX Matrix Plus Router) on page 1424 show system buffers all-chassis (TX Matrix Plus Router) on page 1424 show system buffers node-group (QFabric System) on page 1426
Output Fields	Table 166 on page 1423 describes the output fields for the show system buffers command. Output fields are listed in the approximate order in which they appear.

Table 166: show system buffers Output Fields

Field Name	Field Description
mbufs in use	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
mbufs allocated to packet headers	Number of memory buffers currently holding packet headers
mbufs allocated to control blocks	Number of memory buffers currently holding the state for sockets.
mbufs allocated to send data	Number of memory buffers currently holding socket send data.
mbufs allocated to pfe refill data	Number of memory buffers currently holding Packet Forwarding Engine refill data.
mbufs allocated to fxp data	Number of memory buffers currently holding fxp data.
mbufs allocated to socket names and addresses	Number of memory buffers currently holding addresses for sockets.
mbuf clusters in use	Allocation statistics for memory buffer clusters.
allocated to network	Total amount of memory in use by the networking and interprocess communication (IPC) code.
requests for memory denied	Number of times a memory allocation request within the IPC and networking code failed.
requests for memory delayed	Number of times a memory allocation request within the IPC and networking code was postponed.
calls to protocol drain routines	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

Sample Output

```

show system commit

Syntax	show system commit
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the system commit history and any pending commit operation.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear system commit on page 1178
List of Sample Output	show system commit on page 1428 show system commit (At a Particular Time) on page 1428 show system commit (At the Next Reboot) on page 1428 show system commit (Rollback Pending) on page 1428 show system commit (QFX Series) on page 1428
Output Fields	Table 167 on page 1427 describes the output fields for the show system commit command. Output fields are listed in the approximate order in which they appear.

Table 167: show system commit Output Fields

Field Name	Field Description
Junos XML protocol	Displays the last 50 commit operations listed, most recent to first. The identifier Junos XML protocol designates a configuration created for recovery using the request system configuration rescue save command.
Junos XML protocol	Date and time of the commit operation.
Junos XML protocol	User who executed the commit operation.
Junos XML protocol	Method used to execute the commit operation: <ul style="list-style-type: none"> • Junos XML protocol—CLI interactive user performed the commit operation. • Junos XML protocol—Junos XML protocol client performed the commit operation. • synchronize—The commit synchronize command was performed on the other Routing Engine. • snmp—An SNMP set request caused the commit operation. • button—A button on the router or switch was pressed to commit a rescue configuration for recovery. • autoinstall—A configuration obtained through autoinstallation was committed. • other—When there is no login name associated with the session, the values for user and client default to root and other. For example, during a reboot after package installation, mgd commits the configuration as a system commit, and there is no login associated with the commit.

Sample Output

```

```

show system configuration archival

Syntax show system configuration archival

Release Information Introduced in Junos OS Release 7.6.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display directory and number of files queued for archival transfer.

NOTE: The [edit system configuration] hierarchy is not available on QFabric systems.

Options This command has no options.

Required Privilege Level maintenance

List of Sample Output [show system configuration archival on page 1429](#)

Sample Output

```
show system configuration archival      user@host> show system configuration archival
                                       /var/transfer/config/:
                                       total 8
```

show system configuration rescue

Syntax show system configuration rescue

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display a rescue configuration, if one exists.

.....
NOTE: The [edit system configuration] hierarchy is not available on QFabric systems.
.....

Options This command has no options.

Required Privilege Level maintenance

show system connections

Syntax	show system connections <extensive> <all-chassis all-lcc lcc <i>number</i> scc> <inet inet6> <show-routing-instances>
Syntax (EX Series)	show system connections <extensive> <all-members> <inet inet6> <local> <member <i>member-id</i> > <show-routing-instances>
Syntax (TX Matrix Router)	show system connections <extensive> <all-chassis all-lcc lcc <i>number</i> scc> <inet inet6> <show-routing-instances>
Syntax (TX Matrix Plus Router)	show system connections <extensive> <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <inet inet6> <show-routing-instances>
Syntax (MX Series Router)	show system connections <extensive> <all-members> <inet inet6> <local> <member <i>member-id</i> > <show-routing-instances>
Syntax (QFX Series)	show system connections <extensive> <inet> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> > <show-routing-instances>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.

- Options** **none**—Display information about all active IP sockets on the Routing Engine.
- extensive**—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.
- all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.
- all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs
- all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.
- inet | inet6**—(Optional) Display IPv4 connections or IPv6 connections, respectively.
- infrastructure *name***—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.
- interconnect-device *name***—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.
- lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:
- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
 - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
 - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
 - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- local**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.
- member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.
- node-group *name***—(QFabric systems only) (Optional) Display system connection activity for the Node group.

scc—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

show-routing-instances—(Optional) Display routing instances.

Additional Information By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 168 on page 1434](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

Table 168: show system connections Output Fields

Field Name	Field Description
Proto	Protocol of the socket: IP , TCP , or UDP for IPv4 or IPv6.
Recv-Q	Number of input packets received by the protocol and waiting to be processed by the application.
Send-Q	Number of output packets sent by the application and waiting to be processed by the protocol.
Local Address	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
Foreign Address	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.

Table 168: show system connections Output Fields (*continued*)

Field Name	Field Description
Routing Instance	(Displayed only when the show-routing-instance option is used.) Routing instances associated with active IP sockets on the Routing Engine.
(state)	For TCP, the protocol state of the socket.

Sample Output

show system core-dumps

Syntax	<pre>show system core-dumps <brief detail> <core-filename> <core-file-info></pre>
Syntax (EX Series Switches)	<pre>show system core-dumps <all-members> <brief detail> <core-filename> <core-file-info> <local> <member member-id></pre>
Syntax (TX Matrix Router)	<pre>show system core-dumps <all-chassis all-lcc lcc number scc> <brief detail> <core-filename> <core-file-info></pre>
Syntax (TX Matrix Plus Router)	<pre>show system core-dumps <all-chassis all-lcc lcc number sfc number> <brief detail> <core-filename> <core-file-info></pre>
Syntax (QFX Series)	<pre>show system core-dumps <brief detail> <component (UUID serial number all)> <core-file-info component (UUID serial number) core-file-name> <display-period (hours minutes seconds)> <display-order> <kernel-crashinfo component (UUID serial number)> <repository (core log)></pre>
Release Information	<p>Command introduced before Junos OS Release 8.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	<p>Show core files on all routers or switches running Junos OS. You can use the show system core-dumps command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.</p> <p>You can use the option core-filename and its options core-file-info, brief, and detail to display more information about the specified core-dump files.</p>
Options	<p>none—Display a list of all existing core-dump files.</p>

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the routers [LCCs] connected to the TX Matrix Plus router.

<all-lcc | lcc *number*>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all routers or a specific router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

NOTE: The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

all-members—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

brief—(Optional) View details of a binary file.

component (*UUID* | *serial number* | *all*)—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

core-file-info—(Optional) Display the stack trace of a core file.

core-filename—(Optional) Name of a specific core file to display.

detail—(Optional) View stack trace with details of the binary file.

display-order (timestamp-sort | alphanumeric-sort)—(QFabric systems only) (Optional)
Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—according to their filename.

display-period (hours | minutes | seconds)—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

kernel-crashinfo component (UUID | serial number)—(QFabric systems only) (Optional)
Display kernel crash information from the EEPROM on a QFabric system device.

local—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

member member-id—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value from 0 through 9.

repository (core | log)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

scc—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router.

Output Fields

[Table 169 on page 1456](#) describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

Table 169: show system core-dumps Output Fields

Field Name	Field Description
<i>Permissions</i>	Read/write permissions for the file named.
<i>Links</i>	Number of links to the file.
<i>Owner</i>	Name of the file owner.
<i>Group</i>	Name of the group with file access.
<i>File size</i>	File size in bytes.
<i>Modified</i>	Last file modification date and time.
<i>Path/filename</i>	File path where the file resides and the filename.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the core repository, and the log files are located in the log repository. The default Repository scope is shared since both the core and log repositories are shared by all of the QFabric system devices.
Repository head:	Path to the top-level repository location.
Repository name:	Name of the repository: core or log .
List of nodes for core repository:	List of core-dump files associated with a particular QFabric system device located in the core repository.
Node Group	Name of the QFabric system device.
Node Identifier	UUID or serial number of the QFabric system device.
Num	Number of core-dump and log files.
Model	Model number of the QFabric system device.
Usage	Usage of the repository in megabytes.
Total usage of core repository:	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
Total usage of log repository:	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
List of nodes for core repository:	List of core-dump files associated with a particular QFabric system device located in the core repository.

Table 169: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
List of nodes for log repository:	List of log files associated with a particular QFabric system device located in the log repository.
Filename	Name of the core-dump file.
Date	Last core-dump file modification date and time.
Size	Size of the core-dump file.
Core filename	Filename of the core-dump file.
Process name	Name of the process that is generating a core-dump file or log file.
Release	Junos OS release.
Build server	Junos OS build server.
Build date	Junos OS build date.
Stack trace	Stack trace of the core-dump file.

Sample Output

show system core-dumps

This example shows the command output if core files exist.

```
user@switcht> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

show system core-dumps (TX Matrix Plus Router)

```

show system directory-usage

Syntax	show system directory-usage <depth <i>number</i> > <path>
Syntax (EX Series)	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
Syntax (TX Matrix Router)	show system directory-usage <all-chassis all-lcc lcc <i>number</i> scc> <depth <i>number</i> > <path>
Syntax (TX Matrix Plus Router)	show system directory-usage <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <depth <i>number</i> > <path>
Syntax (MX Series Router)	show system directory-usage <all-members> <depth <i>number</i> > <local> <member <i>member-id</i> > <path>
Syntax (QFX Series)	show system directory-usage <depth <i>number</i> > <path> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display directory usage information.
Options	none —Display all directory usage information. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

depth *number*—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

infrastructure *name*— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

interconnect-device *name*— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

node-group *name*— (QFabric systems only) (Optional) Display directory information for the Node group.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

path—(Optional) Path or root directory to traverse.

scc—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with 0.

show system firmware

Syntax `show system firmware`
 `<compatibility>`

Release Information Command introduced in Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.4 for EX Series switches.

Description (J Series routers and EX8200 switches only) Display firmware information.

NOTE: On SRX100, SRX210, SRX240, and SRX 650 devices, the `show system firmware` command now displays all the installed firmware versions, even if the installed firmware versions are earlier than the currently installed firmware version.

Options `compatibility`—(Optional) Display firmware compatibility information.

Required Privilege Level view

List of Sample Output [show system firmware on page 1473](#)
 [show system firmware compatibility on page 1473](#)

Output Fields [Table 171 on page 1472](#) lists the output fields for the `show system firmware` command. Output fields are listed in the approximate order in which they appear.

Table 171: show system firmware Output Fields

Field Name	Field Description
Part	Physical part on the router or switch affected by the firmware.
Type	Type of firmware on the router or switch.
Tag	Location of the firmware on the interface.
Current version	Firmware version on the affected router or switch parts.
Available version	New versions of firmware for upgrading or downgrading.
Status	Firmware condition on the router or switch.
Action	Whether you can upgrade or downgrade, or if no action is available (none).

Sample Output

```
show system firmware user@host> show system firmware
Part                Type                Tag Current Available Status
                  version
FPC 0                ROM Monitor 0 0 6.4.10
Routing Engine 0 RE BIOS 0 0
                  OK
                  OK
```

```
show system firmware user@host> show system firmware compatibility
compatibility
Part                Type                Tag Current Available Action
                  version
FPC 0                ROM Monitor 0 0 6.4.10
Routing Engine 0 RE BIOS 0 0
                  None
                  None
```

show system license

Syntax	show system license <installed keys usage>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display licenses and information about how they are used.
Options	<p>none—Display all license information.</p> <p>installed—(Optional) Display installed licenses only.</p> <p>keys—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p>usage—(Optional) Display the state of licensed features.</p>
Required Privilege Level	maintenance
List of Sample Output	show system license on page 1476 show system license installed on page 1476 show system license keys on page 1476 show system license usage on page 1476 show system license (QFX Series) on page 1477
Output Fields	Table 172 on page 1474 lists the output fields for the show system license command. Output fields are listed in the approximate order in which they appear.

Table 172: show system license Output Fields

Field Name	Field Description
Feature name	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
Licenses used	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p>NOTE: In Junos OS Release 10.1 and later, the Licenses used column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (scale-subscriber), L2TP (scale-l2tp), Mobile IP (scale-mobile-ip), and so on.</p>

Table 172: show system license Output Fields (*continued*)

Field Name	Field Description
Licenses installed	<p>Information about the installed license key:</p> <ul style="list-style-type: none">• License identifier—Identifier associated with a license key.• State—State of the license key:valid or invalid. An invalid state indicates that the key was entered incorrectly or is not valid for the specific device.• License version—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.• Valid for device—Device that can use a license key.• Group defined—Group membership of a device.• Features—Feature associated with a license, such as data link switching (DLSw).
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Amount of time left within the grace period before a license is required for a feature being used.

Sample Output

show system license

```
user@host> show system license
```

License usage:

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry

show system memory

Syntax	show system memory
Syntax (EX Series Switches)	show system memory <all-members> <local> <member <i>member-id</i> >
Syntax (MX Series Routers)	show system memory <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Routers)	show system memory <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system memory <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (QFX Series)	show system memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced in Junos OS Release 12.1.
Description	Display system-wide memory distribution and usage including the Junos OS kernel, software processes, and memory disks. Use the show system memory command for troubleshooting with Juniper Networks Customer Support.
Options	<p>none—Display the Junos OS system memory distribution and usage information.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system memory distribution and usage information for all chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system memory distribution and usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display the system memory distribution and usage information for all connected T1600 or T4000 LCCs</p> <p>all-members—(EX4200 switches and MX Series routers only) (Optional) Display system memory distribution and usage information for all members of the Virtual Chassis configuration.</p> <p>infrastructure <i>name</i>—(QFabric switches only) (Optional) Display system memory distribution and usage information for the fabric control Routing Engine and fabric manager Routing Engine.</p> <p>interconnect-device <i>name</i>—(QFabric switches only) (Optional) Display system memory distribution and usage information for the Interconnect device.</p>

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system memory distribution and usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system memory distribution and usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system memory distribution and usage information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system memory distribution and usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric switches only) (Optional) Display system memory distribution and usage information for the Node group.

scc—(TX Matrix routers only) (Optional) Display system memory distribution and usage information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system memory distribution and usage information for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 173 on page 1480](#) lists the output fields for the **show system memory** command. Output fields are listed in the approximate order in which they appear.

Table 173: show system memory Output Fields

Field Name	Field Description
System memory usage distribution	Amount of memory used by the system, represented in kilobytes and as a percentage of the total memory. <ul style="list-style-type: none"> Total memory—Actual memory available to the system at the time of system initialization. Reserved memory—Amount of total memory reserved for the system at the time of system initialization, but not managed by virtual memory sub-system. Wired memory—Amount of total memory wired in the system that never paged out. Active memory—Amount of total memory actively in use. Inactive—Amount of total memory in use, but not referenced recently. Cache—Amount of total memory almost available for allocation. Free—Amount of total memory available for allocation.
Memory disk resident memory	Memory used by the memory disks, but not accounted for in the kernel map. For example, swap-based memory disk.
VM-Kbytes	Virtual memory used as per all virtual mappings in the kernel or process map and percentage thereof based on maximum addressable virtual memory as per any kernel, system, architecture, or resource limits.
Resident	Real memory used as per actual resident pages of all mappings in the kernel or process map and percentage thereof based on the total real memory available in the system.
Map-name	Name of the map.
PID	Process ID.
Process-name	Name of the process.

Sample Output

show system memory

```
user@host> show system memory
System memory usage distribution:
    Total memory: 1035552 Kbytes (100%)
    Reserved memory: 18684 Kbytes ( 1%)
    Wired memory: 526072 Kbytes ( 50%)
    Active memory: 154792 Kbytes ( 14%)
    Inactive memory: 64664 Kbytes ( 6%)

show system name-resolution

Syntax	show system name-resolution
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display hostname-to-IP-address mappings.
Options	This command has no options.
Required Privilege Level	view
Output Fields	Table 174 on page 1504 lists the output fields for the show system name-resolution command. Output fields are listed in the approximate order in which they appear.

Table 174: show system name-resolution Output Fields

Field Name	Field Description
Last update	Date and time when the hostname-to-IP address mapping were last resolved.
Refresh interval	Interval for refreshing the cache with the updated hostname-to-IP address mappings.
Addresses	Resolved IP addresses based on the hostname-to-IP address mappings.
Error	Error message displayed if there is a DNS hostname lookup failure.
Last change	Timestamp for the last change in the hostname-to-IP address mappings.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option sfc introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>

Description Display information about software processes that are running on the router or switch and that have controlling terminals.

Options **none**—Display standard information about system processes.

brief | detail | extensive | summary—(Optional) Display the specified level of detail.

adaptive-services—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

alarm-control—(Optional) Display the process to configure the system alarm.

all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.

all-lcc—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.

ancpd-service—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

application-identification—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

audit-process—(Optional) Display the RADIUS accounting process.

auto-configuration—Display the Interface Auto-Configuration process.

bootp—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.

captive-portal-content-delivery—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

ce-l2tp-service—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

cfm—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

chassis-control—(Optional) Display the chassis management process.

class-of-service—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

clksyncd-service—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

craft-control—Display the process for the I/O of the craft interface.

database-replication—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

datapath-trace-service—Display the packet path tracing process.

dhcp-service—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

diameter-service—(Optional) Display the diameter process.

disk-monitoring—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

dynamic-flow-capture—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

ecc-error-logging—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

ethernet-connectivity-fault-management— Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

ethernet-link-fault-management—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

event-processing—(Optional) Display the event process (eventd).

firewall—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

general-authentication-service—(EX Series switches and MX Series routers only) (Optional) Display the general authentication process.

health (*pid* *process-identifier* | *process-name* *process-name*)—(Optional) Display process health information, either by process id (PID) or by process name.

iccp-service—Display the Inter-Chassis Communication Protocol (ICCP) process.

idp-policy—Display the intrusion detection and prevention (IDP) protocol process.

ilmi—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

inet-process—Display the IP multicast family process.

init—Display the process that initializes the USB modem.

interface-control—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

kernel-replication—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

l2-learning—(Optional) Display the Layer 2 address flooding and learning process.

l2cpd-service—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

lACP—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

local-policy-decision-function—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

logical-system-mux—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

mac-validation—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

mib-process—(Optional) Display the MIB II process, which provides the router's MIB II agent.

mobile-ip—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

mountd-service—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

mpls-traceroute—(Optional) Display the MPLS Periodic Traceroute process.

mspd—(Optional) Display the Multiservice process.

multicast-snooping—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

named-service—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

neighbor-liveness—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

nfsd-service—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

ntp—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

packet-triggered-subscribers—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

peer-selection-service—(Optional) Display the Peer Selection Service process.

periodic-packet-services—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

pfe—Display the Packet Forwarding Engine management process.

pgcp-service—(Optional) Display the pgcpd service process running on the Routing Engine.

pgm—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

pic-services-logging—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

ppp—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

ppp-service—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

pppoe—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

process-monitor—Display the process health monitor process (pmond).

providers—(Optional) Display provider processes.

redundancy-interface-process—(Optional) Display the ASP redundancy process.

remote-operations—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

resource-cleanup—Display the resource cleanup process.

resource-limits (brief | detail) *process-name*—(Optional) Display process resource limits.

routing—(Optional) Display the routing protocol process.

sampling—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

sbc-configuration-process—Display the session border controller (SBC) process of the border signaling gateway (BSG).

scc—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

sdk-service—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

secure-neighbor-discovery—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

send—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

service-deployment—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

sfc number—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace *number* with 0.

snmp—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

sonet-aps—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

static-subscribers—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

tunnel-oamd—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

vrrp—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

watchdog—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

wide—(Optional) Display process information that might be wider than 80 columns.

Additional Information By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 175 on page 1513](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

Table 175: show system processes Output Fields

Field Name	Field Description	Level of Output
last pid	Last process identifier assigned to the process.	brief extensive summary
load averages	Three load averages followed by the current time.	brief extensive summary
processes	Number of existing processes and the number of processes in each state (sleeping, running, starting, zombies, and stopped).	brief extensive summary
Mem	Information about physical and virtual memory allocation.	brief extensive summary
Swap	Information about physical and virtual memory allocation.	brief extensive summary
PID	Process identifier.	detail extensive summary
TT	Control terminal name.	none detail

Table 175: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
STAT	<p>Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process:</p> <ul style="list-style-type: none"> • D—In disk or other short-term, uninterruptible wait • I—Idle (sleeping longer than about 20 seconds) • R—Runnable • S—Sleeping for less than 20 seconds • T—Stopped • Z—Dead (zombie) • + —The process is in the foreground process group of its control terminal. • <—The process has raised CPU scheduling priority. • >—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped. • A—The process requested random page replacement. • E—The process is trying to exit. • L—The process has pages locked in core. • N—The process has reduced CPU scheduling priority. • S—The process requested first-in, first-out (FIFO) page replacement. • s—The process is a session leader. • V—The process is temporarily suspended. • W—The process is swapped out. • X—The process is being traced or debugged. 	none detail
UID	User identifier.	detail
USERNAME	Process owner.	extensive summary
PPID	Parent process identifier.	detail
CPU	<p>(D)—Short-term CPU usage.</p> <p>(E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.</p>	detail extensive summary
RSS	Resident set size.	detail
WCHAN	Symbolic name of the wait channel.	detail
STARTED	Local time when the process started running.	detail
PRI	Current priority of the process. A lower number indicates a higher priority.	detail extensive summary
NI or NICE	UNIX "niceness" value. A lower number indicates a higher priority.	detail extensive summary
SIZE	Total size of the process (text, data, and stack), in kilobytes.	extensive summary

Table 175: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, sleep , wait , run , idle , zombie , or stop).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary

show system queues

Syntax	show system queues
Syntax (TX Matrix Router)	show system queues <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system queues <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system queues <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display queue statistics.
Options	<p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system queue statistics for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix Plus router, display system queue statistics for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system queue statistics for all LCC chassis attached to the TX Matrix or TX Matrix Plus router.</p> <p>all-members—(MX Series routers only) (Optional) Display system queue statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system queue statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system queue statistics for a specific connected router that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display system queue statistics for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display system queue statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display queue statistics for the TX Matrix router.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system queue statistics for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system queues** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Required Privilege Level maintenance

[show system queues sfc \(TX Matrix Router\) on page 1536](#)

Output Fields [Table 176 on page 1535](#) lists the output fields for the **show system queues** command. Output fields are listed in the approximate order in which they appear.

Table 176: show system queues Output Fields

Field Name	Field Description
Output interface	Interface on the router on which the queue exists: <ul style="list-style-type: none"> • fxp0—Management Ethernet interface • fxp1—Internal Ethernet interface • lsi—Internally generated interface and not configurable • dsc—Discard interface
bytes	Number of bytes in the queue.
max	Maximum number of bytes allowed in the queue.
packets	Number of packets in the queue.
max	Maximum number of packets allowed in the queue.
drops	Number of packets dropped from the queue.

Sample Output

show system queues

```
user@host> show system queues
output interface      bytes      max      packets    max      drops
fxp0                  0      1250000      0      4166      6
fxp1                  0      1250000      0      4166     19
lsi                   0       12500      0       41       0
dsc                   0         0         0         0       0
```

show system reboot

Syntax	show system reboot <both-routing-engines>
Syntax (EX Series Switches)	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system reboot <all-chassis all-lcc lcc <i>number</i> scc> <both-routing-engines>
Syntax (TX Matrix Plus Router)	show system reboot <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <both-routing-engines>
Syntax (MX Series Router)	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system reboot <both-routing-engines> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-device <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display pending system reboots or halts.
Options	none —Display pending reboots or halts on the active Routing Engine. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router. all-members —(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration. all-lcc —(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers

connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

both-routing-engines—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

infrastructure *name*—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display reboot request information on the Node group.

scc—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

Additional Information By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the

same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

user@host> show system sfc 0
No shutdown/reboot scheduled.

show system reboot (QFX3500 Switch)
user@switch> show system reboot
No shutdown/reboot scheduled.

show system rollback

Syntax `show system rollback number`
 `<compare number>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

NOTE: The `show system rollback` command is a purely operational mode command and cannot be issued with `run` from the configuration mode.

Options *number*—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

compare number —(Optional) Number of another previously committed (rollback) configuration to compare to rollback *number*. The output displays the differences between the two configurations. The range of values is 0 through 49.

Required Privilege Level view

show system services dhcp binding

Syntax	show system services dhcp binding <detail> <address>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(J Series routers only) Display Dynamic Host Configuration Protocol (DHCP) server client binding information.
Options	<p>none—Display brief information about all active client bindings.</p> <p>detail—(Optional) Display detailed information about all active client bindings.</p> <p>address—(Optional) Display detailed client binding information for the specified IP address only.</p>
Required Privilege Level	view and system
Related Documentation	<ul style="list-style-type: none"> • clear system services dhcp binding on page 1183
List of Sample Output	show system services dhcp binding on page 1547 show system services dhcp binding address on page 1547 show system services dhcp binding address detail on page 1547
Output Fields	Table 177 on page 1545 describes the output fields for the show system services dhcp binding command. Output fields are listed in the approximate order in which they appear.

Table 177: show system services dhcp binding Output Fields

Field Name	Field Description	Level of Output
Allocated address	List of IP addresses the DHCP server has assigned to clients.	All levels
MAC address	Corresponding media access control (MAC) hardware address of the client.	All levels
Client identifier	(address option only) Client's unique identifier (represented by an ASCII string or hexadecimal digits). This identifier is used by the DHCP server to index its database of address bindings.	All levels
Binding Type	Type of binding assigned to the client. DHCP servers can assign a dynamic binding from a pool of IP addresses or a static binding to one or more specific IP addresses.	All levels
Lease Expires at	Time the lease expires or never for leases that do not expire.	All levels
Lease Obtained at	(address option only) Time the client obtained the lease from the DHCP server.	detail

Table 177: show system services dhcp binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	Status of the binding. Bindings can be active or expired.	detail
Pool	Address pool that contains the IP address assigned to the client.	detail
Request received on	Interface on which the DHCP message exchange occurs. The IP address pool is configured based on the interface's IP address. If a relay agent is used, its IP address is also displayed.	detail
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	detail

Sample Output

**show system services
dhcp binding**

user@host> show system services dhcp binding

Allocated address	MAC address	Binding Type	Lease expires at
192.168.1.2	00:a0:12:00:12:ab	static	never
192.168.1.3	00:a0:12:00:13:02	dynamic	2004-05-03 13:01:42 PDT

 Code: 19, Type: flag, Value: off
 Code: 40, Type: string, Value: domain.tld
 Code: 32, Type: ip-address, Value: 3.3.3.33

show system services dhcp conflict

Syntax	show system services dhcp conflict
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(J Series routers only and EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) client-detected conflicts for IP addresses. When a conflict is detected, the DHCP server removes the address from the address pool.
Options	This command has no options.
Required Privilege Level	view and system
Related Documentation	<ul style="list-style-type: none"> clear system services dhcp conflict on page 1184
List of Sample Output	show system services dhcp conflict on page 1548
Output Fields	Table 178 on page 1548 describes the output fields for the show system services dhcp conflict command. Output fields are listed in the approximate order in which they appear.

Table 178: show system services dhcp conflict Output Fields

Field Name	Field Description
Detection time	Date and time the client detected the conflict.
Detection method	How the conflict was detected.
Address	IP address where the conflict occurs. The addresses in the conflicts list remain excluded from the pool until you use a clear system services dhcp conflict command to manually clear the list.

Sample Output

show system services dhcp conflict

```
user@host> show system services dhcp conflict
```

Detection time	Detection method	Address
2004-08-03 19:04:00 PDT	ARP	3.3.3.5
2004-08-04 04:23:12 PDT	Ping	4.4.4.8
2004-08-05 21:06:44 PDT	Client	3.3.3.10

show system services dhcp global

Syntax	show system services dhcp global
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) global configuration options. Global options apply to all scopes and clients served by the DHCP server. Global options are overridden if specified otherwise in scope or client options. Scope options apply to specific subnets or ranges of addresses. Client options apply to specific clients.
Options	This command has no options.
Required Privilege Level	view and system
List of Sample Output	show system services dhcp global on page 1550
Output Fields	Table 179 on page 1549 describes the output fields for the show system services dhcp global command. Output fields are listed in the approximate order in which they appear.

Table 179: show system services dhcp global Output Fields

Field Name	Field Description
BOOTP lease length	Length of lease time assigned to BOOTP clients.
Default lease time	Lease time assigned to clients that do not request a specific lease time.
Minimum lease time	Minimum time a client retains an IP address lease on the server.
Maximum lease time	Maximum time a client can retain an IP address lease on the server.
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.

Sample Output

```
show system services dhcp global      user@host> show system services dhcp global

Global settings:
  BOOTP lease length      infinite

DHCP lease times:
  Default lease time      1 hour
  Minimum lease time      2 hours
  Maximum lease time      infinite

DHCP options:
  Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
  Name: domain-name, Value: mydomain.tld
  Code: 19, Type: flag, Value: off
  Code: 40, Type: string, Value: domain.tld
  Code: 32, Type: ip-address, Value: 3.3.3.33
```

show system services dhcp pool

Syntax	show system services dhcp pool <detail> <subnet-address>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) server IP address pools.
Options	none —Display brief information about all IP address pools. detail —(Optional) Display detailed information. subnet-address —(Optional) Display information for the specified subnet address.
Required Privilege Level	view and system
List of Sample Output	show system services dhcp pool on page 1552 show system services dhcp pool subnet-address on page 1552 show system services dhcp pool subnet-address detail on page 1552
Output Fields	Table 180 on page 1551 describes the output fields for the show system services dhcp pool command. Output fields are listed in the approximate order in which they appear.

Table 180: show system services dhcp pool Output Fields

Field Name	Field Description	Level of Output
Pool name	Subnet on which the IP address pool is defined.	None specified
Low address	Lowest address in the IP address pool.	None specified
High address	Highest address in the IP address pool.	None specified
Excluded addresses	Addresses excluded from the address pool.	None specified
Subnet	(<i>subnet-address</i> option only) Subnet to which the specified address pool belongs.	None specified
Address range	(<i>subnet-address</i> option only) Range of IP addresses in the address pool.	None specified
Addresses assigned	Number of IP addresses in the pool that are assigned to DHCP clients and the total number of IP addresses in the pool.	detail
Active	Number of assigned IP addresses in the pool that are active.	detail
Excluded	Number of assigned IP addresses in the pool that are excluded.	detail
Default lease time	Lease time assigned to clients that do not request a specific lease time.	detail

Table 180: show system services dhcp pool Output Fields (*continued*)

Field Name	Field Description	Level of Output
Minimum lease time	Minimum time a client can retain an IP address lease on the server.	detail
Maximum lease time	Maximum time a client can retain an IP address lease on the server.	detail
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	detail

Sample Output

show system snapshot

Syntax	show system snapshot
Syntax (EX Series Switches)	show system snapshot <all-members local member <i>member-id</i> > <media (external internal)>
Release Information	Command introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 10.0 for EX Series switches.
Description	<p>Display information about the backup software:</p> <ul style="list-style-type: none"> On the routers, display information about the backup software, which is located in the /altroot, and /altconfig file systems or on the alternate media. On the switches, display information about the backup of the root file system (/) and directories /altroot, /config, /var, and /var/tmp, which are located either on an external USB flash drive or in internal flash memory.
	<div>  <p>NOTE: To back up software, use the request system snapshot command.</p> </div>
Options	<p>none—Display information about the backup software.</p> <p>all-members local member <i>member-id</i>—(EX Series switch Virtual Chassis only) (Optional) Display the snapshot in a Virtual Chassis:</p> <ul style="list-style-type: none"> all-members—Display the snapshot for all members of the Virtual Chassis. local—Display the snapshot on the member of the Virtual Chassis that you are currently logged into. member <i>member-id</i>—Display the snapshot for the specified member of the Virtual Chassis. <p>media (external internal)—(EX Series switch only) (Optional) Display the destination media location for the snapshot. The external option specifies the snapshot on an external mass storage device, such as a USB flash drive. The internal option specifies the snapshot on an internal memory source, such as internal flash memory. If no additional options are specified, the command displays the snapshot stored in both slices.</p>

show system software

Syntax	show system software <detail>
Syntax (EX Series Switches)	show system software <all-members> <detail> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system software <all-chassis all-lcc lcc <i>number</i> scc> <detail>
Syntax (TX Matrix Plus Router)	show system software <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <detail>
Syntax (J Series Routers)	show system software <backup> <detail>
Syntax (QFX Series)	show system software <detail> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the Junos OS extensions loaded on your router or switch.
Options	<p>none—Display standard information about all loaded Junos OS extensions.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the routers (TX Matrix Plus Router) in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.</p> <p>backup—(J Series routers only) (Optional) Display the status of old system software packages only.</p>

detail—(Optional) Display detailed information about available Junos OS extensions.

infrastructure *name*—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

node-group *name*—(QFabric systems only) (Optional) Display the system software running on the Node group.

scc—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router.

show system statistics

Syntax	show system statistics
Syntax (EX Series Switches)	show system statistics <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system statistics <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system statistics
Release Information	Command introduced before JUNOS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display system-wide protocol-related statistics.
Options	none —Display system statistics for all the following protocols: <ul style="list-style-type: none">• arp—Address Resolution Protocol• bridge—IEEE 802.1 Bridging• clns—Connectionless Network Service• esis—End System-to-Intermediate System• ethoamcfm—Ethernet OAM protocol for connectivity fault management• ethoamlfm—Ethernet OAM protocol for link fault management• icmp—Internet Control Message Protocol• icmp6—Internet Control Message Protocol version 6• igmp—Internet Group Management Protocol• ip—Internet Protocol version 4• ip6—Internet Protocol version 6• mpls—Multiprotocol Label Switching• rdp—Reliable Datagram Protocol

- **tcp**—Transmission Control Protocol
- **tnp**—Trivial Network Protocol
- **ttp**—TNP Tunneling Protocol
- **tudp**—Trivial User Datagram Protocol
- **udp**—User Datagram Protocol
- **vpls**—Virtual Private LAN Service

all-chassis—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

all-lcc—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all routers (line-card chassis) connected to the TX Matrix Plus router

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

show system statistics arp

Syntax	show system statistics arp
Syntax (EX Series Switches)	show system statistics arp <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics arp <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics arp <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide Address Resolution Protocol (ARP) statistics.
Options	<p>none—Display system-wide ARP statistics.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display ARP statistics for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system-wide ARP statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system-wide ARP statistics for all routers connected to the TX Matrix Plus router</p> <p>all-members—(EX4200 switches only) (Optional) Display ARP statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display ARP statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display ARP statistics for a specific router that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display ARP statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display ARP statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display ARP statistics for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display ARP statistics for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics arp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics icmp

Syntax	show system statistics icmp
Syntax (EX Series Switches)	show system statistics icmp <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics icmp <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics icmp <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide Internet Control Message Protocol (ICMP) statistics.
Options	<p>none—Display system statistics for ICMP.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for ICMP for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for ICMP for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for ICMP for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display ICMP statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for ICMP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for ICMP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display ICMP statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display ICMP statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for ICMP for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers and TX Matrix Plus routers with 3D SIBs only) (Optional) Display system statistics for ICMP for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics icmp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics igmp

Syntax	show system statistics igmp
Syntax (EX Series Switches)	show system statistics igmp <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics igmp <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics igmp <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 12.1 for the QFX Series.
Description	Display system-wide Internet Group Management Protocol (IGMP) statistics.
Options	<p>none—Display system statistics for IGMP.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for IGMP for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display IGMP statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IGMP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IGMP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display IGMP statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display IGMP statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for IGMP for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for IGMP for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system statistics igmp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics ip

Syntax	show system statistics ip
Syntax (EX Series Switches)	show system statistics ip <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics ip <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics ip <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide IPv4 statistics.
Options	<p>none—Display system statistics for IPv4.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for IPv4 for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IPv4 for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IPv4 for all T1600 or T4000 routers connected to the TX Matrix Plus router.</p> <p>all-members—(EX4200 switches only) (Optional) Display IPv4 statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IPv4 for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IPv4 for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display IPv4 statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display IPv4 statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for IPv4 for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for IPv4 for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system statistics ip** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics ip6

Syntax	show system statistics ip6
Syntax (EX Series Switches)	show system statistics ip6 <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics ip6 <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics ip <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide IPv6 statistics.
Options	<p>none—Display system statistics for IPv6.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for IPv6 for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IPv6 for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IPv6 for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display IPv6 statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for IPv6 for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for IPv6 for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display IPv6 statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display IPv6 statistics for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for IPv6 for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for IPv6 for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system statistics ip6** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics mpls

Syntax	show system statistics mpls
Syntax (EX Series Switches)	show system statistics mpls <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics mpls <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics mpls <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide Multiprotocol Label Switching (MPLS) statistics.
Options	<p>none—Display system statistics for MPLS.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for MPLS for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for MPLS for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for MPLS for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display MPLS statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for MPLS for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for MPLS for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display MPLS statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display MPLS statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for MPLS for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for MPLS for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics mpls** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics tnp

Syntax	show system statistics tnp
Syntax (EX Series Switches)	show system statistics tnp <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics tnp <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics tnp <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide Trivial Network Protocol (TNP) statistics.
Options	<p>none—Display system statistics for TNP.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for TNP for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for TNP for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for TNP for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display TNP statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for TNP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for TNP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display TNP statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display TNP statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for TNP for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for TNP for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics tnp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics tudp

Syntax	show system statistics tudp
Syntax (EX Series Switches)	show system statistics tudp <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics tudp <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics tudp <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide Trivial User Datagram Protocol (TUDP) statistics.
Options	<p>none—Display system statistics for TUDP.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for TUDP for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for TUDP for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for TUDP for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display TUDP statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for TUDP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for TUDP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display TUDP statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display TUDP statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for TUDP for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system statistics for TUDP for the TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics tudp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

show system statistics udp

Syntax	show system statistics udp
Syntax (EX Series Switches)	show system statistics udp <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system statistics udp <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system statistics udp <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display system-wide User Datagram Protocol (UDP) statistics.
Options	<p>none—Display system statistics for UDP.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for UDP for all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for UDP for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for UDP for all connected T1600 or T4000 LCCs.</p> <p>all-members—(EX4200 switches only) (Optional) Display UDP statistics for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for UDP for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for UDP for a specific router that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches only) (Optional) Display UDP statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches only) (Optional) Display TUDP statistics for the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value from 0 through 9.

scc—(TX Matrix routers only) (Optional) Display system statistics for UDP for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system statistics for UDP for the TX Matrix router or TX Matrix Plus router. Replace ***number*** with 0.

Additional Information By default, when you issue the **show system statistics udp** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Syntax (TX Matrix Plus Router)	show system storage <detail> <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system storage <detail> <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system storage <detail> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display statistics about the amount of free disk space in the router's or switch's file systems.
Options	none —Display standard information about the amount of free disk space in the router's or switch's file systems. detail —(Optional) Display detailed output. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.

all-members—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

infrastructure *name*—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

scc—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 184 on page 1696](#) describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

Table 184: show system storage Output Fields

Field Name	Field Description
Filesystem	Name of the filesystem.
Size	Size of the filesystem.
Used	Amount of space used in the filesystem.
Avail	Amount of space available in the filesystem.
Capacity	Percentage of the filesystem space that is being used.
Mounted on	Directory in which the filesystem is mounted.

show system subscriber-management summary

Syntax	show system subscriber-management summary
Release Information	Command introduced in Junos OS Release 11.1.
Description	Display complete subscriber management database summary information.
Options	none—This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show database-replication statistics on page 1323• show database-replication summary on page 1325
List of Sample Output	show system subscriber-management summary on page 1701
Output Fields	Table 185 on page 1700 lists the output fields for the show system subscriber-management summary command. Output fields are listed in the approximate order in which they appear.

Table 185: show system subscriber-management summary Output Fields

Field Name	Field Description
Graceful Restart	State of graceful Routing Engine switchover (GRES): <ul style="list-style-type: none">• Enabled• Disabled
Mastership	State of the Routing Engine: <ul style="list-style-type: none">• Master• Standby
Database	State of the subscriber management database: <ul style="list-style-type: none">• Available• Init• Not-available

Table 185: show system subscriber-management summary Output Fields (*continued*)

Field Name	Field Description
Chassisd ISSU State	State of unified ISSU chassis daemon: <ul style="list-style-type: none"> • ABORT • DAEMON_ISSU_PREPARE • DAEMON_ISSU_PREPARE_DONE • DAEMON_SWITCHOVER_PREPARE • DAEMON_SWITCHOVER_PREPARE_DONE • FRU_ISSU • FRU_ISSU_DONE • IDLE • UNKNOWN
ISSU State	State of unified ISSU aggregate daemon: <ul style="list-style-type: none"> • ABORT • IDLE • PREPARE • READY • SWITCHOVER_PREPARE • SWITCHOVER_READY • UNKNOWN
ISSU Wait	Amount of time, in seconds, requested by a daemon to perform cleanup. If multiple daemons request time, the displayed value is the highest wait time requested by a daemon.

Sample Output

```
show system
subscriber-management
summary
```

```
user@host> show system subscriber-management summary
General:
  Graceful Restart      Enabled
  Mastership            Master
  Database              Available
  Chassisd ISSU State   DAEMON_ISSU_PREPARE
  ISSU State            PREPARE
  ISSU Wait             198
```

show system switchover

Syntax	show system switchover
Syntax (TX Matrix Router)	show system switchover <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system switchover <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system switchover <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

NOTE: Issue the `show system switchover` command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine, because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the `show system switchover` command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the `show system switchover` command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the `show system switchover` command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 or T4000 routers in the routing matrix.

Options	all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all
----------------	--

Routing Engines on the TX Matrix Plus router and the T1600 or T4000 routers configured in the routing matrix.

all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all connected T1600 or T4000 LCCs.

Note that in this instance, packets get dropped. The LCCs perform GRES on their own chassis (GRES cannot be handled by one particular chassis for the entire router) and synchronization is not possible as the LCC plane bringup time varies for each LCC. Therefore, when there is traffic on these planes, there may be a traffic drop.

all-members—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

lcc number—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router.

Additional Information If you issue the **show system switchover** command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.

Likewise, if you issue the **show system switchover** command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 or T4000 backup Routing Engines that are connected to it.

If you issue the **show system switchover** command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays an error message that graceful Routing Engine switchover (GRES) is not enabled on this member.

Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Routing Matrix with a TX Matrix Plus Router Solutions Page
List of Sample Output	show system switchover (Backup Routing Engine) on page 1705 show system switchover all-lcc (Routing Matrix) on page 1705
Output Fields	Table 186 on page 1704 describes the output fields for the show system switchover command. Output fields are listed in the approximate order in which they appear.

Table 186: show system switchover Output Fields

Field Name	Field Description
Graceful switchover	Display graceful Routing Engine switchover status: <ul style="list-style-type: none"> • On—Indicates graceful-switchover is specified for the routing-options configuration command. • Off—Indicates graceful-switchover is not specified for the routing-options configuration command.
Configuration database	State of the configuration database: <ul style="list-style-type: none"> • Ready—Configuration database has synchronized. • Synchronizing—Configuration database is synchronizing. Displayed when there are updates within the last 5 seconds. • Synchronize failed—Configuration database synchronize process failed.
Kernel database	State of the kernel database: <ul style="list-style-type: none"> • Ready—Kernel database has synchronized. • Synchronizing—Kernel database is synchronizing. Displayed when there are updates within the last 5 seconds. • Version incompatible—The primary and standby Routing Engines are running incompatible kernel database versions. • Replication error—An error occurred when the state was replicated from the primary Routing Engine. Inspect Steady State for possible causes, or notify Juniper Networks customer support.
Peer state	Routing Engine peer state: <ul style="list-style-type: none"> • Steady State—Peer completed switchover transition. • Peer Connected—Peer in switchover transition.

Sample Output

`show system
switchover (Backup
Routing Engine)`

```
user@host> show system switchover
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

`show system
switchover all-lcc
(Routing Matrix)`

```
user@host> show system switchover all-lcc
```

```
lcc0-re0:
```

```
-----
Multichassis replication: On
Configuration database: Ready

show system uptime

Syntax	show system uptime
Syntax (EX Series Switches)	show system uptime <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system uptime <director-group <i>name</i> > <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Syntax (TX Matrix Router)	show system uptime <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system uptime <detail> <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system uptime <all-members> <invoke-on> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
Options	none —Show time since the system rebooted and processes started. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs. all-members —(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

director-group *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

infrastructure *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

invoke-on—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

scc—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 187 on page 1708](#) describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

Table 187: show system uptime Output Fields

Field Name	Field Description
Current time	Current system time in UTC.
System booted	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
Protocols started	Date and time when the routing protocols were last started and how long they have been running.
Last configured	Date and time when a configuration was last committed. Also shows the name of the user who issued the last commit command.
time and up	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

show system users

Syntax	show system users <no-resolve>
Syntax (TX Matrix Router)	show system users <all-chassis all-lcc <i>lccnumber</i> scc> <no-resolve>
Syntax (TX Matrix Plus Router)	show system users <detail> <all-chassis all-lcc <i>lcc number</i> <i>sfc number</i> > <no-resolve>
Syntax (MX Series Router)	show system users <all-members> <local> <member <i>member-id</i> > <no-resolve>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	List information about the users who are currently logged in to the router or switch.

NOTE: The **show system users** command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

Options	<p>none—List information about the users who are currently logged in to the router or switch.</p> <p>all-chassis—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.</p> <p>all-lcc—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.</p> <p>all-members—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is</p>
----------------	---

connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

no-resolve—(Optional) Do not attempt to resolve IP addresses to hostnames.

scc—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

Output Fields [Table 188 on page 1713](#) describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

Table 188: show system users Output Fields

Field Name	Field Description
time and up	Current time, in the local time zone, and how long the router or switch has been operational.
users	Number of users logged in to the router or switch.
load averages	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
USER	Username.
TTY	Terminal through which the user is logged in.
FROM	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
LOGIN@	Time when the user logged in.
IDLE	How long the user has been idle.
WHAT	Processes that the user is running.

Sample Output

show system users

show system virtual-memory

Syntax	show system virtual-memory
Syntax (EX Series)	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show system virtual-memory <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show system virtual-memory <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> >
Syntax (MX Series Router)	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show system virtual-memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the show system virtual-memory command for troubleshooting with Juniper Networks Customer Support.
Options	none —Display kernel dynamic memory usage information. all-chassis —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis. all-lcc —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs. all-members —(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration. infrastructure <i>name</i> —(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

interconnect-device *name*—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

scc—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

Additional Information By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

NOTE: The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

Output Fields	<p>Table 189 on page 1719 lists the output fields for the <code>show system virtual-memory</code> command. Output fields are listed in the approximate order in which they appear.</p>

Table 189: show system virtual-memory Output Fields

Field Name	Field Description
Memory statistics by bucket size	
Size	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
In Use	Number of memory blocks of this size that are in use (bytes).
Free	Number of memory blocks of this size that are free (bytes).
Requests	Number of memory allocation requests made.
HighWater	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
Couldfree	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
Memory usage type by bucket size	
Size	Memory block size (bytes).
Type(s)	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
Memory statistics by type	
Type	Kernel module that is using dynamic memory.
InUse	Number of memory blocks used by this type. The number is rounded up.
MemUse	Amount of memory in use, in kilobytes (KB).
HighUse	Maximum memory ever used by this type.
Limit	Maximum memory that can be allocated to this type.
Requests	Total number of dynamic memory allocation requests this type has made.
Type Limit	Number of times requests were blocked for reaching the maximum limit.
Kern Limit	Number of times requests were blocked for the kernel map.
Size(s)	Memory block sizes this type is using.
Memory Totals	
In Use	Total kernel dynamic memory in use (bytes, rounded up).
Free	Total kernel dynamic memory free (bytes, rounded up).

Table 189: show system virtual-memory Output Fields (*continued*)

Field Name	Field Description
Requests	Total number of memory allocation requests.
ITEM	Kernel module that is using memory.
Size	Memory block size (bytes).
Limit	Maximum memory that can be allocated to this type.
Used	Number of memory blocks used by this type. The number is rounded up.
Free	Number of memory blocks available to this type.
Requests	Total number of memory allocation requests this type has made.
interrupt	Timer events and scheduling interruptions.
total	Total number of interruptions for each type.
rate	Interruption rate.
Total	Total for all interruptions.

show task

Syntax	<pre>show task <logical-system (all <i>logical-system-name</i>)> <summary> <task-name> io memory replication snooping</pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display routing protocol tasks on the Routing Engine.
Options	<p>none—Display all routing protocol tasks on the Routing Engine.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>summary—(Optional) Display summary information about running tasks.</p> <p>task-name—(Optional) Display information about running tasks for all tasks whose name begins with this string (for example, BGP_Group_69_153 and BGP_Group_70_153 are both displayed when you run the show task BGP_Group command).</p> <p>io—Show i/o statistics for all tasks displayed.</p> <p>memory—Show memory statistics for all tasks displayed.</p> <p>replication—Show only replication tasks.</p> <p>snooping—Show only snooping tasks.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show task io on page 1776 • show task memory on page 1778
List of Sample Output	show task on page 1775
Output Fields	Table 190 on page 1774 describes the output fields for the show task command. Output fields are listed in the approximate order in which they appear.

Table 190: show task Output Fields

Field Name	Field Description
Pri	Current priority of the process. A lower number indicates a higher priority.
Task Name	Name of the task.

Table 190: show task Output Fields (*continued*)

Field Name	Field Description
Pro	IP protocol number associated with the process.
Port	TCP or UDP port number associated with the task.
So	Socket number of the task.
Flags	Flags for the task: <ul style="list-style-type: none"> • Accept—Task is waiting for incoming connections. • Connect—Task is waiting for a connection to be completed. • Delete—Task has been deleted and is being cleaned up. • LowPrio—Task will be dispatched to read its socket after other higher-priority tasks.

Sample Output

show task

show task io

Syntax	show task io <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches)	show task io
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display I/O statistics for routing protocol tasks on the Routing Engine.
Options	none —Display I/O statistics for routing protocol tasks on the Routing Engine. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
List of Sample Output	show task io on page 1777
Output Fields	Table 191 on page 1776 describes the output fields for the show task io command. Output fields are listed in the approximate order in which they appear.

Table 191: show task io Output Fields

Field Name	Field Description
Task Name	Name of the task.
Reads	Number of input ready notifications.
Writes	Number of output ready notifications.
Rcvd	Number of requests to the kernel for input.
Sent	Number of requests to the kernel for output.
Dropped	Number of sent requests that failed.

Sample Output

show task io

```
user@host> show task io
```

show task memory

Syntax	show task memory <brief detail history summary> <logical-system (all <i>logical-system-name</i>)>
Syntax (EX Series Switches)	show task memory <brief detail history summary>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display memory utilization for routing protocol tasks on the Routing Engine.
Options	<p>none—Display standard information about memory utilization for routing protocol tasks on the Routing Engine on all logical systems.</p> <p>brief detail history summary—(Optional) Display the specified level of output. Use the history option to display a history of memory utilization information.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	show task memory on page 1780 show task memory detail on page 1780
Output Fields	<p>Table 192 on page 1778 describes the output fields for the show task memory command. Output fields are listed in the approximate order in which they appear.</p>

Table 192: show task memory Output Fields

Field Name	Field Description	Level of Output
Memory Currently In Use	Memory currently in use.	All levels
Memory Maximum Ever Used	Maximum memory ever used.	none specified, brief , history
Memory Available	Memory currently available.	none specified, brief
Size (kB)	Memory capacity in 1000-byte kilobytes.	none specified, brief , history , summary
Percentage	Percentage of memory currently available.	none specified, brief
When	Timestamp.	none specified, brief , history

Table 192: show task memory Output Fields (*continued*)

Field Name	Field Description	Level of Output
Overall Memory Report	Memory utilization by memory size: <ul style="list-style-type: none"> • Size—Block size, in bytes. • TPT—indicates transient memory, and P indicates full page. • Allocs—Number of blocks allocated for named objects. • Mallocs—Number of blocks allocated for anonymous objects. • Alloc Bytes—Number of blocks allocated times block size. • MaxAllocs—Maximum value of Allocs. • MaxBytes—Maximum value of Alloc Bytes. • FreeBytes—Total number of bytes unused on memory pages for this block size. 	detail
Allocator Memory Report	Memory utilization by named objects: <ul style="list-style-type: none"> • Size—Size of the named object in bytes. • Alloc Size—Actual memory used by that object in bytes. • DTP—indicates debug, D T indicates transient, and P indicates full page. • Alloc Blocks—Number of named objects allocated. • AllocBytes—Number of blocks allocated times block size. • MaxAlloc Blocks—Maximum value of Alloc Blocks. • Max Alloc Bytes—Maximum value of AllocBytes. 	detail
Malloc Usage Report	Memory utilization for miscellaneous use: <ul style="list-style-type: none"> • Allocs—Number of allocations. • Bytes—Total bytes consumed. • MaxAllocs—Maximum value of Allocs. • MaxBytes—Maximum value of Bytes. • FuncCalls—Cumulative number of Allocs. 	detail
Dynamically allocated memory	Memory allocated dynamically by the system.	detail
Program data+BSS memory	Program and base station subsystem (BSS) memory.	detail
Page data overhead	Internal memory overhead.	detail
Page directory size	Internal memory overhead.	detail
Total bytes in use	Total memory, in bytes, that is currently in use and percentage of available memory (in parentheses).	detail

Sample Output

show task memory

```

user@host> show task memory
Memory              Size (kB)  Percentage  When
Currently In Use:   29417      3%         now

show task replication

Syntax	show task replication
Release Information	Command introduced in Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Displays nonstop active routing (NSR) status. When you issue this command on the master Routing Engine, the status of nonstop active routing synchronization is also displayed.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show task replication (Issued on the Master Routing Engine) on page 1783 show task replication (Issued on the Backup Routing Engine) on page 1783
Output Fields	Table 193 on page 1782 lists the output fields for the show task replication command. Output fields are listed in the approximate order in which they appear.

Table 193: show task replication Output Fields

Field Name	Field Description
Stateful replication	Displays whether or not graceful Routing Engine switchover is configured. The status can be Enabled or Disabled .
RE mode	Displays the Routing Engine on which the command is issued: Master , Backup , or Not applicable (when the router has only one Routing Engine).
Protocol	Protocols that are supported by nonstop active routing.
Synchronization Status	Nonstop active routing synchronization status for the supported protocols. States are NotStarted , InProgress , and Complete .

Sample Output

show task replication
(Issued on the Master
Routing Engine)

```
user@host> show task replication
          Stateful Replication: Enabled
          RE mode: Master

          Protocol      Synchronization Status
          OSPF           NotStarted
          BGP            Complete
          IS-IS          NotStarted
          LDP            Complete
          PIM            Complete
```

show task replication
(Issued on the Backup
Routing Engine)

```
user@host> show task replication
          Stateful Replication: Enabled
          RE mode: Backup
```

show version

Syntax	show version <brief detail>
Syntax (EX Series Switches)	show version <all-members> <brief detail> <local> <member <i>member-id</i> >
Syntax (TX Matrix Router)	show version <brief detail> <all-chassis all-lcc lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show version <all-chassis all-lcc lcc <i>number</i> sfc <i>number</i> > <brief detail>
Syntax (MX Series Router)	show version <brief detail> <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show version <brief detail> <component <i>component-name</i> all>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the hostname and version information about the software running on the router or switch.
Options	none —Display standard information about the hostname and version of the software running on the router or switch. brief detail —(Optional) Display the specified level of output. all-members —(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration. component all —(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system. component <i>component-name</i> —(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace <i>component-name</i> with the name of the QFabric system

component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

local—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

member *member-id*—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

scc—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Additional Information By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

Required Privilege Level view

List of Sample Output

- [show version on page 1787](#)
- [show version \(TX Matrix Plus Router\) on page 1788](#)
- [show version \(TX Matrix Plus Router with 3D SIBs\) on page 1790](#)
- [show version \(MX Series Router\) on page 1794](#)
- [show version \(QFX3500 Switch\) on page 1794](#)
- [show version \(QFabric System\) on page 1794](#)

show version invoke-on

Syntax	show version invoke-on (all-routing-engines other-routing-engine)
Syntax (MX Series Router)	show version invoke-on (all-routing-engines other-routing-engine) <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before JUNOS Release 7.4.
Description	Display the hostname and version information about the software running on a router with two Routing Engines.
Options	<p>all-routing-engines—Display the hostnames and version information about the software running on all master and backup Routing Engines on a routing matrix based on the TX Matrix or TX Matrix Plus router or on a router that has dual Routing Engines.</p> <p>other-routing-engine—Display the hostnames and version information about the software running on the other Routing Engine. For example, if you issue this command on the master Routing Engine on an M320 router, the JUNOS Software displays the hostname and version information on the backup Routing Engine. On a routing matrix based on the TX Matrix or TX Matrix Plus router, if you issue this command on the TX Matrix or TX Matrix Plus router's master Routing Engine, the JUNOS Software displays all the hostnames and version information on all the backup Routing Engines.</p> <p>all-members—(MX Series routers only) (Optional) Display the hostnames and version information about the software running on all master and backup Routing Engines on all members of the Virtual Chassis configuration. Specify the all-members option before the invoke-on keyword.</p> <p>local—(MX Series routers only) (Optional) Display the hostnames and version information about the software running on all master and backup Routing Engines on the local Virtual Chassis member. Specify the local option before the invoke-on keyword.</p> <p>member <i>member-id</i>—(MX Series routers only) (Optional) Display the hostnames and version information about the software running on all master and backup Routing Engines on the specified member of the Virtual Chassis configuration. Replace <i>member-id</i> with a value of 0 or 1. Specify the member <i>member-id</i> option before the invoke-on keyword.</p>
Required Privilege Level	view
List of Sample Output	show version invoke-on all-routing-engines (TX Matrix Router) on page 1798 show version invoke-on other-routing-engine (TX Matrix Router) on page 1800 show version invoke-on all-routing-engines (TX Matrix Plus Router) on page 1801 show version invoke-on other-routing-engine (TX Matrix Plus Router) on page 1807 show version invoke-on all-routing-engines (TX Matrix Plus Router with 3D SIBs) on page 1809

start shell

Syntax	start shell (csh sh) <user <i>username</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type exit from the shell.
<div>  <p>NOTE:</p> <ul style="list-style-type: none"> To issue this command, the user must have the required login access privileges configured by including the permissions statement at the [edit system login class <i>class-name</i>] hierarchy level. UNIX wheel group membership or permissions are no longer required to issue this command. </div>	
Options	<p>csh—Create a UNIX C shell.</p> <p>sh—Create a UNIX Bourne shell.</p> <p>user <i>username</i>—(Optional) Start the shell as another user.</p>
Additional Information	<p>When you are in the shell, the shell prompt has the following format:</p> <p><i>username@hostname%</i></p> <p>An example of the prompt is:</p> <p>root@host%</p>
Required Privilege Level	shell and maintenance
List of Sample Output	start shell csh on page 1822
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

start shell csh

```
user@host> start shell csh
%
```

```
exit
%
```

```
username@hostname% start shell sh
%
```

```
exit
user@host>
```

test aaa authd-lite user

Syntax	test aaa authd-lite user <i>username</i> password <i>password</i> profile <i>access-profile-name</i> <port <i>nas-port</i> > <zero-stats>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Verify authd-lite subscriber access authentication, accounting, and address allocation configuration.
Options	<p>username—Specify the subscriber username to test.</p> <p>password password—Specify the password associated with the username.</p> <p>profile access-profile-name—Specify the access profile associated with the subscriber.</p> <p>port nas-port—(Optional) Specify the NAS port used for the test.</p> <p>zero-stats—(Optional) Specify that no accounting statistics are set for this test.</p>
Required Privilege Level	view
List of Sample Output	test aaa authd-lite user on page 1824
Output Fields	<p>When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the show network-access aaa statistics, show network-access aaa statistics authentication, show network-access aaa subscribers, and show subscribers commands.</p> <p>The test command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the test command replaces the statistics with time-only accounting statistics.</p>

Sample Output

test aaa authd-lite user The following example tests the configuration for authd-lite subscriber brady-t with a password of a11pr0 and an access profile of employee12, and displays the resulting output:

```

user@host> test aaa authd-lite user brady-t password a11pr0 profile employee12

                        configuration syntax failed
```

Virtual Chassis Operational Mode Commands

Table 194 on page 1835 summarizes the command-line interface (CLI) commands you can use to administer and monitor a Virtual Chassis configuration for MX Series 3D Universal Edge Routers. Commands are listed in alphabetical order.

Table 194: Virtual Chassis Operational Mode Commands

Task	Command
Remove the member ID from a router that you want to remove from a Virtual Chassis.	<code>request virtual-chassis member-id delete</code>
Assign a member ID to a router that you want to add as a member of a Virtual Chassis.	<code>request virtual-chassis member-id set</code>
Change the mastership in a Virtual Chassis by switching the global roles of the master router and backup router.	<code>request virtual-chassis routing-engine master switch</code>
Remove a Virtual Chassis port from a member router in a Virtual Chassis.	<code>request virtual-chassis vc-port delete</code>
Create a Virtual Chassis port to interconnect member routers in a Virtual Chassis.	<code>request virtual-chassis vc-port set</code>
Display information about neighbor reachability from each member router in a Virtual Chassis.	<code>show virtual-chassis active-topology</code>
Display information about neighbor reachability for each hardware device in a Virtual Chassis.	<code>show virtual-chassis device-topology</code>
Display the entries (neighbors) in the Virtual Chassis Control Protocol (VCCP) database for a Virtual Chassis.	<code>show virtual-chassis protocol adjacency</code>
Display the entries in the VCCP link-state database for a Virtual Chassis.	<code>show virtual-chassis protocol database</code>
Display VCCP information about Virtual Chassis port interfaces in a Virtual Chassis.	<code>show virtual-chassis protocol interface</code>

Table 194: Virtual Chassis Operational Mode Commands (*continued*)

Task	Command
Display the VCCP unicast and multicast routing tables for a Virtual Chassis.	show virtual-chassis protocol route
Display VCCP statistics for one or both member routers, or for a specified Virtual Chassis port interface, in a Virtual Chassis.	show virtual-chassis protocol statistics
Display information about the status of both member routers in a Virtual Chassis.	show virtual-chassis status
Display the operational status of the Virtual Chassis ports for both member routers, or for a specified member router, in a Virtual Chassis.	show virtual-chassis vc-port

**NOTE:**

Virtual Chassis configurations are supported on the following routers with Trio Modular Port Concentrator/Modular Interface Card (MPC/MIC) interfaces:

- MX240 3D Universal Edge Router
- MX480 3D Universal Edge Router
- MX960 3D Universal Edge Router

NOTE: For information about how to configure a Virtual Chassis for MX Series routers, see the Junos OS High Availability Configuration Guide.

request virtual-chassis member-id delete (MX Series Virtual Chassis)

Syntax request virtual-chassis member-id delete

Release Information Command introduced in Junos OS Release 11.2.

Description Remove (**delete**) the member ID from an MX Series router that you want to remove from a Virtual Chassis configuration.

NOTE: Issuing the command to remove the member ID causes the router to reboot, and requires you to confirm that you want to proceed with this operation. If you do not confirm the operation, the software cancels the command.

Required Privilege Level system-control

Related Documentation

- Deleting Member IDs in a Virtual Chassis Configuration
- Example: Deleting a Virtual Chassis Configuration for MX Series 3D Universal Edge Routers

List of Sample Output [request virtual-chassis member-id delete on page 1837](#)

Sample Output

```
request virtual-chassis member-id delete
user@host> request virtual-chassis member-id delete
This command will disable virtual-chassis mode and reboot the system.
Continue? [yes,no] (no)
```

request virtual-chassis member-id set (MX Series Virtual Chassis)

Syntax request virtual-chassis member-id set member *member-id*

Release Information Command introduced in Junos OS Release 11.2.

Description Assign (**set**) a member ID to an MX Series router that you want to add as a member of a Virtual Chassis configuration.

NOTE: Issuing the command to assign a member ID causes the router to reboot, and requires you to confirm that you want to proceed with this operation. If you do not confirm the operation, the software cancels the command.

Options **member** *member-id*—Numeric value that identifies a member router in a Virtual Chassis configuration. When you assign a member ID to a router, assign the same member ID defined for this router in the MX Series Virtual Chassis preprovisioned configuration. Replace *member-id* with the value 0 or 1.

Required Privilege Level system-control

- Configuring Member IDs for a Virtual Chassis
- Example: Configuring Interchassis Redundancy for MX Series 3D Universal Edge Routers Using a Virtual Chassis

List of Sample Output [request virtual-chassis member-id set on page 1838](#)

Sample Output

```
request virtual-chassis member-id set
user@host> request virtual-chassis member-id set member 0
This command will enable virtual-chassis mode and reboot the system.
Continue? [yes,no] (no)
```

request virtual-chassis routing-engine master switch (MX Series Virtual Chassis)

Syntax	request virtual-chassis routing-engine master switch <check>
Release Information	Command introduced in Junos OS Release 11.2. Option check introduced in Junos OS Release 12.2.
Description	<p>Change the mastership in an MX Series Virtual Chassis by switching the global roles of the master router and backup router in the Virtual Chassis configuration. The request virtual-chassis routing-engine master switch command must be issued from the master router (VC-Mm).</p> <p>For MX Series routers with dual Routing Engines in a Virtual Chassis, the local roles (master and standby) of the Routing Engines in each member router do not change after you issue the request virtual-chassis routing-engine master switch command.</p> <div style="margin-top: 20px;">  <p>NOTE: Before you issue the request virtual-chassis routing-engine master switch command from the master router in the Virtual Chassis, make sure that the system configuration is synchronized between the master router and backup router. If the configuration on the master router and backup router is not synchronized, or if you attempt to issue the request virtual-chassis routing-engine master switch command from the backup router instead of from the master router, the router displays an error message and rejects the command.</p> <p>If you issue the request virtual-chassis routing-engine master switch command when the Virtual Chassis is in a transition state (for example, the backup router is disconnecting from the Virtual Chassis), the router does not process the command.</p> </div>
Options	check —(Optional) Perform a check from the master router in an MX Series Virtual Chassis to determine whether the member routers are ready for GRES from a database synchronization perspective, without initiating the GRES operation itself.
Required Privilege Level	system-control

```

```
user@host> request virtual-chassis routing-engine master switch check  
error: chassisd Not ready for mastership switch, try after 217 secs.  
mastership switch request NOT honored, backup not ready
```

request virtual-chassis vc-port delete (MX Series Virtual Chassis)

Syntax request virtual-chassis vc-port delete fpc-slot *fpc-slot-number* pic-slot *pic-slot-number* port *port-number*
<(local | member *member-id*)>

Release Information Command introduced in Junos OS Release 11.2.

Description Remove (**delete**) a Virtual Chassis port from a member router in an MX Series Virtual Chassis configuration. After a Virtual Chassis port is created, it is renamed **vcp-slot/pic/port**, and is no longer available for configuration as a standard network port. After you remove a Virtual Chassis port, it becomes available to the global configuration and can again function as a standard network port.

NOTE: If the member ID has not been set on the router where you issue the **request virtual-chassis vc-port delete** command, the software prevents the removal of the Virtual Chassis port on the router. To set the member ID, use the **request virtual-chassis member-id set** command.

Options **fpc-slot *fpc-slot-number***—Number of the Flexible PIC Concentrator (FPC) slot on which the Virtual Chassis port resides. The slot number corresponds to the Modular Port Concentrator (MPC) slot number. Replace ***fpc-slot-number*** with a value appropriate for your router:

- MX960 router—0 through 11.
- MX480 router—0 through 5.
- MX240 router—0 through 2.

pic-slot *pic-slot-number*—Number of the PIC slot on which the Virtual Chassis port resides. Replace ***pic-slot-number*** with a value in the range 0 through 3.

port *port-number*—Number of the port on the PIC on which the Virtual Chassis port resides. Replace ***port-number*** with a value appropriate for your PIC.

local—(Optional) Delete the Virtual Chassis port on the member router on which you are issuing the command. This is the default behavior if you do not specify the **local** or **member** options.

member *member-id*—(Optional) Numeric value that identifies the remote Virtual Chassis member on which you want to delete the Virtual Chassis port. Replace ***member-id*** with the value 0 or 1.

Required Privilege Level system-control

List of Sample Output [request virtual-chassis vc-port delete \(Remove vcp-3/2/1\) on page 1842](#)

Sample Output

[request virtual-chassis vc-port delete \(Remove vcp-3/2/1\)](#)

```
user@host> request virtual-chassis vc-port delete fpc-slot 3 pic-slot 2 port 1
vc-port successfully deleted
```

request virtual-chassis vc-port set (MX Series Virtual Chassis)

Syntax request virtual-chassis vc-port set fpc-slot *fpc-slot-number* pic-slot *pic-slot-number* port *port-number*
<(local | member *member-id*)>

Release Information Command introduced in Junos OS Release 11.2.

Description Create (**set**) a Virtual Chassis port on an MX Series router through which the router connects to other member routers in the Virtual Chassis. You can create Virtual Chassis ports only on Trio Modular Port Concentrator/Modular Interface Card (MPC/MIC) network ports on MX Series routers.

After a Virtual Chassis port is created, it is renamed **vcp-slot/pic/port**, and is no longer available for configuration as a standard network port. Virtual Chassis ports can be used only to interconnect the MX Series routers in the Virtual Chassis.

NOTE: If the member ID has not been set on the router where you issue the **request virtual-chassis vc-port set** command, the software prevents the creation of the Virtual Chassis port on the router. To set the member ID, use the **request virtual-chassis member-id set** command.

Options **fpc-slot** *fpc-slot-number*—Number of the Flexible PIC Concentrator (FPC) slot on which the Virtual Chassis port resides. The slot number corresponds to the Modular Port Concentrator (MPC) slot number. Replace *fpc-slot-number* with a value appropriate for your router:

- MX960 router—0 through 11.
- MX480 router—0 through 5.
- MX240 router—0 through 2.

When you issue the **show interfaces** command on a member router in an MX Series Virtual Chassis, the FPC slot number displayed in the command output reflects the FPC slot numbering and offset used in the Virtual Chassis instead of the physical slot number where the FPC is actually installed. The router with member ID 0 in the Virtual Chassis uses FPC slot numbers 0 through 11 with no offset, and the router with member ID 1 uses FPC slot numbers 12 through 23, with an offset of 12. For example, a 10-Gigabit Ethernet interface that appears as **xe-14/2/2** (FPC slot 14, PIC slot 2, port 2) in the **show interfaces** command is actually interface **xe-2/2/2** (FPC slot 2, PIC slot 2, port 2) on member ID 1 after deducting the FPC slot numbering offset of 12 for member ID 1.

pic-slot *pic-slot-number*—Number of the PIC slot on which the Virtual Chassis port resides. Replace *pic-slot-number* with a value in the range 0 through 3.

port *port-number*—Number of the port on the PIC on which the Virtual Chassis port resides. Replace *port-number* with a value appropriate for your PIC.

local—(Optional) Set the Virtual Chassis port on the member router on which you are issuing the command. This is the default behavior if you do not specify the **local** or **member** options.

member *member-id*—(Optional) Numeric value that identifies the remote Virtual Chassis member on which you want to create the Virtual Chassis port. Replace ***member-id*** with the value 0 or 1.

Required Privilege Level system-control

show virtual-chassis protocol interface (MX Series Virtual Chassis)

Syntax	show virtual-chassis protocol interface <(brief detail)> <interface-name> <(all-members local member <i>member-id</i>)>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display Virtual Chassis Control Protocol (VCCP) information about Virtual Chassis port interfaces in an MX Series Virtual Chassis. You can issue the show virtual-chassis protocol interface command from the console of either member router in the Virtual Chassis.
Options	<p>brief detail—(Optional) Display the specified level of output. Using the brief option is equivalent to issuing the command with no options (the default). The detail option provides more output than the brief option.</p> <p>all-members—(Optional) Display VCCP information about Virtual Chassis port interfaces for both member routers in a Virtual Chassis. This is the default behavior if no options are specified.</p> <p>interface-name—(Optional) Display VCCP information about Virtual Chassis port interfaces for the specified Virtual Chassis port, in the format vcp-slot/pic/port.logical-unit-number.</p> <p>local—(Optional) Display VCCP information about Virtual Chassis port interfaces for the member router on which you are issuing the command.</p> <p>member member-id—(Optional) Display VCCP information about Virtual Chassis port interfaces for the specified member router. Replace member-id with the value 0 or 1.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Viewing Information About Virtual Chassis Port Interfaces in the Virtual Chassis Control Protocol Database

Output Fields	Table 199 on page 1859 lists the output fields for the show virtual-chassis protocol interface command. Output fields are listed in the approximate order in which they appear.

Table 199: show virtual-chassis protocol interface Output Fields

Field Name	Field Description	Level of Output
membern	Member ID of the Virtual Chassis member router for which output is displayed.	All levels

Table 199: show virtual-chassis protocol interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
Interface	Name of the Virtual Chassis port interface, in the format <i>vcp-slot/pic/port.logical-unit-number</i> .	brief
State	State of the Virtual Chassis port interface: <ul style="list-style-type: none"> • Up—The interface is up. • Down—The interface is down. 	brief
Metric	Metric value for this Virtual Chassis port interface.	All levels
<i>vcp-slot/ pic/port. logical-unit-number</i>	Name of the Virtual Chassis port interface.	detail
Index	Interface index number assigned by the Junos OS software.	detail
State	Internal implementation information.	detail
LSP interval	Interval, in milliseconds, between link-state protocol data units (PDUs) sent from the interface.	detail
type Hello padding	Type of hello padding: <ul style="list-style-type: none"> • Adaptive—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state type, length, and value (TLV). If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. • Loose—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. • Strict—Padding is performed on all interface types and for all adjacency states, and is continuous. 	detail
Adjacencies	Number of adjacencies established on this Virtual Chassis port interface.	detail
Hello(s)	Hello interval for the Virtual Chassis port interface.	detail
Hold(s)	Hold time for the Virtual Chassis port interface.	detail

Output Fields	Table 200 on page 1862 lists the output fields for the show virtual-chassis protocol route command. Output fields are listed in the approximate order in which they appear.

Table 200: show virtual-chassis protocol route Output Fields

Field Name	Field Description
membern	Member ID of the Virtual Chassis member router for which output is displayed.
Dev	System ID of the device (member router) that stores the VCCP routing tables. The System ID is derived from the router's media access control (MAC) address.
ucast routing table	VCCP unicast routing table.
mcast routing table	VCCP multicast routing table.

Table 200: show virtual-chassis protocol route Output Fields (*continued*)

Field Name	Field Description
Current version	Version of the shortest-path-first (SPF) algorithm that generated the VCCP unicast or multicast routing table.
System ID	System ID of the device, derived from the device's MAC address.
Version	Version of the SPF algorithm that generated this route in the VCCP unicast or multicast routing table.
Metric	Metric value required to reach this device.
Interface	Name of the Virtual Chassis port interface (in the format <i>vcp-slot/pic/port.logical-unit-number</i>) that interconnects the devices.
Via	MAC address of the next-hop device, if applicable.

show virtual-chassis protocol statistics (MX Series Virtual Chassis)

Syntax	show virtual-chassis protocol statistics < <i>interface-name</i> > <(all-members local member <i>member-id</i>)>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display Virtual Chassis Control Protocol (VCCP) statistics for one or both member routers, or for a specified Virtual Chassis port interface, in an MX Series Virtual Chassis. You can issue the show virtual-chassis protocol statistics command from the console of either member router in the Virtual Chassis.
Options	<p>all-members—(Optional) Display VCCP statistics for both member routers in a Virtual Chassis configuration. This is the default behavior if no options are specified.</p> <p><i>interface-name</i>—(Optional) Display VCCP statistics for the specified Virtual Chassis port interface, in the format vcp-slot/pic/port.logical-unit-number.</p> <p>local—(Optional) Display VCCP statistics for the member router on which you are issuing the command.</p> <p>member <i>member-id</i>—(Optional) Display VCCP statistics for the specified member router. Replace <i>member-id</i> with the value 0 or 1.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Viewing Virtual Chassis Control Protocol Statistics for Member Routers and Virtual Chassis Ports
List of Sample Output	show virtual-chassis protocol statistics all-members on page 1867 show virtual-chassis protocol statistics vcp-1/3/0.32768 member 1 (For Specific Virtual Chassis Port Interface and Member ID) on page 1867
Output Fields	Table 201 on page 1865 lists the output fields for the show virtual-chassis protocol statistics command. Output fields are listed in the approximate order in which they appear.

Table 201: show virtual-chassis protocol statistics Output Fields

Field Name	Field Description
membern	Member ID of the Virtual Chassis member router for which output is displayed.
PDU type	Type of protocol data unit (PDU).
Received	Number of PDUs received since VCCP started or since the statistics were set to zero.
Processed	Number of PDUs received minus the number of PDUs dropped.
Drops	Number of PDUs dropped.

Table 201: show virtual-chassis protocol statistics Output Fields (*continued*)

Field Name	Field Description
Sent	Number of PDUs transmitted since VCCP started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since VCCP started or since the statistics were set to zero.
Total packets received	Total number of PDUs received since VCCP started or since the statistics were set to zero.
Sent	Total number of PDUs transmitted since VCCP started or since the statistics were set to zero.
LSP queue length	Number of link-state PDUs waiting in the queue to be processed.
Drops	Number of link-state PDUs dropped.
SPF runs	Number of shortest-path-first (SPF) calculations performed.
Fragments rebuilt	Number of link-state PDU fragments computed by the local system.
LSP regenerations	Number of regenerated link-state PDUs. A link-state PDU is regenerated when the PDU nears the end of its lifetime and has not changed.
Purges initiated	Number of purges initiated by the software. A purge is initiated when the software determines that it must remove a link-state PDU from the network.

Field Name	Field Description
Virtual Chassis ID	Assigned ID that applies to the entire Virtual Chassis configuration.
Member ID	Member ID assigned in the preprovisioned Virtual Chassis configuration, and the Flexible PIC Concentrator (FPC) slot range, including offset, for each member router in the Virtual Chassis.
Status	<p>State of the member router:</p> <ul style="list-style-type: none"> Prsnt—Router is currently connected to the Virtual Chassis. NotPrsnt—Router is not currently connected to the Virtual Chassis.
Serial No	Serial number of the member router.
Model	Model number of the member router.
Mastership priority	<p>Metric used by the Virtual Chassis software for the mastership election algorithm.</p> <p>This value is assigned by the software and is not configurable in the current release.</p>
Role	<p>Role of the member router in the Virtual Chassis: Master or Backup.</p> <p>The asterisk (*) following the Role denotes the router on which the show virtual-chassis status command was issued.</p>

Table 202: show virtual-chassis status Output Fields (*continued*)

Field Name	Field Description
Neighbor List ID Interface	Member IDs and Virtual Chassis port interfaces (in the format vcp-slot/pic/port) to which this member router is connected.

Sample Output

```

show virtual-chassis status {master:member1-re0}
user@host> show virtual-chassis status
Preprovisioned Virtual Chassis
Virtual Chassis ID: 5a6a.e747.8511

1 (FPC 12- 23) Prsnt  JN10C78D1AFC mx240  129 Master* 0 vcp-1/3/0

```

show virtual-chassis vc-port (MX Series Virtual Chassis)

Syntax	show virtual-chassis vc-port <(all-members local member <i>member-id</i>)>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display the operational status of the Virtual Chassis ports for both member routers or for a specified member router in an MX Series Virtual Chassis configuration. You can issue the show virtual-chassis vc-port command from the console of either member router in the Virtual Chassis.
Options	<p>all-members—(Optional) Display the operational status of the Virtual Chassis ports for both member routers in a Virtual Chassis configuration.</p> <p>local—(Optional) Display the operational status of the Virtual Chassis ports on the member router on which you are issuing the command. This is the default behavior if no options are specified.</p> <p>member <i>member-id</i>—(Optional) Display the operational status of the Virtual Chassis ports on the specified member router. Replace <i>member-id</i> with the value 0 or 1.</p>
Required Privilege Level	view

Output Fields	Table 203 on page 1871 lists the output fields for the show virtual-chassis vc-port command. Output fields are listed in the approximate order in which they appear.

Table 203: show virtual-chassis vc-port Output Fields

Field Name	Field Description
membern	Member ID of the Virtual Chassis member router for which output is displayed.
Interface or Slot/PIC/Port	Location, in the format <i>slot/pic/port</i> , of the Virtual Chassis ports configured on the member router.
Type	Type of Virtual Chassis port. Configured indicates that the Virtual Chassis port is properly configured.

Table 203: show virtual-chassis vc-port Output Fields (*continued*)

Field Name	Field Description
Trunk ID	Trunk ID value assigned to a link aggregation group (LAG) formed by the Virtual Chassis. A positive number indicates that a trunk exists. The value -1 indicates that a trunk is not present.
Status	State of the Virtual Chassis port interface: Up , Down , or Absent .
Speed (mbps)	Speed, in megabits per second, of the Virtual Chassis port interface.
Neighbor ID Interface	Member IDs and Virtual Chassis port interfaces (in vcp-slot/pic/port format) that are connected to this member router.

Sample Output

show virtual-chassis
vc-port all-members

```
{master:member1-re0}
```

```

PART 3

Class of Service

- [Class-of-Service Operational Mode Commands on page 1875](#)

Class-of-Service Operational Mode Commands

Table 204 on page 1875 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot class of service (CoS). Commands are listed in alphabetical order.

Table 204: Class-of-Service (CoS) Operational Mode Commands

Task	Command
Display the entire CoS configuration, including system-chosen defaults.	<code>show class-of-service</code>
(J Series routers only) Display trigger points and associated rates for CoS adaptive shapers.	<code>show class-of-service adaptive-shaper</code>
Display the configuration for the CoS adjustment control profile.	<code>show class-of-service adjustment-control-profile</code>
For each CoS classifier, display the mapping of code point value to forwarding class and loss priority.	<code>show class-of-service classifier</code>
Display the mapping of CoS code point aliases to corresponding bit patterns.	<code>show class-of-service code-point-aliases</code>
Display data points for each CoS random early detection (RED) drop profile.	<code>show class-of-service drop-profile</code>
(M320 routers and T Series routers only) Display the mapping of CoS schedulers to switch fabric traffic priorities and a summary of scheduler parameters for each priority.	<code>show class-of-service fabric scheduler-map</code>
(M320 routers and T Series routers only) Display CoS switch fabric queue statistics.	<code>show class-of-service fabric statistics</code>
Display the mapping of forwarding class names to queue numbers.	<code>show class-of-service forwarding-class</code>

Table 204: Class-of-Service (CoS) Operational Mode Commands (*continued*)

Task	Command
Display entire CoS configuration as it exists in the forwarding table.	<code>show class-of-service forwarding-table</code>
Display the mapping of code point value to queue number and loss priority for each classifier as it exists in the forwarding table.	<code>show class-of-service forwarding-table classifier</code>
For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.	<code>show class-of-service forwarding-table classifier mapping</code>
Display the data points of all random early detection (RED) drop profiles as they exist in the forwarding table.	<code>show class-of-service forwarding-table drop-profile</code>
(M320 routers and T Series routers only) Display the scheduler map information as it exists in the forwarding table for switch fabric.	<code>show class-of-service forwarding-table fabric scheduler-map</code>
(J Series routers only) Display the mapping of code point value to loss priority as it exists in the forwarding table.	<code>show class-of-service forwarding-table loss-priority-map</code>
(J Series routers only) For each logical interface, display the loss priority table index.	<code>show class-of-service forwarding-table loss-priority-map mapping</code>
Display mapping of queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.	<code>show class-of-service forwarding-table rewrite-rule</code>
For each logical interface, display the table identifier of the rewrite rule map for each code point type.	<code>show class-of-service forwarding-table rewrite-rule mapping</code>
For each physical interface, display the scheduler map information as it exists in the forwarding table.	<code>show class-of-service forwarding-table scheduler-map</code>
For Adaptive Services (AS) PIC link services IQ interfaces (lsq) only, display fragmentation properties for specific forwarding classes.	<code>show class-of-service fragmentation-map</code>
Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.	<code>show class-of-service interface</code>

Table 204: Class-of-Service (CoS) Operational Mode Commands (*continued*)

Task	Command
Display the configured shaping rate and the quality of service (QoS) adjusted shaping rate for each logical interface set configured for hierarchical class of service (CoS).	<code>show class-of-service interface-set</code>
Display CoS objects associated with an L2TP session.	<code>show class-of-service l2tp-session</code>
(J Series routers only) Display mapping of code point value to loss priority.	<code>show class-of-service loss-priority-map</code>
Display the mapping of the code-point value to the loss priority rewrite rule.	<code>show class-of-service loss-priority-rewrite</code>
Display the classifier type for each class-of-service (CoS) multidestination classifier.	<code>show class-of-service multi-destination</code>
Display the mapping of forwarding classes and loss priority to code point values.	<code>show class-of-service rewrite-rule</code>
(M Series and T Series routers only) Display mapping of CoS objects to routing instances.	<code>show class-of-service routing-instance</code>
Display mapping of schedulers to forwarding classes and a summary of scheduler parameters for each entry.	<code>show class-of-service scheduler-map</code>
(ACX Series Universal Access routers only) Display classifiers configured under system-defaults .	<code>show class-of-service system-defaults</code>
For Gigabit Ethernet IQ and Channelized IQ PICs only, display traffic shaping and scheduling profiles.	<code>show class-of-service traffic-control-profile</code>
For IQE PICs only, display translation table information.	<code>show class-of-service translation-table</code>
(J Series routers only) Display virtual channel information.	<code>show class-of-service virtual-channel</code>
(J Series routers only) Display virtual channel group information.	<code>show class-of-service virtual-channel-group</code>

.....

NOTE: For information about how to configure CoS, see the Junos OS Class of Service Configuration Guide. For information about the related `show interfaces queue` command, see the Junos OS Operational Mode Commands.

.....

show class-of-service

Syntax	show class-of-service
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the entire class-of-service (CoS) configuration, including system-chosen defaults. Executing this command is equivalent to executing all show class-of-service commands in succession.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service on page 1880
Output Fields	See the output field descriptions for the commands.

Sample Output

```

show class-of-service adaptive-shaper

Syntax	<code>show class-of-service adaptive-shaper</code> <code><adaptive-shaper-name></code>
Release Information	Introduced before Junos OS Release 7.4.
Description	(J Series routers only) Display trigger points and associated rates for class-of-service (CoS) adaptive shapers.
Options	none —Display all adaptive shaper information. adaptive-shaper-name —(Optional) Display information for the named adaptive shaper.
Required Privilege Level	view
List of Sample Output	show class-of-service adaptive-shaper on page 1882
Output Fields	Table 205 on page 1882 describes the output fields for the show class-of-service adaptive-shaper command. Output fields are listed in the approximate order in which they appear.

Table 205: show class-of-service adaptive-shaper Output Fields

Field Name	Field Description
Adaptive shaper	Name of the adaptive shaper.
Index	Internal index of the adaptive shaper.
Trigger type	Adaptive shaper trigger type. The trigger type can be the backward explicit congestion notification (BECN) bit in Frame Relay packet headers.
Shaping rate	CoS adaptive shaping rate.

Sample Output

```

show class-of-service adaptive-shaper
user@host> show class-of-service adaptive-shaper
Adaptive shaper: as, Index: 3155
  Trigger type    Shaping rate
  BECN           30 percent

```

show class-of-service classifier

Syntax	show class-of-service classifier <name <i>name</i> > <type dscp type dscp-ipv6 type exp type ieee-802.1 type inet-precedence>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	For each class-of-service (CoS) classifier, display the mapping of code point value to forwarding class and loss priority.
Options	<p>none—Display all classifiers.</p> <p>name <i>name</i>—(Optional) Display named classifier.</p> <p>type dscp—(Optional) Display all classifiers of the Differentiated Services code point (DSCP) type.</p> <p>type dscp-ipv6—(Optional) Display all classifiers of the DSCP for IPv6 type.</p> <p>type exp—(Optional) Display all classifiers of the MPLS experimental (EXP) type.</p> <p>type ieee-802.1—(Optional) Display all classifiers of the ieee-802.1 type.</p> <p>type inet-precedence—(Optional) Display all classifiers of the inet-precedence type.</p>
Required Privilege Level	view
List of Sample Output	show class-of-service classifier type ieee-802.1 on page 1884 show class-of-service classifier type ieee-802.1 (QFX Series) on page 1884
Output Fields	Table 206 on page 1883 describes the output fields for the show class-of-service classifier command. Output fields are listed in the approximate order in which they appear.

Table 206: show class-of-service classifier Output Fields

Field Name	Field Description
Classifier	Name of the classifier.
Code point type	Type of the classifier: exp (not on EX Series switch), dscp , dscp-ipv6 (not on EX Series switch), ieee-802.1 , or inet-precedence .
Index	Internal index of the classifier.
Code point	Code point value used for classification
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.

Table 206: show class-of-service classifier Output Fields (*continued*)

Field Name	Field Description
Loss priority	Loss priority value used for classification. For most platforms, the value is high or low . For some platforms, the value is high , medium-high , medium-low , or low .

Sample Output

show class-of-service
classifier type
ieee-802.1

```
user@host> show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point      Forwarding Class      Loss priority
000             best-effort           low
001             best-effort           high
010             expedited-forwarding  low
011             expedited-forwarding  high

111             mcast                 low
```

show class-of-service code-point-aliases

Syntax	<code>show class-of-service code-point-aliases</code> <code><dscp dscp-ipv6 exp ieee-802.1 inet-precedence></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns.
Options	<p>none—Display code point aliases of all code point types.</p> <p>dscp—(Optional) Display Differentiated Services code point (DSCP) aliases.</p> <p>dscp-ipv6—(Optional) Display IPv6 DSCP aliases.</p> <p>exp—(Optional) Display MPLS EXP code point aliases.</p> <p>ieee-802.1—(Optional) Display IEEE-802.1 code point aliases.</p> <p>inet-precedence—(Optional) Display IPv4 precedence code point aliases.</p>
Required Privilege Level	view
List of Sample Output	show class-of-service code-point-aliases exp on page 1886
Output Fields	Table 207 on page 1885 describes the output fields for the show class-of-service code-point-aliases command. Output fields are listed in the approximate order in which they appear.

Table 207: show class-of-service code-point-aliases Output Fields

Field Name	Field Description
Code point type	Type of the code points displayed: dscp , dscp-ipv6 (not on EX Series switch), exp (not on EX Series switch or the QFX Series), ieee-802.1 , or inet-precedence (not on the QFX Series).
Alias	Alias for a bit pattern.
Bit pattern	Bit pattern for which the alias is displayed.

Sample Output

```
show class-of-service code-point-aliases exp  user@host> show class-of-service code-point-aliases exp
Code point type: exp
Alias      Bit pattern
af11       100
af12       101
be         000
be1        001

show class-of-service fabric scheduler-map

Syntax	show class-of-service fabric scheduler-map
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Display the mapping of class-of-service (CoS) schedulers to switch fabric traffic priorities and a summary of scheduler parameters for each priority.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service fabric scheduler-map on page 1891
Output Fields	Table 209 on page 1890 describes the output fields for the show class-of-service fabric scheduler-map command. Output fields are listed in the approximate order in which they appear.

Table 209: show class-of-service fabric scheduler-map Output Fields

Field Name	Field Description
Fabric priority	Indicates the fabric traffic priority. Currently, two priorities are supported: low and high .
Scheduler	Name of the scheduler.
Index	Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles.
Drop profiles	Display the assignment of drop profile by name and index to a given loss priority and protocol pair: <ul style="list-style-type: none">• Loss priority—Packet loss priority for drop profile assignment.• Protocol—Transport protocol for drop profile assignment.• Name—Name of the drop profile.

Sample Output

```
show class-of-service fabric scheduler-map
fabric scheduler-map
user@host> show class-of-service fabric scheduler-map
Fabric priority: low
Scheduler: fab-ef-scheduler, Index: 60211
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP  44321  fab-ef-profile
  Low           TCP      44321  fab-ef-profile
  High          non-TCP  44321  fab-ef-profile
  High          TCP      44321  fab-ef-profile

Fabric priority: high
Scheduler: fab-ef-scheduler, Index: 60211
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP  44321  fab-ef-profile
  Low           TCP      44321  fab-ef-profile
  High          non-TCP  44321  fab-ef-profile
  High          TCP      44321  fab-ef-profile
```

show class-of-service fabric statistics

Syntax	show class-of-service fabric statistics <destination <i>fpc-number</i> > <source <i>fpc-number</i> > <summary>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Display class-of-service (CoS) switch fabric queue statistics.
Options	<p>none—Same as summary.</p> <p>destination <i>fpc-number</i>—(Optional) Display details for the specified destination Flexible PIC Concentrator (FPC). The FPC number is a value from 0 through 7.</p> <p>source <i>fpc-number</i>—(Optional) Display details for the specified source FPC. The FPC number is a value from 0 through 7.</p> <p>summary—(Optional) Display all switch fabric statistics.</p>
Required Privilege Level	view
List of Sample Output	show class-of-service fabric statistics on page 1893
Output Fields	Table 210 on page 1892 describes the output fields for the show class-of-service fabric statistics command. Output fields are listed in the approximate order in which they appear.

Table 210: show class-of-service fabric statistics Output Fields

Field Name	Field Description
Destination FPC Index	Index number associated with the destination FPC
Source PFC Index	Index number associated with the source FPC.
Total statistics	<p>Fabric queue statistic totals:</p> <ul style="list-style-type: none"> • Packets—Total packet count for high-priority and low-priority queues. • Bytes—Total byte count for high-priority and low-priority queues. • pps—Total packets-per-second count for high-priority and low-priority queues. • bps—Total bits-per-second count for high-priority and low-priority queues.
Tx statistics	<p>Fabric queue statistics for transmitted traffic:</p> <ul style="list-style-type: none"> • Packets—Transmitted packet count for high-priority and low-priority queues. • Bytes—Transmitted byte count for high-priority and low-priority queues. • pps—Transmitted packets-per-second count for high-priority and low-priority queues. • bps—Transmitted bits-per-second count for high-priority and low-priority queues.

Table 210: show class-of-service fabric statistics Output Fields (*continued*)

Field Name	Field Description
Drop statistics	<p>Fabric queue statistics for dropped traffic:</p> <ul style="list-style-type: none"> • Packets—Dropped packet count for high-priority and low-priority queues. • Bytes—Dropped byte count for high-priority and low-priority queues. • pps—Dropped packets-per-second count for high-priority and low-priority queues. • bps—Dropped bits-per-second count for high-priority and low-priority queues.

Sample Output

show class-of-service fabric statistics

```

user@host> show class-of-service fabric statistics
Destination FPC Index: 0, Source FPC Index: 0
  Total statistics:  High priority      Low priority
    Packets:           0                0
    Bytes :            0                0
    Pps  :             0                0

```

show class-of-service forwarding-class

Syntax	show class-of-service forwarding-class <forwarding-class-map-name>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display the mapping of forwarding class maps and names to queue numbers.
Options	forwarding-class-map-name —(Optional) Display the forwarding class configuration for a specific forwarding class map name. If this option is omitted, information for all forwarding class maps will be displayed.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-class on page 1895 show class-of-service forwarding-class forwarding-class-map-name on page 1895
Output Fields	Table 211 on page 1894 describes the output fields for the show class-of-service forwarding-class command. Output fields are listed in the approximate order in which they appear.

Table 211: show class-of-service forwarding-class Output Fields

Field Name	Field Description
Forwarding class map	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
ID	Forwarding class identifier.
Queue	Queue corresponding to the forwarding class name.
Restricted Queue	(T Series platforms only) Forwarding class restricted queue number. The queue number assigned if the PIC is restricted to four queues.
Fabric Priority	(M320 and T Series platforms only) Forwarding class queue priority.

Sample Output

```

show class-of-service forwarding-class
forwarding-class
user@host> show class-of-service forwarding-class
Forwarding class map FCMAP1  ID      Queue      Restricted queue  Fabric
                                                                    Priority

show class-of-service forwarding-table classifier

Syntax	show class-of-service forwarding-table classifier
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the mapping of code point value to queue number and loss priority for each classifier as it exists in the forwarding table.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table classifier on page 1901
Output Fields	Table 212 on page 1900 describes the output fields for the show class-of-service forwarding-table classifier command. Output fields are listed in the approximate order in which they appear.

Table 212: show class-of-service forwarding-table classifier Output Fields

Field Name	Field Description
Classifier table index	Index of the classifier table.
entries	Total number of entries.
Table type	Type of code points in the table: DSCP , EXP (not on the QFX Series), IEEE 802.1 , IPv4 precedence (not on the QFX Series), or IPv6 DSCP .
Entry #	Entry number.
Code point	Code point value used for classification.
Forwarding-class #	Forwarding class to which the code point is assigned.
PLP	Packet loss priority value set by classification. For most platforms, the value can be 0 or 1 . For some platforms, the value is 0 , 1 , 2 , or 3 . The value 0 represents low PLP. The value 1 represents high PLP. The value 2 represents medium-low PLP. The value 3 represents medium-high PLP.

Sample Output

```
show class-of-service forwarding-table classifier
Classifier table index: 62436, # entries: 64, Table type: DSCP
```

Entry #	Code point	Forwarding-class #	PLP
0	000000	0	0
1	000001	0	0
2	000010	0	0

show class-of-service forwarding-table classifier mapping

Syntax	show class-of-service forwarding-table classifier mapping
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	For each logical interface, display either the table index of the classifier for a given code point type or the queue number (if it is a fixed classification) in the forwarding table.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table classifier mapping on page 1902
Output Fields	Table 213 on page 1902 describes the output fields for the show class-of-service forwarding-table classifier mapping command. Output fields are listed in the approximate order in which they appear.

Table 213: show class-of-service forwarding-table classifier mapping Output Fields

Field Name	Field Description
Table index/ Q num	If the table type is Fixed , the number of the queue to which the interface is mapped. For all other types, this value is the classifier index number.
Interface	Name of the logical interface. This field can also show the physical interface (QFX Series).
Index	Logical interface index.
Table type	Type of code points in the table: DSCP , EXP (not on the QFX Series), Fixed , IEEE 802.1 , IPv4 precedence (not on the QFX Series), or IPv6 DSCP .

Sample Output

```

show class-of-service forwarding-table classifier mapping user@host> show class-of-service forwarding-table classifier mapping
                                     Table index/
Interface      Index    Q num    Table type
so-5/0/0.0     10     62436    DSCP
so-0/1/0.0     11     62436    DSCP
so-0/2/0.0     12         1    Fixed
so-0/2/1.0     13     62436    DSCP
so-0/2/1.0     13     62437    IEEE 802.1
so-0/2/2.0     14     62436    DSCP
so-0/2/2.0     14     62438    IPv4 precedence

```

show class-of-service forwarding-table drop-profile

Syntax	show class-of-service forwarding-table drop-profile
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the data points of all random early detection (RED) drop profiles as they exist in the forwarding table.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table drop-profile on page 1904
Output Fields	Table 214 on page 1903 describes the output fields for the show class-of-service forwarding-table drop-profile command. Output fields are listed in the approximate order in which they appear.

Table 214: show class-of-service forwarding-table drop-profile Output Fields

Field Name	Field Description
RED drop profile index	Index of this drop profile.
# entries	Number of entries in a particular RED drop profile index.
Entry	Drop profile entry number.
Fullness(%)	Percentage fullness of a queue.
Drop probability(%)	Drop probability at this fill level.

Sample Output

**show class-of-service
forwarding-table
drop-profile**

user@host> show class-of-service forwarding-table drop-profile

RED drop profile index: 4, # entries: 1

Entry	Fullness(%)	Drop Probability(%)
0	100	100

RED drop profile index: 8742, # entries: 3

show class-of-service forwarding-table fabric scheduler-map

Syntax	show class-of-service forwarding-table fabric scheduler-map
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Display the scheduler map information as it exists in the forwarding table for switch fabric.
Options	This command has no options.
Additional Information	For information about how PLP priority is assigned to packets, see the Junos OS Class of Service Configuration Guide.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table fabric scheduler-map on page 1906
Output Fields	Table 215 on page 1905 describes the output fields for the show class-of-service forwarding-table fabric scheduler-map command. Output fields are listed in the approximate order in which they appear.

Table 215: show class-of-service forwarding-table fabric scheduler-map Output Fields

Field Name	Field Description
Fabric priority	Fabric traffic priority: low and high .
Scheduler index	Index of the scheduler applied to a fabric traffic priority.
PLP high	Drop profile index for high-packet-loss-priority (PLP) packets.
PLP low	Drop profile index for low-PLP packets.
TCP PLP high	Drop profile index for low-PLP and Transmission Control Protocol (TCP) packets.
TCP PLP low	Drop profile index for high-PLP and TCP packets.

Sample Output

```
show class-of-service forwarding-table fabric scheduler-map
user@host> show class-of-service forwarding-table fabric scheduler-map
Fabric priority: low
  Scheduler index: 60211
    PLP high: 44321, PLP low: 44321, TCP PLP high: 44321, TCP PLP low: 44321

Fabric priority: high
  Scheduler index: 60211
    PLP high: 44321, PLP low: 44321, TCP PLP high: 44321, TCP PLP low: 44321
```

show class-of-service forwarding-table loss-priority-map

Syntax	show class-of-service forwarding-table loss-priority-map
Release Information	Command introduced before Junos OS Release 7.4.
Description	(J Series routers only) Display the mapping of code point value to loss priority as it exists in the forwarding table.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table loss-priority-map on page 1908
Output Fields	Table 216 on page 1907 describes the output fields for the show class-of-service forwarding-table loss-priority-map command. Output fields are listed in the approximate order in which they appear.

Table 216: show class-of-service forwarding-table loss-priority-map Output Fields

Field Name	Field Description
Loss priority map table index	Loss priority map table index.
Entries	Number of table entries.
Table type	Table type: Frame-Relay DE .
Entry #	Table entry number.
Code point	Code point value.
PLP	Packet loss priority value. For most platforms, the value is 0 or 1 . For some platforms, the value is 0 , 1 , 2 , or 3 . The value 0 represents low PLP. The value 1 represents high PLP. The value 2 represents medium-low PLP. The value 3 represents medium-high PLP.

Sample Output

```
show class-of-service forwarding-table loss-priority-map
loss-priority-map
loss-priority-map
```

```
user@host> show class-of-service forwarding-table loss-priority-map
loss-priority-map table index: 2212, # entries: 2, Table type: Frame-Relay DE
Entry #   Code point   PLP
  0         0         2
  1         1         3

loss-priority-map table index: 11038, # entries: 2, Table type: Frame-Relay DE
Entry #   Code point   PLP
  0         0         3
  1         1         1
```

show class-of-service forwarding-table loss-priority-map mapping

Syntax	show class-of-service forwarding-table loss-priority-map mapping
Release Information	Command introduced before Junos OS Release 7.4.
Description	(J Series Services Routers only) For each logical interface, display the loss priority table index.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table loss-priority-map mapping on page 1909
Output Fields	Table 217 on page 1909 describes the output fields for the show class-of-service forwarding-table loss-priority-map mapping command. Output fields are listed in the approximate order in which they appear.

Table 217: show class-of-service forwarding-table loss-priority-map mapping Output Fields

Field Name	Field Description
Interface	Name of the logical interface.
Index	Logical interface index.
Table index	Loss priority table index.
Table type	Table type: Frame-Relay DE .

Sample Output

```

show class-of-service forwarding-table loss-priority-map mapping
user@host> show class-of-service forwarding-table loss-priority-map mapping
Interface      Index  Table index  Table type
fe-0/0/0.0     67     11038       Frame-Relay DE
t1-0/0/2.0     69     2212        Frame-Relay DE

```

show class-of-service forwarding-table rewrite-rule

Syntax	show class-of-service forwarding-table rewrite-rule
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display mapping of queue number and loss priority to code point value for each rewrite rule as it exists in the forwarding table.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table rewrite-rule on page 1911
Output Fields	Table 218 on page 1910 describes the output fields for the show class-of-service forwarding-table rewrite-rule command. Output fields are listed in the approximate order in which they appear.

Table 218: show class-of-service forwarding-table rewrite-rule Output Fields

Field Name	Field Description
Rewrite table index	Index for this rewrite rule.
# entries	Number of entries in this rewrite rule.
Table type	Type of table: DSCP , EXP (not on the QFX Series), EXP-PUSH-3 (not on the QFX Series), EXP-SWAP-PUSH-2 (J Series routers only), IEEE 802.1 , IPv4 precedence (not on the QFX Series), IPv6 DSCP , or Fixed .
Q#	Queue number to which this entry is assigned.
Low bits	Code point value for low-priority loss profile.
State	State of this code point: enabled , rewritten , or disabled .
High bits	Code point value for high-priority loss profile.

Sample Output

```
show class-of-service forwarding-table rewrite-rule
user@host> show class-of-service forwarding-table rewrite-rule
Rewrite table index: 3753, # entries: 4, Table type: DSCP
Q#      Low bits  State      High bits  State
0       000111   Enabled    001010     Enabled
2       000000   Disabled   001100     Enabled
1       101110   Enabled    110111     Enabled
3       110000   Enabled    111000     Enabled
```

show class-of-service forwarding-table rewrite-rule mapping

Syntax	show class-of-service forwarding-table rewrite-rule mapping
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	For each logical interface, display the table identifier of the rewrite rule map for each code point type.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table rewrite-rule mapping on page 1912
Output Fields	Table 219 on page 1912 describes the output fields for the show class-of-service forwarding-table rewrite-rule mapping command. Output fields are listed in the approximate order in which they appear.

Table 219: show class-of-service forwarding-table rewrite-rule mapping Output Fields

Field Name	Field Description
Interface	Name of the logical interface. This field can also show the physical interface (QFX Series).
Index	Logical interface index.
Table index	Rewrite table index.
Type	Type of classifier: DSCP , EXP (not on the QFX Series), EXP-PUSH-3 (not on the QFX Series), EXP-SWAP-PUSH-2 (not on the QFX Series), Frame-Relay DE (J Series routers only), IEEE 802.1 , IPv4 precedence (not on the QFX Series), IPv6 DSCP , or Fixed .

Sample Output

```

show class-of-service forwarding-table rewrite-rule mapping
user@host> show class-of-service forwarding-table rewrite-rule mapping
Interface      Index  Table index  Type
so-5/0/0.0     10     3753        DSCP
so-0/1/0.0     11     3753        DSCP
so-0/2/0.0     12     3753        DSCP
so-0/2/1.0     13     3753        DSCP
so-0/2/2.0     14     3753        DSCP
so-0/2/3.0     15     3753        DSCP

```

show class-of-service forwarding-table scheduler-map

Syntax	show class-of-service forwarding-table scheduler-map
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	For each physical interface, display the scheduler map information as it exists in the forwarding table.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service forwarding-table scheduler-map on page 1914
Output Fields	Table 220 on page 1913 describes the output fields for the show class-of-service forwarding-table scheduler-map command. Output fields are listed in the approximate order in which they appear.

Table 220: show class-of-service forwarding-table scheduler-map Output Fields

Field Name	Field Description
Interface	Name of the physical interface.
Index	Physical interface index.
Map index	Scheduler map index.
Num of queues	Number of queues defined in this scheduler map.
Entry	Number of this entry in the scheduler map.
Scheduler index	Scheduler policy index.
Forwarding-class #	Forwarding class number to which this entry is applied.
Tx rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword remainder , which indicates that the scheduler receives the remaining bandwidth of the interface.
Max buffer delay	Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword remainder , which indicates that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	<ul style="list-style-type: none"> high—Queue priority is high. low—Queue priority is low.
PLP high	Drop profile index for a high packet loss priority profile.

Table 220: show class-of-service forwarding-table scheduler-map Output Fields (*continued*)

Field Name	Field Description
PLP low	Drop profile index for a low packet loss priority profile.
PLP medium-high	Drop profile index for a medium-high packet loss priority profile.
PLP medium-low	Drop profile index for a medium-low packet loss priority profile.
TCP PLP high	Drop profile index for a high TCP packet loss priority profile.
TCP PLP low	Drop profile index for a low TCP packet loss priority profile.
Policy is exact	If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled.

Sample Output

show class-of-service forwarding-table scheduler-map

```

user@host> show class-of-service forwarding-table scheduler-map
Interface: so-5/0/0 (Index: 9, Map index: 17638, Num of queues: 2):
  Entry 0 (Scheduler index: 6090, Forwarding-class #: 0):
    Tx rate: 0 Kb (30%), Max buffer delay: 39 bytes (0%)

```

show class-of-service fragmentation-map

Syntax	show class-of-service fragmentation-map
Release Information	Command introduced in Junos OS Release 7.5.
Description	For Adaptive Services (AS) PIC link services IQ interfaces (lsq) only, display fragmentation properties for specific forwarding classes.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show class-of-service fragmentation-map on page 1916
Output Fields	Table 221 on page 1915 describes the output fields for the show class-of-service fragmentation-map command. Output fields are listed in the approximate order in which they appear.

Table 221: show class-of-service fragmentation-map Output Fields

Field Name	Field Description
Fragmentation map	Name of the class of service (CoS) fragmentation map.
Index	Index number of the CoS fragmentation map.
Forwarding class	Name of the associated forwarding class.
Fragmentation threshold	Maximum size of each multilink fragment.
No Fragmentation	Packets of this class are not fragmented.
Multilink Class	For multilink multiclass PPP only, the multilink class number corresponding to the forwarding class.

Sample Output

```
show class-of-service fragmentation-map  user@host> show class-of-service fragmentation-map
Fragmentation map: fragmap2, Index: 19801
  Forwarding class: fcDefault
  No Fragmentation

  Forwarding class: fcCopper
  Fragmentation threshold: 64, Multilink Class: 1

  Forwarding class: fcSilver
  Fragmentation threshold: 100, Multilink Class: 0

  Forwarding class: fcCritical
  Fragmentation threshold: 64, Multilink Class: 0

Fragmentation map: fragmap, Index: 23147
  Forwarding class: fcDefault
  No Fragmentation

  Forwarding class: fcSilver
  Fragmentation threshold: 100

  Forwarding class: fcCritical
  Fragmentation threshold: 100
```

Output Fields Table 222 on page 1918 describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

Table 222: show class-of-service interface Output Fields

Field Name	Field Description
Physical interface	Name of a physical interface.
Index	Index of this interface or the internal index of this object.
Dedicated Queues	Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Total non-default queues created	Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.
Rewrite Input IEEE Code-point	(QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.
Shaping rate	Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the Shaping rate field is displayed for either the physical interface or the logical interface.
Scheduler map	Name of the output scheduler map associated with this interface.
Input shaping rate	For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.
Input scheduler map	For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.
Chassis scheduler map	Name of the scheduler map associated with the packet forwarding component queues.
Rewrite	Name and type of the rewrite rules associated with this interface.
Classifier	Name and type of classifiers associated with this interface.
Forwarding-class-map	Name of the forwarding map associated with this interface.
Congestion-notification	(QFX Series only) Congestion notification state, enabled or disabled .

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Logical interface	Name of a logical interface.
Object	Category of an object: Classifier , Fragmentation-map (for LSQ interfaces only), Scheduler-map , Rewrite , or Translation Table (for IQE PICs only).
Name	Name of an object.
Type	Type of an object: dscp , dscp-ipv6 , exp , ieee-802.1 , ip , or inet-precedence .
Link-level type	Encapsulation on the physical interface.
MTU	MTU size on the physical interface.
Speed	Speed at which the interface is running.
Loopback	Whether loopback is enabled and the type of loopback.
Source filtering	Whether source filtering is enabled or disabled.
Flow control	Whether flow control is enabled or disabled.
Auto-negotiation	(Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status. <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline.
Device flags	The Device flags field provides information about the physical device and displays one or more of the following values: <ul style="list-style-type: none"> • Down—Device has been administratively disabled. • Hear-Own-Xmit—Device receives its own transmissions. • Link-Layer-Down—The link-layer protocol has failed to connect with the remote endpoint. • Loopback—Device is in physical loopback. • Loop-Detected—The link layer has received frames that it sent, thereby detecting a physical loopback. • No-Carrier—On media that support carrier recognition, no carrier is currently detected. • No-Multicast—Device does not support multicast traffic. • Present—Device is physically present and recognized. • Promiscuous—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media. • Quench—Transmission on the device is quenched because the output buffer is overflowing. • Recv-All-Multicasts—Device is in multicast promiscuous mode and therefore provides no multicast filtering. • Running—Device is active and enabled.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Interface flags	<p>The Interface flags field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> • Admin-Test—Interface is in test mode and some sanity checking, such as loop detection, is disabled. • Disabled—Interface is administratively disabled. • Down—A hardware failure has occurred. • Hardware-Down—Interface is nonfunctional or incorrectly connected. • Link-Layer-Down—Interface keepalives have indicated that the link is incomplete. • No-Multicast—Interface does not support multicast traffic. • No-receive No-transmit—Passive monitor mode is configured on the interface. • Point-To-Point—Interface is point-to-point. • Pop all MPLS labels from packets of depth—MPLS labels are removed as packets arrive on an interface that has the pop-all-labels statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> • 1—Takes effect for incoming packets with one label only. • 2—Takes effect for incoming packets with two labels only. • [1 2]—Takes effect for incoming packets with either one or two labels. • Promiscuous—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses. • Recv-All-Multicasts—Interface is in multicast promiscuous mode and provides no multicast filtering. • SNMP-Traps—SNMP trap notifications are enabled. • Up—Interface is enabled and operational.
Flags	<p>The Logical interface flags field provides information about the logical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> • ACFC Encapsulation—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer). • Device-down—Device has been administratively disabled. • Disabled—Interface is administratively disabled. • Down—A hardware failure has occurred. • Clear-DF-Bit—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit. • Hardware-Down—Interface protocol initialization failed to complete successfully. • PFC—Protocol field compression is enabled for the PPP session. • Point-To-Point—Interface is point-to-point. • SNMP-Traps—SNMP trap notifications are enabled. • Up—Interface is enabled and operational.
Encapsulation	Encapsulation on the logical interface.
Admin	Administrative state of the interface (Up or Down).
Link	Status of physical link (Up or Down).
Proto	Protocol configured on the interface.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Input Filter	Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.
Output Filter	Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.
Link flags	Provides information about the physical link and displays one or more of the following values: <ul style="list-style-type: none"> • ACFC—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option. • Give-Up—Link protocol does not continue connection attempts after repeated failures. • Loose-LCP—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational. • Loose-LMI—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational. • Loose-NCP—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational. • Keepalives—Link protocol keepalives are enabled. • No-Keepalives—Link protocol keepalives are disabled. • PFC—Protocol field compression is configured. The PPP session negotiates the PFC option.
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.
CoS queues	Number of CoS queues configured.
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .
Statistics last cleared	Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface.
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Input errors	<p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Bucket Drops—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • HS link FIFO overflows—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.
Output errors	<p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • HS link FIFO underflows—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeds the MTU of the interface.
Egress queues	Total number of egress queues supported on the specified interface.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Queue counters	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism.
SONET alarms SONET defects	(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SONET PHY , SONET section , SONET line , and SONET path .
SONET PHY	Counts of specific SONET errors with detailed information. <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. A state other than OK indicates a problem. <p>The SONET PHY field has the following subfields:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop • PHY Light—Loss of optical signal
SONET section	Counts of specific SONET errors with detailed information. <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. A state other than OK indicates a problem. <p>The SONET section field has the following subfields:</p> <ul style="list-style-type: none"> • BIP-BI—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOS—Loss of signal • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section)

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
SONET line	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. A state other than OK indicates a problem. <p>The SONET line field has the following subfields:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line)
SONET path	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. A state other than OK indicates a problem. <p>The SONET path field has the following subfields:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload (signal) label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • ES-PFE—Errored seconds (far-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path)

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Received SONET overhead	Values of the received and transmitted SONET overhead: <ul style="list-style-type: none"> • C2—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • F1—Section user channel byte. This byte is set aside for the purposes of users. • K1 and K2—These bytes are allocated for APS signaling for the protection of the multiplex section. • J0—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • S1—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-<i>N</i> signal. • Z3 and Z4—Allocated for future use.
Transmitted SONET overhead	
Received path trace	SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.
Transmitted path trace	
HDLC configuration	Information about the HDLC configuration. <ul style="list-style-type: none"> • Policing bucket—Configured state of the receiving policer. • Shaping bucket—Configured state of the transmitting shaper. • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware.
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte.
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.
Forwarding classes	Total number of forwarding classes supported on the specified interface.
Egress queues	Total number of egress queues supported on the specified interface.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Queue	Queue number.
Forwarding classes	Forwarding class name.
Queued Packets	Number of packets queued to this queue.
Queued Bytes	Number of bytes queued to this queue. The byte counts vary by PIC type.
Transmitted Packets	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the Packet Forwarding Engine Chassis Queues field) shows the prefragmentation values.
Transmitted Bytes	Number of bytes transmitted by this queue. The byte counts vary by PIC type.
Tail-dropped packets	Number of packets dropped because of tail drop.
RED-dropped packets	<p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> • (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> • Low, non-TCP—Number of low-loss priority non-TCP packets dropped because of RED. • Low, TCP—Number of low-loss priority TCP packets dropped because of RED. • High, non-TCP—Number of high-loss priority non-TCP packets dropped because of RED. • High, TCP—Number of high-loss priority TCP packets dropped because of RED. • (MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> • Low—Number of low-loss priority packets dropped because of RED. • Medium-low—Number of medium-low loss priority packets dropped because of RED. • Medium-high—Number of medium-high loss priority packets dropped because of RED. • High—Number of high-loss priority packets dropped because of RED.
RED-dropped bytes	<p>Number of bytes dropped because of RED. The byte counts vary by PIC type.</p> <ul style="list-style-type: none"> • (M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> • Low, non-TCP—Number of low-loss priority non-TCP bytes dropped because of RED. • Low, TCP—Number of low-loss priority TCP bytes dropped because of RED. • High, non-TCP—Number of high-loss priority non-TCP bytes dropped because of RED. • High, TCP—Number of high-loss priority TCP bytes dropped because of RED.
Transmit rate	Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Rate Limit	Rate limiting configuration of the queue. Possible values are : <ul style="list-style-type: none"> • None—No rate limit. • exact—Queue transmits at the configured rate.
Buffer size	Delay buffer size in the queue.
Priority	Scheduling priority configured as low or high .
Excess Priority	Priority of the excess bandwidth traffic on a scheduler: low , medium-low , medium-high , high , or none .
Drop profiles	Display the assignment of drop profiles. <ul style="list-style-type: none"> • Loss priority—Packet loss priority for drop profile assignment. • Protocol—Transport protocol for drop profile assignment. • Index—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles. • Name—Name of the drop profile. • Type—Type of the drop profile: discrete or interpolated. • Fill Level—Percentage fullness of a queue. • Drop probability—Drop probability at this fill level.
Excess Priority	Priority of the excess bandwidth traffic on a scheduler.
Drop profiles	Display the assignment of drop profiles. <ul style="list-style-type: none"> • Loss priority—Packet loss priority for drop profile assignment. • Protocol—Transport protocol for drop profile assignment. • Index—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles. • Name—Name of the drop profile. • Type—Type of the drop profile: discrete or interpolated. • Fill Level—Percentage fullness of a queue. • Drop probability—Drop probability at this fill level.

Table 222: show class-of-service interface Output Fields (*continued*)

Field Name	Field Description
Adjustment information	<p>Display the assignment of shaping-rate adjustments on a scheduler node or queue.</p> <ul style="list-style-type: none"> • Adjusting application—Application that is performing the shaping-rate adjustment. <ul style="list-style-type: none"> • The adjusting application can appear as ancp LS-0, which is the Junos OS Access Node Control Profile process (ancpd) that performs shaping-rate adjustments on schedule nodes. • The adjusting application can also appear as pppoe, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual-data-rate-downstream attribute. The overhead accounting value is based on the access-loop-encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode). • Adjustment type—Type of adjustment: absolute or delta. • Configured shaping rate—Shaping rate configured for the scheduler node or queue. • Adjustment value—Value of adjusted shaping rate. • Adjustment target—Level of shaping-rate adjustment performed: node or queue. • Adjustment overhead-accounting mode—Configured shaping mode: frame or cell.

show class-of-service interface-set

Syntax	show class-of-service interface-set <i><interface-set-name></i>
Release Information	Command introduced in Junos OS Release 9.4.
Description	Display the configured shaping rate and the adjusted shaping rate for each logical interface set configured for hierarchical class of service (CoS).
Options	<p>none—Display CoS associations for all logical interface sets.</p> <p>interface-set <i>interface-set-name</i>—(Optional) Display CoS associations for the specified interface set.</p>
Required Privilege Level	view
List of Sample Output	show class-of-service interface-set on page 1944
Output Fields	Table 223 on page 1943 describes the output fields for the show class-of-service interface-set command. Output fields are listed in the approximate order in which they appear.

Table 223: show class-of-service interface-set Output Fields

Field Name	Field Description
Interface-set	Name of a logical interface set composed of one or more logical interfaces for which hierarchical scheduling is enabled.
Index	Index number of this interface set or the internal index number of this object.
Physical interface	Name of a physical interface.
Queues supported	Number of queues you can configure on the interface.
Queues in use	Number of queues currently configured.
Output traffic control profile	Name of the output traffic-control profile attached to the logical interface set.

Table 223: show class-of-service interface-set Output Fields (*continued*)

Field Name	Field Description
Adjusting application	<p>Name of the application that communicates shaping-rate adjustment information to the Junos OS class-of-service process (cosd) on the broadband services router (BSR). The BSR uses the information from this application to perform shaping-rate adjustments on the scheduler node that manages the interface set. The adjusting application appears as ancp LS-0 which is the Junos OS Access Node Control Profile process (ancpd) that performs shaping-rate adjustments on schedule nodes. The nodes are logical interface sets configured to represent subscriber local loops. When the synchronization speed of the DSL line changes, ancpd communicates the local loop speed to cosd over the default logical system, LS-0, and then the BSR throttles the shaping rate on the scheduler node to the loop speed.</p> <p>The adjusting application can also appear as PPPoE, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual data rate downstream attribute. The overhead accounting value is based on the access loop encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</p>
Adjustment type	Type of shaping-rate adjustment performed by the BSR on the scheduler node. The type of adjustment appears as absolute , meaning that the configured shaping rate is adjusted by an absolute value as opposed to by a percentage of the configured rate.
Configured shaping rate	The maximum transmission rate on the physical interface as configured by the output traffic-control profile attached to the scheduler node.
Adjustment value	Value of the shaping-rate adjustment information sent by the adjusting application to cosd .
Adjustment overhead-accounting mode	Configured shaping mode: frame or cell .

Sample Output

```

show class-of-service interface-set user@host> show class-of-service interface-set example-ifset-ge-4/0/0-7
Interface-set: example-ifset-ge-4/0/0-7, Index: 8
Physical interface: ge-4/0/0, Index: 270
Queues supported: 8, Queues in use: 8
Output traffic control profile: example-tcp-basic-rate, Index: 11395
Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 50000000
Adjustment value: 888000
Adjustment overhead-accounting mode: cell

```

show class-of-service l2tp-session

Syntax	<code>show class-of-service l2tp-session <i>session-id</i></code>
Release Information	Command introduced in Junos OS Release 8.2.
Description	Display CoS objects associated with an L2TP session on M7i, M10i, and M120 routers.
Options	<i>session-id</i> —L2TP session number for which you want to display a summary of CoS attributes.
Required Privilege Level	view
List of Sample Output	show class-of-service l2tp-session on page 1946
Output Fields	Table 224 on page 1945 lists the output fields for the show class-of-service l2tp-session command. Output fields are listed in the approximate order in which they appear.

Table 224: show class-of-service l2tp-session Output Fields

Field Name	Field Description
L2TP Session Username	Username associated with the L2TP session.
Index	Session index identification number.
Physical interface	Physical interface on which the tunnel session is established.
Index	Index ID associated with the physical interface on which the tunnel session is established.
Queues supported	Number of scheduler queues supported for the L2TP session.
Queues in use	Number of scheduler queues active on the L2TP session.
Scheduler map	Scheduler map name associated with the session.
Index	Scheduler map index number associated with the session.
Shaping rate	Maximum bandwidth configured for the session. Each active queue on the session receives a maximum of the configured amount of absolute bandwidth or the configured percentage of bandwidth, even if more bandwidth is available.

Sample Output

```
show class-of-service l2tp-session user@host> show class-of-service l2tp-session 123
l2tp-session L2TP Session Username: user1@bng.com, Index: 12553
Physical interface: ge-2/0/0, Index: 130
Queues supported: 8, Queues in use: 4
Scheduler map: GEN-SCHED-MAP-EF-65%, Index: 5212
Shaping rate: 200000 bps
```

show class-of-service loss-priority-map

Syntax	show class-of-service loss-priority-map <name <i>name</i> > <type frame-relay-de>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(J Series Services Router only) Display mapping of code point value to loss priority.
Options	none —Display all loss priority maps. name <i>name</i> —(Optional) Display the specified loss priority map. type frame-relay-de —(Optional) Display Frame Relay discard eligible code point.
Required Privilege Level	view
List of Sample Output	show class-of-service loss-priority-map on page 1948
Output Fields	Table 225 on page 1947 describes the output fields for the show class-of-service loss-priority-map command. Output fields are listed in the approximate order in which they appear.

Table 225: show class-of-service loss-priority-map Output Fields

Field Name	Field Description
Loss-priority-map	Name of the loss priority map.
Code point type	Type: frame-relay-de .
Index	Internal index.
Code point	Code point value.
Loss priority	Loss priority of low , medium-low , medium-high , or high .

Sample Output

**show class-of-service
loss-priority-map**

```
user@host> show class-of-service loss-priority-map
Loss-priority-map: frame-relay-de-default, Code point type: frame-relay-de, Index:
9
  Code point      Loss priority
  0               low
  1               high

Loss-priority-map: bar, Code point type: frame-relay-de, Index: 2212
  Code point      Loss priority
  0               medium-low
  1               medium-high

Loss-priority-map: abc, Code point type: frame-relay-de, Index: 11038
  Code point      Loss priority
  0               medium-high
  1               high
```

show class-of-service loss-priority-rewrite

Syntax	show class-of-service loss-priority-rewrite <name <i>name</i> > <type frame-relay-de>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Display the mapping of the code-point value to the loss priority rewrite rule.
Options	<p>none—Display all loss priority rewrite maps.</p> <p>name—(Optional) Display the specified loss priority rewrite.</p> <p>frame-relay-de—(Optional) Display the Frame Relay discard eligibility code-point information.</p>
Required Privilege Level	view
List of Sample Output	show class-of-service loss-priority-rewrite on page 1949
Output Fields	This table describes the output fields for the show class-of-service loss-priority-rewrite command. Output fields are listed in the approximate order in which they appear.

Table 226: show class-of-service loss-priority-rewrite Output Fields

Field Name	Field Description
Loss-priority-rewrite	Name of the loss priority rewrite.
Code point type	Type: frame-relay-de .
Index	Internal index.
Loss priority	Loss priority of low , medium-low , medium-high , or high .
Code point	Code-point value.

Sample Output

show class-of-service loss-priority-rewrite

```

user@host> show class-of-service loss-priority-rewrite
Loss-priority-rewrite: frame-relay-de-default, Code point type: frame-relay-de,
Index: 38
  Loss priority      Code point
  low               0
  high              1
  medium-low        0
  medium-high       1

```

show class-of-service rewrite-rule

Syntax	show class-of-service rewrite-rule <name <i>name</i> > <type <i>type</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the mapping of forwarding classes and loss priority to code point values.
Options	<p>none—Display all rewrite rules.</p> <p>name <i>name</i>—(Optional) Display the specified rewrite rule.</p> <p>type <i>type</i>—(Optional) Display the rewrite rule of the specified type. The rewrite rule type can be one of the following:</p> <ul style="list-style-type: none"> dscp—For IPv4 traffic. dscp-ipv6—For IPv6 traffic. exp—For MPLS traffic. frame-relay-de—(J Series routers only) For Frame Relay traffic. ieee-802.1—For Layer 2 traffic. inet-precedence—For IPv4 traffic.
Required Privilege Level	view
List of Sample Output	show class-of-service rewrite-rule type dscp on page 1951 show class-of-service rewrite-rule type dscp (QFX Series) on page 1951
Output Fields	Table 227 on page 1950 describes the output fields for the show class-of-service rewrite-rule command. Output fields are listed in the approximate order in which they appear.

Table 227: show class-of-service rewrite-rule Output Fields

Field Name	Field Description
Rewrite rule	Name of the rewrite rule.
Code point type	Type of rewrite rule: dscp , dscp-ipv6 , exp , frame-relay-de , or inet-precedence .
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router or switch.
Index	Internal index for this particular rewrite rule.
Loss priority	Loss priority for rewriting.

Table 227: show class-of-service rewrite-rule Output Fields (*continued*)

Field Name	Field Description
Code point	Code point value to rewrite.

Sample Output

**show class-of-service
rewrite-rule type dscp**

```
user@host> show class-of-service rewrite-rule type dscp
Rewrite rule: dscp-default, Code point type: dscp
  Forwarding class      Loss priority      Code point

  network-control       high               111000
```

show class-of-service routing-instance

Syntax	<code>show class-of-service routing-instance</code> <code><routing-instance-name></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series and T Series routers only) Display mapping of class of service (CoS) objects to routing instances.
Options	<i>routing-instance-name</i> —(Optional) Name of a routing instance.
Required Privilege Level	view
List of Sample Output	show class-of-service routing-instance on page 1952
Output Fields	Table 228 on page 1952 describes the output fields for the show class-of-service routing-instance command. Output fields are listed in the approximate order in which they appear.

Table 228: show class-of-service routing-instance Output Fields

Field Name	Field Description
Index	Internal index.
Name	Name of an object.
Object	Category of an object: Classifier .
Routing instance	Name of a routing instance.
Type	Type: exp .

Sample Output

show class-of-service routing-instance

```

user@host> show class-of-service routing-instance
Routing Instance : vpn1
  Object      Name      Type      Index
  Classifier   exp-default exp        8

Routing Instance : vpn2
  Object      Name      Type      Index
  Classifier   test2     exp      57507

```

show class-of-service scheduler-map

Syntax	show class-of-service scheduler-map <name>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the mapping of schedulers to forwarding classes and a summary of scheduler parameters for each entry.
Options	none —Display all scheduler maps. name —(Optional) Display a summary of scheduler parameters for each forwarding class to which the named scheduler is assigned.
Required Privilege Level	view
List of Sample Output	show class-of-service scheduler-map on page 1954
Output Fields	Table 229 on page 1953 describes the output fields for the show class-of-service scheduler-map command. Output fields are listed in the approximate order in which they appear.

Table 229: show class-of-service scheduler-map Output Fields

Field Name	Field Description
Scheduler map	Name of the scheduler map.
Index	Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.
Scheduler	Name of the scheduler.
Forwarding class	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
Transmit rate	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword remainder , which indicates that the scheduler receives the remaining bandwidth of the interface.
Rate Limit	Rate limiting configuration of the queue. Possible values are none , meaning no rate limiting, and exact , meaning the queue only transmits at the configured rate.
Maximum buffer delay	Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword remainder to indicate that the buffer is sized according to what remains after other scheduler buffer allocations.
Priority	Scheduling priority: low or high .

Table 229: show class-of-service scheduler-map Output Fields (*continued*)

Field Name	Field Description
Excess priority	Priority of excess bandwidth: low , medium-low , medium-high , high , or none .
Adjust minimum	Minimum shaping rate for an adjusted queue, in bps.
Adjust percent	Bandwidth adjustment applied to a queue, in percent.
Drop profiles	Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.
Loss priority	Packet loss priority for drop profile assignment.
Protocol	Transport protocol for drop profile assignment.
Name	Name of the drop profile.

Sample Output

show class-of-service scheduler-map

```
user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84
```

```
Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile
```

```
Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class
Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile
  Low           TCP       9874   bb-drop-profile
  High          non-TCP   8833   cc-drop-profile
  High          TCP       8484   dd-drop-profile
```

show class-of-service system-defaults

Syntax show class-of-service system-defaults

Release Information Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access routers.

Description Display classifiers configured under **system-defaults**.

Options —This command has no options.

Additional Information

Required Privilege Level view

Output Fields [Table 230 on page 1955](#) describes the output fields for the **show class-of-service system-defaults** command. Output fields are listed in the order in which they appear.

Table 230: show class-of-service system-defaults Output Fields

Field Name	Field Description
Object	Category of an object: Classifier
Name	Name of an object
Type	Type of an object: exp is the only type allowed.
Index	Index of the indicated classifier

Sample Output

```

show class-of-service system-defaults user@host show class-of-service system-defaults
Object                               Name                               Type                               Index
Classifier                           e1                                exp                                9280

```

show class-of-service traffic-control-profile

Syntax	<code>show class-of-service traffic-control-profile</code> <code><profile-name></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Routers.
Description	For Gigabit Ethernet IQ PICs, Channelized IQ PICs, EQ DPCs, and Trio MPC/MIC interfaces only, display traffic shaping and scheduling profiles. (ACX Series routers) For ATM IMA pseudowire interfaces, display traffic shaping and scheduling profiles.
Options	none —Display all profiles. profile-name —(Optional) Display information about a single profile.
Required Privilege Level	view
List of Sample Output	show class-of-service traffic-control-profile on page 1958 show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC) on page 1958 show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces) on page 1958
Output Fields	Table 231 on page 1956 describes the output fields for the show class-of-service traffic-control-profile command. Output fields are listed in the approximate order in which they appear.

Table 231: show class-of-service traffic-control-profile Output Fields

Field Name	Field Description
Traffic control profile	Name of the traffic control profile.
Index	Index number of the traffic control profile.
ATM Service	(MX Series routers with ATM Multi-Rate CE MIC) Configured category of ATM service. Possible values: <ul style="list-style-type: none"> cbr—Constant bit rate. rtvbr—Real time variable bit rate. nrtvbr—Non real time variable bit rate. ubr—Unspecified bit rate.
Maximum Burst Size	Configured maximum burst size, in cells.
Peak rate	Configured peak rate, in cps.

Table 231: show class-of-service traffic-control-profile Output Fields (*continued*)

Field Name	Field Description
Sustained rate	Configured sustained rate, in cps.
Shaping rate	Configured shaping rate, in bps. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) Configured peak rate, in cps.
Shaping rate burst	Configured burst size for the shaping rate, in bytes. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.
Shaping rate priority high	Configured shaping rate for high-priority traffic, in bps.
Shaping rate priority medium	Configured shaping rate for medium-priority traffic, in bps.
Shaping rate priority low	Configured shaping rate for low-priority traffic, in bps.
Shaping rate excess high	Configured shaping rate for high-priority excess traffic, in bps.
Shaping rate excess low	Configured shaping rate for low-priority excess traffic, in bps.
Scheduler map	Name of the associated scheduler map.
Delay Buffer rate	Configured delay buffer rate, in bps.
Excess rate	Configured excess rate, in percent or proportion.
Excess rate high	Configured excess rate for high priority traffic, in percent or proportion.
Excess rate low	Configured excess rate for low priority traffic, in percent or proportion.
Guaranteed rate	Configured guaranteed rate, in bps or cps. NOTE: (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: <ul style="list-style-type: none"> • cbr—Guaranteed rate is equal to the configured peak rate in cps. • rtvbr—Guaranteed rate is equal to the configured sustained rate in cps. • nrtvbr—Guaranteed rate is equal to the configured sustained rate in cps.
Guaranteed rate burst	Configured burst size for the guaranteed rate, in bytes.
adjust-minimum	Configured minimum shaping rate for an adjusted queue, in bps.

Table 231: show class-of-service traffic-control-profile Output Fields (*continued*)

Field Name	Field Description
overhead accounting mode	Configured shaping mode: Frame Mode or Cell Mode .
Overhead bytes	Configured byte adjustment value.

Sample Output

show class-of-service traffic-control-profile

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3
  Delay Buffer rate: 800000
  Guaranteed rate: 3000000
  .Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
  Scheduler map: m4
  Delay Buffer rate: 750000
  Guaranteed rate: 4000000
  ..adjust-minimum 20000000

```

show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
  ATM Service: RTVBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
  Shaping rate: 1000 cps
  Shaping rate burst: 500 cells
  Delay Buffer rate: 2000 cps
  Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
  ATM Service: UBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode

```

show class-of-service traffic-control-profile (ACX Series routers)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
  ATM Service: RTVBR
  Shaping rate: 2000 cps

```

with ATM IMA
pseudowire interfaces)

Shaping rate burst: 200 cells
Scheduler map: <default>
Delay Buffer rate: 1000 cps
Guaranteed rate: 1700 cps

show class-of-service translation-table

Syntax	<pre>show class-of-service translation-table <name translation-table-name> <type (to-dscp-from-dscp to-dscp-ipv6-from-dscp-ipv6 to-exp-from-exp to-inet-precedence-from-inet-precedence)></pre>
Release Information	Command introduced in Junos OS Release 9.3 for IQE PICs.
Description	Display the mapping of class-of-service (CoS) translation table code points to corresponding bit patterns.
Options	<p>none—Display translation table code points for all translation tables.</p> <p>name—(Optional) Display information for the named translation table.</p> <p>type—(Optional) Display information for a certain translation table type:</p> <ul style="list-style-type: none"> to-dscp-from-dscp—Display DSCP translation table information. to-dscp-ipv6-from-dscp-ipv6—Display DSCP IPv6 translation table information. to-exp-from-exp—Display MPLS EXP translation table information. to-inet-precedence-from-intet-precedence—Display Internet precedence translation table information.
Required Privilege Level	view

show class-of-service virtual-channel

Syntax	show class-of-service virtual channel <i><virtual-channel-name></i>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(J Series Services Router only) Display virtual channel information.
Options	none —Display all virtual channels. <i>virtual-channel-name</i> —(Optional) Display the specified virtual channel only.
Required Privilege Level	view
List of Sample Output	show class-of-service virtual-channel on page 1964
Output Fields	Table 233 on page 1964 describes the output fields for the show class-of-service virtual-channel command. Output fields are listed in the approximate order in which they appear.

Table 233: show class-of-service virtual-channel Output Fields

Field Name	Field Description
Virtual channel	Name of a virtual channel.
Index	Internal index.

Sample Output

```
show class-of-service virtual-channel  user@host> show class-of-service virtual-channel
Virtual channel: vc-1, Index: 1
Virtual channel: vc-2, Index: 2
```

show class-of-service virtual-channel-group

Syntax	show class-of-service virtual channel group <virtual-channel-group-name>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(J Series Services Router only) Display virtual channel group information.
Options	none —Display all virtual channel groups. virtual-channel-group-name —(Optional) Display the specified virtual channel group only.
Required Privilege Level	view
List of Sample Output	show class-of-service virtual-channel-group on page 1965
Output Fields	Table 234 on page 1965 describes the output fields for the show class-of-service virtual-channel-group command. Output fields are listed in the approximate order in which they appear.

Table 234: show class-of-service virtual-channel-group Output Fields

Field Name	Field Description
Virtual channel group	Name of a virtual channel group.
Index	Internal index.

Sample Output

```
show class-of-service virtual-channel-group
user@host> show class-of-service virtual-channel-group
Virtual channel group: vc-gp, Index: 16321
    Virtual channel: vc-1
        Scheduler map: sc-map
        Shaping rate : 100 percent
```

Generic Services Operational Mode Commands

Table 235 on page 1969 summarizes the generic command-line interface (CLI) commands you can use with services. Commands are listed in alphabetical order.

Table 235: Generic Services Operational Mode Commands

Task	Command
Clear flow session table entries.	<code>clear services flows</code>
Clear services sessions.	<code>clear services sessions</code>
Display flow session table entries.	<code>show services flows</code>
Display services sessions.	<code>show services sessions</code>

clear services flows

Syntax `clear services flows`
 `<application-protocol protocol>`
 `<destination-port destination-port>`
 `<destination-prefix destination-prefix>`
 `<interface interface-name>`
 `<ip-action>`
 `<protocol protocol>`
 `<service-set service-set>`
 `<source-port source-port>`
 `<source-prefix source-prefix>`

Release Information Command introduced in Junos OS Release 9.5.
 ip-action option introduced in Junos OS Release 10.0.
 application-protocol option introduced in Junos OS Release 11.1.

Description Clear flow session table entries.

Options **none**—Clear all flows.

application-protocol—(Optional) Clear flows for one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol

- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Clear flows for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Clear flows for a particular destination prefix.

interface *interface-name*—(Optional) Clear flows for a particular interface. On M Series and T Series routers, the *interface-name* can be *ms-fpc/pic/port* or *rspnumber*. On J Series routers, the *interface-name* is *ms-pim/O/port*.

ip-action—(Optional) Clear **ip-action** entries generated by the router to log, drop, or block traffic based on previous matches. The IP action options and targets are configured at the **[edit security idp idp-policy policy-name rulebase-ips rule rule-name then]** hierarchy level.

protocol—(Optional) Clear flows for one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **icmp6**—Internet Control Message Protocol version 6
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-over-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Transmission Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Clear flows for a particular service set.

source-port *source-port*—(Optional) Clear flows for a particular source port. The range of values is from 0 through 65535.

source-prefix *source-prefix*—(Optional) Clear flows for a particular source prefix.

Required Privilege Level clear

Output Fields [Table 236 on page 1972](#) lists the output fields for the **clear services flows** command. Output fields are listed in the approximate order in which they appear.

Table 236: clear services flows Output Fields

Field Name	Field Description
Interface	Name of an interface.
Service set	Name of the service set from which flows are being cleared.
Flows removed	Number of flows removed.

Sample Output

```
clear services flows
user@host> clear services flows
Interface  Service set      Flows removed
ms-2/0/0   IDP               1
```

```
clear services flows ip-action
user@host> clear services flows ip-action
Interface  Service set      Flows removed
ms-4/0/0   idp-service      1
```

Release Information Command introduced in Junos OS Release 9.5.
all option introduced in Junos OS Release 11.1.
application-protocol option introduced in Junos OS Release 11.1.

Description Display flow session table entries.

Options **none**—Display standard information about all flows.

all | brief | extensive | terse—(Optional) Display the specified level of output.

application-protocol—(Optional) Display information about one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol

- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **talk**—Talk Program
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

NOTE: The flows for the DCE RPC ALG match the flows for the DCE RPC Portmap ALG. The flows for the RPC ALG match the flows for the RPC Portmap ALG.

count—(Optional) Display a count of the matching entries.

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, *interface-name* can be **ms-fpc/pic/port** or **rspnumber**. On J Series routers, *interface-name* is **ms-pim/O/port**.

limit *number*—(Optional) Maximum number of entries to display.

protocol *protocol*—(Optional) Display information about one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **icmp6**—Internet Control Message Protocol version 6
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol

- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Transmission Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

Output Fields [Table 237 on page 1975](#) lists the output fields for the **show services flows** command. Output fields are listed in the approximate order in which they appear.

Table 237: show services flows Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
Service set	Name of a service set. Individual empty service sets are not displayed. If no service set has any flows, a flow table header is displayed for each service set.	All levels
Flow Count	Number of flows in a session.	count only

Table 237: show services flows Output Fields (*continued*)

Field Name	Field Description	Level of Output
Flow or Flow Prot	Protocol used for this flow.	All levels
Source	Source prefix of the flow in the format <i>source-prefix:port</i> . For ICMP flows, port information is not displayed.	All levels
Dest	Destination prefix of the flow. For ICMP flows, port information is not displayed.	All levels
State	Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without response. • Forward—Forward the packet in the flow without looking at it. • Reject—Drop all packets in the flow with response. • Watch—Inspect packets in the flow. 	All levels
Dir	Direction of the flow: input (I) or output (O).	All levels
Frm count	Number of frames in the flow.	All levels
Byte count	Number of bytes in the flow.	extensive
Flow role	Flow role.	extensive
Timeout	Timeout value.	extensive
Flow path	Flow path: symmetric or asymmetric.	extensive

Border Signaling Gateway Operational Mode Commands

Table 238 on page 1981 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot softwire operations.

Table 238: Softwire Operational Mode Commands

Task	Command
Clear softwire statistics.	<code>clear services softwire statistics</code>
Display information about softwire services. Information is displayed on both 6rd and DS-Lite services.	<code>show services softwire</code>
Display statistics information about the softwire flows.	<code>show services softwire flows</code>
Display softwire services statistics.	<code>show services softwire statistics</code>

clear services border-signaling-gateway denied-messsages

Syntax	<code>clear services border-signaling-gateway denied-messsages gateway gateway <backup master></code>
Release Information	Command introduced in Junos OS Release 9.4.
Description	This command clears border signaling gateway (BSG) denied messages information for the specified gateway and updates the last reset date and time.
Options	gateway gateway —The BSG for which denied messages information is to be cleared. backup master —(Optional) Clear denied messages information for the backup BSG or for the master BSG. If you do not specify an option, the master option is the default.
Required Privilege Level	view
List of Sample Output	clear services border-signaling-gateway gateway statistics on page 1982
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>clear services border-signaling-gateway gateway statistics</code>	<code>user@host> clear services border-signaling-gateway statistics Last Reset 2008 12 18 06:00</code>
---	---

clear services border-signaling-gateway name-resolution-cache

Syntax	<code>clear services border-signaling-gateway name-resolution-cache (all by-fqdn <i>fqdn</i>) gateway <i>gateway-name</i> <backup master></code>
Release Information	Command introduced in Junos OS Release 10.0.
Description	Clear entries in the Domain Name System (DNS) name resolution cache.
Options	<p>all—Clear all entries in the name resolution cache.</p> <p>by-fqdn <i>fqdn</i>—Clear cache entries for a specific fully qualified domain name (FQDN).</p> <p>gateway <i>gateway-name</i>—Clear cache entries associated with this border signalling gateway (BSG).</p> <p>backup—(Optional) Clear cache entries for the backup BSG.</p> <p>master—(Optional) Clear cache entries for the master BSG. If you do not specify the master or backup option, the master option is the default.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show services border-signaling-gateway name-resolution-cache on page 2016

clear services border-signaling-gateway statistics

Syntax	<code>clear services border-signaling-gateway gateway <i>gateway</i> statistics</code> <code><backup master></code>
Release Information	Command introduced in Junos OS Release 9.4.
Description	This command clears a border signaling gateway (BSG) statistics for the specified gateway.
Options	<p><i>gateway-name</i>—The BSG for which statistics are to be cleared.</p> <p>backup—(Optional) Clear statistics for the backup BSG.</p> <p>master—(Optional) Clear statistics for the master BSG. If you do not specify the master or backup option, the master option is the default.</p>
Required Privilege Level	view
List of Sample Output	clear services border-signaling-gateway gateway statistics on page 1986
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services
border-signaling-gateway
gateway statistics

user@host> clear services border-signaling-gateway statistics
```

show services border-signaling-gateway address-of-record bindings

Syntax	show services border-signaling-gateway address-of-record bindings gateway <i>gateway-name</i> all <summary detail> <backup master>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display subscriber registration information based on the subscriber's address-of-record (AOR) information for the BSG.
Options	all—Show information for all subscribers. —Show information for this subscriber. summary—Show summary information only for this AOR (subscriber). detail—Show detailed information for a specified AOR. <i>gateway-name</i> —Show information for this BSG. backup—(Optional) Show information for the backup BSG. master—(Optional) Show statistics for the master BSG. If you do not specify the master or backup option, the master option is the default.

Output Fields	Table 239 on page 1987 lists the output fields for the show services border-signaling-gateway address-of-record bindings command. Output fields are listed in the approximate order in which they appear.

Table 239: show services border-signaling-gateway address-of-record bindings Output Fields

Field Name	Field Description	Level of Output
bindings	Subscriber registrations.	
URI	The URI of a unique subscriber registration.	summary detail
Registered from Realm	The signaling realm from which the subscriber registered.	summary detail
First registration time	The first time a subscriber registered from this URI.	detail

Table 239: show services border-signaling-gateway address-of-record bindings Output Fields (*continued*)

Field Name	Field Description	Level of Output
Last registration time	The most recent time a subscriber registered from this URI.	detail
Expiration time	The duration, in seconds, of a period of time during which the subscriber does not re-register from this URI, after which the subscriber's registration expires.	detail
Registered from sp	The service point from which the subscriber registered.	summary detail
Translated URI	The translated (local or hidden) URI that the BSG uses.	detail
Has active call	The active call indicator.	detail

show services border-signaling-gateway admission-control

Syntax	show services border-signaling-gateway admission-control gateway <i>gateway-name</i> <backup master>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Display border signaling gateway (BSG) Call Admission Control (CAC) information.
Options	<p><i>gateway-name</i>—Display information about each CAC controller associated with this BSG.</p> <p>backup—(Optional) Show statistics for the backup BSG.</p> <p>master—(Optional) Show statistics for the primary BSG. If you do not specify the master or backup options, the master option is the default.</p>
Required Privilege Level	view
List of Sample Output	show services border-signaling-gateway admission-control on page 1991
Output Fields	Table 240 on page 1990 lists the output fields for the show services border-signaling-gateway admission-control command. Output fields are listed in the approximate order in which they appear.

Table 240: show services border-signaling-gateway admission-control Output Fields

Field Name	Field Description
Admission controller	The admission controller for which statistics are displayed.
Dialogs	<p>Information on CAC for dialogs, including the following:</p> <ul style="list-style-type: none"> • Active—Active dialogs shown as a percentage of CAC maximum concurrent dialogs, the number of active dialogs and the CAC maximum for concurrent dialogs. • Events handled—Number of events handled. • Attempts rejected due to concurrent exception—Number of attempts rejected because they exceeded the maximum concurrent dialogs limit. • Attempts rejected due to rate exception—Number of attempts rejected because they exceeded the maximum rate for admission of dialogs per second.
Transactions	<p>Information on CAC for transactions, including the following:</p> <ul style="list-style-type: none"> • Active—Active transactions shown as a percentage of CAC maximum concurrent transactions, the number of active transactions and the CAC maximum for concurrent transactions. • Events handled—Number of events handled. • Attempts rejected due to concurrent exception—Number of attempts rejected because they exceeded the maximum concurrent transactions limit. • Attempts rejected due to rate exception—Number of attempts rejected because they exceeded the maximum rate for admission of transactions per second.

Sample Output

```
show services
border-signaling-gateway
admission-control

user@host> show services border-signaling-gateway admission-control gateway bsg1
Admission controller: Controller1
Dialogs
  Active: 2% (20 out of 1000 allowed)
  Attempts handled: 5500
  Attempts rejected due to concurrent exception: 2
  Attempts rejected due to rate exception: 4
Transactions
  Active: 0% (10 out of 50000 allowed)
  Attempts handled: 20000
  Attempts rejected due to concurrent exception: 10
  Attempts rejected due to rate exception: 1
```

show services border-signaling-gateway by-contact

Syntax	show services border-signaling-gateway by-contact <contact> (brief detail summary) gateway <i>gateway-name</i> <backup master>
Release Information	Command introduced in Junos OS Release 9.4.
Description	Display border signaling gateway (BSG) statistics for active calls for a specific BSG, filtered by contact. Display results for all calls by omitting the variable <i>contact</i> .
Options	<p>contact—(Optional) Display information for this contact. When <i>contact</i> is omitted, information is displayed for all calls.</p> <p>brief—Display abbreviated information for the specified contact.</p> <p>detail—Display a detailed listing of BSG statistics for the specified contact.</p> <p>summary—Display only the number of active calls for the contact.</p> <p>gateway-name—Display information about statistics associated with this BSG.</p> <p>backup—(Optional) Show statistics for the backup BSG.</p> <p>master—(Optional) Show statistics for the master BSG. If you do not specify the master or backup option, the master option is the default.</p>

show services border-signaling-gateway calls-duration by-service-point

Syntax	show services border-signaling-gateway calls-duration by-service-point <code><service-point-name> gateway gateway-name</code> <code><backup master></code>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display histograms for one or more service points showing the number of calls, by duration, for a specific BSG since the last time statistics were cleared.
Options	<p>service-point-name—(Optional) Service point for which call duration statistics are displayed. When you omit this option, call duration statistics are displayed for all service points and grouped by service point.</p> <p>gateway-name—Display information about statistics associated with this BSG.</p> <p>backup—(Optional) Show statistics for the backup BSG.</p> <p>master—(Optional) Show statistics for the primary BSG. If you do not specify the master or backup options, the master option is the default.</p>
Required Privilege Level	view

Output Fields	Table 246 on page 2004 lists the output fields for the show services border-signaling-gateway calls-duration by-service-point command. Output fields are listed in the approximate order in which they appear.

Table 246: show services border-signaling-gateway calls-duration by-service-point Output Fields

Field Name	Field Description	Level of Output
Service Point	Service point for calls shown in the histogram.	none brief
Direction	Direction of calls on this service point. Possible values: <ul style="list-style-type: none"> Egress—Calls are outbound from this service point. Ingress—Calls are inbound to this service point. 	none brief
Duration[Min]	Duration category in which calls fall. The first category is “greater than or equal to zero” and “less than 1.” The other duration categories are defined similarly.	none brief
Number of Calls	Number of calls in the duration category.	detailed

Sample Output

```
show services          user@host> show services border-signaling-gateway calls-duration by-service-point gateway
border-signaling-gateway bsg1
Statistics start       : 02-02-2010 11:38:00.

show services border-signaling-gateway calls-failed by-server

Syntax	show services border-signaling-gateway calls-failed by-server <server-name> gateway gateway-name <backup master>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display BSG (border signaling gateway) failed call statistics by server.
Options	<p>server-name—(Optional) String of one or more characters used to select servers for which failed call statistics are displayed. Results are shown for all servers with names beginning with the specified string. When you omit this option, failed call statistics are displayed for all servers and grouped by server.</p> <p>gateway-name—The gateway for which statistics are displayed.</p> <p>backup—(Optional) Show statistics for the backup BSG.</p> <p>master—(Optional) Show statistics for the master BSG. If you do not specify the master or backup options, the master option is the default.</p>
Required Privilege Level	view
List of Sample Output	show services border-signaling-gateway calls-failed by-server on page 2010
Output Fields	Table 247 on page 2008 lists the output fields for the show services border-signaling-gateway calls-failed by-server command. Output fields are listed in the approximate order in which they appear.

Table 247: show services border-signaling-gateway calls-failed by-server Output Fields

Field Name	Field Description
Statistics Start	Date and time when the accumulation of the current set of statistics began.
Server	Server name.
Protocol error	Number of calls that failed due to protocol errors.
Inactive timeout	Number of calls for which a dialog was closed due to an inactive call timeout violation.
Configured behavior policy rejection	Number of calls that failed due to configured rejection policy.
4/5/6XX response	Number of calls that failed because the call setup failed for reasons other than timeout.
Internal error	Number of calls that failed because the BSG sustained an internal error that terminated one of dialogs comprising a call during setup.
Setup media failure	Number of calls that failed due to a media failure during setup.

Table 247: show services border-signaling-gateway calls-failed-by-server Output Fields (*continued*)

Field Name	Field Description
Established call media inactivity	Number of established calls for which a dialog was closed because the BGF identified media inactivity for the dialog.
CAC policy rejection	Number of calls for which an initial INVITE was rejected due to CAC (call admission control) enforcement.
Default behavior policy rejection	Number of calls for which an initial INVITE was rejected due to no policy match.
Transport conflict policy rejection	Number of calls for which the requested transport on the INVITE conflicts with the transport details of the selected egress service-point.
Setup timeout	Number of calls that failed for one of the following reasons: <ul style="list-style-type: none"> • An INVITE was sent by the BSG and no reply was received. • An INVITE was sent by the BSG, a 1XX was received, and nothing else was received after that. • An INVITE was received by the BSG and nothing else was sent on this open transaction.
Transport error	Number of calls that failed due to a transport error.
Canceled calls	Number of canceled calls.

Compressed Real-Time Transport Protocol Operational Mode Commands

Table 253 on page 2025 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot Compressed Real-Time Transport Protocol (CRTP) services. Commands are listed in alphabetical order.

Table 253: CRTP Operational Mode Commands

Task	Command
Clear CRTP flows statistics.	<code>clear services crtp statistics</code>
Display CRTP output.	<code>show services crtp</code>
Display CRTP flows.	<code>show services crtp flows</code>

NOTE: CRTP is supported on the following interfaces:

- M Series and T Series routers—Link services intelligent queuing (IQ) (`lsq-fpc/pic/port`)
- J Series router—Link services (`ls-pim/0/port`)

NOTE: For information about how to configure CRTP services, see the Junos Services Interfaces Configuration Release 12.3.

clear services crtp statistics

Syntax	clear services crtp statistics <interface <i>interface-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear Compressed Real-Time Transport Protocol (CRTP) flow statistics.
Options	none —Clear CRTP flow statistics on all interfaces. interface <i>interface-name</i> —(Optional) Clear CRTP flow statistics for the specified interface: <ul style="list-style-type: none">• On M Series and T Series routers, a link services IQ (lsq-<i>fpc/pic/port</i>) or redundant link services IQ (rlsq-<i>fpc/pic/port</i>) interface• On the J Series router, a link services (ls-<i>pim/0/port</i>) interface
Required Privilege Level	view
List of Sample Output	clear services crtp statistics on page 2026
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear services crtp statistics	user@host> clear services crtp statistics
--------------------------------	---

show services crtp

Syntax	show services crtp <extensive> <interface <i>interface-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display Compressed Real-Time Transport Protocol (CRTP) extensive output.
Options	<p>none—Display CRTP extensive output for all interfaces.</p> <p>extensive—(Optional) Display extensive CRTP information.</p> <p>interface <i>interface-name</i>—(Optional) Display CRTP flow statistics for the specified interface:</p> <ul style="list-style-type: none"> On M Series and T Series routers, a link services IQ (lsq-<i>fpc/pic/port</i>) or redundant link services IQ (rlsq-<i>fpc/pic/port</i>) interface On the J Series router, a link services (ls-<i>pim/0/port</i>) interface
Required Privilege Level	view
List of Sample Output	show services crtp extensive on page 2029
Output Fields	Table 254 on page 2027 lists the output fields for the show services crtp command. Output fields are listed in the approximate order in which they appear.

Table 254: show services crtp Output Fields

Field Name	Field Description
Interface	Name of the physical interface.
Port minimum	Compression is applied to UDP packets with even ports in the specified range.
Port maximum	
Maximum UDP compressed sessions	Maximum value of a context identifier in the space of context identifiers allocated for UDP.
CRTP maximum period	Maximum interval between full headers. Suggested value is 256.
CRTP maximum time	Maximum time interval between full headers. Suggested value is 5 seconds.
Compression ratio	Ratio of received packet size to compressed packet size, in percentage. For example, if the packet size is 100 bytes when it is received, and is 40 bytes after compression, the compression ratio is $100 \div 40 / 100 * 100 = 60\%$.

Table 254: show services crtp Output Fields (*continued*)

Field Name	Field Description
Decompression ratio	Ratio of received packet size to decompressed packet size, in percentage. For example, if the packet size is 40 bytes when it is received, and is 100 bytes after compression, the decompression ratio is $100 \div 40 / 100 * 100 = 60\%$.
Discards	Number of frames that the incoming packet match code discarded because they were not recognized.
Sessions	Total number of active CRTP sessions.
IP bytes	Number of IP bytes sent and received.
Compressed bytes	Number of compressed IP header bytes sent and received.
CRTP packets	Number of CRTP packets sent and received.
CUDP/CNTCP packets	Number of compressed UDP packets and compressed non-TCP packets sent and received.
Full header packets	Number of full header packets sent and received. Full header packets communicate the uncompressed IP header plus any following headers and data to establish the uncompressed header state in the decompressor for a particular context.
Context state packet	Number of context state packets sent and received. Context state packets are sent from the decompressor to the compressor to communicate a list of context IDs for which synchronization is lost or might be lost.
IP packets	Number of IP packets sent and received.
Compressed packets	Number of compressed packets sent and received.

Sample Output

`show services crtp
extensive`

```
user@host> show services crtp extensive
Interface: lsq-1/1/0.1
Port minimum: 2000, Port maximum: 64009
Maximum UDP compressed sessions: 256
CRTP maximum period: 256, CRTP maximum time: 5
Compression ratio: 0, Decompression ratio: 0, Discards: 0
CRTP stats
```

	Receive	Transmit
Sessions	1	1
IP bytes	60	60
Compressed bytes	61	60
CRTP packets	0	0
CUDP/CNTCP packets	0	0
Full header packets	1	1
Context state packets	0	0
IP packets	1	1
Compressed packets	1	1

show services crtp flows

Syntax	show services crtp flows <interface <i>interface-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display Compressed Real-Time Transport Protocol (CRTP) flows.
Options	<p>none—Display CRTP flows for all interfaces.</p> <p>interface <i>interface-name</i>—(Optional) Display CRTP flows for the specified interface:</p> <ul style="list-style-type: none"> On M Series and T Series routers, a link services IQ (lsq-fpc/pic/port) or redundant link services IQ (rlsq-fpc/pic/port) interface On the J Series router, a link services (ls-pim/0/port) interface
Required Privilege Level	view
List of Sample Output	show services crtp flows on page 2031
Output Fields	Table 255 on page 2030 lists the output fields for the show services crtp flows command. Output fields are listed in the approximate order in which they appear.

Table 255: show services crtp flows Output Fields

Field Name	Field Description
Interface	Name of the physical interface.
Flow	Received or transmitted flow.
Source	IP source address.
Destination	IP destination address.
SSRC ID	Synchronization source (SSRC) identifier. One of the fields in the RTP header used to select the context. The SSRC identifier is a randomly chosen value unique within a particular CRTP session.
Ctx ID	Session context ID. Indicates the session context in which to interpret the packet. The decompressor can use the context ID to index its table of stored session contexts directly.

Sample Output

`show services crtp
flows`

`user@host> show services crtp flows`

Interface: lsq-1/1/0.1

Flow	Source	Destination	SSRC ID	Ctx ID
Receive	60.1.1.3:28004	80.1.1.3:26000	123	0
Transmit	80.1.1.3:26000	60.1.1.3:28004	123	2

CoS Services Operational Mode Commands

Table 256 on page 2033 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot class-of-service (CoS) services on the Adaptive Services PIC. Commands are listed in alphabetical order.

Table 256: CoS Services Operational Mode Commands

Task	Command
Clear CoS statistics.	<code>clear services cos statistics</code>
Display CoS statistics.	<code>show services cos statistics</code>

NOTE: CoS services are supported on the adaptive services interface on the following routers:

- J Series—`sp-pim/0/slot`
- M Series and T Series—`sp-fpc/pic/port`

CoS services are also supported on the redundant adaptive services interface (`rspnumber`) on M Series and T Series routers.

NOTE: For information about how to configure CoS services, see the Junos Services Interfaces Configuration Release 12.3.

clear services cos statistics

Syntax	<code>clear services cos statistics</code> <code><interface <i>interface-name</i>></code> <code><service-set <i>service-set-name</i>></code>
Release Information	Command introduced in Junos OS Release 8.1.
Description	Clear statistics for class-of-service (CoS) code point bit patterns and forwarding classes as configured in CoS services for the AS PIC.
Options	none —Clear all services CoS statistics. interface <i>interface-name</i> —(Optional) Clear statistics for the specified interface only. service-set <i>service-set-name</i> —(Optional) Clear statistics for the specified service set only.
Required Privilege Level	view
List of Sample Output	clear services cos statistics on page 2034
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>clear services cos statistics</code>	<code>user@host> clear services cos statistics</code>
--	--

show services cos statistics

Syntax	<pre>show services cos statistics <brief detail extensive> <diffserv forwarding-class> <interface <i>interface-name</i>> <service-set <i>service-set-name</i>> <summary></pre>
Release Information	Command introduced in Junos OS Release 8.1.
Description	Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns and the mapping of forwarding class names to queue numbers as configured in CoS services for the AS PIC.
Options	<p>none—Display all services CoS statistics.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>diffserv forwarding-class—(Optional) Display only the selected information, either DiffServ codepoints or forwarding classes.</p> <p>interface <i>interface-name</i>—(Optional) Display statistics for the specified interface only.</p> <p>service-set <i>service-set-name</i>—(Optional) Display statistics for the specified service set only.</p> <p>summary—(Optional) Display summary of statistics on a per-interface basis.</p>
Required Privilege Level	view

show services cos statistics brief

The output for the **show services cos statistics brief** command is identical to that for the **show services cos statistics** command.

show services cos statistics detail

The output for the **show services cos statistics detail** command is identical to that for the **show services cos statistics** command.

show services cos statistics extensive

The output for the **show services cos statistics extensive** command is identical to that for the **show services cos statistics** command.

Data Link Switching Operational Mode Commands

Table 258 on page 2039 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot data link switching (DLSw) on J Series routers. Commands are listed in alphabetical order.

Table 258: DLSw Operational Mode Commands

Task	Command
Clear DLSw reachability.	<code>clear dlsw reachability</code>
Display DLSw peer capability.	<code>show dlsw capabilities</code>
Display information about configured DLSw circuits.	<code>show dlsw circuits</code>
Display DLSw peer information.	<code>show dlsw peers</code>
Display information about the cached media access control (MAC) entries.	<code>show dlsw reachability</code>
Display logical link control type 2 (LLC2) redundancy information for DLSw.	<code>show llc2 redundancy</code>
Display LLC2 redundancy statistics.	<code>show llc2 redundancy interface statistics</code>
Display LLC2 redundancy MAC translation information.	<code>show llc2 redundancy mac-translation</code>
Display LLC2 redundancy tracking information.	<code>show llc2 redundancy track</code>

NOTE: DLSw is supported only on the J Series router.

NOTE: For information about how to configure DLSw, see the Junos Services Interfaces Configuration Release 12.3 or the *J Series Services Router Advanced WAN Access Configuration Guide*.

clear dlsw reachability

Syntax	clear dlsw reachability
Release Information	Command introduced in Junos OS Release 8.0.
Description	Clear the data-link switching (DLSw) reachability cache.
Options	This command has no options.

show dlsw reachability

Syntax	show dlsw reachability
Release Information	Command introduced in Junos OS Release 7.4.
Description	(J Series router only) Display media access control (MAC) and IP addresses of remote data link switching (DLSw) peers.
Required Privilege Level	view
List of Sample Output	show dlsw reachability on page 2046
Output Fields	Table 262 on page 2046 describes the output fields for the show dlsw reachability command. Output fields are listed in the approximate order in which they appear.

Table 262: show dlsw reachability Output Fields

Field Name	Field Description
MAC index	Number assigned to the DLSw peer.
MAC address	MAC address of the DLSw peer.
Location	Peer location: local or remote .
Peer/interface	Peer interface name or IP address.

Sample Output

```
show dlsw reachability user@host> show dlsw reachability
MAC index MAC address      Location  Peer/Interface
    0  44:44:00:00:00:06  remote   17.255.17.2
                                     18.255.18.2
    1  22:22:00:00:00:06  local    fe-0/0/1.0
```

show llc2 redundancy

Syntax	show llc2 redundancy <brief detail> <interface statistics mac-translation track (dlsw-remote-destination dlsw-remote-peer interfaces)>
Release Information	Command introduced in Junos OS Release 7.5.
Description	(J Series router only) Display logical link control type 2 (LLC2) redundancy information for data link switching (DLSw).
Options	none —Display basic LLC2 redundancy information. Same as brief . brief detail —(Optional) Display the specified level of output.
Required Privilege Level	view
List of Sample Output	show llc2 redundancy on page 2048 show llc2 redundancy detail on page 2048
Output Fields	Table 263 on page 2047 describes the output fields for the show llc2 redundancy command. Output fields are listed in the approximate order in which they appear.

Table 263: show llc2 redundancy Output Fields

Field Name	Field Description	Level of Output
Interface	IP address of the remote DLSw peer.	All levels
Unit	Logical interface unit number.	brief
Group	Group number.	All levels
Int state or Interface state	Interface state: up or down .	All levels
Er state or state	Indicates master or backup router.	All levels
Index	Number assigned to the router.	detail
Priority	Order to take over as master.	detail
Advertisement interval	Length of time between sending hello packets.	detail
Preempt	Master took over because of a failure.	detail
Advertisement timer	Times the advertisement intervals.	detail
Master router uptime	Length of time the master router has been available.	detail

Table 263: show llc2 redundancy Output Fields (*continued*)

Field Name	Field Description	Level of Output
Tracking	Whether tracking options are enabled or disabled.	detail

Sample Output

```
show llc2 redundancy      user@host> show llc2 redundancy
Interface  Unit  Group  Int state  ER state
fe-0/0/1.0  0    5      up        master
```

```
show llc2 redundancy      user@host> show llc2 redundancy detail
detail
Interface:fe-0/0/1.0 Index 69
Interface state: up, Group 5, State master,
Priority:255, Advertisement interval 5,
Preempt:yes, Advertisement timer 0.0,
Master router uptime:361476.770, Tracking: enabled
```

show llc2 redundancy interface statistics

Syntax	show llc2 redundancy interface statistics
Release Information	Command introduced in Junos OS Release 7.5.
Description	(J Series router only) Display logical link control type 2 (LLC2) redundancy interface statistics for data link switching (DLSw).
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show llc2 redundancy interface statistics on page 2049
Output Fields	Table 264 on page 2049 lists the output fields for the show llc2 redundancy interface statistics command. Output fields are listed in the approximate order in which they appear.

Table 264: show llc2 redundancy interface statistics Output Fields

Field Name	Field Description
Interface	Name of the configured physical interface.
Index	Number assigned to the interface.
Group	Number of the redundancy group.
Interface ERED PDU statistics	
Advertisement sent	Number of packets sent to advertise the router on the network.
Advertisement received	Number of packets received as advertisements on the network.
Interface ERED PDU error statistics	
Invalid ERED TTL value received	Number of invalid Ethernet redundancy time-to-live (TTL) values.

Sample Output

show llc2 redundancy interface statistics

```

user@host> show llc2 redundancy interface statistics
Interface : fe-0/0/1.0, Index : 69, Group : 5
Interface ERED PDU statistics
  Advertisement sent           : 2959
  Advertisement received       : 0
Interface ERED PDU error statistics
  Invalid ERED TTL value received : 0

```

show llc2 redundancy mac-translation

Syntax	show llc2 redundancy mac-translation
Release Information	Command introduced in Junos OS Release 7.5.
Description	(J Series router only) Display logical link control type 2 (LLC2) redundancy media access control (MAC) translation information for data link switching (DLSw).
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show llc2 redundancy mac-translation on page 2050
Output Fields	Table 265 on page 2050 lists the output fields for the show llc2 redundancy mac-translation command. Output fields are listed in the approximate order in which they appear.

Table 265: show llc2 redundancy mac-translation Output Fields

Field Name	Field Description
Local mac	MAC address of the local DLSw peer router.
Remote mac	MAC address of the remote DLSw peer router.
Interface	Physical interface configured for Ethernet redundancy.
Group	Assigned redundancy group number.

Sample Output

```

user@host> show llc2 redundancy mac-translation
Local mac      Remote mac      Interface      group
44:44:44:44:44 44:44:44:44:10:25 fe-0/0/1.0     5
44:44:44:44:44 44:44:44:44:10:16 fe-0/0/1.0     5
44:44:44:44:44 44:44:44:44:10:39 fe-0/0/1.0     5
09:00:2b:00:00 09:00:2b:00:00:05 fe-0/0/1.0     5
00:00:5e:00:01 00:0d:88:45:ce:5c fe-0/0/1.0     5

```

show llc2 redundancy track

Syntax	show llc2 redundancy <brief detail> <interface statistics mac-translation track (dlsw-remote-destination dlsw-remote-peer interfaces)>
Release Information	Command introduced in Junos OS Release 7.5.
Description	(J Series router only) Display logical link control type 2 (LLC2) redundancy tracking information for data link switching (DLSw).
Options	<p>brief detail—(Optional) Display the specified level of output.</p> <p>dlsw-remote-destination—(Optional) Display LLC2 remote destination tracking information.</p> <p>dlsw-remote-peer—(Optional) Display LLC2 remote peer tracking information.</p> <p>interfaces—(Optional) Display LLC2 interface tracking information.</p>
Required Privilege Level	view
List of Sample Output	show llc2 redundancy track dlsw-remote-destination on page 2052 show llc2 redundancy track dlsw-remote-peer on page 2052 show llc2 redundancy track interfaces on page 2052
Output Fields	Table 266 on page 2051 lists the output fields for the show llc2 redundancy track command. Output fields are listed in the approximate order in which they appear.

Table 266: show llc2 redundancy track Output Fields

Field Name	Field Description
Remote dest	MAC address of the remote peer router.
Peer dest	IP address of the remote peer.
Track if	Physical interface configured for tracking.
Connectivity	Status of the connection.
Cost	Value assigned to place the router in a redundancy hierarchy.
Interface	Physical interfaces configured for DLSw redundancy.
Group	Assigned redundancy group number.
Cfg	Priority value configured on the router.
Run	Value after all priority values are applied.

Table 266: show llc2 redundancy track Output Fields (*continued*)

Field Name	Field Description
ER state	Status of the router: master or backup .

Sample Output

```
show llc2 redundancy track dlsw-remote-destination
user@host> show llc2 redundancy track dlsw-remote-destination

```

Diameter Base Protocol Operational Mode Commands

Table 267 on page 2053 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot Diameter base protocol services.

Table 267: Diameter Base Protocol Operational Mode Commands

Task	Command
Clear Diameter function statistics.	<code>clear diameter function statistics</code>
Clear Diameter peers.	<code>clear diameter peer</code>
Clear pending Gx-Plus login and logout requests.	<code>clear network-access gx-plus replay</code>
Clear Gx-Plus statistics.	<code>clear network-access gx-plus statistics</code>
Override PCRF control of a session	<code>request network-access aaa subscriber set session-id</code>
Display information about the Diameter node.	<code>show diameter</code>
Display information about Diameter functions.	<code>show diameter function</code>
Display Diameter function statistics.	<code>show diameter function statistics</code>
Display information about Diameter instances.	<code>show diameter instance</code>
Display information about Diameter network elements.	<code>show diameter network-element</code>
Display information about Diameter network element maps.	<code>show diameter network-element map</code>
Display information about Diameter peers.	<code>show diameter peer</code>
Display information about Diameter peer maps.	<code>show diameter peer map</code>
Display Diameter peer statistics.	<code>show diameter peer statistics</code>

Table 267: Diameter Base Protocol Operational Mode Commands (*continued*)

Task	Command
Display information about Diameter routes.	<code>show diameter route</code>
Display Gx-Plus provisioning state, synchronization state, and statistics information.	<code>show network-access gx-plus</code>

NOTE: For information about how to configure Diameter Base Protocol services, see the Junos OS Subscriber Management, Release 13.1.

clear diameter function statistics

Syntax	clear diameter function < <i>function-name</i> > statistics
Release Information	Command introduced in Junos OS Release 9.6. Support for PTSP introduced in Junos OS Release 10.2. Support for Gx-Plus introduced in Junos OS Release 11.2.
Description	Clear current statistics accumulated for a specified function (application) or for all functions associated with the Diameter instance.
Options	<i>function-name</i> —(Optional) Clear statistics for the specified function. Currently, Gx-Plus, JSRC, and packet-triggered-subscribers are supported functions.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • Gx-Plus for Provisioning Subscribers Overview • Juniper Networks Session and Resource Control (SRC) and JSRC Overview • PTSP Overview • show diameter on page 2060 • show diameter function on page 2066 • show diameter function statistics on page 2071
List of Sample Output	clear diameter function statistics on page 2055
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear diameter function statistics user@host> **clear diameter function jsrc statistics**

clear diameter peer

Syntax	<code>clear diameter peer <i>peer-name</i></code> <code><connection statistics></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Delete the specified Diameter peer and clear all statistics or only current statistics for the specified peer.
Options	<p><i>peer-name</i>—Delete the Diameter peer.</p> <p><i>connection</i>—(Optional) Clear all peer statistics and restart the peer state machine for the specified Diameter peer. This is the default action.</p> <p><i>statistics</i>—(Optional) Clear current statistics for the specified Diameter peer.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show diameter on page 2060• show diameter peer on page 2083• show diameter peer map on page 2088• show diameter peer statistics on page 2092
List of Sample Output	clear diameter peer on page 2056
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear diameter peer` user@host> clear diameter peer peer5 connection

clear network-access gx-plus replay

Syntax	clear network-access gx-plus replay
Release Information	Command introduced in Junos OS Release 11.2.
Description	Clear pending Gx-Plus login and logout requests (replays). Sends JSER message to PCRF that includes the Juniper-Event-Type AVP (AVP code 2103) with a value of 3 indicating a discovery request. The PCRF returns a JDER message to initiate discovery of all subscribers. When this discovery completes, all pending subscriber requests are cleared.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• clear network-access gx-plus statistics on page 2058• show network-access gx-plus on page 2098
List of Sample Output	clear network-access gx-plus replay on page 2057
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear network-access
gx-plus replay` user@host> clear network-access gx-plus replay

clear network-access gx-plus statistics

Syntax	clear network-access gx-plus statistics
Release Information	Command introduced in Junos OS Release 11.2.
Description	Clear Gx-Plus statistics.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show network-access gx-plus on page 2098
List of Sample Output	clear network-access gx-plus statistics on page 2058
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>clear network-access gx-plus statistics</code>	<code>user@host> clear network-access gx-plus statistics</code>
--	--

request network-access aaa subscriber set session-id

Syntax	request network-access aaa subscriber set session-id <i>subscriber-session-id</i> provisioning-state none
Release Information	Command introduced in Junos OS Release 12.3.
Description	Release control of the PCRF over the specified subscriber session. In response, AAA clears the subscriber's provisioning state and sends a terminated request to the PCRF indicating the subscriber is no longer available.
Options	<i>subscriber-session-id</i> —ID of the subscriber session.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Disabling PCRF Control of a Subscriber Session Activating and Deactivating Subscriber Services Locally with the CLI

List of Sample Output [request network-access aaa subscriber set session-id on page 2059](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. [Table 268 on page 2059](#) lists possible error messages that might be returned if the service activation fails.

Table 268: Service Activation/Deactivation Error Messages

Message	Description	Corrective Action
Error: AUTHD ISSU in progress	A unified ISSU operation is active.	Wait until the unified ISSU operation completes and then retry the service activation/deactivation.
Service activation/deactivation already in progress	Another service activation/deactivation operation is currently in progress.	Wait until the active operation completes and then retry the activation/deactivation operation.
Session identifier is not for a subscriber session	The session ID is incorrect.	Verify the correct session ID for the subscriber and then retry the activation/deactivation operation.

Sample Output

```
request network-access aaa subscriber set session-id
user@host> request network-access aaa subscriber set session-id session-id 49 provisioning-state none
Successful completion
```

show diameter

Syntax	show diameter <brief detail summary>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display information about the Diameter node.
Options	brief detail summary —(Optional) Display the specified level of output. The summary output is displayed by default and includes Diameter node status. The brief output adds summary information about functions, instances, network elements, and peers. The detail output adds summary information about routes.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear diameter function statistics on page 2055 • clear diameter peer on page 2056 • show diameter function on page 2066 • show diameter instance on page 2074 • show diameter network-element on page 2076 • show diameter peer on page 2083 • show diameter route on page 2096
List of Sample Output	show diameter brief on page 2064 show diameter detail on page 2064 show diameter summary on page 2064
Output Fields	Table 269 on page 2060 lists the output fields for the show diameter command. Output fields are listed in the approximate order in which they appear.

Table 269: show diameter Output Fields

Field Name	Field Description	Level of Output
Diameter process id	ID number of the Diameter process.	All levels
Functions	Number of functions associated with Diameter.	All levels
Connected functions	Number of functions with active Diameter connections.	All levels
Instances	Number of configured Diameter instances.	All levels

Table 269: show diameter Output Fields (*continued*)

Field Name	Field Description	Level of Output
Network elements (NEs)	Number of configured Diameter network elements.	All levels
Connected NEs	Number of Diameter network elements with active connections.	All levels
Peers	Number of Diameter peer nodes.	All levels
Activated peers	Number of Diameter peers with active connections.	All levels
Open peers	Number of peers in the open state, without active network element connections but available for a connection.	All levels
Transports	Number of transports configured.	All levels
Requests queued for network transmit	Number of requests waiting to be sent to the Diameter peers.	All levels
Answers queued for network transmit	Number of replies waiting to be sent to the Diameter peers.	All levels
Expected answers from network	Number of replies expected to be received from the Diameter peers.	All levels
Requests queued for function transmit	Number of requests waiting to be sent to the functions associated with Diameter.	All levels
Answers queued for function transmit	Number of replies waiting to be sent to the functions associated with Diameter.	All levels
Expected answers from functions	Number of replies expected to be received from the functions associated with Diameter.	All levels
Memory used by network transmit queues	Amount of memory consumed by network transmit queues.	All levels
Memory used by function transmit queues	Amount of memory consumed by function transmit queues.	All levels
Origin-state-id	Value of the Origin-State-ID AVP.	All levels
Function	Name of the function for which information is displayed.	brief detail
State	State of the Diameter connection with the function: Connected or Disconnec (disconnected).	brief detail

Table 269: show diameter Output Fields (*continued*)

Field Name	Field Description	Level of Output
Upstream Transaction Utilization	Percent of upstream traffic used for this function.	brief detail
Downstream Transaction Utilization	Percent of downstream traffic used for this function.	brief detail
Net Queue Buffer Utilization	Percent of network transmission buffer used for this function.	brief detail
Func Queue Buffer Utilization	Percent of function transmission buffer used for this function.	brief detail
Routed Dests	Number of destinations that have this function associated with their routes.	brief detail
Name	Name of the Diameter instance.	brief detail
Origin-Realm	Value of Origin-Realm attribute-value pair (AVP).	brief detail
Origin Host	Value of Origin-Host AVP.	brief detail
NE-Total	Number of configured network elements.	brief detail
NE-Connected	Number of network elements with active Diameter connections.	brief detail
Name	Name of the Diameter network element.	brief detail
Instance	Name of the Diameter instance in which the network element is configured.	brief detail
State	State of the network element: <ul style="list-style-type: none"> Connecting—None of the network element peers are in the open state and available for connection. Selecting—One network element peer is connected and the network element is waiting for another peer to reach the open state so that it can be connected. Partially-Connected—One network element peer is in the open state and connected. Post-selection-delay—Three or more peers are in the open state and the network element is waiting to deactivate the peers in excess of two. Fully-connected—Two network element peers are in the open state and connected. 	brief detail
Primary Peer	Primary peer for the network element, based on the configured peer priority.	brief detail
Secondary Peer	Secondary peer for the network element, based on the configured peer priority.	brief detail
Peer	Name of the peer.	brief detail

Table 269: show diameter Output Fields (*continued*)

Field Name	Field Description	Level of Output
Instance	Name of the Diameter instance in which the peer is configured.	brief detail
State	State of the peer: <ul style="list-style-type: none"> • Bad-Config—Misconfiguration. • Bad-Remote—Remote side does not conform to one of the decisions or is sending malformed messages. • Closed—Normal disconnect due to a request from the remote site or due to excessive watchdog timeouts. • Destructing—Peer to be deleted on the next timer tick. Until then, it performs no actions. • Disabled—Peer is administratively disabled. • Internal-error—Internal error has been detected and the peer is in the process of restarting. • No-Activation—Peer is not used by any Diameter network element. • Rejected—Connection was rejected by remote side of the connection. • Suspended—All other reasons to be suspended. 	brief detail
NE-Count	Number of network elements associated with the peer.	brief detail
Activated Count	Activation status of the peer: <ul style="list-style-type: none"> • 1—Peer is activated. • 0—Peer is not activated. 	brief detail
Primary Count	Status of the peer: primary (1) or secondary (0).	brief detail
Secondary Count	Status of the peer: secondary (0) or primary (1).	brief detail
Route	Name of the Diameter route.	detail
NE	Name of the Diameter network element in which the route is configured	detail
Instance	Name of the Diameter instance in which the route is configured.	detail
Valid	Determination of whether the route is valid: yes or no .	detail
Up	State of the route: yes for an active route, no for an inactive route.	detail

user@host> show diameter function gx-plus detail
```

```
Diameter function:
  Function name           : gx-plus
  State                   : Connected
  Upstream transaction utilization : 0 %
  Downstream transaction utilization : 0 %
  Network transmit buffer utilization : 0 %
  Function transmit buffer utilization : 0 %
  Routed destinations     : 1
  Requests queued for network tx : 0
  Pending answers from network : 0
  Answers queued for function tx : 0
  Total upstream transactions pending : 0
  Upstream transactions limit : 1024
  Requests queued for function tx : 0
  Pending answers from function : 0
  Answers queued for network tx : 0
  Total downstream transactions pending : 0
  Downstream transactions limit : 1024
  Buffers used by network tx queue : 0
  Limit on network tx queue buffers : 10485760
  Buffers used by function tx queue : 0
  Limit on function tx queue buffers : 10485760
  Origin-state-id        : 0
```

show diameter function statistics

Syntax	show diameter function statistics <brief detail summary> <function-name>
Release Information	Command introduced in Junos OS Release 9.6. Support for PTSP introduced in Junos OS Release 10.2. Support for Gx-Plus introduced in Junos OS Release 11.2.
Description	Display statistics about all functions associated with Diameter instances or only the specified function.
Options	<p>brief detail summary—(Optional) Display the specified level of output. The summary output is displayed by default and includes basic function statistics. The brief output displays the summary information in a different format and adds numbers accumulated since the Diameter node was started. The detail output adds information to the brief output.</p> <p>function-name—(Optional) Display information for only the specified function. Currently, Gx-Plus, JSRC, and packet-triggered-subscribers are supported functions. When you specify a function, the brief output is displayed by default, even when you explicitly specify summary.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear diameter function statistics on page 2055 • show diameter on page 2060 • show diameter function on page 2066
List of Sample Output	show diameter function statistics on page 2073 show diameter function statistics brief on page 2073 show diameter function statistics detail on page 2073
Output Fields	Table 271 on page 2071 lists the output fields for the show diameter function statistics command. Output fields are listed in the approximate order in which they appear.

Table 271: show diameter function statistics Output Fields

Field Name	Field Description	Level of Output
Function	Name of the function for which information is displayed.	All levels
Delivered Requests	Number of requests delivered by Diameter to the application.	All levels
Delivered Answers	Number of answers delivered by Diameter to the application.	All levels
Delivered Messages	Total number of messages delivered by Diameter to the application.	All levels

Table 271: show diameter function statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
Forwarded Requests	Number of requests sent by Diameter to the network.	All levels
Forwarded Answers	Number of answers sent by Diameter to the network.	All levels
Forwarded Messages	Number of messages sent by Diameter to the network.	All levels
Function name	Name of the function for which information is displayed.	All levels
Over-limit network requests	Number of requests sent to Diameter peers that exceeded the limit on the network transmit queue.	detail
Over-limit network answers	Number of answers sent to Diameter peers that exceeded the limit on the network transmit queue.	detail
Over-limit network messages	Total number of messages sent to Diameter peers that exceeded the limit on the network transmit queue.	detail
Failed to deliver requests	Number of requests sent by Diameter to its application that were not successfully delivered.	detail
Failed to deliver answers	Number of answers sent by Diameter to its application that were not successfully delivered.	detail
Failed to deliver messages	Total number of messages sent by Diameter to its application that were not successfully delivered.	detail
Over-limit function requests	Number of requests sent to Diameter peers that exceeded the limit on the function transmit queue.	detail
Over-limit function answers	Number of answers sent to Diameter peers that exceeded the limit on the function transmit queue.	detail
Over-limit function messages	Total number of messages sent to Diameter peers that exceeded the limit on the function transmit queue.	detail
Failed to forward requests	Number of requests that were not successfully sent by Diameter to the network.	detail
Failed to forward answers	Number of answers that were not successfully sent by Diameter to the network.	detail
Failed to forward messages	Total number of messages that were not successfully sent by Diameter to the network.	detail

Sample Output

show diameter function statistics

```
user@host> show diameter function statistics
Diameter function statistics:
      Delivered Delivered Delivered Forwarded Forwarded Forwarded
Function Requests  Answers  Messages  Requests  Answers  Messages
jsrc              0         0         0         0         0         0
```

show diameter function statistics brief

```
user@host> show diameter function statistics brief
Diameter function statistics:
Function name           : jsrsc

Delivered requests      :          0          0
Delivered answers       :          0          0
Delivered messages      :          0          0
Forwarded requests      :          0          0
Forwarded answers       :          0          0
Forwarded messages      :          0          0
```

show diameter function statistics detail

```
user@host> show diameter function statistics detail
Diameter function statistics:
Function name           : jsrsc

Delivered requests      :          0          0
Delivered answers       :          0          0

Output Fields	Table 273 on page 2076 lists the output fields for the show diameter network-element command. Output fields are listed in the approximate order in which they appear.

Table 273: show diameter network-element Output Fields

Field Name	Field Description	Level of Output
Name	Name of the Diameter network element.	summary
Instance	Name of the Diameter instance in which the network element is configured.	summary

Table 273: show diameter network-element Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	State of the network element: <ul style="list-style-type: none"> Connecting—None of the network element peers are in the open state and available for connection. Selecting—One network element peer is connected and the network element is waiting for another peer to reach the open state so that it can be connected. Partially-Connected—One network element peer is in the open state and connected. Post-selection-delay—Three or more peers are in the open state and the network element is waiting to deactivate the peers in excess of two. Fully-connected—Two network element peers are in the open state and connected. 	All levels
Primary peer	Primary peer for the network element, based on the configured peer priority.	All levels
Secondary peer	Secondary peer for the network element, based on the configured peer priority.	All levels
NE name	Name of the Diameter network element.	brief detail
Instance name	Name of the Diameter instance in which the network element is configured.	brief detail
Peers	Number of configured peers.	brief detail
Activated peers	Number of peers that have been activated.	brief detail
Open peers	Number of peers in the open state, without active network element connections but available for a connection.	brief detail
Routes	Number of routes configured for the network element.	brief detail
Invalid routes	Number of routes that are invalid because they lack one or more of the following: application and partition, Diameter instance, or destination realm.	brief detail
Activation delay	Period in milliseconds between peer activations by the network element.	brief detail
First selection delay	Period in milliseconds that the network element waited after connecting to the first peer to allow other peers to reach the open state.	brief detail
Postselection delay	Period in milliseconds that the network element waited after having two peers in the open state before deactivating all lower-priority peers.	brief detail

Sample Output

`show diameter network-element`

```
user@host> show diameter network-element
```

```
Diameter network-elements:
```

Name	Instance	State	Primary Peer	Secondary Peer
ne0	master	Fully-connected	p0	p1

`show diameter network-element detail`

```
user@host> show diameter network-element detail
```

```
Diameter network-element:
```

```
NE name           : ne0
```

```
Instance name     : master
```

```
State             : Fully-connected
```

```
Primary peer      : p0
```

```
Secondary peer    : p1
```

```
Peers             : 5
```

```
Activated peers   : 4
```

```
Open peers       : 2
```

```
Routes           : 1
```

```
Invalid routes   : 0
```

```
Activation delay  : 10000 ms
```

```
First selection delay : 0 ms
```

```
Post selection delay : 30000 ms
```

show diameter network-element map

Syntax	show diameter network-element map <brief detail summary> <element-name>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display network-element-to-peer mapping information for all Diameter network elements or only the specified network element.
Options	<p>brief detail summary—(Optional) Display the specified level of output. The summary output is displayed by default. The brief output and detail output display the summary information in a different format.</p> <p>element-name—(Optional) Display information for only the specified network element.</p>

Output Fields	Table 275 on page 2083 lists the output fields for the show diameter peer command. Output fields are listed in the approximate order in which they appear.

Table 275: show diameter peer Output Fields

Field Name	Field Description	Level of Output
Peer	Name of the peer.	brief summary
Instance	Name of the Diameter instance in which the peer is configured.	brief summary

Table 275: show diameter peer Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	State of the peer: <ul style="list-style-type: none"> • Bad-Config—Misconfiguration. • Bad-Remote—Remote side does not conform to one of the decisions or is sending malformed messages. • Closed—Normal disconnect due to a request from the remote site or due to excessive watchdog timeouts. • Destructing—Peer to be deleted on the next timer tick; until then, it performs no actions. • Disabled—Peer is administratively disabled. • Internal-error—Internal error has been detected and the peer is in the process of restarting. • No-Activation—Peer is not used by any Diameter network element. • Rejected—Connection was rejected by remote side of the connection. • Reopen—Connection has been unexpectedly closed and Diameter is attempting to reopen the connection. • Suspended—All other reasons to be suspended. 	All levels
NE-Count	Number of network elements associated with the peer.	brief summary
Activated Count	Activation status of the peer: <ul style="list-style-type: none"> • 1—Peer is activated. • 0—Peer is not activated. 	All levels
Primary Count	Status of the peer, primary (1) or secondary (0).	All levels
Secondary Count	Secondary (0) versus Primary (1) status of the peer.	All levels
Peer name	Name of the peer.	detail
NEs	Number of network elements associated with the peer.	detail
Vrf	Logical system:routing instance of the configuration.	detail
Remote address	Remote IP address of the peer.	detail
Remote port	Remote port on the peer on which the connection is made.	detail
Remote end origin realm	Name of the realm of the Diameter node that originates messages to the peer.	detail
Remote end origin host	Name of the host of the Diameter node that originates messages to the peer.	detail
Local address	Local IP address on the Diameter origin node.	detail
Local port	Local port on the Diameter origin node.	detail

Table 275: show diameter peer Output Fields (*continued*)

Field Name	Field Description	Level of Output
Local transport	Number of transports configured.	detail
Time since last enable	Period since peer was enabled in <i>hh:mm:ss</i> format.	detail
In state time	Period that peer has been in present state in <i>hh:mm:ss</i> format.	detail
Remaining in state time	Period that peer will remain in present state in <i>hh:mm:ss</i> format.	detail
Missing wd events	Number of missed watchdog events.	detail
Tx queue length	Number of messages in the transmit queue.	detail
Answer waiting count	Number of answers on which the peer is waiting.	detail
Time since last rx	Number of milliseconds since the last message was received by the peer.	detail
Time until wd timeout	Time remaining until next watchdog event.	detail
Operation timeout	Watchdog timeout period.	detail
Suspended timeout base	Base timeout period in suspended states (suspended, rejected, bad-remonte, bad-config). This timeout doubles after each consecutive suspension, until the maximum value of 600 seconds is reached.	detail
Closed timeout	Timeout period in normal closed state, such as when an external peer requested a disconnect.	detail
Connection timeout	Timeout period for establishing a connection.	detail
Waiting origin state id	Whether the peer is waiting for the Origin-State-Id AVP, yes or no .	detail

Sample Output

show diameter peer

user@host> show diameter peer

Diameter peer list:

Peer	Instance	State	NE-Count	Activated Count	Primary Count	Secondary Count
p0	master	I-Open	1	1	1	0
p1	master	I-Open	1	1	0	1
p288	master	Suspended	1	1	0	0
pA	master	Suspended	1	1	0	0
pB	master	No-Activation	1	0	0	0
pc	master	No-Activation	0	0	0	0
pd	master	No-Activation	0	0	0	0

show diameter peer statistics

Syntax	show diameter peer statistics <brief detail summary> <peer-name>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display statistics about all peers associated with Diameter instances or only the specified peer.
Options	<p>brief detail summary—(Optional) Display the specified level of output. The summary output is displayed by default and includes basic function statistics. The brief output displays the summary information in a different format and adds numbers accumulated since the peer was connected. The detail output adds information to the brief output.</p> <p>peer-name—(Optional) Display information for only the specified peer. When you specify a peer, the brief output is displayed by default, even when you explicitly specify summary.</p>
Required Privilege Level	view

show diameter route

Syntax	show diameter route <brief detail summary> <route-name>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display information about all routes associated with Diameter instances or only the specified route.
Options	<p>brief detail summary—(Optional) Display the specified level of output. The summary output is displayed by default and includes basic function information. The brief output displays the summary information in a different format. The detail output adds information to the brief output.</p> <p>route-name—(Optional) Display information for only the specified route.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show diameter on page 2060 • show diameter network-element on page 2076
List of Sample Output	<p>show diameter route on page 2097</p> <p>show diameter route detail on page 2097</p>
Output Fields	Table 278 on page 2096 lists the output fields for the show diameter route command. Output fields are listed in the approximate order in which they appear.

Table 278: show diameter route Output Fields

Field Name	Field Description	Level of Output
Route	Name of the route.	summary brief
NE	Name of the network element associated with the route.	summary brief
Instance	Name of the Diameter instance in which the route is configured.	summary brief
NE name	Name of the network element associated with the route.	brief detail
Instance name	Name of the Diameter instance in which the route is configured.	brief detail
Valid	Determination whether the route is valid, yes or no .	All levels
Up	State of the route, yes (up) or no (down).	All levels
Function	Name of the function associated with the route.	brief detail

Table 278: show diameter route Output Fields (*continued*)

Field Name	Field Description	Level of Output
Partition	Partition associated with the function.	brief detail
Dest-realm	Destination realm configured for the route.	brief detail
Dest-host	Destination hostname configured for the route.	brief detail
Metric	Metric associated with the destination and function to create the route.	brief detail
Score	<p>Value that represents how a route is configured. The basic score is 0. Points are added according to the following scheme:</p> <ul style="list-style-type: none"> • Function is specified—Add 3. • Function partition is specified—Add 1. • Destination realm is specified—Add 1. • Destination host is specified—Add 1. 	brief detail

Distributed Denial-of-Service Protection Operational Mode Commands

Table 280 on page 2101 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot the distributed denial-of-service (DDoS) protection feature. Commands are listed in alphabetical order.

Table 280: DDoS Protection Operational Mode Commands

Task	Command
Clear current DDoS protection statistics or violation states.	<code>clear ddos-protection protocols</code>
Display DDoS protection configuration information and statistics.	<code>show ddos-protection protocols</code>
Display DDoS flow detection culprit flow information.	<code>show ddos-protection protocols culprit-flows</code>
Display DDoS flow detection information.	<code>show ddos-protection protocols flow-detection</code>
Display DDoS protection configuration information.	<code>show ddos-protection protocols parameters</code>
Display traffic statistics and DDoS policer violation statistics.	<code>show ddos-protection protocols statistics</code>
Display the number of DDoS policer violations.	<code>show ddos-protection protocols violations</code>
Display DDoS protection global statistics for bandwidth violations.	<code>show ddos-protection statistics</code>
Display the DDoS protection version.	<code>show ddos-protection version</code>

NOTE: For information about how to configure DDoS protection parameters, see the *Junos OS DDoS Protection Configuration Guide*.

clear ddos-protection protocols

Syntax	<code>clear ddos-protection protocols</code> <code><protocol-group <packet-type>> (culprit-flows states statistics)</code>
Release Information	Command introduced in Junos OS Release 11.2. Option culprit-flows introduced in Junos OS Release 12.3.
Description	Clear current DDoS protection statistics, violation states, or culprit flows for all packet types in all protocol groups, for all packet types in a particular protocol group, or for a particular packet type in a particular protocol group.
Options	<p>protocol-group—(Optional) Protocol group that is cleared. See show ddos-protection protocols for a list of available groups.</p> <p>packet-type—(Optional) Packet type in a particular protocol group that is cleared. See show ddos-protection protocols for a list of available packet types.</p> <p>culprit-flows—Clear culprit flows for a packet type, for a protocol group, or for all protocol groups.</p> <p>states—Clear DDoS protection violation states for a packet type, for a protocol group, or for all protocol groups.</p> <p>statistics—Clear DDoS protection statistics such as packet counts and rates for a packet type, for a protocol group, or for all protocol groups.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show ddos-protection protocols on page 2103• show ddos-protection statistics on page 2146• show ddos-protection version on page 2147
List of Sample Output	clear ddos-protection protocols on page 2102
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear ddos-protection protocols  user@host> clear ddos-protection protocols dhcpv4 bootp states
```

show ddos-protection protocols

Syntax	show ddos-protection protocols <i><protocol-group (aggregate packet-type)></i>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display DDoS protection configuration and statistics for protocol groups or individual packet types.
Options	<p>none—Display information for all packet types in all protocol groups.</p> <p>aggregate—(Optional) Display DDoS protection information for the aggregate policer. The aggregate option is available for all protocol groups.</p> <p>packet-type—(Optional) Display DDoS protection information for the specified packet type in the protocol group. The available packet types vary by protocol group. Only an aggregate policer is available for protocol groups that are not in the following list:</p> <ul style="list-style-type: none"> • dhcpv4—The following packet types are available for DHCPv4 traffic: <ul style="list-style-type: none"> • ack—DHCPACK packets. • bad-packets—DHCPv4 packets with bad formats. • bootp—DHCPBOOTP packets. • decline—DHCPDECLINE packets. • discover—DHCDISCOVER packets. • force-renew—DHCPFORCERENEW packets. • inform—DHCPINFORM packets. • lease-active—DHCPLEASEACTIVE packets. • lease-query—DHCPLEASEQUERY packets. • lease-unassigned—DHCPLEASEUNASSIGNED packets. • lease-unknown—DHCPLEASEUNKNOWN packets. • nak—DHCPNAK packets. • no-message-type—DHCP packets that are missing the message type.. • offer—DHCOFFER packets. • release—DHCPACK packets. • renew—DHCPRENEW packets. • request—DHCPREQUEST packets. • unclassified— All unclassified packets in the protocol group. • dhcpv6—The following packet types are available for DHCPv6 traffic:

- **advertise**—ADVERTISE packets.
- **confirm**—CONFIRM packets.
- **decline**—DECLINE packets.
- **information-request**—INFORMATION-REQUEST packets.
- **leasequery**—LEASEQUERY packets.
- **leasequery-data**—LEASEQUERY-DATA packets.
- **leasequery-done**—LEASEQUERY-DONE packets.
- **leasequery-reply**—LEASEQUERY-REPLY packets.
- **rebind**—REBIND packets.
- **reconfigure**—RECONFIGURE packets.
- **relay-forward**—RELAY-FORWARD packets.
- **relay-reply**—RELAY-REPLY packets.
- **release**—RELEASE packets.
- **renew**—RENEW packets.
- **reply**—REPLY packets.
- **request**—REQUEST packets.
- **solicit**—SOLICIT packets.
- **unclassified**— All unclassified packets in the protocol group.
- **frame-relay**—The following packet types are available for Frame Relay traffic:
 - **frf15**—Multilink frame relay FRF.15 packets.
 - **frf16**—Multilink frame relay FRF.16 packets.
- **ip-fragments**—The following packet types are available for IP fragments:
 - **first-fragment**—First IP fragment.
 - **trail-fragment**—Last IP fragment.
- **ip-options**—The following packet types are available for IP option traffic:
 - **non-v4v6**—Options packets other than IPv4/v6.
 - **router-alert**—Router alert options packets.
 - **unclassified**— All unclassified packets in the protocol group.
- **mlp**—The following MLP packet types are available:
 - **aging-exception**—MLP aging exception packets.
 - **packets**—MLP packets.
 - **unclassified**— All unclassified packets in the protocol group.

- **ppp**—The following PPP packet types are available:
 - **authentication**—PPP authentication protocol packets.
 - **echo-rep**—LCP echo reply packets.
 - **echo-req**—LCP echo request packets.
 - **ipcp**—IP Control Protocol packets.
 - **ipv6cp**—IPv6 Control Protocol packets.
 - **isis**—IS-IS packets.
 - **lcp**—Link Control Protocol packets.
 - **mlppp-lcp**—MLPPP LCP packets.
 - **mplscp**—MPLS Control Protocol packets.
 - **unclassified**— All unclassified packets in the protocol group.
- **pppoe**—The following PPPoE packet types are available:
 - **padi**—PADI packets.
 - **padm**—PADM packets.
 - **padn**—PADN packets.
 - **pado**—PADO packets.
 - **padr**—PADR packets.
 - **pads**—PADS packets.
 - **padt**—PADT packets.
- **radius**—The following RADIUS packet types are available:
 - **accounting**—RADIUS accounting packets.
 - **authorization**—RADIUS authorization packets.
 - **server**—RADIUS server traffic.
 - **unclassified**— All unclassified packets in the protocol group.
- **sample**—The following sample packet types are available:
 - **host**—Host packets.
 - **pfe**—Packet Forwarding Engine packets.
 - **syslog**—System log message packets.
 - **tap**—TAP packets.
- **tcp-flags**—The following TCP-flagged packet types are available:
 - **established**—TCP ACK and RST connection packets.

- **initial**—TCP SYN and SYN ACK packets.
- **virtual-chassis**—The following packet types are available for virtual chassis packets:
 - **control-low**—Low-priority control packets.
 - **control-high**—High-priority control packets.
 - **unclassified**— All unclassified packets in the protocol group.
 - **vc-packets**—All exception packets on the virtual chassis link.
 - **vc-ttl-errors**—Virtual chassis TTL error packets.

protocol-group—(Optional) Display DDoS protection information for one of the following protocol groups:

- **amtv4**—IPv4 AMT traffic.
- **amtv6**—IPv6 AMT traffic.
- **anccp**—ANCP traffic.
- **anccpv6**—ANCPv6 traffic.
- **arp**—ARP traffic.
- **atm**—ATM traffic.
- **bfd**—BFD traffic.
- **bfdv6**—BFDv6 traffic.
- **bgp**—BGP traffic.
- **bgpv6**—BGPv6 traffic.
- **control**—Control traffic.
- **demux-autosense**—Demux autosensing traffic.
- **dhcipv4**—DHCPv4 traffic.
- **dhcipv6**—DHCPv6 traffic.
- **diameter**—Diameter and Gx-Plus traffic.
- **dns**—DNS traffic.
- **dtcp**—DTCP traffic.
- **dynamic-vlan**—Dynamic VLAN exception traffic.
- **egpv6**—EGPv6 traffic.
- **eoam**—EOAM traffic.
- **esmc**—ESMC traffic.
- **fab-probe**—Fab out probe packets.
- **firewall-host**—Firewall send-to-host traffic.
- **frame-relay**—Frame relay traffic.

- **ftp**—FTP traffic.
- **ftpv6**—FTPV6 traffic.
- **gre**—GRE traffic.
- **icmp**—ICMP traffic.
- **igmp**—IGMP traffic
- **igmpv4v6**—IGMP v4/v6 traffic.
- **igmpv6**—IGMPv6 traffic.
- **inline-ka**—Inline service interfaces keepalive traffic.
- **inline-svcs**—Inline services traffic.
- **ip-fragments**—IP fragments traffic.
- **ip-options**—IP traffic with IP packet header options.
- **ipv4-unclassified**—All unclassified IPv4 host-bound traffic.
- **ipv6-unclassified**—All unclassified IPv6 host-bound traffic.
- **isis**—IS-IS traffic.
- **jfm**—JFM traffic.
- **keepalive**—Keepalive traffic.
- **l2pt**—Layer 2 protocol tunneling traffic.
- **l2tp**—L2TP traffic.
- **lACP**—LACP traffic.
- **ldp**—LDP traffic.
- **ldpv6**—LDPv6 traffic.
- **lldp**—LLDP traffic.
- **lmp**—LMP traffic.
- **lmpv6**—LMPv6 traffic.
- **mac-host**—Layer 2 MAC send-to-host traffic.
- **mlp**—MLP traffic.
- **msdp**—MSDP traffic.
- **msdpv6**—MSDPv6 traffic.
- **multicast-copy**—Host copy traffic due to multicast routing.
- **mvrp**—MVRP traffic.
- **ndpv6**—NDPv6 traffic.
- **ntp**—NTP traffic.
- **oam-lfm**—OAM-LFM traffic.

- **ospf**—OSPF traffic.
- **ospfv3v6**—OSPFv3/IPv6 traffic.
- **pfe-alive**—Packet Forwarding Engine keepalive traffic
- **pim**—PIM traffic.
- **pimv6**—PIMv6 traffic.
- **pmvrp**—PMVRP traffic.
- **pos**—POS traffic.
- **ppp**—PPP traffic.
- **pppoe**—PPPoE traffic.
- **ptp**—PTP traffic.
- **pvstp**—PVSTP traffic.
- **radius**—RADIUS traffic.
- **redirect**—Traffic that triggers ICMP redirects.
- **reject**—Packets rejected by a next-hop forwarding decision.
- **rejectv6**—V6 packets rejected by a next-hop forwarding decision.
- **rip**—RIP traffic.
- **ripv6**—RIPv6 traffic.
- **rsvp**—RSVP traffic.
- **rsvpv6**—RSVPv6 traffic.
- **services**—Service traffic.
- **snmp**—SNMP traffic.
- **snmpv6**—SNMPv6 traffic.
- **ssh**—SSH traffic.
- **sshv6**—SSHv6 traffic.
- **stp**—STP traffic.
- **tacacs**—TACACS traffic.
- **tcp-flags**—Traffic with TCP flags.
- **telnet**—TELNET traffic.
- **telnetv6**—TELNETv6 traffic.
- **ttl**—TTL traffic.
- **tunnel-fragment**—Tunnel fragments traffic.
- **virtual-chassis**—Virtual chassis traffic.

- **vrp**—VRRP traffic.
- **vrpv6**—VRRPv6 traffic.

Output Fields Table 281 on page 2109 lists the output fields for the **show ddos-protection protocols** command. Output fields are listed in the approximate order in which they appear.

Table 281: show ddos-protection protocols Output Fields

Field Name	Field Description
Packet types	Number of packet types
Modified	Number of packets for which policer values have been modified from the default.
Received traffic	Number of traffic flows received.
Currently violated	Number of flows that are currently violating the flow bandwidth limit.
Currently tracked flows	Number of active flows that are being tracked as culprit flows by flow detection.
Total detected flows	Total number of culprit flows that have been detected, including those that have recovered or timed out.
Protocol Group	Name of protocol group.
Packet type	Name of packet type in protocol group.

Table 281: show ddos-protection protocols Output Fields (*continued*)

Field Name	Field Description
Bandwidth	Bandwidth policer value; number of packets per second that is allowed before a violation is declared.
Burst	Burst policer value; the maximum number of packets that is allowed in a burst before a violation is declared.
Priority	Priority of the packet type for individual packet policers that enables more important traffic to pass through in the event of traffic congestion: low , medium , or high . Lower priority packets can be dropped when insufficient bandwidth is available.
Recover time	Time that must pass since the last violation before the traffic flow is considered to have recovered from the attack. A notification is generated when the timer expires.
Enabled	State of the policer, enabled (Yes), disabled (No), or partially disabled (Partial); Partial indicates that only some of the policer instances are disabled for the policer.
Bypass aggregate	<p>State of the bypass aggregate configuration:</p> <ul style="list-style-type: none"> • Yes—The aggregate policer is bypassed. • No—The aggregate policer is enforced. <p>This field appears only for individual policers.</p>
Flow detection configuration	<p>State of flow detection configured on the router:</p> <ul style="list-style-type: none"> • Detection mode—Mode of operation for suspicious flow detection: automatic, off, or on. • Log flows—State of automatic logging of suspicious traffic flows: on (Yes) or off (No). • Timeout flows—State of culprit flow timeout behavior: flow is suppressed for a configured timeout period (Yes) or flow is suppressed until it is no longer in violation (No). • Detect time—Time in seconds that must pass before a suspicious flow that has exceeded the bandwidth allowed for the packet type is considered to be a culprit flow. • Recover time—Time in seconds that must pass before a culprit flow is considered to have returned to normal. The period starts when the flow drops below the threshold that triggered the last violation. • Timeout time—Time in seconds that a culprit flow is suppressed, if timeouts have been enabled. • Flow aggregation level configuration—Flow detection mode, flow control mode, and flow bandwidth for traffic at each of the traffic flow aggregation levels: subscriber, logical interface, and physical interface. <ul style="list-style-type: none"> • Detection mode—State of flow detection: automatic, off, or on. • Control mode—Mode of controlling culprit traffic: dropped, kept, or policed back to within the allowed bandwidth. • Flow rate—Bandwidth allowed for the control traffic in packets per second.

Table 281: show ddos-protection protocols Output Fields (*continued*)

Field Name	Field Description
System-wide information	<p>The following information collected for the router:</p> <ul style="list-style-type: none"> • A message indicates whether the policer has been violated. • No. of FPCs currently receiving excess traffic—Number of cards that are currently in violation of a policer. • No. of FPCs that have received excess traffic—Number of cards that have at some point been in violation of a policer. • Violation first detected at—Timestamp of the first violation. • Violation last seen at—Timestamp of the last observed violation. • Duration of violation—Length of the violation. • Number of violations—Number of times the violation has occurred. • Received—Number of packets received at all card slots and the Routing Engine. • Dropped—Number of packets dropped regardless of where they were dropped. • Arrival rate—Current traffic rate for packets arriving from all cards and at the Routing Engine. • Max arrival rate—Highest traffic rate for packets arriving from all cards and at the Routing Engine.
Routing Engine information	<p>The following information collected for the Routing Engine:</p> <ul style="list-style-type: none"> • Bandwidth—Maximum number of packets per second that is allowed. • Burst—Maximum number of packets that is allowed in a burst. • A message indicates the State of the policer, enabled (Yes) or disabled (No). • A message indicates whether the policer has been violated; the policer might be passed at the individual cards, but the combined rate of packets arriving at the Routing Engine can exceed the configured policer value. • Violation first detected at—Timestamp of the first violation. • Violation last seen at—Timestamp of the last observed violation. • Duration of violation—Length of the violation. • Number of violations—Number of times the violation has occurred. • Received—Number of packets received at the Routing Engine from all cards. • Dropped—Number of packets dropped at the Routing Engine; includes packets dropped by the aggregate policer and by individual protocol policers. • Arrival rate—Current traffic rate for packets arriving at the Routing Engine from all cards. • Max arrival rate—Highest traffic rate for packets arriving at the Routing Engine from all cards. • Dropped by aggregate policer—Number of packets dropped by the aggregate policer. • Dropped by individual policers—Number of packets dropped by individual policer.

Table 281: show ddos-protection protocols Output Fields (*continued*)

Field Name	Field Description
FPC slot information	<p>The following information collected for the card in the indicated slot:</p> <ul style="list-style-type: none"> • Bandwidth—Bandwidth scaling percentage and the number of packets per second that is allowed before a violation is declared. • Burst—Burst scaling percentage and the maximum number of packets that is allowed in a burst before a violation is declared. • A message indicates whether the policer has been violated. • Violation first detected at—Timestamp of the first violation. • Violation last seen at—Timestamp of the last observed violation. • Duration of violation—Length of the violation. • Number of violations—Number of times the violation has occurred. • Received—Number of packets received on the line card. • Dropped—Number of packets dropped at the line card; includes packets dropped by the aggregate policer and by individual protocol policers. • Arrival rate—Current traffic rate for packets arriving at the line card. • Max arrival rate—Highest traffic rate for packets arriving at the line card. • Dropped by this policer—Number of packets dropped by the individual policer. • Dropped by aggregate policer—Number of packets dropped by the aggregate policer.
Bypass aggr.	<p>State of the bypass aggregate configuration:</p> <ul style="list-style-type: none"> • Yes—The aggregate policer configuration is bypassed. • No—The aggregate policer configuration is enforced. <p>Dashes indicate that the bypass aggregate configuration is not available; this is possible only for aggregate policers.</p>
FPC Mod	<p>Indicates whether configuration has changed from the default for any line cards.</p> <ul style="list-style-type: none"> • No—The default configuration has not changed from the default for the packet type. • Yes—The default configuration has changed from the default for the packet type
Op mode	<p>Mode of operation for suspicious flow detection for the packet type: always-on (on), (auto), or disabled (off).</p>
Policer BW (pps)	<p>Bandwidth policer value; number of packets per second that is allowed before a violation is declared.</p>
Aggr level Op:Fc:Bandwidth (pps)	<p>Flow operation mode, flow control mode, and flow bandwidth for traffic of the packet type at each traffic flow aggregation level: subscriber (sub), logical interface (ifl), and physical interface (ifd).</p>
Log flow	<p>State of automatic logging of suspicious traffic flows for the packet type: on (Yes) or off (No).</p>

Table 281: show ddos-protection protocols Output Fields (*continued*)

Field Name	Field Description
Time out	State of culprit flow timeout behavior for the packet type: flow is suppressed or monitored for a configured timeout period (Yes) or flow is suppressed or monitored until it is no longer in violation (No).

show ddos-protection protocols culprit-flows

Syntax	<code>show ddos-protection protocols <protocol-group (aggregate packet-type)> culprit-flows</code>
Release Information	Command introduced in Junos OS Release 12.3.
Description	Display culprit flow information for protocol groups or individual packet types.
Options	<p>none—Display information for all protocol groups and packet types.</p> <p>aggregate—(Optional) Display DDoS protection information for the aggregate policer. The aggregate option is available for all protocol groups.</p> <p>packet-type—(Optional) Display information for the specified packet type in the protocol group. The available packet types vary by protocol group. See show ddos-protection protocols for a list of available packet types.</p> <p>protocol-group—(Optional) Display information for a particular protocol group. See show ddos-protection protocols for a list of available groups.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear ddos-protection protocols on page 2102 • show ddos-protection protocols on page 2103 • show ddos-protection protocols flow-detection on page 2122 • show ddos-protection protocols parameters on page 2126 • show ddos-protection protocols statistics on page 2133 • show ddos-protection protocols violations on page 2144

Table 282: show ddos-protection protocols culprit-flows Output Fields

Field Name	Field Description	Level of Output
Currently tracked flows	Number of active flows that are being tracked as culprit flows by flow detection.	none
Total detected flows	Total number of culprit flows that have been detected, including those that have recovered or timed out.	none
Protocol Group	Name of protocol group.	none

Table 282: show ddos-protection protocols culprit-flows Output Fields (*continued*)

Field Name	Field Description	Level of Output
Packet type	Name of packet type in protocol group.	none
Arriving Interface	Logical interface on which the traffic flow arrived.	none
Source Address MAC or IP	Source address of the traffic flow, either a MAC address or an IP address.	none
pps	Rate of the traffic flow in packets per second.	none
pkts	Number of packets in the traffic flow.	none
Additional information	Flow ID numbers automatically assigned to flow, with embedded slot ID. The flow ID is prefixed by sub , ifl , or ifd , which indicate the subscriber, logical interface, and physical interface flow aggregation levels. Timestamp that identifies when the flow arrived on the interface.	none

show ddos-protection protocols parameters

Syntax	show ddos-protection protocols <protocol-group> parameters <brief detail terse>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display DDoS protection configuration information for all protocol groups or for a particular protocol group.
Options	<p>none—Display information for all protocol groups.</p> <p>brief detail terse—(Optional) Display the specified level of output.</p> <ul style="list-style-type: none">• brief—Display basic function information.• detail—Add information to the brief output; it is identical to the output displayed when you choose no option. The brief and detail options display information for all protocol groups, which can be a long list.• terse—Display the same level of information as the brief option but only for active protocol groups—groups that show traffic in the Received (packets) column. <p>protocol-group—(Optional) Display information for a particular protocol group. See show ddos-protection protocols for a list of available groups.</p>
Required Privilege Level	view

Output Fields	Table 284 on page 2127 lists the output fields for the show ddos-protection protocols parameters command. Output fields are listed in the approximate order in which they appear.

Table 284: show ddos-protection protocols parameters Output Fields

Field Name	Field Description	Level of Output
Protocol Group	Name of protocol group.	All levels
Packet type	Name of packet type in protocol group.	All levels
Bandwidth	Bandwidth policer value; number of packets per second that is allowed before a violation is declared. In the brief output, an asterisk indicates the value has been modified from the default.	All levels
Burst	Burst policer value; the maximum number of packets that is allowed in a burst before a violation is declared. In the brief output, an asterisk indicates the value has been modified from the default.	All levels
Priority	Priority of the packet type in the event of traffic congestion: low , medium , or high . Lower priority packets can be dropped when insufficient bandwidth is available. In the brief output, an asterisk indicates the value has been modified from the default.	All levels
Recover time	Time that must pass since the last violation before the traffic flow is considered to have recovered from the attack. A notification is generated when the timer expires. In the brief output, an asterisk indicates the value has been modified from the default.	All levels
Enabled	State of the policer, enabled (Yes) or disabled (No).	detail none
Bypass aggregate	State of the bypass aggregate configuration: <ul style="list-style-type: none">• Yes—The aggregate policer is bypassed.• No—The aggregate policer is enforced. This field appears only for individual policers.	detail none
FPC slot information	The following configuration information for the card in the indicated slot: <ul style="list-style-type: none">• Bandwidth—Bandwidth scale and the number of packets per second that is allowed before a violation is declared• Burst—Burst scale and the maximum number of packets that is allowed in a burst before a violation is declared• enabled or disabled—State of the line card policer	detail none
Number of policers modified	Number of policers that have been changed from the default configuration. An asterisk by a particular value indicates that value has been modified.	brief terse
Policer Enabled	State of the policer, enabled (Yes), disabled (No), or partially disabled (part.); part. indicates that only some of the policer instances are disabled for the policer.	brief terse

Table 284: show ddos-protection protocols parameters Output Fields (*continued*)

Field Name	Field Description	Level of Output
Bypass aggr.	State of the bypass aggregate configuration: <ul style="list-style-type: none">• Yes—The aggregate policer is bypassed.• No—The aggregate policer is enforced. Dashes indicate that the bypass aggregate configuration is not available; this is possible only for aggregate policers.	brief terse
FPC Mod	Indicates whether configuration has changed from the default for any line cards. <ul style="list-style-type: none">• No—The default configuration has not changed from the default for the packet type.• Yes—The default configuration has changed from the default for the packet type	brief terse

Sample Output

**show ddos-protection
protocols parameters**

user@host> **show ddos-protection protocols parameters**

Protocol Group: IPv4-Unclassified

Packet type: aggregate (Aggregate for unclassified host-bound IPv4 traffic)

Aggregate policer configuration:

Bandwidth: 20000 pps
Burst: 20000 packets
Priority: medium
Recover time: 300 seconds
Enabled: Yes

FPC slot 1 information:

Bandwidth: 100% (20000 pps), Burst: 100% (20000 packets), enabled

Protocol Group: IPv6-Unclassified

Packet type: aggregate (Aggregate for unclassified host-bound IPv6 traffic)

Aggregate policer configuration:

Bandwidth: 20000 pps
Burst: 20000 packets
Priority: medium
Recover time: 300 seconds
Enabled: Yes

FPC slot 1 information:

Bandwidth: 100% (20000 pps), Burst: 100% (20000 packets), enabled

...

Protocol Group: PPPoE

Packet type: aggregate (Aggregate for all PPPoE control traffic)

Aggregate policer configuration:

Bandwidth: 800 pps
Burst: 2000 packets
Priority: medium
Recover time: 300 seconds
Enabled: Yes

FPC slot 1 information:

Bandwidth: 100% (800 pps), Burst: 100% (2000 packets), enabled

Packet type: padi (PPPoE PADI)

Individual policer configuration:

Bandwidth: 500 pps
Burst: 500 packets
Priority: low
Recover time: 300 seconds
Enabled: Yes

Bypass aggregate: No

FPC slot 1 information:

Bandwidth: 100% (500 pps), Burst: 100% (500 packets), enabled

Packet type: pado (PPPoE PADO)

Individual policer configuration:

Bandwidth: 0 pps
Burst: 0 packets
Priority: low
Recover time: 300 seconds
Enabled: Yes

Bypass aggregate: No

FPC slot 1 information:

Bandwidth: 100% (0 pps), Burst: 100% (0 packets), enabled

Packet type: padr (PPPoE PADR)

Individual policer configuration:

Bandwidth: 500 pps

Burst: 500 packets

Priority: medium

Recover time: 300 seconds

Enabled: Yes

Bypass aggregate: No

FPC slot 1 information:

Bandwidth: 100% (500 pps), Burst: 100% (500 packets), enabled

Output Fields	Table 286 on page 2144 lists the output fields for the show ddos-protection protocols violations command. Output fields are listed in the approximate order in which they appear.

Table 286: show ddos-protection protocols violations Output Fields

Field Name	Field Description
Number of packet types that are being violated	Number of individual policers and aggregate policers that are currently being violated
Protocol Group	Name of protocol group
Packet type	Name of packet type in protocol group
Bandwidth (pps)	Policer bandwidth
Arrival rate (pps)	Current traffic rate for packets arriving from all cards and at the Routing Engine

Table 286: show ddos-protection protocols violations Output Fields (*continued*)

Field Name	Field Description
Peak rate (pps)	Highest traffic rate for packets arriving from all cards and at the Routing Engine
Policer bandwidth violation detected at	Timestamp of the policer violation
Detected on	Slot number of the card on which the violation was detected

Sample Output

show ddos-protection protocols violations

show ddos-protection statistics

Syntax	show ddos-protection statistics
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display DDoS protection global statistics for bandwidth violations.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear ddos-protection protocols on page 2102 • show ddos-protection protocols on page 2103 • show ddos-protection version on page 2147
List of Sample Output	show ddos-protection statistics on page 2146
Output Fields	Table 287 on page 2146 lists the output fields for the show ddos-protection statistics command. Output fields are listed in the approximate order in which they appear.

Table 287: show ddos-protection statistics Output Fields

Field Name	Field Description
Currently violated packet types	Number of packet types currently experiencing a bandwidth violation.
Packet types have seen violations	Number of packet types that have experienced a bandwidth violation since statistics were cleared.
Total violation counts	Total number of bandwidth violations.

Sample Output

```

show ddos-protection statistics user@host> show ddos-protection statistics
DDOS protection global statistics:
  Currently violated packet types: 2
  Packet types have seen violations: 2
  Total violation counts: 2

```

show ddos-protection version

Syntax	show ddos-protection version
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display the DDoS protection version and the total numbers of protocol groups and packet types that this version can be configured in this version.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear ddos-protection protocols on page 2102 • show ddos-protection protocols on page 2103 • show ddos-protection statistics on page 2146
List of Sample Output	show ddos-protection version on page 2147
Output Fields	Table 288 on page 2147 lists the output fields for the show ddos-protection version command. Output fields are listed in the approximate order in which they appear.

Table 288: show ddos-protection version Output Fields

Field Name	Field Description
Version	Version number of the DDoS protection code.
Total protocol groups	Number of protocol groups configured with DDoS protection.
Total tracked packet types	Number of protocol packet types configured with DDoS protection.

Sample Output

```

show ddos-protection version  user@host> show ddos-protection version
                               DDOS protection, Version 1.0
                               Total protocol groups      = 83
                               Total tracked packet types  = 154

```

Dynamic Application Awareness Operational Mode Commands

Table 289 on page 2149 summarizes the command line interface (CLI) commands that you can use to monitor and troubleshoot services pertaining to Dynamic Application Awareness operations.

Table 289: Dynamic Application Awareness Operational Mode Commands

Task	Command
Clear entries from application system cache.	<code>clear services application-identification application-system-cache</code>
Clear application- aware access list (AACL) statistics.	<code>clear services application-aware-access-list statistics</code>
Clear application identification counters.	<code>clear services application-identification counter</code>
Clear IDP ip-action entries.	<code>clear services flows ip-action</code>
Clear local policy decision function (L-PDF) statistics.	<code>clear services local-policy-decision-function statistics</code>
Display application-aware-access-list (AACL) flows.	<code>show services application-aware-access-list flows</code>
Display application-aware-access-list (AACL) statistics.	<code>show services application-aware-access-list statistics</code>
Display the database of cached values stored by the application identification (APPID) system.	<code>show services application-identification application-system-cache</code>
Display application identification (APPID) counter statistics.	<code>show services application-identification counter</code>
Display local policy decision function (L-PDF) flows.	<code>show services local-policy-decision-function flows</code>
Display local policy decision function (L-PDF) statistics.	<code>show services local-policy-decision-function statistics</code>

.....

NOTE: For information about how to configure adaptive services, see the Junos Services Interfaces Configuration Release 12.3.

.....

clear services application-identification application-system-cache

Syntax	<code>clear services application-identification application-system-cache</code>
Release Information	Command introduced in Junos OS Release 9.5.
Description	Clear entries from application system cache.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show services application-identification application-system-cache on page 2161

clear services application-aware-access-list statistics

Syntax	clear services application-aware-access-list statistics
Release Information	Command introduced in Junos OS Release 9.5.
Description	Clear application aware access list (AACL) statistics.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show services application-aware-access-list statistics on page 2159

clear services application-identification counter

Syntax	clear services application-identification counter
Release Information	Command introduced in Junos OS Release 9.5.
Description	Clear application identification counters.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show services application-identification counter on page 2163

clear services flows ip-action

Syntax	clear services flows ip-action
Release Information	Command introduced in Junos OS Release 10.0.
Description	Clear ip-action entries generated by the router to log, drop, or block traffic based on previous matches. The IP action options and targets are configured at the [edit security idp idp-policy <i>policy-name</i> rulebase-ips rule <i>rule-name</i> then] hierarchy level.
Options	This command has no options.
Required Privilege Level	clear
Output Fields	When you issue this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> clear services flows ip-action
Interface  Service set      Flows removed
ms-4/0/0   idp-service      1
```

clear services local-policy-decision-function statistics

Syntax	clear services local-policy-decision-function statistics
Release Information	Command introduced in Junos OS Release 9.5.
Description	Clear local policy decision function (L-PDF) statistics.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show services local-policy-decision-function statistics on page 2168

show services application-aware-access-list flows

Syntax	show services application-aware-access-list flows <interface <i>interface-name</i>> <subscriber <i>subscriber-name</i>>
Release Information	Command introduced in Junos OS Release 10.1. Offload status for flows using Juniper Forwarding Mechanism (JFM) added in Junos OS Release 12.1.
Description	Display application-aware-access-list (AACL) flows. Offloading using JFM is supported only on MX Series routers with Modular Port Concentrators (MPCs).
Options	interface <i>interface-name</i> —Displays AACL flows for the specified interface(s) only. The keyword, interface, must be appended to the command. subscriber <i>subscriber-name</i> —Displays AACL flows for the specified subscriber(s) only. The keyword, subscriber, must be appended to the command.
Required Privilege Level	view

show services application-identification application-system-cache

Syntax `show application-identification application-system-cache
<interface interface-name>`

Release Information Command introduced in Junos OS Release 9.5.
interface option added in Junos OS Release 10.1.

Description Display the database of cached values stored by the application identification (APPID) system.

NOTE: The `show services application-identification application-system-cache` command gives the information only when the application identifier (AI) is matched with the signature.

Options `interface interface-name`—Displays the services interfaces to query.

Required Privilege Level view

show services application-identification counter

Syntax	show services application-identification counter <interface <i>interface-name</i>>
Release Information	Command introduced in Junos OS Release 9.5. interface option added in Junos OS Release 10.1.
Description	Display application identification (APPID) counter statistics.
Options	interface <i>interface-name</i> —Displays the services interfaces to query.
Required Privilege Level	view
List of Sample Output	show services application-identification counter on page 2165 show services application-identification counter on page 2165
Output Fields	Table 293 on page 2163 lists the output fields for the show services application-identification counter command. Output fields are listed in the approximate order in which they appear.

Table 293: show services application-identification counter Output Fields

Field Name	Field Description
pic	PIC number.
Total sessions	Total number of sessions.
Total identified sessions	Total number of identified sessions.
Total unidentified sessions	Total number of unidentified sessions.
Total identified-by-address sessions	Number of sessions identified by address.
Total unidentified-by-address sessions	Number of sessions not identified by address.
Total identified-by-port sessions	Number of sessions identified by port.
Total unidentified-by-port sessions	Number of sessions not identified by port.
Total identified-by-icmp sessions	Number of sessions identified by ICMP.
Total unidentified-by-icmp sessions	Number of sessions not identified by ICMP.
Total identified-by-ip-protocol sessions	Number of sessions identified by IP protocol.
Total unidentified-by-ip-protocol sessions	Number of sessions not identified by IP protocol.
Total identified-by-signature sessions	Number of sessions identified by signature.

Table 293: show services application-identification counter Output Fields (*continued*)

Field Name	Field Description
Total unidentified-by-signature sessions	Number of sessions not identified by signature.
Total unspecified encrypted sessions	Number of encrypted sessions not specified by normal processes.
Total encrypted P2P sessions	Number of encrypted point-to-point sessions.
Total application system cache hits	Number of sessions found in the application system cache.
Total application system cache misses	Number of sessions not found in the application system cache.
Total identified-by-protocol sessions	Number of sessions identified by protocol.
Total unidentified-by-protocol sessions	Number of sessions not identified by protocol.

Sample Output

Flow Collection and Monitoring Operational Mode Commands

Table 296 on page 2171 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot flow collection and monitoring services. In the table, the commands are grouped by functionality. In the remainder of this chapter, they are listed strictly in alphabetical order.

Table 296: Flow Collection and Monitoring Operational Commands

Task	Command
Active Flow Monitoring	
Display information about next-hop groups.	<code>show forwarding-options next-hop-group</code>
Display information about port-mirroring instances.	<code>show forwarding-options port-mirroring</code>
Display information about aggregated flows.	<code>show services accounting aggregation</code>
Display information about flow aggregation templates.	<code>show services accounting aggregation template</code>
Display error statistics.	<code>show services accounting errors</code>
Display the number of active flow statistics.	<code>show services accounting flow</code>
Display information about the flows being processed by the accounting service.	<code>show services accounting flow-detail</code>
Display memory and flow record statistics.	<code>show services accounting memory</code>
Display packet size distribution histogram.	<code>show services accounting packet-size-distribution</code>
Display available PICs for the service and redundancy model.	<code>show services accounting status</code>
Display the CPU usage of the PIC.	<code>show services accounting usage</code>

Table 296: Flow Collection and Monitoring Operational Commands (*continued*)

Task	Command
Dynamic Flow Capture	
Clear dynamic flow capture information.	<code>clear services dynamic-flow-capture</code>
Display information for a content destination.	<code>show services dynamic-flow-capture content-destination</code>
Display information for a control source.	<code>show services dynamic-flow-capture control-source</code>
Display dynamic flow capture statistics.	<code>show services dynamic-flow-capture statistics</code>
Flow Collection	
Clear the flow collector statistics for one interface or all interfaces.	<code>clear services flow-collector statistics</code>
Switch to the primary server.	<code>request services flow-collector change-destination primary interface</code>
Switch to the secondary server.	<code>request services flow-collector change-destination secondary interface</code>
Transfer a test file to the primary or secondary FTP server configured as a flow collector.	<code>request services flow-collector test-file-transfer</code>
Display information about the files present on the collector service.	<code>show services flow-collector file interface</code>
Display the number of packets received by one or more flow collection interfaces from one or all monitoring interfaces.	<code>show services flow-collector input interface</code>
Display overall statistics for the flow collector application.	<code>show services flow-collector interface</code>
Passive Flow Monitoring	
Clear passive monitoring statistics.	<code>clear passive-monitoring statistics</code>
Display error statistics.	<code>show passive-monitoring error</code>
Display the number of active flow statistics.	<code>show passive-monitoring flow</code>
Display memory and flow record statistics.	<code>show passive-monitoring memory</code>
Display available PICs for the service and redundancy model.	<code>show passive-monitoring status</code>

Table 296: Flow Collection and Monitoring Operational Commands (*continued*)

Task	Command
Display the CPU usage of the PIC.	<code>show passive-monitoring usage</code>

NOTE: Active flow monitoring is supported on the adaptive services interface (`sp-fpc/pic/port`) on J Series, M Series, and T Series routers, and on the flow monitoring (`mo-fpc/pic/port`) interface on the M Series and T Series routers.

Flow collection is supported on the flow collector interface (`cp-fpc/pic/ /port`) on M40e, M160, and M320 routers and on the T Series routers.

Passive flow monitoring is supported on the flow monitoring interface (`mo-fpc/pic/port`) on the M40e, M160, and M320 routers and on the T Series routers.

NOTE: For information about how to configure flow collection and monitoring services, see the Junos Services Interfaces Configuration Release 12.3.

clear services dynamic-flow-capture

Syntax	<code>clear services dynamic-flow-capture capture-group <i>group-name</i></code> <code><criteria-identifier <i>identifier</i>></code> <code><destination-identifier <i>identifier</i>></code> <code><force></code> <code><static></code>
Release Information	Command introduced in Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Clear dynamic flow capture information for specified capture group.
Options	<code>capture-group <i>group-name</i></code> —Capture-group identifier. <code>criteria-identifier <i>identifier</i></code> —(Optional) Criteria identifier. <code>destination-identifier <i>identifier</i></code> —(Optional) Content destination identifier. <code>force</code> —(Optional) Force clearing of criteria. <code>static</code> —(Optional) Clear static criteria.
Required Privilege Level	network
List of Sample Output	clear services dynamic-flow-capture on page 2174
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services dynamic-flow-capture user@host> clear services dynamic-flow-capture capture-group flow-a
```

clear passive-monitoring statistics

Syntax	clear passive-monitoring statistics (all interface <i>interface-name</i>)
Release Information	Command introduced in Junos OS Release 7.6.
Description	(M40e, M160, and M320 routers and T Series routers only) Clear statistics for one passive monitoring interface or for all passive monitoring interfaces.
Options	<p>all—Clear statistics for all configured passive monitoring interfaces.</p> <p>interface <i>interface-name</i>—Clear statistics for the specified passive monitoring interface (<i>mo-fpc/pic/port</i>).</p>
Required Privilege Level	network
List of Sample Output	clear passive-monitoring statistics on page 2175
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear
passive-monitoring
statistics
```

```
user@host> clear passive-monitoring statistics interface mo-5/0/0
```

clear services flow-collector statistics

Syntax	clear services flow-collector statistics (all interface <i>interface-name</i>)
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Clear statistics for one flow collector interface or for all flow collector interfaces.
Options	all —Clear statistics for all configured flow collector interfaces. interface <i>interface-name</i> —Clear statistics for the specified flow collector interface (<i>cp-fpc/pic/port</i>).
Required Privilege Level	network
List of Sample Output	clear services flow-collector statistics on page 2176
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>clear services flow-collector statistics</code>	<pre>user@host> clear services flow-collector statistics interface cp-5/0/0 Flow collector interface: cp-5/0/0 Interface state: Collecting flows Statistics cleared successfully</pre>
---	---

request services flow-collector change-destination primary interface

Syntax	request services flow-collector change-destination primary interface <i>cp-fpc/pic/port</i> <clear-files> <clear-logs> <immediately gracefully>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Switch to the primary File Transfer Protocol (FTP) server that is configured as a flow collector.
Options	<p>none—Switch to the primary FTP server.</p> <p>cp-fpc/pic/port—Specify the flow collector interface name for the primary destination.</p> <p>clear-files—(Optional) Request clearing of existing data files in the FTP wait queue when the switch takes place.</p> <p>clear-logs—(Optional) Request clearing of existing logs when the switch takes place.</p> <p>immediately gracefully—(Optional) Specify whether you want the switch to take place immediately, or to affect only newly created files.</p>
Required Privilege Level	maintenance
List of Sample Output	request services flow-collector change-destination primary interface on page 2177
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request services flow-collector change-destination primary interface	<pre>user@host> request services flow-collector change-destination primary interface cp-6/0/0 Flow collector interface: cp-6/0/0 Interface state: Collecting flows Destination change successful</pre>
---	---

request services flow-collector change-destination secondary interface

Syntax	<code>request services flow-collector change-destination secondary interface <i>cp-fpc/pic/port</i></code> <code><clear-files></code> <code><clear-logs></code> <code><immediately gracefully></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Switch to the secondary File Transfer Protocol (FTP) server that is configured as a flow collector.
Options	<p>none—Switch to the secondary FTP server.</p> <p><i>cp-fpc/pic/port</i>—Specify the flow collector interface name (<i>cp-fpc/pic/port</i>) for the secondary destination.</p> <p>clear-files—(Optional) Request clearing of existing data files in the FTP wait queue when the switch takes place.</p> <p>clear-logs—(Optional) Request clearing of existing logs when the switch takes place.</p> <p>immediately gracefully—(Optional) Specify whether you want the switch to take place immediately, or to affect only newly created files.</p>
Required Privilege Level	maintenance
List of Sample Output	request services flow-collector change-destination secondary interface on page 2178
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>request services flow-collector change-destination secondary interface</code>	<pre>user@host> request services flow-collector change-destination secondary interface cp-6/0/0 Flow collector interface: cp-6/0/0 Interface state: Collecting flows Destination change successful</pre>
---	---

request services flow-collector test-file-transfer

Syntax	<code>request services flow-collector test-file-transfer <i>filename</i> interface (all <i>cp-fpc/pic/port</i>) (channel-zero channel-one) (primary secondary)</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers, PTX Series, and T Series routers only) Transfer a test file to the primary or secondary File Transfer Protocol (FTP) server that is configured as a flow collector. This command verifies that the output side of the flow collector interface is operating properly.
Options	<p><i>filename</i>—Name of the test file to transfer.</p> <p>interface all <i>cp-fpc/pic/port</i>—Transfer a test file of flows from all configured flow collector interfaces or from only the specified interface.</p> <p>channel-zero channel-one—Transfer a file from export channel 0 (unit 0) or channel 1 (unit 1) of the PIC.</p> <p>primary secondary—Transfer a file to the primary or secondary server configured as a flow collector.</p>
Required Privilege Level	network
List of Sample Output	request services flow-collector test-file-transfer on page 2179
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```

request services flow-collector test-file-transfer
user@router> request services flow-collector test-file-transfer test_file interface cp-7/1/0
channel-one primary

Flow collector interface: cp-7/1/0
Interface state: Collecting flows
Response: Test file transfer successfully scheduled

```

show forwarding-options next-hop-group

Syntax	show forwarding-options next-hop-group <terse brief detail> <group-name>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display current state of next-hop groups.
Options	terse brief detail —(Optional) Display the specified level of output. group-name —(Optional) Display a single next-hop group.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show forwarding-options port-mirroring on page 2184

show forwarding-options port-mirroring

Syntax	show forwarding-options port-mirroring <terse detail> <instance-name>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display current state of port-mirroring instances.
Options	terse detail —(Optional) Display the specified level of output. instance-name —(Optional) Display a single port-mirroring instance.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show forwarding-options next-hop-group on page 2180
List of Sample Output	show forwarding-options port-mirroring terse on page 2185 show forwarding-options port-mirroring detail on page 2185
Output Fields	Table 298 on page 2184 lists the output fields for the show forwarding-options port-mirroring command. Output fields are listed in the approximate order in which they appear.

Table 298: show forwarding-options port-mirroring Output Fields

Field Name	Field Description	Level of Output
Instance Name	Name of port-mirroring instance.	All levels
Instance Id	Instance identification number.	All levels
State	Instance state, either up or down .	All levels
Input parameters		
Rate	Rate (ratio of packets sampled).	detail
Run-length	Run length (number of consecutive packets sampled).	detail
Maximum-packet-length	Maximum packet length.	detail
Output parameters		
Family	Protocol family.	detail
State	Instance state, either up or down .	detail
Destination	Destination (next-hop group name).	detail

Sample Output

show
forwarding-options
port-mirroring terse

```
user@host> show forwarding-options port-mirroring terse
Instance Name      Instance Id  State
&global_instance   1           up

    Family: vpls/bridge State: down Destination: vpls_nhg_2
```

show passive-monitoring error

Syntax	<code>show passive-monitoring error (* all mo-fpc/pic/port)</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display passive monitoring error statistics.
Options	<code>* all mo-fpc/pic/port</code> —Display error statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name.
Required Privilege Level	view
List of Sample Output	show passive-monitoring error all on page 2187
Output Fields	Table 299 on page 2186 lists the output fields for the show passive-monitoring error command. Output fields are listed in the approximate order in which they appear.

Table 299: show passive-monitoring error Output Fields

Field Name	Field Description
Passive monitoring interface	Name of the passive monitoring interface.
Local interface index	Index counter of the local interface.
Interface state	State of the passive monitoring interface: <ul style="list-style-type: none"> • Monitoring—Specified interface is actively monitoring. • Disabled—Specified interface has been disabled from the CLI. • Not monitoring—The interface is operational, but not monitoring. This condition occurs when an interface first comes online, or when the interface is operational, but no logical unit has been configured under the physical interface. • Unknown—Unknown state. • Error—An error occurred during the process of determining the state of the interface.
Error information	
Packets dropped (no memory)	Number of packets dropped because of memory shortage.
Packets dropped (not IP)	Number of non-IP packets dropped.
Packets dropped (not IPv4)	Number of packets dropped because they failed the IPv4 version check.
Packets dropped (header too small)	Number of packets dropped because the packet length or IP header length was too small.

Table 299: show passive-monitoring error Output Fields (*continued*)

Field Name	Field Description
Memory allocation failures	Number of flow record memory allocation failures. A small number reflects failures to replenish the free list. A large number indicates the monitoring station is almost out of memory space.
Memory free failures	Number of flow record memory free failures.
Memory free list failures	Number of flow records received from free list that failed. Memory is nearly exhausted or too many new flows greater than 128 KB are being created per second.
Memory warning	Whether the flows have exceeded 1 million packets per second (Mpps) on a Monitoring Services PIC or 2 Mpps on a Monitoring Services II PIC. The response can be Yes or No .
Memory overload	Whether the memory has been overloaded. The response can be Yes or No .
PPS overload	Whether the PIC is receiving more packets per second than the configured threshold. The response can be Yes or No .
BPS overload	Whether the PIC is receiving more bits per second than the configured threshold. The response can be Yes or No .

Sample Output

**show
passive-monitoring
error all**

```

user@host> show passive-monitoring error all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Interface state: Monitoring
Error information
  Packets dropped (no memory): 0, Packets dropped (not IP): 0
  Packets dropped (not IPv4): 0, Packets dropped (header too small): 0
  Memory allocation failures: 0, Memory free failures: 0
  Memory free list failures: 0
  Memory warning: No, Memory overload: No, PPS overload: No, BPS overload: No

Passive monitoring interface: mo-4/1/0, Local interface index: 45
Interface state: Not monitoring
Error information
  Packets dropped (no memory): 0, Packets dropped (not IP): 0
  Packets dropped (not IPv4): 0, Packets dropped (header too small): 0
  Memory allocation failures: 0, Memory free failures: 0
  Memory free list failures: 0
  Memory warning: No, Memory overload: No, PPS overload: No, BPS overload: No

```

show passive-monitoring flow

Syntax	show passive-monitoring flow (* all mo- <i>fpc/pic/port</i>)
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display passive flow statistics.
Options	* all mo- <i>fpc/pic/port</i> —Display passive flow statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name.
Required Privilege Level	view
List of Sample Output	show passive-monitoring flow all on page 2189
Output Fields	Table 300 on page 2188 lists the output fields for the show passive-monitoring flow command. Output fields are listed in the approximate order in which they appear.

Table 300: show passive-monitoring flow Output Fields

Field Name	Field Description
Passive monitoring interface	Name of the passive monitoring interface.
Local interface index	Index counter of the local interface.
Interface state	State of the passive monitoring interface: <ul style="list-style-type: none"> • Monitoring—Specified interface is actively monitoring. • Disabled—Specified interface has been disabled from the CLI. • Not monitoring—The interface is operational, but not monitoring. This condition occurs when an interface first comes online, or when the interface is operational, but no logical unit has been configured under the physical interface. • Unknown—Unknown state. • Error—An error occurred during the process of determining the state of the interface.
Flow information	
Flow packets	Number of packets received by an operational PIC.
Flow bytes	Number of bytes received by an operational PIC.
Flow packets 10-second rate	Number of packets per second handled by the PIC and displayed as a 10-second average.
Flow bytes 10-second rate	Number of bytes per second handled by the PIC and displayed as a 10-second average.
Active flows	Number of currently active flows tracked by the PIC.
Total flows	Total number of flows received by an operational PIC.

Table 300: show passive-monitoring flow Output Fields (*continued*)

Field Name	Field Description
Flows exported	Total number of flows exported by an operational PIC.
Flows packets exported	Total number of cflowd packets exported by an operational PIC.
Flows inactive timed out	Total number of flows that are exported because of inactivity.
Flows active timed out	Total number of long-lived flows that are exported because of an active timeout.

Sample Output

**show
passive-monitoring
flow all**

```
user@host> show passive-monitoring flow all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Interface state: Monitoring
Flow information
  Flow packets: 6533434, Flow bytes: 653343400
  Flow packets 10-second rate: 0, Flow bytes 10-second rate: 0
  Active flows: 0, Total flows: 1599
  Flows exported: 1599, Flows packets exported: 55
  Flows inactive timed out: 1599, Flows active timed out: 0

Passive monitoring interface: mo-4/1/0, Local interface index: 45
Interface state: Monitoring
Flow information
  Flow packets: 6537780, Flow bytes: 653778000
  Flow packets 10-second rate: 0, Flow bytes 10-second rate: 0
  Active flows: 0, Total flows: 1601
  Flows exported: 1601, Flows packets exported: 55
  Flows inactive timed out: 1601, Flows active timed out: 0
```

show passive-monitoring memory

Syntax	<code>show passive-monitoring memory (* all mo-<i>fpc/pic/port</i>)</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display passive monitoring memory and flow record statistics
Options	<code>* all mo-<i>fpc/pic/port</i></code> —Display memory and flow record statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name.
Required Privilege Level	view
List of Sample Output	show passive-monitoring memory all on page 2191
Output Fields	Table 301 on page 2190 lists the output fields for the show passive-monitoring memory command. Output fields are listed in the approximate order in which they appear.

Table 301: show passive-monitoring memory Output Fields

Field Name	Field Description
Passive monitoring interface	Name of the passive monitoring interface.
Local interface index	Index counter of the local interface.
Memory utilization	
Allocation count	Number of flow records allocated.
Free count	Number of flow records freed.
Maximum allocated	Maximum number of flow records allocated since the monitoring station booted. This number represents the peak number of flow records allocated at a time.
Allocations per second	Flow records allocated per second during the last statistics interval on the PIC.
Frees per second	Flow records freed per second during the last statistics interval on the PIC.
Total memory used, Total memory free	Total memory currently used and total amount of memory currently free (in bytes).

Sample Output

show
passive-monitoring
memory all

```
user@host> show passive-monitoring memory all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Memory utilization
  Allocation count: 1600, Free count: 1599, Maximum allocated: 1600
  Allocations per second: 3200, Frees per second: 1438
  Total memory used (in bytes): 103579176, Total memory free (in bytes):
  163914184
```

show passive-monitoring status

Syntax	<code>show passive-monitoring status (* all mo-fpc/pic/port)</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display passive monitoring status.
Options	<code>* all mo-fpc/pic/port</code> —Display status for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name.
Required Privilege Level	view
List of Sample Output	show passive-monitoring status all on page 2193
Output Fields	Table 302 on page 2192 lists the output fields for the show passive-monitoring status command. Output fields are listed in the approximate order in which they appear.

Table 302: show passive-monitoring status Output Fields

Output Field	Output Field Description
Passive monitoring interface	Name of the passive monitoring interface.
Local interface index	Index counter of the local interface.
Interface state	Monitoring state of the passive monitoring interface. <ul style="list-style-type: none"> • Monitoring—PIC is actively monitoring. • Disabled—PIC has been disabled using the CLI. • Not monitoring—PIC is operational, but not monitoring. This condition can happen while the PIC is coming online, or when the PIC is operational but has no logical unit configured under the physical interface. • Unknown
Group index	Integer that represents the monitoring group of which the PIC is a member. Group index is a mapping from the group name to an index. It is not related to the number of monitoring groups.
Export interval	Configured export interval for cflowd records, in seconds.
Export format	Configured export format (only cflowd version 5 is supported).
Protocol	Protocol the PIC is configured to monitor (only IPv4 is supported).
Engine type	Configured engine type that is inserted in output cflowd packets.
Engine ID	Configured engine ID that is inserted in output cflowd packets.

Sample Output

`show
passive-monitoring
status all`

```
user@host> show passive-monitoring status all
Passive monitoring interface: mo-4/0/0, Local interface index: 44
Interface state: Monitoring
  Group index: 0
  Export interval: 15 secs, Export format: cflowd v5
  Protocol: IPv4, Engine type: 1, Engine ID: 1

Passive monitoring interface: mo-4/1/0, Local interface index: 45
Interface state: Disabled

Passive monitoring interface: mo-4/2/0, Local interface index: 46
Interface state: Not monitoring
```

show passive-monitoring usage

Syntax	<code>show passive-monitoring usage (* all mo-fpc/pic/port)</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display passive monitoring usage statistics.
Options	<code>* all mo-fpc/pic/port</code> —Display usage statistics for monitoring interfaces. Use a wildcard character, specify all interfaces, or provide a specific interface name.
Required Privilege Level	view
List of Sample Output	show passive-monitoring usage all on page 2195
Output Fields	Table 303 on page 2194 lists the output fields for the show passive-monitoring usage command. Output fields are listed in the approximate order in which they appear.

Table 303: show passive-monitoring usage Output Fields

Output Field	Output Field Description
Passive monitoring interface	Name of the passive monitoring interface.
Local interface index	Index counter of the local interface.
CPU utilization	
Uptime	Time, in milliseconds, that the PIC has been operational.
Interrupt time	Total time that the PIC has spent processing packets since the last PIC reset.
Load (5 second)	CPU load on the PIC, averaged more than 5 seconds. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time.
Load (1 minute)	CPU load on the PIC, averaged more than 1 minute. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time.

Sample Output

show
passive-monitoring
usage all

```
user@host> show passive-monitoring usage
Passive monitoring interface: mo-4/0/0, Local interface index: 44
CPU utilization
  Uptime: 653155 milliseconds, Interrupt time: 40213754 microseconds
  Load (5 second): 20%, Load (1 minute): 17%

Passive monitoring interface: mo-4/1/0, Local interface index: 45
CPU utilization
  Uptime: 652292 milliseconds, Interrupt time: 40223178 microseconds
  Load (5 second): 22%, Load (1 minute): 15%

Passive monitoring interface: mo-4/2/0, Local interface index: 46
CPU utilization
  Uptime: 649491 milliseconds, Interrupt time: 40173645 microseconds
  Load (5 second): 22%, Load (1 minute): 10098862%
```

show services accounting aggregation

Syntax	<pre>show services accounting aggregation <i>aggregation-type</i> <<i>aggregation-value</i>> <detail extensive terse> <limit <i>limit-value</i>> < name <i>service-name</i>> <order (bytes packets)></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display information about the aggregated active flows being processed by the accounting service.
Options	<p><i>aggregation-type</i> <<i>aggregation-value</i>>—Display information for a particular aggregation type and optional value:</p> <ul style="list-style-type: none"> as <<i>source-as-value</i> <i>destination-as-value</i> <i>input-snmp-interface-index-value</i> <i>output-snmp-interface-index-value</i>>—Aggregate by autonomous system (AS). destination-prefix <<i>destination-prefix-value</i> <i>destination-as-value</i> <i>output-snmp-interface-index-value</i>>—Aggregate by destination prefix. protocol-port <<i>protocol-value</i> <i>source-port-value</i> <i>destination-port-value</i>>—Aggregate by protocol and port. source-destination-prefix <<i>source-prefix-value</i> <i>destination-prefix-value</i> <i>destination-as-value</i> <i>source-as-value</i> <i>input-snmp-interface-index-value</i> <i>output-snmp-interface-index-value</i>>—Aggregate by source and destination prefix. source-prefix <<i>source-prefix-value</i> <i>source-as-value</i> <i>input-snmp-interface-index-value</i>>—Aggregate by source prefix. <p>detail extensive terse—(Optional) Display the specified level of output.</p> <p>limit <i>limit-value</i>—(Optional) Limit the display output to this number of flows. The default is no limit.</p> <p>name <i>service-name</i>—(Optional) Display information about the aggregated flows for a particular service name.</p> <p>order (bytes packets)—(Optional) Display the flow with the ordering of the highest number, either by byte count or by packet count.</p>
Additional Information	For information about aggregation configuration options, see the Junos Services Interfaces Configuration Release 12.3.
Required Privilege Level	view

Output Fields Table 304 on page 2197 lists the output fields for the **show services accounting aggregation** command. Output fields are listed in the approximate order in which they appear.

Table 304: show services accounting aggregation Output Fields

Field Name	Field Description
Service Accounting interface	Name of the service accounting interface.
Local interface index	Index corresponding to the service accounting interface.
Service name	Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit forwarding-options sampling-level] hierarchy level.
Protocol	Protocol identifier and number.
Source Port	Source port identifier and number.
Destination Port	Destination port identifier and number.
Source-AS	Source autonomous system (AS) number.
Destination-AS	Destination AS number.
Source Prefix	Source prefix.
Destination Prefix	Destination prefix.
Source address	Source address.
Source prefix length	Source prefix length.
Destination address	Destination address.
Destination prefix length	Destination prefix length.
Input SNMP interface index	SNMP index of the interface the packet came in on.
Output SNMP interface index	SNMP index of the interface the packet went out on.

Table 304: show services accounting aggregation Output Fields (*continued*)

Field Name	Field Description
Start time	Actual time when the packet in this aggregation was first seen.
End time	Actual time when the packet in this aggregation was last seen.
Flow count	Number of flows in the aggregation.
Packet count	Number of packets in the aggregation.
Byte count	Number of bytes in the aggregation.

Sample Output

show services

show services accounting aggregation template

Syntax	show services accounting aggregation template <template-name <i>template-name</i>>
Release Information	Command introduced in Junos OS Release 8.3.
Description	Display information for flow aggregation version 9 templates.
Options	<template-name <i>template-name</i>> —(Optional) Display information for the specified template only.
Required Privilege Level	view
List of Sample Output	show services accounting aggregation template on page 2200
Output Fields	Table 305 on page 2200 lists the output fields for the show services accounting aggregation template command. Output fields are listed in the approximate order in which they appear.

Table 305: show services accounting aggregation template Output Fields

Field Name	Field Description
MPLS Label 1	Position of first MPLS label.
MPLS Label 2	Position of second MPLS label.
MPLS Label 3	Position of third MPLS label.
MPLS Top Level Address	Outer top label FEC IP address.
Packet Count	Number of packets sent.

Sample Output

show services accounting aggregation template

```

user@host> show services accounting aggregation template template-name mpls
MPLS label 1: 299808, MPLS label 2: 0, MPLS label 3: 0
Source address: 11.1.1.2, Destination address: 10.255.15.22, Top Label Address:
22.15.255.10
Source port: 0, Destination port: 0
Protocol: 61, TOS: 0, TCP flags: 0
Source mask: 24, Destination mask: 32
Input SNMP interface index: 503, Output SNMP interface index: 505
Start time: 40780, End time: 157330
Packet count: 3949198, Byte count: 181663062

```

show services accounting errors

Syntax	show services accounting errors <inline-jflow name (* all <i>service-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display active flow error statistics.
Options	<p>none—Display error statistics for all services accounting instances.</p> <p>inline-jflow fpc-slot <i>slot-number</i>—(Optional) Display error statistics for inline jflow.</p> <p>name (* all <i>service-name</i>)—(Optional) Display active flow error statistics. Use a wildcard character, specify all services, or provide a specific service name.</p>
Required Privilege Level	view
List of Sample Output	<p>show services accounting errors (Monitoring PIC interface) on page 2202</p> <p>show services accounting errors (Service PIC interface) on page 2203</p> <p>show services accounting errors inline-jflow fpc-slot slot-number (when only IPv6 is configured) on page 2203</p> <p>show services accounting errors inline-jflow fpc-slot slot-number (when both IPv4 and IPv6 are configured) on page 2203</p> <p>show services accounting errors inline-jflow (MX80 Router when both IPv4 and IPv6 are configured) on page 2203</p>
Output Fields	Table 306 on page 2201 lists the output fields for the show services accounting errors command. Output fields are listed in the approximate order in which they appear.

Table 306: show services accounting errors Output Fields

Field	Field Description
Service Accounting interface	Name of the service accounting interface.
Local interface index	Index counter of the local interface.
FPC slot	Slot number of the FPC for which the flow information is displayed. (Available only when the inline-jflow fpc-slot slot-number option is used.)
Service name	Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit forwarding-options sampling-level] hierarchy level.
Error Information	
Packets dropped (no memory)	Number of packets dropped because of memory shortage.

Table 306: show services accounting errors Output Fields (*continued*)

Field	Field Description
Packets dropped (not IP)	Number of non-IP packets dropped.
Packets dropped (not IPv4)	Number of packets dropped because they failed the IPv4 version check.
Packets dropped (header too small)	Number of packets dropped because the packet length or IP header length was too small.
Memory allocation failures	Number of flow record memory allocation failures. A small number reflects failures to replenish the free list. A large number indicates the monitoring station is almost out of memory space.
Memory free failures	Number of flow record memory free failures.
Memory free list failures	Number of flow records received from the free list that failed. Memory is nearly exhausted, or too many new flows greater than 128 KB are being created per second.
Memory overload	Whether the memory has been overloaded. The response can be Yes or No .
PPS overload	Whether the PIC is receiving more packets per second than the configured threshold. The response can be Yes or No .
BPS overload	Whether the PIC is receiving more bits per second than the configured threshold. The response can be Yes or No .
Flow Creation Failures	Number of times flow creation failed.
Route Record Lookup Failures	Number of times the route record lookup failed.
AS Lookup Failures	Number of times autonomous system lookup failed.
Export Packet Failures	Number of times packet export failed.

Sample Output

**show services
accounting errors**

```
user@host> show services accounting errors

show services accounting flow

Syntax	<code>show services accounting flow</code> <code><inline-jflow logical-system name (* all service-name)></code>
Release Information	Command introduced before Junos OS Release 7.4. Junos OS Release 10.0 added the capability to display output from multiple sampling instances.
Description	Display active flow statistics.
Options	<p>none—Display active flow statistics for all service instances.</p> <p>logical-system (all logical-system)—(Optional) Display active flow statistics for the specified logical system or all logical systems on the device.</p> <p>inline-jflow (fpc-slot slot-number)—(Optional) Display inline flow statistics for the specified FPC.</p> <p>name (* all service-name)—(Optional) Display services accounting active flow statistics. Use a wildcard character, specify all services, or provide a specific service name.</p>
Required Privilege Level	view
List of Sample Output	show services accounting flow (flow aggregation v5/v8 configuration) on page 2206 show services accounting flow (flow aggregation v9 configuration) on page 2206 show services accounting flow name on page 2207 show services accounting flow name all on page 2207 show services accounting flow (multiple sampling instances) on page 2207 show services accounting flow inline-jflow fpc-slot slot-number (for IPv4 flow) on page 2208 show services accounting flow inline-jflow fpc-slot slot-number (with IPv4 and IPv6 Configuration) on page 2208 show services accounting flow inline-jflow (MX80 Router with IPv4 and IPv6 Configuration) on page 2208
Output Fields	Table 307 on page 2205 lists the output fields for the show services accounting flow command. Output fields are listed in the approximate order in which they appear.

Table 307: show services accounting flow Output Fields

Output Field	Output Field Description
Service Accounting interface	Name of the service accounting interface.
Local interface index	Index counter of the local interface.
Service name	Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling) , indicates the service was configured at the [edit forwarding-options sampling-level] hierarchy level.

Table 307: show services accounting flow Output Fields (*continued*)

Output Field	Output Field Description
Flow Information	
FPC Slot	Slot number of the FPC for which the flow information is displayed. (Available only when the inline-jflow fpc-slot slot-number option is used.)
Flow packets	Number of packets received by an operational PIC.
Flow bytes	Number of bytes received by an operational PIC.
Flow packets 10-second rate	Number of packets per second handled by the PIC and displayed as a 10-second average.
Flow bytes 10-second rate	Number of bytes per second handled by the PIC and displayed as a 10-second average.
Active flows	Number of currently active flows tracked by the PIC.
Total flows	Total number of flows received by an operational PIC.
Flows exported	Total number of flows exported by an operational PIC.
Flows packets exported	Total number of cflowd packets exported by an operational PIC.
Flows inactive timed out	Total number of flows that are exported because of inactivity.
Flows active timed out	Total number of long-lived flows that are exported because of an active timeout.

Sample Output

show services accounting flow-detail

Syntax `show services accounting flow-detail`
 `<detail | extensive | terse>`
 `<filters>`
 `<limit limit-value>`
 `<name (* | all | service-name)>`
 `<order (bytes | packets)>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display information about the flows being processed by the accounting service.

Options `detail | extensive | terse`—(Optional) Display the specified level of output.

filters—(Optional) Filter the display output of the currently active flow records. The following filters query actively changing data structures and result in different results for multiple invocations:

- **destination-as**—Display flow records filtered by destination autonomous system information.
- **destination-port**—Display flow records filtered by destination port information.
- **destination-prefix**—Display flow records filtered by destination prefix information.
- **input-snmp-interface-index**—Display flow records filtered by SNMP input interface index information.
- **output-snmp-interface-index**—Display flow records filtered by SNMP output interface index information.
- **proto**—Display flow records filtered by protocol type.
- **source-as**—Display flow records filtered by source autonomous system information.
- **source-port**—Display flow records filtered by source port information.
- **source-prefix**—Display flow records filtered by source prefix information.
- **tos**—Display flow records filtered by type of service classification.

limit limit-value—(Optional) Limit the display output to the specified number of flows. The default is no limit.

name (* | all | service-name)—(Optional) Display information about the flows being processed. Use a wildcard character, specify all services, or provide a specific services name.

order (bytes | packets)—(Optional) Display the flow with the ordering of the highest number, either by byte count or by packet count.

Additional Information When no PIC is active, or when no route record has been downloaded from the PIC, this command reports no flows, even though packets are being sampled. This command

displays information about two concurrent sessions only. If a third session is attempted, the command pauses with no output until one of the previous sessions is completed.

Required Privilege Level view

List of Sample Output [show services accounting flow-detail on page 2213](#)
[show services accounting flow-detail limit on page 2213](#)

Output Fields [Table 308 on page 2211](#) lists the output fields for the **show services accounting flow-detail** command. Output fields are listed in the approximate order in which they appear.

Table 308: show services accounting flow-detail Output Fields

Field Name	Field Description	Output Level
Service Accounting interface	Name of the service accounting interface.	All levels
Service name	Name of a service that was configured at the [edit forwarding-options accounting] hierarchy level. The default display, (default sampling) , indicates the service was configured at the [edit forwarding-options sampling] hierarchy level.	All levels
Local interface index	Index counter of the local interface.	All levels
TOS	Type-of-service value from the IP header.	extensive
Input SNMP interface index	SNMP index of the interface on which the packet came in.	extensive
Output SNMP interface index	SNMP index of the interface on which the packet went out.	extensive
Source-AS	Source AS number.	extensive
Destination-AS	Destination AS number.	extensive
Protocol	Name of the protocol used for the packet flow from the corresponding source address.	All levels
Input interface	Interface on which the packets were received.	All levels
Output interface	Interface on which the packets were transmitted.	All levels
TCP flags	Number of TCP header flags detected in the flow.	extensive
Source address	Address where the flow originated.	All levels
Source port	Name of the source port.	All levels

Table 308: show services accounting flow-detail Output Fields (*continued*)

Field Name	Field Description	Output Level
Source prefix length	Source prefix length.	extensive
Destination address	Address where the flow is sent.	All levels
Destination prefix length	Destination prefix length.	extensive
Destination port	Name of the destination port.	All levels
Start time	Actual time when the packet in this aggregation was first seen.	detail extensive
End time	Actual time when the packet in this aggregation was last seen.	detail extensive
Packet count	Number of packets in the aggregation.	All levels
Byte count	Number of bytes in the aggregation.	All levels
Time since last active timeout	Amount of time elapsed since the last active timeout, in the format <i>hh:mm:ss</i> .	None specified
Packet count for last active timeout	Number of packets in the aggregation since the last active timeout.	None specified
Byte count for last active timeout	Number of bytes in the aggregation since the last active timeout.	None specified

Sample Output

show services accounting flow-detail

In this sample, the output is split into three sections, with ellipses (...) indicating where the sections are continued.

```
user@host> show services accounting flow-detail
Service Accounting interface: rsp0, Local interface index: 171
Service name: (default sampling)
Interface state: Accounting

show services accounting memory

Syntax	show services accounting memory
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display memory and flow record statistics.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show services accounting memory (Monitoring PIC interface) on page 2215 show services accounting memory (Service PIC interface) on page 2216
Output Fields	Table 309 on page 2215 lists the output fields for the show services accounting memory command. Output fields are listed in the approximate order in which they appear.

Table 309: show services accounting memory Output Fields

Output Field	Output Field Description
Service Accounting interface	Name of the service accounting interface.
Memory Utilization	
Local interface index	Index counter of the local interface.
Allocation count	Number of flow records allocated.
Free count	Number of flow records freed.
Maximum allocated	Maximum number of flow records allocated since the monitoring station booted. This number represents the peak number of flow records allocated at a time.
Allocations per second	Flow records allocated per second during the last statistics interval on the PIC.
Frees per second	Flow records freed per second during the last statistics interval on the PIC.
Total memory used	Total amount of memory currently used (in bytes).
Total memory free	Total amount of memory currently free (in bytes).

Sample Output

```

show services accounting memory
user@host> show services accounting memory
Service Accounting interface: mo-2/0/0, Local interface index: 468
Memory utilization

```

(Monitoring PIC interface)

Allocation count: 437340, Free count: 433699, Maximum allocated: 6782
 Allocations per second: 3366, Frees per second: 6412
 Total memory used (in bytes): 133460320,
 Total memory free (in bytes): 133918352

Sample Output

show services
 accounting memory
 (Service PIC interface)

```
user@host> show services accounting memory
Service Accounting interface: sp-0/1/0
  Memory utilization
    Allocation count: 1000, Free count: 0
    Allocations per second: 0, Frees per second: 0
    Total memory used (in bytes): 218158272
    Total memory free (in bytes): 587147696

Service Accounting interface: sp-1/0/0
  Memory utilization
    Allocation count: 1000, Free count: 0
    Allocations per second: 0, Frees per second: 0
    Total memory used (in bytes): 218157592
    Total memory free (in bytes): 587148376
```

show services accounting packet-size-distribution

Syntax	show services accounting packet-size-distribution <name (* all <i>service-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display a packet size distribution histogram.
Options	<p>none—Display a packet size distribution histogram of all accounting services.</p> <p>name (* all <i>service-name</i>)—(Optional) Display a packet size distribution histogram. Use a wildcard character, specify all services, or provide a specific services name.</p>
Required Privilege Level	view
List of Sample Output	show services accounting packet-size-distribution name on page 2217
Output Fields	Table 310 on page 2217 lists the output fields for the show services accounting packet-size-distribution command. Output fields are listed in the approximate order in which they appear.

Table 310: show services accounting packet-size-distribution Output Fields

Field Name	Field Description
Service Accounting interface	Name of the service accounting interface.
Service name	Name of a service that was configured at the [edit-forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit-forwarding-options sampling-level] hierarchy level.
Local interface index	Index counter of the local interface.
Range start	Smallest packet length (in bytes) to count.
Range end	Largest packet length (in bytes) to count.
Number of packets	Count of packets detected in the size between Range start and Range end.
Percentage packets	Percentage of the total number of packets that are in this size range.

Sample Output

```

show services accounting
user@host> show services accounting packet-size-distribution name test3
Service Accounting interface: mo-0/2/0, Local interface index: 163
Service name: test3

```

packet-size-distribution	Range start	Range end	Number of packets	Percentage packets
name	32	64	2924	100

show services accounting status

Syntax	show services accounting status <inline-jflow name (* all <i>service-name</i>)>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display available Physical Interface Cards (PICs) for accounting services.
Options	<p>none—Display available PICs for all accounting services.</p> <p>inline-jflow fpc-slot <i>slot-number</i>—(Optional) Display inline flow accounting status for the specified FPC.</p> <p>name (* all <i>service-name</i>)—(Optional) Display available PICs. Use a wildcard character, specify all services, or provide a specific services name.</p>
Required Privilege Level	view
List of Sample Output	<p>show services accounting status name (Monitoring PIC interface) on page 2220</p> <p>show services accounting status name (Service PIC interface) on page 2220</p> <p>show services accounting status inline-jflow fpc-slot <i>slot-number</i> (when both IPv4 and IPv6 are configured) on page 2221</p> <p>show services accounting status inline-jflow (MX80 Router when both IPv4 and IPv6 are configured) on page 2221</p>
Output Fields	Table 311 on page 2219 lists the output fields for the show services accounting status command. Output fields are listed in the approximate order in which they appear.

Table 311: show services accounting status Output Fields

Field	Field Description
Service Accounting interface	Name of the service accounting interface.
Service name	Name of a service that was configured at the [edit-forwarding-options accounting] hierarchy level. The default display, (default sampling) , indicates the service was configured at the [edit-forwarding-options sampling-level] hierarchy level.
FPC Slot	Slot number of the FPC for which the flow information is displayed. (Available only when the inline-jflow fpc-slot <i>slot-number</i> option is used.)
Local interface index	Index counter of the local interface.

Table 311: show services accounting status Output Fields (*continued*)

Field	Field Description
Interface state	Accounting state of the passive monitoring interface. <ul style="list-style-type: none"> • Accounting—PIC is actively accounting. • Disabled—PIC has been disabled from the CLI. • Not accounting—PIC is up but not accounting. This can happen while the PIC is coming online, or when the PIC is up but has no logical unit configured under the physical interface. • Unknown
Group index	Integer that represents the monitoring group of which the PIC is a member. Group index is a mapping from the group name to an index. It is not related to the number of monitoring groups.
Export interval (in seconds)	Configured export interval for cflowd records, in seconds.
Export format	Configured export format .
Protocol	Protocol the PIC is configured to monitor .
Engine type	Configured engine type that is inserted in output cflowd packets.
Engine ID	Configured engine ID that is inserted in output cflowd packets.
Route Record Count	Number of routes recorded.
AS Record Count	Number of autonomous systems recorded.
Route Records Set	Status of route recording; whether routes are recorded or not.
Configuration Set	Status of monitoring configuration; whether monitoring configuration is set or not.

Sample Output

**show services
accounting status
name (Monitoring PIC
interface)**

```
user@host> show services accounting status name count1
Service Accounting interface: mo-2/0/0, Local interface index: 468
Service name: count1
Interface state: Accounting
  Group index: 0
  Export interval (in seconds): 60, Export format: cflowd v8
  Protocol: IPv4, Engine type: 55, Engine ID: 5
```

Sample Output

**show services
accounting status**

```
user@host> show services accounting status name
Service Accounting interface: sp-0/1/0
Interface state: Accounting
```

name (Service PIC interface)

Export format: 9, Route record count: 0
IFL to SNMP index count: 7, AS count: 0
Configuration set: Yes, Route record set: No, IFL SNMP map set: Yes

Service Accounting interface: sp-1/0/0

Interface state: Accounting

Export format: 9, Route record count: 33
IFL to SNMP index count: 7, AS count: 1
Configuration set: Yes, Route record set: Yes, IFL SNMP map set: Yes

show services
accounting status
inline-jflow fpc-slot
slot-number (when
both IPv4 and IPv6 are
configured)

```
user@host> show services accounting status inline-jflow fpc-slot 5
FPC Slot: 5
  IPv4 export format: Version-IPFIX, IPv6 export format: Version-IPFIX
  VPLS export format: Not set
  IPv4 Route Record Count: 5, IPv6 Route Record Count: 7
  Route Record Count: 12, AS Record Count: 1
  Route-Records Set: Yes, Config Set: Yes
```

show services
accounting status
inline-jflow (MX80
Router when both IPv4
and IPv6 are
configured)

```
user@host> show services accounting status inline-jflow

Status information
TFEB Slot: 0
Export format: IP-FIX
IPv4 Route Record Count: 6, IPv6 Route Record Count: 8
Route Record Count: 14, AS Record Count: 1
Route-Records Set: Yes, Config Set: Yes
```

show services accounting usage

Syntax	show services accounting usage <name <i>service-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display the CPU usage of PIC used for active flow monitoring.
Options	<p>none—Display CPU usage for all service names.</p> <p>name <i>service-name</i>—(Optional) Display CPU usage for the specified service name.</p>
Additional Information	When no route record has been downloaded from the PIC, this command reports no flows, even though packets are being sampled.
Required Privilege Level	view
List of Sample Output	show services accounting usage (Monitoring PIC interface) on page 2223 show services accounting usage (Service PIC interface) on page 2223
Output Fields	Table 312 on page 2222 lists the output fields for the show services accounting usage command. Output fields are listed in the approximate order in which they appear.

Table 312: show services accounting usage Output Fields

Output Field	Output Field Description
Service Accounting interface	Name of the service accounting interface.
Service name	Name of a service that was configured at the [edit-forwarding-options accounting] hierarchy level. The default display, (default sampling), indicates the service was configured at the [edit-forwarding-options sampling-level] hierarchy level.
Local interface index	Index counter of the local interface.
Uptime	Time that the PIC has been operational (in milliseconds).
Interrupt time	Total time that the PIC has spent processing packets since the last PIC reset (in microseconds).
Load (5 second)	CPU load on the PIC, averaged more than 5 seconds. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time.
Load (1 minute)	CPU load on the PIC, averaged more than 1 minute. The number is a percentage obtained by dividing the time spent on active tasks by the total elapsed time.

Sample Output

**show services
accounting usage
(Monitoring PIC
interface)**

```
user@host> show services accounting usage
Service Accounting interface: mo-1/1/0, Local interface index: 15
Service name: (default sampling)
CPU utilization
  Uptime: 600413856 milliseconds, Interrupt time: 2403 microseconds
  Load (5 second): 43%, Load (1 minute): 24%
```

Sample Output

**show services
accounting usage
(Service PIC interface)**

```
user@host> show services accounting usage
Service Accounting interface: sp-0/1/0
Service name: (default sampling)
CPU utilization
  Uptime: 7853940 milliseconds, Interrupt time: 0 microseconds
  Load (5 second): 2%, Load (1 minute): 0%
```

```
Service Accounting interface: sp-0/1/0
Service name: (default sampling)
CPU utilization
  Uptime: 331160 milliseconds, Interrupt time: 0 microseconds
  Load (5 second): 2%, Load (1 minute): 0%
```

show services dynamic-flow-capture content-destination

Syntax	<code>show services dynamic-flow-capture content-destination capture-group <i>group-name</i> destination-identifier <i>identifier</i> <terse></code>
Release Information	Command introduced in Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Display information about the content destination that receives packets from the dynamic flow capture (DFC) interface.
Options	<p>capture-group <i>group-name</i>—Capture-group identifier.</p> <p>destination-identifier <i>identifier</i>—Content destination identifier.</p> <p>terse—(Optional) Display summary information.</p>
Required Privilege Level	view
List of Sample Output	show services dynamic-flow-capture content-destination on page 2225
Output Fields	Table 313 on page 2224 lists the output fields for the show services dynamic-flow-capture content-destination command. Output fields are listed in the approximate order in which they appear.

Table 313: show services dynamic-flow-capture content-destination Output Fields

Output Field	Output Field Description	Level of Output
Capture group	Name of the capture group.	to be provided
Content destination	Name of the content destination.	to be provided
Criteria	Number of criteria specified.	to be provided
Bandwidth	Bandwidth used by the matched traffic.	to be provided
Matched packets	Number of matched packets sent to the content destination.	to be provided
Matched bytes	Number of matched bytes sent to the content destination.	to be provided
Congestion notifications	Number of notification messages sent.	to be provided

Sample Output

show services
dynamic-flow-capture
content-destination

```
user@host> show services dynamic-flow-capture content-destination capture-group g1
destination-identifier cd1 terse
  Capture group: g1, Content destination: cd1, Criteria: 0, Bandwidth: 0, Matched
  packets: 0, Matched bytes: 0, Congestion notifications: 0
```

show services dynamic-flow-capture control-source

Syntax	<code>show services dynamic-flow-capture control-source capture-group <i>group-name</i> control-source <i>identifier</i> <detail terse></code>
Release Information	Command introduced in Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Display information about the control source that makes dynamic flow capture requests to the dynamic flow capture interface.
Options	<p><code>capture-group <i>group-name</i></code>—Capture group identifier.</p> <p><code>control-source <i>identifier</i></code>—Control source identifier.</p> <p><code>detail terse</code>—(Optional) Display the specified level of output.</p>
Required Privilege Level	view
List of Sample Output	show services dynamic-flow-capture control-source on page 2227 show services dynamic-flow-capture control-source detail on page 2227
Output Fields	Table 314 on page 2226 lists the output fields for the <code>show services dynamic-flow-capture control-source</code> command. Output fields are listed in the approximate order in which they appear.

Table 314: show services dynamic-flow-capture control-source Output Fields

Output Field	Output Field Description
Capture group	Name of the capture group.
Control source	Name of the control source.
Criteria added, Criteria add failed	Number of criteria added or added and failed.
Active criteria	Number of active criteria.
Static criteria, Dynamic criteria	Number of static or dynamic criteria.
Control protocol requests	Total number of control protocol requests.
Requests	Number of Add , Delete , List , Refresh , and No-op control protocol requests.
Failed	Number of Add , Delete , List , Refresh , and No-op failed control protocol requests.
Add request rate	Rate of add requests.

Table 314: show services dynamic-flow-capture control-source Output Fields (*continued*)

Output Field	Output Field Description
Add request peak rate	Peak rate of add requests.
Bandwidth across all criteria	Bandwidth used by all the requests.
Total notifications	Total number of notifications sent and the number of notifications by category: Restart , Rollover , Timeout , Congestion , Congestion delete , and Dups (duplicates) dropped.
Criteria deleted	Total number of criteria deleted and the number of deleted criteria by category: Timeout idle , Timeout total , Packets , and Bytes .
Sequence number	Sequence number.

Sample Output

show services dynamic-flow-capture control-source

```
user@host> show services dynamic-flow-capture control-source source-identifier cs0_cg0
capture-group cg_0
Capture group: cg_0, Control source: cs0_cg0
Criteria added: 28, Criteria add failed: 0, Active criteria: 0, Control protocol
requests: 28, Add request rate: 0,
Add request peak rate: 1, Bandwidth across all criteria: 0, Total notifications:
1, Criteria deleted: 28, Sequence number: 0
```

show services dynamic-flow-capture control-source detail

```
user@host> show services dynamic-flow-capture control-source source-identifier cs0_cg0
capture-group cg_0 detail
Capture group: cg_0, Control source: cs0_cg0
Criteria added: 28, Criteria add failed: 0
Active criteria: 0
Static criteria: 0, Dynamic criteria: 0
Control protocol requests: 28
```

	Add	Delete	List	Refresh	No-op
Requests	28	0	0	0	0
Failed	0	0	0	0	0

```

Add request rate: 0
Add request peak rate: 1
Bandwidth across all criteria: 0
Total notifications: 1
Restart: 1, Rollover: 0, No-op: 0, Timeout: 0, Congestion: 0, Congestion
delete: 0, Dups dropped: 0
Criteria deleted: 28
Timeout idle: 0, Timeout total: 0, Packets: 0, Bytes: 0
Sequence number: 0
```

show services dynamic-flow-capture statistics

Syntax	show services dynamic-flow-capture statistics capture-group <i>group-name</i>
Release Information	Command introduced in Junos OS Release 7.4.
Description	(M320 routers and T Series routers only) Display statistics information about the capture group specified for dynamic flow capture.
Options	capture-group <i>group-name</i> —Capture group identifier.
Required Privilege Level	view
List of Sample Output	show services dynamic-flow-capture statistics on page 2230
Output Fields	Table 315 on page 2228 lists the output fields for the show services dynamic-flow-capture statistics command. Output fields are listed in the approximate order in which they appear.

Table 315: show services dynamic-flow-capture statistics Output Fields

Output Field	Output Field Description
Input	<p>Incoming dynamic flow capture packet statistics:</p> <ul style="list-style-type: none"> • Control protocol packets—Number of control protocol packets received. • Captured data packets—Number of data packets captured. • Control IRI packets—Number of control IRI packets received.
Control protocol drops	<p>Control protocol packets dropped for the following reasons:</p> <ul style="list-style-type: none"> • Not IP packets—Dropped packets were not IP packets. • Not UDP packets—Dropped packets were not User Datagram Protocol (UDP) packets. • Invalid destination address—Dropped packets had invalid destination addresses. • No memory—Packets dropped because of insufficient memory. • Unauthorized control source—Packets dropped because the control source was not authenticated. • Bad request—Packets dropped because the request was invalid. • Unknown control source—Packets dropped because the control source was not known. • Not DTCP—Dropped packets did not adhere to the control protocol format. • Bad command line—Packets dropped because of a version mismatch. • Bandwidth exceeded—Packets dropped because the bandwidth was exceeded. • Drop rate due to exceeded bandwidth—Rate of traffic dropped because the bandwidth was exceeded. • Other—Packets dropped for other reasons or undetermined causes.

Table 315: show services dynamic-flow-capture statistics Output Fields (*continued*)

Output Field	Output Field Description
Input drops	<p>Incoming dynamic flow capture packets dropped for the following reasons:</p> <ul style="list-style-type: none"> • Unknown packets—Packets dropped because the packet type was not recognized. • Captured data not IPv4—Packets dropped because they were not IPv4 packets. • Captured data too small—Packets dropped because they were smaller than the size reported in their headers. • Captured data drops—Data packets dropped because of undetermined causes. • Captured data not matched—Packets dropped because they did not match filter criteria. • Bandwidth exceeded—Packets dropped because the bandwidth was exceeded. • Drop rate due to exceeded bandwidth—Rate of traffic dropped because the bandwidth was exceeded.
Output	<p>Outgoing dynamic flow capture packet statistics:</p> <ul style="list-style-type: none"> • Control protocol packets—Number of control protocol packets sent. • Captured data packets—Number of captured data packets sent.
Output drops	<p>Outgoing packets dropped:</p> <ul style="list-style-type: none"> • Control protocol drops—Number of control protocol packets dropped. • Captured data drops—Number of captured data packets dropped.
Flow Statistics	<p>DFC flow statistics:</p> <ul style="list-style-type: none"> • Active flow cache entries • Active flow cache usage percentage • Flow cache entries allocated • Number of control sources • Number of content destinations • Number of criteria • Maximum criteria matching one flow • Cached flows purged for memory • Maximum filters matching one packet

Sample Output

**show services
dynamic-flow-capture
statistics**

user@host> show services dynamic-flow-capture statistics capture-group gl

Input:

Control protocol packets: 643, Captured data packets: 69977, Control IRI packets: 337

Control protocol drops:

Not IP packets: 0, Not UDP packets: 3, Invalid destination address: 0, No memory: 0, Unauthorized control source: 0,

Bad request: 0, Unknown control source: 0, Not DTCP: 0, Bad command line: 0, Bandwidth exceeded: 0,

Drop rate due to exceeded bandwidth: 0, Other: 0

Input drops:

Unknown packets: 0, Captured data not IPv4: 0, Captured data too small: 0, Captured data drops: 0, Captured data not matched: 0,

Bandwidth exceeded: 0, Drop rate due to exceeded bandwidth: 0

Output:

Control protocol packets: 644, Captured data packets: 1119624

Output drops:

Control protocol drops: 0, Captured data drops: 0

Flow Statistics:

Active flow cache entries: 40, Active flow cache usage percentage: 0, Flow cache entries allocated: 40,

Number of control sources: 4, Number of content destinations: 64, Number of criteria: 640,

Maximum criteria matching one flow: 16, Cached flows purged for memory: 0, Maximum filters matching one packet: 16

show services flow-collector file interface

Syntax	show services flow-collector file interface (all cp-fpc/pic/port) <detail extensive terse>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display information about flow collector files.
Options	<p>all cp-fpc/pic/port—Display file information for all configured flow collector interfaces or for the specified interface.</p> <p>detail extensive terse—(Optional) Display the specified level of output.</p>
Additional Information	No entries are displayed for files that have been successfully transferred.
Required Privilege Level	view
List of Sample Output	show services flow-collector file interface extensive on page 2232
Output Fields	Table 316 on page 2231 lists the output fields for the show services flow-collector file interface command. Output fields are listed in the approximate order in which they appear.

Table 316: show services flow-collector file interface Output Fields

Output Field	Output Field Description	Level of Output
Filename	Name of the file created on the flow collector interface.	All levels
Flows	Total number of collector flows for which records are present in the file.	none specified
Throughput	Throughput statistics: <ul style="list-style-type: none"> • Flow records—Number of flow records in the file. <ul style="list-style-type: none"> • per second—Average number of flow records per second. • peak per second—Peak number of flow records per second. • Uncompressed bytes—Total file size before compression. <ul style="list-style-type: none"> • per second—Average number of uncompressed bytes per second. • peak per second—Peak number of uncompressed bytes per second. • Compressed bytes—Total file size after compression. <ul style="list-style-type: none"> • per second—Average number of compressed bytes per second. • peak per second—Peak number of compressed bytes per second. 	extensive

Table 316: show services flow-collector file interface Output Fields (*continued*)

Output Field	Output Field Description	Level of Output
Status	<p>File statistics:</p> <ul style="list-style-type: none"> • Compressed blocks—(extensive output only) Data blocks in the file that have been compressed. The file is exported only when the compressed block count and block count become the same. • Block count—(extensive output only) Total number of data blocks in the file. • State—Processing state of the file. <ul style="list-style-type: none"> • Active—The flow collector interface is writing to the file. • Export 1—File export is in progress to the primary server. • Export 2—File export is in progress to the secondary server. • Wait—File is pending export. • Transfer attempts 0—Number of attempts made to transfer the file. If the file is successfully transferred in the first attempt, this field is 0. 	All levels

Sample Output

show services
flow-collector file
interface extensive

```
user@host> show services flow-collector file interface cp-3/2/0 extensive
Filename: cFlowd-py69Ni69-0-20031112_014301-so_3_0_0_0.bcp.bi.gz
Throughput:
  Flow records: 188365, per second: 238, peak per second: 287
  Uncompressed bytes: 21267756, per second: 27007, peak per second: 32526
  Compressed bytes: 2965643, per second: 0, peak per second: 22999
Status:
  Compressed blocks: 156, Block count: 156
  State: Active, Transfer attempts: 0
```

show services flow-collector input interface

Syntax	show services flow-collector input interface (all <i>cp-fpc/pic/port</i>) <detail extensive terse>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display the number of packets received by collector interfaces from monitoring interfaces.
Options	<p>all cp-fpc/pic/port—Display packets received by all configured flow collector interfaces or by the specified interface.</p> <p>detail extensive terse—(Optional) Display the specified level of output.</p>
Required Privilege Level	view
List of Sample Output	show services flow-collector input interface on page 2234 show services flow-collector input interface all on page 2234
Output Fields	Table 317 on page 2233 lists the output fields for the show services flow-collector input interface command. Output fields are listed in the approximate order in which they appear.

Table 317: show services flow-collector input interface Output Fields

Output Field	Output Field Description
Interface	Name of the monitoring interface.
Packets	Number of packets traveling from the monitoring interface to the flow collector interface.
Bytes	Number of bytes traveling from the monitoring interface to the flow collector interface.

Sample Output

**show services
flow-collector input
interface**

```

show services flow-collector interface

Syntax	show services flow-collector interface (all <i>cp-fpc/pic/port</i>) <detail extensive terse>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e, M160, and M320 routers and T Series routers only) Display overall statistics for the flow collector application.
Options	<p>all <i>cp-fpc/pic/port</i>—Display statistics for flow collector applications on all interfaces or for the specified interface.</p> <p>detail extensive terse—(Optional) Display the specified level of output.</p>
Required Privilege Level	view
List of Sample Output	show services flow-collector interface all detail on page 2238 show services flow-collector interface all extensive on page 2238 show services flow-collector interface all terse on page 2240 show services flow-collector interface extensive on page 2240
Output Fields	Table 318 on page 2235 lists the output fields for the show services flow-collector interface command. Output fields are listed in the approximate order in which they appear.

Table 318: show services flow-collector interface Output Fields

Output Field	Output Field Description	Level of Output
Flow collector interface	Name of the flow collector interface.	All levels
Interface state	Collecting flow state for the interface.	All levels
Packets	Total number of packets received.	none specified
Flows Uncompressed Bytes	Total uncompressed data size for all files created on this PIC.	none specified
Compressed Bytes	Total compressed data size for all files created on this PIC.	none specified
FTP bytes	Total number of bytes transferred to the FTP server, including those dropped during transfer.	none specified
FTP files	Total number of FTP transfers attempted by the server.	none specified
Memory	Bytes used on the PIC and bytes free.	detail extensive

Table 318: show services flow-collector interface Output Fields (*continued*)

Output Field	Output Field Description	Level of Output
Input	Incoming flow collector packet statistics: <ul style="list-style-type: none"> • Packets—Number of packets received on the unit. <ul style="list-style-type: none"> • per second—Average number of packets per second. • peak per second—Peak number of packets per second. • Bytes—Number of bytes received on the unit. <ul style="list-style-type: none"> • per second—Average number of bytes per second. • peak per second—Peak number of bytes per second. • Flow records processed—Number of records in the flow collector packets that were processed by the flow-collector interface. <ul style="list-style-type: none"> • per second—Average number of flow records processed per second. • peak per second—Peak number of flow records per second. 	detail extensive
Allocation	Data block statistics: <ul style="list-style-type: none"> • Blocks allocated—Total number of data blocks (containing flow records) allocated to the files created on this PIC. <ul style="list-style-type: none"> • per second—Average number of blocks allocated per second. • peak per second—Peak number of blocks allocated per second. • Blocks freed—Total number of data blocks freed. <ul style="list-style-type: none"> • per second—Average number of blocks freed per second. • peak per second—Peak number of blocks freed per second. • Blocks unavailable—Total number of data block requests denied, typically because of a memory shortage. <ul style="list-style-type: none"> • per second—Average number of blocks unavailable per second. • peak per second—Peak number of blocks unavailable per second. 	extensive
Files	File statistics, incremented since the PIC last booted: <ul style="list-style-type: none"> • Files created—Total number of files created on this PIC. • Files exported— Number of files successfully created and exported. • Files destroyed— (extensive output only) Number of files successfully exported and files dropped by the flow collection interface. 	detail extensive
Throughput	Throughput statistics: <ul style="list-style-type: none"> • Uncompressed bytes—Total uncompressed data size for all files created on this PIC. <ul style="list-style-type: none"> • per second—Average number of uncompressed bytes per second. • peak per second—Peak number of uncompressed bytes per second. • Compressed bytes—Total compressed data size for all files created on this PIC. <ul style="list-style-type: none"> • per second—Average number of compressed bytes per second. • peak per second—Peak number of compressed bytes per second. 	detail extensive

Table 318: show services flow-collector interface Output Fields (*continued*)

Output Field	Output Field Description	Level of Output
Packet drops	<p>Number of packets dropped for the following causes:</p> <ul style="list-style-type: none"> • No memory—Packets dropped because of insufficient memory. • Not IP—Packets dropped because they are not IP packets. • Not IPv4—Packets dropped because they are not IP version 4 packets. • Too small—Packets dropped because each packet was smaller than the size reported in its header. • Fragments—Packets dropped because of fragmentation. Fragments are not reassembled. • ICMP—Packets dropped because they are not ICMP packets. • TCP—Packets dropped because they are not TCP packets. • Unknown—Packets dropped because of undetermined causes. • Not Junos flow—Packets dropped because they are not interpreted by the Junos OS. The Junos OS interprets only IPv4, UDP cflowd version 5 packets. 	extensive
File transfer	<p>File transfer statistics:</p> <ul style="list-style-type: none"> • FTP bytes—Total number of bytes transferred to the FTP server, including those dropped during transfer. • FTP files—Total number of FTP transfers attempted by the server. • FTP failure—Total number of FTP failures encountered by the server. 	detail extensive
Flow collector interface	Physical interface acting as a flow collector.	detail
Export channel	<p>Export channel 0 is unit 0. Export channel 1 is unit 1. Flow receive channel is unit 2. Server status statistics are the following:</p> <ul style="list-style-type: none"> • Current server Primary or Secondary—Current FTP server being used. Value is • Primary server state—State of the server: <ul style="list-style-type: none"> • OK—Server is operating without problems. • FTP error—Server encountered an FTP protocol error while sending files. • Network error—Flow-collector interface has errors when contacting the primary FTP server. • Unknown—First file transfer has not been sent to the primary server. • Secondary server state—State of the server: <ul style="list-style-type: none"> • OK—Server is operating without errors. • FTP error—Server encountered an FTP protocol error while sending files. • Network error—Flow-collector interface has errors when contacting the secondary FTP server. • Unknown—First file transfer has not been sent to the secondary server. • Not configured—Secondary server is not configured. 	detail extensive

Sample Output

Intrusion Detection Service Operational Mode Commands

Table 319 on page 2241 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot the intrusion detection service (IDS). Commands are listed in alphabetical order.

Table 319: IDS Operational Mode Commands

Task	Command
Clear (set to zero) IDS events and event information.	<code>clear services ids</code>
Clear the IDS events for a particular address that might be under attack.	<code>clear services ids destination-table</code>
Clear the IDS attack source and destination address pair table.	<code>clear services ids pair-table</code>
Clear all IDS events for addresses that are suspected attackers.	<code>clear services ids source-table</code>
Display IDS event information.	<code>show services ids</code>

NOTE: IDS is supported on the adaptive services interface on the following routers:

- J Series routers—`sp-pim/0/slot`
- M Series and T Series routers—`sp-fpc/pic/port`

IDS is also supported on the redundant adaptive services interface (`rspnumber`) on M Series and T Series routers.

NOTE: For information about how to configure IDS, see the Junos Services Interfaces Configuration Release 12.3.

clear services ids

Syntax	<code>clear services ids</code> <code><interface <i>interface-name</i>></code> <code><service-set <i>service-set-name</i>></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear intrusion detection service (IDS) events.
Options	<p>none—Clear all IDS events for all adaptive services interfaces for all service sets, and clear and reset IDS.</p> <p>interface <i>interface-name</i>—(Optional) On M Series and T Series routers, the <i>interface-name</i> can be <i>sp-fpc/pic/port</i> or <i>rspnumber</i>. On the J Series, the <i>interface-name</i> is <i>sp-pim/O/port</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear all IDS events for a particular service set.</p>
Required Privilege Level	view
List of Sample Output	clear services ids on page 2242
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear services ids` user@host> clear services ids

clear services ids destination-table

Syntax	clear services ids destination-table <destination-prefix <i>destination-prefix-name</i> > <interface <i>interface-name</i> > <service-set <i>service-set-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear the intrusion detection service (IDS) events for a particular address that might be under attack.
Options	<p>none—Clear the attack destination address table.</p> <p>destination-prefix <i>destination-prefix-name</i>—(Optional) Clear the attack destination table for a particular destination prefix.</p> <p>interface <i>interface-name</i>—(Optional) Clear the attack destination table for a particular interface. On M Series and T Series routers, the <i>interface-name</i> can be <i>sp-fpc/pic/port</i> or <i>rspnumber</i>. On the J Series routers, the <i>interface-name</i> is <i>sp-pim/O/port</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear the attack destination table for a particular service set.</p>
Required Privilege Level	view
List of Sample Output	clear services ids destination-table on page 2243
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services ids destination-table      user@host> clear services ids destination-table
```

clear services ids pair-table

Syntax	<code>clear services ids pair-table</code> <code><destination-prefix <i>destination-prefix-name</i>></code> <code><interface <i>interface-name</i>></code> <code><service-set <i>service-set-name</i>></code> <code><source-prefix <i>source-prefix-name</i>></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear the intrusion detection service (IDS) attack source and destination address pair table.
Options	<p>none—Clear the attack source and destination address pair table.</p> <p>destination-prefix <i>destination-prefix-name</i>—(Optional) Clear the attack source and destination address pair table for a particular destination prefix.</p> <p>interface <i>interface-name</i>—(Optional) Clear the attack destination table for a particular interface. On M Series and T Series routers, the <i>interface-name</i> can be sp-fpc/pic/port or rspnumber. On the J Series routers, the <i>interface-name</i> is sp-pim/0/port.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear the attack source and destination address pair table for a particular service set.</p> <p>source-prefix <i>source-prefix-name</i>—(Optional) Clear the attack source and destination address pair table for a particular source prefix.</p>
Required Privilege Level	view
List of Sample Output	clear services ids pair-table on page 2244
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>clear services ids pair-table</code>	<code>user@host> clear services ids pair-table</code>
--	--

clear services ids source-table

Syntax	clear services ids source-table <interface <i>interface-name</i> > <service-set <i>service-set-name</i> > <source-prefix <i>source-prefix-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear all intrusion detection service (IDS) events for addresses that are suspected attackers.
Options	<p>none—Clear the attack source address table.</p> <p>interface <i>interface-name</i>—(Optional) On M Series and T Series routers, the <i>interface-name</i> can be <i>sp-fpc/pic/port</i> or <i>rspnumber</i>. On the J Series routers, the <i>interface-name</i> is <i>sp-pim/0/port</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Clear the attack source address table for a particular service set.</p> <p>source-prefix <i>source-prefix-name</i>—(Optional) Clear the attack source address table for a particular source prefix.</p>

Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services ids
source-table      user@host> clear services ids source-table
```

show services ids

Syntax show services ids (destination-table | pair-table | source-table)
 <brief | extensive | terse>
 <destination-prefix *destination-prefix-name*>
 <interface *interface-name*>
 <limit *number*>
 <order (anomalies | bytes | flows | packets)>
 <service-set *service-set-name*>
 <source-prefix *source-prefix-name*>
 <threshold *number*>

Release Information Command introduced before Junos OS Release 7.4.

Description Display information about intrusion detection service (IDS) events. All events gathered by IDS are reported as anomalies. For example, events such as **create forward or watch flow**, **FTP passive**, and **FTP active** are genuinely allowed by the stateful firewall but are logged as anomalies to track the rates and number for these events.

Options **destination-table**—Display information for an address under possible attack.

pair-table—Display information for a particular suspected attack source and destination address pair.

source-table—Display information for an address that is a suspected attacker.

brief | extensive | terse—(Optional) Display the specified level of output.

destination-prefix *destination-prefix-name*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*. On J Series routers, the *interface-name* is *sp-pim/O/port*.

limit *number*—(Optional) Maximum number of entries to display. By default, all tables display the top 32 entries sorted by the number of events for the criteria chosen. To display additional entries, configure the limit option to set up to 256 entries.

order—(Optional) Display events according to one of the following table-ordering criteria. The default is anomalies.

- **anomalies**—Display information for particular anomalies.
- **bytes**—Order output by number of bytes received.
- **flows**—Order output by number of flows.
- **packets**—Order output by number of packets received.

service-set *service-set-name*—(Optional) Display information about a particular service set.

source-prefix *source-prefix-name*—(Optional) Display information about a particular source prefix.

threshold *number*—(Optional) Limit the display to events with this number of anomalies, bytes, flows, or packets, whichever criterion you specify for order. For example, to display all events with more than 100 flows, specify order flows and threshold 100.

Output Fields [Table 320 on page 2247](#) lists the output fields for the **show services ids** command. Output fields are listed in the approximate order in which they appear.

Table 320: show services ids Output Fields

Field Name	Field Description	Output Level
Interface	Name of an adaptive services interface.	All levels
Service set	Name of a service set. Individual empty service sets are not displayed, but if no service set has any flows, a flow table header is printed for each service set.	All levels
Sorting order	Primary mode to display information: Anomalies , Bytes , Flows , or Packets .	All levels
Source address	Name of the source address.	All levels
Dest address	Name of the destination address.	All levels
Time	Total time the information has been in the table.	All levels
Flags	Flags can be Forced , F (terse output only), SYNcookie , S (terse output only), Forced+SYNcookie , and F+S (terse output only). The SYNcookie flag is visible only in the destination table.	All levels
Application	Configured application, such as FTP or Telnet .	All levels
Bytes	Total number of bytes sent from the source to the destination address, in thousands (k) or millions (m).	All levels
Packets	Total number of packets sent from the source to the destination address, in thousands (k) or millions (m).	All levels
Flows	Total number of flows of packets sent from the source to the destination address, in thousands (k) or millions (m).	All levels

Table 320: show services ids Output Fields (*continued*)

Field Name	Field Description	Output Level
Anomalies	Total number of packets in the anomaly table, in thousands (k) or millions (m).	All levels
Anomaly description	<p>One or more of the following types of anomalies. For more information, see the detailed descriptions in the stateful firewall section of the <i>Junos OS System Log Messages Reference</i>.</p> <ul style="list-style-type: none">• First packet of TCP session not SYN• ICMP echo request dropped, because sequence number duplicated• ICMP echo reply dropped. No matching sequence number• ICMP echo request dropped. Too many echo requests without echo reply• ICMP header length check failed• ICMP packet length greater than 64K• IP fragment assembly timeout• IP fragment length error• IP fragment overlap• IP packet length greater than 64K• IP packet too short• IP packet with broadcast destination address• IP packet with checksum error• IP packet with incorrect length• IP packet with TTL equal to 0	extensive

Table 320: show services ids Output Fields (*continued*)

Field Name	Field Description	Output Level
Anomaly description (continued)	<ul style="list-style-type: none"> • IP packet with version other than 4 • Land attack (IP src address = dest address) • No matching SFW rule; attempting to create discard flow • Number of open sessions exceeds IDS limit; packet dropped • Packet rate exceeds IDS limit; packet dropped • Session creation rate exceeds IDS limit; packet dropped • SFW application message too long • SFW discard packet contains non-configured IP option types • SFW drop packet because of discard flow • SFW dropped TCP watch packet • SFW rules request FTP active mode data packets to be accepted; attempting to create forward flow • SFW rules request FTP passive mode data packets to be accepted; attempting to create forward flow • SFW rules request packet to be accepted; attempting to create forward or watch flow • SFW rules request packet to be discarded; attempting to create discard flow • SFW rules request packet to be rejected; attempting to create reject flow • SFW discard flow requires packet to be dropped • SFW SYN defense • Smurf attack (ping to IP broadcast address) • TCP FIN/RST or SYN/(URG FIN RST) flags set • TCP header length check failed • TCP port scan (port not in LISTEN state) • TCP seq number zero and FIN/PSH/RST flags set • TCP seq number zero and no flags set • TCP source or destination port zero • TCP SYN flood attack • UDP header length check failed • UDP port scan (port not in LISTEN state) • UDP source or destination port zero 	extensive
Count	Number of times that a particular anomaly occurred, in thousands (k) or millions (M).	extensive
Rate (eps)	Anomaly events per second. The IDS subsystem attempts to maintain a weighted average of rates, which might not reflect the exact incoming rate of attack at low rates. However, at high rates exceeding 160 events per second, the rates generally match.	extensive
Elapsed	Time since the same type of event last occurred.	extensive
Total IDS table entries	Number of entries in the IDS table. This number is not necessarily the sum of all entries displayed.	All levels

Table 320: show services ids Output Fields (*continued*)

Field Name	Field Description	Output Level
Total failed IDS table entry insertions	Number of IDS entries not allowed into the table because the table was full	All levels
Total number of events (closed flows and anomalies detected)	Total number of events since the system was started or since the show ids services command was executed.	All levels

Sample Output

show services ids destination-table

```

user@host> show services ids destination-table
Interface: sp-1/3/0, Service set: null-sfw

IP Security Operational Mode Commands

Table 321 on page 2255 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot IP Security (IPsec) services. In the table, the commands are grouped by the interfaces on which they are supported. In the remainder of this chapter, the commands are listed in alphabetical order.

- Services Interfaces:
 - M Series, MX Series and T Series routers—*sp-fpc/pic/port* or *ms-fpc/pic/port*. IPsec is also supported on the redundant services interface (*rspnumber*).
- Encryption Interfaces (M Series and T Series routers only) *es-fpc/pic/port*.

Table 321: IPsec Services Operational Mode Commands

Task	Command
Services Interface	
Delete certificate authority (CA) digital certificates from the router.	<code>clear security pki ca-certificate</code>
Delete manually generated local digital certificate requests from the router.	<code>clear security pki certificate-request</code>
Delete all CRLs from the router.	<code>clear security pki crl</code>
Clear public key infrastructure (PKI) key pair information for local digital certificates from the router.	<code>clear security pki key-pair</code>
Delete local digital certificates, certificate requests, and the corresponding public/private key pairs from the router.	<code>clear security pki local-certificate</code>
Clear IPsec statistics.	<code>clear services ipsec-vpn ipsec statistics</code>
Clear either Internet Key Exchange (IKE) or IPsec VPN security associations.	<code>clear services ipsec-vpn ike security-associations</code> <code>clear services ipsec-vpn ipsec security-associations</code>
Request a digital certificate from a CA online by using the Simple Certificate Enrollment Protocol (SCEP).	<code>request security pki ca-certificate enroll</code>

Table 321: IPsec Services Operational Mode Commands (*continued*)

Task	Command
Manually load a CA digital certificate from a specified location.	<code>request security pki ca-certificate load</code>
Verify the digital certificate installed for the specified certificate authority (CA).	<code>request security pki ca-certificate verify</code>
Manually install a CRL on the router.	<code>request security pki crl load</code>
Manually generate a local digital certificate request in the Public-Key Cryptography Standards #10 (PKCS-10) format.	<code>request security pki generate-certificate-request</code>
Generate a Public Key Infrastructure (PKI) public and private key pair for a local digital certificate.	<code>request security pki generate-key-pair</code>
Request a CA to enroll and install a local digital certificate online by using the SCEP.	<code>request security pki local-certificate enroll</code>
Manually generate a self-signed certificate for the given distinguished name.	<code>request security pki local-certificate generate-self-signed</code>
Manually load a local digital certificate from a specified location.	<code>request security pki local-certificate load</code>
Verify the validity of the local digital certificate identifier.	<code>request security pki local-certificate verify</code>
Switch between the primary and backup IPsec VPN tunnels.	<code>request services ipsec-vpn ipsec switch tunnel</code>
Display information about authentication keychains configured for the BGP Protocol, the LDP routing protocols, the Bidirectional Forwarding Detection (BFD) Protocol, and the IS-IS Protocol.	<code>show security keychain</code>
Display information about certificate authority (CA) digital certificates installed in the router.	<code>show security pki ca-certificate</code>
Display information about manually generated local digital certificate requests that are stored in the router.	<code>show security pki certificate-request</code>
Display information about the certificate revocation lists (CRLs) that are stored in the router.	<code>show security pki crl</code>
Display information about the local digital certificates and the corresponding public keys installed in the router.	<code>show security pki local-certificate</code>
Display IKE VPN security associations for service sets.	<code>show services ipsec-vpn ike security-associations</code>

Table 321: IPsec Services Operational Mode Commands (*continued*)

Task	Command
Display IPsec VPN security associations for service sets.	<code>show services ipsec-vpn ipsec security-associations</code>
Display IPsec VPN statistics for service sets.	<code>show services ipsec-vpn ipsec statistics</code>
Encryption Interface	
Clear Internet Key Exchange (IKE) security associations.	<code>clear ike security-associations</code>
Clear IPsec security associations.	<code>clear ipsec security-associations</code>
Switch between primary and backup interfaces and tunnels.	<code>request ipsec switch</code>
Obtain a public key certificate from a certification authority.	<code>request security certificate (signed)</code> <code>request security certificate (unsigned)</code>
Generate a public and private key pair.	<code>request security key-pair</code>
Add a certificate provided by the Juniper Networks certificate authority.	<code>request system certificate add</code>
Display IKE security association information.	<code>show ike security-associations</code>
Display primary and backup interface and tunnel information.	<code>show ipsec redundancy</code>
Display IPsec security association information.	<code>show ipsec security-associations</code>
Display installed certificates signed by the Juniper Networks certificate authority.	<code>show system certificate</code>

NOTE: For information about how to configure IPsec services, see the Junos Services Interfaces Configuration Release 12.3 for adaptive services interfaces and the Junos OS System Basics Configuration Guide for encryption interfaces.

clear ike security-associations

Syntax	clear ike security-associations <destination-ip-address>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(Encryption interface on M Series and T Series routers only) Clear information about the current Internet Key Exchange (IKE) security association. This command is valid for dynamic security associations only.
Options	none —Clear all IKE security associations. destination-ip-address —(Optional) Clear the IKE security association at the specified destination address.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show ike security-associations on page 2290
List of Sample Output	clear ike security-associations on page 2258
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ike
security-associations

```
user@host> clear ike security-associations
```

clear ipsec security-associations

Syntax	clear ipsec security-associations <i><sa-name></i>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(Encryption interface on M Series and T Series routers only) Clear information about the current IP Security (IPsec) security association. This command is valid for dynamic security associations only. When this command is issued, a new security association is created.
Options	none —Clear all IPsec security associations. sa-name —(Optional) Clear the specified security association.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show ipsec security-associations on page 2296
List of Sample Output	clear ipsec security-associations on page 2260
Output Fields	See the show ipsec security-associations for an explanation of output fields.

Sample Output

`clear ipsec security-associations`

The following output from the `show ipsec security-associations detail` command is displayed before and after the `clear ipsec security-associations` command is issued:

```
user@host> show ipsec security-associations detail
Security association: sa-dynamic, Interface family: Up

Direction: inbound, SPI: 242379418, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 22979 seconds
Hard lifetime: Expires in 28739 seconds

Direction: outbound, SPI: 368592771, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 22979 seconds
Hard lifetime: Expires in 28739 seconds
```

```
user@host> clear ipsec security-associations
```

```
user@host> show ipsec security-associations detail
Security association: sa-dynamic, Interface family: Up

Direction: inbound, SPI: 1031597683, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 23037 seconds
Hard lifetime: Expires in 28797 seconds

Direction: outbound, SPI: 1618419878, State: Installed
Mode: tunnel, Type: dynamic
Protocol: ESP, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expires in 23037 seconds
Hard lifetime: Expires in 28797 seconds
```

clear security pki ca-certificate

Syntax	clear security pki ca-certificate (all ca-profile <i>ca-profile-name</i>)
Release Information	Command introduced in Junos OS Release 7.5.
Description	Delete certificate authority (CA) digital certificates from the router.
Options	<p>all—Delete all CA digital certificates from the router.</p> <p>ca-profile <i>ca-profile-name</i>—Delete the specified CA profile.</p>
Required Privilege Level	clear

clear security pki  
certificate-request all
```

```
user@host> clear security pki certificate-request all
```

clear security pki crt

Syntax	clear security pki crt (all ca-profile <i>ca-profile-name</i>)
Release Information	Command introduced in Junos 8.1
Description	Delete certificate revocation lists (CRLs) from the router.
Options	all —Delete all CRLs from the router. ca-profile <i>ca-profile-name</i> —Delete CRLs associated with the specified CA profile.
Required Privilege Level	clear
List of Sample Output	clear security pki crt ca-profile all on page 2263
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear security pki crt ca-profile all	user@host> clear security pki crt ca-profile all
--	--

clear security pki key-pair

Syntax	clear security pki key-pair (all certificate-id <i>certificate-id-name</i>)
Release Information	Command introduced in Junos OS Release 8.5.
Description	Clear public key infrastructure (PKI) key pair information for local digital certificates from the router.
Options	<p>all—Delete all local digital certificates, certificate requests, and the corresponding public and private key pairs from the router.</p> <p>certificate-id <i>certificate-id-name</i>—Delete the specified local digital certificate and corresponding public/private key pair.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• request security pki local-certificate enroll on page 2279• show security pki local-certificate on page 2307
Output Fields	This command produces no output.

Sample Output

```
clear security pki key pair

user@host> clear security pki key pair
```

clear security pki local-certificate

Syntax	clear security pki local-certificate <all certificate-id <i>certificate-id-name</i> system-generated>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Delete local digital certificates, certificate requests, and the corresponding public/private key pairs from the router.
Options	<p>all—(Optional) Delete all local digital certificates, certificate requests, and the corresponding public and private key pairs from the router.</p> <p>certificate-id <i>certificate-id-name</i>—(Optional) Delete the specified local digital certificate and corresponding public and private key pair.</p> <p>system-generated—(Optional) Auto-generated self-signed certificate.</p>
Required Privilege Level	clear

security-associations

```
user@host> clear services ipsec-vpn ipsec security-associations
```

request security certificate (signed)

Syntax	<code>request security certificate enroll filename <i>filename</i> subject <i>subject</i> alternative-subject <i>alternative-subject</i> certification-authority <i>certification-authority</i> encoding (binary pem) key-file <i>key-file</i> domain-name <i>domain-name</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(Encryption interface on M Series and T Series routers and EX Series switches only) Obtain a signed certificate from a certificate authority (CA). The signed certificate validates the CA and the owner of the certificate. The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory.
Options	<p>filename <i>filename</i>—File that stores the certificate.</p> <p>subject <i>subject</i>—Distinguished name (dn), which consists of a set of components—for example, an organization (o), an organization unit (ou), a country (c), and a locality (l).</p> <p>alternative-subject <i>alternative-subject</i>—Tunnel source address.</p> <p>certification-authority <i>certification-authority</i>—Name of the certificate authority profile in the configuration.</p> <p>encoding (binary pem)—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default format is binary.</p> <p>key-file <i>key-file</i>—File containing a local private key.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name.</p>
Required Privilege Level	maintenance
List of Sample Output	request security certificate (signed) on page 2269
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
request security
certificate (signed)
user@host> request security certificate enroll filename host.crt subject c=uk,o=london
alternative-subject 10.50.1.4 certification-authority verisign key-file host-1.prv domain-name
host.juniper.net
CA name: juniper.net CA file: ca_verisign
local pub/private key pair: host.prv
subject: c=uk,o=london domain name: host.juniper.net
alternative subject: 10.50.1.4
Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
the key management process (kmd) log file at /var/log/kmd. <-----
```

request security certificate (unsigned)

Syntax	<code>request security certificate enroll filename <i>filename</i> ca-file <i>ca-file</i> ca-name <i>ca-name</i> encoding (binary perm) url <i>url</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(Encryption interface on M Series and T Series routers and EX Series switches only) Obtain a certificate from a certificate authority (CA). The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory.
Options	<p>filename <i>filename</i>—File that stores the public key certificate.</p> <p>ca-file <i>ca-file</i>—Name of the certificate authority profile in the configuration.</p> <p>ca-name <i>ca-name</i>—Name of the certificate authority.</p> <p>encoding (binary pem)—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default value is binary.</p> <p>url <i>url</i>—Certificate authority URL.</p>
Required Privilege Level	maintenance
List of Sample Output	request security certificate (unsigned) on page 2270
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
request security certificate (unsigned) user@host> request security certificate enroll filename ca_verisign ca-file verisign ca-name
juniper.net urlxyzcompany URL
http://<verisign ca-name xyzcompany url>/cgi-bin/pkiclient.exe CA name: juniper.net
CA file: verisign Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
the key management process (kmd) log file at /var/log/kmd. <-----
```

request security key-pair

Syntax	<code>request security key-pair <i>filename</i></code> <code><size <i>key-size</i>></code> <code><type (rsa dsa)></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(Encryption interface on M Series and T Series routers and EX Series switches only) Generate a public and private key pair for a digital certificate.
Options	<i>filename</i> —Name of a file in which to store the key pair. <i>size key-size</i> —(Optional) Key size, in bits. The key size can be 512 , 1024 , or 2048 . The default value is 1024 . <i>type</i> —(Optional) Algorithm used to encrypt the key: <ul style="list-style-type: none"> • rsa—RSA algorithm. This is the default. • dsa—Digital signature algorithm with Secure Hash Algorithm (SHA).
Required Privilege Level	maintenance
List of Sample Output	request security key-pair on page 2271
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
request security key-pair      user@host> request security key-pair security-key-file
```

request security pki ca-certificate enroll

Syntax	request security pki ca-certificate enroll ca-profile <i>ca-profile-name</i>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Request a digital certificate from a certificate authority (CA) online by using the Simple Certificate Enrollment Protocol (SCEP).
Options	ca-profile <i>ca-profile-name</i> —CA profile name.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• clear security pki ca-certificate on page 2261• show security pki ca-certificate on page 2299
List of Sample Output	request security pki ca-certificate enroll on page 2272
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request security pki ca-certificate enroll

```
user@host> request security pki ca-certificate enroll ca-profile entrust
Received following certificates:
Certificate: C=us, O=juniper, CN=First Officer
Fingerprint: 46:71:15:34:f0:a6:41:76:65:81:33:4f:68:47:c4:df:78:b8:e3:3f
Certificate: C=us, O=juniper, CN=First Officer
Fingerprint: bc:78:87:9b:a7:91:13:20:71:db:ac:b5:56:71:42:ad:1a:b6:46:17
Certificate: C=us, O=juniper
Fingerprint: 00:8e:6f:58:dd:68:bf:25:0a:e3:f9:17:70:d6:61:f3:53:a7:79:10
Do you want to load the above CA certificate ? [yes,no] (no) yes
```

request security pki ca-certificate load

Syntax	<code>request security pki ca-certificate load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Manually load a certificate authority (CA) digital certificate from a specified location.
Options	<p>ca-profile <i>ca-profile-name</i>—Load the specified CA profile.</p> <p>filename <i>path/filename</i>—Directory location and filename of the CA digital certificate.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • clear security pki ca-certificate on page 2261 • show security pki ca-certificate on page 2299
List of Sample Output	request security pki ca-certificate load on page 2273
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
request security pki ca-certificate load user@host> request security pki ca-certificate load ca-profile ca-private filename pki-file
```

request security pki ca-certificate verify

Syntax	<code>request security pki ca-certificate verify ca-profile <i>ca-profile-name</i></code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Verify the digital certificate installed for the specified certificate authority (CA).
Options	ca-profile <i>ca-profile-name</i> —Name of the local digital certificate identifier.
Required Privilege Level	maintenance
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki ca-certificate verify ca-profile ca1 (CRL not downloaded)
user@host> request security pki ca-certificate verify ca-profile ca1
```

```
CA certificate ca1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

request security pki crt load

Syntax	<code>request security pki crt load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code>
Release Information	Command introduced in Junos OS Release 8.1.
Description	Manually install a certificate revocation list (CRL) on the router from a specified location.
Options	<code>ca-profile <i>ca-profile-name</i></code> —Load the specified certificate authority (CA) profile. <code>filename <i>path/filename</i></code> —Directory location and filename of the CRL.
Required Privilege Level	maintenance
List of Sample Output	request security pki crt load on page 2275
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`request security pki crt load` `user@host> request security pki crt load ca-profile ca-private filename pki-file`

request security pki generate-certificate-request

Syntax	<code>request security pki generate-certificate-request certificate-id <i>certificate-id-name</i> domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i> <email <i>email-address</i>> <filename (<i>path</i> <i>terminal</i>)> <ip-address <i>ip-address</i>></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Manually generate a local digital certificate request in the Public-Key Cryptography Standards #10 (PKCS-10) format.
Options	<p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none">• CN—Common name• OU—Organizational unit name• O—Organization name• ST—State• C—Country <p>email <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p>filename (<i>path</i> <i>terminal</i>)—(Optional) Location where the local digital certificate request should be placed or the login terminal.</p> <p>ip-address <i>ip-address</i>—(Optional) IP address of the router.</p>
Required Privilege Level	maintenance

request security pki local-certificate enroll

Syntax	request security pki local-certificate enroll <i>ca-profile ca-profile-name</i> <i>certificate-id certificate-id-name</i> challenge-password <i>password</i> domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i> <email <i>email-address</i> > <ip-address <i>ip-address</i> >
Release Information	Command introduced in Junos OS Release 7.5.
Description	Request that a certificate authority (CA) enroll and install a local digital certificate online by using the Simple Certificate Enrollment Protocol (SCEP).
Options	<p>ca-profile <i>ca-profile-name</i>—CA profile name.</p> <p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>challenge-password <i>password</i>—Password set by the administrator and normally obtained from the SCEP enrollment webpage of the CA. The password is 16 characters in length.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> • CN—Common name • OU—Organizational unit name • O—Organization name • ST—State • C—Country <p>email <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p>ip-address <i>ip-address</i>—(Optional) IP address of the router.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • show security pki local-certificate on page 2307
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> request security pki local-certificate enroll certificate-id r3-entrust-scep ca-profile  
entrust domain-name router3.juniper.net subject "CN=router3,OU=Engineering,O=juniper,C=US"  
challenge-password 123
```

Certificate enrollment has started. To view the status of your enrollment, check the public key infrastructure log (pkid) log file at /var/log/pkid. Please save the challenge-password for revoking this certificate in future. Note that this password is not stored on the router.

request security pki local-certificate generate-self-signed

Syntax	request security pki local-certificate generate-self-signed certificate-id <i>certificate-id-name</i> domain-name <i>domain-name</i> ip-address <i>ip-address</i> email <i>email-address</i> subject <i>subject-distinguished-name</i>
Release Information	Command introduced in Junos OS Release 9.1.
Description	Manually generate a self-signed certificate for the given distinguished name.
Options	<p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>email <i>email-address</i>—E-mail address of the certificate holder.</p> <p>ip-address <i>ip-address</i>—IP address of the router.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> • CN—Common name • OU—Organizational unit name • O—Organization name • ST—State • C—Country
Required Privilege Level	maintenance security
Related Documentation	<ul style="list-style-type: none"> • show security pki local-certificate on page 2307
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> request security pki local-certificate generate-self-signed certificate-id self-cert
subject cn=abc domain-name juniper.net email mholmes@juniper.net
Self-signed certificate generated and loaded successfully
```

request security pki local-certificate load

Syntax	<code>request security pki local-certificate load certificate-id <i>certificate-id-name</i> filename <i>path</i></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Manually load a local digital certificate from a specified location.
Options	<p>certificate-id <i>certificate-id-name</i>—Name of the public/private key pair mapped to the local digital certificate.</p> <p>filename <i>path/filename</i>—Directory location and filename of the local digital certificate provided by the CA.</p>
Required Privilege Level	maintenance
List of Sample Output	request security pki local-certificate load on page 2282
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>request security pki local-certificate load</code>	<pre>user@host> request security pki local-certificate load filename /tmp/router2-cert certificate-id local-entrust2 Local certificate local-entrust2 loaded successfully</pre>
--	--

request security pki local-certificate verify

Syntax	<code>request security pki local-certificate verify certificate-id <i>certificate-id-name</i></code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Verify the validity of the local digital certificate identifier.
Options	<code>certificate-id <i>certificate-id-name</i></code> —Display the specified certificate identifier name.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • show security pki local-certificate on page 2307
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate-id bme1 (not downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
```

```
Local certificate bme1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

You receive the following response after the certificate revocation list (CRL) is downloaded

```
request security pki local-certificate verify certificate bme1 (downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
Local certificate bme1 verification success
```

request ipsec switch

Syntax	<code>request ipsec switch (interface <es-fpc/pic/port> security-associations <sa-name>)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	(Encryption interface on M Series, PTX Series, and T Series routers and EX Series switches only) Manually switch from the primary to the backup encryption services interface, or switch from the primary to the backup IP Security (IPsec) tunnel.
Options	<code>interface <es-fpc/pic/port></code> —Switch to the backup encryption interface. <code>security-associations <sa-name></code> —Switch to the backup tunnel.
Required Privilege Level	view

```

show security keychain

Syntax	show security keychain <brief detail>
Release Information	Command introduced in Junos OS Release 11.2.
Description	Display information about authentication keychains configured for the Border Gateway Protocol (BGP), the Label Distribution Protocol (LDP) routing protocols, the Bidirectional Forwarding Detection (BFD) protocol, and the Intermediate System-to-Intermediate System (IS-IS) protocol.
Options	none —Display information about authentication keychains. brief detail —(Optional) Display the specified level of output.
Required Privilege Level	view
List of Sample Output	show security keychain brief on page 2288 show security keychain detail on page 2288
Output Fields	Table 322 on page 2286 describes the output fields for the show security keychain command. Output fields are listed in the approximate order in which they appear.

Table 322: show security keychain Output Fields

Field Name	Field Description	Level of Output
keychain	The name of the keychain in operation.	All levels
Active-ID Send	Number of routing protocols packets sent with the active key.	All levels
Active-ID Receive	Number of routing protocols packets received with the active key.	All levels
Next-ID Send	Number of routing protocols packets sent with the next key.	All levels
Next-ID Receive	Number of routing protocols packets received with the next key.	All levels
Transition	Amount of time until the current key will be replaced with the next key in the keychain.	All levels
Tolerance	Configured clock-skew tolerance, in seconds, for accepting keys for a key chain.	All levels
Id	Identification number configured for the current key.	detail
Algorithm	Authentication algorithm configured for the current key.	detail

Table 322: show security keychain Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the current key.</p> <p>The value can be:</p> <ul style="list-style-type: none"> • receive • send • send-receive <p>For the active key, the State can be send-receive, send, or receive. For keys that have a future start time, the State is inactive. Compare the State field to the Mode field.</p>	detail
Option	<p>For IS-IS only, the option determines how Junos OS encodes the message authentication code in routing protocol packets.</p> <p>The values can be:</p> <ul style="list-style-type: none"> • basic—Based on RFC 5304. • isis-enhanced—Based on RFC 5310. <p>The default value is basic. When you configure the isis-enhanced option, Junos OS sends RFC 5310-encoded routing protocol packets and accepts both RFC 5304-encoded and RFC 5310-encoded routing protocol packets that are received from other devices.</p> <p>When you configure basic (or do not include the options statement in the key configuration) Junos OS sends and receives RFC 5304-encoded routing protocols packets, and drops 5310-encoded routing protocol packets that are received from other devices.</p> <p>Because this setting is for IS-IS only, the TCP and the BFD protocol ignore the encoding option configured in the key.</p>	detail
Start-time	Time that the current key became active.	detail
Mode	<p>Mode of each key (Informational only.)</p> <p>The value can be</p> <ul style="list-style-type: none"> • receive • send • send-receive <p>The mode of the key is based on the configuration. Suppose you configure two keys, one with a start-time of today and the other with a start-time of next week. For both keys, the Mode can be send-receive, send, or receive, regardless of the configured start-time. Compare the Mode field to the State field.</p>	detail

Sample Output

**show security keychain
brief**

```
user@host> show security keychain brief
keychain          Active-ID      Next-ID      Transition  Tolerance
                  Send  Receive    Send  Receive
hakr              3     3          1     1        1d 23:58    3600
```

**show security keychain
detail**

```
user@host> show security keychain detail
keychain          Active-ID      Next-ID      Transition  Tolerance
                  Send  Receive    Send  Receive
hakr              3     3          1     1        1d 23:58    3600
  Id 3, Algorithm hmac-md5, State send-receive, Option basic
  Start-time Wed Aug 11 16:28:00 2010, Mode send-receive
  Id 1, Algorithm hmac-md5, State inactive, Option basic
  Start-time Fri Aug 20 11:30:57 2010, Mode send-receive
```

request system certificate add

Syntax	<code>request system certificate add (<i>filename</i> terminal)</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	(Encryption interface on M Series and T Series routers, PTX Series, and QFX Series switches only) Add a certificate provided by the Juniper Networks certificate authority (CA).
Options	<i>filename</i> —Filename (URL, local, or remote). <i>terminal</i> —Use login terminal.
Required Privilege Level	maintenance
List of Sample Output	request system certificate add on page 2289
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>request system certificate add</code>	<code>user@host> request system certificate add terminal</code>
---	--

show ike security-associations

Syntax	show ike security-associations <brief detail> <peer-address>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(Encryption interface on M Series and T Series routers only) Display information about Internet Key Exchange (IKE) security associations.
Options	<p>none—Display standard information about all IKE security associations.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>peer-address—(Optional) Display IKE security associations for the specified peer address.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> clear ike security-associations on page 2258
List of Sample Output	show ike security-associations on page 2293 show ike security-associations detail on page 2293
Output Fields	Table 323 on page 2290 lists the output fields for the show ike security-associations command. Output fields are listed in the approximate order in which they appear.

Table 323: show ike security-associations Output Fields

Field Name	Field Description	Level of Output
IKE peer	Remote end of the IKE negotiation.	detail
Role	Part played in the IKE session. The router triggering the IKE negotiation is the initiator, and the router accepting the first IKE exchange packets is the responder.	detail
Remote Address	Responder's address.	none specified
State	State of the IKE security association: <ul style="list-style-type: none"> Matured—The IKE security association is established. Not matured—The IKE security association is in the process of negotiation. 	none specified
Initiator cookie	When the IKE negotiation is triggered, a random number is sent to the remote node.	All levels

Table 323: show ike security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Responder cookie	<p>The remote node generates its own random number and sends it back to the initiator as a verification that the packets were received.</p> <p>Of the numerous security services available, protection against denial of service (DoS) is one of the most difficult to address. A “cookie” or anticlogging token (ACT) is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. An exchange prior to CPU-intensive public key operations can thwart some DoS attempts (such as simple flooding with invalid IP source addresses).</p>	All levels
Exchange type	<p>Specifies the number of messages in an IKE exchange, and the payload types that are contained in each message. Each exchange type provides a particular set of security services, such as anonymity of the participants, perfect forward secrecy of the keying material, and authentication of the participants. Junos OS supports two types of exchanges:</p> <ul style="list-style-type: none"> • Main—The exchange is done with six messages. Main encrypts the payload, protecting the identity of the neighbor. • Aggressive—The exchange is done with three messages. Aggressive does not encrypt the payload, leaving the identity of the neighbor unprotected. 	All Levels
Authentication method	Type of authentication determines which payloads are exchanged and when they are exchanged. The Junos OS supports only pre-shared keys .	detail
Local	Prefix and port number of the local end.	detail
Remote	Prefix and port number of the remote end.	detail
Lifetime	Number of seconds remaining until the IKE security association expires.	detail
Algorithms	<p>Header for the IKE algorithms output.</p> <ul style="list-style-type: none"> • Authentication—Type of authentication algorithm used: md5 or sha1. • Encryption—Type of encryption algorithm used: des-cbc, 3des-cbc, or None. • Pseudo random function—Function that generates highly unpredictable random numbers: hmac-md5 or hmac-sha1. 	detail
Traffic statistics	<p>Number of bytes and packets received and transmitted on the IKE security association.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the IKE security association. • Input packets, Output packets—Number of packets received and transmitted on the IKE security association. 	detail

Table 323: show ike security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Flags	Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> • caller notification sent—Caller program notified about the completion of the IKE negotiation. • waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. • waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. • waiting for policy manager—Negotiation is waiting for a response from the policy manager. 	detail
IPsec security associates	Number of IPsec security associations created and deleted with this IKE security association.	detail
Phase 2 negotiations in progress	Number of phase 2 IKE negotiations in progress and status information: <ul style="list-style-type: none"> • Negotiation type—Type of phase 2 negotiation. The Junos OS currently supports quick mode. • Message ID—Unique identifier for a phase 2 negotiation. • Local identity—Identity of the local phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[O..id-data-len] = iddata-presentation)</i> • Remote identity—Identity of the remote phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[O..id-data-len] = iddata-presentation)</i> • Flags—Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> • caller notification sent—Caller program notified about the completion of the IKE negotiation. • waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. • waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. • waiting for policy manager—Negotiation is waiting for a response from the policy manager. 	detail

Sample Output

**show ike
security-associations**

```
user@host> show ike security-associations
Remote Address  State      Initiator cookie  Responder cookie  Exchange type
4.4.4.4         Matured           93870456fa000011  723a20713700003e  Main
```

**show ike
security-associations
detail**

```
user@host> show ike security-associations detail
IKE peer 4.4.4.4
Role: Initiator, State: Matured
Initiator cookie: cf22bd81a7000001, Responder cookie: fe83795c2800002e
Exchange type: Main, Authentication method: Pre-shared-keys
Local: 4.4.4.5:500, Remote: 4.4.4.4:500
Lifetime: Expires in 187 seconds
Algorithms:
Authentication      : md5
Encryption           : 3des-cbc
Pseudo random function: hmac-md5
Traffic statistics:
Input  bytes  :           1000
Output bytes  :           1280
Input  packets:             5
Output packets:            9
Flags: Caller notification sent
IPsec security associations: 2 created, 0 deleted
Phase 2 negotiations in progress: 1

Negotiation type: Quick mode, Role: Initiator, Message ID: 3582889153
Local: 4.4.4.5:500, Remote: 4.4.4.4:500
Local identity: ipv4_subnet(tcp:80,[0..7]=10.1.1.0/24)
Remote identity: ipv4_subnet(tcp:100,[0..7]=10.1.2.0/24)
Flags: Caller notification sent, Waiting for done
```

show ipsec redundancy

Syntax	<code>show ipsec redundancy (interface <es-fpc/pic/port> security association <sa-name>)</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(Encryption interface on M Series and T Series routers only) Display information about IPsec redundancy.
Options	<p>interface <es-fpc/pic/port>—Display information about all encryption interfaces, or optionally, about a particular encryption interface.</p> <p>security association <sa-name>—Display information about all remote tunnels, or optionally, about a particular remote tunnel.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> request ipsec switch on page 2284
List of Sample Output	<p>show ipsec redundancy interface on page 2295</p> <p>show ipsec redundancy security-associations on page 2295</p>
Output Fields	Table 324 on page 2294 lists the output fields for the show ipsec redundancy command. Output fields are listed in the approximate order in which they appear.

Table 324: show ipsec redundancy Output Fields

Field Name	Field Description
Failure counter	Number of times a PIC switched between primary and backup interfaces, or the number of times the tunnel switched between the primary and remote peers since the software has been activated.
Primary interface '	Name of the interface configured to be the primary interface.
Backup interface	Name of the interface configured to be the backup interface.
State	State of the primary or backup interface can be Active , Offline , or Standby . Both ES PICs are initialized to Offline . For primary and remote peers, State can be Active or Standby . Both peers are in a state of Standby by default (there is not yet a connection between the two peers).
Security association	Name of the security association.
Local IP	Local IP address.
Primary remote IP	IP address of the configured primary remote peer.
Backup remote IP	IP address of the configured backup remote peer.

Sample Output

```
show ipsec redundancy interface user@host> show ipsec redundancy interface
Failure counter: 0
Primary interface: es-1/3/0, State: Active
Backup interface : es-1/1/0, State: Standby
```

```
show ipsec redundancy security-associations user@host> show ipsec redundancy security-associations sa-dynamic
Security association: sa-dynamic, Failure counter: 0
Local IP: 4.4.4.4
Primary remote IP: 4.4.4.5, State: Standby
Backup remote IP : 3.3.3.3, State: Standby
```

show ipsec security-associations

Syntax	show ipsec security-associations <brief detail> <sa-name>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display information about the IPsec security associations applied to the local or transit traffic stream.
Options	<p>none—Display standard information about all IPsec security associations.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>sa-name—(Optional) Display the specified IPsec security association.</p>
Required Privilege Level	view
List of Sample Output	show ipsec security-associations sa-name on page 2298 show ipsec security-associations sa-name detail on page 2298
Output Fields	Table 325 on page 2296 lists the output fields for the show ipsec security-associations command. Output fields are listed in the approximate order in which they appear.

Table 325: show ipsec security-associations Output Fields

Field Name	Field Description	Level of Output
Security association	Name of the security association.	All levels
Interface family	<p>Status of the interface family of the security association. If the interface family field is absent, it is a transport mode security association. The interface family can have one of three options:</p> <ul style="list-style-type: none"> • Up—The security association is referenced in the interface family and the interface family is up. • Down—The security association is referenced in the interface family and the interface family is down. • No reference—The security association is not referenced in the interface family. 	All levels
Local gateway	Gateway address of the local system.	All levels
Remote gateway	Gateway address of the remote system.	All levels
Local identity	Prefix and port number of the local end	All levels
Remote identity	Prefix and port number of the remote end.	All levels
Direction	Direction of the security association: inbound or outbound .	All levels
SPI	Value of the security parameter index.	All levels

Table 325: show ipsec security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
AUX-SPI	Value of the auxiliary security parameter index. <ul style="list-style-type: none"> When the value is AH or ESP, AUX-SPI is always 0. When the value is AH+ESP, AUX-SPI is always a positive integer. 	All levels
State	Status of the security association: <ul style="list-style-type: none"> Installed—The security association is installed in the security association database. (For transport mode security associations, the value of State must always be Installed.) Not installed—The security association is not installed in the security association database. 	detail
Mode	Mode of the security association: <ul style="list-style-type: none"> transport—Protects single host-to-host protections. tunnel—Protects connections between security gateways. 	All levels
Type	Type of security association: <ul style="list-style-type: none"> manual—Security parameters require no negotiation. They are static, and are configured by the user. dynamic—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode. 	All levels
Protocol	Protocol supported: <ul style="list-style-type: none"> transport mode—Supports Encapsulation Security Protocol (ESP) or Authentication Header (AH). tunnel mode—Supports ESP or AH+ESP. 	All levels
Authentication	Type of authentication used: hmac-md5-96 , hmac-sha1-96 , or None .	detail
Encryption	Type of encryption used: des-cbc , 3des-csc , or None .	detail
Soft lifetime Hard lifetime	(dynamic output only) Each lifetime of a security association has two display options, hard and soft, one of which must be present for a dynamic security association. The hard lifetime specifies the lifetime of the SA. The soft lifetime , which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This allows the key management system to negotiate a new SA before the hard lifetime expires. <ul style="list-style-type: none"> Expires in seconds seconds—Number of seconds left until the security association expires. Expires in kilobytes kilobytes—Number of kilobytes left until the security association expires. 	detail
Anti-replay service	State of the service that prevents packets from being replayed: Enabled or Disabled .	detail

Table 325: show ipsec security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Replay window size	Configured size, in packets, of the antireplay service window: 32 or 64 . The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. If the replay window size is 0 , the antireplay service is disabled.	detail

Sample Output

**show ipsec
security-associations
sa-name**

```
user@host> show ipsec security-associations sa-cosmic brief
Security association: sa-cosmic, Interface family: Up
Local gateway: 21.21.1.1, Remote gateway: 21.21.2.1
Local identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Direction SPI          AUX-SPI    Mode      Type      Protocol
inbound  2908734119  0         tunnel    dynamic   AH
outbound 3494029335  0         tunnel    dynamic   AH
```

Mode: tunnel, Type: dynamic
Protocol: AH, Authentication: hmac-md5-96, Encryption: None
Soft lifetime: Expired
Hard lifetime: Expires in 120 seconds
Anti-replay service: Disabled
```

show security pki ca-certificate

Syntax	show security pki ca-certificate <brief detail> <ca-profile <i>ca-profile-name</i> >
Release Information	Command introduced in Junos OS Release 7.5.
Description	Display information about certificate authority (CA) digital certificates installed in the router.
Options	<p>none—(Same as brief) Display information about all CA digital certificates.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>ca-profile <i>ca-profile-name</i>—(Optional) Display information about only the specified CA profile.</p>
Required Privilege Level	view
List of Sample Output	show security pki ca-certificate on page 2301 show security pki ca-certificate detail on page 2301
Output Fields	Table 326 on page 2299 lists the output fields for the show security pki ca-certificate command. Output fields are listed in the approximate order in which they appear.

Table 326: show security pki ca-certificate Output Fields

Field Name	Field Description	Level of Output
Certificate identifier	Name of the digital certificate.	All levels
Certificate version	Revision number of the digital certificate.	detail
Serial number	Unique serial number of the digital certificate.	detail
Issued by	Authority that issued the digital certificate.	none brief
Issued to	Device that was issued the digital certificate.	none brief
Issuer	<p>Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> • Common name—Name of the authority. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. 	detail

Table 326: show security pki ca-certificate Output Fields (*continued*)

Field Name	Field Description	Level of Output
Subject	<p>Details of the digital certificate holder organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> • Common name—Name of the requestor. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. 	detail
Validity	<p>Time period when the digital certificate is valid. Values are:</p> <ul style="list-style-type: none"> • Not before—Start time when the digital certificate becomes valid. • Not after—End time when the digital certificate becomes invalid. 	All levels
Public key algorithm	Encryption algorithm used with the private key, such as rsaEncryption(1024 bits) .	All levels
Signature algorithm	Encryption algorithm that the CA used to sign the digital certificate, such as sha1WithRSAEncryption .	detail
Fingerprint	Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.	detail
Distribution CRL	Distinguished name information and the URL for the certificate revocation list (CRL) server.	detail
Use for key	Use of the public key, such as Certificate signing , CRL signing , Digital signature , or Key encipherment .	detail

show security pki certificate-request

Syntax	show security pki certificate-request <brief detail> <certificate-id <i>certificate-id-name</i> >
Release Information	Command introduced in Junos OS Release 7.5.
Description	Display information about manually generated local digital certificate requests that are stored in the router.
Options	<p>none—(same as brief) Display information about all local digital certificate requests.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>certificate-id <i>certificate-id-name</i>—(Optional) Display information about only the specified local digital certificate request</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear security pki certificate-request on page 2262
List of Sample Output	show security pki certificate-request on page 2304 show security pki certificate-request detail on page 2304
Output Fields	Table 327 on page 2303 lists the output fields for the show security pki certificate-request command. Output fields are listed in the approximate order in which they appear.

Table 327: show security pki certificate-request Output Fields

Field Name	Field Description	Level of Output
Certificate identifier	Name of the digital certificate.	All levels
Certificate version	Revision number of the digital certificate.	detail
Issued to	Device that was issued the digital certificate.	none brief
Subject	<p>Details of the digital certificate holder organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> • Common name—Name of the authority. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. 	detail
Alternate subject	Domain name or IP address of the device related to the digital certificate.	detail

Table 327: show security pki certificate-request Output Fields (*continued*)

Field Name	Field Description	Level of Output
Validity	Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> Not before—Time when the digital certificate becomes valid. Not after—End time when the digital certificate becomes invalid. 	All levels
Public key algorithm	Encryption algorithm used with the private key, such as rsaEncryption(1024 bits) .	All levels
Public key verification status	Public key verification status: Failed or Passed . The detail output also provides the verification hash.	All levels
Fingerprint	Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.	detail
Use for key	Use of the public key, such as Certificate signing , CRL signing , Digital signature , or Key encipherment .	detail

Sample Output

show services ipsec-vpn ike security-associations

Syntax	show services ipsec-vpn ike security-associations <brief detail> <peer-address>
Release Information	Command introduced before Junos OS Release 7.4. Statistics for Internet Key Exchange (IKE) security associations for each services PIC introduced in Junos OS Release 12.1.
Description	(Adaptive services interface only) Display information for Internet Key Exchange (IKE) security associations. If no security association is specified, the information for all security associations is displayed.
Options	none —(same as brief) Display standard information for all IPsec security associations. brief detail —(Optional) Display the specified level of output. peer-address —(Optional) Display information about a particular security association address.
Required Privilege Level	view
List of Sample Output	show services ipsec-vpn ike security-associations on page 2313 show services ipsec-vpn ike security-associations detail on page 2313
Output Fields	Table 330 on page 2310 lists the output fields for the show services ipsec-vpn ike security-associations command. Output fields are listed in the approximate order in which they appear.

Table 330: show services ipsec-vpn ike security-associations Output Fields

Field Name	Field Description	Level of Output
IKE peer	Remote end of the IKE negotiation.	detail
Role	Part played in the IKE session. The router triggering the IKE negotiation is the initiator, and the router accepting the first IKE exchange packets is the responder.	detail
Remote Address	Responder's address.	none specified
State	State of the IKE security association: <ul style="list-style-type: none"> • Matched—IKE security association is established. • Not matched—The IKE security association is in the process of negotiation. 	none specified
Initiator cookie	When the IKE negotiation is triggered, a random number is sent to the remote node.	All levels

Table 330: show services ipsec-vpn ike security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Responder cookie	<p>The remote node generates its own random number and sends it back to the initiator as a verification that the packets were received.</p> <p>Of the numerous security services available, protection against denial of service (DoS) is one of the most difficult to address. A “cookie” or anticlogging token (ACT) is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. An exchange prior to CPU-intensive public key operations can thwart some DoS attempts (such as simple flooding with invalid IP source addresses).</p>	All levels
Exchange type	<p>Specifies the number of messages in an IKE exchange, and the payload types that are contained in each message. Each exchange type provides a particular set of security services, such as anonymity of the participants, perfect forward secrecy of the keying material, and authentication of the participants. Junos OS supports two types of exchanges:</p> <ul style="list-style-type: none"> • Main—The exchange is done with six messages. Main encrypts the payload, protecting the identity of the neighbor. • Aggressive—The exchange is done with three messages. Aggressive does not encrypt the payload, leaving the identity of the neighbor unprotected. • IKEv2—The exchange is negotiated using IKE version 2. 	All levels
PIC	The services PIC for which the IKE security associations are displayed.	All levels
Authentication method	Type of authentication determines which payloads are exchanged and when they are exchanged. The Junos OS supports only pre-shared keys .	detail
Local	Prefix and port number of the local end.	detail
Remote	Prefix and port number of the remote end.	detail
Lifetime	Number of seconds remaining until the IKE security association expires.	detail
Algorithms	<p>Header for the IKE algorithms output.</p> <ul style="list-style-type: none"> • Authentication—(detail output only) Type of authentication algorithm used: md5 or sha1 • Encryption—(detail output only) Type of encryption algorithm used: des-cbc, 3des-cbc, or None. • Pseudo random function—Function that generates highly unpredictable random numbers: hmac-md5 or hmac-sha1. 	detail
Traffic statistics	<p>Number of bytes and packets received and transmitted on the IKE security association.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the IKE security association. • Input packets, Output packets—Number of packets received and transmitted on the IKE security association. 	detail

Table 330: show services ipsec-vpn ike security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Flags	Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> caller notification sent—Caller program notified about the completion of the IKE negotiation. waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. waiting for policy manager—Negotiation is waiting for a response from the policy manager. 	detail
IPsec security associates	Number of IPsec security associations created and deleted with this IKE security association.	detail
Phase 2 negotiations in progress	Number of phase 2 negotiations in progress and status information: <ul style="list-style-type: none"> Negotiation type—Type of phase 2 negotiation. The Junos OS currently supports quick mode. Message ID—Unique identifier for a phase 2 negotiation. Local identity—Identity of the local phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>. Remote identity—Identity of the remote phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>. Flags—Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> caller notification sent—Caller program notified about the completion of the IKE negotiation. waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. waiting for policy manager—Negotiation is waiting for a response from the policy manager. 	detail

show services ipsec-vpn ipsec security-associations

Syntax	show services ipsec-vpn ipsec security-associations <brief detail extensive> <service-set <i>service-set-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	(Adaptive services interface only) Display IPsec security associations for the specified service set. If no service set is specified, the security associations for all service sets are displayed.
Options	<p>none—Display standard information about IPsec security associations for all service sets.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>service-set <i>service-set-name</i>—(Optional) Display information about a particular service set.</p>
Required Privilege Level	view
List of Sample Output	show services ipsec-vpn ipsec security associations extensive on page 2317
Output Fields	Table 331 on page 2315 lists the output fields for the show services ipsec-vpn ipsec security-associations command. Output fields are listed in the approximate order in which they appear.

Table 331: show services ipsec-vpn ipsec security-associations Output Fields

Field Name	Field Description	Level of Output
Service set	Name of the service set for which the IPsec security associations are defined. If appropriate, includes the outside service interface VRF name.	All levels
Rule	Name of the rule set applied to the security association.	detail extensive
Term	Name of the IPsec term applied to the security association.	detail extensive
Tunnel index	Numeric identifier of the specific IPsec tunnel for the security association.	detail extensive
Local gateway	Gateway address of the local system.	All levels
Remote gateway	Gateway address of the remote system.	All levels
IPsec inside interface	Name of the logical interface hosting the IPsec tunnels.	All levels
Tunnel MTU	MTU of the IPsec tunnel.	All levels
Local identity	Prefix and port number of the local end	All levels

Table 331: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Remote identity	Prefix and port number of the remote end.	All levels
Primary remote gateway	IP address of the configured primary remote peer.	All levels
Backup remote gateway	IP address of the configured backup remote peer.	All levels
State	State of the primary or backup interface: Active , Offline , or Standby . Both ES PICs are initialized to Offline . For primary and backup peers, State can be Active or Standby . If both peers are in a state of Standby , no connection exists yet between the two peers.	All levels
Failover counter	Number of times a PIC switched between primary and backup interfaces, or the number of times the tunnel switched between the primary and remote peers since the software has been activated.	All levels
Direction	Direction of the security association: inbound or outbound .	All levels
SPI	Value of the security parameter index.	All levels
AUX-SPI	Value of the auxiliary security parameter index. <ul style="list-style-type: none"> When the value of Protocol is AH or ESP, AUX-SPI is always 0. When the value of Protocol is AH+ESP, AUX-SPI is always a positive integer. 	All levels
Mode	Mode of the security association: <ul style="list-style-type: none"> transport—Protects single host-to-host protections. tunnel—Protects connections between security gateways. 	detail extensive
Type	Type of security association: <ul style="list-style-type: none"> manual—Security parameters require no negotiation. They are static, and are configured by the user. dynamic—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode. 	detail extensive
State	Status of the security association: <ul style="list-style-type: none"> Installed—The security association is installed in the security association database. (For transport mode security associations, the value of State must always be Installed) Not installed—The security association is not installed in the security association database. 	detail extensive
Protocol	Protocol supported: <ul style="list-style-type: none"> transport mode supports Encapsulation Security Protocol (ESP) or Authentication Header (AH). tunnel mode supports ESP or AH+ESP. 	All levels

Table 331: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Authentication	Type of authentication used: hmac-md5-96 , hmac-sha1-96 , or none .	detail extensive
Encryption	Type of encryption algorithm used: can be aes-cbc (128 bits) , aes-cbc (192 bits) , aes-cbc (256 bits) , des-cbc , 3des-cbc , or None .	detail
Soft lifetime Hard lifetime	Each lifetime of a security association has two display options, hard and soft, one of which must be present for a dynamic security association. The hard lifetime specifies the lifetime of the SA. The soft lifetime, which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This information allows the key management system to negotiate a new SA before the hard lifetime expires. <ul style="list-style-type: none"> • Expires in seconds seconds—Number of seconds left until the security association expires. • Expires in kilobytes kilobytes—Number of kilobytes left until the security association expires. 	detail extensive
Anti-replay service	State of the service that prevents packets from being replayed: Enabled or Disabled .	detail extensive
Replay window size	Configured size, in packets, of the antireplay service window: 32 or 64 . The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. If the replay window size is 0 , antireplay service is disabled.	detail

Sample Output

**show services
ipsec-vpn ipsec
security associations
extensive**

```

user@host> show services ipsec-vpn ipsec security-associations extensive
Service set: service-set-1
  Rule: _junos_, Term: term-1, Tunnel index: 1

  Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
  Soft lifetime: Expires in 23043 seconds
  Hard lifetime: Expires in 23178 seconds
  Anti-replay service: Enabled, Replay window size: 64

```

show services ipsec-vpn ipsec statistics

Syntax	show services ipsec-vpn ipsec statistics <brief detail> <remote-gw remote-peer-address> <service-set service-set-name>
Release Information	Command introduced before Junos OS Release 7.4. New fields added in Junos OS Release 10.0.
Description	(Adaptive services interface only) Display IPsec statistics for the specified service set. If no service set is specified, the statistics for all service sets are displayed.
Options	<p>none—Display standard IPsec statistics for all service sets.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>remote-gw remote-peer-address—(Optional) Display IPsec statistics for an individual IPsec tunnel and an individual remote host.</p> <p>service-set service-set-name—(Optional) Display information about a particular service set.</p>
Required Privilege Level	view
List of Sample Output	show services ipsec-vpn ipsec statistics detail on page 2320 show services ipsec-vpn ipsec statistics remote-gw on page 2320
Output Fields	Table 332 on page 2318 lists the output fields for the show services ipsec-vpn ipsec statistics command. Output fields are listed in the approximate order in which they appear.

Table 332: show services ipsec-vpn ipsec statistics Output Fields

Field Name	Field Description	Level of Output
PIC	The physical interface on which the IPsec tunnel is configured.	All levels
Service set	Name of the service set for which the IPsec tunnel is defined.	All levels
Local gateway	Gateway address of the local system.	All levels
Remote gateway	Gateway address of the remote system.	All levels
Tunnel index	Numeric identifier of the specific IPsec tunnel for the security association.	All levels

Table 332: show services ipsec-vpn ipsec statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
ESP statistics	Encapsulation Security Payload (ESP) statistics: <ul style="list-style-type: none"> • Encrypted bytes—Total number of bytes encrypted by the local system across the IPsec tunnel. • Decrypted bytes—Total number of bytes decrypted by the local system across the IPsec tunnel. • Encrypted packets—Total number of packets encrypted by the local system across the IPsec tunnel. • Decrypted packets—Total number of packets decrypted by the local system across the IPsec tunnel. 	All levels
AH Statistics	Authentication Header statistics: <ul style="list-style-type: none"> • Input bytes—Total number of bytes received by the local system across the IPsec tunnel. • Output bytes—Total number of bytes transmitted by the local system across the IPsec tunnel. • Input packets—Total number of packets received by the local system across the IPsec tunnel. • Output packets—Total number of packets transmitted by the local system across the IPsec tunnel. 	All levels
Errors	<ul style="list-style-type: none"> • AH authentication failures—Number of authentication header (AH) failures. An AH failure occurs when there is a mismatch of the authentication header in a packet transmitted across an IPsec tunnel. • ESP authentication failures—Number of Encapsulation Security Payload (ESP) failures. An ESP failure occurs when there is an authentication mismatch in ESP packets. • ESP Decryption failures—Number of ESP decryption failures. • Bad headers—Number of invalid headers detected. • Bad trailers—Number of invalid trailers detected. • Replay before window drops—Number of replay errors. A replay error is generated when a duplicate packet is received within the replay window. • Replayed pkts—Number of packets replayed. • IP integrity errors—Number of IP integrity errors. • Exceeds tunnel MTU—Number of times the tunnel maximum transmission unit (MTU) value was exceeded. • Rule lookup failures—Number of rule lookup failures. • No SA errors—Number of errors resulting from a missing security association (SA). • Flow errors—Number of flow errors. • Misc errors—Number of miscellaneous errors. 	All levels

Sample Output

**show services
ipsec-vpn ipsec
statistics detail**

user@host> show services ipsec-vpn ipsec statistics

PIC: sp-0/2/0, Service set: ss0

```
ESP Statistics:
  Encrypted bytes:          0
  Decrypted bytes:         0
  Encrypted packets:       0
  Decrypted packets:       0
AH Statistics:
  Input bytes:             168
  Output bytes:            168
  Input packets:           2
  Output packets:          2
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0
```

**show services
ipsec-vpn ipsec
statistics remote-gw**

user@host> show services ipsec-vpn ipsec statistics remote-gw 22.22.2.1

PIC: sp-3/1/0, Service set: service-set-2

Local gateway: 22.22.1.1, Remote gateway: 22.22.2.1, Tunnel index: 2

```
ESP Statistics:
  Encrypted bytes:          0
  Decrypted bytes:         0
  Encrypted packets:       0
  Decrypted packets:       0
AH Statistics:
  Input bytes:             0
  Output bytes:            0
  Input packets:           0
  Output packets:          0
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0
```

show system certificate

Syntax	<code>show system certificate</code> <code><certificate-id></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	(Encryption interface on M Series, T Series routers, and QFX Series switches only) Display installed certificates signed by the Juniper Networks certificate authority.
Options	none —Display all installed certificates signed by the Juniper Networks certificate authority. certificate-id —(Optional) Display the details of a particular certificate.
Required Privilege Level	maintenance
List of Sample Output	show system certificate on page 2322 show system certificate (QFX Series) on page 2322
Output Fields	Table 333 on page 2321 lists the output fields for the show system certificate command. Output fields are listed in the approximate order in which they appear.

Table 333: show system certificate Output Fields

Field Name	Field Description
Certificate identifier	Unique identifier associated with a certificate. The certificate identifier is the common name of the subject.
Issuer Subject	Information about the certificate issuer and the distinguished name (DN) of the issuer, respectively: <ul style="list-style-type: none"> • Organization—Name of the owner's organization. • Organizational unit—Name of the owner's department. • Country—Two-character country code in which the owner's system is located. • State—State in the USA in which the owner is using the certificate. • Locality—City in which the owner's system is located. • Common name—Name of the owner of the certificate. • E-mail address—E-mail address of the owner of the certificate.
Validity	When a certificate is valid.
Signature algorithm	Encryption algorithm applied to the installed certificate.
Public key algorithm	Encryption algorithm applied to the public key.

Sample Output

show system certificate

```
user@host> show system certificate
Certificate identifier: Dallas-v3
  Issuer:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
    E-mail address:ca@juniper.net
  Subject:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
    E-mail address:ca@juniper.net
  Validity:
    Not before: Mar 13 03:23:25 2004 GMT
    Not after: Mar 24 03:23:25 2014 GMT
  Signature algorithm: sha1WithRSAEncryption
  Public key algorithm: dsaEncryption
```

show system certificate (QFX Series)

```
user@host> show system certificate
Certificate identifier: Dallas-v3
  Issuer:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas CA,
    E-mail address:ca@juniper.net
  Subject:
    Organization: Juniper Networks, Organizational unit: Juniper CA,
    Country: US, State: CA, Locality: Sunnyvale, Common name: Dallas-v3,
    E-mail address:ca@juniper.net
  Validity:
    Not before: Mar 13 03:23:25 2004 GMT
    Not after: Mar 24 03:23:25 2014 GMT

  Public key algorithm: dsaEncryption
```

Layer 2 Tunneling Protocol Operational Mode Commands

Table 334 on page 2323 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot Layer 2 Tunneling Protocol (L2TP) services. Commands are listed in alphabetical order.

Table 334: L2TP Services Operational Mode Commands

Task	Command
Clear L2TP destinations.	<code>clear services l2tp destination</code>
Clear L2TP destination statistics.	<code>clear services l2tp destination statistics</code>
Clear L2TP multilink bundles.	<code>clear services l2tp multilink</code>
Clear L2TP sessions.	<code>clear services l2tp session</code>
Clear statistics for L2TP sessions.	<code>clear services l2tp session statistics</code>
Clear L2TP tunnels.	<code>clear services l2tp tunnel</code>
Clear statistics for L2TP tunnels.	<code>clear services l2tp tunnel statistics</code>
Display information about L2TP tunnel destinations.	<code>show services l2tp destination</code>
Display L2TP multilink bundles.	<code>show services l2tp multilink</code>
Display RADIUS server and statistics information.	<code>show services l2tp radius</code>
Display active L2TP sessions.	<code>show services l2tp session</code>
Display L2TP summary information.	<code>show services l2tp summary</code>
Display active L2TP tunnels.	<code>show services l2tp tunnel</code>
Display active L2TP users.	<code>show services l2tp user</code>

Table 334: L2TP Services Operational Mode Commands (*continued*)

Task	Command
Display IP reassembly statistics	show services inline ip-reassembly statistics
Test tunnel configurations on an MX Series router configured as the LAC.	<code>test services l2tp tunnel</code>

NOTE: L2TP services are supported on the adaptive services (*sp-fpc/pic/port*) interface on M7i and M10i routers. L2TP access concentrator (LAC) services are supported on MX Series routers.

NOTE: For information about how to configure L2TP services on M7i and M10i routers, see the Junos Services Interfaces Configuration Release 12.3. For information about how to configure LAC services on MX Series routers, see the Junos OS Subscriber Management, Release 13.1.

clear services l2tp destination

Syntax	clear services l2tp destination <all local-gateway <i>gateway-address</i> peer-gateway <i>gateway-address</i> >
Release Information	Command introduced in Junos OS Release 10.4. Statistics option introduced in Junos OS Release 13.1
Description	Clear all Layer 2 Tunneling Protocol (L2TP) destinations and all tunnels and sessions that belong to the destinations. This command is available only for LAC on MX Series routers.
Options	<p>all—Close all L2TP destinations.</p> <p>local-gateway <i>gateway-address</i>—Clear only the L2TP destinations and all tunnels and sessions associated with the specified local gateway address.</p> <p>peer-gateway <i>gateway-address</i>—Clear only the L2TP destinations and all tunnels and sessions associated with the peer gateway with the specified address.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show services l2tp destination on page 2335
List of Sample Output	clear services l2tp destination all on page 2325
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services l2tp destination all
user@host> clear services l2tp destination all
Destination 2 closed
```

clear services l2tp multilink

Syntax	clear services l2tp multilink (all <statistics> bundle-id <i>number</i> <statistics> statistics (all bundle-id <i>number</i>))
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M10i and M7i routers only) Close Layer 2 Tunneling Protocol (L2TP) multilink sessions or clear session statistics.
Options	<p>all <statistics>—Close all L2TP multilink sessions or clear statistics for all L2TP multilink sessions.</p> <p>bundle-id <i>number</i> <statistics>—L2TP multilink bundle ID. The value is an internally generated number from 1 to 65535. Close the specified L2TP multilink session, or using the statistics keyword with this option, clear statistics for the specified session.</p> <p>statistics (all bundle-id <i>number</i>)—Clear all session statistics or clear statistics for the specified multilink bundle ID.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show services l2tp multilink on page 2338
List of Sample Output	clear services l2tp multilink statistics all on page 2326
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services l2tp multilink statistics all
user@host> clear services l2tp multilink statistics all
Multilink 1 statistics cleared
```

clear services l2tp session

Syntax	clear services l2tp session (all interface <i>interface-name</i> local-gateway <i>gateway-address</i> local-gateway-name <i>gateway-name</i> local-session-id <i>session-id</i> local-tunnel-id <i>tunnel-id</i> peer-gateway <i>gateway-address</i> peer-gateway-name <i>gateway-name</i> tunnel-group <i>group-name</i> user <i>username</i>)
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M10i and M7i routers only) Clear Layer 2 Tunneling Protocol (L2TP) sessions on LNS. (MX Series routers only) Clear L2TP sessions on LAC and LNS.
Options	<p>all—Close all L2TP sessions.</p> <p>interface <i>interface-name</i>—Clear only the L2TP sessions using the specified adaptive services or inline services interface. The interface type depends on the line card as follows:</p> <ul style="list-style-type: none"> • si-<i>fpc/pic/port</i>—MPCs on MX Series routers only. This option is not available for L2TP on M Series routers. • sp-<i>fpc/pic/port</i>—AS or Multiservices PICs on M7i, M10i, and M120 routers only. This option is not available for L2TP on MX Series routers. <p>local-gateway <i>gateway-address</i>—Clear only the L2TP sessions associated with the specified local gateway address.</p> <p>local-gateway-name <i>gateway-name</i>—Clear only the L2TP sessions associated with the specified local gateway name.</p> <p>local-session-id <i>session-id</i>—Clear only the L2TP sessions with this identifier for the local endpoint of the L2TP session.</p> <p>local-tunnel-id <i>tunnel-id</i>—Clear only the L2TP sessions associated with the specified local tunnel identifier.</p> <p>peer-gateway <i>gateway-address</i>—Clear only the L2TP sessions associated with the peer gateway with the specified address.</p> <p>peer-gateway-name <i>gateway-name</i>—Clear only the L2TP sessions associated with the peer gateway with the specified name.</p> <p>tunnel-group <i>group-name</i>—Clear only the L2TP sessions associated with the specified tunnel group. This option is not available for L2TP LAC on MX Series routers.</p> <p>user <i>username</i>—(M Series routers only) Clear only the L2TP sessions for the specified username.</p>

clear services l2tp tunnel statistics

Syntax	clear services l2tp tunnel statistics (all interface <i>sp-fpc/pic/port</i> local-gateway <i>gateway-address</i> local-gateway-name <i>gateway-name</i> local-tunnel-id <i>tunnel-id</i> peer-gateway <i>gateway-address</i> peer-gateway-name <i>gateway-name</i> tunnel-group <i>group-name</i>)
Release Information	Command introduced before Junos OS Release 7.4. Support for MX Series routers added in Junos OS Release 10.4.
Description	(M10i and M7i routers: LNS only. MX Series routers: LAC only.) Clear statistics for Layer 2 Tunneling Protocol (L2TP) tunnels.
Options	<p>all—Clear statistics for all L2TP tunnels.</p> <p>interface <i>sp-fpc/pic/port</i>—Clear statistics for only the L2TP tunnels using the specified adaptive services interface. This option is not available for L2TP LAC on MX Series routers.</p> <p>local-gateway <i>gateway-address</i>—Clear statistics for only the L2TP tunnels associated with the local gateway with the specified address.</p> <p>local-gateway-name <i>gateway-name</i>—Clear statistics for only the L2TP tunnels associated with the local gateway with the specified name.</p> <p>local-tunnel-id <i>tunnel-id</i>—Clear statistics for only the L2TP tunnels that have the specified local tunnel identifier.</p> <p>peer-gateway <i>gateway-address</i>—Clear statistics for only the L2TP tunnels associated with the peer gateway with the specified address.</p> <p>peer-gateway-name <i>gateway-name</i>—Clear statistics for only the L2TP tunnels associated with the peer gateway with the specified name.</p> <p>tunnel-group <i>group-name</i>—Clear statistics for only the L2TP tunnels in the specified tunnel group. This option is not available for L2TP LAC on MX Series routers.</p>
Required Privilege Level	clear

Output Fields	Table 335 on page 2335 lists the output fields for the show services l2tp destination command. Output fields are listed in the approximate order in which they appear.

Table 335: show services l2tp destination Output Fields

Field Name	Field Description	Level of Output
Local Name	Name of this destination.	All levels
Remote IP	IP address of the remote peer (LNS).	All levels

Table 335: show services l2tp destination Output Fields (*continued*)

Field Name	Field Description	Level of Output
Tunnels	Number of tunnel connections for the destination in the following categories: <ul style="list-style-type: none"> • total • active • failed 	All levels for total extensive for active and failed
Sessions	Number of session connections for the destination in the following categories: <ul style="list-style-type: none"> • total • active • failed 	All levels for total extensive for active and failed
State	Administrative state of the L2TP destination: <ul style="list-style-type: none"> • Enabled—No restrictions exist on creation or operation of sessions and tunnels for this destination. • Disabled—Existing sessions and tunnels for this destination have been disabled and no new sessions or tunnels are created while in the Disabled state. 	All levels
Local IP	IP address of the local gateway (LAC).	detail extensive
Transport	Medium used for tunneling. Only ipUdp is supported.	detail extensive
Logical System	Logical system in which the tunnel is configured.	detail extensive
Router Instance	Routing instance in which the tunnel is configured.	detail extensive
Lockout State	Reachability state of the destination: <ul style="list-style-type: none"> • not locked—Destination is considered reachable. • waiting for lockout timeout—Destination is locked out by L2TP because it is unreachable, so no attempts are made to reach the destination until the lockout timeout (300 seconds) expires, unless this is the only destination available for tunneling the subscriber. 	detail extensive
Connections	Number of total, active, and failed tunnel and session connections for the destination.	extensive
Control Tx	Amount of control information transmitted, in packets and bytes.	statistics
Control Rx	Amount of control information received, in packets and bytes.	statistics
Data Tx	Amount of data transmitted, in packets and bytes.	statistics
Data Rx	Amount of data received, in packets and bytes.	statistics
Error Tx	Number of errors transmitted, in packets.	statistics

Table 335: show services l2tp destination Output Fields (*continued*)

Field Name	Field Description	Level of Output
Error Rx	Number of errors received, in packets.	statistics

show services l2tp radius

Syntax	<pre>show services l2tp radius <accounting (servers statistics)> <authentication (servers statistics)> <servers> <statistics></pre>
Release Information	Command introduced in Junos OS Release 9.0.
Description	(M7i, M10i, and M120 routers only) Display RADIUS servers and statistics information for the RADIUS servers configured on the router.
Options	<p>You must include one of the following keywords to provide a valid completion for the command:</p> <p>accounting (servers statistics)—(Optional) Display RADIUS servers or statistical accounting information only.</p> <p>authentication (servers statistics)—(Optional) Display RADIUS servers or statistical authentication information only.</p> <p>servers—(Optional) Display RADIUS authentication and accounting server information only.</p> <p>statistics—(Optional) Display RADIUS authentication and accounting statistics information only.</p>
Required Privilege Level	view
List of Sample Output	<p>show services l2tp radius servers on page 2344</p> <p>show services l2tp radius statistics on page 2344</p>
Output Fields	<p>Table 337 on page 2342 lists the output fields for the show services l2tp radius command. Output fields are listed in the approximate order in which they appear.</p>

Table 337: show services l2tp radius Output Fields

Field Name	Field Description
IP Address	IP address of the server.
State	(servers keyword only) Present state of the server.
UDP Port	Number of the UDP port used to send authentication or accounting messages to the server.
Retry Count	(servers keyword only) Number of times the RADIUS client resends a packet if no ACK is received.
Timeout	(servers keyword only) Length of time the client waits for an ACK before retransmission.
Pending Requests	(servers keyword only) Number of client pending authentication or accounting requests.

Table 337: show services l2tp radius Output Fields (*continued*)

Field Name	Field Description
Maximum Sessions	(servers keyword only) Maximum number of pending requests on each RADIUS client before the server moves to the next RADIUS client, which is 200 times the maximum number of clients that can be created on a server (which is 12).
Dead Time	(servers keyword only) Interval to wait before retrying a server after it fails to send a response to an authentication or accounting request.
Secret Type	(servers keyword only) Secret type configured on the RADIUS server.
Profile	(servers keyword only) Name of profile configured for the RADIUS server.
Access requests	(statistics keyword only) Number of access requests sent to the server.
Rollover requests	(statistics keyword only) Number of requests coming into the server as a result of the previous server timing out.
Retransmissions	(statistics keyword only) Number of retransmissions.
Access accepts	(statistics keyword only) Number of access accept messages received from the server.
Access rejects	(statistics keyword only) Number of access reject messages received from the server.
Access challenges	(statistics keyword only) Number of access challenges received from the server.
Malformed responses	(statistics keyword only) Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).
Bad authenticators	(statistics keyword only) Number of responses in which the authenticator is incorrect for the matching request. This can occur if the RADIUS secrets for the client and server do not match.
Requests pending	(statistics keyword only) Number of requests waiting for a response.
Request timeouts	(statistics keyword only) Number of requests that timed out.
Unknown responses	(statistics keyword only) Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.
Packets dropped	(statistics keyword only) Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request. For example, if the router sends a request that times out, the router removes the request from the list and sends a new request. If the server is slow and sends a response to the first request after the router removes the request, the packet is dropped.

Sample Output

**show services l2tp
radius servers**

user@host> **show services l2tp radius servers**

RADIUS Authentication Servers

Release Information Command introduced before Junos OS Release 7.4.
 Support for LAC on MX Series routers introduced in Junos OS Release 10.4.
 Support for LNS on MX Series routers introduced in Junos OS Release 11.4.

Description (M10i and M7i routers only) Display information about active L2TP sessions for LNS.

 (MX Series routers only) Display information about active L2TP sessions for LAC and LNS.

Options **none**—Display standard information about all active L2TP sessions.

brief | detail | extensive—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display L2TP session information for only the specified adaptive services or inline services interface. The interface type depends on the line card as follows:

- **si-*fpc/pic/port***—MPCs on MX Series routers only. This option is not available for L2TP on M Series routers.
- **sp-*fpc/pic/port***—AS or Multiservices PICs on M7i, M10i, and M120 routers only. This option is not available for L2TP on MX Series routers.

local-gateway *gateway-address*—(Optional) Display L2TP session information for only the specified local gateway address.

local-gateway-name *gateway-name*—(Optional) Display L2TP session information for only the specified local gateway name.

local-session-id *session-id*—(Optional) Display L2TP session information for only the specified local session identifier.

local-tunnel-id *tunnel-id*—(Optional) Display L2TP session information for only the specified local tunnel identifier.

peer-gateway *gateway-address*—(Optional) Display L2TP session information for only the specified peer gateway address.

peer-gateway-name *gateway-name*—(Optional) Display L2TP session information for only the specified peer gateway name.

statistics—(Optional) Display the number of control packets and bytes transmitted and received for the session. You cannot include this option with any of the level options, **brief**, **detail**, or **extensive**.

tunnel-group *group-name*—(Optional) Display L2TP session information for only the specified tunnel group. To display information about L2TP CPU and memory usage, you can include the tunnel group name in the **show services service-sets memory-usage *group-name*** and **show services service-sets cpu-usage *group-name*** commands. This option is not available for L2TP LAC on MX Series routers.

user *username*—(M Series routers only) (Optional) Display L2TP session information for only the specified username.

Required Privilege Level view

Table 338: show services l2tp session Output Fields

Field Name	Field Description	Level of Output
Interface	(LNS only) Name of an adaptive services interface.	All levels
Tunnel group	(LNS only) Name of a tunnel group.	All levels
Tunnel local ID	Identifier of the local endpoint of the tunnel, as assigned by the L2TP network server (LNS).	All levels
Session local ID	Identifier of the local endpoint of the L2TP session, as assigned by the LNS.	All levels
Session remote ID	Identifier of the remote endpoint of the L2TP session, as assigned by the L2TP access concentrator (LAC).	All levels

Table 338: show services l2tp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	<p>State of the L2TP session:</p> <ul style="list-style-type: none"> • Established—The session is operating. This is the only state supported for the LAC. • closed—The session is being closed. • destroyed—The session is being destroyed. • clean-up—The session is being cleaned up. • lns-ic-accept-new—A new session is being accepted. • lns-ic-idle—The session has been created and is idle. • lns-ic-reject-new—The new session is being rejected. • lns-ic-wait-connect—The session is waiting for the peer's incoming call connected (ICCN) message. 	All levels
Bundle ID	(LNS only) Bundle identifier. Indicates the session is part of a multilink bundle. Sessions that have a blank Bundle field are not participating in the Multilink Protocol. Sessions in a multilink bundle might belong to different L2TP tunnels. For L2TP output organized by bundle ID, issue the show services l2tp multilink extensive command.	All levels
Mode	<p>(LNS) Mode of the interface representing the session: shared or exclusive.</p> <p>(LAC) Mode of the interface representing the session: shared or dedicated. Only dedicated is currently supported for the LAC.</p>	extensive
Local IP	IP address of local endpoint of the Point-to-Point Protocol (PPP) session.	extensive
Remote IP	IP address of remote endpoint of the PPP session.	extensive
Username	(LNS only) Name of the user logged in to the session.	All levels
Assigned IP address	(LNS only) IP address assigned to remote client.	extensive
Local name	For LNS, name of the LNS instance in which the session was created. For LAC, name of the LAC.	extensive
Remote name	For LNS, name of the LAC from which the session was created. For LAC, name of the LAC instance.	extensive
Local MRU	(LNS only) Maximum receive unit (MRU) setting of the local device, in bytes.	extensive
Remote MRU	(LNS only) MRU setting of the remote device, in bytes.	extensive
Tx speed	Transmit speed of the session conveyed from the LAC to the LNS, in bits per second (bps).	extensive
Rx speed	Receive speed of the session conveyed from the LAC to the LNS, in bits per second (bps).	extensive

Table 338: show services l2tp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
Bearer type	Type of bearer enabled: <ul style="list-style-type: none"> • 0—Might indicate that the call was not received over a physical link (for example, when the LAC and PPP are located in the same subsystem). • 1—Digital access requested. • 2—Analog access requested. • 4—Asynchronous Transfer Mode (ATM) bearer support. 	extensive
Framing type	Type of framing enabled: <ul style="list-style-type: none"> • 1—Synchronous framing • 2—Asynchronous framing 	extensive
LCP renegotiation	(LNS only) Whether Link Control Protocol (LCP) renegotiation is configured: On or Off .	extensive
Authentication	Type of authentication algorithm used: Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP).	extensive
Interface ID	(LNS only) Identifier used to look up the logical interface for this session.	extensive
Interface unit	Logical interface for this session.	All levels
Call serial number	Unique serial number assigned to the call.	extensive
Policer bandwidth	Maximum policer bandwidth configured for this session.	extensive
Policer burst size	Maximum policer burst size configured for this session.	extensive
Firewall filter	Configured firewall filter name.	extensive
Session encapsulation overhead	Overhead allowance configured for this session, in bytes.	extensive
Session cell overhead	Cell overhead activation (On or Off).	extensive
Create time	Date and time when the call was created.	extensive
Up time	Length of time elapsed since the call became active, in hours, minutes, and seconds.	extensive
Idle time	Length of time elapsed since the call became idle, in hours, minutes, and seconds.	extensive

Table 338: show services l2tp session Output Fields (*continued*)

Field Name	Field Description	Level of Output
Statistics since	<p>Date and time when collection of the following statistics began:</p> <ul style="list-style-type: none"> • Control Tx—Amount of control information transmitted, in packets and bytes. • Control Rx—Amount of control information received, in packets and bytes. • Data Tx—Amount of data transmitted, in packets and bytes. • Data Rx—Amount of data received, in packets and bytes. • Errors Tx—Number of errors transmitted, in packets. • Errors Rx—Number of errors received, in packets. • LCP echo req Tx—Number of LCP echo requests transmitted, in packets. • LCP echo req Rx—Number of LCP echo requests received, in packets. • LCP echo rep Tx—Number of LCP echo responses transmitted, in packets. • LCP echo rep Rx—Number of LCP echo responses received, in packets. • LCP echo Req timeout—Number of LCP echo requests that timed out. • LCP echo Req error—Number of errors received for LCP echo packets. • LCP echo Rep error—Number of errors transmitted for LCP echo packets. 	extensive

Sample Output

show services l2tp session (LNS on M Series Routers)

show services l2tp summary

Syntax	show services l2tp summary <statistics> <interface sp-fpc/pic/port>
Release Information	Command introduced before Junos OS Release 7.4. Support for LAC on MX Series routers introduced in Junos OS Release 10.4. Support for LNS on MX Series routers introduced in Junos OS Release 11.4. Support for statistics option introduced in Junos OS Release 13.1
Description	(M10i and M7i routers: LNS only. MX Series routers: LAC and LNS.) Display Layer 2 Tunneling Protocol (L2TP) summary information.
Options	<p>none—Display complete L2TP summary information. For LNS on M Series routers, display L2TP summary information for all adaptive services interfaces. For LNS on MX Series routers, display L2TP summary information for all inline services interfaces.</p> <p>interface sp-fpc/pic/port—(Optional) Display L2TP summary information for only the specified adaptive services interface. This option is not available for L2TP on MX Series routers.</p> <p>statistics—(Optional) Display a summary of control packets and bytes transmitted and received.</p>
Required Privilege Level	view
List of Sample Output	show services l2tp summary (LAC) on page 2357 show services l2tp summary (LAC on MX Series routers) on page 2357 show services l2tp summary (LNS on MX Series routers) on page 2357 show services l2tp summary (LNS on M Series routers) on page 2357 show services l2tp summary statistics (MX Series routers) on page 2357
Output Fields	Table 339 on page 2354 lists the output fields for the show services l2tp summary command. Output fields are listed in the approximate order in which they appear.

Table 339: show services l2tp summary Output Fields

Field Name	Field Description
Failover within a preference level	State of this tunnel selection method on the LAC. When enabled, tunnel selection fails over within a preference level. When disabled, tunnel selection drops to the next lower preference level. Not displayed for LNS on M Series routers.
Weighted load balancing	State of this tunnel selection method on the LAC. When enabled, the maximum session limit of a tunnel determines its weight within a preference level. Tunnel selection proceeds from greatest to least weight. When disabled, selection defaults to a round robin method. Not displayed for LNS on M Series routers.

Table 339: show services l2tp summary Output Fields (*continued*)

Field Name	Field Description
Tunnel authentication challenge	State of tunnel authentication, indicating whether the LAC and LNS exchange an authentication challenge and response during the establishment of the tunnel. The state is Enabled when a secret is configured in the tunnel profile or on the RADIUS server in the Tunnel-Password attribute [69]. The state is Disabled when the secret is not present. Not displayed for LNS on M Series routers.
Calling number avp	When the state is Enabled , the LAC includes the value of the Calling Number AVP 22 in ICRQ packets sent to the LNS. When the state is Disabled , the attribute is not sent to the LNS. Not displayed for LNS on M Series routers.
Failover Protocol	When the state is enabled, the LAC operates in the default <i>failover-protocol-fall-back-to-silent-failover</i> manner. When the state is disabled, the disable-failover-protocol statement has been issued and the LAC operates only in silent failover mode. Not displayed for LNS on M Series routers.
Tx connect speed method	The connection speed method configured to send the speed values in the L2TP Tx Connect Speed (AVP 24) and L2TP Rx Connect Speed (AVP 38). Possible values are: <ul style="list-style-type: none"> • ancp • pppoe-ia-tag • static
Rx speed avp when equal	Indicates if the Rx connect speed when equal configuration is enabled or disabled .
Tunnel assignment id	Format of the tunnel name. Format of the tunnel name, based on RADIUS attributes returned from the AAA server: <ul style="list-style-type: none"> • authentication-id—Name consists of only Tunnel Assignment-Id [82]. This is the default value. • client-server-id—Name is a combination of Tunnel-Client-Auth-Id [90], Tunnel-Server-Endpoint [67], and Tunnel-Assignment-Id [82]. This format is available only on MX Series routers.
Max Retransmissions for Established Tunnel	Maximum number of times control messages are retransmitted for established tunnels.
Max Retransmissions for Not Established Tunnel	Maximum number of times control messages are retransmitted for tunnels that are not established.
Tunnel Idle Timeout	Period that a tunnel can be inactive—that is, carrying no traffic—before it times out and is torn down.
Destruct Timeout	Period that the router attempts to maintain dynamic destinations, tunnels, and sessions after they have been destroyed.

Table 339: show services l2tp summary Output Fields (*continued*)

Field Name	Field Description
Destinations	Number of L2TP destinations for the LAC. Not displayed for LNS on M Series routers.
Tunnels	Number of L2TP tunnels established on the router.
Sessions	Number of L2TP sessions established on the router.
Control	Count of L2TP control packets and bytes sent and received.
Data	Count of L2TP data packets and bytes sent and received.
Errors	Count of L2TP error packets and bytes sent and received.

Sample Output

Output Fields [Table 340 on page 2360](#) lists the output fields for the **show services l2tp tunnel** command. Output fields are listed in the approximate order in which they appear.

Table 340: show services l2tp tunnel Output Fields

Field Name	Field Description
Interface	(LNS only) Name of an adaptive services interface.
Tunnel group	(LNS only) Name of a tunnel group.
Local ID	<p>On the LNS, number assigned by the LNS that identifies the local endpoint of the tunnel relative to the LNS: the LNS.</p> <p>On the LAC, number assigned by the LAC that identifies the local endpoint of the tunnel relative to the LAC: the LAC.</p>
Remote ID	<p>On the LNS, number assigned by the LAC that identifies the remote endpoint of the tunnel relative to the LNS: the LAC.</p> <p>On the LAC, number assigned by the LNS that identifies the remote endpoint of the tunnel relative to the LAC: the LNS.</p>
Remote IP	IP address of the peer endpoint of the tunnel.
Sessions	Number of L2TP sessions established through the tunnel.
State	<p>State of the L2TP tunnel:</p> <ul style="list-style-type: none"> • cc_responder_accept_new—The tunnel has received and accepted the start control connection request (SCCRQ). • cc_responder_reject_new—The tunnel has received and rejected the SCCRQ. • cc_responder_idle—The tunnel has just been created. • cc_responder_wait_ctl_conn—The tunnel has sent the start control connection response (SCCRP) and is waiting for the start control connection connected (SCCCN) message. • clean-up—The tunnel is being cleaned up. • closed—The tunnel is being closed. • destroyed—The tunnel is being destroyed. • Established—The tunnel is operating. This is the only state supported for the LAC. • Terminate—The tunnel is terminating. • Unknown—The tunnel is not connected to the router.
Tunnel Name	(LAC only) Name of the created tunnel. This value includes the destination name followed by the value of the RADIUS Tunnel-Assignment-ID VSA [82].

Table 340: show services l2tp tunnel Output Fields (*continued*)

Field Name	Field Description
Local IP	IP address of the local endpoint of the tunnel.
Local name	Name used for local tunnel endpoint during tunnel negotiation.
Remote name	Name used for remote tunnel endpoint during tunnel negotiation.
Effective Peer Resync Mechanism	(LAC only) Peer resynchronization mechanism (PRM) in effect for the tunnel: <ul style="list-style-type: none"> • Failover protocol • Silent failover—Recovery takes place in the failed endpoint only using the proprietary silent failover protocol.
Tunnel Logical System	Logical system in which the L2TP tunnel is brought up.
Tunnel Routing Instance	Routing instance in which the L2TP tunnel is brought up.
Max sessions	Maximum number of sessions that can be established on this tunnel.
Window size	Number of control messages that can be sent without receipt of an acknowledgment.
Hello interval	Interval between the transmission of hello messages, in seconds.
Create time	Date and time when the tunnel was created. While the LNS and LAC are connected, this value should correspond to the router's uptime. If connection to the LAC is severed, the State changes to Unknown and the Create time value resets.
Up time	Amount of time elapsed since the tunnel became active, in hours, minutes, and seconds.
Idle time	Amount of time elapsed since the tunnel became idle, in hours, minutes, and seconds.
Statistics since	Date and time when collection of the following statistics began: <ul style="list-style-type: none"> • Control Tx—Amount of control information transmitted, in packets and bytes. • Control Rx—Amount of control information received, in packets and bytes. • Data Tx—Amount of data transmitted, in packets and bytes. • Data Rx—Amount of data received, in packets and bytes. • Errors Tx—Number of errors transmitted, in packets. • Errors Rx—Number of errors received, in packets.

show services l2tp user

Syntax	show services l2tp user <brief detail extensive statistics> <user <i>username</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M10i and M7i routers only) Display a list of active Layer 2 Tunneling Protocol (L2TP) users.
Options	<p>none—Display all active L2TP users.</p> <p>brief detail extensive statistics—(Optional) Display the specified level of output. Use the statistics option to display L2TP user statistics.</p> <p>user <i>username</i>—(Optional) Display L2TP user information for only the specified username.</p>
Required Privilege Level	view
List of Sample Output	show services l2tp user extensive on page 2368
Output Fields	Table 341 on page 2365 lists the output fields for the show services l2tp user command. Output fields are listed in the approximate order in which they appear.

Table 341: show services l2tp user Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Tunnel group	Name of a tunnel group.
Tunnel local ID	Local identifier of the tunnel, as assigned by the L2TP network server (LNS).
Session local ID	Local identifier of the session, as assigned by the L2TP network server (LNS).
Session remote ID	Remote identifier of the session, as assigned by the L2TP access concentrator (LAC).
State	<p>State of the L2TP session:</p> <ul style="list-style-type: none"> • Established—The session is operating. • closed—The session is being closed. • destroyed—The session is being destroyed. • clean-up—The session is being cleaned up. • lns-ic-accept-new—A new session is being accepted. • lns-ic-idle—The session has been created and is idle. • lns-ic-reject-new—The new session is being rejected. • lns-ic-wait-connect—The session is waiting for the peer's incoming call connected (ICCN) message.

Table 341: show services l2tp user Output Fields (*continued*)

Field Name	Field Description
Mode	Mode of the interface representing the session: shared or exclusive .
Local IP	IP address of the local endpoint of the tunnel.
Remote IP	IP address of the peer endpoint of the tunnel.
Username	Name of the user logged in to the session.
Assigned IP address	IP address assigned to remote client.
Local name	Name of the local device.
Remote name	Name of the remote device.
Local MRU	Maximum receive unit (MRU) setting of the local device, in bytes.
Remote MRU	MRU setting of the remote device, in bytes.
Tx speed	Transmit speed of the tunnel session, in bps.
Rx speed	Receive speed of the tunnel session, in bps.
Bearer type	Type of bearer enabled: <ul style="list-style-type: none"> • 0—Might indicate that the call was not received over a physical link (for example, when the LAC and PPP are located in the same subsystem) • 1—Digital access requested • 2—Analog access requested • 4—Asynchronous Transfer Mode (ATM) bearer support
Framing type	Type of framing enabled: <ul style="list-style-type: none"> • 1—Synchronous framing • 2—Asynchronous framing
LCP renegotiation	Whether Link Control Protocol (LCP) renegotiation is configured: On or Off .
Authentication	Type of authentication algorithm used: Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP).
Interface ID	Name of the logical unit.
Interface unit	Logical unit number.
Call serial number	Unique serial number assigned to the call.
Create time	Date and time when the call was created.

Table 341: show services l2tp user Output Fields (*continued*)

Field Name	Field Description
Up time	Amount of time elapsed since the call became active, in hours, minutes, and seconds.
Idle time	Amount of time elapsed since the call became idle, in hours, minutes, and seconds.
Statistics since	<p>Date and time when collection of the following statistics began:</p> <ul style="list-style-type: none">• Control Tx—Amount of control information transmitted, in packets and bytes.• Control Rx—Amount of control information received, in packets and bytes.• Data Tx—Amount of data transmitted, in packets and bytes.• Data Rx—Amount of data received, in packets and bytes.• Errors Tx—Number of errors transmitted, in packets.• Errors Rx—Number of errors received, in packets.

test services l2tp tunnel

Syntax	test services l2tp tunnel user <i>user-name</i> <password <i>user-password</i>> <tunnel-name <i>name</i>>
Release Information	Command introduced in Junos OS Release 11.4.
Description	(MX Series routers only) Test and verify Layer 2 Tunneling Protocol (L2TP) tunnel configurations from the L2TP access concentrator (LAC). The test determines whether the user can be authenticated and tunneled according to the L2TP configuration. The establishment of all tunnels associated with the user is tested. You can optionally specify a particular tunnel to test for the user.
Options	<p>user <i>user-name</i>—Name of the user under test. You must use an existing configured username, although it can be created solely for testing a tunnel configuration.</p> <p>password <i>user-password</i>—(Optional) Authentication password for the specified user. If you omit this option, the test generates a dummy password—<i>testpass</i>—for the user.</p> <p>tunnel-name <i>name</i>—(Optional) Name of a tunnel to test.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Testing L2TP Tunnel Configurations from the LAC
List of Sample Output	test services l2tp tunnel (User authentication fails) on page 2370 test services l2tp tunnel (Multiple tunnels tested) on page 2370 test services l2tp tunnel (Specific tunnel tested) on page 2370
Output Fields	Table 342 on page 2369 lists the output fields for the test services l2tp tunnel command. Output fields are listed in the approximate order in which they appear.

Table 342: test services l2tp tunnel Output Fields

Field Name	Field Description
Tunnel-name	Name of the tunnel as configured in the local tunnel profile.
Tunnel-peer	IP address of the tunnel's remote peer (the L2TP network server [LNS]).
Logical-System	Logical system in which the tunnel is created.
Routing-Instance	Routing instance in which the tunnel is created.
Status	Status of the tunnel.

Sample Output

**test services l2tp
tunnel (User
authentication fails)**

```
user@host> test services l2tp tunnel user testuser@example.com
Subscriber: testuser@example.com, authentication failed
```

**test services l2tp
tunnel (Multiple
tunnels tested)**

```
user@host> test services l2tp tunnel user testuser@example.com
Subscriber: testuser@example.com, authentication success, l2tp tunneled
  Tunnel-name  Tunnel-peer  Logical-System  Routing-Instance  Status
  test1tunnel  192.168.2.3   default        default           Up
  test2tunnel  172.24.3.3    default        default           Peer unresponsive

  test3tunnel  172.24.5.1    default        test             Up
```

**test services l2tp
tunnel (Specific tunnel
tested)**

```
user@host> test services l2tp tunnel user testuser@example.com tunnel-name test1tunnel
Subscriber: testuser@example.com, authentication success, l2tp tunneled
  Tunnel-name  Tunnel-peer  Logical-System  Routing-Instance  Status
  test1tunnel  192.168.2.3   default        default           Up
```

Link Services Operational Mode Commands

Table 343 on page 2371 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot Link Services IQ (LSQ) PICs.

Table 343: Link Services Operational Mode Commands

Task	Command
Display information about Link Services IQ (LSQ) PIC CPU usage.	<code>show services link-services cpu-usage</code>

NOTE: LSQ functionality is supported on the adaptive services interface on the following routers:

- J Series routers—`ls-pim/0/slot`
- M Series and T Series routers—`lsq-fpc/pic/port`

NOTE: For information about how to configure link services, see the Junos Services Interfaces Configuration Release 12.3.

show services link-services cpu-usage

Syntax	show services link-services cpu-usage <brief detail> <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 8.4.
Description	(M Series and T Series routers only) Display information about Link Services IQ (LSQ) CPU usage.
Options	<p>none—Display standard information about CPU usage for all LSQ interfaces.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>interface <i>interface-name</i>—(Optional) Display information about the specified LSQ interface.</p>
Required Privilege Level	view
List of Sample Output	show services link-services cpu-usage brief (AS PIC) on page 2374 show services link-services cpu-usage brief (MultiServices PIC) on page 2374 show services link-services cpu-usage detail (AS PIC) on page 2374 show services link-services cpu-usage detail (MultiServices PIC) on page 2375
Output Fields	Table 344 on page 2372 lists the output fields for the show services link-services cpu-usage command. Output fields are listed in the approximate order in which they appear.

Table 344: show services link-services cpu-usage Output Fields

Field Name	Field Description	Level of Output
Role	CPU functional category.	brief
1 Second Average	Percentage of usage during 1-second duration.	All levels
5 Second Average	Percentage of usage during 5-second duration.	All levels
QoS	Quality of service (QoS) CPU, which takes care of queuing and scheduling of incoming IP packets on a per-bundle basis. It schedules packets with higher QoS values first.	All levels
Sequencer	Assigns sequence numbers to outgoing MLPPP fragments and interleaves link fragmentation and interleaving (LFI) traffic.	All levels
Load Balancer	Distributes load across different fragmenter CPUs.	All levels
Fragmenter	Main LSQ CPU; fragments IP packets into MLPPP fragments and also reassembles MLPPP fragments into IP packets.	All levels
Total	Sum of all CPU functions.	brief

Table 344: show services link-services cpu-usage Output Fields (*continued*)

Field Name	Field Description	Level of Output
Idle	Counts idle cycles when the CPU does not have any work.	detail
Timer	Takes care of periodic events driven by a timer, such as timeouts.	detail
System	System housekeeping thread.	detail
Input (QoS)	Acquires and queues incoming IP frames from hardware interfaces.	detail
Output (QoS)	Sends scheduled frames to the next processing CPU.	detail
Output Frags (QoS)	Sends outstanding frames to the fragmenter CPU.	detail
Bypass (QoS)	Sends outstanding frames for LFI.	detail
Free frame (QoS)	Frees dropped frames.	detail
CPUnumber	Identifier number of specific CPU.	detail
Drop (Fragmenter)	Drops frames that have been marked by the QoS CPU.	detail
Frag (Fragmenter)	Fragments IP frames into MLPPP fragments.	detail
Reass (Fragmenter)	Reassembles MLPPP fragments into IP frames.	detail
Freeback (Fragmenter)	Handles freeback of credits from other CPUs (MultiServices PICs only).	detail
Input LFI (Sequencer)	Receives LFI traffic from QoS CPU and transmits it with strict priority over MLPPP.	detail
Input Frag (Sequencer)	Receives MLPPP fragments from fragmenter CPUs, assigns sequence numbers, and appends MLPPP headers.	detail
Output Frag (Sequencer)	Load-balances and transmits fragments across links.	detail
Retry (Sequencer)	Retries transmission if hardware was busy in the previous attempt.	detail
Input Alloc (Load Balancer)	Acquires frames from hardware interfaces and validates them.	detail
Input (Load Balancer)	Performs error and sanity checks and check frames for PortMapping.	detail
Output (Load Balancer)	Sends frame to next processing CPU.	detail

Table 344: show services link-services cpu-usage Output Fields (*continued*)

CHAPTER 29

Load Balancing Operational Mode Commands

Table 345 on page 2377 summarizes the command-line interface (CLI) commands you can use to monitor load balancing.

Table 345: Load Balancing Operational Mode Commands

Task	Command
Show information about load balancing on aggregated Multiservices (AMS) interfaces.	show interfaces load-balancing

show interfaces load-balancing

Syntax	show interfaces load-balancing <detail>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Display status information about load balancing on aggregated Multiservices (AMS) interfaces.
Options	none —Display standard information about status of all AMS interfaces. detail —(Optional) Display detailed status of all AMS interfaces.
Required Privilege Level	view
List of Sample Output	show interfaces load-balancing on page 2380 show interfaces load-balancing detail on page 2380
Output Fields	Table 346 on page 2378 lists the output fields for the show interfaces load-balancing (aggregated Multiservices interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 346: Aggregated Multiservices show interfaces load-balancing Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the aggregated Multiservices (AMS) interface.	All levels
State	Status of AMS interfaces: <ul style="list-style-type: none"> • Up—Interface is configured and operational. • Coming Up—Interface is becoming operational. • Wait Timer—Interface is waiting for member interfaces (mams) to come online. • Members Seen—Member interfaces (mams) are available. • Wait for Members—Member interfaces (mams) are not available. 	All levels
Last change	Time elapsed since the last change to the interface.	All levels
Member count	Number of member PICs (mams) that are part of the aggregated interface.	All levels
Members interface	List of all member PICs (mams) that are part of the aggregated interface.	detail
Weight	Weight associated with each member PIC for load balancing. The minimum weight is 1, maximum weight is 100; default weight is 10.	detail

Table 346: Aggregated Multiservices show interfaces load-balancing Output Fields (*continued*)

Field Name	Field Description	Level of Output
State	Status of each member PIC (mams) : <ul style="list-style-type: none">• Invalid—Configured interface is not valid.• Down—Interface is not operational.• Active—Interface is configured and operational.• Discard—Interface has been discarded.• Inactive—Configured interface is not online.• Backup—Interface has been configured as backup.	detail

Sample Output

**show interfaces
load-balancing**

```
user@host> show interfaces load-balancing
Interface  State      Last change  Member count
ams0       Up         1d 00:50     2
ams1       Up         00:00:59     2
```

**show interfaces
load-balancing detail**

```
user@host> show interfaces load-balancing detail

  mams-2/0/0  10     Active
  mams-2/1/0  10     Active
```

Mobile IP Operational Mode Commands

Table 347 on page 2381 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot Mobile IP services.

Table 347: Mobile IP Operational Mode Commands

Task	Command
Clear information about Mobile IP bindings.	<code>clear mobile-ip binding</code>
Display information about Mobile IP home agent bindings	<code>show mobile-ip home-agent bindings</code>
Display general information about Mobile IP home agent.	<code>show mobile-ip home-agent overview</code>
Display information about traffic specific to Mobile IP home agents.	<code>show mobile-ip home-agent traffic</code>
Display information about Mobile IP home agent virtual networks.	<code>show mobile-ip home-agent virtual-network</code>
Display information about the WiMAX Forum Network Architecture release.	<code>show mobile-ip wimax release</code>

NOTE: For information about how to configure Mobile IP services, see the Junos OS Subscriber Management, Release 13.1.

clear mobile-ip binding

Syntax	<code>clear mobile-ip binding</code> (<code>all</code> <code>ip-address</code> <i>ip-address</i> <code>nai</code> <i>nai-string</i>) < <code>logical-system</code> <i>logical-system-name</i> > < <code>routing-instance</code> <i>routing-instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.3.
Description	Clear the Mobile IP binding.
Options	<p><code>all</code>—Clear all Mobile IP bindings.</p> <p><code>ip-address</code> <i>ip-address</i>—Clear the Mobile IP bindings for the specified IP home address (HoA).</p> <p><code>nai</code> <i>nai-string</i>—Clear the Mobile IP bindings for the specified network access identifier.</p> <p><code>logical-system</code> <i>logical-system-name</i>—(Optional) Clear the Mobile IP bindings for the specified logical system.</p> <p><code>routing-instance</code> <i>routing-instance-name</i>—(Optional) Clear the Mobile IP bindings for the specified routing instance.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show mobile-ip home-agent bindings on page 2383
List of Sample Output	clear mobile-ip binding on page 2382
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear mobile-ip binding` `user@host> clear mobile-ip binding all`

show mobile-ip home-agent bindings

Syntax	show mobile-ip home-agent bindings <ip-address <i>ip-address</i> nai <i>nai-string</i> summary> <logical-system <i>logical-system-name</i> > <routing-instance <i>routing-instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.3.
Description	Display information about Mobile IP home agent bindings.
Options	<p>ip-address <i>ip-address</i>—(Optional) Display information for the specified Mobile IP home address.</p> <p>logical-system <i>logical-system-name</i>—(Optional) Display information for the specified logical system.</p> <p>nai <i>nai-string</i>—(Optional) Display information for the specified Mobile IP network access identifier.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Display information for the specified routing instance.</p> <p>summary—(Optional) Display only summary (total bindings) information.</p>
Required Privilege Level	view

Output Fields	Table 348 on page 2383 lists the output fields for the show mobile-ip home-agent bindings command. Output fields are listed in the approximate order in which they appear.

Table 348: show mobile-ip home-agent bindings Output Fields

Field Name	Field Description
Home Address	Home address of the mobile node.
NAI	Network access identifier of the mobile node.

Table 348: show mobile-ip home-agent bindings Output Fields (*continued*)

Field Name	Field Description
Home agent	Home agent address of the mobile node.
Care-of-address	Care of address used by the mobile node.
Lifetime Granted	Lifetime granted for the mobile node.
Lifetime Remaining	Remaining lifetime for the mobile node.
Tunnel Type	Type of tunnel requested by the mobile node.
Tunnel ID	Tunnel ID the mobile node is using.
Tunnel Source	Tunnel source address the mobile node is using.
Tunnel Destination	Tunnel destination address the mobile node is using.
Identification	Identification value received from the mobile node.
Revocation Support	Whether registration revocation is supported for this binding.
Notify MN	Whether mobile node notification has been negotiated.
Total Bindings	Total number of Mobile IP home agent bindings.

Sample Output

**show mobile-ip
home-agent bindings**

```
user@host> show mobile-ip home-agent bindings
Home address  NAI           Home agent  Care-of-address
10.1.1.3      abcde@def.com  10.1.1.1   50.50.50.1
30.1.1.3      -             55.55.55.1 50.50.50.1

List of Sample Output	show mobile-ip home-agent overview on page 2386
Output Fields	Table 349 on page 2386 lists the output fields for the show mobile-ip home-agent overview command. Output fields are listed in the approximate order in which they appear.

Table 349: show mobile-ip home-agent overview Output Fields

Field Name	Field Description
Status	Total number of registration requests received.
Service Enabled on	Total number of registration requests forwarded.
Home Agents	Total number of registration requests denied.
Authentication	Total number of registration replies sent.

Sample Output

```

show mobile-ip          user@host> show mobile-ip home-agent overview
home-agent overview
Status                  : Active
Service Enabled on     : ge-0/0/3.0, ge-0/0/2.0
Home agents            : 10.1.1.1, 20.1.1.1, 55.55.55.1
Authentication         : AAA

```

show mobile-ip home-agent traffic

Syntax	show mobile-ip home-agent traffic <logical-system <i>logical-system-name</i> > <routing-instance <i>routing-instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.3.
Description	Display information about Mobile IP home agent protocol statistics.
Options	<p>logical-system <i>logical-system-name</i>—(Optional) Display information for the specified logical system.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Display information for the specified routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show mobile-ip home-agent bindings on page 2383 • show mobile-ip home-agent overview on page 2386 • show mobile-ip home-agent virtual-network on page 2389 • show mobile-ip wimax release on page 2391
List of Sample Output	show mobile-ip home-agent traffic on page 2388
Output Fields	Table 350 on page 2387 lists the output fields for the show mobile-ip home-agent traffic command. Output fields are listed in the approximate order in which they appear.

Table 350: show mobile-ip home-agent traffic Output Fields

Field Name	Field Description
Registration request received	Total number of registration requests received.
Registration request forwarded	Total number of registration requests forwarded.
Registration request denied	Total number of registration requests denied.
Registration replies sent	Total number of registration replies sent.
Registration Errors unspecified	Total number of registration requests denied by the home agent for reasons unspecified.

Table 350: show mobile-ip home-agent traffic Output Fields (*continued*)

Field Name	Field Description
Registration Errors Administrative prohibited	Total number of registration requests denied by home agent as “administrative prohibited.”
Registration Errors Insufficient Resource	Total number of registration requests denied by the home agent for insufficient resources.
Registration Errors Bad request form	Total number of registration requests denied by the home agent due to a bad request form.
Registration Errors Too many Bindings	Total number of registration requests denied by the home agent for having too many bindings.
Registration Errors Unknown HA	Total number of registration requests denied by the home agent for having an unknown home agent.
Registration Errors ID mismatch	Total number of registration requests denied by the home agent for having a mismatched ID.
Registration Errors Authentication failed MN	Total number of registration requests denied by the home agent because the mobile node failed authentication.
Registration Errors Authentication failed FA	Total number of registration requests denied by the home agent because the foreign agent failed authentication.

Sample Output

**show mobile-ip
home-agent traffic**

```

user@host> show mobile-ip home-agent traffic
Registration Request
  Received : 10
  Forwarded : 5
  Denied   : 5
Registration Replies

show mobile-ip home-agent virtual-network

Syntax	show mobile-ip home-agent virtual-network <logical-system <i>logical-system-name</i> > <routing-instance <i>routing-instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.3.
Description	Display information about Mobile IP home agent virtual networks.
Options	<p>logical-system <i>logical-system-name</i>—(Optional) Display information for the specified logical system.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Display information for the specified routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show mobile-ip home-agent bindings on page 2383 • show mobile-ip home-agent overview on page 2386 • show mobile-ip home-agent traffic on page 2387 • show mobile-ip wimax release on page 2391
List of Sample Output	show mobile-ip home-agent virtual-network on page 2390
Output Fields	Table 351 on page 2389 lists the output fields for the show mobile-ip home-agent virtual-network command. Output fields are listed in the approximate order in which they appear.

Table 351: show mobile-ip home-agent virtual-network Output Fields

Field Name	Field Description
Home agent address	Home agent address of the mobile node.
Registration Lifetime	Maximum registration lifetime that home agent allows.
Time Tolerance	Number of seconds the time stamp may differ.
Address Pool	Address pool configured.
Total MNs	Current number of mobile nodes that the home agent is serving.
Home address	Home address of the mobile node.
NAI	Network access identifier of the mobile node.

Table 351: show mobile-ip home-agent virtual-network Output Fields (*continued*)

Field Name	Field Description
Care-of-address	Care of address used by the mobile node.
RegLifetime Granted	Lifetime granted for the mobile node.
RegLifetime Remaining	Remaining lifetime for the mobile node.

Sample Output

**show mobile-ip
home-agent
virtual-network**

```
user@host> show mobile-ip home-agent virtual-network
Home Agent Address   : 55.55.55.55
Registration Lifetime : 1800
Time Tolerance       : 120
Address Pool         : 10.1.1.10 - 10.1.1.50
Total MN's           : 2

MN's :
  Home address       : 60.60.60.1
  NAI                 : abcde@def.com
  Care-of-address     : 50.50.50.1
  Reglifetime granted : 120
  Reglifetime remaining: 100

  Home address       : 70.70.70.1
  NAI                 : def@def.com
  Care-of-address     : 80.80.80.1
  Reglifetime granted : 120
  Reglifetime remaining: 100
```

show mobile-ip wimax release

Syntax	show mobile-ip wimax release <logical-system <i>logical-system-name</i> > <routing-instance <i>routing-instance-name</i> >
Release Information	Command introduced in Junos OS Release 9.5.
Description	Display the WiMAX Forum Network Architecture release that is supported by the current Mobile IP implementation.
Options	<p>logical-system <i>logical-system-name</i>—(Optional) Display information for the specified logical system.</p> <p>routing-instance <i>routing-instance-name</i>—(Optional) Display information for the specified routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show mobile-ip home-agent bindings on page 2383 • show mobile-ip home-agent overview on page 2386 • show mobile-ip home-agent traffic on page 2387 • show mobile-ip home-agent virtual-network on page 2389

List of Sample Output [show mobile-ip wimax release on page 2391](#)

Output Fields [Table 352 on page 2391](#) lists the output fields for the **show mobile-ip wimax release** command. Output fields are listed in the approximate order in which they appear.

Table 352: show mobile-ip wimax release Output Fields

Field Name	Field Description
Release	WiMAX Forum Network Architecture release number.
Version	WiMAX Forum Network Architecture version number.

Sample Output

```
show mobile-ip wimax release user@host> show mobile-ip wimax release
Release 1, Version 1.2
```

Network Address Translation Operational Mode Commands

Table 353 on page 2393 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot Network Address Translation (NAT) services.

Table 353: NAT Operational Mode Commands

Task	Command
Clear information about NAT pool utilization using an inline services interface hosted on a Trio-based line card.	<code>clear services inline nat pool</code>
Clear global statistics about NAT utilization using an inline services interface hosted on a Trio-based line card.	<code>clear services inline nat statistics</code>
Display information about NAT pool utilization using an inline services interface hosted on a Trio-based line card.	<code>show services inline nat pool</code>
Display information about NAT utilization using an inline services interface hosted on a Trio-based line card.	<code>show services inline nat statistics</code>
Display information about deterministic NAT mapping based on internal host.	<code>show services nat deterministic-nat internal-host</code>
Display information about deterministic port mapping based on NAT port block.	<code>show services nat deterministic-nat nat-port-block</code>
Display the status of IPv6 interfaces	<code>show services nat ipv6-multicast-interfaces</code>
Display information about NAT address and port mappings.	<code>show services nat mappings</code>
Display information about NAT pools.	<code>show services nat pool</code>

.....

NOTE: NAT is supported on the adaptive services interface on the following routers:

- J Series routers—*sp-pim/0/slot*
- M Series and T Series routers—*sp-fpc/pic/port*

NAT is also supported on the redundant adaptive services interface (*rspnumber*) on M Series and T Series routers.

.....

.....

NOTE: For information about how to configure NAT services, see the Junos Services Interfaces Configuration Release 12.3.

.....

clear services inline nat pool

Syntax	clear services inline nat pool <i>pool-name</i>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Clear global inline NAT statistics.
Options	pool-name —Name of the NAT pool for which statistic are cleared.
Required Privilege Level	clear
List of Sample Output	clear services inline nat pool on page 2395
Output Fields	When you enter this command, the NAT pool statistics are cleared. There is no specific output.

Sample Output

`clear services inline nat pool` user@host> clear services inline nat pool p1

clear services inline nat statistics

Syntax	clear services inline nat statistics
Release Information	Command introduced in Junos OS Release 11.4.
Description	Clear global inline NAT statistics.
Required Privilege Level	clear
List of Sample Output	clear services inline nat statistics on page 2396
Output Fields	When you enter this command, the global inline NAT statistics are cleared. There is no specific output.

Sample Output

`clear services inline nat statistics` user@host> clear services inline nat statistics

show services inline nat pool

Syntax	<code>show services inline nat pool</code> <code><pool pool--name></code>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Display information about inline Network Address Translation (NAT) pool.
Options	<i>pool-name</i> —Display information about the specified services-inline interface NAT pool.
Required Privilege Level	view
List of Sample Output	show services inline nat pool on page 2397
Output Fields	Table 354 on page 2397 lists the output fields for the <code>show services inline nat pool</code> command. Output fields are listed in the order in which they appear.

Table 354: show services inline nat pool Output Fields

Field Name	Field Description
Interface	Name of an <code>si</code> interface hosted on a Trio-based line card.
NAT pool	Name of the pool used for address translations.
Translation type	Translation type specified in the applicable NAT rule for the service set.
Address range	Starting and ending public NAT addresses available for translation.
NATed packets	Number of packets translated for the specified pool.
un-NATed packets	Number of received packets that were not translated.
Errors	Number of packets with translation errors.

Sample Output

```

show services inline nat pool
user@host> show services inline nat pool p1
Interface: si-5/0/0, Service set: ss-inat
NAT pool: p1, Translation type: BASIC NAT44
Address range: 20.20.20.0-20.20.20.255
NATed packets: 0, Un-NATed packets: 0, Errors: 0

```

show services inline nat statistics

Syntax	<code>show services inline nat statistics</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Display information about inline Network Address Translation (NAT) address translations.
Options	<i>interface-name</i> —(Optional) Display information about the specified NAT services-inline interface only. When a specific interface is not specified, statistics for all services-inline interfaces are shown.
Required Privilege Level	view
List of Sample Output	show services inline nat statistics on page 2398
Output Fields	Table 355 on page 2398 lists the output fields for the <code>show services inline nat statistics</code> command. Output fields are listed in the order in which they appear.

Table 355: show services inline nat statistics Output Fields

Field Name	Field Description	Level of Output
Service PIC	Name of an <code>si</code> interface hosted on a Trio-based line card.	All levels
Slow path packets received	Number of ICMP exception packets received for NAT translation.	All levels
Slow path packets dropped	Number of received ICMP exception packets that were dropped.	All levels

Sample Output

```

show services inline nat statistics
user@host> show services inline nat statistics
Service PIC Name                               :si-5/0/0
Slow path packets received                      :0
Slow path packets dropped                      :0

```

show services nat deterministic-nat internal-host

Syntax	<code>show services nat deterministic-nat internal-host</code> <i>nat-address</i> <i>nat-port</i>
Release Information	Command introduced in Junos OS Release 12.1.
Description	This command prints the internal host address and algorithmically determined port ranges for the specified NAT IP address and port number. The results are calculated on the PIC and the results are sent to RE.
Options	<i>nat-address</i> —NAT address of the internal host. <i>nat-port</i> —NAT port of the internal host.
Required Privilege Level	view
List of Sample Output	show services nat deterministic-nat internal-host on page 2399
Output Fields	Table 356 on page 2399 lists the output fields for the <code>show services nat mapping</code> command. Output fields are listed in the approximate order in which they appear.

Table 356: show services nat deterministic-nat internal-host Output Fields

Field Name	Field Description
Interface	Name of a service interface.
Service set	Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set.
Internal Host	Private IP address of a subscriber on the access network.
NAT IP address	NAT public IP address
NAT Port Start	Lowest port number in range of assigned ports.
NAT Port End	Highest port number in range of assigned ports.

Sample Output

```

show services nat deterministic-nat internal-host
user@host> show services nat deterministic-nat internal-host 32.32.32.1 2000
Service set: ss1
Interface: sp-2/0/0
NAT pool: pool1
Internal Host: 128.1.1.4, NAT IP Address: 32.32.32.1, NAT Port Start: 1792, NAT
Port End: 2047

```

show services nat deterministic-nat nat-port-block

Syntax	<code>show services nat deterministic-nat nat-port-block</code> <i>nat-address</i> <i>nat-port</i>
Release Information	Command introduced in Junos OS Release 12.1.
Description	Display the translated NAT address and port ranges for the given internal host.
Options	<i>internal-host</i> —IP address of the internal host.
Required Privilege Level	view
List of Sample Output	run show services nat deterministic-nat nat-port-block on page 2400
Output Fields	Table 357 on page 2400 lists the output fields for the show services nat deterministic-nat nat-port-block command. Output fields are listed in the approximate order in which they appear.

Table 357: show services nat deterministic-nat nat-port-block Output Fields

Field Name	Field Description
Interface	Name of a service interface.
Service set	Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set.
Internal Host	Private IP address of a subscriber on the access network.
NAT IP address	NAT public IP address
NAT Port Start	Lowest port number in range of assigned ports.
NAT Port End	Highest port number in range of assigned ports.

Sample Output

```

run show services nat deterministic-nat nat-port-block
user@host> show services nat deterministic-nat nat-port-block 128.1.1.1
root@netcat1# run show services nat deterministic-nat nat-port-block 128.1.1.1
Service set: ss1
Interface: sp-2/0/0
NAT pool: pool1
Internal Host: 128.1.1.1, NAT IP Address: 32.32.32.1, NAT Port Start: 1024, NAT
Port End: 1279

```

show services nat ipv6-multicast-interfaces

Syntax	show services nat ipv6-multicast-interfaces
Release Information	Command introduced in Junos OS Release 8.5.
Description	Displays a list of interfaces enabled for IPv6 mutlicast.
Required Privilege Level	view
List of Sample Output	show services nat ipv6-multicast-interfaces on page 2402
Output Fields	Table 358 on page 2401 lists the output fields for the show services nat ipv6-multicast-interfaces command. Output fields are listed in the approximate order in which they appear.

Table 358: show services nat ipv6-multicast-interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a service interface.	All levels
Admin State	Configured IPv6 multicast capability of an interface ,	All levels
Operational State	Operation IPv6 multicast status of an interface.	All levels

Sample Output

```

show services nat mappings

Syntax	<code>show services nat mappings</code> <code><brief detail summary></code> <code><pool-name></code>
Release Information	Command introduced in Junos OS Release 10.1. summary option introduced in Junos OS Release 11.1.
Description	Display information about Network Address Translation (NAT) address and port mappings.
Options	none —Display standard information about all NAT pools. brief detail summary —(Optional) Display the specified level of output. pool-name —(Optional) Display information about the specified NAT pool.
Required Privilege Level	view
List of Sample Output	show services nat mappings brief on page 2406 show services nat mappings detail on page 2406 show services nat mappings pool-name on page 2406 show services nat mappings summary on page 2406
Output Fields	Table 359 on page 2404 lists the output fields for the show services nat mappings command. Output fields are listed in the approximate order in which they appear.

Table 359: show services nat mappings Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a service interface.	All levels
Service set	Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set.	All levels
NAT pool	Name of the NAT pool.	All levels
Address Mapping	Mapping performed by NAT to conceal the network address.	All levels
No. of Port Mappings	Number of port mappings.	All levels
Port mapping	Port mapping performed by NAT.	detail
Flow Count	Number of flows.	detail

show services nat pool

Syntax	<pre>show services nat pool <brief detail> <pool-name> pgcp <ports-per-session remotely-controlled></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>pgcp option added in Junos OS Release 8.5.</p>
Description	Display information about Network Address Translation (NAT) pools.
Options	<p>none—Display standard information about all NAT pools.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>pool-name—(Optional) Display information about the specified NAT pool.</p> <p>pgcp—(Optional) Display information about a NAT pool that is exclusive to the BGF.</p> <p>ports-per-session—(Optional) Display the number of ports allocated per session from the NAT pool.</p> <p>remotely-controlled—(Optional) Display if the NAT pool is explicitly specified by the gateway controller.</p>
Required Privilege Level	view
List of Sample Output	<p>show services nat pool brief on page 2409</p> <p>show services nat pool detail on page 2409</p> <p>show services nat pool for Secured Port Block Allocation on page 2409</p> <p>show services nat pool for Deterministic Port Block Allocation on page 2409</p> <p>show services nat pool detail for Port Block Allocation on page 2409</p>
Output Fields	<p>Table 360 on page 2407 lists the output fields for the show services nat pool command. Output fields are listed in the approximate order in which they appear.</p>

Table 360: show services nat pool Output Fields

Field Name	Field Description	Level of Output
Interface	Name of an adaptive services interface.	All levels
Service set	Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set.	All levels
NAT pool	Name of the Network Address Translation pool.	All levels

Table 360: show services nat pool Output Fields (*continued*)

Field Name	Field Description	Level of Output
Type or Translation type	Address translation type: basic-nat-pt , basic-nat44 , basic-nat66 , deterministic-napt44 , dnat-44 , dynamic-nat44 , napt44 , napt-66 , napt-pt , stateful-nat64 , twice-basic-nat-44 , twice-dynamic-nat-44 , twice-dynamic-napt-44 .	All levels
Address or Address range	IPv4 address range of the pool.	All levels
Port or Port range	Port range of the pool. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.	All levels
Ports used' or Ports in use	Number of ports allocated in this pool with this name. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.	All levels
Port block type	Type of port block allocation: secured or deterministic	All levels
Out of port errors	Number of port allocation errors. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.	detail
Max ports used	Maximum number of ports used. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.	detail
Addresses in use	Number of addresses in use for dynamic source address NAT pools.	detail
Current EIF Inbound flows count	Current count of EIF inbound flows, including all EIF flows per pool.	
EIF flow limit exceeded drops	Current number of flow drops due to exceeded flow limit. This number is per pool, not per EIF mapping.

Sample Output

PGCP Operational Mode Commands for the BGF Feature

Table 361 on page 2411 summarizes the Packet Gateway Control Protocol (PGCP) command-line interface (CLI) commands you can use to monitor and troubleshoot the PGCP service that is used for the border gateway function (BGF) feature. Commands are listed in alphabetical order.

Table 361: PGCP Services Operational Mode Commands

Task	Command
Clear gates on a virtual BGF.	<code>clear services pgcp gates</code>
Clear statistical information.	<code>clear services pgcp statistics</code>
Display information about the configuration for a virtual BGF.	<code>show services pgcp active-configuration</code>
Display in-depth information about a particular gate on a virtual BGF.	<code>show services pgcp gate</code>
Display summary information about all gates on a virtual BGF.	<code>show services pgcp gates</code>
Display information about H.248 root terminations.	<code>show services pgcp root-termination</code>
Display information about BGF statistics.	<code>show services pgcp statistics</code>
Display information about conversations.	<code>show services pgcp conversations</code>
Display information about flows.	<code>show services pgcp flows</code>
Display summary information about terminations.	<code>show services pgcp terminations</code>

NOTE:

PGCP services are supported on Adaptive Services (AS) PICS, Multiservices (*sp-fpc/pic/port*) PICS, and the Multiservices Dense Port Concentrator (MS-DPC) on the following routers:

- Juniper Networks M120 Multiservice Edge Router
- Juniper Networks M320 Multiservice Edge Router
- Juniper Networks T640 Core Router

NOTE: For information about how to use PGCP services to monitor the BGF feature, see the *Junos Multiplay Solutions Guide*.

clear services pgcp gates

Syntax	clear services pgcp gates gateway <i>gateway-name</i>
Release Information	Command introduced in Junos OS Release 8.5.
Description	<p>Clear all gates on a virtual border gateway function (BGF). Use this command only for debugging and testing purposes. The recommended way to clear the state of gates is to use the set services-state out-of-service-graceful statement at the [edit services pgcp gateway <gateway-name>] hierarchy.</p> <p>When you enter this command, the virtual BGF sends an H.248 FO/905 message to the gateway controller. The status of the virtual BGF then changes to In-Service (Disconnected). The virtual BGF then reregisters with the gateway controller by sending an RE/901 message, and the status of the virtual BGF changes to In-Service (Registered).</p>
Options	<p>gates—Clear gate information.</p> <p>gateway <i>gateway-name</i>—Clear statistics associated with this virtual BGF.</p>
Required Privilege Level	view
List of Sample Output	clear services pgcp gates on page 2413
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services pgcp gates      user@host> clear services pgcp gates
```

clear services pgcp statistics

Syntax	clear services pgcp statistics gateway <i>gateway-name</i> <virtual-interface <i>interface-number</i>>
Release Information	Command introduced in Junos OS Release 9.3. gateway option added in Junos OS Release 9.5. virtual-interface option added in Junos OS Release 11.1.
Description	Clear statistics for a virtual border gateway function (BGF).
Options	<i>gateway-name</i> —Name of the virtual BGF for which you want to clear statistics. <i>interface-number</i> —Number of the virtual interface for which you want to clear statistics. When you specify a virtual interface, statistics are cleared for that virtual interface only.
Required Privilege Level	view
List of Sample Output	clear services pgcp statistics on page 2414
Output Fields	When you enter this command, you receive either command prompt (indicating success) or an error message.

Sample Output

<code>clear services pgcp statistics</code>	<code>user@host> clear services pgcp statistics gateway <i>gateway-name</i></code>
---	---

show services pgcp active-configuration

Syntax	show services pgcp active-configuration gateway <i>gateway-name</i> <backup> <master>
Release Information	Command introduced in Junos OS Release 8.4. gateway option introduced in Junos OS Release 9.5. backup option introduced in Junos OS Release 9.6. master option introduced in Junos OS Release 9.6.
Description	Display information about the active Packet Gateway Control Protocol (PGCP) configuration, which includes information received from the adaptive services process and information negotiated with the gateway controller.
Options	gateway <i>gateway-name</i> —Display information about the active configuration associated with this virtual border gateway function (BGF). backup —(Optional) Display information for the backup services PIC. This option applies if you are running the virtual BGF on a services PIC or MS-DPC, and you have a primary and backup PIC configured on a virtual redundant MultiServices PIC (rms) interface. master —(Optional) Display information for the Routing Engine or primary services PIC. If the virtual BGF is running on the Routing Engine, the active configuration on the Routing Engine is displayed. If the virtual BGF is running on a services PIC, the active configuration on the primary services PIC is displayed. If you do not specify the master or backup options, the master option is the default.
Required Privilege Level	view
List of Sample Output	show services pgcp active-configuration (controller: border signaling gateway) on page 2419 show services pgcp active-configuration (controller: external) on page 2421
Output Fields	Table 362 on page 2415 lists the output fields for the show services pgcp active-configuration command. Output fields are listed in the approximate order in which they appear.

Table 362: show services pgcp active-configuration Output Fields

Field Name	Field Description
BGF virtual interface configuration	Information about the virtual interface configuration. <ul style="list-style-type: none"> Virtual interface name—Name of the virtual interface. Routing Instance name—Name of the routing instance associated with the virtual interface. Status—Service status of the virtual interface: In-Service, In-Service (Graceful Shutdown), Out-of-Service, Out-of-Service (Physical Interface). Interface name—Name of the service interface for the virtual interface.

Table 362: show services pgcp active-configuration Output Fields (*continued*)

Field Name	Field Description
Virtual BGF configuration	<p>Information about the active virtual BGF configuration.</p> <ul style="list-style-type: none"> • Name—Name of the virtual BGF. • IP address—IP address of the virtual BGF. • Routing Instance—Name of the routing instance associated with the virtual BGF. • Port—Port of the virtual BGF. • Platform—Service interface for the BGF. • Status—Service state of the virtual BGF: <ul style="list-style-type: none"> • In-Service (Disconnected)—The virtual BGF is configured to be in service; however, it is disconnected from the gateway controller. • In-Service (Registering)—The virtual BGF is in the process of registering with the gateway controller. • In-Service (Registered)—The virtual BGF has completed registration with the gateway controller. • In-Service (Graceful Shutdown)—The virtual BGF is in draining mode because of a graceful shutdown. • In-Service (Shutdown)—The virtual BGF is shut down because of a forced shutdown. • Out-Of-Service—The virtual BGF is not connected to the gateway controller. • Active gateway controller—Gateway controller that is currently controlling this virtual BGF. NULL means that there is no active gateway controller. • Replication socket <ul style="list-style-type: none"> • Connected (Ready)—The replication is ready and a switchover can be processed. • Connected (Syncing)—The replication is synchronizing. Performing a switchover is not safe. • Connected (Error)—An error occurred in the previous switchover. • Disconnected—The backup Routing Engine is down. There is no route to the backup Routing Engine. • Synchronization state—The status of the synchronization between the internal state of the pgcpd process and the flow of media on a data PIC after a failover of the pgcpd process. <ul style="list-style-type: none"> • Idle—The pgcpd process and the data PIC media flow are in synch. • Initializing—The pgcpd process is reading the current status of the data PIC to determine required synchronization. • synchronizing—The pgcpd process is synchronizing it's internal state with the data PIC. <p>NOTE: BGF service is not affected when synchronizing. Gates can be created, modified, and deleted normally.</p> <ul style="list-style-type: none"> • Cleanup timeout [secs]—Time to wait before the virtual BGF removes gates following a disconnection from the gateway controller. • Maximum concurrent calls—Maximum number of concurrent calls allowed on the BGF. • Gate inactivity delay—Time to wait before packet inactivity detection begins on a gate for which there is no latching event. • Gate inactivity duration—Time during which the virtual BGF monitors gates for packet inactivity.

Table 362: show services pgcp active-configuration Output Fields (*continued*)

Field Name	Field Description
H248 timers configuration	<p>Information about the H.248 timers configuration.</p> <ul style="list-style-type: none"> • Max waiting delay (MWD)—Maximum time the virtual BGF waits before contacting a new gateway controller when the connection to the controlling gateway controller is lost. • Max retransmission delay (T-MAX)—Maximum delay time allowed a transaction resulting from retransmissions. • Initial average ack delay (I-AAD)—Average network propagation delay time. • Maximum net propagation delay (M-NPD)—Maximum network propagation delay time.
H248 options configuration	<p>Information about the H.248 options configuration.</p> <ul style="list-style-type: none"> • Wildcard response service-change—Whether or not the virtual BGF issues service change notifications as wildcard notifications. • Event history—Whether or not the virtual BGF has enabled its history of all event notifications to be accessed by the gateway controller.
H248 diffserv configuration	<p>Information about the H.248 DiffServ configuration.</p> <ul style="list-style-type: none"> • DSCP—DSCP value set in the DiffServ configuration. If there is no configured value, the default value is shown.
Notification Behavior	<p>Information about the regulation of media inactivity notifications sent to the gateway controller.</p> <ul style="list-style-type: none"> • Notification Regulation—Either the percentage of notification to be suppressed, expressed as a number from 0 through 100, or the value once, meaning that only the first of a series of media inactivity notifications is sent to the gateway controller.
Application data inactivity detection	<p>Information about the reporting of media inactivity events.</p> <ul style="list-style-type: none"> • IP flow stop detection—Default method for reporting media inactivity.
Event timestamp Notification	<p>Information about the availability of event timestamp information.</p> <ul style="list-style-type: none"> • Requested timestamp—Whether or not the virtual BGF has enabled timestamp information for events to be viewed by the gateway controller.
H248 segmentation	<p>Information about the H.248 segmentation configuration.</p> <ul style="list-style-type: none"> • MG segmentation timer—The time within which the gateway controller waits to receive outstanding message segments from the virtual BGF after it receives the SegmentationCompleteToken message. • MG maximum PDU size—The maximum size of the virtual BGF's incoming protocol data unit for the control association's transport protocol. The gateway controller should avoid building messages that exceed this size. • MGC segmentation timer—The time within which the virtual BGF waits to receive outstanding message segments from the gateway controller after it receives the SegmentationCompleteToken message. • MGC maximum PDU size—The maximum size of the gateway controller's incoming protocol data unit for the control association's transport protocol. The virtual BGF will not build messages that exceed this size. • minimum—Minimum value accepted from the gateway controller. • maximum—Maximum value accepted from the gateway controller. • default—Default value that is used when the gateway controller does not set a value.

Table 362: show services pgcp active-configuration Output Fields (*continued*)

Field Name	Field Description
H248 base root	<p>Information about the H.248 base root configuration.</p> <ul style="list-style-type: none"> • Normal MG execution time—The interval within which the gateway controller waits for a response to transactions from the virtual BGF (exclusive of network delay). • MG Provisional response timer—The time within which the gateway controller waits for a pending response from the virtual BGF if a transaction cannot be completed. • MG Originated pending limit—The number of transaction pending messages that the gateway controller can receive from the virtual BGF. • Normal MGC execution time—The interval within which the virtual BGF waits for a response to a transaction from the gateway controller (exclusive of network delay). • MGC Provisional response timer—The time within which the virtual BGF waits for a pending response from the gateway controller if a transaction cannot be completed. • MGC Originated pending limit—The number of transaction pending messages that the virtual BGF can receive from the gateway controller. • minimum—Minimum value accepted from the gateway controller. • maximum—Maximum value accepted from the gateway controller. • default—Default value that is used when the gateway controller does not set a value.
Inactivity Timer	<p>Information about inactivity timer configuration.</p> <ul style="list-style-type: none"> • Default—Whether the inactivity timer is on or off by default. • Maximum inactivity time default—Default value for the inactivity timer. This value is used if the gateway controller does not send an inactivity timer value. • minimum—Minimum value accepted from the gateway controller. • maximum—Maximum value accepted from the gateway controller. • default—Default value that is used when the gateway controller does not set a value.
Fast update filters	<p>Information about the fast update filter (FUF) configuration.</p> <ul style="list-style-type: none"> • Maximum terms—Maximum number of FUF terms that can be installed for the virtual BGF. • Maximum term percentage—Maximum percentage of gates with FUF filters relative to all gates currently installed for the virtual BGF.
Overload control configuration	<p>Information about the overload control configuration.</p> <ul style="list-style-type: none"> • Queue limit percentage—Maximum percentage of the work queue for H.248 transactions that can be used before overload messages are generated. • Reject new calls threshold—Maximum percentage of the work queue for H.248 transactions that can be used before all new, non-emergency calls are rejected. • Reject all transactions threshold—Maximum percentage of the work queue for H.248 transactions that can be used before all non-emergency transactions are rejected.
Gateway controller configuration	<p>Information about the gateway controller configuration.</p> <ul style="list-style-type: none"> • Controller name—Name of the gateway controller. • Controller IP address—For an external controller, the IP address of the gateway controller. When the controller is a BSG instance, this field contains internal. • Controller port—Listening port of the gateway controller to which the virtual BGF sends messages.

Table 362: show services pgcp active-configuration Output Fields (*continued*)

Field Name	Field Description
BGF rule configuration	<p>Information about the rule configuration.</p> <ul style="list-style-type: none"> • Rule name—Name of the rule set. • Virtual BGF—Name of the virtual BGF that processes the rule set.
BGF service set configuration	<p>Information about the service set configuration.</p> <ul style="list-style-type: none"> • Service set name—Name of the service set. • Service set id—Numeric identifier of the service set. • Rule name—Name of the rule set configured for the service set.
BGF MultiServices PIC status	<p>Information about the services PICs' status.</p> <ul style="list-style-type: none"> • Name—Name of the services interface. • Status—Status of the services interface: Connected.
Firewall	<p>Information about firewall filter status for the virtual BGF.</p> <ul style="list-style-type: none"> • Status—Status of the firewall associated with the virtual BGF: Connected or Unsupported Platform. • Number of terms—Number of match condition terms used in the virtual BGF. For each filter, a default term is installed to allow traffic to pass through (otherwise, all traffic is dropped because it is the default firewall action). For example, there are two terms listed when there are two filters. • Number of filters—Number of firewall filters used in the virtual BGF.

show services pgcp gate

Syntax	show services pgcp gate gateway-name gateway-name gate-id gate-id < brief extensive session-mirroring statistics > < master backup >
Release Information	Command introduced in Junos OS Release 9.5. statistics option introduced in Junos OS Release 9.1. session-mirroring option introduced in Junos OS Release 9.2. gateway option introduced in Junos OS Release 9.5. master option introduced in Junos OS Release 9.6 backup option introduced in Junos OS Release 9.6
Description	Display in-depth information about a Packet Gateway Control Protocol (PGCP) gate.
Options	gateway gateway-name —(Optional) Display information about gates associated with this virtual border gateway function (BGF). gate-id gate-id —(Optional) Display information about a particular gate. brief —(Optional) Display brief output. extensive —(Optional) Display extensive output. session-mirroring —(Optional) Display the session mirroring information for gates that are being mirrored. You must have a login with sufficient permission to view session mirroring information. The set system login class class-name permissions pgcp-session-mirroring command grants this permission. statistics —(Optional) Display statistics for gates. master —(Optional) Display information for the backup services PIC. This option applies if you are running the virtual BGF on a services PIC or MS-DPC, and you have a primary and backup PIC configured on a virtual redundant MultiServices PIC (rms) interface. backup —(Optional) Display information for the Routing Engine or primary services PIC. If the virtual BGF is running on the Routing Engine, gate information for the routing engine is displayed. If the virtual BGF is running on a services PIC, gate information the primary services PIC is displayed. If you do not specify the master or backup options, the master option is the default.
Required Privilege Level	view pgcp-session-mirroring—To view session mirroring fields.

Output Fields Table 363 on page 2425 lists the output fields for the **show services pgcp gate** command. Output fields are listed in the approximate order in which they appear.

Table 363: show services pgcp gate Output Fields

Field Name	Field Description	Output Level
Gate information	Information about the gate.	brief, extensive
Direction	Direction of the gate.	brief, extensive
State	State of the gate: <ul style="list-style-type: none"> • active • disabled • closed 	brief, extensive
remote source address	IP address of the remote source of the gate.	brief, extensive
remote source port	Port of the remote source of the gate.	brief, extensive
remote dest address	IP address of the remote destination of the gate.	brief, extensive
remote dest port	Port of the remote destination of the gate.	brief, extensive
local source address	IP address of the local source of the gate.	brief, extensive
local source port	Port of the local source of the gate.	brief, extensive
local dest address	IP address of the local destination of the gate.	brief, extensive
local dest port	Port of the local destination of the gate.	brief, extensive
transport	Transport protocol.	brief, extensive
gate version	Numeric identifier for the version of the gate.	brief, extensive
latch	Latch status: <ul style="list-style-type: none"> • latch • none 	brief, extensive
yellow action	Action to take in this state.	brief, extensive
red action	Action to take in this state.	brief, extensive
notifications	Number of notifications.	brief, extensive
User Data	Numeric identifier for the user data.	brief, extensive

Table 363: show services pgcp gate Output Fields (*continued*)

Field Name	Field Description	Output Level
Transport	H.248 media descriptor field: <ul style="list-style-type: none"> • udp • tcp • rtp • avp 	extensive
RTCP	Additional (shadow) gate allocated for the Real-Time Control Protocol (RTCP): auto or off.	extensive
Latch	State of the latch action on the gate: <ul style="list-style-type: none"> • none • latch • relatch 	extensive
DSCP	DiffServ code point (DSCP) marking value for the gate.	extensive
Policing	Status of policing on the gate: <ul style="list-style-type: none"> • On • Off 	extensive
Fast update filter	Status of the fast update filter: <ul style="list-style-type: none"> • On • Off 	extensive
Gate Statistics	Statistics for the specific gate.	statistics
Output Packets	Number of output packets from the PIC.	statistics
Input Packets	The number of PIC input packets plus the number of packets that the Packet Forwarding Engine dropped because they did not conform to rate limits.	statistics
Dropped Packets	Number of packets that the Packet Forwarding Engine and the PIC dropped because they did not conform to rate limits.	statistics
Lost RTP Packets	Number of RTP packets that have been lost on this gate.	statistics
Fractional lost RTP Packets	The fraction of RTP data packets that the remote side lost. The fraction is expressed as a percentage value.	statistics
RTCP Statistics	RTCP statistics for packets sent and received.	statistics
RTCP Sender Statistics	RTCP statistics for the sending endpoint.	statistics
SSRC	Synchronization source ID for the sending endpoint.	statistics

Table 363: show services pgcp gate Output Fields (*continued*)

Field Name	Field Description	Output Level
Sender Octets	Number of octets sent.	statistics
Sender Packets	Number of packets sent.	statistics
Invalid Packets	Number of invalid packets.	statistics
RTCP Receiver Statistics	Statistics for the endpoint receiving the RTCP packets.	statistics
SSRC	Synchronization source ID for the receiving endpoint.	statistics
Lost packets	The number of RTP data packets that the remote side lost in the current transmission.	statistics
Lost fraction	The fraction (percentage) of RTP data packets that the remote side lost in the current transmission.	statistics
Jitter	An estimate of the statistical variance of the RTP data packet interarrival time. The jitter is measured in the units of the RTP timestamp and represents the mean deviation of the difference in packet spacing at the receiver compared to the sender for a pair of packets.	statistics
Received RTCP-XR Statistics:	Statistics on RTCP packets sent and received.	statistics
Packet loss concealment	Method of packet loss concealment: <ul style="list-style-type: none"> • U—Unspecified • E—Enhanced • D—Disabled • S—Standard 	statistics
Loss Rate	The fraction of RTP data packets from the source lost since the beginning of reception.	statistics
Discard Rate	The fraction of RTP data packets from the source that have been discarded since the beginning of reception.	statistics
Round Trip Delay	The most recent round-trip time between interfaces, in milliseconds.	statistics
End System Delay	The most recently estimated end system delay, expressed in milliseconds.	statistics
Signal Level	The voice signal relative level shown as the ratio of the signal level to dBm0.	statistics
Noise Level	The ratio of the silent period background noise level to dBm0.	statistics

Table 363: show services pgcp gate Output Fields (*continued*)

Field Name	Field Description	Output Level
RERL	The residual echo return loss value expressed as an integer in the range from 0 to 100 dB. A value of 94 corresponds to "toll quality", and values of 50 or less are regarded as unusable. This metric includes the effects of delay.	statistics
R Factor	A voice quality metric describing the segment of the call that is carried over this RTP session expressed as an integer in the range from 0 to 100 dB. A value of 94 corresponds to "toll quality", and values of 50 or less are regarded as unusable. This metric includes the effects of delay. A value of 127 indicates that this parameter is unavailable.	statistics
Ext. R Factor	The external R factor is a voice quality metric describing the segment of the call that is carried over a network segment external to the RTP segment, such as a cellular network. Its values are interpreted in the same manner as for the RTPR factor. This metric includes the effects of delay and relates to the outward voice path from the VoIP termination for which this metrics block applies.	statistics
MOS-LQ	The estimated mean opinion score for listening quality (MOS-LQ) is a voice quality metric on a scale from 1 to 5, in which 5 represents excellent and 1 represents unacceptable. It includes the effects of delay and other effects that would affect listening quality.	statistics
MOS-CQ	The estimated mean opinion score for conversational quality (MOS-CQ) is a voice quality metric on a scale from 1 to 5, in which 5 represents excellent and 1 represents unacceptable. It includes the effects of delay and other effects that would affect conversational quality.	statistics
Received RTCP Burst Metrics Statistics	This section provides statistics for burst metrics received from the far end of the RTCP session.	statistics
Minimum Gap Threshold	This field contains the value used for this report block to determine if a gap exists. The recommended value of 16 corresponds to a burst period having a minimum density of 6.25 percent of lost or discarded packets, which may cause noticeable degradation in call quality. During gap periods defined with a threshold of 16, each lost or discarded packet is preceded by and followed by a sequence of at least 16 received non-discarded packets.	statistics
Burst Density	The fraction of RTP data packets within burst periods since the beginning of reception that were either lost or discarded.	statistics
Burst Duration	The mean duration of the burst periods that have occurred since the beginning of reception, in milliseconds.	statistics
Gap Loss Density	The fraction of RTP data packets within inter-burst gaps since the beginning of reception that were either lost or discarded.	statistics

Table 363: show services pgcp gate Output Fields (*continued*)

Field Name	Field Description	Output Level
Gap Duration	The mean duration of the gap periods that have occurred since the beginning of reception, in milliseconds.	statistics
Gate Measured Rate	Current gate throughput measured in bytes per second.	statistics
Rate-Limiting Statistics	Counter showing data traffic statistics based on the TRTC (two-rate-three-colors) policer.	statistics
FUF statistics	The number of dropped packets when the Fast Update Filter was enabled on the gate.	statistics
Drop count	The number of packets dropped by the data PIC.	statistics
Session mirroring status	Status of session mirroring: <ul style="list-style-type: none"> • On • Off 	session mirroring
Session mirroring correlation number	Indicates whether the data mirrors are encrypted.	session mirroring
Session mirroring target ID list	One or more targets of the mirrored packets.	session mirroring
Session mirroring direction	Direction of session mirroring: <ul style="list-style-type: none"> • Egress • Ingress 	session mirroring

show services pgcp root-termination

Syntax `show services pgcp root-termination gateway gateway-name`
`<backup | master>`

Release Information Command introduced in Junos OS Release 8.5.
gateway option introduced in Junos OS Release 9.5.
master option introduced in Junos OS Release 9.6
backup option introduced in Junos OS Release 9.6

Description Display information about the H.248 root termination.

NOTE: This command is not applicable when the gateway controller for the BGF is a BSG.

Options **gateway *gateway-name***—Display information about root terminations in H.248 transactions associated with this virtual BGF.

backup—(Optional) Display information for the backup services PIC. This option applies if you are running the virtual BGF on a services PIC or MS-DPC, and you have a primary and backup PIC configured on a virtual redundant MultiServices PIC (rms) interface.

master—(Optional) Display information for the Routing Engine or primary services PIC. If the virtual BGF is running on the Routing Engine, the route terminations on the routing engine are displayed. If the virtual BGF is running on a services PIC, the route terminations on primary services PIC are displayed. If you do not specify the **master** or **backup** options, the **master** option is the default.

            SEG/MGSEGMENTATIONTIMERVALUE = 6000 }
    },
```

show services pgcp statistics

Syntax	show services pgcp statistics gateway <i>gateway-name</i> <brief extensive> <backup master> <virtual-interface <i>interface-number</i> >
Release Information	Command introduced in Junos OS Release 8.4. brief extensive option introduced in Junos OS Release 9.3. gateway option introduced in Junos OS Release 9.5. master option introduced in Junos OS Release 9.6. backup option introduced in Junos OS Release 9.6. virtual-interface option introduced in Junos OS 11.1
Description	Display information about statistics associated with the virtual border gateway function (vBGF) or for a specific virtual interface on the vBGF.
Options	gateway <i>gateway-name</i> —Display information about statistics associated with this virtual BGF. brief extensive —(Optional) Display the specified level of output. The default level is brief. backup —(Optional) Display information for the backup services PIC. This option applies if you are running the virtual BGF on a services PIC or MS-DPC, and you have a primary and backup PIC configured on a virtual redundant Multiservices PIC (rms) interface. master —(Optional) Display information for the Routing Engine or primary services PIC. If the virtual BGF is running on the Routing Engine, statistics on the Routing Engine are displayed. If the virtual BGF is running on a services PIC, statistics on the primary services PIC are displayed. If you do not specify the master or backup options, the master option is the default.
Required Privilege Level	view
List of Sample Output	show services pgcp statistics on page 2445 show services pgcp statistics extensive on page 2445
Output Fields	Table 366 on page 2441 lists the output fields for the show services pgcp statistics command. Output fields are listed in the approximate order in which they appear.

Table 366: show services pgcp statistics Output Fields

Field Name	Field Description	Level of Output
Virtual BGF configuration	<p>Information about the virtual BGF configuration.</p> <ul style="list-style-type: none"> • Name—Name of the virtual BGF. • Platform—The service interface for the BGF. • IP address—IP address of the virtual BGF. • Routing Instance—Name of the routing instance associated with the virtual BGF. • Port—Port of the virtual BGF. • Status—Status of the virtual BGF: In-Service, Out-of-Service, • Active gateway controller—Gateway controller that is currently controlling this virtual BGF. NULL means that there is no active gateway controller. • Replication socket <ul style="list-style-type: none"> • Connected (Ready)—The replication is ready and a switchover can be processed. • Connected (Syncing)—The replication is synchronizing. Performing a switchover is not safe. • Connected (Error)—An error occurred in the previous switchover. • Disconnected—The backup Routing Engine is down. There is no route to the backup Routing Engine. • Synchronization state—The status of the synchronization between the internal state of the pgcpd process and the flow of media on a data PIC after a failover of the pgcpd process. <ul style="list-style-type: none"> • Idle—The pgcpd process and the data PIC media flow are in synch. • Initializing—The pgcpd process is reading the current status of the data PIC to determine required synchronization. • synchronizing—The pgcpd process is synchronizing its internal state with the data PIC. <p>NOTE: BGF service is not affected when synchronizing. Gates can be created, modified, and deleted normally.</p> <ul style="list-style-type: none"> • Up time—The time, in hours, minutes, and seconds, since the pgcpd process started. <p>NOTE: This metric is not affected by changes to the BGF's administrative state (in-service, out-of-service) or clearing of statistics by use of the clear services pgcp statistics command.</p> <ul style="list-style-type: none"> • Load status—Describes the current load on the system. <ul style="list-style-type: none"> • Normal—The system is not overloaded. • Overloaded—The system is sending overload messages to the gateway controller. • Overloaded (rejecting new calls)—The system is overloaded and is rejecting all attempts to create new gates. 	all
Usage Counters	<p>Information about usage of contexts and emergency contexts.</p> <ul style="list-style-type: none"> • Contexts—The number of active contexts out of the total number of contexts. • Emergency contexts—The number of active contexts that are emergency contexts. 	
BGF MultiServices PIC status	<p>Information about the Multiservice PIC providing the BGF service.</p> <ul style="list-style-type: none"> • Name—Service interface assigned for the BGF. • Status—Connection status of the BGF. 	

Table 366: show services pgcp statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
Traffic summary	<p>Traffic statistics accumulated since the last time statistics were cleared. Statistics shown are for either the vBGF or for a specifically requested virtual interface.</p> <ul style="list-style-type: none"> • Input Packets—Number of packets received. • Output Packets—Number of packets sent. • Input Octets—Number of octets received. • Output Octets—Number of octets sent. • Dropped packets—Number of packets dropped for each of the following reasons: <ul style="list-style-type: none"> • Rate limit—Number of packets dropped due to rate limiting. • Explicit drop—Packets dropped due to actions on the control plane, such as send-only, receive-only, out-of-service, remote-destination-unknown. • Algs—Count of packets dropped due to L4-L7 validation by ALGs (Application Layer Gateways). • Other—Total number of packets dropped for any of the following reasons: <ul style="list-style-type: none"> • Basic packet verification failure • Source ifl does not match • NAT translation failure ipv4 to ipv6 • Virtual interface out of service • Latching operation not completed 	
H.248 statistics	<p>Information about H.248 statistics. Statistics shown are for either the vBGF or for a specifically requested virtual interface. If the vBGF's controller is a BSG, the statistics represent the number of API messages that are used in lieu of actual H.248 messages.</p> <ul style="list-style-type: none"> • Messages received—Number of H.248 messages received. • Messages sent—Number of H.248 messages sent. • Protocol errors—Number of errors detected for this virtual BGF, including: <ul style="list-style-type: none"> • Syntax errors detected in received messages. • Outgoing transactions that have failed for protocol reasons. 	all
Received Commands	<p>Information about command requests received by the virtual BGF. The following information is shown for each possible command.</p> <ul style="list-style-type: none"> • Total—Total number of commands received, including commands with wildcard termination IDs. • Wildcards—Number of commands received that contain wildcard termination IDs. • Success—Number of success replies sent by the virtual BGF. • Error—Number of error replies sent by the virtual BGF. <p>Commands are not counted in the following cases:</p> <ul style="list-style-type: none"> • The command was not executed because of a previous error. • The command was not fully executed because of its own syntax error, which made it impossible to obtain the command type itself. 	all

show services pgcp conversations

Syntax `show services pgcp conversations gateway gateway-name`
 `<brief | extensive | terse>`
 `<backup | master>`
 `<destination-port destination-port>`
 `<destination-prefix destination-prefix>`
 `<destination-routing-instance vrf>`
 `<gate-id gate-id>`
 `gateway-name`
 `<protocol protocol>`
 `<service-set service-set>`
 `<source-port source-port>`
 `<source-prefix source-prefix>`
 `<source-routing-instance vrf>`

Release Information Command introduced in Junos OS Release 8.4.
 gateway-name option added in Junos OS Release 9.2.
 master option introduced in Junos OS Release 9.6
 backup option introduced in Junos OS Release 9.6

Description Display information about Packet Gateway Control Protocol (PGCP) conversations.

Options **gateway *gateway-name***—Display information about statistics associated with this virtual border gateway function (BGF).

none—Display standard information about all PGCP conversations.

brief | extensive | terse—(Optional) Display the specified level of output.

backup—(Optional) Display information for the backup services PIC. This option applies if you are running the virtual BGF on a services PIC or MS-DPC, and you have a primary and backup PIC configured on a virtual redundant Multiservices PIC (rms) interface.

master—(Optional) Display information for the Routing Engine or primary services PIC. If the virtual BGF is running on the Routing Engine, the conversations on the routing engine are displayed. If the virtual BGF is running on a services PIC, the conversations on the primary services PIC are displayed. If you do not specify the **master** or **backup** options, the **master** option is the default.

destination-port *destination-port*—(Optional) Display information for a particular destination port.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

destination-routing-instance *vrf*—(Optional) Display information for a particular destination VPN routing and forwarding instance (VRF).

gate *gate-id*—(Optional) Display information about a particular gate.

gateway-name—Display information about a virtual BGF.

protocol *protocol*—(Optional) Display information about one of the following IP protocol types:

- ***number***—Numeric protocol value from 0 to 255
- ***ah***—IPsec Authentication Header protocol
- ***egp***—An exterior gateway protocol
- ***esp***—IPsec Encapsulating Security Payload protocol
- ***gre***—A generic routing encapsulation protocol
- ***icmp***—Internet Control Message Protocol
- ***igmp***—Internet Group Management Protocol
- ***ipip***—IP-over-IP Encapsulation Protocol
- ***ospf***—Open Shortest Path First protocol
- ***pim***—Protocol Independent Multicast protocol
- ***rsvp***—Resource Reservation Protocol
- ***sctp***—Stream Control Protocol
- ***tcp***—Transmission Control Protocol
- ***udp***—User Datagram Protocol

service-set *service-set*—(Optional) Display information for the specific service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

source-routing-instance *vrf*—(Optional) Display information for a particular source VPN routing and forwarding instance (VRF).

List of Sample Output [show services pgcp conversations on page 2451](#)
[show services pgcp conversations extensive on page 2451](#)

Output Fields [Table 367 on page 2449](#) lists the output fields for the **show services pgcp conversations** command. Output fields are listed in the approximate order in which they appear.

Table 367: show services pgcp conversations Output Fields

Field Name	Field Description	Level of Output
Interface	Name of a services interface.	All levels
Service set	Name of a service set. Individual empty service sets are not displayed. If no service set has any flows, a flow table header is printed for each service set.	All levels

Table 367: show services pgcp conversations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Conversation	Information about a group of related flows. <ul style="list-style-type: none"> • ALG Protocol—Application-level gateway protocol. • Number of initiators—Number of flows that initiated a session. • Number of responders—Number of flows that responded in a session. 	All levels
Flow	Protocol used for this flow.	All levels
Source	Source prefix of the flow, in the format <i>source-prefix-port</i> .	All levels
Destination	Destination prefix of the flow.	All levels
State	Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without response. • Forward—Forward the packet in the flow without looking at it. • Reject—Drop all packets in the flow with response. • Watch—Inspect packets in the flow. 	All levels
Dir	Direction of the flow: input (I) or output (O).	All levels
Frm Count	Number of frames in the flow.	All levels
Gate id	Numeric identifier of the gate.	All levels
NAT source	Original and translated source IPv4 or IPv6 addresses are displayed if Network Address Translation (NAT) is configured on this particular flow or conversation.	All levels
NAT dest	Original and translated destination IPv4 or IPv6 addresses are displayed if NAT is configured on this particular flow or conversation.	All levels
Byte count	Number of bytes forwarded in the flow.	extensive
Flow role	Role of the flow that is under evaluation: Initiator , Master , Responder , or Unknown .	extensive
Timeout	Lifetime of the flow, in seconds.	extensive
Tman Policing	Whether traffic-management policing is ON or OFF	extensive
SDR	Sustained data rate being enforced for the gate.	extensive
SDR MBS	Sustained data rate maximum burst size being enforced for the gate.	extensive
PDR	Peak data rate being enforced for the gate.	extensive
PDR MBS	Peak data rate maximum burst size being enforced for the gate.	extensive

show services pgcp flows

Syntax `show services pgcp flows gateway gateway-name`
`<brief | extensive | terse>`
`<backup | master>`
`<count>`
`<destination-port destination-port>`
`<destination-prefix destination-prefix>`
`<destination-routing-instance vrf>`
`<gate-id gate-id>`
`<gateway-name>`
`<protocol protocol>`
`<service-set service-set>`
`<source-port source-port>`
`<source-prefix source-prefix>`
`<source-routing-instance vrf>`

Release Information Command introduced in Junos OS Release 8.4.
gate-id option added in Release 9.2.
gateway-name option added in Junos OS Release 9.2.
destination-routing-instance option added in Junos OS Release 9.3.
source-routing-instance option added in Junos OS Release 9.3.
master option introduced in Junos OS Release 9.6
backup option introduced in Junos OS Release 9.6

Description Display information for Packet Gateway Control Protocol (PGCP) flows.

Options **gateway *gateway-name***—Display information about statistics associated with this virtual border gateway function (BGF).

none—Display standard information about all PGCP flows.

brief | extensive | terse—(Optional) Display the specified level of output.

backup—(Optional) Display information for the backup services PIC. This option applies if you are running the virtual BGF on a services PIC or MS-DPC, and you have a primary and backup PIC configured on a virtual redundant Multiservices PIC (rms) interface.

master—(Optional) Display information for the Routing Engine or primary services PIC. If the virtual BGF is running on the Routing Engine, the flows on the routing engine are displayed. If the virtual BGF is running on a services PIC, the flows on the primary services PIC are displayed. If you do not specify the **master** or **backup** options, the **master** option is the default.

count—(Optional) Display a count of the matching entries.

destination-port *destination-port*—(Optional) Display information for a particular destination port.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

destination-routing-instance *vrf*—(Optional) Display information for a particular destination VPN routing and forwarding instance (VRF).

gate *gate-id*—(Optional) Display information about a particular gate.

gateway-name—(Optional) Display information about a particular virtual BGF.

protocol *protocol*—(Optional) Display information about one of the following IP protocol types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

source-routing-instance *vrf*—(Optional) Display information for a particular source VPN routing and forwarding instance (VRF).

Required Privilege Level	view
List of Sample Output	show services pgcp flows on page 2456 show services pgcp flows extensive on page 2456
Output Fields	Table 368 on page 2455 lists the output fields for the show services pgcp flows command. Output fields are listed in the approximate order in which they appear.

Table 368: show services pgcp flows Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the services interface.	All levels
Service set	Name of a service set. Individual empty service sets are not displayed. If no service set has any flows, a flow table header is displayed for each service set.	All levels
Flow	Protocol used for this flow.	All levels
Source	Source prefix of the flow in the format <i>source-prefix:port</i> .	All levels
Dest	Destination prefix of the flow.	All levels
State	Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without response. • Forward—Forward the packet in the flow without looking at it. • Reject—Drop all packets in the flow with response. • Watch—Inspect packets in the flow. 	All levels
Dir	Direction of the flow: input (I), output (O), or unknown (U).	All levels
Frm count	Number of frames in the flow.	All levels
Gate id	Numeric identifier of the gate.	All levels
NAT source	Original and translated source IPv4 or IPv6 addresses are displayed if Network Address Translation (NAT) is configured on this particular flow or conversation.	All levels
NAT dest	Original and translated destination IPv4 or IPv6 addresses are displayed if NAT is configured on this particular flow or conversation.	All levels
VRF	If you have VPN aggregation configured, shows the source (ingress) VRF and the destination (egress) VRF.	extensive
Byte count	Number of bytes forwarded in the flow.	extensive
Flow role	Role of the flow that is under evaluation: Initiator , Master , Responder , or Unknown .	extensive
Timeout	Lifetime of the flow, in seconds.	extensive
Tman Policing	Whether traffic-management policing is ON or OFF	extensive
SDR	Sustained data rate being enforced for the gate.	extensive
SDR MBS	Sustained data rate maximum burst size being enforced for the gate.	extensive
PDR	Peak data rate being enforced for the gate.	extensive
PDR MBS	Peak data rate maximum burst size being enforced for the gate.	extensive

PTSP Operational Mode Commands

Table 370 on page 2465 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot the packet-triggered subscribers and policy control (PTSP) services. Commands are listed in alphabetical order.

Table 370: PTSP Operational Mode Commands

Task	Command
Clear the packet-triggered subscriber session and log out the specified subscriber.	<code>clear services subscriber sessions</code>
Clear the subscriber profile associated with the given subscriber.	<code>clear request services subscribers</code>
Set the subscriber profile associated with the given subscriber.	<code>set request services subscribers</code>
Display bandwidth information about the packet-triggered subscribers.	<code>show services subscriber bandwidth</code>
Display information about the active dynamic policies applied to the specific subscribers.	<code>show services subscriber dynamic-policies</code>
Display information about the data flows associated with the specific subscriber.	<code>show services subscriber flows</code>
Display information about the active packet-triggered subscriber sessions on the router.	<code>show services subscriber sessions</code>
Display information about the data traffic statistics for the specified packet-triggered subscriber and for each service rule attached to that subscriber.	<code>show services subscriber statistics</code>

NOTE: PTSP services are supported on the MultiServices Dense Port Concentrator (MS-DCP) on the MX Series routers.

.....

NOTE: For information about how to configure the PTSP services, see the Junos OS Subscriber Management, Release 13.1.

.....

clear services subscriber sessions

Syntax	<code>clear services subscriber sessions client-id <i>client-id</i></code>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Clear the packet-triggered subscriber sessions on the router to log out the subscribers.
Options	<code>client-id <i>client-id</i></code> —Logs out the packet-triggered subscriber with this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show services subscriber sessions on page 2477
List of Sample Output	clear services subscriber sessions on page 2467
Output Fields	When you issue this command, you are provided feedback on the status of your request.

Sample Output

<code>clear services subscriber sessions</code>	<code>user@host> clear services subscriber sessions client-id 1 Initiated logout request for 1 subscriber session(s)</code>
---	--

clear request services subscribers

Syntax	<code>request services subscribers clear subscriber-profile <i>profile</i> client-id <i>client-id</i></code>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Clear the subscriber profile associated with the given subscriber.
Options	<i>profile</i> —Name of the subscriber profile to clear the active subscriber profile for the given subscriber. <i>client-id</i> —Client session ID assigned to the subscriber.
Required Privilege Level	clear
List of Sample Output	request services subscriber clear subscriber-profile tc_act_prof client-id on page 2468

Sample Output

set request services subscribers

Syntax	<code>request services subscribers set subscriber-profile <i>profile</i> client-id <i>client-id</i></code>
Release Information	Command introduced in Junos OS Release 11.4.
Description	Set the subscriber profile associated with the given subscriber.
Options	<p><i>profile</i>—Name of the subscriber profile to create or override the currently active subscriber profile for the given subscriber.</p> <p><i>client-id</i>—Client session ID assigned to the subscriber.</p>
Required Privilege Level	view
List of Sample Output	request services subscriber set subscriber-profile tc_act_prof client-id on page 2469

Sample Output

```

request services subscriber set subscriber-profile tc_act_prof client-id
2533274790395909 | display xml

show services subscriber bandwidth

Syntax	<pre>show services subscriber bandwidth <client-id <i>client-id</i>> <interface <i>interface-name</i>> <top-talkers <i>top-talkers</i>> <ip-address <i>ip-address</i>> <service-interface <i>interface-name</i>> <top-talkers <i>top-talkers</i>></pre>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display bandwidth information about subscribers with the specified criteria. The bandwidth is computed at fixed intervals on the MS-DPC and only the last interval is used for comparison.
Options	<p>client-id <i>client-id</i>—(Optional) Displays bandwidth information for the subscriber with this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.</p> <p>interface <i>interface-name</i>—(Optional) Displays bandwidth information for the subscriber with this underlying interface name.</p> <p>ip-address <i>ip-address</i>—(Optional) Displays bandwidth information for the subscriber with this IPv4 address.</p> <p>service-interface <i>interface-name</i>—(Optional) Displays bandwidth information for the subscriber with this service interface name.</p> <p>top-talkers <i>number-top-talkers</i>—(Optional) Displays bandwidth information for the specified number of subscribers using the most bandwidth based on the input-bps or output-bps values for the interface or service interface.</p>
Required Privilege Level	view
List of Sample Output	show services subscriber bandwidth client-id on page 2471
Output Fields	Table 371 on page 2470 lists the output fields for the show services subscriber bandwidth command. Output fields are listed in the approximate order in which they appear.

Table 371: show services subscriber bandwidth Output Fields

Field Name	Field Description
client-id	Client identifier.
input-bps	Ingress bandwidth in bytes per second.
output-bps	Egress bandwidth in bytes per second.
input-pps	Ingress bandwidth in packets per second.
output-pps	Egress bandwidth in packets per second.

Sample Output

```
show services subscriber bandwidth client-id 1
subscriber bandwidth
client-id      client-id  input-bps  output-bps  input-pps  output-pps
1              1          20         20          1000       1000
```

show services subscriber dynamic-policies

Syntax	show services subscriber dynamic-policies client-id <i>client-id</i>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display information about the active dynamic policies applied to the specified subscriber.
Options	client-id <i>client-id</i> —Displays information about the active dynamic policies applied to the subscriber with this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
Required Privilege Level	view
List of Sample Output	show services subscriber dynamic-policies client-id on page 2474
Output Fields	Table 372 on page 2472 lists the output fields for the show services subscriber dynamic-policies command. Output fields are listed in the approximate order in which they appear.

Table 372: show services subscriber dynamic-policies Output Fields

Field Name	Field Description
Subscriber session	Client identifier.
Policy name	Dynamic policy identifier.
rpr	Rule precedence for the dynamic policy.
d	Direction of the dynamic policy.
Template	Service rule associated with the dynamic policy.
tpr	Term precedence.
ra	Remote address.
rm	Remote address mask.
lpl	Lower boundary for the local port range.
lph	Upper boundary for the local port range.
rpl	Lower boundary for the remote port range.
rph	Upper boundary for the remote port range.
p	Protocol.

Table 372: show services subscriber dynamic-policies Output Fields (*continued*)

Field Name	Field Description
a-f	Action.
a-s	Type of statistics collection and aggregation.
a-fc	Forwarding class.
a-p-l	Policer instance.
a-p-bw	Policer bandwidth.
a-p-mbs	Policer maximum burst size.
a-fu	Unit number for forwarding instance.
anl	Application names.
agl	Application group name.

Sample Output

```
show services
subscriber
dynamic-policies

show services subscriber flows

Syntax	show services subscriber flows client-id <i>client-id</i>
Release Information	Command introduced in Junos OS Release 10.2. Offload status for flows using Juniper Forwarding Mechanism (JFM) added in Junos OS Release 12.1.
Description	Display information about the data flows associated with the specified subscriber. Offloading using JFM is supported only on MX Series routers with Modular Port Concentrators (MPCs) for the packet-triggered subscribers and policy control (PTSP) plug-in.
Options	client-id <i>client-id</i> —Displays information about the data flows associated with the subscriber identified by this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
Required Privilege Level	view
List of Sample Output	show services subscriber flows client-id on page 2476 show services subscriber flows client-id for offloading using JFM on page 2476
Output Fields	Table 373 on page 2475 lists the output fields for the show services subscriber flows command. Output fields are listed in the approximate order in which they appear.

Table 373: show services subscriber flows Output Fields

Field Name	Field Description
Subscriber session	Client identifier.
Number of data flows	Number of data sessions associated with this subscriber.
Data flow high-water-mark	High water mark number of concurrent data sessions for this subscriber. This value is never reset during the login session.
5-tuple	5 tuple information for each flow.
Application-ID	Application ID for each flow.
Policy-name	Service rule name for each flow.
Dir	Direction of each flow.
Packets	Information about counter statistics for each flow.
Bytes	Information about counter statistics for each flow.

Table 373: show services subscriber flows Output Fields (*continued*)

Field Name	Field Description
Off	The status of offload to Packet Forwarding Engine using JFM. The various options are: <ul style="list-style-type: none"> • Not Offloaded (-) • Offload requested but not completed (R) • Offload requested and completed (O)
Action	Action of the service rule for each flow.

Sample Output

**show services

show services subscriber statistics

Syntax	show services subscriber statistics client-id <i>client-id</i>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display information about the data traffic statistics for the specified packet-triggered subscriber and for each service rule attached to that subscriber.
Options	client-id <i>client-id</i> —Displays information about the data traffic statistics associated with the subscriber identified by this client ID. The client ID is a generated identifier assigned to each packet-triggered subscriber known to the router.
Required Privilege Level	view
List of Sample Output	show services subscriber statistics client-id by rule on page 2481 show services subscriber statistics client-id by application on page 2481
Output Fields	Table 375 on page 2480 lists the output fields for the show services subscriber statistics command. Output fields are listed in the approximate order in which they appear.

Table 375: show services subscriber statistics Output Fields

Field Name	Field Description
Aggregation-level	Type of statistics collected — subscriber and service rule or application.
Name/Id	Identifier for Aggregation-level field.
Packets-in	Number of ingress packets.
Packets-out	Number of egress packets.
Bytes-in	Number of ingress bytes.
Bytes-out	Number of egress bytes.

Sample Output

```
show services subscriber statistics client-id 1
subscriber statistics client-id by rule
user@host> show services subscriber statistics client-id 1
Aggregation-level Name/Id      Packets-in Packets-out Bytes-in Bytes-out

Service Sets Operational Mode Commands

Table 376 on page 2483 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot service sets. Commands are listed in alphabetical order.

Table 376: Service Sets Operational Mode Commands

Task	Command
Clear service sets dropped packet statistics.	<code>clear services service-sets statistics packet-drops</code>
Clear service sets syslog statistics.	<code>clear services service-sets statistics syslog</code>
Display service sets CPU utilization.	<code>show services service-sets cpu-usage</code>
Display information about statistics associated with the HTTP URL manipulation.	<code>show services hcm statistics</code>
Display services sets memory utilization.	<code>show services service-sets memory-usage</code>
Display plug-in information for service sets.	<code>show services service-sets plug-ins</code>
Display service sets dropped packet statistics.	<code>show services service-sets statistics packet-drops</code>
Display service sets syslog statistics.	<code>show services service-sets statistics syslog</code>
Display services sets TCP maximum segment size (MSS) statistics.	<code>show services service-sets statistics tcp-mss</code>
Display service sets summary information.	<code>show services service-sets summary</code>

.....

NOTE: Service sets are supported on the adaptive services interface on the following routers:

- J Series routers—*sp-pim/0/slot*
- M Series and T Series routers—*ms-fpc/pic/port* or *sp-fpc/pic/port*

Service sets are also supported on the redundant adaptive services interface (*rspnumber*) on M Series and T Series routers.

.....

.....

NOTE: For information about how to configure service sets, see the Junos Services Interfaces Configuration Release 12.3.

.....

clear services service-sets statistics packet-drops

Syntax	clear services service-sets statistics packet-drops <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 7.4.
Description	Clear dropped-packet statistics for one adaptive services interface or for all adaptive services interfaces.
Options	<p>none—Clear dropped-packet statistics for all configured adaptive services interfaces.</p> <p>interface <i>interface-name</i>—(Optional) Clear dropped-packet statistics for the specified adaptive services interface. On M Series and T Series routers, the <i>interface-name</i> can be <i>ms-fpc/pic/port</i>, <i>sp-fpc/pic/port</i> or <i>rspnumber</i>. On J Series routers, the <i>interface-name</i> is <i>sp-pim/0/port</i>.</p>
Required Privilege Level	network
Related Documentation	<ul style="list-style-type: none"> • show services service-sets statistics packet-drops on page 2493
List of Sample Output	clear services service-sets statistics packet-drops on page 2485
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear services
service-sets statistics
packet-drops
```

```
user@host> clear services service-sets statistics packet-drops interface sp-5/0/0
Flow collector interface: cp-5/0/0
Interface state: Collecting flows
Statistics cleared successfully
```

clear services service-sets statistics syslog

Syntax	<code>clear services service-sets statistics syslog</code> <code><service-set <i>service-set-name</i>></code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 11.1.
Description	Clear system log statistics for one services interface or for all services interfaces, and for one named service set or all service sets on the interface or interfaces.
Options	none —Clear system log for all configured services interfaces and their service sets. interface <i>interface-name</i> —(Optional) Clear system log statistics for the specified services interface. On M Series, MX Series, and T Series routers, the <i>interface-name</i> can be ms-fpc/pic/port , sp-fpc/pic/port , or rspnumber . On J Series routers, the <i>interface-name</i> is sp-pim/O/port . service-set <i>service-set-name</i> —(Optional) Clear system log statistics for the specified services interface.
Required Privilege Level	network

<code>clear services</code> <code>service-sets statistics</code> <code>syslog</code>	<code>user@host> clear services service-sets statistics syslog interface sp-5/0/0</code> Flow collector interface: cp-5/0/0 Interface state: Collecting flows Statistics cleared successfully
--	---

show services service-sets cpu-usage

Syntax	show services service-sets cpu-usage <interface <i>interface-name</i> > <service-set <i>service-set-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display service set CPU usage as a percentage. The command is supported only on Adaptive Services PICs (SP PICs).
Options	<p>none—Display CPU usage for all adaptive services interfaces and service sets.</p> <p>interface <i>interface-name</i>—(Optional) Display CPU usage for a particular interface. On M Series and T Series routers, the <i>interface-name</i> parameter can have the value <i>sp-fpc/pic/port</i> or <i>rspnumber</i>. On J Series routers, <i>interface-name</i> is <i>sp-pim/O/port</i>.</p> <p>service-set <i>service-set-name</i>—(Optional) Display CPU usage for a particular service set. For the Layer 2 Tunneling Protocol (L2TP), you can use a tunnel group to represent a service set.</p>
Required Privilege Level	view
List of Sample Output	show services service-sets cpu-usage on page 2488
Output Fields	Table 377 on page 2487 lists the output fields for the show services service-sets cpu-usage command. Output fields are listed in the approximate order in which they appear.

Table 377: show services service-sets cpu-usage Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface
Service set (system category)	Name of the CPU usage category: <ul style="list-style-type: none"> • idp_recommended—Name of the service sets (displays all the service sets attached to the service PICs) • Idle • System • Receive • Transmit
CPU utilization %	Percentage of the CPU resources being used

Sample Output

```
show services      user@host> show services service-sets cpu-usage
service-sets cpu-usage
```

Interface	Service set (system category)	CPU utilization %
sp-4/1/0	idp_recommended	18.20 %
sp-4/1/0	Idle	44.69 %
sp-4/1/0	System	7.01 %
sp-4/1/0	Receive	15.10 %
sp-4/1/0	Transmit	15.00 %

show services service-sets memory-usage

Syntax show services service-sets memory-usage
 <interface *interface-name*>
 <service-set *service-set-name*>
 <zone>

Release Information Command introduced before Junos OS Release 7.4.

Description Display service set memory usage.

Options none—Display service set memory usage.

interface *interface-name*—(Optional) Display memory usage for a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port*, or *rspnumber*. On J Series routers, the *interface-name* is *sp-pim/0/port*.

NOTE: This command is not supported on Multilink Protocol-based services PICs.

The interface option is not supported on Multiservice PICs.

service-set *service-set-name*—(Optional) Display memory usage for a particular service set. For Layer 2 Tunneling Protocol (L2TP), you can use a tunnel group to represent a service set.

zone—(Optional) Display the memory usage zone of the adaptive services interface or an individual service set.

Required Privilege Level view

show services service-sets statistics packet-drops

Syntax	show services service-sets statistics packet-drops <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 7.4.
Description	Display the number of dropped packets for service sets exceeding CPU limits or memory limits.
Options	<p>none—Display the number of dropped service sets packets for all adaptive services interfaces.</p> <p>interface <i>interface-name</i>—(Optional) Display the number of dropped service sets packets for a particular interface. On M Series and T Series routers, <i>interface-name</i> can be <i>ms-fpc/pic/port</i>, <i>sp-fpc/pic/port</i>, or <i>rspnumber</i>. On J Series routers, <i>interface-name</i> is <i>sp-pim/0/port</i>.</p>

Output Fields	Table 380 on page 2493 lists the output fields for the show services service-sets packet-drops command. Output fields are listed in the approximate order in which they appear.

Table 380: show services service-sets packet-drops Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Service set	Name of a service set.
CPU limit Drops	Number of packets dropped because the service set exceeded the average CPU limit.
Memory limit Drops	Number of packets dropped because the service set exceeded the memory limit.
Flow limit Drops	Number of packets dropped because the service set exceeded the flow limit.

Sample Output

```
show services          user@host> show services service-sets statistics packet-drops interface sp-1/0/0
service-sets statistics      Cpu limit  Memory limit  Flow limit
packet-drops interface      Drops      Drops      Drops
sp-1/0/0      sset1              0          0          0
```

show services service-sets statistics syslog

Syntax	show services service-sets statistics syslog <interface <i>interface-name</i> > <service-set <i>service-set-name</i> > <brief detail>
Release Information	Command introduced in Junos OS Release 11.1.
Description	Display the system log statistics with optional filtering by interface and service set name..
Options	<p>none—Display the system log statistics for all services interfaces and all service sets.</p> <p>brief—(Default) Display abbreviated system log statistics.</p> <p>detail—Display detailed system log statistics.</p> <p>interface <i>interface-name</i>—(Optional) Display the system log statistics for a specific adaptive service interface. On M Series and T Series routers, <i>interface-name</i> can be <i>ms-fpc/pic/port</i>, <i>sp-fpc/pic/port</i>, or <i>rspnumber</i>. On J Series routers, <i>interface-name</i> is <i>sp-pim/0/port</i>.</p> <p>service-set <i>service-set name</i>—(Optional) Display the system log statistics for a specific named service-set.</p>

Table 382: show services service-sets statistics tcp-mss Output Fields

Field Name	Field Description
Interface	Name of the adaptive services interface.
Service Set	Name of the configured service set.
SYN Received	Number of TCP SYN packets received.
SYN Modified	Number of TCP SYN packets with the MSS value modified to match the MSS value specified in the TCP MSS configuration.

Sample Output

```

show services
service-sets statistics
tcp-mss
user@host> show services service-sets statistics tcp-mss
Interface  Service Set      SYN Received  SYN Modified
sp-1/2/0   asq_ipsec_svc_0   500           220

```

show services service-sets summary

Syntax	show services service-sets summary <interface <i>interface-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display service set summary information.
Options	<p>none—Display service set summary information for all adaptive services interfaces.</p> <p>interface <i>interface-name</i>—(Optional) Display service set summary information for a particular interface. On M Series and T Series routers, <i>interface-name</i> can be <i>ms-fpc/pic/port</i>, <i>sp-fpc/pic/port</i>, or <i>rspnumber</i>. On J Series routers, <i>interface-name</i> is <i>sp-pim/0/port</i>.</p>

Output Fields	Table 383 on page 2499 lists the output fields for the show services service-sets summary command. Output fields are listed in the approximate order in which they appear.

Table 383: show services service-sets summary Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface
Service type	Type of adaptive service, such as stateful firewall (SFW), Network Address Translation (NAT), intrusion detection service (IDS), Layer 2 Tunneling Protocol (L2TP), Compressed Real-Time Transport Protocol (CRTP), or IP Security (IPsec)
Service sets configured	Total number of service sets configured on the PIC that use internal service set IDs and do not consume external service sets, including CRTP and L2TP
Bytes used	Bytes used by a particular service or all services
Policy bytes used	Policy bytes used by a particular service or all services
CPU utilization	Percentage of the CPU resources being used

Sample Output

show services
service-sets summary

```
user@host> show services service-sets summary
```

Interface	Service sets configured	Bytes used	Policy bytes used	CPU utilization
ms-4/0/0	1	14821556 (4.53 %)	855124 (0.40 %)	N/A
ms-4/1/0	1	14691700 (4.49 %)	855068 (0.40 %)	N/A

show services
service-sets summary
interface

```
user@host> show services service-sets summary interface sp-1/3/0
```

Interface: sp-1/3/0

Service type	Service sets configured	Bytes used	CPU utilization
SFW/NAT/IDS	1	54 (0.00 %)	N/A
L2TP	1	58 (0.00 %)	N/A
CRTP	1	58 (0.00 %)	N/A
System	0	920831 (0.44 %)	N/A
Idle	0	0 (0.00 %)	N/A
Total	3	921001 (0.44 %)	N/A

Software Operational Mode Commands

Table 384 on page 2501 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot software services. Commands are listed in alphabetical order.

Table 384: Software Operational Mode Commands

Task	Command
Clear software statistics	<code>clear services software statistics</code>
Show software information	<code>show services software</code>
Show software flow information	<code>show services software flows</code>
Show software statistics	<code>show services software statistics</code>

clear services software statistics

Syntax	<code>clear services software statistics</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 10.4.
Description	Clear software statistics.
Options	<code>interface <i>interface-name</i></code> — (Optional) Name of the interface servicing the software. When you omit this option, data for all interfaces are cleared.
Required Privilege Level	view
List of Sample Output	clear services software statistics on page 2502
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear services software statistics` `user@host> clear services software statistics`

show services software

Syntax	show services software <count>
Release Information	Command introduced in Junos OS Release 10.4. <count> option added in Junos OS Release 11.2.
Description	Display information about software services. Information is displayed on both 6rd and DS-Lite services.
Options	count <i>interface-name</i> —(Optional) Display the current software counts for a service set for both DS-Lite and 6rd.
Required Privilege Level	view
List of Sample Output	show services software on page 2503 show services software count on page 2503
Output Fields	Table 385 on page 2503 lists the output fields for the command-name command. Output fields are listed in the approximate order in which they appear.

Table 385: show-services-software Output Fields

Field Name	Field Description	Level of Output
Interface	Interface for which information is displayed.	All levels
Service Set	Service set containing the software rules for the interface.	All levels
Software	Name of the software concentrator.	All levels
Direction	Direction of the flow.	All levels
Flow count	Number of flows.	All levels

Sample Output

```

show services software  user@host> show services software
                        Interface: sp-3/0/0, Service set: v6rd-dom1-dom3-service-set
                        Software
                        10.10.10.2      ->      30.30.30.1      Direction      Flow count
                                           I              13

show services software  user@host> show services software count
count                  Interface      Service set      DS-Lite      6RD

show services software statistics

Syntax	<code><ds-lite></code> <code><interface <i>interface-name</i>></code> <code><v6rd></code>
Release Information	Command introduced in JUNOS Release 10.4.
Description	Display information about software services.
Options	<p>ds-lite—(Optional) Display only DS-Lite.</p> <p>interface <i>interface-name</i> —(Optional) Name of the interface servicing the software. When you omit this option, data for all interfaces are shown.</p> <p>v6rd—(Optional) Display only 6rd statistics.</p>
Required Privilege Level	view
List of Sample Output	show services software statistics on page 2511
Output Fields	Table 387 on page 2508 lists the output fields for the command-name command. Output fields are listed in the approximate order in which they appear.

Table 387: command-name Output Fields

Field Name	Field Description	Level of Output
Softwires Created	Number of softwires created.	statistics
Softwires Created for EIF/HP	Number of softwires created for endpoint-independent filtering (EIF) or hairpinning (HP).	statistics for ds-lite only
Softwires Deleted	Number of softwires deleted.	statistics
Flows Created	Number of flows created.	statistics
Flows Deleted	Number of flows deleted.	statistics
Slow Path Packets Processed	Number of packets processed as initial packets in a software session. These packets require a rule lookup and setting up of flows; this processing of an initial packet in a flow is called “the slow path.”	statistics
Slow Path Packets Processed for EIF/HP	Number of slow path EIF/HP packets processed.	statistics for ds-lite only
Fast Path Packets Processed	Number of packets processed that are not “slow path.”	statistics
Fast Path Encapsulated	Number of packets encapsulated in the fast path.	statistics

Table 387: command-name Output Fields (*continued*)

Field Name	Field Description	Level of Output
Softwire EIF Accept	Number of packets which matched an EIF entry that initiated the creation of a DS-Lite tunnel. The EIF entry was previously triggered by a DS-Lite packet.	statistics for ds-lite only
Rule Match Failed	Number of packets that did not match any softwire rule.	statistics
Rule Match Succeeded	Number of packets that matched a softwire rule.	statistics
IPv6 Packets Fragmented	Number of packets fragmented by the services PIC.	statistics for ds-lite only
IPv4 Client Fragments	Number of IPv4 fragments received from the client end over the softwire tunnel destined to the server	statistics for ds-lite only
IPv4 Server First Fragments	Number of IPv4 first fragments received from the server destined to go over the softwire tunnel to the client.	statistics for ds-lite only
IPv4 Server More Fragments	Number of IPv4 other fragments (excluding first and last fragment) received from the server destined to go over the softwire tunnel to the client.	statistics for ds-lite only
IPv4 Server Last Fragments	Number of IPv4 last fragments received from the server destined to go over the softwire tunnel to the client.	statistics for ds-lite only
Softwire Creation Failed	Number of softwire creation failures.	DS-Lite and 6rd
Softwire Creation Failed for EIF/HP	Number of softwire creation failures for EIF/HP.	statistics for ds-lite only
Flow Creation Failed	Number of flow creation failures.	statistics
Flow Creation Failed for EIF/HP	Number of flow creation failures for EIF/HP.	statistics for ds-lite only
Flow Creation Failed - Retry	Number of flows creations retried after failure.	statistics
Slow Path Failed	Number of failures detected in the slow path.	statistics
Slow Path Failed - Retry	Number of times processing of a packet was reprocessed in the slow path.	statistics
Packet not IPv4 in IPv6	Number of IPv4 packets not encapsulated in IPv6.	statistics for ds-lite only
Slow Path Failed-IPv6 Next Header Offset	Number of IPv6 header errors detected in slow path processing.	statistics for ds-lite only

Table 387: command-name Output Fields (*continued*)

Field Name	Field Description	Level of Output
Decapsulated Packet not IPv4	Number of packets without IPv4 inner header.	statistics for ds-lite only
Decap Failed - IPv6 Next Header Offset	Decapsulation failure due to an unexpected inner header.	statistics for ds-lite only
Decap Failed - IPv4 L3 Integrity	Decapsulation failure due to incorrect Layer 3 data, such as not an IP packet, bad source or destination address, checksum error, protocol error.	statistics for ds-lite only
Decap Failed - IPv4 L3 Integrity	Decapsulation failure due to incorrect Layer 4 data, such as errors in TCP, UDP, or TCP headers.	statistics for ds-lite only
No Software ID	Number of times a software ID was not found.	statistics
No Flow Extension	Number of times flow extensions were not found.	statistics
Packet not IPv6 in IPv4	Number of IPv6 packets not encapsulated in IPv4.	statistics for v6rd only
Decapsulated Packet not IPv6	Number of packets without an IPv6 inner header.	statistics for v6rd only
Encapsulation Failed - No space for Outer Header	Failed to encapsulate IPv6 packets in IPv4 due to low memory.	statistics for v6rd only

Stateful Firewall Operational Mode Commands

Table 388 on page 2513 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot stateful firewall services and stateful firewalls in SDK applications. Commands are listed in alphabetical order.

Table 388: Stateful Firewall Services Operational Mode Commands

Task	Command
Clear stateful firewall flows.	<code>clear services stateful-firewall flows</code>
Remove established flows from the flow table (SDK).	<code>clear services stateful-firewall flows</code>
Clear stateful firewall Session Initiation Protocol (SIP) call information.	<code>clear services stateful-firewall sip-call</code>
Clear stateful firewall SIP register information.	<code>clear services stateful-firewall sip-register</code>
Clear stateful firewall statistics.	<code>clear services stateful-firewall statistics</code>
Display stateful firewall conversation information.	<code>show services stateful-firewall conversations</code>
Display stateful firewall flow information.	<code>show services stateful-firewall flows</code>
Display stateful firewall flow table entries (SDK).	<code>show services stateful-firewall flows</code>
Display stateful firewall SIP call information.	<code>show services stateful-firewall sip-call</code>
Display stateful firewall SIP register information.	<code>show services stateful-firewall sip-register</code>
Display stateful firewall statistics.	<code>show services stateful-firewall statistics</code>
Display stateful firewall statistics (SDK). For this command, only rule and ALG statistics are given. In the extensive option, other statistics appear but do not populate correctly; those values are all zeros.	<code>show services stateful-firewall statistics</code>

Table 388: Stateful Firewall Services Operational Mode Commands (*continued*)

Task	Command
Display statistics information for the application protocol SIP.	<code>show services stateful-firewall statistics application-protocol sip</code>

NOTE: Stateful firewall services are supported on the adaptive services interface on the following routers:

- J Series routers—`sp-pim/O/slot`
- M Series and T Series routers—`ms-fpc/pic/port`, or `sp-fpc/pic/port`

Stateful firewall services are also supported on the redundant adaptive services interface (*rspnumber*) on M Series and T Series routers. For information about how to configure stateful firewall services, see the Junos Services Interfaces Configuration Release 12.3.

clear services stateful-firewall flows

Syntax	<pre>clear services stateful-firewall flows <application-protocol <i>protocol</i>> <destination-port <i>destination-port</i>> <destination-prefix <i>destination-prefix</i>> <interface <i>interface-name</i>> <protocol <i>protocol</i>> <service-set <i>service-set</i>> <source-port <i>source-port</i>> <source-prefix <i>source-prefix</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear stateful firewall flows.
Options	<p>none—Clear all stateful firewall flows.</p> <p>destination-port <i>destination-port</i>—(Optional) Clear stateful firewall flows for a particular destination port. The range of values is 0 to 65535.</p> <p>destination-prefix <i>destination-prefix</i>—(Optional) Clear stateful firewall flows for a particular destination prefix.</p> <p>interface <i>interface-name</i>—(Optional) Clear stateful firewall flows for a particular interface. On M Series and T Series routers, the <i>interface-name</i> can be <i>ms-fpc/pic/port</i> or <i>rspnumber</i>. On J Series routers, the <i>interface-name</i> is <i>ms-pim/0/port</i>.</p> <p>protocol—(Optional) Clear stateful firewall flows for one of the following IP types:</p> <ul style="list-style-type: none"> <i>number</i>—Numeric protocol value from 0 to 255. ah—IPsec Authentication Header protocol egp—An exterior gateway protocol esp—IPsec Encapsulating Security Payload protocol gre—A generic routing encapsulation protocol icmp—Internet Control Message Protocol igmp—Internet Group Management Protocol ipip—IP-over-IP Encapsulation Protocol ospf—Open Shortest Path First protocol pim—Protocol Independent Multicast protocol rsvp—Resource Reservation Protocol sctp—Stream Control Protocol tcp—Transmission Control Protocol udp—User Datagram Protocol

service-set *service-set*—(Optional) Clear stateful firewall flows for a particular service set.

source-port *source-port*—(Optional) Clear stateful firewall flows for a particular source port. The range of values is from 0 through 65535.

source-prefix *source-prefix*—(Optional) Clear stateful firewall flows for a particular source prefix.

Output Fields [Table 389 on page 2516](#) lists the output fields for the **clear services stateful-firewall flows** command. Output fields are listed in the approximate order in which they appear.

Table 389: clear services stateful-firewall flows Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Service set	Name of the service set from which flows are being cleared.
Conv removed	Number of conversations removed.

Sample Output

**clear services
stateful-firewall flows**

```

user@host> clear services stateful-firewall flows
Interface  Service set      Conv removed
ms-0/3/0   svc_set_trust    0
ms-0/3/0   svc_set_untrust  0

```

clear services stateful-firewall flows (SDK)

Syntax	clear services stateful-firewall flows <interface <i>interface-name</i> >
Release Information	For routers running Junos SDK applications, support for ms- interfaces added in Junos OS Release 9.5.
Description	Remove established flows from the flow table.
Options	none —Clear all stateful firewall flows. interface <i>interface-name</i> —(Optional) Clear stateful firewall flows for the named interface.
Required Privilege Level	clear
Output Fields	There is no output for this command.

clear services stateful-firewall sip-call

Syntax clear services stateful-firewall sip-call
<application-protocol *protocol*>
<destination-port *destination-port*>
<destination-prefix *destination-prefix*>
<interface *interface-name*>
<protocol *protocol*>
<service-set *service-set*>
<source-port *source-port*>
<source-prefix *source-prefix*>

Release Information Command introduced in Junos OS Release 7.4.

Description Clear Session Initiation Protocol (SIP) call information in stateful firewall flows.

Options **none**—Clear stateful firewall statistics for all interfaces and all service sets.

application-protocol—(Optional) Clear information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol

- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Clear information for a particular destination port. The range of values is 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Clear information for a particular destination prefix.

interface *interface-name*—(Optional) Clear information for a particular adaptive services interface. On M Series and T Series routers, the *interface-name* can be **sp-fpc/pic/port** or **rspnumber**. On J Series routers, the *interface-name* is **sp-pim/0/port**.

protocol—(Optional) Clear information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Clear information for a particular service set.

source-port *source-port*—(Optional) Clear information for a particular source port. The range of values is 0 to 65535.

source-prefix *source-prefix*—(Optional) Clear information for a particular source prefix.

Output Fields [Table 390 on page 2520](#) lists the output fields for the **clear services stateful-firewall sip-call** command. Output fields are listed in the approximate order in which they appear.

Table 390: clear services stateful-firewall sip-call Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Service set	Name of the service set from which flows are being cleared.
SIP calls removed	Number of SIP calls removed.

Sample Output

**clear services
stateful-firewall
sip-call**

```
user@host> clear services stateful-firewall sip-call
Interface  Service set      SIP calls removed
sp-0/3/0   test_sip_777     1
```

clear services stateful-firewall sip-register

Syntax	<pre>clear services stateful-firewall sip-register <application-protocol <i>protocol</i>> <destination-port <i>destination-port</i>> <destination-prefix <i>destination-prefix</i>> <interface <i>interface-name</i>> <protocol <i>protocol</i>> <service-set <i>service-set</i>> <source-port <i>source-port</i>> <source-prefix <i>source-prefix</i>></pre>
Release Information	Command introduced in Junos OS Release 7.4.
Description	Clear Session Initiation Protocol (SIP) register information in stateful firewall flows.
Options	<p>application-protocol—(Optional) Clear information about one of the following application protocols:</p> <ul style="list-style-type: none"> • bootp—(SIP only) Bootstrap protocol • dce-rpc—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols • dce-rpc-portmap—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service • dns—(SIP only) Domain Name System protocol • exec—(SIP only) Exec • ftp—(SIP only) File Transfer Protocol • h323—H.323 standards • icmp—Internet Control Message Protocol • iiop—Internet Inter-ORB Protocol • login—Login • netbios—NetBIOS • netshow—NetShow • realaudio—RealAudio • rpc—Remote Procedure Call protocol • rpc-portmap—Remote Procedure Call protocol portmap service • rtsp—Real-Time Streaming Protocol • shell—Shell • sip—Session Initiation Protocol • snmp—Simple Network Management Protocol • sqlnet—SQLNet

- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Clear information for a particular destination port. The range of values is 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Clear information for a particular destination prefix.

interface *interface*—(Optional) Clear information about a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*. On the J Series routers, the *interface-name* is *sp-pim/O/port*.

protocol—(Optional) Clear information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol

show services stateful-firewall conversations

Syntax show services stateful-firewall conversations
 <brief | extensive | terse>
 <application-protocol *protocol*>
 <destination-port *destination-port*>
 <destination-prefix *destination-prefix*>
 <interface *interface-name*>
 <limit *number*>
 <pgcp>
 <protocol *protocol*>
 <service-set *service-set*>
 <source-port *source-port*>
 <source-prefix *source-prefix*>

Release Information Command introduced before Junos OS Release 7.4.
pgcp option introduced in Junos OS Release 8.4.

Description Display information about stateful firewall conversations.

Options **none**—Display standard information about all stateful firewall conversations.

brief | extensive | terse—(Optional) Display the specified level of output.

application-protocol *protocol*—(Optional) Display information about one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol

- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*. On J Series routers, the *interface-name* is *sp-pim/0/port*.

limit *number*—(Optional) Maximum number of entries to display.

pgcp—(Optional) Display information about stateful firewall conversations for Packet Gateway Control Protocol (PGCP) flows.

protocol *protocol*—(Optional) Display information about one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for the specific service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

List of Sample Output [show services stateful-firewall conversations on page 2528](#)
[show services stateful-firewall conversations destination-port on page 2528](#)

Output Fields Table 392 on page 2527 lists the output fields for the **show services stateful-firewall conversations** command. Output fields are listed in the approximate order in which they appear.

Table 392: show services stateful-firewall conversations Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Service set	Name of a service set. Individual empty service sets are not displayed, but if no service set has any flows, a flow table header is printed for each service set.
Conversation	Information about a group of related flows. <ul style="list-style-type: none"> • ALG Protocol—Application-level gateway protocol. • Number of initiators—Number of flows that initiated a session. • Number of responders—Number of flows that responded in a session.
Flow or Flow Prot	Protocol used for this flow.
Source	Source prefix of the flow, in the format <i>source-prefix-port</i> .
Destination	Destination prefix of the flow.
State	Status of the flow: <ul style="list-style-type: none"> • Drop—Drop all packets in the flow without response. • Forward—Forward the packet in the flow without looking at it. • Reject—Drop all packets in the flow with response. • Watch—Inspect packets in the flow.
Dir	Direction of the flow: input (I) or output (O).
Source NAT	Original and translated source IPv4 or IPv6 addresses are displayed if Network Address Translation (NAT) is configured on this particular flow or conversation.
Frm Count	Number of frames in the flow.
Destin NAT	Original and translated destination IPv4 or IPv6 addresses are displayed if NAT is configured on this particular flow or conversation.

Table 392: show services stateful-firewall conversations Output Fields (*continued*)

Field Name	Field Description
Byte count	Number of bytes forwarded in the flow.
TCP established	Whether a TCP connection was established: Yes or No .
TCP window size	Negotiated TCP connection window size, in bytes.
TCP acknowledge	TCP acknowledgment sequence number.
TCP tickle	Whether TCP inquiry mode is on (enabled or disabled) and the time remaining to send the next inquiry, in seconds.
Master flow	Flow that initiated the conversation.
Timeout	Lifetime of the flow, in seconds.

Sample Output

show services stateful-firewall conversations

```

show services stateful-firewall flows

Syntax show services stateful-firewall flows
 <brief | extensive | summary | terse>
 <application-protocol *protocol*>
 <count>
 <destination-port *destination-port*>
 <destination-prefix *destination-prefix*>
 <interface *interface-name*>
 <limit *number*>
 <protocol *protocol*>
 <service-set *service-set*>
 <source-port *source-port*>
 <source-prefix *source-prefix*>

Release Information Command introduced before Junos OS Release 7.4.
pgcp option introduced in Junos OS Release 8.4.
application-protocol option introduced in Junos OS Release 10.4.

Description Display stateful firewall flow table entries. When the interface is used for software processing, the type of software concentrator (**DS-LITE** or **6rd**) is shown, and frame counts are provided.

Options **none**—Display standard information about all stateful firewall flows.

brief | extensive | summary | terse—(Optional) Display the specified level of output.

application-protocol *application-protocol*—(Optional) Display information about one of the following application-level gateway (ALG) protocol types:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment (DCE) remote procedure call (RPC) protocol

NOTE: Use this option to select Microsoft Remote Procedure Call (MSRPC).

- **dce-rpc-portmap**—Distributed Computing Environment (DCE) remote procedure call (RPC) portmap protocol
- **dns**—Domain Name Service protocol
- **exec**—Remote execution protocol
- **ftp**—File Transfer Protocol
- **h323**—H.323 protocol
- **icmp**—Internet Control Message Protocol
- **iioip**—Internet Inter-ORB Protocol

- **ip**—Internet protocol
- **netbios**—NetBIOS protocol
- **netshow**—Netshow protocol
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio protocol
- **rpc**—Remote Procedure Call protocol

NOTE: Use this option to select Sun Microsystems Remote Procedure Call protocol (SunRPC).

- **rpc-portmap**—Remote Procedure Call portmap protocol
- **rtsp**—Real-Time Streaming Protocol
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **talk**—Talk protocol
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

count—(Optional) Display a count of the matching entries.

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular interface.
On M Series and T Series routers, *interface-name* can be **ms-fpc/pic/port** or **rspnumber**.
On J Series routers, *interface-name* is **ms-pim/0/port**.

limit *number*—(Optional) Maximum number of entries to display.

protocol *protocol*—(Optional) Display information about one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol

- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

Output Fields [Table 393 on page 2531](#) lists the output fields for the **show services stateful-firewall flows** command. Output fields are listed in the approximate order in which they appear.

Table 393: show services stateful-firewall flows Output Fields

Field Name	Field Description
Interface	Name of the interface.
Service set	Name of a service set. Individual empty service sets are not displayed. If no service set has any flows, a flow table header is displayed for each service set.
Flow Count	Number of flows in a session.
Flow or Flow Prot	Protocol used for this flow.

Table 393: show services stateful-firewall flows Output Fields (*continued*)

Field Name	Field Description
Source	Source prefix of the flow in the format <i>source-prefix:port</i> . For ICMP flows, port information is not displayed.
Dest	Destination prefix of the flow. For ICMP flows, port information is not displayed.
State	Status of the flow: <ul style="list-style-type: none">• Drop—Drop all packets in the flow without response.• Forward—Forward the packet in the flow without looking at it.• Reject—Drop all packets in the flow with response.• Watch—Inspect packets in the flow.
Dir	Direction of the flow: input (I) or output (O).
Frm count	Number of frames in the flow.

Sample Output

**show services
stateful-firewall flows**

```
user@host> show services stateful-firewall flows
Interface: ms-1/3/0, Service set: green
```

show services stateful-firewall sip-call

Syntax show services stateful-firewall sip-call
 <brief | extensive | terse>
 <application-protocol *protocol*>
 <destination-port *destination-port*>
 <destination-prefix *destination-prefix*>
 <interface *interface-name*>
 <limit *number*>
 <protocol *protocol*>
 <service-set *service-set*>
 <source-port *source-port*>
 <source-prefix *source-prefix*>

Release Information Command introduced in Junos OS Release 7.4.

Description Display stateful firewall Session Initiation Protocol (SIP) call information.

Options **count**—(Optional) Display a count of the matching entries.

brief—(Optional) Display brief SIP call information.

extensive—(Optional) Display detailed SIP call information.

terse—(Optional) Display terse SIP call information.

application-protocol—(Optional) Display information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol

- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

destination-port *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

destination-prefix *destination-prefix*—(Optional) Display information for a particular destination prefix.

interface *interface-name*—(Optional) Display information about a particular adaptive services interface. On M Series and T Series routers, *interface-name* can be *sp-fpc/pic/port* or *rspnumber*. On J Series routers, *interface-name* is *sp-pim/0/port*.

limit *number*—(Optional) Maximum number of entries to display.

protocol—(Optional) Display information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

service-set *service-set*—(Optional) Display information for a particular service set.

source-port *source-port*—(Optional) Display information for a particular source port. The range of values is from 0 to 65535.

source-prefix *source-prefix*—(Optional) Display information for a particular source prefix.

SIP Register	Register information header.
Protocol	Protocol used for this flow.
Registered IP	Register IP address.
Port	Register port number.
Expiration timeout	Configured lifetime, in seconds.
Timeout remaining	Lifetime remaining, in seconds.
From	Initiator address.
To	Responder address.
Call ID	SIP call identification string.

Sample Output

show services stateful-firewall statistics

Syntax	<pre>show services stateful-firewall statistics <application-protocol <i>protocol</i>> <brief detail extensive summary> <interface <i>interface-name</i>> <service-set <i>service-set</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display stateful firewall statistics.
Options	<p>none—Display standard information about all stateful firewall statistics.</p> <p>brief detail extensive summary—(Optional) Display the specified level of output.</p> <p>interface <i>interface-name</i>—(Optional) Display information about a particular interface. On M Series and T Series routers, the <i>interface-name</i> can be <i>ms-fpc/pic/port</i> or <i>rspnumber</i>. On J Series routers, the <i>interface-name</i> is <i>ms-pim/O/port</i>.</p> <p>service-set <i>service-set</i>—(Optional) Display information about a particular service set.</p>

List of Sample Output	show services stateful-firewall statistics extensive on page 2549
Output Fields	Table 397 on page 2545 lists the output fields for the show services stateful-firewall statistics command. Output fields are listed in the approximate order in which they appear.

Table 397: show services stateful-firewall statistics Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Service set	Name of a service set.
New flows	Rule match counters for new flows: <ul style="list-style-type: none"> Accept—New flows accepted. Discard—New flows discarded. Reject—New flows rejected.
Existing flows	Rule match counters for existing flows: <ul style="list-style-type: none"> Accept—Match existing forward or watch flow. Discard—Match existing discard flow. Reject—Match existing reject flow.

Table 397: show services stateful-firewall statistics Output Fields (*continued*)

Field Name	Field Description
Drops	Drop counters: <ul style="list-style-type: none"> • TCP SYN defense—Packets dropped by SYN defender. • NAT ports exhausted—Hide mode. The router has no available Network Address Translation (NAT) ports for a given address or pool.
Errors	Total errors, categorized by protocol: <ul style="list-style-type: none"> • IP—Total IP version 4 errors. • TCP—Total Transmission Control Protocol (TCP) errors. • UDP—Total User Datagram Protocol (UDP) errors. • ICMP—Total Internet Control Message Protocol (ICMP) errors. • Non-IP—Total non-IPv4 errors.
IP Errors	IPv4 errors: <ul style="list-style-type: none"> • IP packet length inconsistencies—IP packet length does not match the Layer 2 reported length. • Minimum IP header length check failures—Minimum IP header length is 20 bytes. The received packet contains less than 20 bytes. • Reassembled packet exceeds maximum IP length—After fragment reassembly, the reassembled IP packet length exceeds 65,535. • Illegal source address 0—Source address is not a valid address. Invalid addresses are, loopback, broadcast, multicast, and reserved addresses. Source address 0, however, is allowed to support BOOTP and the destination address 0xffffffff. • Illegal destination address 0—Destination address is not a valid address. The address is reserved. • TTL zero errors—Received packet had a time-to-live (TTL) value of 0. • IP protocol number 0 or 255—IP protocol is 0 or 255. • Land attack—IP source address is the same as the destination address. • Smurf attack—Echo request is sent to a directed broadcast address. • Non-IP packets—Packet did not conform to the IP standard. • IP option—Packet dropped because of a nonallowed IP option. • Non-IPv4 packets—Packet was not IPv4. (Only IPv4 is supported.) • Bad checksum—Packet had an invalid IP checksum. • Illegal IP fragment length—Illegal fragment length. All fragments (other than the last fragment) must have a length that is a multiple of 8 bytes. • IP fragment overlap—Fragments have overlapping fragment offsets. • IP fragment reassembly timeout—Some of the fragments for an IP packet were not received in time, and the reassembly handler dropped partial fragments.

Table 397: show services stateful-firewall statistics Output Fields (*continued*)

Field Name	Field Description
TCP Errors	<p>TCP protocol errors:</p> <ul style="list-style-type: none"> • TCP header length inconsistencies—Minimum TCP header length is 20 bytes, and the IP packet received does not contain at least 20 bytes. • Source or destination port number is zero—TCP source or destination port is zero. • Illegal sequence number, flags combination—Dropped because of TCP errors, such as an illegal sequence number, which causes an illogical combination of flags to be set. • SYN attack (multiple SYN messages seen for the same flow)—Multiple SYN packets received for the same flow are treated as a SYN attack. The packets might be retransmitted SYN packets and therefore valid, but a large number is cause for concern. • First packet not SYN—First packets for a connection are not SYN packets. These packets might originate from previous connections or from someone performing an ACK/FIN scan. • TCP port scan (Handshake, RST seen from server for SYN)—In the case of a SYN defender, if an RST (reset) packet is received instead of a SYN/ACK message, someone is probably trying to scan the server. This behavior can result in false alarms if the RST packet is not combined with an intrusion detection service (IDS). • Bad SYN cookie response—SYN cookie generates a SYN/ACK message for all incoming SYN packets. If the ACK received for the SYN/ACK message does not match, this counter is incremented.
UDP Errors	<p>UDP protocol errors:</p> <ul style="list-style-type: none"> • IP data length less than minimum UDP header length (8 bytes)—Minimum UDP header length is 8 bytes. The received IP packets contain less than 8 bytes. • Source or destination port is zero—UDP source or destination port is 0. • UDP port scan (ICMP error seen for UDP flow)—ICMP error is received for a UDP flow. This could be a genuine UDP flow, but it is counted as an error.
ICMP Errors	<p>ICMP protocol errors:</p> <ul style="list-style-type: none"> • IP data length less than minimum ICMP header length (8 bytes)—ICMP header length is 8 bytes. This counter is incremented when received IP packets contain less than 8 bytes. • ICMP error length inconsistencies—Minimum length of an ICMP error packet is 48 bytes, and the maximum length is 576 bytes. This counter is incremented when the received ICMP error falls outside this range. • Ping duplicate sequence number—Received ping packet has a duplicate sequence number. • Ping mismatched sequence number—Received ping packet has a mismatched sequence number.

Table 397: show services stateful-firewall statistics Output Fields (*continued*)

Field Name	Field Description
Drop Flows	<ul style="list-style-type: none">• Maximum Ingress Drop flows allowed--Maximum number of ingress flow drops allowed.• Maximum Egress Drop flows allowed--Maximum number of egress flow drops allowed.• Current Ingress Drop flows--Current number of ingress flow drops.• Current Egress Drop flows--Current number of egress flow drops.• Ingress Drop Flow limit drops count--Number of ingress flow drops due to maximum number of ingress flow drops being exceeded.• Egress Drop Flow limit drops count--Number of egress flow drops due to maximum number of egress flow drops being exceeded.

show services stateful-firewall statistics (SDK)

Syntax	show services stateful-firewall statistics <extensive>
Release Information	For routers running Junos SDK applications, support for ms- interfaces added in Junos OS Release 9.5.
Description	Display only rule statistics or rule and application-level gateway (ALG) statistics.
Options	<p>none—Display standard information about all stateful firewall statistics. For Multiservices interfaces, standard information is only rule statistics.</p> <p>extensive—(Optional) Display the extensive level of output. For Multiservices interfaces, the extensive level gives just rule and ALG statistics. Other statistics shown do not populate correctly and show all zeros.</p>
Required Privilege Level	view
List of Sample Output	show services stateful-firewall statistics on page 2551
Output Fields	Table 398 on page 2551 lists the output fields for the show services stateful-firewall statistics command. Output fields are listed in the approximate order in which they appear.

Table 398: show services stateful-firewall statistics Output Fields

Field	Field Description
Interface	Interface ID.
Service set	Name of service set.
Accept	Number of flows accepted.
Discard	Number of flows discarded.
Reject	Number of flows rejected.
Errors	Number of errors.

Sample Output

```

show services

```

show services stateful-firewall statistics application-protocol sip

Syntax	show services stateful-firewall application-protocol sip
Release Information	Command introduced in Junos OS Release 7.4.
Description	Display stateful firewall Session Initiation Protocol (SIP) statistics.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show services stateful-firewall statistics application-protocol-sip on page 2553
Output Fields	Table 399 on page 2552 lists the output fields for the show services stateful-firewall statistics application-protocol-sip command. Output fields are listed in the approximate order in which they appear.

Table 399: show services stateful-firewall statistics application-protocol-sip Output Fields

Field Name	Field Description
Interface	Name of an adaptive services interface.
Service set	Name of the service set flow.
ALG	Name of the application-layer gateway.
Active SIP call count	Number of active SIP calls.
Active SIP registration count	Number of active SIP registrations.
REGISTER	Number of new, invalid, and retransmitted register requests sent to the SIP registrar.
INVITE	Number of new, invalid, and retransmitted invite messages sent by user agent clients.
ReINVITE	Number of new, invalid, and retransmitted reinvite messages sent by user agent clients.
ACK	Number of new, invalid, and retransmitted ACK messages received (in response to a SIP Call Invite message).
BYE	Number of new, invalid, and retransmitted requests to terminate SIP dialogues.
CANCEL	Number of new, invalid, and retransmitted SIP request cancellations.
SUBSCRIBE	Number of new, invalid, and retransmitted SIP requests to subscribe for event notifications.
NOTIFY	Number of new, invalid, and retransmitted event notifications in SIP dialogues.

Table 399: show services stateful-firewall statistics application-protocol-sip
Output Fields (continued)

Field Name	Field Description
OPTIONS	Number of new, invalid, and retransmitted requests to query SIP capabilities.
INFO	Number of new, invalid, and retransmitted requests carrying application-level information.
UPDATE	Number of new, invalid, and retransmitted SIP dialogue updates.
REFER	Number of new, invalid, and retransmitted requests to the recipient to contact a third party.
Provisional responses	Number of new, invalid, and retransmitted responses from the user agent server to indicate the progress of a SIP transaction.
OK responses to INVITES	OK responses sent from the user agent clients to user agent servers in response to Invite messages. The server can then return an ACK message.
OK responses to non-INVITES	OK responses to SIP messages other than an Invite message.
Redirection responses	Responses from the user agent server to a user agent client requesting the client to contact a different SIP uniform resource identifier (URI).
Request failure responses	Responses that indicate a definite failure from a particular server. The client must not retry the same request without modification after receiving this response.
Server failure responses	Responses that indicate a server failure.
Global failure responses	Responses that indicate a server has definitive information about a particular user, not just the particular instance indicated in the Request URI.
Invalid responses	Responses that are invalid.
Response (all) retransmits	Retransmissions of all responses.
Parser	Syntax errors, content errors, and unknown methods counted by the message parser.
