This product includes the Envoy SNMP Engine, developed by Epilogue Technology, an Integrated Systems Company. Copyright © 1986-1997, Epilogue Technology Corporation. All rights reserved. This program and its documentation were developed at private expense, and no part of them is in the public domain.

This product includes memory allocation software developed by Mark Moraes, copyright © 1988, 1989, 1993, University of Toronto.

This product includes FreeBSD software developed by the University of California, Berkeley, and its contributors. All of the documentation and software included in the 4.4BSD and 4.4BSD-Lite Releases is copyrighted by the Regents of the University of California. Copyright © 1979, 1980, 1983, 1986, 1988, 1989, 1991, 1992, 1993, 1994. The Regents of the University of California. All rights reserved.

GateD software copyright © 1995, the Regents of the University. All rights reserved. Gate Daemon was originated and developed through release 3.0 by Cornell University and its collaborators. Gated is based on Kirton's EGP, UC Berkeley's routing daemon (routed), and DCN's HELLO routing protocol. Development of Gated has been supported in part by the National Science Foundation. Portions of the GateD software copyright © 1988, Regents of the University of California. All rights reserved. Portions of the GateD software copyright © 1991, D. L. S. Associates.

This product includes software developed by Maker Communications, Inc., copyright © 1996, 1997, Maker Communications, Inc.

Juniper Networks, Junos, Steel-Belted Radius, NetScreen, and ScreenOS are registered trademarks of Juniper Networks, Inc. in the United States and other countries. Revision History

January 2013—Junos OS 13.1

The information in this document is current as of the date on the title page.

YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

Abbreviated Table of Contents

	About This Guide	xxi
Part 1	Monitoring and Testing Tools	
Chapter 1	Connectivity Operational Mode Commands	3
Chapter 2	Interface Diagnostics Operational Mode Commands	35
Chapter 3	RADIUS Diagnostics Operational Mode Commands	55
Chapter 4	Real-Time Performance Monitoring Operational Mode Commands	63
Chapter 5	Real-Time Router Monitoring Operational Mode Commands	79
Part 2	System Management	
Chapter 6	Accounting Operational Mode Commands	145
Chapter 7	Chassis Operational Mode Commands	169
Chapter 8	Command-Line Interface Operational Mode Commands	969
Chapter 9	File Management Operational Mode Commands	991
Chapter 10	Packet Forwarding Engine Operational Mode Commands	1015
Chapter 11	Remote System Access Operational Mode Commands	1115
Chapter 12	Simple Network Management Protocol Operational Mode Commands ..	1121
Chapter 13	System Software Operational Mode Commands	1155
Chapter 14	Virtual Chassis Operational Mode Commands	1835
Part 3	Class of Service	
Chapter 15	Class-of-Service Operational Mode Commands	1875
Part 4	Services	
Chapter 16	Generic Services Operational Mode Commands	1969
Chapter 17	Border Signaling Gateway Operational Mode Commands	1981
Chapter 18	Compressed Real-Time Transport Protocol Operational Mode Commands	2025
Chapter 19	CoS Services Operational Mode Commands	2033
Chapter 20	Data Link Switching Operational Mode Commands	2039
Chapter 21	Diameter Base Protocol Operational Mode Commands	2053
Chapter 22	Distributed Denial-of-Service Protection Operational Mode Commands	2101
Chapter 23	Dynamic Application Awareness Operational Mode Commands	2149

Chapter 24	Flow Collection and Monitoring Operational Mode Commands	2171
Chapter 25	Intrusion Detection Service Operational Mode Commands	2241
Chapter 26	IP Security Operational Mode Commands	2255
Chapter 27	Layer 2 Tunneling Protocol Operational Mode Commands	2323
Chapter 28	Link Services Operational Mode Commands	2371
Chapter 29	Load Balancing Operational Mode Commands	2377
Chapter 30	Mobile IP Operational Mode Commands	2381
Chapter 31	Network Address Translation Operational Mode Commands	2393
Chapter 32	PGCP Operational Mode Commands for the BGF Feature	2411
Chapter 33	PTSP Operational Mode Commands	2465
Chapter 34	Service Sets Operational Mode Commands	2483
Chapter 35	Software Operational Mode Commands	2501
Chapter 36	Stateful Firewall Operational Mode Commands	2513
Part 5	Index	
	Index	2557
	Index of Statements and Commands	2581

Table of Contents

	About This Guide	xxi
	Junos OS Documentation and Release Notes	xxi
	Objectives	xxi
	Audience	xxii
	Supported Platforms	xxiii
	Using the Indexes	xxiii
	Documentation Conventions	xxiii
	Documentation Feedback	xxv
	Requesting Technical Support	xxv
	Self-Help Online Tools and Resources	xxvi
	Opening a Case with JTAC	xxvi
Part 1	Monitoring and Testing Tools	
Chapter 1	Connectivity Operational Mode Commands	3
	ping	5
	ping atm	9
	ping clns	11
	ping mpls l2circuit	13
	ping mpls l2vpn	16
	ping mpls l3vpn	19
	ping mpls ldp	21
	ping mpls lsp-end-point	24
	ping mpls rsvp	26
	ping vpls instance	32
Chapter 2	Interface Diagnostics Operational Mode Commands	35
	test interface ds0-bert-start	37
	test interface ds0-bert-stop	38
	test interface e1-bert-start	39
	test interface e1-bert-stop	40
	test interface e3-bert-start	41
	test interface e3-bert-stop	42
	test interface fdl-line-loop	43
	test interface fdl-payload-loop	45
	test interface feac-loop-initiate	46
	test interface feac-loop-terminate	47
	test interface inband-line-loop	48
	test interface inband-payload-loop	49
	test interface restart-auto-negotiation	50
	test interface t1-bert-start	51

	test interface t1-bert-stop	52
	test interface t3-bert-start	53
	test interface t3-bert-stop	54
Chapter 3	RADIUS Diagnostics Operational Mode Commands	55
	test access profile	56
	test access radius-server	61
Chapter 4	Real-Time Performance Monitoring Operational Mode Commands	63
	clear services rpm twamp server connection	64
	show services rpm active-servers	65
	show services rpm history-results	66
	show services rpm probe-results	70
	show services rpm twamp server connection	76
	show services rpm twamp server session	78
Chapter 5	Real-Time Router Monitoring Operational Mode Commands	79
	monitor ethernet delay-measurement	81
	monitor ethernet loss-measurement	86
	monitor interface	92
	monitor label-switched-path	101
	monitor list	104
	monitor start	105
	monitor stop	107
	monitor traffic	108
	mtrace	118
	mtrace from-source	121
	mtrace monitor	124
	mtrace to-gateway	126
	traceroute	129
	traceroute monitor	133
	traceroute mpls ldp	135
	traceroute mpls rsvp	138
Part 2	System Management	
Chapter 6	Accounting Operational Mode Commands	145
	clear lldp neighbor	146
	clear lldp statistics	147
	show lldp	148
	show lldp local-information	151
	show lldp neighbors	153
	show lldp remote-global-statistics	157
	show lldp statistics	159
	show accounting profile	161
	show accounting records	165
Chapter 7	Chassis Operational Mode Commands	169
	clear chassis display message	176
	request chassis cb	179
	request chassis ccg	182

request chassis cfeb	183
request chassis clock master switch	184
request chassis cip	185
request chassis fabric plane	186
request chassis feb	188
request chassis fpc	190
request chassis fpm resync	194
request chassis lcc	196
request chassis mcs	198
request chassis pcg	199
request chassis pic	200
request chassis mic	203
request chassis redundancy feb slot	205
request chassis routing-engine master	206
request chassis scg	211
request chassis sfm	213
request chassis sfm master switch	214
request chassis sib	215
request chassis sib f13 train-link-receive slot	217
request chassis sib f13 train-link-transmit slot	218
request chassis sib train-link-receive slot	219
request chassis sib train-link-transmit slot	220
request chassis spmb restart	221
request chassis ssb master switch	223
request chassis synchronization mode	224
request chassis synchronization switch	225
set chassis display message	227
show chassis alarms	230
show chassis cfeb	243
show chassis cip	245
show chassis craft-interface	247
show chassis environment	264
show chassis environment cb	320
show chassis environment ccg	339
show chassis environment cip	341
show chassis environment fpc	343
show chassis environment fpm	371
show chassis environment mcs	378
show chassis environment monitored	380
show chassis environment pcg	394
show chassis environment pdu	396
show chassis environment pem	399
show chassis environment routing-engine	408
show chassis environment scg	413
show chassis environment sfm	419
show chassis environment sib	423
show chassis ethernet-switch	451
show chassis fan	495
show chassis fabric destinations	508

	show chassis fabric feb	518
	show chassis fabric errors	519
	show chassis fabric fpcs	524
	show chassis fabric map	558
	show chassis fabric optical-links	565
	show chassis fabric plane	570
	show chassis fabric plane-location	611
	show chassis fabric reachability	616
	show chassis fabric redundancy-mode	623
	show chassis fabric sibs	624
	show chassis fabric summary	634
	show chassis fabric topology	639
	show chassis fabric unreachable-destinations	662
	show chassis feb	664
	show chassis firmware	668
	show chassis forwarding	679
	show chassis fpc	681
	show chassis fpc-feb-connectivity	708
	show chassis hardware	710
	show chassis in-service-upgrade	828
	show chassis lccs	830
	show chassis location	832
	show chassis mac-addresses	836
	show chassis network services	842
	show chassis pic	843
	show chassis power-ratings	856
	show chassis power	859
	show chassis power sequence	871
	show chassis psd	873
	show chassis redundancy feb	875
	show chassis routing-engine	878
	show chassis scb	898
	show chassis sfm	900
	show chassis sibs	903
	show chassis spmb	914
	show chassis spmb sibs	924
	show chassis ssb	930
	show chassis synchronization	932
	show chassis synchronization (MX Series Routers)	936
	show chassis temperature-thresholds	944
	show chassis zones	961
	show chassis zones (PTX Series Packet Transport Switches)	967
Chapter 8	Command-Line Interface Operational Mode Commands	969
	clear cli logical-system	971
	set cli complete-on-space	972
	set cli directory	973
	set cli idle-timeout	974
	set cli logical-system	975

	set cli prompt	976
	set cli restart-on-upgrade	977
	set cli screen-length	978
	set cli screen-width	979
	set cli terminal	980
	set cli timestamp	981
	set date	982
	show cli	983
	show cli authorization	985
	show cli directory	988
	show cli history	989
Chapter 9	File Management Operational Mode Commands	991
	clear log	993
	file archive	994
	file checksum md5	996
	file checksum sha1	997
	file checksum sha-256	998
	file compare	999
	file copy	1002
	file delete	1004
	file list	1005
	file rename	1007
	file show	1009
	show log	1011
Chapter 10	Packet Forwarding Engine Operational Mode Commands	1015
	show pfe cfeb	1017
	show pfe feb	1022
	show pfe fpc	1029
	show pfe fwdd	1047
	show pfe lcc	1051
	show pfe next-hop	1055
	show pfe route	1060
	show pfe scb	1065
	show pfe sfm	1068
	show pfe ssb	1071
	show pfe statistics dma	1075
	show pfe statistics error	1079
	show pfe statistics ip	1084
	show pfe statistics ip6	1087
	show pfe statistics notification	1090
	show pfe statistics pio	1093
	show pfe statistics traffic	1095
	show pfe statistics traffic protocol bfd	1102
	show pfe statistics traffic protocol cfm	1105
	show pfe statistics traffic protocol lfm	1107
	show pfe terse	1109
	show pfe resource usage memory	1111
	show pfe version	1114

Chapter 11	Remote System Access Operational Mode Commands	1115
	ssh	1116
	telnet	1118
Chapter 12	Simple Network Management Protocol Operational Mode Commands . .	1121
	clear snmp statistics	1122
	request snmp spoof-trap	1124
	show snmp health-monitor	1130
	show snmp inform-statistics	1138
	show snmp mib	1140
	show snmp rmon	1144
	show snmp statistics	1148
	show snmp v3	1152
Chapter 13	System Software Operational Mode Commands	1155
	clear arp	1164
	clear dhcp server binding	1165
	clear dhcp server statistics	1168
	clear dhcp statistics	1170
	clear dhcpv6 server binding	1171
	clear dhcpv6 server statistics	1173
	clear dhcpv6 statistics	1174
	clear network-access aaa statistics	1175
	clear network-access aaa subscriber	1177
	clear system commit	1178
	clear system reboot	1179
	clear system services dhcp binding	1183
	clear system services dhcp conflict	1184
	clear system services dhcp statistics	1185
	configure	1186
	op	1188
	request dhcp server reconfigure	1190
	request dhcpv6 server reconfigure	1192
	request message	1194
	request network-access aaa subscriber add session-id	1195
	request network-access aaa subscriber delete session-id	1197
	request network-access aaa subscriber modify session-id	1199
	request routing-engine login	1200
	request services static-subscribers login group	1203
	request services static-subscribers login interface	1204
	request services static-subscribers logout group	1205
	request services static-subscribers logout interface	1206
	request support information	1207
	request system configuration rescue delete	1214
	request system configuration rescue save	1215
	request system firmware	1216
	request system halt	1217
	request system license add	1223
	request system license delete	1224

request system license save	1225
request system logout	1226
request system partition abort	1227
request system partition hard-disk	1229
request system power-off	1231
request system reboot	1235
request system scripts add	1240
request system scripts convert	1241
request system scripts delete	1243
request system scripts event-scripts	1244
request system scripts rollback	1245
request system snapshot	1246
request system software abort	1253
request system software add	1257
request system software delete	1265
request system software delete-backup	1269
request system software in-service-upgrade	1270
request system software in-service-upgrade (MX Series 3D Universal Edge Routers)	1275
request system software rollback	1288
request system software validate	1292
request system software validate-in-service-upgrade	1295
request system storage cleanup	1298
restart	1308
show arp	1318

	show class-of-service routing-instance	1952
	show class-of-service scheduler-map	1953
	show class-of-service system-defaults	1955
	show class-of-service traffic-control-profile	1956
	show class-of-service translation-table	1960
	show class-of-service virtual-channel	1964
	show class-of-service virtual-channel-group	1965
Part 4	Services	
Chapter 16	Generic Services Operational Mode Commands	1969
	clear services flows	1970
	show services flows	1973
Chapter 17	Border Signaling Gateway Operational Mode Commands	1981
	clear services border-signaling-gateway denied-messsages	1982
	clear services border-signaling-gateway name-resolution-cache	1983
	clear services border-signaling-gateway registrations statistics	1984
	clear services border-signaling-gateway registrations subscription	1985
	clear services border-signaling-gateway statistics	1986
	show services border-signaling-gateway address-of-record bindings	1987
	show services border-signaling-gateway admission-control	1990
	show services border-signaling-gateway by-contact	1992
	show services border-signaling-gateway by-request-uri	1994
	show services border-signaling-gateway calls by-server	1997
	show services border-signaling-gateway calls by-service-point	1999
	show services border-signaling-gateway calls-duration by-server	2001
	show services border-signaling-gateway calls-duration by-service-point	2004
	show services border-signaling-gateway calls-failed by-server	2008
	show services border-signaling-gateway calls-failed by-service-point	2011
	show services border-signaling-gateway denied-messages	2015
	show services border-signaling-gateway name-resolution-cache	2016
	show services border-signaling-gateway registrations	2018
	show services border-signaling-gateway routing-blacklist	2020
	show services border-signaling-gateway status	2021
Chapter 18	Compressed Real-Time Transport Protocol Operational Mode Commands	2025
	clear services crtp statistics	2026
	show services crtp	2027
	show services crtp flows	2030

Chapter 19	CoS Services Operational Mode Commands	2033
	clear services cos statistics	2034
	show services cos statistics	2035
Chapter 20	Data Link Switching Operational Mode Commands	2039
	clear dlsw reachability	2040
	show dlsw capabilities	2041
	show dlsw circuits	2042
	show dlsw peers	2044

About This Guide

This preface provides the following guidelines for using the *Junos[®] OS System Basics and Services Command Reference*:

- [Junos OS Documentation and Release Notes on page xxi](#)
- [Objectives on page xxi](#)
- [Audience on page xxii](#)
- [Supported Platforms on page xxiii](#)
- [Using the Indexes on page xxiii](#)
- [Documentation Conventions on page xxiii](#)
- [Documentation Feedback on page xxv](#)
- [Requesting Technical Support on page xxv](#)

Junos OS Documentation and Release Notes

For a list of related Junos OS documentation, see <http://www.juniper.net/techpubs/software/junos/>.

If the information in the latest release notes differs from the information in the documentation, follow the *Junos OS Release Notes*.

To obtain the most current version of all Juniper Networks[®] technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

Juniper Networks supports a technical book program to publish books by Juniper Networks engineers and subject matter experts with book publishers around the world. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration using the Junos operating system (Junos OS) and Juniper Networks devices. In addition, the Juniper Networks Technical Library, published in conjunction with O'Reilly Media, explores improving network security, reliability, and availability using Junos OS configuration techniques. All the books are for sale at technical bookstores and book outlets around the world. The current list can be viewed at <http://www.juniper.net/books>.

Objectives

This guide provides descriptions of the Junos OS commands that you use to monitor and troubleshoot basic system operations and services on the router.

For additional commands, see these references:

- Junos OS Operational Mode Commands
- Junos OS Operational Mode Commands

NOTE: For additional information about the Junos OS—either corrections to or information that might have been omitted from this guide—see the software release notes at <http://www.juniper.net/>.

For information about configuration statements and guidelines related to the commands described in this reference, see the following configuration guides:

- CLI User Guide—Describes how to use the Junos OS command-line interface (CLI) to configure, monitor, and manage Juniper Networks routers.
- Installation and Upgrade Guide—Provides a description of Junos OS components and packaging, and includes detailed information about how to initially configure, reinstall, and upgrade the Junos system software.
- Junos OS System Basics Configuration Guide—Describes Juniper Networks routers, and provides information about how to configure basic system parameters, supported protocols and software processes, authentication, and a variety of utilities for managing your router on the network.
- Junos Services Interfaces Configuration Release 12.3—Includes configuration statements and guidelines for real-time performance monitoring (RPM) and all services, such as Compressed Real-Time Transport Protocol (CRTP), Data Link Switching (DLSw), flow collection and monitoring, and stateful firewall filters.
- Junos OS Class of Service Configuration Guide—Includes configuration statements and guidelines for class of service (CoS) features.
- Junos® OS Network Interfaces—Includes configuration statements and guidelines for bit error rate test (BERT) parameters and Automatic Protection Switching (APS).
- Network Management Configuration Guide—Includes configuration statements and guidelines for accounting parameters and the Simple Network Management Protocol (SNMP).

For information about related tasks performed by network operations center (NOC) personnel, see the following Network Operations Guides:

- *Junos Hardware Network Operations Guide*
- *Junos Baseline Network Operations Guide*

Audience

This guide is designed for network administrators who are configuring and monitoring a Juniper Networks M Series, MX Series, T Series, EX Series, or J Series router or switch.

To use this guide, you need a broad understanding of networks in general, the Internet in particular, networking principles, and network configuration. You must also be familiar with one or more of the following Internet routing protocols:

- Border Gateway Protocol (BGP)
- Distance Vector Multicast Routing Protocol (DVMRP)
- Intermediate System-to-Intermediate System (IS-IS)
- Internet Control Message Protocol (ICMP) router discovery
- Internet Group Management Protocol (IGMP)
- Multiprotocol Label Switching (MPLS)
- Open Shortest Path First (OSPF)
- Protocol-Independent Multicast (PIM)
- Resource Reservation Protocol (RSVP)
- Routing Information Protocol (RIP)
- Simple Network Management Protocol (SNMP)

Personnel operating the equipment must be trained and competent; must not conduct themselves in a careless, willfully negligent, or hostile manner; and must abide by the instructions provided by the documentation.

Supported Platforms

For the features described in this manual, the Junos OS currently supports the following platforms:

- J Series
- M Series
- MX Series
- SRX Series
- T Series
- EX Series

Using the Indexes

This reference contains two indexes: a standard index with topic entries, and an index of commands.

Documentation Conventions

[Table 1 on page xxiv](#) defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 2 on page xxiv defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: <code>user@host> configure</code>
Fixed-width text like this	Represents output that appears on the terminal screen.	<code>user@host> show chassis alarms</code> <code>No alarms currently active</code>
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies book names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS System Basics Configuration Guide</i> RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: <code>[edit]</code> <code>root@# set system domain-name <i>domain-name</i></code>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the <code>[edit protocols ospf area area-id]</code> hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Enclose optional keywords or variables.	<code>stub <default-metric <i>metric</i>>;</code>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast <i>(string1 string2 string3)</i>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Enclose a variable for which you can substitute one or more values.	community name members [community-ids]
Indentation and braces ({ })	Identify a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
J-Web GUI Conventions		
Bold text like this	Represents J-Web graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of J-Web selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract,

or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf> .
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/> .
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>
- Join and participate in the Juniper Networks Community Forum: <http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

Monitoring and Testing Tools

- [Connectivity Operational Mode Commands on page 3](#)
- [Interface Diagnostics Operational Mode Commands on page 35](#)
- [RADIUS Diagnostics Operational Mode Commands on page 55](#)
- [Real-Time Performance Monitoring Operational Mode Commands on page 63](#)
- [Real-Time Router Monitoring Operational Mode Commands on page 79](#)

CHAPTER 1

Connectivity Operational Mode Commands

Table 3 on page 3 summarizes the command-line interface (CLI) commands you can use to perform and monitor connectivity functions. Commands are listed in alphabetical order.

Table 3: Connectivity Operational Mode Commands

Task	Command
Check host reachability and network connectivity.	<code>ping</code>
Check the reachability of a remote Asynchronous Transfer Mode (ATM) node.	<code>ping atm</code>
Check the operability of a remote Connectionless Network Service (CLNS) node.	<code>ping clns</code>
Check the operability of MPLS BGP-signaled LSP connections.	<code>ping mpls bgp</code>
Check the operability of a Layer 2 circuit.	<code>ping mpls l2circuit</code>
Check the operability of a Layer 2 virtual private network (VPN).	<code>ping mpls l2vpn</code>
Check the operability of a Layer 3 VPN.	<code>ping mpls l3vpn</code>
Check the operability of MPLS connections.	<code>ping mpls ldp</code>
Check the operability of MPLS label-switched path (LSP) endpoint connections.	<code>ping mpls lsp-end-point</code>
Check the operability of MPLS RSVP-signaled LSP connections.	<code>ping mpls rsvp</code>
Check the operability of virtual private LAN service (VPLS) connections.	<code>ping vpls instance</code>

.....

NOTE: For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Baseline Network Operations Guide*.

Release Information Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Check host reachability and network connectivity. The **ping** command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.

Options **host**—IP address or hostname of the remote system to ping.

bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

count requests—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.

detail—(Optional) Include in the output the interface on which the ping reply was received.

do-not-fragment—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.

NOTE: In Junos OS Release 11.1 and later, when issuing the **ping** command for an IPv6 route with the **do-not-fragment** option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.

inet—(Optional) Ping Packet Forwarding Engine IPv4 routes.

inet6—(Optional) Ping Packet Forwarding Engine IPv6 routes.

interface source-interface—(Optional) Interface to use to send the ping requests.

interval seconds—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

logical-system logical-system-name—(Optional) Name of logical system from which to send the ping requests.

Alternatively, enter the **set cli logical-system logical-system-name** command and then run the **ping** command. To return to the main router, enter the **clear cli logical-system** command.

loose-source value—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

mac-address *mac-address*—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern *string*—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

record-route—(Optional) Record and report the packet's path (IPv4).

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the ping attempt.

size *bytes*—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

strict—(Optional) Use the strict source route option (IPv4).

strict-source *value*—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

tos *type-of-service*—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is **0** through **255**.

ttl *value*—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

verbose—(Optional) Display detailed output.

vpls *instance-name*—(Optional) Ping the instance to which this VPLS belongs.

wait *seconds*—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

Required Privilege Level network

Related Documentation • [Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages](#)

List of Sample Output [ping hostname on page 8](#)
[ping hostname rapid on page 8](#)

[ping hostname size count on page 8](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately.

Sample Output

ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes

ping atm

Syntax	<pre>ping atm interface <i>interface-name</i> vci <i>vci</i> <brief> <count <i>count</i>> <end-to-end segment> <interval <i>seconds</i>> <sequence-number <i>sequence-number</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Check the reachability of a remote Asynchronous Transfer Mode (ATM) node. All packets are 53 bytes. Type Ctrl+c to interrupt a ping atm command.
Options	<p>interface <i>interface-name</i>—Interface to use to send the ATM ping requests. For ATM 1 and ATM 2 interfaces, you must include a logical unit number in the interface name</p> <p>vci <i>vci</i>—ATM point-to-point virtual circuit identifier. It can be a virtual circuit identifier (vci) or a virtual private identifier (vpi.vci).</p> <p>brief—(Optional) Display only the ATM ping summary statistics. These are displayed after you type Ctrl+c to interrupt the ping atm command.</p> <p>count <i>count</i>—(Optional) Number of ping requests to send. The range of values is 0 through 10,000. The default value is an unlimited number of requests.</p> <p>end-to-end—(Optional) Cells are sent to the end node. This is the default.</p> <p>segment—(Optional) Cells are sent only to the intermediate node.</p> <p>interval <i>seconds</i>—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through 10,000. The default value is 1.</p> <p>sequence-number <i>sequence-number</i>—(Optional) Starting sequence number (correlation tag). The range of values is 0 through 65,468. The default value is 1.</p>
Required Privilege Level	network
List of Sample Output	ping atm on page 10
Output Fields	When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

ping atm

```
user@host> ping atm interface at-4/0/1.0 vci 0.33
53 byte oam cell received on (vpi=0 vci=33): seq=1
53 byte oam cell received on (vpi=0 vci=33): seq=2
^C[abort]
--- atmping statistics ---
5 cells transmitted, 5 cells received, 0% cell loss
```

ping clns

Syntax `ping clns host`
 `<brief>`
 `<count requests>`
 `<detail>`
 `<do-not-fragment>`
 `<interval seconds>`
 `<no-resolve>`
 `<pattern string>`
 `<rapid>`
 `<routing-instance routing-instance-name>`
 `<size bytes>`
 `<source source-address>`
 `<ttl value>`
 `<verbose>`
 `<wait seconds>`

Release Information Command introduced before Junos OS Release 7.4.

Description Check the reachability of a remote Connectionless Network Service (CLNS) node. Type Ctrl+c to interrupt a **ping clns** command.

Options *host*—IP address or hostname of the remote system to ping.

brief—(Optional) Display brief information.

count *requests*—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default is an unlimited number of requests.

detail—(Optional) Include in the output the interface on which the ping reply was received.

do-not-fragment—(Optional) Set the do-not-fragment (DF) bit in the IP header of the ping packets.

interval *seconds*—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

pattern *string*—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

rapid—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of request, include the count option.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the ping attempt.

size bytes—(Optional) Size of ping request packets. The range of values, in bytes, is **0** through **65,468**. The default value is **56**, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

ttl value—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is **0** through **255**.

verbose—(Optional) Display detailed output.

wait seconds—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is **10** seconds. If this option is used without the count option, a default count of **5** packets is used.

Required Privilege Level network

ping mpls l2circuit

Syntax ping mpls l2circuit (interface *interface-name* | virtual-circuit *virtual-circuit-id* neighbor *address*)
 <count *count*>
 <destination *address*>
 <detail>
 <exp *forwarding-class*>
 <logical-system (all | *logical-system-name*)>
 reply-mode (application-level-control-channel | ip-udp | no-reply)
 <size *bytes*>
 <source *source-address*>
 <sweep>
 <v1>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.
 The **reply-mode** option and its suboptions are introduced in Junos OS Release 10.4R1.

Description Check the operability of the MPLS Layer 2 circuit connections. Type Ctrl+c to interrupt a ping mpls l2circuit command.

Options **count** *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

interface *interface-name*—Ping an interface configured for the Layer 2 circuit on the egress provider edge (PE) router.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel—Reply using an application level control channel.

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

NOTE: The reply-mode option and its suboptions application-level-control-channel, ip-udp, and no-reply are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

vl—(Optional) Use the type 9 Layer 2 circuit type, length, and value (TLV).

virtual-circuit virtual-circuit-id neighbor address—Ping the virtual circuit identifier on the egress PE router or switch and the specified neighbor, testing the integrity of the Layer 2 circuit between the ingress and egress PE routers or switches.

Additional Information You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level network

!!!!
--- lsping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

ping mpls l2vpn

Syntax ping mpls l2vpn (instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number* | interface *interface-name*)
 <bottom-label-ttl>
 <count *count*>
 <destination *address*>
 <detail>
 <exp *forwarding-class*>
 <fec129>
 <logical-system (all | *logical-system-name*)>
 reply-mode (application-level-control-channel | ip-udp | no-reply)
 <size *bytes*>
 <source *source-address*>
 <sweep>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
size and **sweep** options introduced in Junos OS Release 9.6.
reply-mode option and its suboptions introduced in Junos OS Release 10.4R1.
fec129 option introduced in Junos OS Release 12.2.

Description Check the operability of MPLS Layer 2 virtual private network (VPN) connections. Type Ctrl+c to interrupt a **ping mpls l2vpn** command.

Options **bottom-label-ttl**—(Optional) Display the time-to-live value for the bottom label in the label stack.

count *count*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination *address*—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

fec129—(Optional) Ping the LSP for an FEC 129 Layer 2 VPN connection.

instance *instance-name* local-site-id *local-site-id-number* remote-site-id *remote-site-id-number*—Ping a combination of the Layer 2 VPN routing instance name, the local site identifier, and the remote site identifier, testing the integrity of the Layer 2 VPN circuit (specified by the identifiers) between the ingress and egress provider edge (PE) routers or switches.

interface *interface-name*—Ping an interface configured for the Layer 2 VPN on the egress PE router or switch.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

reply-mode—(Optional) Reply mode for the ping request. This option has the following suboptions:

application-level-control-channel—Reply using an application level control channel.

ip-udp—Reply using an IPv4 or IPv6 UDP packet.

no-reply—Do not reply to the ping request.

The **reply-mode** option and its suboptions **application-level-control-channel**, **ip-udp**, and **no-reply** are also available in Junos OS Release 10.2R4 and 10.3R2.

size bytes—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.

source source-address—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

ping mpls l3vpn

Syntax	<pre>ping mpls l3vpn prefix <i>prefix-name</i> <l3vpn-name> <bottom-label-ttl> <count <i>count</i>> <destination <i>address</i>> <detail> <exp <i>forwarding-class</i>> <logical-system (all <i>logical-system-name</i>)> <size <i>bytes</i>> <source <i>source-address</i>> <sweep></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>The size and sweep options were introduced in Junos OS Release 9.6.</p>
Description	<p>Check the operability of a MPLS Layer 3 virtual private network (VPN) connection. Type Ctrl+c to interrupt a ping mpls l3vpn command.</p>
Options	<p>bottom-label-ttl—(Optional) Display the time-to-live value for the bottom label in the label stack.</p> <p>count <i>count</i>—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p>destination <i>address</i>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p>detail—(Optional) Display detailed information about the echo requests sent and received.</p> <p>exp <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p>l3vpn-name—(Optional) Layer 3 VPN name.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p>prefix <i>prefix-name</i>—Ping to test whether a prefix is present in a provider edge (PE) router's or switch's VPN routing and forwarding (VRF) table, by means of a Layer 3 VPN destination prefix. This option does not test the connection between a PE router or switch and a customer edge (CE) router or switch.</p> <p>size <i>bytes</i>—(Optional) Size of the label-switched path (LSP) ping request packet (96 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 97, 98, 99, or 100, the router or switch uses a size value of 100 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 96-byte minimum.</p>

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the egress PE router or switch (the router or switch receiving the MPLS echo packets) to ping a Layer 2 circuit.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

If the Layer 3 VPN traffic transits a route reflector within the network, the **ping mpls l3vpn** command does not work.

Required Privilege Level network

List of Sample Output [ping mpls l3vpn on page 20](#)
[ping mpls l3vpn detail on page 20](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. When an echo reply is received with an error code, the packets are not counted in the received packets count, and are counted separately..

ping mpls ldp

Syntax	<pre>ping mpls ldp fec <count count> <destination address> <detail> <exp forwarding-class> <instance routing-instance-name> <logical-system (all logical-system-name)> <p2mp root-addr ip-address lsp-id identifier> <size bytes> <source source-address> <sweep></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>size and sweep options introduced in Junos OS Release 9.6.</p> <p>instance option introduced in Junos OS Release 10.0.</p> <p>p2mp, root-address, and lsp-id options introduced in Junos OS Release 11.2.</p>
Description	<p>Check the operability of MPLS LDP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a ping mpls command.</p>
Options	<p>count <i>count</i>—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p>destination <i>address</i>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p>detail—(Optional) Display detailed information about the echo requests sent and received.</p> <p>exp <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p>fec—Ping an LDP-signaled LSP using the forwarding equivalence class (FEC) prefix and length.</p> <p>instance <i>routing-instance-name</i>—(Optional) Allows you to ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP.</p> <p>logical-system (<i>all</i> <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p>p2mp <i>root-addr ip-address lsp-id identifier</i>—(Optional) Ping the end points of a point-to-multipoint LSP. Enter the IP address of the point-to-multipoint LSP root and the ID number of the point-to-multipoint LSP.</p> <p>size <i>bytes</i>—(Optional) Size of the LSP ping request packet (88 through 65468 bytes). Packets are 4-byte aligned. For example, If you enter a size of 89, 90, 91, or 92, the router or switch uses a size value of 92 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 88-byte minimum.</p>

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (**lo.0**).

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

You can configure the ping interval for the **ping mpls ldp** command by specifying a new time in seconds using the **lsp-ping-interval** statement at the **[edit protocols ldp oam]** hierarchy level. For more information, see the Junos OS MPLS Applications Configuration Guide.

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

Required Privilege Level network

List of Sample Output [ping mpls ldp fec count on page 23](#)
[ping mpls ldp p2mp root-addr lsp-id on page 23](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with error codes are not counted in the received packets count. They are accounted for separately.

Sample Output

ping mpls ldp fec count user@host> ping mpls ldp 10.255.245.222 count 10
!!!xxx...x--- lsping statistics ---10 packets transmitted, 3 packets received,
70% packet loss 4 packets received with error status, not counted as received.

ping mpls lsp-end-point

Syntax	<code>ping mpls lsp-end-point <i>prefix-name</i></code> <code><count <i>count</i>></code> <code><destination <i>address</i>></code> <code><detail></code> <code><exp <i>forwarding-class</i>></code> <code><instance <i>routing-instance-name</i>></code> <code><logical-system (all <i>logical-system-name</i>)></code> <code><size <i>bytes</i>></code> <code><source <i>source-address</i>></code> <code><sweep></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. The size and sweep options were introduced in Junos OS Release 9.6. The instance option was introduced in Junos OS Release 10.0.
Description	Check the operability of MPLS label-switched path (LSP) endpoint connections. Type Ctrl+c to interrupt a ping mpls command.
Options	<p>count <i>count</i>—(Optional) Number of ping requests to send. If count is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.</p> <p>destination <i>address</i>—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.</p> <p>detail—(Optional) Display detailed information about the echo requests sent and received.</p> <p>exp <i>forwarding-class</i>—(Optional) Value of the forwarding class for the MPLS ping packets.</p> <p>instance <i>routing-instance-name</i>—(Optional) Ping a combination of the routing instance and forwarding equivalence class (FEC) associated with an LSP connection.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on the specified logical system.</p> <p>prefix-name—LDP forwarding equivalence class (FEC) prefix or RSVP LSP endpoint address.</p> <p>size <i>bytes</i>—(Optional) Size of the LSP ping request packet. If the endpoint is LDP-based, the minimum size of the packet is 88 bytes. If the endpoint is RSVP-based, the minimum size of the packet is 100 bytes. The maximum size in either case is 65468 bytes.</p> <p>source <i>source-address</i>—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).</p> <p>sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).</p>

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

```

ping mpls rsvp

Syntax ping mpls rsvp
 <lsp-name>
 <count count>
 <destination address>
 <detail>
 <dynamic-bypass>
 <egress egress-address>
 <exp forwarding-class>
 <interface interface-name>
 <logical-system (all | logical-system-name)>
 <manual-bypass>
 <multipoint>
 <size bytes>
 <source source-address>
 <standby standby-path-name>
 <sweep>

Release Information Command introduced before Junos OS Release 7.4.
 The **egress** and **multipoint** options were introduced in Junos OS Release 9.2.
 The **size** and **sweep** options were introduced in Junos OS Release 9.6.
 The **dynamic-bypass** and **manual-bypass** options were introduced in Junos OS Release 10.2.

Description Check the operability of MPLS RSVP-signaled label-switched path (LSP) connections. Type Ctrl+c to interrupt a **ping mpls** command.

Options **count count**—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

destination address—(Optional) Specify an address other than the default (127.0.0.1/32) for the ping echo requests. The address can be anything within the 127/8 subnet.

detail—(Optional) Display detailed information about the echo requests sent and received.

NOTE: When using the **detail** option, the reported time is based on the system time configured on the local and remote routers. Differences in these system times can result in inaccurate one way ping trip times being reported.

In practice, it is difficult to synchronize the system times of independent Juniper Networks routers with sufficient accuracy to provide a meaningful time value for the **detail** option (even when synchronized using NTP).

dynamic-bypass—(Optional) Ping dynamically generated bypass LSPs, used for protecting other LSPs.

egress *egress-address*—(Optional) Only the specified egress router or switch responds to the ping request.

exp *forwarding-class*—(Optional) Value of the forwarding class for the MPLS ping packets.

interface—(Optional) Specify the name of the interface protected by the manual bypass LSP. This option is only available when you have also used the **manual-bypass** option.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on the specified logical system.

lsp-name—Ping an RSVP-signaled LSP using an LSP name.

manual-bypass—(Optional) Ping manually configured bypass LSPs, used for protecting other LSPs. For this option, you must also specify the interface protected by the manual bypass LSP using the **interface** option.

multipoint—(Optional) Send ping requests to each of the egress routers or switches participating in a point-to-multipoint LSP. You can also include the **egress** option to ping a specific egress router or switch participating in a point-to-multipoint LSP.

size *bytes*—(Optional) Size of the LSP ping request packet (100 through 65468 bytes). Packets are 4-byte aligned. For example, if you enter a size of 101, 102, 103, or 104, the router or switch uses a size value of 104 bytes. If you enter a packet size that is smaller than the minimum size, an error message is displayed reminding you of the 100-byte minimum.

source *source-address*—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface.

standby *standby-path-name*—(Optional) Name of the standby path.

sweep—(Optional) Automatically determine the size of the maximum transmission unit (MTU).

Additional Information If the LSP changes, the label and interface information displayed when you issued the **ping** command continues to be used. You must configure MPLS at the **[edit protocols mpls]** hierarchy level on the remote router or switch to ping an LSP terminating there. You must configure MPLS even if you intend to ping only LDP forwarding equivalence classes (FECs).

In asymmetric MTU scenarios, the echo response may be dropped. For example, if the MTU from System A to System B is 1000 bytes, the MTU from System B to System A is 500 bytes, and the ping request packet size is 1000 bytes, the echo response is dropped because the PAD TLV is included in the echo response, making it too large.

ping vpls instance

Syntax ping vpls instance *instance-name* destination-mac *address* source-ip *address*
<bd-name *name*>
<control-plane-response>
<count *number*>
<detail>
<learning-vlan-id *number*>
<logical-system *logical-system-name*>

Release Information Command introduced in Junos OS Release 9.1.

Description Check the operability of virtual private LAN service (VPLS) connections. Type Ctrl+c to interrupt a **ping vpls instance** command.

When you issue a **ping vpls instance** command, a chassis MAC address is drawn from the ingress PE router's pool of MAC addresses and used to create the VPLS ping packet. The ping packet is then forwarded to the egress PE router. When the egress PE router receives the ping packet, it learns the MAC address from the VPLS ping packet. The MAC address is added to the egress PE router's MAC table.

The **ping vpls instance** command relies on the LSP ping and trace infrastructure defined in RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures* and further enhancements defined in Internet draft draft-stokes-vkompella-ppvpn-hvpls-oam-02, *Testing Hierarchical Virtual Private LAN Services*.

Options **instance *instance-name***—Specify the name of the VPLS routing instance.

destination-mac *address*—Specify a destination MAC address for the ping echo requests.

source ip *address*—IP address of the outgoing interface.

bd-name *name*—(Optional) Name of the bridge domain.

control-plane-response—(Optional) Request VPLS OAM responses using the control plane.

count *number*—(Optional) Number of ping requests to send. If **count** is not specified, five ping requests are sent. The range of values is 1 through 1,000,000. The default value is 5.

detail—(Optional) Display detailed information about the echo requests sent and received.

learning-vlan-id *number*—(Optional) Specify a learning VLAN identifier for the ping echo requests. The range of values is 0 through 4094.

logical-system *logical-system-name*—(Optional) Specify a logical system name for the ping echo requests.

Additional Information This statement is only supported on the MX Series routers, the M120 and M320 routers, and the T1600 router.

Required Privilege Level network

List of Sample Output [ping vpls instance on page 33](#)

Output Fields When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. Packets with an error code are not counted in the received packets count. They are accounted for separately.

Sample Output

```

```

CHAPTER 2

Interface Diagnostics Operational Mode Commands

Table 4 on page 35 summarizes the command-line interface (CLI) commands you can use to run diagnostics on router interfaces. Commands are listed in alphabetical order.

Table 4: Interface Diagnostics Operational Mode Commands

Task	Command
Start a bit error rate test (BERT) on a DS0 interface.	<code>test interface ds0-bert-start</code>
Stop a BERT on a DS0 interface.	<code>test interface ds0-bert-stop</code>
Start a BERT on an E1 interface.	<code>test interface e1-bert-start</code>
Stop a BERT on an E1 interface.	<code>test interface e1-bert-stop</code>
Start a BERT on an E3 interface.	<code>test interface e3-bert-start</code>
Stop a BERT on an E3 interface.	<code>test interface e3-bert-stop</code>
Transmit over a facilities data link (FDL) to initiate or terminate a far-end line loopback.	<code>test interface fdl-line-loop</code>
Transmit over an FDL to initiate or terminate a far-end payload loopback.	<code>test interface fdl-payload-loop</code>
Transmit the line loopback activate code word sequence on the interface's far-end alarm and control (FEAC) channel.	<code>test interface feac-loop-initiate</code>
Transmit the line loopback deactivate code word sequence on the interface's FEAC channel.	<code>test interface feac-loop-terminate</code>
Initiate or terminate a far-end line loopback.	<code>test interface inband-line-loop</code>
Initiate or terminate a far-end payload loopback.	<code>test interface inband-payload-loop</code>

Table 4: Interface Diagnostics Operational Mode Commands (*continued*)

Task	Command
Restart auto-negotiation on a Fast Ethernet or Gigabit Ethernet interface.	<code>test interface restart-auto-negotiation</code>
Start a BERT on a T1 interface.	<code>test interface t1-bert-start</code>
Stop a BERT on a T1 interface.	<code>test interface t1-bert-stop</code>
Start a BERT on a T3 interface.	<code>test interface t3-bert-start</code>
Stop a BERT on a T3 interface.	<code>test interface t3-bert-stop</code>

NOTE: For information about how to configure interface test parameters, see the Junos® OS Network Interfaces. For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Interfaces Network Operations Guide*.

test interface ds0-bert-start

Syntax	<code>test interface ds0-bert-start <i>ds-fpc/pic/port</i></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Start a bit error rate test (BERT) on a DS0 interface.
Options	<i>ds-fpc/pic/port</i> —DS0 interface name.
Additional Information	Before starting a BERT, you must disable the interface. To do so, include the disable statement at the [edit interfaces <i>interface-name</i>] hierarchy level. You can run a BERT on only one interface per PIC at a time.
Required Privilege Level	view
List of Sample Output	test interface ds0-bert-start on page 37
Output Fields	To display the results of the BERT, use the show interfaces extensive command.

Sample Output

<code>test interface ds0-bert-start</code>	<code>user@host> test interface ds0-bert-start ds-1/0/0</code>
--	---

test interface ds0-bert-stop

Syntax	<code>test interface ds0-bert-stop ds-<i>fpc/pic/port</i></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Stop a bit error rate test (BERT) on a DS0 interface.
Options	<i>ds-fpc/pic/port</i> —DS0 interface name.
Required Privilege Level	view
List of Sample Output	test interface ds0-bert-stop on page 38
Output Fields	To display the results of the BERT, use the <code>show interfaces extensive</code> command.

Sample Output

<code>test interface ds0-bert-stop</code>	<code>user@host> test interface ds0-bert-stop ds-1/0/0</code>
---	--

test interface e1-bert-start

Syntax	test interface e1-bert-start <i>interface-name</i>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Start a bit error rate test (BERT) on an E1 interface.
Options	<i>interface-name</i> —Interface name: <i>e1-fpc/pic/port</i> or <i>ce1-fpc/pic/port <:channel></i>
Additional Information	Before starting a BERT, you must disable the interface. To do this, include the disable statement at the [edit interfaces <i>interface-name</i>] hierarchy level. You can run a BERT on only one interface per PIC at a time.
	<div>  <p>NOTE: Due to hardware limitations of the framer used in IQ PICs, BERT is not supported in unframed mode on the interface and may return false positive results. BERT in unframed mode is supported on Enhanced IQ (IQE) PICs.</p> </div>

```

test interface e3-bert-start

Syntax	<code>test interface e3-bert-start e3-fpc/pic/port</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Start a bit error rate test (BERT) on an E3 interface.
Options	<code>e3-fpc/pic/port</code> —E3 interface name.
Additional Information	Before starting a BERT, you must disable the interface. To do so, include the disable statement at the <code>[edit interfaces interface-name]</code> hierarchy level. You can run a BERT on only one interface per PIC at a time.
	<div>  <p>NOTE: Due to hardware limitations of the framer used in IQ PICs, BERT is not supported in unframed mode on the interface and may return false positive results. BERT in unframed mode is supported on Enhanced IQ (IQE) PICs.</p> </div>

--	---

test interface fdl-line-loop

Syntax `test interface fdl-line-loop (ansi (initiate | terminate) | bellcore (initiate | terminate))
t1-fpc/pic/port <:channel>`

Release Information Command introduced before Junos OS Release 7.4.

Description Send commands over the facilities data link (FDL) on a T1 interface to initiate or terminate a far-end line loopback using either an ANSI or Bellcore FDL command code. If the far end of the connection is in C-bit parity mode and it has been configured to accept line loopback requests from the near end, the far end executes the request. See the ANSI T1.107 specification for more details.

NOTE: The following restrictions apply to this command:

- If you attach a SmartJack network interface unit on the T1 connection between an M Series router with a channelized DS3 IQ, channelized OC3 IQ, or channelized OC12 IQ interface and a standard T1 interface, and you issue the `test interface fdl-line-loop bellcore initiate` command on the channelized T1 interface, the loopback test might not function correctly.
- On channelized DS3-to-DS1 and multichannel DS3 PICs, this command can only be initiated by T1 interfaces. These types of T1 interfaces cannot accept a request for this test sent by another router.
- This command is not supported on the 4-port T1 PIC.

Options `ansi`—ANSI FDL command code.

`bellcore`—Bellcore FDL command code.

`initiate`—Initiate the far-end line loopback.

`terminate`—Terminate the far-end line loopback.

`t1-fpc/pic/port <:channel>`—Name of a T1 interface. The channel number indicates a channelized interface.

Required Privilege Level view

List of Sample Output [test interface fdl-line-loop on page 44](#)

Output Fields To display the state and the number of times the interface has placed itself into remote loopback, use the `show interfaces extensive` command.

Sample Output

test interface
fdl-line-loop

```
user@host> test interface fdl-line-loop ansi initiate t1-1/0/0
```

test interface fdl-payload-loop

Syntax `test interface fdl-payload-loop (ansi (initiate | terminate) | bellcore (initiate | terminate) t1-fpc/pic/port <:channel>)`

Release Information Command introduced before Junos OS Release 7.4.

Description Send commands over the facilities data link (FDL) on a T1 interface to initiate or terminate a far-end payload loopback using either an ANSI or Bellcore FDL command code. If the far end of the connection is in C-bit parity mode and has been configured to accept payload loopback requests from the near end, the far end executes the request. See the ANSI T1.107 specification for more details.

NOTE: The following restrictions apply to this command:

- On channelized DS3-to-DS1 and multichannel DS3 PICs, this command can only be initiated by T1 interfaces. These types of T1 interfaces cannot accept a request for this test sent by another router.
- This command is not supported on the 4-port T1 PIC.

Options **ansi**—ANSI FDL command code.

bellcore—Bellcore FDL command code.

initiate—Initiate the far-end payload loopback.

terminate—Terminate the far-end payload loopback.

t1-fpc/pic/port <:channel>—Name of a T1 interface. The channel number indicates a channelized interface.

Output Fields To display the state and the number of times the interface has placed itself into remote loopback, use the **show interfaces extensive** command.

Sample Output

**test interface
fdl-payload-loop**

```
user@host> test interface fdl-payload-loop ansi initiate t1-1/0/0
```

test interface feac-loop-initiate

Syntax `test interface t3-fpc/pic/port <:channel> feac-loop-initiate`

Release Information Command introduced before Junos OS Release 7.4.

Description Have the interface transmit the word sequence for the line loopback activate code on its far-end alarm and control (FEAC) channel. If the far end of the connection is in C-bit parity mode and has been configured to accept remote loopback requests from the near end, the far end places its interface into remote loopback. See the ANSI T1.107 specification for more details.

.....
NOTE: This command is not supported for T3 interfaces configured on DS3 and channelized OC12 PICs.
.....

Options `t3-fpc/pic/port <:channel>`—Name of a T3 interface. The channel number indicates a channelized interface.

Required Privilege Level view

feac-loop-initiate`

`user@host> test interface feac-loop-initiate t3-1/0/0`

test interface feac-loop-terminate

Syntax	<code>test interface t3-<i>fpc/pic/port</i> <:channel> feac-loop-terminate</code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Have the interface transmit the line loopback deactivate code word sequence on its far-end alarm and control (FEAC) channel. If the far end of the connection is in C-bit parity mode and has been configured to accept remote loopback requests from the near end, the far end clears remote loopback on the interface. See the ANSI T1.107 specification for more details.
	<div>  <p>NOTE: This command is not supported for T3 interfaces configured on DS3 and Channelized OC12 PICs.</p> </div>
Options	<code>t3-<i>fpc/pic/port</i> <:channel></code> —Name of a T3 interface. The channel number indicates a channelized interface.
Required Privilege Level	view

Output Fields	To display the state and the number of times the interface has placed itself into remote loopback, use the show interfaces extensive command.

Sample Output

```
test interface
feac-loop-terminate      user@host> test interface feac-loop-terminate t3-1/0/0
```

test interface inband-line-loop

Syntax `test interface inband-line-loop (ansi (initiate | terminate) | bellcore (initiate | terminate))
t1-fpc/pic/port <:channel>`

Release Information Command introduced before Junos OS Release 7.4.

Description Send commands on a T1 interface to initiate or terminate a far-end line loopback using either an ANSI or Bellcore FDL command code. If the far end of the connection is in C-bit parity mode and it has been configured to accept line loopback requests from the near end, the far end executes the request.

NOTE: The following restrictions apply to this command:

- On channelized DS3-to-DS1 and multichannel DS3 PICs, this command can only be initiated by T1 interfaces. These types of T1 interfaces cannot accept a request for this test sent by another router.
- This command is not supported on the 4-port T1 PIC.

Options **ansi**—ANSI FDL command code.

bellcore—Bellcore FDL command code.

initiate—Initiate the far-end payload loopback.

terminate—Terminate the far-end payload loopback.

t1-fpc/pic/port <:channel>—Name of a T1 interface. The channel number indicates a channelized interface.

```

test interface restart-auto-negotiation

Syntax	test interface restart-auto-negotiation <i>interface-name</i>
Release Information	Command introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Restarts auto-negotiation on a Fast Ethernet or Gigabit Ethernet interface.
Options	<i>interface-name</i> —Interface name: <i>fe-fpc/pic/port</i> or <i>ge-fpc/pic/port</i> .
Required Privilege Level	view
List of Sample Output	test interface restart-auto-negotiation on page 50
Output Fields	Use the <code>show interfaces extensive</code> command to see the state for auto-negotiation.

--	---

test interface t1-bert-start

Syntax	test interface t1-bert-start <i>interface-name</i>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Start a bit error rate test (BERT) on a T1 interface.
Options	<i>interface-name</i> —Interface name: <i>t1-fpc/pic/port</i> or <i>ct1-fpc/pic/port <:channel></i> .
Additional Information	Before starting a BERT, you must disable the interface. To do so, include the disable statement at the [edit interfaces <i>interface-name</i>] hierarchy level. You can run a BERT on only one interface per PIC at a time.
	<div>  <p>NOTE: Due to hardware limitations of the framer used in IQ PICs, BERT is not supported in unframed mode on the interface and may return false positive results. BERT in unframed mode is supported on Enhanced IQ (IQE) PICs.</p> </div>

CHAPTER 3

RADIUS Diagnostics Operational Mode Commands

Table 5 on page 55 summarizes RADIUS diagnostics commands that allow you to test RADIUS authentication by verifying a user, password, IP address, profile, and other RADIUS authentication attributes. Commands are listed in alphabetical order.

Table 5: RADIUS Operational Mode Commands

Task	Command
Test a RADIUS authentication profile	<code>test access profile</code>
Test RADIUS server authentication	<code>test access radius-server</code>

test access profile

Syntax	<code>test access profile <i>profile-name</i> user <i>username</i> password <i>password</i> <detail></code>
Release Information	Command introduced in Junos OS Release 9.1.
Description	Specify a profile to use to get information from a RADIUS server, which includes all the information from the test access radius-server command.
Options	<p>detail—(Optional) Show the RADIUS attributes returned by the server.</p> <p>profile-name—Access profile name configured.</p> <p>password—Password for the username.</p> <p>username—User name to be authenticated to the RADIUS server.</p>
Required Privilege Level	view
List of Sample Output	<p>test access profile on page 58</p> <p>test access profile detail on page 58</p>
Output Fields	Table 6 on page 56 lists the output fields for the test access profile command. Output fields are listed in the approximate order in which they appear.

Table 6: test access profile Output Fields

Field Name	Field Description
Profile Name	Name of the configured access profile.
Client Username	The user name authenticated by the RADIUS server.
Client Password	The user password authenticated by the RADIUS server.
Num Servers	Number of RADIUS servers in the configured access profile.
Server List	List of RADIUS servers in the configure access profile.
IP Address	The IP address of the RADIUS server authenticated.
UDP Port	The RADIUS server port utilized during the authentication test.
Source Address	The source IP address of the client making the RADIUS request. If no address is shown, it defaults to the address of the outgoing interface.
Timeout	The RADIUS server timeout period.
Retry Count	The number of authentication attempts allowed by the RADIUS server.

Table 6: test access profile Output Fields (*continued*)

Field Name	Field Description
Secret	The shared secret used for authentication with the RADIUS server.
Status	The test result status (Accepted or Rejected) and the number of retransmits utilized during authentication.
Attempts	The number of authentication attempts on the RADIUS server.
Attribute List	The list of returned RADIUS attributes, sorted by the attribute name, and including parameter length and value. See your RADIUS server documentation for attribute descriptions.
(Attribute) Name	The name of the attribute.
(Attribute) Length	The attribute length in bytes.
(Attribute) Value	The attribute value.

Sample Output

test access profile

The following example uses the **test access profile** command to access and display basic information about the RADIUS server(s) shown in the resulting output:

```
user@host> test access profile alpha user TEST password TEST
user@host> test access profile alpha user TEST password TEST
Test Radius Profile Access
  Profile Name       : alpha
  Client Username    : TEST
  Client Password    : TEST
  Num Servers        : 5
    Server List
      IP Address      UDP      Source      Retry
      Attempts       Port      Address      Timeout Count Secret      Status
1.1.1.1             1812    10.10.10.10    2         1    TEST      Timeout
2
1.2.3.4             1812    Default       1         2    TEST      Timeout
3
192.168.10.10      1812    Default       3         3    TEST      Accepted
1
```

test access profile detail

The following example uses the **test access profile detail** command to access and display detailed information about the RADIUS server(s) shown in the resulting output:

```
user@host> test access profile alpha user TEST password TEST detail
user@host> test access profile alpha user TEST password TEST detail
Test Radius Profile Access Detailed
  Profile Name       : alpha
  Client Username    : TEST
  Client Password    : TEST
  Num Servers        : 5

test access radius-server

Syntax `test access radius-server address user username password password secret secret
<authentication-port port>
<retry number>
<source-address address>
<timeout number>`

Release Information Command introduced in Junos OS Release 9.1.

Description Verify RADIUS server authentication parameters.

Options **address**—RADIUS server under test IP address.

password—Password for the user.

secret—Secret shared with the RADIUS server.

user—User name to be authenticated to the RADIUS server.

authentication-port—(Optional) RADIUS server authentication port number (1through 65535).

retry—(Optional) Retry attempts (1through 10).

source-address—(Optional) Use an alternate address as the source address.

timeout—(Optional) Request timeout period (1through 90 seconds).

Required Privilege Level view

Table 7: test access radius-server Output Fields

Field Name	Field Description
Server	The IP address of the RADIUS server authenticated.
UDP port	The RADIUS server port utilized during the authentication test.
Source IP Address	"Default" is shown if the IP address is the same as that of the RADIUS server. Alternatively, an IP address specified for authentication is shown.
Server timeout	The RADIUS server timeout period.
Sever retry count	The number of authentication attempts allowed by the RADIUS server.

Table 7: test access radius-server Output Fields (*continued*)

Field Name	Field Description
Secret	The shared secret used for authentication with the RADIUS server.
Client Username	The user name authenticated by the RADIUS server.
Client Password	The user password authenticated by the RADIUS server.
Status	The test result status (Accepted or Rejected) and the number of retransmits utilized during authentication.

Sample Output

**test access
radius-server user
password secret**

The following example command tests RADIUS authentication with a specific server (172.28.30.95), user (JOHNDOE), secret (No1Knows), and password (JohnPass); and displays the resulting output:

```
user@host> test access radius-server 172.28.30.95 user JOHNDOE password JohnPass secret
No1Knows
Test Radius Server Access
  Server           : 172.28.30.95
  UDP port         : 1812
  Source IP Address : Default
  Server timeout   : 3
  Sever retry count : 3
  Secret           : No1Knows
  Client Username   : JOHNDOE
  Client Password   : JohnPass
  Status            : Accepted, retransmits: 0
```

CHAPTER 4

Real-Time Performance Monitoring Operational Mode Commands

Table 8 on page 63 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot real-time performance monitoring (RPM). Commands are listed in alphabetical order.

Table 8: RPM Operational Mode Commands

Task	Command
Clear Two-Way Active Measurement Protocol (TWAMP) connections and associated sessions.	<code>clear services rpm twamp server connection</code>
Show configured probe servers.	<code>show services rpm active-servers</code>
Show the results of the last 50 completed probes for each RPM instance.	<code>show services rpm history-results</code>
Show probe results.	<code>show services rpm probe-results</code>
Show TWAMP connections.	<code>show services rpm twamp server connection</code>
Show TWAMP sessions.	<code>show services rpm twamp server session</code>

NOTE: For information about how to configure RPM, see the Junos Services Interfaces Configuration Release 12.3.

clear services rpm twamp server connection

Syntax	clear services rpm twamp server connection <i><connection-id></i>
Release Information	Command introduced in Junos OS Release 9.3.
Description	Clear connections established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control clients. By default all established connections are cleared (along with the sessions on those connections). To clear only a specific connection, specify the connection ID when you issue the command.
Options	<i>connection-id</i> —(Optional) Clear only the specified connection.
Required Privilege Level	clear

show services rpm active-servers

Syntax	show services rpm active-servers
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the protocols and corresponding ports for which a router or switch is configured as a real-time performance monitoring (RPM) server.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show services rpm active-servers on page 65
Output Fields	Table 9 on page 65 lists the output fields for the show services rpm active-servers command. Output fields are listed in the approximate order in which they appear.

Table 9: show services rpm active-servers Output Fields

Field Name	Field Description
Protocol	Protocol configured on the receiving probe server. The protocol can be the User Datagram Protocol (UDP) or the Transmission Control Protocol (TCP).
Port	Port configured on the receiving probe server.
Destination interface name	Output interface name for the probes.

Sample Output

show services rpm active-servers

```
user@host> show services rpm active-servers
Protocol: TCP, Port: 50000, Destination interface name: lt-0/0/0.0
Protocol: UDP, Port: 50001, Destination interface name: lt-0/0/0.0
```

show services rpm history-results

Syntax	<pre>show services rpm history-results <brief detail> <owner <i>owner</i>> <since <i>time</i>> <test <i>name</i>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	Display standard information about the results of the last 50 probes for each real-time performance monitoring (RPM) instance.
Options	<p>none—Display the results of the last 50 probes for all RPM instances.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>owner <i>owner</i>—(Optional) Display information for the specified probe owner.</p> <p>since <i>time</i>—(Optional) Display information from the specified time. Specify time as <i>yyyy-mm-dd.hh:mm:ss</i>.</p> <p>test <i>name</i>—(Optional) Display information for the specified test.</p>
Required Privilege Level	view
List of Sample Output	<p>show services rpm history-results on page 68</p> <p>show services rpm history-results detail on page 68</p>
Output Fields	Table 10 on page 66 lists the output fields for the show services rpm history-results command. Output fields are listed in the approximate order in which they appear.

Table 10: show services rpm history-results Output Fields

Field Name	Field Description	Level of Output
Owner	Probe owner.	All levels
Test	Name of a test for a probe instance.	All levels
Probe received	Timestamp when the probe result was determined.	All levels
Round trip time	Average ping round-trip time (RTT), in microseconds.	All levels
Probe results	<p>Result of a particular probe performed by a remote host. The following information is contained in the results:</p> <ul style="list-style-type: none"> Response received—Timestamp when the probe result was determined. Rtt—Average ping round-trip time (RTT), in microseconds. 	detail

Table 10: show services rpm history-results Output Fields (*continued*)

Field Name	Field Description	Level of Output
Results over current test	Displays the results for the current test by probe at the time each probe was completed, as well as the status of the current test at the time the probe was completed.	detail
Probes sent	Number of probes sent with the current test.	detail
Probes received	Number of probe responses received within the current test.	detail
Loss percentage	Percentage of lost probes for the current test.	detail
Measurement	<p>Increment of measurement. Possible values are round-trip time delay and, for the probe type icmp-pin-timestamp, the egress and ingress delay:</p> <ul style="list-style-type: none"> • Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. • Jitter—Difference, in microseconds, between the maximum and minimum RTT measured over the course of the current test. • Stddev—Standard deviation of the round-trip time, in microseconds, measured over the course of the current test. 	detail

Sample Output

show services rpm history-results

```
user@host> show services rpm history-results
```

Owner, Test	Probe received	Round trip time
p1, t1	Wed Aug 12 01:02:35 2009	315 usec
p1, t1	Wed Aug 12 01:02:36 2009	266 usec
p1, t1	Wed Aug 12 01:02:37 2009	314 usec
p1, t1	Wed Aug 12 01:02:38 2009	388 usec
p1, t1	Wed Aug 12 01:02:39 2009	316 usec
p1, t1	Wed Aug 12 01:02:40 2009	271 usec
p1, t1	Wed Aug 12 01:02:41 2009	314 usec

```

show services rpm probe-results

Syntax	show services rpm probe-results <owner <i>owner</i> > <test <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the results of the most recent real-time performance monitoring (RPM) probes.
Options	none —Display all results of the most recent RPM probes. owner <i>owner</i> —(Optional) Display information for the specified probe owner. test <i>name</i> —(Optional) Display information for the specified test.
Required Privilege Level	view
List of Sample Output	show services rpm probe-results on page 73 show services rpm probe-results (BGP Neighbor Discovery) on page 74
Output Fields	Table 11 on page 70 lists the output fields for the show services rpm probe-results command. Output fields are listed in the approximate order in which they appear.

Table 11: show services rpm probe-results Output Fields

Field Name	Field Description
Owner	Owner name. When you configure the probe owner statement at the [edit services rpm] hierarchy level, this field displays the configured owner name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-Bgp-Owner .
Test	Name of a test representing a collection of probes. When you configure the test test-name statement at the [edit services rpm probe owner] hierarchy level, the field displays the configured test name. When you configure BGP neighbor discovery through RPM, the output for this field is Rpm-BGP-Test-n , where <i>n</i> is a cumulative number.
Target address	Destination address used for the probes.
Source address	Source address used for the probes.
Probe type	Protocol configured on the receiving probe server: http-get , http-metadata-get , icmp-ping , icmp-ping-timestamp , tcp-ping , udp-ping , or udp-ping-timestamp .
Test size	Number of probes within a test.

Table 11: show services rpm probe-results Output Fields (*continued*)

Field Name	Field Description
Routing Instance Name	<p>(BGP neighbor discovery) Name of the configured (if any) routing instance, logical system name, or both, in which the probe is configured:</p> <ul style="list-style-type: none"> When a routing instance is defined within a logical system, the logical system name is followed by the routing instance name. A slash (/) is used to separate the two entities. For example, if the routing instance called R1 is configured within the logical system called LS, the name in the output field is LS/R1. When a routing instance is configured but the default logical system is used, the name in the output field is the name of the routing instance. When a logical system is configured but the default routing instance is used, the name in the output field is the name of the logical system followed by default. A slash (/) is used to separate the two entities. For example, LS/default.
Probe results	<p>Raw measurement of a particular probe sample done by a remote host. This data is provided separately from the calculated results. The following information is contained in the raw measurement:</p> <ul style="list-style-type: none"> Response received—Timestamp when the probe result was determined. Client and server hardware timestamps—If timestamps are configured, an entry appears at this point. Rtt—Average ping round-trip time (RTT), in microseconds. Egress jitter—Egress jitter, in microseconds. Ingress jitter—Ingress jitter, in microseconds. Round trip jitter—Round-trip jitter, in microseconds. Egress interarrival jitter—Egress interarrival jitter, in microseconds. Ingress interarrival jitter—Ingress interarrival jitter, in microseconds. Round trip interarrival jitter—Round-trip interarrival jitter, in microseconds.
Results over current test	<p>Probes are grouped into tests, and the statistics are calculated for each test. If a test contains 10 probes, the average, minimum, and maximum results are calculated from the results of those 10 probes. If the command is issued while the test is in progress, the statistics use information from the completed probes.</p> <ul style="list-style-type: none"> Probes sent—Number of probes sent within the current test. Probes received—Number of probe responses received within the current test. Loss percentage—Percentage of lost probes for the current test. Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> Samples—Number of probes. Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. Peak to peak—Peak-to-peak difference, in microseconds. Stddev—Standard deviation, in microseconds. Sum—Statistical sum.

Table 11: show services rpm probe-results Output Fields (*continued*)

Field Name	Field Description
Results over last test	<p>Results for the most recently completed test. If the command is issued while the first test is in progress, this information is not displayed</p> <ul style="list-style-type: none"> • Probes sent—Number of probes sent for the most recently completed test. • Probes received—Number of probe responses received for the most recently completed test. • Loss percentage—Percentage of lost probes for the most recently completed test. • Test completed—Time the most recent test was completed. • Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe type icmp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> • Samples—Number of probes. • Minimum—Minimum RTT, ingress delay, or egress delay measured for the most recently completed test. • Maximum—Maximum RTT, ingress delay, or egress delay measured for the most recently completed test. • Average—Average RTT, ingress delay, or egress delay measured for the most recently completed test. • Peak to peak—Peak-to-peak difference, in microseconds. • Stddev—Standard deviation, in microseconds. • Sum—Statistical sum.
Results over all tests	<p>Displays statistics made for all the probes, independently of the grouping into tests, as well as statistics for the current test.</p> <ul style="list-style-type: none"> • Probes sent—Number of probes sent in all tests. • Probes received—Number of probe responses received in all tests. • Loss percentage—Percentage of lost probes in all tests. • Measurement—Measurement type. Possible values are round-trip time, positive round-trip jitter, negative round-trip jitter, egress time, positive egress jitter, negative egress jitter, ingress time, positive ingress jitter, negative ingress jitter, and, for the probe types icmp-ping-timestamp and udp-ping-timestamp, the egress delay and ingress delay. <p>For each measurement type, the following individual calculated results are provided:</p> <ul style="list-style-type: none"> • Samples—Number of probes. • Minimum—Minimum RTT, ingress delay, or egress delay measured over the course of the current test. • Maximum—Maximum RTT, ingress delay, or egress delay measured over the course of the current test. • Average—Average RTT, ingress delay, or egress delay measured over the course of the current test. • Peak to peak—Peak-to-peak difference, in microseconds. • Stddev—Standard deviation, in microseconds. • Sum—Statistical sum.

show services rpm twamp server connection

Syntax	show services rpm twamp server connection <i><connection-id></i>
Release Information	Command introduced in Junos OS Release 9.3.
Description	Display information about the connections established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control-clients. By default, all established sessions are displayed, unless you specify a session ID when you issue the command.
Options	<i>connection-id</i> —(Optional) Display only information about the specified connection ID.
Required Privilege Level	view
List of Sample Output	show services rpm twamp server connection on page 77

Table 12: show services rpm twamp server connection Output Fields

Field Name	Field Description
Connection ID	Connection ID that uniquely identifies the connection between the TWAMP server and a particular client.
Client address	Client IP address.
Client port	Client port number.
Server address	Server IP address.
Server port	Server port number.
Session count	Session count.
Auth mode	Authentication mode.

Sample Output

```
show services rpm
twamp server
connection
```

```
user@host> show services rpm twamp server connection
```

Connection	Client	Client	Server	Server	Session	Auth
ID	address	port	address	port	count	mode
4	1.1.1.1	12345	192.168.219.203	890	16	none
78	3.22.1.55	345	22.2.2.2	89022	5	none
234	192.168.219.203	2345	2.2.22.2	3333	16	none
5	221.4.1.1	82345	2.2.2.2	45909	16

show services rpm twamp server session

Syntax	show services rpm twamp server session <i><session-id></i>
Release Information	Command introduced in Junos OS Release 9.3.
Description	Display information about the sessions established between the real-time performance monitoring (RPM) Two-Way Active Measurement Protocol (TWAMP) server and control clients. By default, all established sessions are displayed, unless you specify a session ID when you issue the command.
Options	<i>session-id</i> —(Optional) Display only information about the specified session ID.
Required Privilege Level	view
List of Sample Output	show services rpm twamp server session on page 78
Output Fields	Table 13 on page 78 lists the output fields for the show services rpm twamp server session command. Output fields are listed in the approximate order in which they appear.

Table 13: show services rpm twamp server session Output Fields

Field Name	Field Description
Session ID	Session ID that uniquely identifies the session between the TWAMP server and a particular client.
Connection ID	Connection ID that uniquely identifies the connection between the TWAMP server and a particular client.
Sender address	Sender IP address.
Sender port	Sender port number.
Reflector address	Reflector IP address.
Reflector port	Reflector port number.

Sample Output

**show services rpm
twamp server session**

```

user@host> show services rpm twamp server session
  Session  Connection  Sender  Sender  Reflector  Reflector
   ID      ID         address port    address    port

CHAPTER 5

Real-Time Router Monitoring Operational Mode Commands

Table 14 on page 79 summarizes the command-line interface (CLI) commands you can use to monitor files, interfaces, and traffic in real time. Commands are listed in alphabetical order.

Table 14: Real-Time Router Monitoring Operational Mode Commands

Task	Command
Start an Ethernet frame delay monitoring session. (MX Series, Ethernet Dense Port Concentrators only)	<code>monitor ethernet delay-measurement</code>
Start an Ethernet frame loss monitoring session. (MX Series, Ethernet Dense Port Concentrators only)	<code>monitor ethernet loss-measurement</code>
Monitor statistics for a physical interface.	<code>monitor interface</code>
Monitor a RSVP label-switched path (LSP).	<code>monitor label-switched-path</code>
Display the status of monitored log and trace files.	<code>monitor list</code>
Start displaying the system log or trace file and additional entries being added to those files.	<code>monitor start</code>
Stop displaying the system log or trace file.	<code>monitor stop</code>
Monitor packet headers transmitted through network interfaces sent from or received by the Routing Engine.	<code>monitor traffic</code>
Display trace information about an IP multicast path.	<code>mtrace</code>
Display trace information about a IP multicast path from a source to the router.	<code>mtrace from-source</code>
Listen passively for IP multicast responses.	<code>mtrace monitor</code>
Display trace information about an IP multicast path from the router to a gateway router.	<code>mtrace to-gateway</code>

Table 14: Real-Time Router Monitoring Operational Mode Commands (*continued*)

Task	Command
Determine the route to a network system.	<code>traceroute</code>
Monitor the route to a network system.	<code>traceroute monitor</code>
Monitor the route to a remote host for an MPLS LSP signaled by LDP.	<code>traceroute mpls ldp</code>
Monitor the route to a remote host for an MPLS LSP signaled by RSVP.	<code>traceroute mpls rsvp</code>

NOTE: For information about how to configure interface parameters, see the Junos® OS Network Interfaces.

For information about how to configure IP multicast parameters, see the Multicast Protocols Configuration Guide.

For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Baseline Network Operations Guide*.

monitor ethernet delay-measurement

Syntax monitor ethernet delay-measurement
 maintenance-domain *md-name*
 maintenance-association *ma-name*
 (one-way | two-way)
 (*remote-mac-address* | mep *remote-mep-id*)
 <count *frame-count*>
 <wait *interval-seconds*>
 <priority *802.1p value*>
 <size>
 <no-session-id-tlv>
 <xml>

Release Information Command introduced in Junos OS Release 9.5.

Description Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet delay-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

Options **maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
maintenance-association *ma-name*—Name of an existing CFM maintenance association.

one-way—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (IDM) frame and the time at which the receiver MEP receives the frame.

two-way—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.

mep remote-mep-id—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

count frame-count—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.

wait interval-seconds—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

priority 802.1p value—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

no-session-id-tlv—(Optional) Prevent insertion of the session ID TLV in the request frame.

xml—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

Additional Information To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the Junos OS Operational Mode Commands:

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the Junos OS Operational Mode Commands.

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the Junos OS Operational Mode Commands.

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos® OS Network Interfaces.

Required Privilege Level trace and maintenance

List of Sample Output [monitor ethernet delay-measurement one-way on page 85](#)
[monitor ethernet delay-measurement two-way on page 85](#)
[monitor ethernet delay-measurement two-way \(Invalid DMR Frames Received\) on page 85](#)

Output Fields The **monitor ethernet delay-measurement** command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- [Table 15 on page 83](#) lists the run-time output fields for the **monitor ethernet delay-measurement one-way** command.
- [Table 16 on page 84](#) lists the run-time output fields for the **monitor ethernet delay-measurement two-way** command.

Output fields are listed in the approximate order in which they appear.

Table 15: monitor ethernet delay-measurement one-way Output Fields

Output Field Name	Output Field Description
One-way ETH-DM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
IDM Frames sent	PDU frames sent to the remote MEP in this ETH-DM session.
Packets transmitted	Total number of IDM PDU frames sent to the remote MEP during this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

Table 15: monitor ethernet delay-measurement one-way Output Fields (*continued*)

Output Field Name	Output Field Description
-------------------	--------------------------

NOTE: For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 16: monitor ethernet delay-measurement two-way Output Fields

Output Field Name	Output Field Description
Two-way Ethernet frame delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
DMR received from	Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.
Delay	Two-way delay, in microseconds, for the initiator-transmitted DMM frame.
Delay variation	Difference, in microseconds, between the current and previous delay values. This is also known as <i>jitter</i> .
Packets transmitted	Total number of DMM PDU frames sent to the remote MEP in this measurement session.
Valid packets received	Total number of DMR PDU frames received from the remote MEP in this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

monitor ethernet loss-measurement

Syntax monitor ethernet loss-measurement
 maintenance-domain *md-name*
 maintenance-association *ma-name*
 (*remote-mac-address* | mep *remote-mep-id*)
 <count *frame-count*>
 <wait *interval-seconds*>
 <priority *802.1p value*>
 <no-session-id-tlv>
 <xml>

Release Information Command introduced in Junos OS Release 11.1.

Description Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the **monitor ethernet loss-measurement** command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

Options **maintenance-domain *md-name***—Name of an existing CFM maintenance domain.

maintenance-association *ma-name*—Name of an existing CFM maintenance association.

mep *remote-mep-id*—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* (for example, 0011.2233.4455 or 00:11:22:33:44:55). Multicast MAC addresses are not supported.

count *frame-count*—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

wait *interval-seconds*—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

priority *802.1p value*—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

no-session-id-tlv—(Optional) Disable the **session id TLV** argument set in the request frame.

xml—(Optional) Allow the output of the command to be displayed in XML format.

Additional Information To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the Junos OS Operational Mode Commands:

- **show oam ethernet connectivity-fault-management loss-statistics**
- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the Junos OS Operational Mode Commands:

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command, as described in the Junos OS Operational Mode Commands.

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the Junos® OS Network Interfaces.

[monitor ethernet loss-measurement \(with CIR and EIR counters enabled\) on page 90](#)

Output Fields Table 17 on page 88 lists the output fields for the **monitor ethernet loss-measurement** command and their descriptions. Output fields are listed in the approximate order in which they appear.

Table 17: monitor ethernet loss-measurement output fields

Output Field Name	Output Field Description
Ethernet loss delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
LMR received from	Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
LMM packets transmitted	Total number of LMM PDU frames sent to the remote MEP in this measurement session.
LMR packets received	Total number of LMR PDU frames received from the remote MEP in this measurement session.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case frame loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case frame loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.

Table 17: monitor ethernet loss-measurement output fields (*continued*)

Output Field Name	Output Field Description
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.
Far-end worst case frame loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

Sample Output

```

monitor interface

Syntax `monitor interface`
 `<interface-name> | traffic <detail>>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

NOTE: This command is not supported on the QFX3000 QFabric system.

Options **none**—Display real-time statistics for all interfaces.

detail—(Optional) With traffic option only, display detailed output.

interface-name—(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

traffic—(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

Additional Information The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the c key. For a description of the statistical information provided in the output of this command, see the **show interfaces extensive** command for a particular interface type in the Junos OS Operational Mode Commands. To control the output of the **monitor interface** command while it is running, use the keys listed in [Table 18 on page 92](#). The keys are not case-sensitive.

Table 18: Output Control Keys for the monitor interface Command

Key	Action
c	Clears (returns to zero) the delta counters since monitor interface was started. This does not clear the accumulative counter. To clear the accumulative counter, use the clear interfaces interval command.
f	Freezes the display, halting the display of updated statistics and delta counters.
i	Displays information about a different interface. The command prompts you for the name of a specific interface.

Table 18: Output Control Keys for the monitor interface Command (*continued*)

Key	Action
n	Displays information about the next interface. The monitor interface command displays the physical or logical interfaces in the same order as the show interfaces terse command.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws the display, resuming the update of the statistics and delta counters.

To control the output of the **monitor interface traffic** command while it is running, use the keys listed in [Table 19 on page 93](#). The keys are not case-sensitive.

Table 19: Output Control Keys for the monitor interface traffic Command

Key	Action
b	Displays the statistics in units of bytes and bytes per second (Bps).
c	Clears (return to 0) the delta counters in the Current Delta column. The statistics counters are not cleared.
d	Displays the Current Delta column (instead of the rate column) in Bps or packets per second (pps).
p	Displays the statistics in units of packets and packets per second (pps).
q or Esc	Quits the command and returns to the command prompt.
r	Displays the rate column (instead of the Current Delta column) in Bps and pps.

[monitor interface traffic detail \(QFX3500 Switch\) on page 99](#)

Output Fields [Table 20 on page 94](#) describes the output fields for the **monitor interface** command. Output fields are listed in the approximate order in which they appear.

Table 20: monitor interface Output Fields

Field Name	Field Description	Level of Output
routerl	Hostname of the router.	All levels
Seconds	How long the monitor interface command has been running or how long since you last cleared the counters.	All levels
Time	Current time (UTC).	All levels
Delay x/y/z	Time difference between when the statistics were displayed and the actual clock time. <ul style="list-style-type: none"> • x—Time taken for the last polling (in milliseconds). • y—Minimum time taken across all pollings (in milliseconds). • z—Maximum time taken across all pollings (in milliseconds). 	All levels
Interface	Short description of the interface, including its name, status, and encapsulation.	All levels
Link	State of the link: Up , Down , or Test .	All levels
Current delta	Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.	All levels
Local Statistics	(Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	All levels
Remote Statistics	(Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	All levels

Table 20: monitor interface Output Fields (*continued*)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	All levels
Description	With the traffic option, displays the interface description configured at the [edit interfaces <i>interface-name</i>] hierarchy level.	detail

Sample Output

monitor interface
(Physical)

```

user@host> monitor interface so-0/0/0
router1                               Seconds: 19                               Time: 15:46:29

Interface: so-0/0/0, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C48
Traffic statistics:
Input packets:                        6045 (0 pps)                               [11]
Input bytes:                          6290065 (0 bps)                            [13882]
Output packets:                       10376 (0 pps)                               [10]
Output bytes:                         10365540 (0 bps)                          [9418]
Encapsulation statistics:

monitor label-switched-path

Syntax `monitor label-switched-path lsp-name`
`<logical-system (logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display the real-time status of the specified RSVP label-switched path (LSP).

Options `logical-system (logical-system-name)`—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsp-name—Name of the LSP.

Additional Information You can track the amount of traffic traversing an RSVP LSP and observe its essential parameters, such as uptime, ingress and egress addresses, labels, routes, and ports. Values are typically sampled every second. The display also allows you to scroll to other currently running LSPs. You cannot use this command to display information about static LSPs or LDP-signaled LSPs.

The output of this command shows how much each field has changed since you started the command or since you cleared the counters by using the `c` key. To control the output of the `monitor label-switched-path` command while it is running, use the keys listed in [Table 21 on page 101](#). The keys are not case-sensitive.

Table 21: Output Control Keys for the monitor label-switched-path Command

Key	Action
c	Clears the screen and refreshes the display for this LSP.
f	Freezes the display, preventing new information from being displayed.
l	Monitors a different LSP. After you type l, you can type the new LSP name.
n	Displays information about the next LSP (whose name is alphabetically higher than the current LSP name) configured on the router.
p	Goes to the previous LSP (whose name is alphabetically lower than the current LSP name) configured on the router.
q or Esc	Quits the command and returns to the command prompt.
t	Thaws, or restarts, the data display for this LSP.

Required Privilege Level trace

List of Sample Output [monitor label-switched-path on page 103](#)

Output Fields Table 22 on page 102 describes the output fields for the **monitor label-switched-path** command. Output fields are listed in the approximate order in which they appear.

Table 22: monitor label-switched-path Output Fields

Field Name	Field Description
(1)	Displays the following information: <ul style="list-style-type: none"> • hostname—Name of the router. • Seconds—Time elapsed since this display was started. • Time—Current local time.
(2)	Delay —Length of the time delay, in milliseconds, required to obtain the information in the monitor display. The first number shows the current sampling delay. The second number shows the shortest delay recorded to date. The third number shows the worst delay recorded to date. This delay can vary substantially depending on the system load.
(3)	Displays the following: <ul style="list-style-type: none"> • To—Destination address of the LSP. • From—Originating address of the LSP. • State—Current state of the LSP: Up or Down.
(4)	Displays the following: <ul style="list-style-type: none"> • LSPName—Name of the LSP. • Type—Type of LSP: Ingress, Egress, or Transit.
(5)	Displays the following: <ul style="list-style-type: none"> • Label in—Incoming label of the LSP. • Label out—Outgoing label of the LSP.
(6)	Port number —Port number for the sending router, the port number for the receiving router, and the protocol ID. For MPLS traffic engineering applications, the protocol ID is always 0.
(7/8)	Record route —All intermediate and egress router addresses for this LSP.
(9/10/11)	Displays traffic statistics: <ul style="list-style-type: none"> • Output packets—Number of packets that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago. • Output bytes—Number of bytes that have traversed this LSP, and the change (delta) in the number since the last sample, typically 1 second ago.
(12)	Displays any errors the router encountered while attempting to retrieve information on the LSP.
(13)	Lists the keyboard commands you can use to navigate to other LSPs. For a description of the keyboard commands, see Table 21 on page 101.

Sample Output

```

monitor
label-switched-path
user@host> monitor label-switched-path
(1) host                               Seconds: 112           Time: 15:32:22
(2)                                     Delay: 0/0/0
(3) To 10.10.10.16, From 10.10.10.17, state: Up
(4) LSPname: k, type: Ingress
(5) Label in: -, Label out: 126000
(6) Port number: sender 1, receiver 45583, protocol 0
(7) Record Route: <self> 192.168.224.196
(8)   192.168.224.202 192.168.224.179
(9) Traffic statistics:                               Current delta
(10)  Output packets:                                0                      [0]
(11)  Output bytes:                                  0                      [0]

    LSP='l'

```

monitor list

Syntax	monitor list
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the status of monitored log and trace files.
Options	This command has no options.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols protocol] hierarchy levels.
Required Privilege Level	trace
Related Documentation	<ul style="list-style-type: none"> monitor start on page 105 monitor stop on page 107
List of Sample Output	monitor list on page 104
Output Fields	Table 23 on page 104 describes the output fields for the monitor list command. Output fields are listed in the approximate order in which they appear.

Table 23: monitor list Output Fields

Field Name	Field Description
monitor start	Indicates the file is being monitored.
"filename"	Name of the file that is being monitored.
Last changed	Date and time at which the file was last modified.

Sample Output

monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

monitor start

Syntax	<code>monitor start <i>filename</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Start displaying the system log or trace file and additional entries being added to those files.
Options	<i>filename</i> —Specific log or trace file.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols protocol] hierarchy levels.

NOTE: To monitor a log file within a logical system, issue the `monitor start logical-system-name/filename` command.

Required Privilege Level	trace
Related Documentation	<ul style="list-style-type: none"> • monitor list on page 104 • monitor stop on page 107
List of Sample Output	monitor start on page 106
Output Fields	Table 24 on page 105 describes the output fields for the monitor start command. Output fields are listed in the approximate order in which they appear.

Table 24: monitor start Output Fields

Field Name	Field Description
<i>filename</i>	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
<i>Date and time</i>	Timestamp for the log entry.

Sample Output

monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from trip.jcmax.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

monitor stop

Syntax	<code>monitor stop <i>filename</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Stop displaying the system log or trace file.
Options	<i>filename</i> —Specific log or trace file.
Additional Information	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the syslog statement at the [edit system] hierarchy level and the options statement at the [edit routing-options] hierarchy level. The trace files generated by the routing protocol process are those configured with traceoptions statements at the [edit routing-options] , [edit interfaces] , and [edit protocols <i>protocol</i>] hierarchy levels.
Required Privilege Level	trace

Output Fields	This command produces no output.

Sample Output

`monitor stop` `user@host> monitor stop`

monitor traffic

Syntax `monitor traffic`
 `<brief | detail | extensive>`
 `<absolute-sequence>`
 `<count count>`
 `<interface interface-name>`
 `<layer2-headers>`
 `<matching matching>`
 `<no-domain-names>`
 `<no-promiscuous>`
 `<no-resolve>`
 `<no-timestamp>`
 `<print-ascii>`
 `<print-hex>`
 `<resolve-timeout>`
 `<size size>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display packet headers or packets received and sent from the Routing Engine.

NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

NOTE: This command is not supported on the QFabric system.

Options **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

brief | detail | extensive—(Optional) Display the specified level of output.

absolute-sequence—(Optional) Display absolute TCP sequence numbers.

count *count*—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The **monitor traffic** command quits automatically after displaying the number of packets specified.

interface *interface-name*—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

layer2-headers—(Optional) Display the link-level header on each line.

matching *matching*—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

no-domain-names—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

no-promiscuous—(Optional) Do not put the interface into promiscuous mode.

no-resolve—(Optional) Suppress reverse lookup of the IP addresses.

no-timestamp—(Optional) Suppress timestamps on displayed packets.

print-ascii—(Optional) Display each packet in ASCII format.

print-hex—(Optional) Display each packet, except the link-level header, in hexadecimal format.

resolve-timeout *timeout*—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

size *size*—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

Additional Information In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

monitor traffic matching "*expression*"

Replace ***expression*** with one or more of the match conditions listed in [Table 25 on page 110](#).

Table 25: Match Conditions for the monitor traffic Command

Match Type	Condition	Description
Entity	host [<i>address</i> <i>hostname</i>]	Matches packets that contain the specified address or hostname. The protocol match conditions arp , ip , or rarp , or any of the directional match conditions can be prepended to the host match condition.
	net <i>address</i>	Matches packets with source or destination addresses containing the specified network address.
	net <i>address mask mask</i>	Matches packets containing the specified network address and subnet mask.
	port (<i>port-number</i> <i>port-name</i>)	Matches packets containing the specified source or destination TCP or UDP port number or port name. In place of the numeric port address, you can specify a text synonym, such as bgp (179), dhcp (67), or domain (53) (the port numbers are also listed).
Directional	dst	Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.
	src	Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.
	src and dst	Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.
	src or dst	Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.
Packet Length	less <i>value</i>	Matches packets shorter than or equal to the specified value, in bytes.
	greater <i>value</i>	Matches packets longer than or equal to the specified value, in bytes.

Table 25: Match Conditions for the monitor traffic Command (*continued*)

Match Type	Condition	Description
Protocol	amt	Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.
	arp	Matches all ARP packets.
	ether	Matches all Ethernet packets.
	ether (broadcast multicast)	Matches broadcast or multicast Ethernet frames. This match condition can be prepended with src and dst .
	ether protocol (address (arp ip rarp))	Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The ether protocol arguments arp , ip , and rarp are also independent match conditions, so they must be preceded by a backslash (\) when used in the ether protocol match condition.
	icmp	Matches all ICMP packets.
	ip	Matches all IP packets.
	ip (broadcast multicast)	Matches broadcast or multicast IP packets.
	ip protocol (address (icmp igmp tcp udp))	Matches packets with the specified address or protocol type. The ip protocol arguments icmp , tcp , and udp are also independent match conditions, so they must be preceded by a backslash (\) when used in the ip protocol match condition.
	isis	Matches all IS-IS routing messages.
	rarp	Matches all RARP packets.
	tcp	Matches all TCP datagrams.
	udp	Matches all UDP datagrams.

To combine expressions, use the logical operators listed in [Table 26 on page 111](#).

Table 26: Logical Operators for the monitor traffic Command

Logical Operator (Highest to Lowest Precedence)	Description
!	Logical NOT. If the first condition does not match, the next condition is evaluated.

Table 26: Logical Operators for the monitor traffic Command (*continued*)

Logical Operator (Highest to Lowest Precedence)	Description
&&	Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped.
	Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.
()	Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 27 on page 113](#).

NOTE: Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (**| match**) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 25 on page 110](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

Table 27: Arithmetic and Relational Operators for the monitor traffic Command

Arithmetic or Relational Operator	Description
Arithmetic Operator	
+	Addition operator.
-	Subtraction operator.
/	Division operator.
&	Bitwise AND.
*	Bitwise exclusive OR.
	Bitwise inclusive OR.
Relational Operator (Highest to Lowest Precedence)	
<=	If the first expression is less than or equal to the second, the packet matches.
>=	If the first expression is greater than or equal to the second, the packet matches.
<	If the first expression is less than the second, the packet matches.
>	If the first expression is greater than the second, the packet matches.
=	If the compared expressions are equal, the packet matches.
!=	If the compared expressions are unequal, the packet matches.

mtrace

Syntax	<code>mtrace source</code> <code><logical-system logical-system-name></code> <code><routing-instance routing-instance-name></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 9.5 for SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for the PTX Series.
Description	Display trace information about an IP multicast path.
Options	source —Source hostname or address. logical-system (logical-system-name) —(Optional) Perform this operation on a logical system. routing-instance routing-instance-name —(Optional) Trace a particular routing instance.
Additional Information	The mtrace command for multicast traffic is similar to the traceroute command used for unicast traffic. Unlike traceroute , mtrace traces traffic backwards, from the receiver to the source.
Required Privilege Level	view
List of Sample Output	mtrace source on page 120
Output Fields	Table 28 on page 118 describes the output fields for the mtrace command. Output fields are listed in the approximate order in which they appear.

Table 28: mtrace Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.

Table 28: mtrace Output Fields (*continued*)

Field Name	Field Description
<i>protocol</i>	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

Sample Output

mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2)  PIM thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2)  PIM thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

mtrace from-source

Syntax `mtrace from-source source source`
`<brief | detail>`
`<extra-hops extra-hops>`
`<group group>`
`<interval interval>`
`<loop>`
`<max-hops max-hops>`
`<max-queries max-queries>`
`<multicast-response | unicast-response>`
`<no-resolve>`
`<no-router-alert>`
`<response response>`
`<routing-instance routing-instance-name>`
`<ttl ttl>`
`<wait-time wait-time>`

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

Options `brief | detail`—(Optional) Display the specified level of output.

`extra-hops extra-hops`—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

`group group`—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

`interval interval`—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

`loop`—(Optional) Loop indefinitely, displaying rate and loss statistics.

`max-hops max-hops`—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

`max-queries max-queries`—(Optional) Maximum number of query attempts for any hop. The range of values is **1** through **32**. The default is **3**.

`multicast-response`—(Optional) Always request the response using multicast.

`no-resolve`—(Optional) Do not attempt to display addresses symbolically.

`no-router-alert`—(Optional) Do not use the router-alert IP option.

`response response`—(Optional) Send trace response to a host or multicast address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

source *source*—Source hostname or address.

ttl *tll*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

unicast-response—(Optional) Always request the response using unicast.

wait-time *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

Required Privilege Level view

List of Sample Output [mtrace from-source on page 123](#)

Output Fields [Table 29 on page 122](#) describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

Table 29: mtrace from-source Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
number-of-hops	Number of hops from the source to the named router or switch.
router-name	Name of the router or switch for this hop.
address	Address of the router or switch for this hop.
protocol	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.
source	Source address.
Response Dest	Response destination address.
Overall	Average packet rate for all traffic at each hop.

Table 29: mtrace from-source Output Fields (*continued*)

Field Name	Field Description
Packet Statistics for Traffic From	Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop.
Receiver	IP address receiving the multicast.
Query source	IP address sending the mtrace query.

Sample Output

mtrace from-source

```

user@host> mtrace from-source source 192.1.4.2 group 225.1.1.1
Mtrace from 192.1.4.2 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
  0  routerA.lab.mycompany.net (192.1.1.2)
 -1  routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
 -2  routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
 -3  hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.

Waiting to accumulate statistics...Results after 10 seconds:

Source      Response Dest    Overall    Packet Statistics For Traffic From

```

mtrace monitor

Syntax	mtrace monitor
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Listen passively for IP multicast responses. To exit the mtrace monitor command, type Ctrl+c.
Options	none —Trace the master instance.
Required Privilege Level	view
List of Sample Output	mtrace monitor on page 125
Output Fields	Table 30 on page 124 describes the output fields for the mtrace monitor command. Output fields are listed in the approximate order in which they appear.

Table 30: mtrace monitor Output Fields

Field Name	Field Description
Mtrace query at	Date and time of the query.
by	Address of the host issuing the query.
resp to	Response destination.
qid	Query ID number.
packet from...to	IP address of the query source and default group destination.
from...to	IP address of the multicast source and the response address.
via group	IP address of the group to trace.
mxhop	Maximum hop setting.

Sample Output

mtrace monitor

```
user@host> mtrace monitor
Mtrace query at Oct 22 13:36:14 by 192.1.3.2, resp to 224.0.1.32, qid 74a5b8
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:17 by 192.1.3.2, resp to 224.0.1.32, qid 1d07ba
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:20 by 192.1.3.2, resp to same, qid 2fea1d
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)

Mtrace query at Oct 22 13:36:30 by 192.1.3.2, resp to same, qid 7c88ad
packet from 192.1.3.2 to 224.0.0.2
from 192.1.3.2 to 192.1.3.38 via group 224.1.1.1 (mxhop=60)
```

mtrace to-gateway

Syntax	mtrace to-gateway gateway gateway <brief detail> <extra-hops <i>extra-hops</i> > <group <i>group</i> > <interface <i>interface-name</i> > <interval <i>interval</i> > <loop> <max-hops <i>max-hops</i> > <max-queries <i>max-queries</i> > <multicast-response unicast-response> <no-resolve> <no-router-alert> <response <i>response</i> > <routing-instance <i>routing-instance-name</i> > <tll <i>tll</i> > <unicast-response> <wait-time <i>wait-time</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series.
Description	Display trace information about a multicast path from this router or switch to a gateway router or switch.
Options	gateway gateway —Send the trace query to a gateway multicast address. brief detail —(Optional) Display the specified level of output. extra-hops <i>extra-hops</i> —(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between 0 and 255 . group <i>group</i> —(Optional) Group address for which to trace the path. The default group address is 0.0.0.0 . interface <i>interface-name</i> —(Optional) Source address for sending the trace query. interval <i>interval</i> —(Optional) Number of seconds to wait before gathering statistics again. The default value is 10 . loop —(Optional) Loop indefinitely, displaying rate and loss statistics. max-hops <i>max-hops</i> —(Optional) Maximum hops to trace toward the source. You can specify a number between 0 and 255 . The default value is 32 . max-queries <i>max-queries</i> —(Optional) Maximum number of query attempts for any hop. You can specify a number between 0 and 255 . The default value is 3 . multicast-response —(Optional) Always request the response using multicast. no-resolve —(Optional) Do not attempt to display addresses symbolically.

no-router-alert—(Optional) Do not use the router-alert IP option.

response *response*—(Optional) Send trace response to a host or multicast address.

routing-instance *routing-instance-name*—(Optional) Trace a particular routing instance.

ttl *tll*—(Optional) IP time-to-live value. You can specify a number between 0 and 225. Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

unicast-response—(Optional) Always request the response using unicast.

wait-time *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

Required Privilege Level

List of Sample Output [mtrace to-gateway on page 128](#)

Output Fields [Table 31 on page 127](#) describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

Table 31: mtrace to-gateway Output Fields

Field Name	Field Description
Mtrace from	IP address of the receiver.
to	IP address of the source.
via group	IP address of the multicast group (if any).
Querying full reverse path	Indicates the full reverse path query has begun.
<i>number-of-hops</i>	Number of hops from the source to the named router or switch.
<i>router-name</i>	Name of the router or switch for this hop.
<i>address</i>	Address of the router or switch for this hop.
<i>protocol</i>	Protocol used (for example, PIM).
Round trip time	Average round-trip time, in milliseconds (ms).
total ttl of	Time-to-live (TTL) threshold.

Sample Output

mtrace to-gateway user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief

```
Mtrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
Querying full reverse path... * *
 0  routerA.lab.mycompany.net (192.1.1.2)
-1  routerA.lab.mycompany.net (192.1.1.2)  PIM  thresh^ 1
-2  routerB.lab.mycompany.net (192.1.2.2)  PIM  thresh^ 1
-3  routerC.lab.mycompany.net (192.1.3.2)  PIM  thresh^ 1
Round trip time 2 ms; total ttl of 3 required.
```

traceroute

Syntax	<pre> traceroute <i>host</i> <as-number-lookup> <bypass-routing> <clns> <gateway <i>address</i>> <inet inet6> <interface <i>interface-name</i>> <logical system <i>logical-system-name</i>> <monitor <i>host</i>> <mpls (<i>ldp FEC address</i> <i>rsvp label-switched-path-name</i>)> <no-resolve> <propagate-ttl> <routing-instance <i>routing-instance-name</i>> <source <i>source-address</i>> <tos <i>value</i>> <ttl <i>value</i>> <wait <i>seconds</i>> </pre>
Syntax (QFX Series)	<pre> traceroute <i>host</i> <as-number-lookup> <bypass-routing> <gateway <i>address</i>> <inet> <interface <i>interface-name</i>> <monitor <i>host</i>> <no-resolve> <routing-instance <i>routing-instance-name</i>> <source <i>source-address</i>> <tos <i>value</i>> <ttl <i>value</i>> <wait <i>seconds</i>> </pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>mpls option introduced in Junos OS Release 9.2.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>propagate-ttl option introduced in Junos OS Release 12.1.</p>
Description	<p>Display the route that packets take to a specified network host. Use traceroute as a debugging tool to locate points of failure in a network.</p>
Options	<p>host—IP address or name of remote host.</p> <p>as-number-lookup—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.</p> <p>bypass-routing—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.</p>

clns—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

gateway address—(Optional) Address of a router or switch through which the route transits.

inet | inet6—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

interface *interface-name*—(Optional) Name of the interface over which to send packets.

logical-system *logical-system-name*—(Optional) Perform this operation on all logical systems or on a particular logical system.

monitor *host*—(Optional) Display real-time monitoring information for the specified host.

mpls (*ldp FEC address | rsvp label-switched-path name*)—(Optional) See [traceroute mpls ldp](#) and [traceroute mpls rsvp](#).

no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

propagate-ttl—(Optional) On the PE router, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only. Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

NOTE: Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the traceroute attempt.

source *source-address*—(Optional) Source address of the outgoing traceroute packets.

tos *value*—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

ttl *value*—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

wait *seconds*—(Optional) Maximum time to wait for a response to the traceroute request.

Required Privilege Level network

traceroute monitor

Syntax	<pre>traceroute monitor <i>host</i> <count <i>value</i>> <inet inet 6> <interval <i>seconds</i>> <no resolve> <size <i>value</i>> <source <i>source-address</i>> <summary></pre>
Syntax (QFX Series)	<pre>traceroute monitor <i>host</i> <count <i>value</i>> <inet> <interval <i>seconds</i>> <no resolve> <size <i>value</i>> <source <i>source-address</i>> <summary></pre>
Release Information	<p>Command introduced in Junos OS Release 8.0</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.
Options	<p><i>host</i>—IP address or name of remote host.</p> <p><i>count value</i>—Number of ping requests, in packets, to send in summary mode. The default value is 10.</p> <p><i>inet inet6</i>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><i>interval seconds</i>—(Optional) Number of seconds to wait before sending ping requests. The default value is 1.</p> <p><i>no resolve</i>—(Optional) Do not attempt to display addresses symbolically.</p> <p><i>size value</i>—(Optional) Receive the specified number of bytes for each packet. The range is 0 through 65468 bytes. The default value is 64.</p> <p><i>source source-address</i>—(Optional) Source address of the outgoing ping packets.</p> <p><i>summary</i>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p>
Required Privilege Level	network
List of Sample Output	traceroute monitor on page 134
Output Fields	<p>Table 33 on page 134 describes the output fields for the traceroute monitor command. Output fields are listed in the approximate order in which they appear.</p>

Table 33: traceroute monitor Output Fields

Field Name	Field Description
Host	Hostname or IP address of the router at each hop.
Loss%	Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage.
Snt	Number of ping requests sent to the router at this hop.
Last	Most recent round-trip time, in milliseconds, to the router at this hop.
Avg	Average round-trip time, in milliseconds, to the router at this hop.
Best	Shortest round-trip time, in milliseconds, to the router at this hop.
Wrst	Longest round-trip time, in milliseconds, to the router at this hop.
StDev	Standard deviation of round-trip times, in milliseconds, to the router at this hop.

Sample Output

traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

	Loss%	Snt	Last	Avg	Best	Wrst	StDev
Host							
1. 10.17.41.254	0.0%	17	0.7	1.0	0.6	5.4	1.2
2. secret.net	0.0%	17	0.6	1.0	0.6	6.6	1.4
3. top-secret.net	0.0%	17	0.6	0.6	0.6	0.6	0.0

traceroute mpls ldp

Syntax `traceroute mpls <ldp> fec`
`<destination>`
`<detail>`
`<exp>`
`<fanout>`
`<logical-system>`
`<no-resolve>`
`<paths>`
`<retries>`
`<routing-instance>`
`<source>`
`<ttl>`
`<update>`
`<wait>`

Release Information Command introduced in Junos OS Release 8.4.

Description Trace route to a remote host for an MPLS label-switched path signaled by the LDP. Use **traceroute mpls ldp** as a debugging tool to locate MPLS label-switched path forwarding issues in a network. (Currently supported for IPv4 packets only.)

Options *fec*—Specify the IP address and optional prefix of the forwarding equivalence class (FEC).

destination—(Optional) Specify the destination address to use when sending probes.

detail—(Optional) Display detailed output.

exp—(Optional) Specify the class-of-service to use when sending probes. The range of values is 0 through 7. The default value is 7.

fanout—(Optional) Specify the maximum number of nexthops to search per node. The range of values is 1 through 16. The default value is 16.

logical-system—(Optional) Specify the name of the logical system for the traceroute attempt.

no-resolve—(Optional) Specify not to resolve the hostname that corresponds to the IP address.

paths—(Optional) Specify the number of paths to search. The range of values is 1 through 255. The default value is 16.

retries—(Optional) Specify the number of times to resend probe. values. The range of values is 1 through 9. The default value is 3.

routing-instance *routing-instance-name*—(Optional) Specify the name of the routing instance for the traceroute attempt.

source *source-address*—(Optional) Specify the source address of the outgoing traceroute packets.

ttl value—(Optional) Specify the maximum time-to-live value to include in the traceroute request, in seconds. The range of values is **1** through **125** and the default value is **64**.

wait seconds—(Optional) Specify the number of seconds to wait before resending a probe. The range of values is **5** through **15** and the default value is **10** seconds.

Required Privilege Level network

Output Fields [Table 34 on page 136](#) describes the output fields for the **traceroute mpls ldp fec** command and the **traceroute mpls ldp fec detail** commands. Output fields are listed in the approximate order in which they appear.

Table 34: traceroute mpls ldp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the traceroute mpls ldp fec command.	all levels
ttl	Time to live value of the labeled packet.	none specified
Label	Outgoing label used for forwarding the packet along the label-switched paths.	none specified
Protocol	Signaling protocol used. For this command, it is LDP.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null .	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths).	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	detail
Parent	Address of the previous hop. Parent value for the first hop is null .	detail
Return Code	Return code for reporting the result of processing the echo request by the receiver.	detail
Response time	Time for the echo request to reach the receiver.	detail
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none .	detail

Table 34: traceroute mpls ldp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Label Stack	Label stack used to forward the packet.	detail

traceroute mpls rsvp

Syntax	<code>traceroute mpls <rsvp> <i>lsp-name</i></code> <code><detail></code> <code><egress></code> <code><exp></code> <code><logical-system></code> <code><multipoint></code> <code><no-resolve></code> <code><retries></code> <code><source <i>source-address</i>></code> <code><ttl></code>
Release Information	Command introduced in Junos OS Release 9.2. <code>egress</code> , <code>multipoint</code> , and <code>ttl</code> options added in Junos OS Release 11.2.
Description	Trace route to a remote host for an MPLS LSP signaled by RSVP. Use traceroute mpls rsvp as a debugging tool to locate MPLS label-switched path (LSP) forwarding issues in a network. (Currently supported for IPv4 packets only.)
Options	<p><i>lsp-name</i>—Specify the name of the LSP to be traced.</p> <p><code>detail</code>—(Optional) Display detailed output.</p> <p><code>egress</code>—(Optional) Request that a specific point-to-multipoint egress node reply to the trace route. The trace route would follow the associated sub-LSP to the egress node.</p> <p><code>exp</code>—(Optional) Specify the class of service to use when sending probes. The range of values is 0 through 7. The default value is 7.</p> <p><code>logical-system</code>—(Optional) Specify the name of the logical system for the traceroute attempt.</p> <p><code>multipoint</code>—(Optional) Perform a trace route on a point-to-multipoint LSP.</p> <p><code>no-resolve</code>—(Optional) Specify not to resolve the hostname that corresponds to the IP address.</p> <p><code>retries</code>—(Optional) Specify the number of times to resend probe. The range of values is 1 through 9. The default value is 3.</p> <p><code>source <i>source-address</i></code>—(Optional) Specify the source address of the outgoing traceroute packets.</p> <p><code>ttl</code>—(Optional) Specify the number of hops to follow before forcing the trace route to quit.</p>
Required Privilege Level	network

Output Fields Table 35 on page 139 describes the output fields for the **traceroute mpls rsvp *lsp-name*** and **traceroute mpls rsvp *lsp-name* detail** commands. Output fields are listed in the approximate order in which they appear.

Table 35: traceroute mpls rsvp Output Fields

Field Name	Field Description	Level of Output
Probe options	Probe options specified in the traceroute mpls rsvp <i>lsp-name</i> command.	all levels
ttl	Time-to-live value of the labeled packet.	none specified
Label	MPLS label used to forward the packets along the LSP.	none specified
Protocol	Signaling protocol used. For this command, it is RSVP-TE.	none specified
Address	Address of the next hop.	none specified
Previous Hop	Address of the previous hop. Previous hop address of the first hop is null .	none specified
Probe status	Forwarding status from the first hop to the last-hop label-switching router (egress point in the label-switched paths). Displays Success if the trace to a hop is successful or Egress if the trace has reached the last router on the path.	none specified
Hop	Address of the hops in the label-switched path from the first hop to the last hop. Depth indicates the level of the hop.	detail
Parent	Address of the previous hop. Parent value for the first hop is null .	detail
Return Code	Return code for reporting the result of processing the echo request by the receiver.	detail
Sender timestamp	Displays the timestamp when the MPLS echo request is sent to the next hop.	detail
Receiver timestamp	Timestamp when the echo request from the previous hop is received and acknowledged with an echo response by the next hop.	detail
Response time	Time for the echo request to reach the receiver.	detail
MTU	Size of the largest packet that includes the label stack forwarded to the next hop.	detail

Table 35: traceroute mpls rsvp Output Fields (*continued*)

Field Name	Field Description	Level of Output
Multipath type	Labels or addresses used by the specified multipath type. If multipaths are not used, the value is none .	detail
Label stack	Label stack used to forward the packet.	detail
Path	Displays the sub-lsp path number for this traceroute, the interface used, and the destination address.	all levels

CHAPTER 6

Accounting Operational Mode Commands

Table 36 on page 145 summarizes the command-line interface (CLI) commands you can use to monitor and troubleshoot the Link Layer Discovery Protocol (LLDP) protocol. Commands are listed in alphabetical order.

Table 36: Accounting Operational Mode Commands

Task	Command
Clear LLDP neighbor information.	<code>clear lldp neighbor</code>
Clear LLDP statistics.	<code>clear lldp statistics</code>
Display basic LLDP information.	<code>show lldp</code>
Display LLDP local information.	<code>show lldp local-information</code>
Display LLDP neighbor information.	<code>show lldp neighbors</code>
Display LLDP remote global statistics.	<code>show lldp remote-global-statistics</code>
Display LLDP statistics.	<code>show lldp statistics</code>
Display accounting profile information.	<code>show accounting profile</code>
Display accounting records for the specified accounting profile.	<code>show accounting records</code>

clear lldp neighbor

Syntax	clear lldp neighbor <interface <i>interface-name</i>>
Release Information	Command introduced in Junos OS Release 9.6.
Description	<p>On MX Series and T Series routers, clear information regarding all Link Layer Discovery Protocol (LLDP) neighbors or LLDP neighbors of the specified interface.</p> <p>For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.</p>
Options	interface <i>interface-name</i> —(Optional) Clear the LLDP neighbors on the specified interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• clear lldp statistics on page 147
List of Sample Output	clear lldp statistics on page 146
Output Fields	When you enter this command, you are provided no feedback on the status of your request. You can enter the show lldp neighbors command before and after clearing the LLDP neighbors to verify the clear operation.

Sample Output

```
clear lldp statistics      user@host> clear lldp statistics
                           user@host> clear lldp statistics interface ge-0/2/0
```

clear lldp statistics

Syntax	<code>clear lldpp neighbor</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	<p>On MX Series and T Series routers, clear all Link Layer Discovery Protocols (LLDP) statistics or LLDP statistics associated with the specified interface.</p> <p>For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.</p>
Options	<code>interface <i>interface-name</i></code> —(Optional) Clear LLDP statistics on the specified interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • clear lldp neighbor on page 146
List of Sample Output	clear lldp neighbor on page 147
Output Fields	When you enter this command, you are provided no feedback on the status of your request. You can enter the show lldp statistics command before and after clearing the LLDP statistics to verify the clear operation.

Sample Output

```
clear lldp neighbor      user@host> clear lldp neighbors
                        user@host> clear lldp neighbors interface ge-0/2/2
```

show lldp

Syntax	<code>show lldp</code> <code><detail></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	On MX Series and T Series routers, display information about the Link Layer Discovery Protocol (LLDP).
Options	detail —(Optional) Display the detailed output level.
Required Privilege Level	view
List of Sample Output	show lldp on page 150 show lldp detail on page 150
Output Fields	Table 37 on page 148 describes the output fields for the show lldp command. Output fields are listed in the approximate order in which they appear.

Table 37: show lldp Output Fields

Field Name	Field Description
LLDP	Status of LLDP: Enabled or Disabled .
Advertisement interval	Value of the advertisement interval parameter.
Transmit delay	Value of the transmit delay parameter.
Hold timer	Value of the hold timer parameter.
Notification interval	Value of the notification interval parameter.
Config Trap Interval	Value of the configuration trap parameter.
Connection Hold timer	Value of the connection hold timer parameter.
Interface	<p>List of LLDP interfaces, showing status (Enabled or Disabled) and Neighbor count (detail only).</p> <p>For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.</p>
LLDP basic TLVs supported	List of basic LLDP TLVs supported by this device (detail only).

Table 37: show lldp Output Fields (*continued*)

Field Name	Field Description
LLDP 802 TLVs supported	List of IEEE 802.1 LLDP TLVs supported by this device (detail only).

Sample Output

show lldp

```
user@host> show lldp
LLDP : Enabled
Advertisement interval : 30 Second(s)
Transmit delay : 2 Second(s)
Hold timer : 4 Second(s)
Notification interval : 30 Second(s)
Config Trap Interval : 300 Second(s)
Connection Hold timer : 60 Second(s)
```

Interface	LLDP
ge-0/0/0	Enabled
ge-0/0/1	Enabled
ge-0/0/4	Enabled

Sample Output

show lldp detail

```
user@host> show lldp detail
LLDP : Enabled
Advertisement interval : 30 Second(s)
Transmit delay : 2 Second(s)
Hold timer : 4 Second(s)
Notification interval : 30 Second(s)
Config Trap Interval : 300 Second(s)
Connection Hold timer : 60 Second(s)
```

Interface	LLDP	Neighbor count
ge-0/0/0	Enabled	0
ge-0/0/1	Enabled	0
ge-0/0/4	Enabled	0

LLDP basic TLVs supported:

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

LLDP 802 TLVs supported:

Link aggregation, Maximum frame size, MAC/PHY Configuration/Status, Port VLAN ID, Port VLAN name.

show lldp local-information

Syntax	show lldp local-information
Release Information	Command introduced in Junos OS Release 9.6.
Description	On MX Series and T Series routers, display local Link Layer Discovery Protocol (LLDP) information.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show lldp local-information on page 152
Output Fields	Table 38 on page 151 describes the output fields for the show lldp local-information command. Output fields are listed in the approximate order in which they appear.

Table 38: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information that follows pertains to the local system.
Chassis ID	List of chassis identifiers for local information.
System name	Local system name reported by LLDP.
System descr	Local system description reported by LLDP.
System Capabilities	Capabilities (such as Bridge or Router) that are Supported or Enabled by system on the interface.
Management Information	Listed by Interface Name , Address Subtype (such as ipv4), Address (such as 192.168.168.229), Interface Number , and Interface Numbering Subtype .
Interface Name	List of local interfaces. For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.
Interface ID	List of local interface identifiers.
Interface Description	List of local interface descriptions.
Status	List of interface conditions: UP or DOWN .

Sample Output

show lldp
local-information

user@host> **show lldp local-information**

LLDP Local Information details

Chassis ID : 00:90:69:0a:77:c0

System name : sw-mx-u

System descr : Juniper Networks, Inc. MX 960, Version 9.4I0.1, Build date
2008-09-04 14:51:50 UTC

System Capabilities

Supported : Bridge Router

Enabled : Bridge Router

Management Information

Interface Name : fxp0

Address Subtype : IPv4(1)

Address : 192.168.168.229

Interface Number : 1

Interface Numbering Subtype : ifIndex(2)

Interface Name	Interface ID	Interface Description	Status
ge-0/1/0	18	Avaya Port	UP
ge-0/1/1	27	-	DOWN
ge-0/1/2	13	Port for Hub	UP

show lldp neighbors

Syntax	<code>show lldp neighbors</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	On MX Series and T Series routers, display information about LLDP neighbors. For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.
Options	<code>interface <i>interface-name</i></code> —(Optional) Display the neighbor information about a particular physical interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear lldp neighbor on page 146
List of Sample Output	show lldp neighbors on page 155 show lldp neighbors interface ge-0/0/4 on page 155
Output Fields	Table 39 on page 153 describes the output fields for the show lldp neighbors command. Output fields are listed in the approximate order in which they appear.

Table 39: show lldp neighbors Output Fields

Field Name	Field Description
LLDP Remote Devices Information	Information about remote devices.
LocalInterface	List of local interfaces for which neighbor information is available.
ChassisId	List of chassis identifiers for neighbors.
PortInfo	List of port information gathered from neighbors. This could be the port identifier or port description.
SysName	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both local and neighbor systems on the interface (appears when the <code>interface</code> option is used).
Local Information	Information about local systems on the interface (appears when the <code>interface</code> option is used).

Table 39: show lldp neighbors Output Fields (*continued*)

Field Name	Field Description
Neighbor Information	Information about both local and neighbor system on the interface (appears when the interface option is used).
Index	Local interface index (appears when the interface option is used).
Time Mark	Date and timestamp of information (appears when the interface option is used).
Time To Live	Number of seconds for which this information is valid (appears when the interface option is used).
Local Interface	Name of the local physical interface (appears when the interface option is used).
Local Port ID	Local port identifier (appears when the interface option is used).
Neighbor Information	Information about neighbor systems on the interface (appears when the interface option is used).
Chassis type	Type of chassis identifier supplied, such as MAC address (appears when the interface option is used).
Chassis ID	Chassis identifier of type listed (appears when the interface option is used).
Port type	Type of port identifier supplied, such as local (appears when the interface option is used).
Port ID	Port identifier of type listed (appears when the interface option is used).
Port description	Port description (appears when the interface option is used).
System name	Name supplied by the system on the interface (appears when the interface option is used).
System Description	Description supplied by the system on the interface (appears when the interface option is used).
System Capabilities	Capabilities (such as bridge or router) that are Supported or Enabled by the system on the interface (appears when the interface option is used).
Management address	Details of the management address: Address Type (such as ipv4), Address (such as 10.204.34.35), Interface Number , Interface Subtype , and Organization Identifier (OID) (appears when the interface option is used).
Organization Info	One or more entries listing remote information by Organizationally Unique Identifier (OUI), Subtype , Index , and Info (appears when the interface option is used).

Sample Output

show lldp remote-global-statistics

Syntax	show lldp remote-global-statistics
Release Information	Command introduced in Junos OS Release 9.6.
Description	On MX Series and T Series routers, display remote Link Layer Discovery Protocol (LLDP) global statistics.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show lldp remote-global-statistics on page 158
Output Fields	Table 40 on page 157 describes the output fields for the show lldp remote-global-statistics command. Output fields are listed in the approximate order in which they appear.

Table 40: show lldp remote-global-statistics Output Fields

Field Name	Field Description
LLDP Remote Database Table Counters	Information about remote database table counters.
LastchangeTime	Time elapsed between LLDP agent startup and the last change to the remote database table information.
Inserts	Number of insertions made in the remote database table.
Deletes	Number of deletions made in the remote database table.
Drops	Number of LLDP frames dropped from the remote database table because of errors.
Ageouts	Number of remote database table entries that have aged out of the table.

Sample Output

```
show lldp remote-global-statistics
user@host> show lldp remote-global-statistics
LLDP Remote Database Table Counters
LastchangeTime      Inserts    Deletes    Drops    Ageouts
00:00:76 (76 sec)   192        0          0        0
```

show lldp statistics

Syntax	show lldp statistics <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 9.6.
Description	On MX Series and T Series routers, display information about Link Layer Discovery Protocol (LLDP) statistics.
Options	interface <i>interface-name</i> —(Optional) Display the statistics about a particular physical interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear lldp statistics on page 147
List of Sample Output	show lldp statistics on page 160 show lldp statistics interface ge-0/1/1 on page 160
Output Fields	Table 41 on page 159 describes the output fields for the show lldp statistics command. Output fields are listed in the approximate order in which they appear.

Table 41: show lldp statistics Output Fields

Field Name	Field Description
Interface	Interface name. For information about interface names, see Interface Naming Overview. For information about interface names for TX Matrix routers, see TX Matrix Router Chassis and Interface Names. For information about FPC numbering on TX Matrix routers, see Routing Matrix with a TX Matrix Router FPC Numbering.
Received	Number of LLDP frames received on this interface.
Transmitted	Number of LLDP frames sent on this interface.
Unknown-TLVs	Number of LLDP frames with unsupported content received on this interface.
With-Errors	Number of LLDP frames with errors received on this interface.
Discarded	Number of LLDP frames received on this interface that were discarded because of problems.

Sample Output

show lldp statistics

```
user@host> show lldp statistics
Interface Received Transmitted Unknown-TLVs With-Errors Discarded
-----
ge-0/1/1  544      540        0          0          0
ge-0/1/2  540      500        0          0          0
ge-0/1/3  544      540        0          0          0
ge-0/1/4  544      540        0          0          0
ge-0/1/5  544      540        0          0          0
ge-0/1/6  544      540        0          0          0
ge-0/1/7  0         0          0          0          0
```

Sample Output

**show lldp statistics
interface ge-0/1/1**

```
user@host> show lldp statistics interface ge-0/1/1
Interface Received Transmitted Unknown-TLVs With-Errors Discarded
-----
ge-0/1/1  544      540        0          0          0
```

show accounting profile

Syntax	<code>show accounting profile <i>profile-name</i></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display accounting profile information.
Options	<i>profile-name</i> —Name of the accounting profile.
Required Privilege Level	view
List of Sample Output	show accounting profile (Interface) on page 163 show accounting profile (Filter) on page 163 show accounting profile (Destination Class) on page 163 show accounting profile (Routing Engine) on page 164
Output Fields	Table 42 on page 161 lists the output fields for the show accounting profile command. Output fields are listed in the approximate order in which they appear.

Table 42: show accounting profile Output Fields

Field Name	Field Description
Profile	Name of the accounting profile.
Sampling interval	Configured interval, in minutes, for statistic collection.
Profile Usage Count	Number of items configured for collecting accounting statistics.
<i>file information</i>	Information about the accounting profile log, including: <ul style="list-style-type: none"> • File—Name of accounting profile log. If no name is explicitly provided, the name of the accounting profile is used. All statistics files are placed in the <code>/var/log</code> directory. • maximum size—Configured size. When the size is exceeded, the log file closes and a new log file opens. • maximum number—Configured maximum number of log files. • bytes written—Number of bytes written to the log file.
Transfer Interval	Length of time (in minutes) the file remains open, receiving statistics before it is closed, transferred, and rotated. When either the time or the file size is exceeded, the file is closed and a new one opened, whether or not a transfer site is specified.
Next Scheduled Transfer	Time at which the next transfer occurs.

Table 42: show accounting profile Output Fields (*continued*)

Field Name	Field Description
Column Labels	<p>Names of sampled statistics. This list varies depending on the configuration:</p> <ul style="list-style-type: none"> • profile-layout—List of data fields reported, in the order they appear in the output. • epoch-timestamp—Number of seconds since the epoch. • interfaces—(For interface, filter, and destination class profiles) Name of the interfaces on which the filter is applied. • filter-name—(For filter profiles) Name of the filter. • counter-name—(For filter profiles) Name of the counter. • packet-count—(For filter and destination class profiles) Number of packets for the counter. • byte-count—(For filter and destination class profiles) Number of bytes for the counter. • input-bytes—(For interface profiles) Input bytes. • input-errors—(For interface profiles) Generic input error packets. • input-multicast—(For interface profiles) Input packets arriving by multicast. • input-packets—(For interface profiles) Input packets. • input-unicast—(For interface profiles) Input unicast packets. • output-bytes—(For interface profiles) Output bytes. • output-errors—(For interface profiles) Generic output error packets. • output-multicast—(For interface profiles) Output packets sent by multicast. • output-packets—(For interface profiles) Output packets. • output-unicast—(For interface profiles) Output unicast packets. • no-proto—(For interface profiles) Packets for unsupported protocol. • snmp-index—(For interface profiles) SNMP index. • destination-class-name—(For destination class profiles) Configured destination class name. • host name—(For Routing Engine profiles) Hostname for the router. • date-yyyyymmdd—(For Routing Engine profiles) Date. • timeofday-hhmmss—(For Routing Engine profiles) Time of day. • uptime—(For Routing Engine profiles) Time since the last reboot, in seconds. • cpu1min—(For Routing Engine profiles) Average system load over the last 1 minute. • cpu5min—(For Routing Engine profiles) Average system load over the last 5 minutes. • cpu15min—(For Routing Engine profiles) Average system load over the last 15 minutes.
Interface name	Name of the interface configured for this accounting profile.
Filter name	Name of the filter configured for this accounting profile.
routing-engine-stats	Routing Engine accounting profile.
Next Scheduled Collection	Time for next collection of statistics for the named interface.

Sample Output

show accounting records

Syntax	<code>show accounting records <i>profile-name</i></code> <code><since <i>time</i>></code> <code><utc_timestamp></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display accounting records for the specified accounting profile.
Options	<p><i>profile-name</i>—Name of the accounting profile.</p> <p>since <i>time</i>—(Optional) Display accounting statistics since the specified time (<i>YYYY-MM-DD-HH:MM:SS</i>)</p> <p>utc_timestamp—(Optional) Display the timestamp in Coordinated Universal Time (UTC) format.</p>
Required Privilege Level	view
List of Sample Output	show accounting records on page 167 show accounting records utc-timestamp on page 167 show accounting records (Since Time) on page 167 show accounting records (Filter Profile) on page 167 show accounting records (Destination Class Profile) on page 167 show accounting records (Routing Engine Profile) on page 167
Output Fields	<p>Table 43 on page 165 lists the output fields for the show accounting records command. Output fields are listed in the approximate order in which they appear.</p>

Table 43: show accounting records Output Fields

Field Name	Field Description
Timestamp	Date and time of sample.
Interface Name	(For interface profiles) Name and SNMP index of the interface for the accounting profile.
Filter name	(For filter profiles) Name of the filter.
Interfaces	(For filter profiles) Name of the interfaces for the accounting profile.
Counter name	(For filter profiles) Name of the counter.
Destination Class	(For destination class profiles) Name of the destination class.
Input Bytes	(For interface profiles) Input bytes.
Output Bytes	(For interface profiles) Output bytes.

Table 43: show accounting records Output Fields (*continued*)

Field Name	Field Description
Input Packets	(For interface profiles) Input packets.
Output Packets	(For interface profiles) Output packets.
Input Unicast Packets	(For interface profiles) Input unicast packets.
Output Unicast Packets	(For interface profiles) Output unicast packets
Input Multicast Packets	(For interface profiles) Input packets arriving by multicast.
Output Multicast Packets	(For interface profiles) Output packets sent by multicast.
Unsupported Protocol Packets	(For interface profiles) Packets for unsupported protocols.
Input Errors	(For interface profiles) Generic input error packets.
Output Errors	(For interface profiles) Generic output error packets.
Host Name	(For Routing Engine profiles) Hostname for the router.
Date	(For Routing Engine profiles) Date, in <i>YYYYMMDD</i> format.
Time of Day	(For Routing Engine profiles) Time of day, in <i>HHMMSS</i> format.
Uptime	(For Routing Engine profiles) Time since the last reboot, in seconds.
Average CPU Load (1 min)	(For Routing Engine profiles) Average system load over the last 1 minute.
Average CPU Load (5 min)	(For Routing Engine profiles) Average system load over the last 5 minutes.
Average CPU Load (15 min)	(For Routing Engine profiles) Average system load over the last 15 minutes.

CHAPTER 7

Chassis Operational Mode Commands

Table 44 on page 169 summarizes the command-line interface (CLI) commands you can use to monitor the router chassis. Commands are listed in alphabetical order.

Table 44: Chassis Operational Mode Commands

Task	CLI Command
(T Series and M320 routers only) Clear or stop a text message on the craft interface.	clear chassis display message
(T Series, M120, M320, and MX Series routers only) Change Control Board (CB) status information.	request chassis cb
(PTX Series Packet Transport Switches only) Control the operation of the Centralized Clock Generator (CCG).	request chassis ccg
(M7i and M10i routers only) Control the operation of the Compact Forwarding Engine Board (CFEB).	request chassis cfeb
(TX Matrix Plus routers only) Control the operation of the Connector Interface Panel (CIP).	request chassis cip
(PTX Series Packet Transport Switches only) Control which Centralized Clock Generator (CCG) is master.	request chassis clock master switch
(M120 and MX Series routers only) Control the operation of the specified fabric plane.	request chassis fabric plane
(M120 router only) Control the operation of the specified Forwarding Engine Board (FEB).	request chassis feb
(M20, M40, M40e, M120 M160, M320, and MX Series routers: T Series routers; and PTX Series Packet Transport Switches only) Control the operation of the Flexible PIC Concentrator (FPC).	request chassis fpc
(M40e, M120, M160, M320, and MX Series routers, and T Series routers only) Resynchronize the Front Panel Module (FPM) craft interface status	request chassis fpm resync

Table 44: Chassis Operational Mode Commands *(continued)*

Task	CLI Command
(TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, control the operation of the T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, control the operation of a specified router (line-card chassis) that is connected to the TX Matrix Plus router.	<code>request chassis lcc</code>
(MX Series routers) Control the operation of Modular Interface Cards (MICs)	<code>request chassis mic</code>
(M40e and M160 routers only) Control the operation of the Miscellaneous Control Subsystem (MCS).	<code>request chassis mcs</code>
(MX Series routers only) Control the operation of a MIC.	<code>request chassis mic</code>
(M40e and M160 routers only) Control the operation of the Packet Forwarding Engine Clock Generator (PCG).	<code>request chassis pcg</code>
Control the operation of a PIC.	<code>request chassis pic</code>
(M120 routers only) Control the operation of a FEB in a redundancy group.	<code>request chassis redundancy feb slot</code>
For routers with multiple Routing Engines, control which Routing Engine is the master.	<code>request chassis routing-engine master</code>
(T Series routers only) Control the operation of the specified SONET Clock Generator (SCG).	<code>request chassis scg</code>
(M40e and M160 routers only) Control which Switching and Forwarding Module (SFM) is master.	<code>request chassis sfm master switch</code>
(M40e and M160 routers only) Control the operation of the specified SFM.	<code>request chassis sfm</code>
(M320 routers and T Series routers only) Control the operation of the specified Switch Interface Board (SIB).	<code>request chassis sib</code>
(TX Matrix Plus routers only) Control the receiving link of the specified Switch Interface Board (SIB) of the SFC.	<code>request chassis sib f13 train-link-receive slot</code>
(TX Matrix Plus routers only) Control the transmission link of the specified Switch Interface Board (SIB) of the SFC.	<code>request chassis sib f13 train-link-transmit slot</code>
(T1600 routers (LCCs) and TX Matrix Plus routing platform only) Control the receiving link of the specified Switch Interface Board (SIB) of the LCC.	<code>request chassis sib train-link-receive slot</code>
(T1600 routers (LCCs) and TX Matrix Plus routing platform only) Control the transmission link of the specified Switch Interface Board (SIB) of the LCC.	<code>request chassis sib train-link-transmit slot</code>

Table 44: Chassis Operational Mode Commands *(continued)*

Task	CLI Command
(T Series routers only) Restart the specified Switch Processor Mezzanine Board (SPMB) on the CB.	<code>request chassis spmb restart</code>
On MX80, MX240, MX480, and MX960 routers and PTX Series Packet Transport Switches, you can change the chassis synchronization source used for synchronized Ethernet (Sync-E) configuration. This feature is not supported on MX80T routers.	<code>request chassis synchronization mode</code>
(M320 routers and PTX Series Packet Transport Switches only) Change the external clock source used for chassis synchronization.	<code>request chassis synchronization switch</code>
Send a message to the router's craft interface.	<code>set chassis display message</code>
Display chassis alarm status.	<code>show chassis alarms</code>
(M7i and M10i routers only) Change and display CFEB status information.	<code>show chassis cfeb</code>
(TX Matrix Plus routers only) Display environmental information about the CIP.	<code>show chassis cip</code>
View information that is currently displayed on the craft interface.	<code>show chassis craft-interface</code>
Display environmental information about the router chassis, including the temperature and information about the fans, power supplies, and Routing Engine.	<code>show chassis environment</code>
(T Series, M120, M320, and MX Series routers; and PTX Series Packet Transport Switches only) Display CB environmental information.	<code>show chassis environment cb</code>
(PTX Series Packet Transport Switches) Display environmental information about the Centralized Clock Generator.	<code>show chassis environment ccg</code>
(TX Matrix Plus router only) Display environmental information about the Connector Interface Panel (CIP).	<code>show chassis environment cip</code>
(M20, M40, M40e, M120, M160, M320, and MX Series routers; T Series routers; and PTX Series Packet Transport Switches only) Display FPC environmental status information.	<code>show chassis environment fpc</code>
(M20, M40, M40e, M120, M160, M320, and MX Series routers; T Series routers; and PTX Series Packet Transport Switches only) Change and display FPM status information.	<code>show chassis environment fpm</code>
(M40e and M160 routers only) Display MCS environmental status information.	<code>show chassis environment mcs</code>

Table 44: Chassis Operational Mode Commands *(continued)*

Task	CLI Command
(PTX Series Packet Transport Switches) Display status information for monitored temperatures.	<code>show chassis environment monitored</code>
Display generic environmental information.	<code>show chassis environment</code>
(M40e and M160 routers only) Display PCG environmental status information.	<code>show chassis environment pcg</code>
(PTX Series Packet Transport Switches) Display environmental information about Power Distribution Units (PDUs).	<code>show chassis environment pdu</code>
(M40e, M120, M160, M320, and MX Series routers, and T Series routers only) Display Power Entry Module (PEM) environmental status information.	<code>show chassis environment pem</code>
Display Routing Engine environmental status information.	<code>show chassis environment routing-engine</code>
(T Series routers only) Display SCG environmental information.	<code>show chassis environment scg</code>
(M40e and M160 routers only) Display SFM environmental information.	<code>show chassis environment sfm</code>
(M320 routers, T Series routers, and PTX Series Packet Transport Switches only) Display SIB environmental information.	<code>show chassis environment sib</code>
(M10i, M40e, M120, M160, M320, and MX Series routers; T Series routers; and PTX Series Packet Transport Switches only) Display information about the ports on the CB Ethernet switch.	<code>show chassis ethernet-switch</code>
(MX Series routers only) Display information about the fan and fan trays.	<code>show chassis fan</code>
(MX Series routers only) Display the state of fabric destinations for all FPCs.	<code>show chassis fabric destinations</code>
(M120 router only) Display the state of the electrical and optical switching fabric link between the FEBs and the fabric planes, as interpreted by the FEB.	<code>show chassis fabric feb</code>
(TX Matrix Plus routers only) Display chassis fabric errors for FPCs and SIBs.	<code>show chassis fabric errors</code>
(M320 and MX Series routers and T Series router only) Display the state of the electrical and optical switch fabric links between the FPCs and the SIBs.	<code>show chassis fabric fpcs</code>
(T640 and T1600 routers only) Display the state of fabric destination reachability, based on periodic reachability checks.	<code>show chassis fabric reachability</code>

Table 44: Chassis Operational Mode Commands *(continued)*

Task	CLI Command
(MX240, MX480, and MX960 routers only) Display whether redundancy mode is configured for active control boards to enable increased fabric bandwidth usage.	<code>show chassis fabric redundancy-mode</code>
(T640 and T1600 routers only) Display the list of destinations that have transitioned from a reachable state to an unreachable state.	<code>show chassis fabric unreachable-destinations</code>
(M120 and MX Series routers only) Display the state of the switching fabric map for connections from the FEBs to the ports on the fabric planes, as interpreted by the fabric plane.	<code>show chassis fabric map</code>
(TX Matrix Plus routers with 3D SIBs only) Display information about the optical ports on the TX Matrix Plus router (or the switch-fabric chassis (SFC)) and on the T1600 or T4000 line-card chassis (LCCs) connected to it in a routing matrix.	<code>show chassis fabric optics</code>
(TX Matrix Plus routers with 3D SIBs only) Display optical link connectivity and its current status. This command shows status of all the optical links on online SIBs at one place along with the state of optical-link, high speed link status and mapped FPCs.	<code>show chassis fabric optical-links</code>
(M120, MX Series, T1600, and TX Matrix Plus routers only) Display the state of all fabric plane connections to the FEBs. On a TX Matrix Plus router, display the state of the fabric management plane and the logical planes on the SFC and line-card chassis (LCC)	<code>show chassis fabric plane</code>
(M120, MX Series, T1600, and TX Matrix Plus router only) Display the CB location of each plane.	<code>show chassis fabric plane-location</code>
<p>(T Series routers only) Display the state of the electrical and optical switch fabric links:</p> <ul style="list-style-type: none"> • Between the SIBs in the TX Matrix router and the SIBs in the T640 routers. • Between the T640 SIBs and the FPCs in a T640 router. 	<code>show chassis fabric sibs</code>
(T Series routers only) Display the state of the switching fabric topology for the SIB connection between the TX Matrix router and the T640 routers.	<code>show chassis fabric topology</code>
(M5, M10, and M120 routers only). Display FEB status information.	<code>show chassis feb</code>
Display the version levels of the firmware running on the SCB, SFM, SSB, FEB, and FPCs.	<code>show chassis firmware</code>
(J Series Services Routers only) Display status of the forwarding process (fwdd).	<code>show chassis forwarding</code>

Table 44: Chassis Operational Mode Commands (*continued*)

Task	CLI Command
(M20, M40, M40e, M160, and M320 routers: MX Series routers: T Series routers; and PTX Series Packet Transport Switches only) Display FPC status information.	<code>show chassis fpc</code>
(M120 router only) Display the FPC and FEB mapping and their respective states.	<code>show chassis fpc-feb-connectivity</code>
Display hardware inventory.	<code>show chassis hardware</code>
Display the status of the most recent unified in-service software upgrade (ISSU).	<code>show chassis in-service-upgrade</code>
(TX Matrix and TX Matrix Plus router only) On a TX Matrix router, display the status of all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display the status of all routers (or line-card chassis) connected to the TX Matrix Plus router.	<code>show chassis lccs</code>
(TX Matrix Plus router only) Display the mode in which the LCCs are connected to the TX Matrix Plus router.	<code>show chassis lcc-mode</code>
Display chassis location information.	<code>show chassis location</code>
Display MAC address information.	<code>show chassis mac-addresses</code>
Display the network services mode.	<code>show chassis network services</code>
Display PIC status information.	<code>show chassis pic</code>
(J Series routers only) Display PIM power ratings.	<code>show chassis power-ratings</code>
(MX Series 3D Universal Edgerouters and PTX Series Packet Transport Switches only) Display power limits and usage.	<code>show chassis power</code>
(MX Series 3D Universal Edgerouters and PTX Series Packet Transport Switches only) Show power-on sequence for the chassis DPCs.	<code>show chassis power sequence</code>
(Root System Domain [RSD] only) Display information about Protected System Domains (PSDs).	<code>show chassis psd</code>
(M120 routers only) Display status information about configured FEB redundancy groups.	<code>show chassis redundancy feb</code>
Display the information about one or more Routing Engines.	<code>show chassis routing-engine</code>
(M40 router only) Display System Control Board (SCB) status information.	<code>show chassis scb</code>

Table 44: Chassis Operational Mode Commands *(continued)*

Task	CLI Command
(M40e and M160 routers only) Change and display SFM status information.	<code>show chassis sfm</code>
(M320 routers and T Series routers only) Display SIB status information.	<code>show chassis sibs</code>
(T Series routers only) Display SPMB status information.	<code>show chassis spmb</code>
(T Series routers only) Display SPMB Switch Interface Board (SIB) status information.	<code>show chassis spmb sibs</code>
(M320 routers and PTX Series Packet Transport Switches only) Display information about the external clock source currently used for chassis synchronization.	<code>show chassis synchronization</code>
Display chassis temperature threshold settings, in degrees Celsius.	<code>show chassis temperature-thresholds</code>
Display status of the cooling system zones.	<code>show chassis zones</code> <code>show chassis zones (PTX Series Packet Transport Switches)</code>

NOTE: For information about how to configure chassis parameters, such as conditions that activate the alarm LEDs on the router's craft interface, properties for specific PICs, and redundancy, see the *Junos OS System Basics Configuration Guide*.

For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Hardware Network Operations Guide*.

clear chassis display message

Syntax	clear chassis display message
Syntax (TX Matrix Router)	clear chassis display message <lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	clear chassis display message <lcc <i>number</i> sfc <i>number</i> >
Syntax (QFabric Systems)	clear chassis display message <node-device <i>name</i> interconnect-device <i>name</i> >
Release Information	Command introduced in Junos OS Release 7.5. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option for the TX Matrix Plus routers introduced in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.
Options	none —Clear or stop a text message on the craft interface display. interconnect-device <i>name</i> —(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device. lcc <i>number</i> —(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number. Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

node-device *name*—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

scc—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

Description	(M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB). For information about the meaning of “CBs” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
Options	<p>offline—Take the Control Board offline.</p> <div style="margin-top: 20px;">  <p>NOTE: On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the <code>request chassis cb slot <i>backup-slot-number</i> offline</code> command.</p> </div> <div style="margin-top: 20px;">  <p>NOTE: Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.</p> </div> <p>online—Bring the Control Board online.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:</p> <p>slot <i>slot-number</i>—Control Board slot number:</p>

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

- M320 router—Replace **slot-number** with a value from 0 through 1.
- MX480/MX240 routers—Replace **slot-number** with a value from 0 through 1.
- MX960 router—Replace **slot-number** with a value from 0 through 2.
- MX2020 and MX2010 routers—Replace **slot-number** with 0 or 1.
- EX8208 switch—Replace **slot-number** with a value from 0 through 2.
- EX8216 switch—Replace **slot-number** with a value from 0 through 1.
- QFabric System—Replace **slot-number** with a value from 0 through 1.

lcc number—(TX Matrix, TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

sfc number—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (switch-fabric chassis). Replace **number** with 0.

Required Privilege Level	maintenance

Backup CB 1 cannot be set offline, backup RE is online
```

request chassis ccg

Syntax	<code>request chassis ccg (offline online) slot <i>slot-number</i></code>
Release Information	Command introduced in Junos OS 12.1 for the PTX Series Packet Transport Switches.
Description	(PTX Series Packet Transport Switches) Control the operation of the Centralized Clock Generator (CCG).
Options	offline —Take the CCG offline. online —Bring the CCG online. slot <i>slot-number</i> —CCG slot number. Replace <i>slot-number</i> with a value from 0 through 1.
Required Privilege Level	maintenance
List of Sample Output	request chassis ccg on page 182
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

`request chassis ccg` `user@host> request chassis ccg offline slot 1`
CCG 1 is offline, Backup CCG 0 is now online.

request chassis cfep

Syntax	request chassis cfep (offline online restart)
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M7i and M10i routers only) Control the operation of the Compact Forwarding Engine Board (CFEB).
Options	offline —Take the CFEB offline. online —Bring the CFEB online. restart —Restart the CFEB.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• show chassis cfep on page 243• Configuring CFEB Redundancy on the M10i Router• CFEB Overview

Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request chassis cfep user@host> request chassis cfep offline
CFEB Offlined

request chassis clock master switch

Syntax	request chassis clock master switch
Release Information	Command introduced in Junos OS Release 12.1.
Description	(PTX Series Packet Transport Switches only) Control which Centralized Clock Generator (CCG) is the master.
Options	This command has no options.
Additional Information	<p>By default, the CCG in slot 0 (CCG0) is the master and the CCG in slot 1 (CCG1) is the backup. If you use this command to change the master, and then restart the chassis software for any reason, the master reverts to the default setting. To change the default master CCG, include the ccg statement at the [edit chassis redundancy] hierarchy level in the configuration. For more information, see the Junos OS System Basics Configuration Guide.</p> <p>The configurations on the two CCGs do not have to be the same, and they are not automatically synchronized. If you configure both CCGs as masters, when the chassis software restarts for any reason, the CCG in slot 0 becomes the master and the one in slot 1 becomes the backup.</p> <p>The switchover from the primary CCG to the backup CCG is immediate.</p>
Required Privilege Level	maintenance

**request chassis feb
restart slot 0** user@host> request chassis feb restart slot 0
Restart initiated, use “show chassis feb” to verify

request chassis feb (ACX Series Routers)

user@host> request chassis feb restart slot 0
FEB will be restarted NOW.

request chassis fpc

Syntax	request chassis fpc (offline online restart) slot <i>slot-number</i>
Syntax (TX Matrix and TX Matrix Plus Routers)	request chassis fpc (offline online restart) slot <i>slot-number</i> <lcc <i>number</i> >
Syntax (MX Series Routers)	request chassis fpc (offline online restart) slot <i>slot-number</i> <all-members> <local> <member <i>member-id</i> >
Syntax (MX2020 3D Universal Edge Routers)	request chassis fpc (offline online restart) slot <i>slot-number</i>
Syntax (MX2010 3D Universal Edge Routers)	request chassis fpc (offline online restart) slot <i>slot-number</i>
Syntax (QFabric System)	request chassis fpc <interconnect-device <i>name</i> slot <i>slot-number</i> (offline online)> <(offline online) interconnect-device <i>name</i> slot <i>slot-number</i> > <slot <i>slot-number</i> interconnect-device <i>name</i> (offline online)>
Syntax (PTX Series Packet Transport Switches)	request chassis fpc (offline online restart) slot <i>slot-number</i>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS 11.3 for QFX Series.</p> <p>Command introduced in Junos OS 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Switches only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
Options	<p>offline—Take the FPC offline.</p> <p>online—Bring the FPC online.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:</p>

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

restart—Restart the FPC.

slot slot-number—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace **slot-number** with a value from 0 through 2.
- EX Series switches:
 - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9.
 - EX6210 switches—Replace **slot-number** with a value from 0 through 9.

NOTE: These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace **slot-number** with a value from 0 through 7.
- EX8216 switches—Replace **slot-number** with a value from 0 through 15.
- PTX5000 Packet Transport Switch—Replace **slot-number** with a value from 0 through 7.

all-members—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

local—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Required Privilege Level maintenance

request chassis pic

Syntax	<code>request chassis pic (offline online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
Syntax (ACX4000 Series Routers)	<code>request chassis pic (offline online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
Syntax (TX Matrix and TX Matrix Plus Routers)	<code>request chassis pic (offline online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> <lcc <i>number</i>></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.3 for ACX4000 Routers.</p>
Description	Control the operation of the PIC.

NOTE: The `request chassis pic (offline | online) fpc-slot slot number pic-slot slot-number` command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the `show chassis hardware` command.

NOTE: T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only online and offline command options to PIC slot 0 are allowed. Use of the online and offline command options for PIC slot 1 with the described router and PIC combination is not allowed.

NOTE: In T Series routers, when the PIC state is set from offline to online or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC offline or online:

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify
```

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
```

Options **offline**—Take the PIC offline.

online—Bring the PIC online.

fpc-slot slot-number—Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—0.
 - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
 - EX8208 switches—0 through 7 (line card).
 - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.
- M120 routers—0 through 5.
- MX960 routers—0 through 11.
- M40, M40e, M160, M320, T320, T640, and T1600 routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, replace *slot-number* with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the *number* of the T1600 or T4000 router by using the lcc number option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, for the FPC slot number, replace *slot-number* with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace *slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline
```

pic-slots slot-number—PIC slot number. For the M Series router, the T640 router, the T1600 router, the TX Matrix and TX Matrix Plus routers, it can be 0, 1, 2, or 3. On the MX960 router, *slot-number* corresponds to the slot number of the Packet Forwarding Engine. For the T320 router, it can be 0 or 1. For EX3200 and EX4200 switches, it is 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, it is 0.

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Sample Output

request chassis pic

```
user@host> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

request chassis mic

Syntax `request chassis mic (offline | online) fpc-slot slot-number mic-slot slot-number`

Release Information Command introduced in Junos OS Release 10.1.
 Command introduced in Junos OS Release 12.3 for ACX4000 Series Router.
 Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.
 Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description (MX Series routers only) Control the operation of the Modular Interface Cards (MICs) installed on a Modular Port Concentrator (MPC).

NOTE: On MX960 routers, if the MIC is not functioning correctly, you should take the MPC offline, replace it with a new MPC, and reinstall the MIC.

Options `offline`—Take the MIC offline.

`online`—Bring the MIC online.

`fpc-slot slot-number`—FPC slot number where the MIC is installed:

- ACX4000 router—Replace *fpc-slot* with the value **0** or **1**.
- MX80 router—Replace *fpc-slot* with the value **1**. This command is not supported on FPC slot 0.
- MX240 router—Replace *fpc-slot* with a value from **0** through **2**.
- MX480 router—Replace *fpc-slot* with a value from **0** through **5**.
- MX-960 router—Replace *fpc-slot* with a value from **0** through **11**.
- MX2020 router—Replace *fpc-slot* with a value from **0** through **19**.
- MX2010 router—Replace *fpc-slot* with a value from **0** through **9**.

`mic-slot slot-number`—MIC slot number. Replace *slot-number* with **0** or **1**.

Syntax (QFX Series)	request chassis routing-engine master (release switch) <check> <interconnect-device <i>name</i> > <node-group <i>name</i> > <no-confirm>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>all-chassis option added in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

CAUTION: (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing

Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the Junos OS High Availability Configuration Guide.

NOTE: Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

NOTE: On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

Options **acquire**—Attempt to become the master Routing Engine.

release—Request that the other Routing Engine become the master.

switch—Toggle mastership between Routing Engines.

The **acquire**, **release**, and **switch** options have the following suboptions:

all-chassis—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

all-lcc—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

all-members—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

check—(QFabric systems, MX240, MX480, MX960, MX2010, and MX2020 Routers only) (Optional) Available only with the **switch** option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

interconnect-device *name*—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace *member-id* with a value of 0 or 1.

no-confirm—(Optional) Do not request confirmation for the switch.

node-group *name*—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

scc—(TX Matrix routers only) TX Matrix (switch-card chassis).

sfc—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

force—(Optional) Available only with the **acquire** option. Force the change to a new master Routing Engine.

Additional Information

Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (RE0) is the master and the Routing Engine in slot 1 (RE1) is the backup. To change the default master Routing Engine, include the

routing-engine statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the Junos OS System Basics Configuration Guide

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

NOTE: Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • show chassis routing-engine on page 878 • Configuring Routing Engine Redundancy • Switching the Global Master and Backup Roles in a Virtual Chassis Configuration
List of Sample Output	request chassis routing-engine master acquire on page 210 request chassis routing-engine master switch on page 210
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

**request chassis
routing-engine master
acquire**

```
user@host> request chassis routing-engine master acquire
warning: Traffic will be interrupted while the PFE is re-initialized
warning: The other routing engine's file system could be corrupted
Reset other routing engine and become master ? [yes,no] (no)
```

**request chassis
routing-engine master
switch**

```
user@host> request chassis routing-engine master switch
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch
warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

request chassis scg

Syntax	request chassis scg (offline online) slot <i>slot-number</i>
Syntax (TX Matrix and TX Matrix Plus Routers)	request chassis scg lcc <i>number</i> (offline online) slot <i>slot-number</i>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(T Series routers only) Control the operation of the specified SONET Clock Generator (SCG).
Options	<p>lcc <i>number</i>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>offline—Take the SCG offline. When you change the SCG status to offline, the unit is not powered down.</p> <p>online—Bring the SCG online.</p> <p>slot <i>slot-number</i>—SCG slot number. Replace <i>slot-number</i> with 0 or 1.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • show chassis environment scg on page 413 • Configuring the Clock Source • T320 SONET Clock Generator (SCG) Description

set chassis display message

Syntax	set chassis display message " <i>message</i> " <permanent>
Syntax (TX Matrix Router)	set chassis display message " <i>message</i> " (<i>lcc number</i> <i>scc</i>) <permanent>
Syntax (TX Matrix Plus Router)	set chassis display message " <i>message</i> " (<i>fpc-slot slot-number</i> <i>lcc number</i> <i>sfc number</i>) <permanent>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option for TX Matrix Plus router introduced in Junos OS Release 9.6.
Description	Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages three times, switching between messages every 60 seconds.

NOTE: On T Series routers, when this command is executed with the **permanent** option, the display of the text message alternates with that of the standard craft interface message continuously every 60 seconds.

By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

Options **"message"**—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks ("") deletes the text message from the craft interface display. On the LCD panel display, the message is limited to 16 characters.

fpc-slot slot-number—(TX Matrix Plus routers and EX4200 and QFX Series only) On the router or switch, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace **slot-number** with a value from 0 through 31. On the switch, display the text message for a specific member of a Virtual Chassis, where **fpc-slot slot-number** corresponds to the member ID. Replace **slot-number** with a value from 0 through 9. On the QFX Series, the **slot-number** is always 0. On a TX Matrix Plus router with 3D SIBs replace **slot-number** with a value from 0 through 63.

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

permanent—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

scc—(TX Matrix routers only) Display the text message on the craft interface display of the TX Matrix router (switch-card chassis).

sfc number—(TX Matrix Plus routers only) Display the text message on the craft interface display of the TX Matrix Plus router (or switch-fabric chassis).

Required Privilege Level	clear

Sample Output

set chassis display message (Creating)

The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
message sent

user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
Host OK LED:    On
Host fail LED:  Off
FPCs           0  1  2  3  4  5  6  7
-----
Green  ..  *..  *  *.
Red    .....
LCD screen:
+-----+
|NOC contact Dusty |
|(888) 555-1234   |
+-----+
```

set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```
user@host> set chassis display message ""
message sent

user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
Host OK LED:    On
Host fail LED:  Off
FPCs           0  1  2  3  4  5  6  7
-----
Green  ..  *..  *  *.
Red    .....
LCD screen:
+-----+
|host           |
|Up: 0+17:05:47 |
|               |
|Temperature OK  |
+-----+
```

Description	Display information about the conditions that have been configured to trigger alarms.
Options	none —Display information about the conditions that have been configured to trigger alarms.

all-members—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

scc—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with 0.

Additional Information

You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code:
257
```

```
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

To understand what CM_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

As per the above table, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

First, you have to convert 559 to binary; that is **1000101111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **100010111**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3

CMALARM_LCHIP_LOUT_HDRF_TOERR_ERR	5
CMALARM_LCHIP_LOUT_HDRF_PARITY_ERR	6
CMALARM_LCHIP_LOUT_HDRF_UCERR_ERR	7

CMALARM_LCHIP_LOUT_NLIF_CRCDROP_ERR	8
CMALARM_LCHIP_LOUT_NLIF_CRCERR_ERR	9
CMALARM_LCHIP_UCODE_TIMEOUT_ERR	10
CMALARM_LCHIP_LIN_SRCTL_ACCT_DROP_ERR	11
CMALARM_LCHIP_LIN_SRCTL_ACCT_ADDR_SIZE_ERR	12
CMALARM_LCHIP_SRAM_PARITY_ERR	13
CMALARM_LCHIP_UCODE_OVFLW_ERR	14
CMALARM_LCHIP_LOUT_HDRF_MTU_ERR	15

Chip Type: M Chip	Code
CMALARM_MCHIP_ECC_UNCORRECT_ERR	128

Chip Type: N Chip	Code
CMALARM_NCHIP_RDDMA_JBUS_TIMEOUT_ERR	256
CMALARM_NCHIP_RDDMA_FIFO_OVFLW_ERR	257
CMALARM_NCHIP_RDDMA_FIFO_UNFLW_ERR	258
CMALARM_NCHIP_RDDMA_SIZE_ERR	259
CMALARM_NCHIP_RDDMA_JBUS_CRC_ERR	260
CMALARM_NCHIP_WRDMA_PKTR_ERR	261
CMALARM_NCHIP_WRDMA_PKT_CRC_ERR	262
CMALARM_NCHIP_WRDMA_JBUS_TIMEOUT_ERR	263
CMALARM_NCHIP_WRDMA_FIFO_OVFLW_ERR	264
CMALARM_NCHIP_WRDMA_FIFO_UNFLW_ERR	265
CMALARM_NCHIP_WRDMA_PKT_LEN_ERR	266
CMALARM_NCHIP_WRDMA_JBUS_CRC_ERR	267
CMALARM_NCHIP_PKTR_DMA_AGE_ERR	268
CMALARM_NCHIP_PKTR_ICELLSIG_ERR	269

CMALARM_NCHIP_PKTR_FTTL_ERR	270
CMALARM_NCHIP_RODR_OFFSET_OVFLW_ERR	271
CMALARM_NCHIP_PKTR_TMO_CELL_ERR	272
CMALARM_NCHIP_PKTR_TMO_OUTRANGE_ERR	273
CMALARM_NCHIP_PKTR_MD_REQUEST_Q_OVFLW_ERR	274
CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR	275
CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR	276
CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279

Chip Type: R Chip	Code
CMALARM_RCHIP_SRAM_PARITY_ERR	512

Chip Type: R Chip	Code
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602
CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608
CMALARM_ICHIP_WO_IP_INTER_ERR	609
CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630

CMALARM_ICHIP_SDRAM_BIST_ERR	631
CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM_NCHIP_DBUF_CRC_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice-versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code = $(257-1)/2 = 128$. Similarly, for minor alarms, Actual Error Code = $(\text{Error Code})/2$

show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router are online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

```

show chassis cfeb

Syntax	show chassis cfeb
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M7i and M10i routers only) Display status information about the Compact Forwarding Engine Board (CFEB).
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis cfeb on page 183 • Configuring CFEB Redundancy on the M10i Router • CFEB Overview
List of Sample Output	show chassis cfeb (M7i) on page 244 show chassis cfeb (M10i) on page 244
Output Fields	Table 46 on page 243 lists the output fields for the show chassis cfeb command. Output fields are listed in the approximate order in which they appear.

Table 46: show chassis cfeb Output Fields

Field Name	Field Description
State	Status of the CFEB: <ul style="list-style-type: none"> • Online—CFEB is online and running. • Offline—CFEB is powered down.
Intake Temperature	Temperature of the air before flowing past the CFEB.
Exhaust Temperature	Temperature of the air after flowing past the CFEB.
CPU utilization	Percentage of CPU being used by the CFEB processor.
Interrupt utilization	Of the total CPU being used by the CFEB processor, the percentage being used for interrupts
Heap Utilization	Percentage of heap space (dynamic memory) being used by the CFEB processor. If this number exceeds 80 percent, there may be a software problem (memory leak).
Buffer Utilization	Percentage of buffer space being used by the CFEB processor for buffering internal messages
Total CPU DRAM	Amount of DRAM available to the CFEB CPU.

Table 46: show chassis cfep Output Fields (*continued*)

Field Name	Field Description
Internet Processor II	Information about the CFEB processor.
Start time	Time when the Routing Engine detected that the CFEB was running.
Uptime	How long the Routing Engine has been connected to the CFEB and, therefore, how long the Flexible PIC Concentrator (FPC) has been up and running.

Sample Output

show chassis cfep (M7i)

```

user@host> show chassis cfep
CFEB status:
  State                               Online
  Intake Temperature                  27 degrees C / 80 degrees F
  Exhaust Temperature                 33 degrees C / 91 degrees F
  CPU utilization                      3 percent
  Interrupt utilization                0 percent
  Heap utilization                     8 percent
  Buffer utilization                    21 percent
  Total CPU DRAM                      128 MB
  Internet Processor II               Version 1, Foundry IBM, Part number 164
  Start time:                         2003-06-11 11:41:22 PDT
  Uptime:                             1 hour, 39 minutes, 31 seconds

```

```

show chassis cip

Syntax (TX Matrix Plus Router)	show chassis cip
Release Information	Command introduced in Junos OS Release 9.6.
Description	(TX Matrix Plus routers only) Display environmental information about the Connector Interface Panel (CIP) that provides Ethernet Control Plane connectivity to line-card chassis (LCCs), switch fabric chassis, and other devices.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis cip on page 185 • Installing a T1600 CIP • Installing a T640 CIP • Installing a TX-CIP • Installing an M320 CIP • Installing an M320 CIP • Installing the T1600 CIP • Installing the T320 CIP • CIP Overview
Output Fields	Table 47 on page 245 lists the output fields for the show chassis cip command. Output fields are listed in the approximate order in which they appear.

Table 47: show chassis cip Output Fields

Field Name	Field Description
Eswitch	Ethernet switch used to connect to the LCC or to a JCS1200: 0 or 1.
Port	<p>Physical port number of the Ethernet switch:</p> <ul style="list-style-type: none"> • Port numbers: 4 to 8 on Ethernet switch 0 can be used to connect up to four (reserved for future use) other SFCs or optional JCS1200s. <p>NOTE: The current configuration of the routing matrix based on a TX Matrix Plus router supports only one SFC.</p> <ul style="list-style-type: none"> • Port numbers 0 to 15 on Ethernet switch 1 can be used to connect up to 16 LCCs. <p>NOTE: The current configuration of a routing matrix based on a TX Matrix Plus router supports only up to eight LCCs. You can connect LCCs to the port numbers corresponding to LCC0 to LCC7 (0 to 15) on the Ethernet switch 1.</p>

Table 47: show chassis cip Output Fields (*continued*)

Field Name	Field Description
Type	Type of CIP: <ul style="list-style-type: none"> XE—Ethernet switch 0 ports used for connections to the SFC control plane or other devices such as JCS1200. GE—Ethernet switch 1 ports used for connections to the LCC control plane.
Connected-to	Show control plane connection to a specific LCC or SFC.
Link	State of the connection to an LCC control plane, SFC control plane, or other devices: Up or Down .
Speed	Ethernet link speed.
Duplex	Type of Ethernet link: Full or Half Duplex .
Auto-neg	Status of autonegotiation for the CIP connection to the LCC, SFC, or other devices: On or Off .

show chassis craft-interface

Syntax	show chassis craft-interface
Syntax (MX Series Routers)	show chassis craft-interface <all-members> <local> <member <i>member-id</i> >
Syntax (MX2010 Universal Edge Routers)	show chassis craft-interface
Syntax (MX2020 Universal Edge Routers)	show chassis craft-interface
Syntax (TX Matrix Routers)	show chassis craft-interface <lcc <i>number</i> scc>
Syntax (TX Matrix Plus Routers)	show chassis craft-interface <lcc <i>number</i> sfc <i>number</i> >
Syntax (ACX Series Universal Access Routers)	show chassis craft-interface
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	For routers or switches that have a display on the craft interface, show the messages that are currently displayed. On all routers except for the M20 router, you must enter this command on the master Routing Engine.
Options	<p>none—(TX Matrix, TX Matrix Plus routers, MX2020 and MX2010 routers, and ACX Series routers only) On a TX Matrix router, show messages that are currently displayed on the craft interface on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, show messages that are currently displayed on the craft interface on the TX Matrix Plus router and its attached routers.</p> <p>all-members—(MX Series routers only) (Optional) Display information currently on the craft interface for all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix, TX Matrix Plus routers only) (Optional) On a TX Matrix router, show messages that are currently displayed on the craft interface for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show messages that are currently displayed on the craft interface</p>

for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display information currently on the craft interface for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display information currently on the craft interface for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Show messages that are currently displayed on the craft interface for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Show messages that are currently displayed on the craft interface for the respective TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

Output Fields [Table 48 on page 249](#) lists the output fields for the **show chassis craft-interface** command. Output fields are listed in the approximate order in which they appear.

Table 48: show chassis craft-interface Output Fields

Field Name	Field Description
LCD screen or FPM Display Contents	<p>Contents of the Front Panel Module display:</p> <ul style="list-style-type: none"> • router-name—Name of the router. • Up—How long the router has been operational, in days, hours, minutes, and seconds. • message—Information about the router traffic load, the power supply status, the fan status, and the temperature status. The display of this information changes every 2 seconds. If a text message has been created with the set chassis display command, this message appears on all four lines of the craft interface display. The display alternates between the text message and the standard system status messages every 2 seconds.
SFC Front Panel Switch Settings	<p>(TX Matrix Plus Routers)—Display the SFC front panel switch settings:</p> <p>SFC Chassis Number and Config Size are settings on physical switches located on the left side of the craft interface of the TX Matrix Plus router.</p> <ul style="list-style-type: none"> • SFC Chassis Number—This field always displays the value 00. • Config Size—The value of this field is 0 for the TX Matrix Plus router. The value of this field is 3 for TX Matrix Plus router with 3D SIBs.
Front Panel System LEDs	(MX2010 and MX2020 Routers) Status of the Front Panel System LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
Front Panel Alarm Indicators	(MX2010 and MX2020 Routers) Status of the Front Panel Alarm indicators. A dot (.) indicates the relay is off. An asterisk (*) indicates the relay is active.
Input Relay	Status of the configured input relay ports—0 through 3. The mode is normally open or closed. The status is clear or raised.
Output Relay	Status of the configured output ports—0 or 1. The mode is normally open or closed. The status is clear or raised.
Front Panel FPC LEDs	(MX2010 and MX2020 Routers) Status of the Front Panel Flexible PIC Concentrator (FPC) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit. On MX2010 routers, there are 10 (0-9) FPCs LEDs. On MX2020 routers, there are 20 (0-9 and 10-19) FPCs LEDs.
CB LEDs	Status of the Control Board (CB) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
PS LEDs	(MX2010 and MX2020 Routers) Status of the Power Supply (PS) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit. On MX2010 routers, there are 9 (0-8) PS LEDs. On MX2020 routers, there are 18 (0-8 and 9-17) PS LEDs.
FAN Tray LEDs	(MX2010 and MX2020 Routers) Status of the Fan Tray LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
Front Panel SFB LEDs	(MX2010 and MX2020 Routers) Status of the Front Panel Switch Fabric Boards (SFB) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
Front Panel Chassis Info	(MX2010 and MX2020 Routers) Information about the chassis such as the chassis number and role. User can set the chassis number in multi-chassis configurations.

Table 48: show chassis craft-interface Output Fields (*continued*)

Field Name	Field Description
MCS and SFM LEDs	Status of the Miscellaneous Control Subsystem (MCS) and Switching and Forwarding Module (SFM) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit. When neither a dot nor an asterisk is displayed, there is no board in that slot.
SIB LEDs	Status of the Switch Interface Board (SIB) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
SCG LEDs	Status of the SONET Clock Generator (SCG) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. monitored option added in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. pem option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.

Description Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

Options **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

adc *adc-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace ***adc-slot-number*** with a value from 0 through 19. For MX2010 routers, replace ***adc-slot-number*** with a value from 0 through 9.

cb *cb-slot-number*—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Switches, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace ***cb-slot*** with 0 or 1. For the EX Series switches, see EX Series Switches Hardware and CLI Terminology Mapping for information on CB slot numbering.

cip *cip-slot-number*—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the ***cip-slot-number*** variable with a value of 0 or 1.

cb interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

ccg *ccg-slot-number*—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace ***cb-slot*** with a value of 0 or 1.

fpc *fpc-slot*—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Switches, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace ***fpc-slot*** with a value from 0 through 9. For MX2020 routers, replace ***fpc-slot*** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see EX Series Switches Hardware and CLI Terminology Mapping for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace ***fpc-slot*** with a value from 0 through 63.

fpm—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Switches, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

interconnect-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

monitored—(MX2020 routers and PTX Series Packet Transport Switches only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* variable with a value of 0 or 1. For EX Series switches, see member for member ID values.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

pdu *pdu-slot-number*—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

pem—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

pem *pem-slot-number*—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

psm *psm-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace *psm-slot-number* with a value from 0 through 17. For MX2010 routers, replace *psm-slot-number* with a value from 0 through 8.

psu *psu-slot-number*—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See EX Series Switches Hardware and CLI Terminology Mapping for detailed information.

routing-engine—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

routing-engine *re-slot-number*—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

scg—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

scc—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

sfb *sfb-slot-number*—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace *sfb-slot-number* with a value from 0 through 7.

sfc *number*—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

sib *sib-slot-number*—(M320 routers, PTX Series Packet Transport Switches, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see [show chassis environment sib](#).

Output Fields Table 49 on page 270 lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 49: show chassis environment Output Fields

Field Name	Field Description
Class	<p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> • Power: Power information: <ul style="list-style-type: none"> • (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: OK, Testing, (during initial power-on), Failed, or Absent. • (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: OK, Testing, (during initial power-on), Check, Failed, or Absent. • (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: OK, Testing, (during initial power-on), Check, Failed, or Absent. • Temp: Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones. • Pic: On ACX4000 Routers, multiple temperature channels on a MIC. The status is: OK and the Measurement is in degrees Celsius (C) and Fahrenheit (F). • Fan: Fan status: OK, Testing (during initial power-on), Failed, or Absent. On PTX Series Packet Transport Switches and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. Measurement indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only). • Misc: Information about other components of the chassis. <ul style="list-style-type: none"> • On some routers, this field indicates the status of one or more additional components. • On the M40e, M160, and M320 router, Misc includes CIP (Connector Interface Panel). OK indicates that the CIP is present. Absent indicates that the CIP is not present. • On T Series routers, Misc includes CIP and SPMB (Switch Processor Mezzanine Board). OK indicates that the CIP or SPMB is present. Absent indicates that the CIP or SPMB is not present. • On PTX Series Packet Transport Switches, Misc includes the SPMB (Switch Processor Mezzanine Board). The SPMB is located on the control boards. OK indicates that the control board is present. Absent indicates that the control board is not present.
Item	(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).

Table 49: show chassis environment Output Fields (*continued*)

Field Name	Field Description
Status	<p>(MX2010 and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> • OK: The fans are operational. • Testing: The fans are being tested during initial power-on. • Failed: The fans have failed or the fans are not spinning. • Absent: The fan tray is not installed. <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> • OK: The power component is operational. • Testing: The power component is being tested during initial power-on. • Check: There is insufficient power---that is, fewer than the minimum required feeds are connected. • Failed: The inputs leads have failed. • Absent: The power component is not installed.
Measurement	<p>(MX2010 and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>

Release Information	<p>Command introduced before Junos Release 7.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.1 for T4000 Core Routers.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos Release 9.6.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Switches only) Display environmental information about the Control Boards (CBs). For information about the meaning of "CBs" on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
Options	none —Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 or T4000 routers.

all-members—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

interconnect-device—(QFabric systems only) Display environmental information about the CBs on the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Switches, replace *slot* with 0 or 1. On EX Series switches replace *slot* with 0, 1, or 2. On QFX Series switches, replace *slot* with 0 or 1.

Output Fields [Table 50 on page 322](#) lists the output fields for the **show chassis environment cb** command. Output fields are listed in the approximate order in which they appear.

Table 50: show chassis environment cb Output Fields

Field Name	Field Description
State	<p>Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby.</p> <ul style="list-style-type: none"> • Online—CB is online and running. • Offline—CB is powered down. <p>NOTE: On the EX8208 switch, the installation can include three CBs. See EX Series Switches Hardware and CLI Terminology Mapping.</p>
Temperature	<p>Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB.</p> <ul style="list-style-type: none"> • Temperature Intake—Measures the temperature of the air intake to cool the power supplies. • Temperature Exhaust—Measures the temperature of the hot air exhaust. <p>NOTE: On the MX2010 and MX2020 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010 and MX2020 routers include intake and exhaust temperatures for multiple zones (Intake A, Intake B, Intake C, Exhaust A, Exhaust B, and TCBC).</p>
Power	<p>Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</p>
BUS Revision	<p>Revision level of the generic bus device. (Not on switches.)</p>
FPGA Revision	<p>Revision level of the field-programmable gate array (FPGA). (Not on switches.)</p>

Table 50: show chassis environment cb Output Fields (*continued*)

Field Name	Field Description
PMBus device (on MX240, MX480, and MX960 routers with Enhanced MX SCB)	<p>Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB:</p> <ul style="list-style-type: none">• Expected voltage• Measured voltage• Measured current• Calculated power

show chassis environment ccg

Syntax	<code>show chassis environment ccg</code> <code><slot></code>
Release Information	Command introduced in Junos OS Release 12.1.
Description	(PTX Series Packet Transport Switches only) Display environmental information about the Centralized Clock Generators (CCGs).
Options	<p>none—Display environmental information about all CCGs on the PTX Packet Transport Switch.</p> <p>slot —(Optional) Display environmental information about the specified CCG. Replace <i>slot</i> with 0 or 1.</p>
Required Privilege Level	view
List of Sample Output	show chassis environment ccg (PTX5000) on page 340
Output Fields	Table 51 on page 339 lists the output fields for the show chassis environment ccg command. Output fields are listed in the approximate order in which they appear.

Table 51: show chassis environment cb Output Fields

Field Name	Field Description
State	Status of the CCG: Online - Master clock , Online - Standby , or Offline . If two CCGs are installed and online, one is functioning as the master clock, and the other is the standby clock.
Temperature	Temperature of the air flowing past the CCG.
Power	Power required and measured on the CCG. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
BUS Revision	Revision level of the generic bus device.

Sample Output

`show chassis
environment ccg
(PTX5000)`

```
user@host> show chassis environment ccg
CCG 0 status:
  State           Online - Master clock
  Temperature      31 degrees C / 87 degrees F
  Power
    1.2 V bias     1200 mV
    1.8 V          1799 mV
    3.3 V          3300 mV
    3.3 V bias     3300 mV
  Bus Revision     103
CCG 1 status:
  State           Offline
  Power           Disabled
  Temperature      31 degrees C / 87 degrees F
  Power
    1.2 V bias     1198 mV
    1.8 V          161 mV
    3.3 V          451 mV
    3.3 V bias     3311 mV
  Bus Revision     103
```

show chassis environment cip

Syntax (TX Matrix Plus Router)	show chassis environment cip <slot-number>
Release Information	Command introduced in Junos OS Release 9.6 for the TX Matrix Plus router.
Description	(TX Matrix Plus router only) Display environmental information about the Connector Interface Panel (CIP).
Options	<p>none—Display environmental information about all the CIP.</p> <p>slot—Display environmental information about a specific CIP. Replace slot with a value from 0 through 1.</p>
Required Privilege Level	view
Output Fields	Table 52 on page 341 lists the output fields for the show chassis environment cip command. Output fields are listed in the approximate order in which they appear.

Table 52: show chassis environment cip Output Fields

Field Name	Field Description
State	<p>State of the CIP:</p> <ul style="list-style-type: none"> • Online Active: CIP is online and there is active control plane data transfer between the SFC and LCCs in the routing matrix. • Online Inactive: CIP is online, but inactive. • Offline: CIP is offline.
Temp	Temperature of the CIP in Celsius (C) and Fahrenheit (F).
Power	Information about the voltage supplied to the CIP. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
Bus Revision	Bus revision number.

show chassis environment cip (TX Matrix Plus Router)

```
user@host> show chassis environment cip
CIP 0 status:
  State           Online Active
  Temperature      23 degrees C / 73 degrees F
  Power 1
    1.0 V          1015 mV
    1.8 V          1817 mV
    2.5 V          2497 mV
    3.3 V          3325 mV
    3.3 V bias     3300 mV
    5.0 V          5001 mV
    9.0 V          9049 mV
  Bus Revision     74
CIP 1 status:
  State           Online Inactive
  Temperature      24 degrees C / 75 degrees F
  Power 1
    1.0 V          1008 mV
    1.8 V          1820 mV
    2.5 V          2504 mV
    3.3 V          3325 mV
    3.3 V bias     3306 mV
    5.0 V          5091 mV
    9.0 V          9049 mV
  Bus Revision     74
```

show chassis environment fpc

Syntax	show chassis environment fpc <slot>
Syntax (TX Matrix and TX Matrix Plus Routers)	show chassis environment fpc <fcc number> <slot>
Syntax (MX Series Routers)	show chassis environment fpc <slot> <all-members> <local> <member <i>member-id</i> >
Syntax (MX2010 3D Universal Edge Routers)	show chassis environment fpc <slot>
Syntax (MX2020 3D Universal Edge Routers)	show chassis environment fpc <slot>
Syntax (QFX Series)	show chassis environment fpc <fpc-slot> interconnect-device <i>name</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series switches only) Display environmental information about Flexible PIC Concentrators (FPCs).
Options	<p>none—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.</p> <p>all-members—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.</p> <p>fcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

slot* or *fpc-slot—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the ***lcc number*** option (the recommended method), replace ***slot*** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the ***lcc number*** option (the recommended method), replace ***slot*** with a value from 0 through 7. Otherwise, replace ***slot*** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
```

```
user@host> show chassis environment fpc 9
```

- M120 router—Replace ***slot*** with a value from 0 through 5.
- MX240 router—Replace ***slot*** with a value from 0 through 2.
- MX480 router—Replace ***slot*** with a value from 0 through 5.
- MX960 router—Replace ***slot*** with a value from 0 through 11.
- MX2010 router—Replace ***slot*** with a value from 0 through 9.
- MX2020 router—Replace ***slot*** with a value from 0 through 19.
- Other routers—Replace ***slot*** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace ***slot*** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace ***slot*** with a value from 0 through 9 (switch's member ID).
 - EX6210 switches—Replace ***slot*** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Routing Engine (SRE) module), or 6 through 9 (line card only).

- EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
- EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Switch—Replace **fpc-slot** with 0 through 7.

Output Fields [Table 53 on page 346](#) lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

Table 53: show chassis environment fpc Output Fields

Field Name	Field Description
State	<p>Status of the FPC:</p> <ul style="list-style-type: none"> • Unknown—FPC is not detected by the router. • Empty—No FPC is present. • Present—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online. • Ready—FPC is in intermediate or transition state. • Announce online—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative. • Online—FPC is online and running. • Offline—FPC is powered down. • Diagnostics—FPC is set to operate in diagnostics mode.
Temperature	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
PMB Temperature	(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).
Temperature Intake	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
Temperature Top	(T Series routers only) Temperature of the air flowing past the top of the FPC.
Temperature Exhaust	<p>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.</p> <p>The PTX Series Packet Transport Switches, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</p>
Temperature Bottom	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
TL <i>n</i> Temperature	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
TQ <i>n</i> Temperature	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
Temperature MMBO	(T640 router only) Temperature of the air flowing past the type 3 FPC.
Temperature MMB1	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
Power	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
CMB Revision or BUS revision	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

Output Fields Table 54 on page 372 lists the output fields for the **show chassis environment fpm** command. Output fields are listed in the approximate order in which they appear.

Table 54: show chassis environment fpm Output Fields

Field Name	Field Description
State	FPM status: <ul style="list-style-type: none"> • Online—FPM is online and running. • Offline—FPM is powered down.
FPM CMB Voltage	(M40e and M160 routers only) Information about the voltage supplied to the FPM chassis management bus (CMB) device. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
FPM GBUS Voltage	(M320 and T Series routers only) Information about the voltage supplied to the FPM generic bus (GBUS) device. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
FPM I2CS Voltage	(PTX Series only) Information about the voltage supplied to the FPM generic bus (I2CS) device. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
FPM Display Voltage	Information about the voltage supplied to the FPM display. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
FPM CMB Temperature	(M40e and M160 routers only) Temperature of the air flowing past the FPM CMB device
FPM GBUS Temperature	(M320 and T Series routers only) Temperature of the air flowing past the FPM GBUS device.
FPM I2CS Temperature	(PTX Series only) Temperature of the air flowing past the FPM I2CS device.

Table 54: show chassis environment fpm Output Fields (*continued*)

Field Name	Field Description
FPM Display Temperature	Temperature of the air flowing past the FPM display.
CMB Revision	(M40e and M160 routers only) Revision level of the CMB device.
GBUS Revision	(M320 and T Series routers only) Revision level of the GBUS device.
I2CS Revision	(MX2010 routers, MX2020 routers, and PTX Series only) Revision level of the I2CS device.

show chassis environment mcs

Syntax	<code>show chassis environment mcs</code> <code><slot></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e and M160 routers only) Display environmental information about the Miscellaneous Control Subsystems (MCSs).
Options	<p>none—Display environmental information about both MCSs.</p> <p>slot —(Optional) Display environmental information about an individual MCS. Replace slot with 0 or 1</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> request chassis mcs on page 198
List of Sample Output	show chassis environment mcs (M40e Router) on page 379 show chassis environment mcs (M160 Router) on page 379
Output Fields	Table 55 on page 378 lists the output fields for the show chassis environment mcs command. Output fields are listed in the approximate order in which they appear.

Table 55: show chassis environment mcs Output Fields

Field Name	Field Description
State	<p>Status of the MCS:</p> <ul style="list-style-type: none"> Present—MCS is detected by the chassis daemon but is either not supported by the current version of Junos or MCS is coming up but not yet online. Online—MCS is online and running. Offline—MCS is powered down. Empty—No MCS is present. Master—MCS is online, operating as master. Standby—MCS is online, operating as standby.
Temperature	Temperature of the air flowing past the MCS.
Power	Information about the voltage supplied to the MCS. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
BUS Revision	Revision level of the generic bus device.
FPGA Revision	Revision level of the field-programmable gate array (FPGA) revision.

show chassis environment monitored

Syntax	show chassis environment monitored
Release Information	Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	<p>(PTX Series Packet Transport Switches, and MX2010 and MX2020 routers) Display status information for monitored temperatures.</p> <p>On the PTX Series Packet Transport Switches, and on MX2010 and MX2020 routers, you can configure which temperatures are monitored for computing temperature alarms. Use this command to display only the temperatures that are monitored. Temperatures that are not included in the temperature alarm computations are not displayed.</p>
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show chassis environment monitored (PTX5000 Packet Transport Switch) on page 380 show chassis environment monitored (MX2010 Router) on page 381 show chassis environment monitored (MX2020 Router) on page 384
Output Fields	Table 56 on page 380 lists the output fields for the show chassis environment monitored command. Output fields are listed in the approximate order in which they appear.

Table 56: show chassis environment monitored Output Fields

Field Name	Field Description
Item	<p>Chassis component:</p> <ul style="list-style-type: none"> (PTX Series Packet Transport Switches, and MX2010 and MX2020 routers)—Information about the chassis, Routing Engines, Control Boards (CBs), Switch Interface Boards (SIBs), PICs, and Flexible PIC Concentrators (FPCs).
Status	Status of the specified item. Status can be OK or Alarm .
Measurement	Temperature of the air flowing past the specified chassis component. Temperature is displayed in degrees Celsius (C) and degrees Fahrenheit (F).

show chassis environment pcg

Syntax	<code>show chassis environment pcg</code> <code><slot></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e and M160 routers only) Display environmental information about the Packet Forwarding Engine clock generators (PCGs).
Options	<p>none—Display environmental information about both PCGs.</p> <p>slot—(Optional) Display environmental information about an individual PCG. Replace slot with 0 or 1.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> request chassis pcg on page 199
List of Sample Output	show chassis environment pcg (M40e Router) on page 395 show chassis environment pcg (M160 Router) on page 395
Output Fields	Table 57 on page 394 lists the output fields for the show chassis environment pcg command. Output fields are listed in the approximate order in which they appear.

Table 57: show chassis environment pcg Output Fields

Field Name	Field Description
PCG slot status	Slot number: 0 or 1.
State	Status of PCG: <ul style="list-style-type: none"> Present—PCG is detected by the chassis process but is either not supported by the current version of Junos OS or PCG is coming up but is not yet online. Online—PCG is powered down. If Online, it can be the Master clock or the Standby clock. Offline—PCG is powered down. Empty—No PCG is present.
Temperature	Temperature of the air flowing past the PCG.
Frequency	Frequency setting and measurement for the PCG.
Power	Information about the voltage supplied to the PCG. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
BUS Revision	Revision level of the generic bus device.

Sample Output

**show chassis
environment pcg
(M40e Router)**

```
user@host> show chassis environment pcg
PCG 0 status:
  State                Online - Master clock
  Temperature           44 degrees C / 111 degrees F
  Frequency:
    Setting             125.00 MHz
    Measurement         124.95 MHz
  Power:
    3.3 V               3266 mV
    5.0 V bias          4964 mV
    8.0 V bias          8112 mV
  BUS Revision         12
PCG 1 status:
  State                Online - Standby
  Temperature           47 degrees C / 116 degrees F
  Frequency:
    Setting             125.00 MHz
    Measurement         124.96 MHz
  Power:
    3.3 V               3271 mV
    5.0 V bias          4979 mV
    8.0 V bias          8117 mV
  BUS Revision         12
```

**show chassis
environment pcg
(M160 Router)**

```
user@host> show chassis environment pcg
PCG 0 status:
  State                Online - Master clock
  Temperature           41 degrees C / 105 degrees F
  Frequency:
    Setting             125.00 MHz
    Measurement         125.03 MHz
  Power:
    3.3 V               3286 mV
    5.0 V bias          5010 mV
    8.0 V bias          8183 mV
  BUS Revision         12
PCG 1 status:
  State                Online - Standby
  Temperature           43 degrees C / 109 degrees F
  Frequency:
    Setting             125.00 MHz
    Measurement         125.01 MHz
  Power:
    3.3 V               3288 mV
    5.0 V bias          4993 mV
    8.0 V bias          8197 mV
  BUS Revision         12
```

show chassis environment pdu

Syntax	<code>show chassis environment pdu</code> <code><slot></code>
Release Information	Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Description	<p>(PTX Series Packet Transport Switches only) Display Power Distribution Unit (PDU) environmental status information.</p> <p>On the PTX Series Packet Transport Switches, the power supply consists of Power Distribution Units (PDUs) that contain Power Supply Modules (PSMs). There are four PSMs for each PDU and each PSM provides power to a specific set of FRUs.</p> <ul style="list-style-type: none"> • PSM 0: Fan Trays • PSM 1: Routing Engines, CBs, SIBs, FPD, and CCGs • PSM 2: FPCs • PSM 3: FPCs <p>This arrangement of PDUs and PSMs provide a modular power management design. Depending on which FRUs are present in the chassis, the required number of PSMs change enabling you to use only as much power as required to power the chassis.</p>
Options	<p>none—Display environmental information about all PDUs.</p> <p>slot —(Optional) Display environmental information about an individual PDU. For the PTX5000 Packet Transport Switch, replace slot with 0 or 1.</p>
Required Privilege Level	view
List of Sample Output	show chassis environment pdu (PTX5000 Packet Transport Switch) on page 397
Output Fields	Table 58 on page 396 lists the output fields for the <code>show chassis environment pdu</code> command. Output fields are listed in the approximate order in which they appear.

Table 58: show chassis environment pdu Output Fields

Field Name	Field Description
PDU slot status	Number of the PDU slot.
PDU - State	Status of the PDU. Status can be Online , Present , or Absent .
PDU - Hours Used	Number of hours the PDU has been operational.
PDU - Firmware Version	Version level of the firmware running on the PDU.
PSM number status	PSM number. PSMs are numbered 0 through 3 .

Table 58: show chassis environment pdu Output Fields (*continued*)

Field Name	Field Description
PSM - State	Status of the PSM. Status can be Online , Present , or Absent .
PSM - Temperature	Temperature of the air flowing past the PSM.
PSM - Fans	Status of the cooling fans associated with the PSM.
PSM - AC Input	Status of the AC input for the specified component
PSM - AC Output	Status of the AC output for the specified component.
PSM - DC input	Status of the DC input for the specified component.
PSM - DC output	Status of the DC output for the specified component.
PSM - Hours Used	Number of hours the PSM has been operational.
PSM - Firmware Version	Version level of the firmware running on the PSM.

Sample Output

**show chassis
environment pdu**

```
user@host> show chassis environment pdu 0
PDU 0 status:
  State                Online

show chassis environment pem

Syntax	show chassis environment pem <slot>
Syntax (ACX4000 Router)	show chassis environment pem
Syntax (TX Matrix Routers)	show chassis environment pem <lcc number scc> <slot>
Syntax (TX Matrix Plus Routers)	show chassis environment pem <lcc number sfc number> <slot>
Syntax (MX Series Router)	show chassis environment pem <slot> <all-members> <local> <member member-id>
Syntax (QFX Series)	show chassis environment pem <slot (interconnect-device name slot) (node-device name)>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS 11.3 for the QFX Series.
Description	Display Power Entry Module (PEM) environmental status information.

NOTE: The new high-capacity (4100W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.

- Options**
- none**—Display environmental information about both PEMs. For the TX Matrix router, display environmental information about the PEMs, the TX Matrix router, and its attached T640 routers. For the TX Matrix Plus router, display environmental information about the PEMs, the TX Matrix Plus router, and its attached routers.
 - all-members**—(MX Series routers only) (Optional) Display environmental information about the PEMs in all the member routers of the Virtual Chassis configuration.
 - interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Interconnect device.
 - lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the PEM in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the PEM in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display chassis environmental information about the PEMs in the Node device.

scc—(TX Matrix routers only) (Optional) Display environmental information about the PEM in the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display environmental information about the PEM in the TX Matrix Plus router (or switch-fabric chassis).

slot —(Optional) Display environmental information about an individual PEM. Replace *slot* with 0 or 1.

Output Fields Table 59 on page 401 lists the output fields for the **show chassis environment pem** command. Output fields are listed in the approximate order in which they appear.

Table 59: show chassis environment pem Output Fields

Field Name	Field Description
PEM slot status	Number of the PEM slot.
State	Status of the PEM.
Temperature	Temperature of the air flowing past the PEM.
AC Input	Status of the AC input for the specified component
AC Output	Status of the AC output for the specified component.
DC input	Status of the DC input for the specified component.
DC output	Status of the DC output for the specified component.
Load	(Not available on M40e or M160 routers) Information about the load on supply, in percentage of rated current being used.
Voltage	(M120, M160, M320, T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about voltage supplied to the PEM.
Current	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM current.
Power	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) Information about the PEM power.
SCG/CB/SIB	(T640, T1600, TX Matrix, and TX Matrix Plus routers only) SONET Clock Generator/Control Board/Switch Interface Board.
FAN	(T640, T1600, and T4000 routers with six-input DC power supply only) Information about the DC output to the fan.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.1 for the T4000 Core Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	Display Routing Engine environmental status information.
Options	<p>none—Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.</p> <p>all-members—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.</p>

interconnect-device *name*—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

scc—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

slot—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX2020 routers, and T Series routers, replace *slot* with 0 or 1. On M5, M7i, M10, and M40 routers and on the J Series router, replace *slot* with 0. On EX3200 and EX4200 standalone switches, replace *slot* with 0. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with 0 or 1. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Switches, replace *slot* with 0 or 1.

show chassis environment sfm

Syntax	<code>show chassis environment sfm</code> <code><slot></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e and M160 routers only) Display Switching and Forwarding Module (SFM) environmental information.
Options	<p>none—Display environmental information about all SFMs.</p> <p>slot—(Optional) Display environmental information about an individual SFM. Replace slot with a value from 0 through 3.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis sfm on page 213 • request chassis sfm master switch on page 214 • Configuring SFM Redundancy on M40e and M160 Routers • Switching the Global Master and Backup Roles in a Virtual Chassis Configuration
List of Sample Output	<p>show chassis environment sfm (M40e Router) on page 421</p> <p>show chassis environment sfm (M160 Router) on page 421</p>
Output Fields	Table 62 on page 419 lists the output fields for the <code>show chassis environment sfm</code> command. Output fields are listed in the approximate order in which they appear.

Table 62: show chassis environment sfm Output Fields

Field Name	Field Description
SFM slot status	SFM slot number: 0 or 1 on an M40e router, or 0 , 1 , 2 , or 3 on an M160 router.
State	<p>Status of the SFM:</p> <ul style="list-style-type: none"> • Online—SFM is online and running. • Offline—SFM is powered down. <p>If two SFMs are installed and online, one is functioning as the master, and the other is marked as the Standby.</p>
SPP Temperature	Temperature of the air flowing past the Switch Plane Processor card.
SPR Temperature	Temperature of the air flowing past the Switch Plane Router card.
SPP Power	Information about the voltage supplied to the Switch Plane Processor card. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.

Table 62: show chassis environment sfm Output Fields (*continued*)

Field Name	Field Description
SPR Power	Information about the voltage supplied to the Switch Plane Router. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
CMB Revision	Revision level of the Chassis Management Bus (CMB) device.

show chassis environment sib

Syntax	show chassis environment sib <slot>
Syntax (TX Matrix router)	show chassis environment sib <lcc number scc> <slot>
Syntax (TX Matrix Plus Router)	show chassis environment sib <sib-slot> <lcc number sfc number> <f13 sib-slot> <f2s sib-slot/sib-f2s-slot-number>
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced in Junos OS Release 9.6. for the TX Matrix Plus router. Command introduced in Junos OS 12.1 for the PTX Series Packet Transport Switches. Command introduced in Junos OS 12.1 for the T4000 Core Routers.
Description	(M320, T Series, TX Matrix, TX Matrix Plus routers, and PTX Packet Transport Switches only) Display Switch Interface Boards (SIB) environmental information.
Options	<p>none—Display environmental information about all SIBs. On a TX Matrix router, display environmental information about all SIBs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all SIBs on the TX Matrix Plus router and its attached routers .</p> <p>f13 sib-slot—(TX Matrix Plus routers only) (Optional) Display SIB F13 environmental information only. Replace sib-slot with one of the following values: 0, 1, 3, 4, 6, 7, 8, 9, 11, or 12. (Slots 2, 5, 10, 13, 14, and 15 are unused).</p> <p>f2s sib-slot/sib-f2s-slot-number—(TX Matrix Plus routers only) (Optional) Display SIB F2s environmental information only. Replace sib-slot with a value from 0 through 4, followed by a sib-f2s-slot-number value of 0, 2, 4 or 6.</p> <p>lcc number—(TX Matrix router, and TX Matrix Plus router only) (Optional) Line-card chassis number. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

scc—(TX Matrix routers only) (Optional) Display environmental information about the SIB in the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) On a TX Matrix Plus router, display environmental information about the SIB in the TX Matrix Plus router (switch-fabric chassis).

sib-slot—(Optional) Display environmental information about the specified SIB. For the M320 router, replace **sib-slot** with a value from 0 through 3. For the T640, T1600, T4000, and TX Matrix routers, replace **sib-slot** with a value from 0 through 4. For the TX Matrix Plus router, see f13 **sib-slot** and f2s **sib-slot/sib-f2s-slot-number**. For the T320 router, replace **sib-slot** with a value from 0 through 2. For the PTX5000 Packet Transport Switch, replace **sib-slot** with a value from 0 through 8.

Output Fields [Table 63 on page 425](#) lists the output fields for the **show chassis environment sib** command. Output fields are listed in the approximate order in which they appear.

Table 63: show chassis environment sib Output Fields

Field Name	Field Description
SIB slot status	<p>SIB slot number:</p> <ul style="list-style-type: none"> • 0 through 3 on an M320 router. • 0 or 2 on a T320 router. • 0 through 4 on a T640, T1600, T4000, or TX Matrix router. • 0, 1, 3, 4, 6, 7, 8, 9, 11, or 12 for F13 SIBs on a TX Matrix Plus router. (Slots 2, 5, 10, 13, 14, and 15 are unused). • 0 through 4, followed by 0, 2, 4, or 6 for F2S SIBs on a TX Matrix Plus router. For example, SIB F2S 0/4. • 0 through 8 on a PTX5000 Packet Transport Switch.
State	<p>Status of the SIB:</p> <ul style="list-style-type: none"> • Online—SIB is online and running. • Offline—SIB is powered down. • Spare (T640, T1600, T4000, and TX Matrix routers only)—SIB is redundant and will move to active state if one of the working SIBs fails. <p>Only four of the SIBs are active at any time. The fifth one is marked Spare. It is activated if there is a fault on one of the active SIBs.</p> <p>Online standby (TX Matrix Plus router only).</p>
Temperature	<p>Temperature of the air flowing past the SIB.</p> <p>On PTX Series Packet Transport Switches, separate temperatures are displayed for Intake, Exhaust, and Junction.</p>
Power	<p>Information about the voltage supplied to the SIB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</p>

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.4 for EX Series switches. sfc option introduced in Junos OS Release 9.6 for the TX Matrix Plus router. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	(M10i, M40e, M120, M160, M320, MX Series, and T Series routers and EX8200 and PTX Series switches only) Display information about the ports on the Control Board (CB) Ethernet switch.
Options	none —Display information about each connected port on the Ethernet switch. On a TX Matrix router, display information about each connected port on the Ethernet switch

on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about each connected port on the Ethernet switch on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on all the members of the Virtual Chassis configuration.

errors—(Optional) Display the numbers and types of errors accumulated on all ports of the Ethernet switch.

errors *port*—(Optional) Display the numbers and types of errors accumulated on the specified port (0 through 15) of the Ethernet switch. On the TX Matrix router, replace *port* with a value from 0 through 15. On the TX Matrix Plus router and EX8200 switch, replace *port* with a value from 0 through 27. On the PTX Series Packet Transport Switches, replace *port* with a value from 0 through 25. On the T4000 routers, MX2020 routers, and MX2010 routers, replace *port* with a value from 0 through 27.

errors switch *number*—(TX Matrix Plus router only) (Optional) Display the numbers and types of errors accumulated on the specified switch. Replace *number* with a value from 0 through 2.

lcc *number*—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

port-state—(PTX Series only) (Optional) Display information about current port operation (**Blocking**, **Listening**, or **Disabled**).

scc—(TX Matrix router only) (Optional) Display information about the ports on the CB's Ethernet switch on the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display information about the ports on the CB's Ethernet switch on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

statistics—(Optional) Display traffic statistics for each connected port on the Ethernet switch.

statistics *port*—(Optional) Display traffic statistics for the specified port on the Ethernet switch. On the TX Matrix router, replace ***port*** with a value from 0 through 25. On the TX Matrix Plus router or EX8200 switch, replace ***port*** with a value from 0 through 27. On the PTX Series Packet Transport Switches, replace ***port*** with a value from 0 through 25. On the T4000 routers, MX2020 routers, and MX2010 routers, replace ***port*** with a value from 0 through 27.

statistics switch *number*—(TX Matrix Plus routers and EX8200 switch only) (Optional) Display traffic statistics for the specified Ethernet switch number. On the TX Matrix Plus router and EX8216 switch, replace ***number*** with a value from 0 through 2. On the EX8208 switch, replace ***number*** with a value from 0 through 1.

Output Fields [Table 64 on page 454](#) lists the output fields for the **show chassis ethernet-switch** command. Output fields are listed in the approximate order in which they appear.

Table 64: show chassis ethernet-switch Output Fields

Field Name	Field Description
Link is good on port <i>n</i> connected to device	Information about the link between each port on the CB's Ethernet switch and one of the following devices: <ul style="list-style-type: none"> FPC0 (Flexible PIC Concentrator 0) through FPC7 Local controller Routing Engine Other Routing Engine (on a system with two Routing Engines) SPMB (Switch Processor Mezzanine Board) (TX Matrix router only) LCC0 (line-card chassis 0) through LCC3
or	
Link is good on Fast Ethernet port <i>n</i> connected to device	
or	
Link is good on Gigabit Ethernet port <i>n</i> connected to device	
or	
Link is down on Gigabit Ethernet port connected to device	
Speed is	Speed at which the Ethernet link is running: 10 Mb or 100 Mb . When the device is RE or Other RE on the TX Matrix router, the speed is 1000 Mb . NOTE: Irrespective of the device, the speed is 1000 Mb on the MX2010 and MX2020 routers.
Duplex is	Duplex type of the Ethernet link: full or half .
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the no-concatenate statement at the [edit chassis] hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i>).
Flow Control TX is Enabled (or Disabled)	(MX2010 routers, MX2020 routers, and PTX Series) Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.
Flow Control RX is Enabled (or Disabled)	(MX2010 routers, MX2020 routers, and PTX Series) Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.
MLT3	Number of multilevel threshold-3 (MLT-3) Fast Ethernet errors detected.
Accumulated error counts for port <i>n</i> connected to device FPC<i>n</i>: (error output only)	
Lock	Number of lock errors detected.
Xmit	Number of transmission errors detected.
ESD	Number of electrostatic discharge (ESD) errors detected.
False Carrier	Number of false carrier errors detected.

Table 64: show chassis ethernet-switch Output Fields (*continued*)

Field Name	Field Description
Disconnects	Number of disconnect errors detected.
FX mode	Number of errors detected on an Ethernet link over optical fiber.
Statistics for port <i>n</i> connected to device <i>FPCn</i> (statistics output only)	
TX Packets 64 Octets	(MX2010 and MX2020 routers) Number of packets of size 64 octets transmitted.
TX Packets 65 - 127 Octets	(MX2010 and MX2020 routers) Number of packets of size 65 through 127 octets transmitted.
TX Packets 128 - 255 Octets	(MX2010 and MX2020 routers) Number of packets of size 128 through 255 octets transmitted.
TX Packets 256 - 511 Octets	(MX2010 and MX2020 routers) Number of packets of size 256 through 511 octets transmitted.
TX Packets 512 - 1023 Octets	(MX2010 and MX2020 routers) Number of packets of size 512 through 1023 octets transmitted.
TX Packets 1024 - 1518 Octets	(MX2010 and MX2020 routers) Number of packets of size 1024 through 1518 octets transmitted.
TX Packets 1519 - 2047 Octets	(MX2010 and MX2020 routers) Number of packets of size 1519 through 2047 octets transmitted.
TX Packets 2048 - 4095 Octets	(MX2010 and MX2020 routers) Number of packets of size 2048 through 4095 octets transmitted.
TX Packets 4096 - 9216 Octets	(MX2010 and MX2020 routers) Number of packets of size 4096 through 9216 octets transmitted.
TX 1519 - 1522 Good Vlan frms	(MX2010 and MX2020 routers) Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.
TX Octets	Number of octets sent.
TX Unicast packets	Number of unicast packets sent.
TX Multicast packets	Number of multicast packets sent.
TX Broadcast packets	Number of broadcast packets sent.
TX Single Collision frames	(MX2010 and MX2020 routers) Number of packets sent after one collision.
TX Mult. Collision frames	(MX2010 and MX2020 routers) Number of packets sent after multiple collisions.

Table 64: show chassis ethernet-switch Output Fields (*continued*)

Field Name	Field Description
TX Late collisions	Number of packets aborted during sending because of collisions after 64 bytes.
TX Excessive collisions	Number of packets not sent because of too many collisions.
TX Dropped packets	Number of transmitted packets that were dropped.
TX PAUSEMAC Ctrl Frames	Number of Media Access Control (MAC) frames containing PAUSE commands that were sent.
TX Oversize Packets	Number of oversize packets that were sent.
TX FCS Error Counter	Number of packets discarded because of frame check sequence errors.
TX Fragment Counter	Number of fragmented packets sent.
TX Byte Counter	Number of bytes sent.
TX Packet OK Counter	Number of viable packets sent.
TX Pause Packet Counter	Number of PAUSE packets sent.
RX Packets 64 Octets	(MX2010 and MX2020 routers) Number of packets of size 64 octets received.
RX Packets 65 - 127 Octets	(MX2010 and MX2020 routers) Number of packets of size 65 through 127 octets received.
RX Packets 128 - 255 Octets	(MX2010 and MX2020 routers) Number of packets of size 128 through 255 octets received.
RX Packets 256 - 511 Octets	(MX2010 and MX2020 routers) Number of packets of size 256 through 511 octets received.
RX Packets 512 - 1023 Octets	(MX2010 and MX2020 routers) Number of packets of size 512 through 1023 octets received.
RX Packets 1024 - 1518 Octets	(MX2010 and MX2020 routers) Number of packets of size 1024 through 1518 octets received.
RX Packets 1519 - 2047 Octets	(MX2010 and MX2020 routers) Number of packets of size 1519 through 2047 octets received.
RX Packets 2048 - 4095 Octets	(MX2010 and MX2020 routers) Number of packets of size 2048 through 4095 octets received.
RX Packets 4096 - 9216 Octets	(MX2010 and MX2020 routers) Number of packets of size 4096 through 9216 octets received.

Table 64: show chassis ethernet-switch Output Fields (*continued*)

Field Name	Field Description
RX Octets	Number of octets received.
RX Unicast packets	Number of unicast packets received.
RX Multicast packets	Number of multicast packets received.
RX Broadcast packets	Number of broadcast packets received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Alignment Errors	Number of incomplete octets received.
RX Dropped Packets	Number of incoming packets that were dropped.
RX Fragments	Number of fragmented packets received.
RX Symbol Errors	Number of symbols received that the router did not correctly decode.
RX MAC Control	Number of Media Access Control (MAC) packets received.
RX Oversize Packets	Number of oversize packets received.
RX Undersize Packets	Number of undersize packets received.
RX Jabbers	Total number of frames received that exceed the maximum byte count and contain CRC errors .
RX Control Frame Counter	Number of control frames received.
RX Pause Frame Counter	Number of pause frames received.
RX FCS Errors	Number of packets discarded because of frame check sequence errors.
RX Fragments	Number of fragmented packets received.
RX Byte Counter	Number of bytes received.
RX Packet OK Counter	Number of viable packets received.

Release Information	<p>Command introduced in Junos OS Release 10.0 on MX Series 3D Universal Edge Routers, M120 routers, and M320 routers, T320 routers, T640 routers, T1600 routers, TX Matrix Routers, and TX Matrix Plus routers.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 11.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.3 for PTX5000 Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.1 for T4000 routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for ACX Series Routers.</p>
Description	(T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers, QFX3008-I Interconnect devices, EX Series switches, and PTX Series Packet Transport Switches only) Show information about the fan tray and fans.
Options	<p>all-members—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.</p> <p>local—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.</p>

member *member-id*—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* variable with a value 0 or 1.

interconnect-device *name*—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

scc—(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

Output Fields Table 65 on page 497 lists the output fields for the **show chassis fan** command. Output fields are listed in the approximate order in which they appear.

Table 65: show chassis fan Output Fields

Field Name	Field Description
Item	Fan item identifier.
Status	Status of the fan: <ul style="list-style-type: none"> • OK—Fan is running properly and within the normal range. • Check—Fan is in Check state because of some fault or alarm condition.
RPM	(T Series routers, TX Matrix routers, TX Matrix Plus routers, MX Series 3D Universal Edge Routers, QFX3108 Interconnect devices, and EX Series switches only) Fan speed in revolutions per minute (RPM).
% RPM	(MX2010 routers, MX2020 routers, and PTX Series Packet Transport Switches only) Percentage of the fan speed being used.
Measurement	(T Series routers, TX Matrix routers, TX Matrix Plus routers, MX Series 3D Universal Edge Routers, QFX3108 Interconnect devices, and EX Series switches only) Fan speed status based on different chassis cooling requirements: <ul style="list-style-type: none"> • Spinning at high speed • Spinning at intermediate speed • Spinning at normal speed • Spinning at low speed (except EX Series switches) (MX2010 routers, MX2020 routers, and PTX Series Packet Transport Switches only) Fan speed in revolutions per minute (RPM) for each fan in the fan tray.

show chassis fabric destinations

Syntax	show chassis fabric destinations
Syntax (MX240, MX480, and MX960 Routers)	show chassis fabric destinations fpc < <i>fpc-slot-number</i> >
Syntax (MX2020 3D Universal Edge Routers)	show chassis fabric destinations fpc < <i>fpc-slot-number</i> >
Syntax (MX2010 3D Universal Edge Routers)	show chassis fabric destinations fpc < <i>fpc-slot-number</i> >
Release Information	Command introduced in Junos OS Release 12.1 for MX240, MX480, and MX960 routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	Display the state of fabric destinations for all FPCs.
Options	<p>none—Display information about the fabric destinations of all FPCs.</p> <p>fpc-slot-number—(Optional) Display information about the specified FPC. For MX2020 routers, replace fpc-slot-number with a value from 0 through 19. For MX2010 routers, replace fpc-slot-number with a value from 0 through 9.</p>
Required Privilege Level	view
List of Sample Output	show chassis fabric destinations fpc 1 (MX240 Router) on page 510 show chassis fabric destinations fpc 2 (MX480 Router) on page 510 show chassis fabric destinations (MX960 Router) on page 511 show chassis fabric destinations fpc 1 (MX2020 Router) on page 512 show chassis fabric destinations (MX2010 Router) on page 513
Output Fields	Table 66 on page 508 lists the output fields for the show chassis fabric destinations command. Output fields are listed in the approximate order in which they appear.

Table 66: show chassis fabric destinations Output Fields

Field Name	Field Description
Fabric destinations state	<p>Indicates the state of the fabric destinations:</p> <ul style="list-style-type: none"> 0—Destination is non-existent. 2—Destination is enabled. 3—Destination is disabled.

Table 66: show chassis fabric destinations Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none">• 6—Destination is in erroneous state and is disabled.
Flexible PIC Concentrator (FPC) number	Source FPC number.
Packet Forwarding Engine number	Source Packet Forwarding Engine number.
Plane number	Source plane number.

Sample Output

show chassis fabric destinations fpc 1 (MX240 Router)

In the output, the values followed by the plane number denote multiple quadruples. The first quadruple specifies FPC1, the second quadruple specifies FPC2 and so on. Each quadruple specifies the states of the fabric plane to the Packet Forwarding Engines.

show chassis fabric feb

Syntax	show chassis fabric feb
Release Information	Command introduced in Junos OS Release 8.0.
Description	(M120 router only) Display the state of the electrical and optical switching fabric links between the Forwarding Engine Boards (FEBs) and the fabric planes, as interpreted by the FEB.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show chassis fabric feb on page 518
Output Fields	Table 67 on page 518 lists the output fields for the show chassis fabric feb command.

Table 67: show chassis fabric feb Output Fields

Field Name	Field Description
Fabric management FEB state	State of the switching fabric link between each FEB and fabric plane: desalination error, disabled, enabled, link error, link ok, or unused.

Sample Output

```
show chassis fabric feb
user@host> show chassis fabric feb
Fabric management      FEB state
FEB 0                  Plane 0: Plane enabled
                       Plane 1: Plane enabled
                       Plane 2: Plane enabled
                       Plane 3: Plane enabled
FEB 4                  Plane 0: Plane enabled
                       Plane 1: Plane enabled
                       Plane 2: Plane enabled
                       Plane 3: Plane enabled
```

show chassis fabric errors

Syntax	show chassis fabric errors <fpc <i>slot-number</i> lcc <i>number</i> > <sib (<i>slot</i> f13 <i>sib-slot</i> f2s <i>sib-slot/sib-f2s-slot-number</i> lcc <i>number</i>)>
Syntax (PTX Series Packet Transport Switches)	show chassis fabric errors (autoheal fpc <i>slot-number</i> sib <i>sib-slot</i>)
Release Information	Command introduced in Junos OS Release 10.0. Command introduced in Junos OS Release 12.1X48 for the PTX Series Packet Transport Switches.
Description	Display the first ten and last ten fabric errors for the FPC or Switch Interface Boards (SIBs).

NOTE: This command can only be issued on a master Routing Engine.

- Options**
- autoheal**—(PTX Series Packet Transport Switches only) Show an error log of the first 100 autoheal actions taken on the system.
 - fpc *slot-number***—Show error log of the first ten and last ten errors for the specified FPC. (PTX5000 Packet Transport Switches only)—Replace *slot-number* with a value from 0 through 7.

(TX Matrix Plus routers only)—Replace *slot-number* with a value from 0 through 31. On TX Matrix Plus router with 3D SIBs, replace *slot-number* with a value from 0 through 63. This option has the following suboptions:
 - **lcc *number***—Show error log of the first ten and last ten errors for the specified FPC on a specific network device (line-card chassis) that is part of the routing matrix. Replace *number* with the following values depending on the LCC configuration:
 - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
 - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
 - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
 - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- If you specify the number of the network device by using only the **lcc *number*** option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, replace *slot-number* with a value from 0 through 31. On TX Matrix Plus

router with 3D SIBs, replace *slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> show chassis fabric errors fpc 1 lcc 1
user@host> show chassis fabric errors fpc 9
```

sib—Show error log of the first ten and last ten errors for the specified SIB. This option has the following suboptions:

- (TX Matrix Plus routers only) *sib-slot*—Specify a value ranging from 0 through 4.
- (PTX Series Packet Transport Switches) *sib-slot*—Specify a value ranging from 0 through 8.
- **f13 sib-slot**—(Optional) Show SIB F13 errors. Specify a valid SIB value number: 0, 1, 3, 4, 6, 7, 8, 9, 11, or 12.
- **f2s sib-slot/sib-f2s-slot-number**—(Optional) Show SIB F2S errors. Replace *sib-slot* with a value from 0 through 4, followed by a *sib-f2s-slot-number* value 0, 2, 4 or 6.
- **lcc number**—(Optional) Show error log of the first ten and last ten SIB errors for the specified network device (line-card chassis).

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

NOTE: The *lcc number* suboption is mandatory when using the following format for the command: `show chassis fabric errors sib lcc number sib slot-number`. For instance, issuing `show chassis fabric errors sib lcc 2 3` displays errors detected on LCC 2, SIB 3.

This suboption is not required when the *f13* or *f2s* suboptions are used with the *sib slot-number* option.

Required Privilege Level view

List of Sample Output [show chassis fabric errors \(F13 SIB Errors on a TX Matrix Plus Router\) on page 521](#)
[show chassis fabric errors \(F2S SIB Errors on a TX Matrix Plus Router\) on page 522](#)
[show chassis fabric errors \(SIB Errors Specific to an LCC Connected to a TX Matrix Plus Router\) on page 522](#)

[show chassis fabric errors \(FPC Errors Specific to an LCC Connected to a TX Matrix Plus Router\) on page 522](#)

[show chassis fabric errors \(SIB Errors Specific to an LCC Connected to a TX Matrix Plus Router with 3D SIBs\) on page 522](#)

[show chassis fabric errors fpc or sib \(PTX Series Packet Transport Switches\) on page 522](#)

[show chassis fabric errors autoheal \(PTX Series Packet Transport Switches\) on page 522](#)

Output Fields Table 68 on page 521 lists the output fields for the **show chassis fabric errors** command. Output fields are listed in the approximate order in which they appear.

Table 68: show chassis fabric errors Output Fields

Field Name	Field Description
Time	Time the error was logged. (PTX Series Packet Transport Switches only) For the autoheal option, shows the timestamp when autoheal was attempted on a SIB that was in fault state.
Error log of first 10 errors	List of the first ten errors.
Error log of last 10 errors	List of the last ten errors.
Error log of first 100 errors	Indicates the autoheal action taken on the SIB. The following actions can occur: <ul style="list-style-type: none"> • Req—A SIB autoheal request was made on a faulty SIB. • Action—Autohealing (taking the SIB offline and then online) is initiated. • Denied—Autohealing (taking the SIB offline and then online) is denied because the SIB went to a fault state before the autoheal configuration period completed. • Set info—Setting information to force skipping autoheal on the SIB so that no further attempts to autoheal the faulty SIB are made. • Clear info—If a user takes a SIB offline and then online, then the autoheal information of the SIB is cleared. If the SIB goes to a fault state, autoheal is attempted on the SIB.
fpc slot number	(PTX5000 Packet Transport Switch only)—Range is 0 through 7.
sib slot number	(PTX Series Packet Transport Switches only)—Range is 0 through 8.
lcc number	Not supported on PTX Series Packet Transport Switches.

Sample Output

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	(M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Switches only) Display the state of the electrical switch fabric links between the Flexible PIC Concentrators (FPCs) and the Switch Interface Boards (SIBs).
Options	<p>none—Display the switch fabric link state. On a TX Matrix router, display the switching fabric link states for the FPCs in all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display the switching fabric link states for the FPCs in all routers connected to the TX Matrix Plus router.</p> <p>all-members—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in all members of the Virtual Chassis configuration.</p> <p>lcc <i>number</i>—(TX Matrix router and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the switch fabric link state for the FPCs in the specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the switch fabric link state for the FPCs in the specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace <i>number</i> with a following value depending on the LCC configurations:</p>

- From **0** through **3** on a T640 router on the routing matrix with TX Matirx routers.
- From **0** through **3** on a T1600 router on the routing matrix with TX Matirx Plus routers.
- From **0** through **7** on a T1600 router in a routing matrix with TX Matrix Plus router with 3D SIBs.
- **0, 2, 4, 6** on a T4000 router in a routing matrix with TX Matrix Plus router with 3D SIBs.

local—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

slot *fpc-slot*—(PTX Series Packet Transport Switches only) (Optional) Display the fabric state of the specified FPC slot. If no value is provided, display the status of all FPCs.

Output Fields [Table 69 on page 526](#) lists the output fields for the **show chassis fabric fpcs** command. Output fields are listed in the approximate order in which they appear.

Table 69: show chassis fabric fpcs Output Fields

Field Name	Field Description
Fabric management FPC state	<p>Switching fabric link (link from SIB to FPC) state for each FPC:</p> <ul style="list-style-type: none"> • Unused—FPC is not present. (On MX240 and MX480 routers with AS- MLC modular carrier card only) the fabric plane from the pair that share physical links (1 and 5, and 3 and 7) is inactive. • Destination error on PFEs <i>list of PFE numbers</i>—Destination errors to the listed Packet Forwarding Engines. Indicates that the link is not carrying traffic to the listed Packet Forwarding Engines. <p>NOTE: In Junos OS Release 9.6 and later, the list of Packet Forwarding Engines with destination errors is displayed in the output.</p> <p>In Junos OS Releases before 9.6, the output only indicates that there are destination errors. However, the list of Packet Forwarding Engines with destination errors is not displayed.</p> <ul style="list-style-type: none"> • Links ok—Link between the spare SIB and FPC is eligible to carry traffic. • Link error—Link between the SIB and FPC has CRC errors. However, the link is still eligible to carry traffic. • Plane disabled—Fabric plane has been disabled for the following reasons: <ul style="list-style-type: none"> • Destination errors have exceeded the thresholds. • Run-time link errors have exceeded the thresholds. • Initialization time link errors detected, and link training was unsuccessful. • Plane Disabled, Links Error (PTX Series Packet Transport Switches only)—The plane is disabled because of link errors detected at the FPC RX. • Plane Disabled, Links Down (PTX Series Packet Transport Switches only)—The plane is disabled because of link errors detected at the SIB RX. • Plane enabled—Link between the active SIB and FPC is eligible to carry traffic. <p>NOTE: On the Enhanced MX SCB with MPC, a maximum of 4 planes are operational and running. On all the other SCBs with MPC, all the planes are operational and running.</p> <ul style="list-style-type: none"> • Plane Enabled, Links OK (PTX Series Packet Transport Switches only)—The FPC CCL RX link is eligible to carry traffic.

show chassis fabric map

Syntax	show chassis fabric map plane <plane-number>
Syntax (MX Series Router)	show chassis fabric map <all-members> <local> <member member-id> <plane plane-number>
Release Information	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.4 for EX Series switches.
Description	(M120 and MX Series routers and EX8200 switches only) On the M120 router, display the state of the switching fabric map for connections from the Forwarding Engine Boards (FEBs) to the ports on the fabric planes, as interpreted by the fabric plane. On the MX Series router and the EX8200 switch, display the state of the switching fabric map for connections from each Packet Forwarding Engine on the Dense Port Concentrators (DPCs) to the ports on the fabric planes, as interpreted by the fabric plane. For information about the meaning of “fabric plane”, “DPCs”, and “SIBs” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.
Options	<p>none—Display the switching fabric map state for the M120 or MX Series router or EX8200 switch.</p> <p>all-members—(MX Series routers only) (Optional) Display the switching fabric map state for all the members of the Virtual Chassis configuration.</p> <p>local—(MX Series routers only) (Optional) Display the switching fabric map state for the local Virtual Chassis member.</p> <p>member member-id—(MX Series routers only) (Optional) Display the switching fabric map state for the specified member of the Virtual Chassis configuration. Replace the member-id with a value of 0 or 1.</p> <p>plane plane-number—(Optional) Display the state of the fabric link for the specified plane number.</p> <ul style="list-style-type: none"> For the M120 router, replace plane-number with a value from 0 through 3. For the MX480 and MX240 routers, replace plane-number with a value from 0 through 7. For the MX960 router, replace plane-number with a value from 0 through 5. For the EX8208 switch, replace plane-number with a value from 0 through 11. For the EX8216 switch, replace plane-number with a value from 0 through 7.
Required Privilege Level	view

List of Sample Output [show chassis fabric map \(M120 Router\) on page 560](#)
[show chassis fabric map \(MX Series Routers\) on page 560](#)
[show chassis fabric map plane 1 \(EX8200 Switch\) on page 563](#)

Output Fields [Table 70 on page 559](#) lists the output fields for the **show chassis fabric map** command. Output fields are listed in the approximate order in which they appear.

Table 70: show chassis fabric map Output Fields

Field Name	Field Description
in-links	Fabric map for receive side links.
out-links	Fabric map for transmit side links.
state	State of the fabric link: <ul style="list-style-type: none">• RESET—Link between SIB and FPC/DPC is powered down on purpose. This is done in all non-dual PFE based boards.• UP—Link between SIB and FPC/DPC is up and running.• DOWN—Link between SIB and FPC/DPC is powered down.• FAULT—SIB is in alarmed state where the SIB's plane is not operational for the following reasons:<ul style="list-style-type: none">• On-board F-chip is not operational.• Fiber optic connector faults.• FPC connector faults.• SIB midplane connector faults.

show chassis fabric optical-links

Syntax (TX Matrix Plus Router with 3D SIBs)	show chassis fabric optical-links <detail> <lcc number>
Release Information	Command introduced in Junos OS Release 13.1.
Description	Display optical link connectivity and its current status. Display the status of all the optical links on online SIBs along with the state of optical-link, high-speed link status and mapped FPCs. Show the cable connectivity based on mode of operation of line-card chassis (LCC) and flag the problems with cable connectivity, if any.
Options	<p>detail—(TX Matrix Plus routers with 3D SIBs only) (Optional) Display detailed output for optical link connectivity and current status of all the optical links. Also, highlight the FPC slots that are impacted in case of an error on a particular optical link.</p> <p>lcc number—(Optional) Display information for the LCC that is connected to the TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> From 0 through 7 on T1600 routers connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. 0, 2, 4, or 6 on T4000 routers connected to TX Matrix Plus router with 3D SIBs in a routing matrix.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show chassis fabric optics Routing Matrix with a TX Matrix Plus Router Solutions Page
List of Sample Output	show chassis fabric optical-links on page 567 show chassis fabric optical-links detail on page 568 show chassis fabric optical-links lcc on page 569
Output Fields	Table 71 on page 565 lists the output fields for the show chassis fabric optical-links command. Output fields are listed in the approximate order in which they appear.

Table 71: show chassis fabric optical-links Output Fields

Field Name	Field Description
Lcc optical link	Line Card chassis links are shown as LCCxx_SIByy_CXPzz, where xx is LCC number, yy is the LCC SIB slot ID, and zz is the optics number within that LCC SIB.

Table 71: show chassis fabric optical-links Output Fields (*continued*)

Field Name	Field Description
Link	<p>The status of the optical link.</p> <ul style="list-style-type: none"> • -----<?>----- Transceiver is not inserted in the SIB or not recognized. • -----<U>----- The connected transceiver is not supported. • -----<F>----- The connected transceiver is faulty or it has exceeded the operating limits. • -----< >----- The transceiver is inserted, but the cable is not connected. Loss of Light (LOL) is observed in the optics. • -----<///>----- The transceiver is not connected to the correct port. The link status indicates where it is wrongly connected. • -----<O>----- Indicates a bad or dirty cable or an issue with transceiver. Some channels show error. • -----<E>----- The cable is connected properly but high-speed link errors are present on this link. • -----<L>----- A loopback transceiver is inserted. • -----<X>----- Error due to high-speed links links being down. • -----< >----- The cable is connected but optical link is disabled. • -----< >----- The cable is connected properly with the requisite power settings. High-speed links on the port are up and running.
Sc optical link	<p>Switch-fabric chassis links are shown as SFCa_F13bb_LCCcc_CXPdd, where <i>a</i> is the SFC chassis 0, <i>bb</i> is F13 SIB slot, <i>cc</i> is the LCC this cable is connected to, and <i>dd</i> is the optics number within that F13 SIB.</p>
State	<p>Link status:</p> <ul style="list-style-type: none"> • Up—Link is online and fully functional. • Connected—The cable is connected but optical link is disabled. • Link Down—High speed links are down in the system. • Loopback—A loopback transceiver is inserted in the system. • Link Error—The cable is properly connected but high speed link error exists in the system. • Optical Error—Indicates a bad cable. • Mis connected—The transceiver is not connected to correct port. • Module Absent—The transceiver is not inserted in the SIB or the transceiver is not recognized. • Not Connected—The transceiver is inserted but cable is not connected to the system. • Faulty Module—The connected transceiver is faulty or it has exceeded the operating limits.

Syntax (MX2020 3D Universal Edge Routers)	show chassis fabric plane
Release Information	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>detail, extensive, lcc, sfc, and terse options introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	<p>(TX Matrix Plus router, T4000, T1600, M120, and MX Series routers and EX8200 switches only) On the M120 router, display the state of all fabric plane connections to the Forwarding Engine Boards (FEBs). On MX Series routers, display the state of all fabric plane connections to the Dense Port Concentrators (DPCs) and Packet Forwarding Engines (PFEs) on the Flexible PIC Concentrators (FPCs). On the TX Matrix Plus router, and on T1600 or T4000 routers in a routing matrix, display the state of the fabric management plane and the logical planes on the switch-fabric chassis (SFC) and line-card chassis (LCC). On EX8200 switches, display the state of all fabric planes. This command can be used on the master Routing Engine only.</p>
Options	<p>none—(MX2010 and MX2020 Routers only) (Optional) Display the state of the fabric management plane.</p> <p>detail—(TX Matrix Plus routers, T1600 or T4000 routers in a routing matrix, and MX Series routers only) (Optional) Display detailed output for the fabric management plane. Show Switch Interface Board (SIB) states for the TXP-F13 SIB and the TXP-F2S SIB.</p> <p>extensive—(TX Matrix Plus routers, T1600 or T4000 routers in a routing matrix, and MX Series routers only) (Optional) Display extensive output for the fabric management plane.</p>

terse—(TX Matrix Plus routers and MX Series routers only) (Optional) Display terse output for the fabric management plane.

all-members—(MX Series routers only) (Optional) Display the state of all fabric plane connections on all members of the Virtual Chassis configuration.

lcc *number*—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the state of all fabric plane connections on the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the state of all fabric plane connections on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

sfc *number*—(TX Matrix Plus router only) (Optional) Show information about the TX Matrix Plus router (SFC). Replace *number* with 0.

Output Fields Table 72 on page 572 lists the output fields for the **show chassis fabric plane** command. Output fields are listed in the approximate order in which they appear.

Table 72: show chassis fabric plane Output Fields

Field Name	Field Description	Level of output
Plane	(TX Matrix Plus, MX Series routers, M120 routers, and EX8200 switches only) Number of the plane.	none
Plane state	<p>(MX Series and M120 routers and EX8200 switches only) State of each plane:</p> <ul style="list-style-type: none"> • ACTIVE—SIB is operational and running. <p>NOTE: On the Enhanced MX SCB with MPCs, a maximum of 4 planes are operational and running. On all the other SCBs with MPCs, all the planes are operational and running.</p> <ul style="list-style-type: none"> • FAULTY— SIB is in alarmed state where the SIB's plane is not operational for the following reasons: <ul style="list-style-type: none"> • On-board fabric ASIC is not operational. • Fiber optic connector faults. • FPC connector faults. • SIB midplane connector faults. <p>(MX2010 and MX2020 Routers only) State of each plane:</p> <ul style="list-style-type: none"> • ACTIVE—SFB is operational and running. • OFFLINE— SFB is in offline. 	none
FEB	<p>(M120 routers only) FEB number and state of links to each FEB:</p> <ul style="list-style-type: none"> • Link error—Link between SIB and FPC is not operational. • Links ok—Link between SIB and FPC is active. • Unused—No FPC is present. 	none

Table 72: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
FPC	(MX Series routers only) Slot number of each Dense Port Concentrator (DPC) or Flexible PIC Concentrator (FPC). An FPC occupies two DPC slots on an MX Series router. The interface corresponds to the lowest numbered DPC slot for which the FPC is installed.	none
PFE	<p>(MX Series and M120 routers only) Slot number of each Packet Forwarding Engine and the state of the links to the DCP: Links ok, Link error, or Unused. Each DPC includes four Packet Forwarding Engines.</p> <ul style="list-style-type: none"> • Links ok: Link between SIB and FPC is active. • Link error: Link between SIB and FPC is not operational. • Unused: No FPC is present. <p>(On MX240 and MX480 routers with AS MLC modular carrier card) Indicates that the link between the fabric plane and the hardware link on the modular carrier card is not operational.</p> <p>(MX2010 and MX2020 routers only) Slot number of each Packet Forwarding Engine and the state of the links to the DPC: Links ok, Link error, or Unused. Each DPC includes four Packet Forwarding Engines.</p> <ul style="list-style-type: none"> • Links ok: Link between SFB and FPC is active. • Link error: Link between SFB and FPC is not operational. • Unused: No FPC is present. 	none

Table 72: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
State	<p>(TX Matrix Plus, and T1600 or T4000 routers in a routing matrix only)—State of the fabric plane:</p> <ul style="list-style-type: none"> • Online: Fabric plane is operational and running and links on the SIB are operational. • Offline: Fabric plane state is Offline because the plane does not have four or more F2S and one F13 online. • Empty: Fabric plane state is Empty if all SIBs in the plane are absent. • Spare: Fabric plane is redundant and can be operational if the operational fabric plane encounters an error. • Check: Fabric plane is in alarmed state due to the following reason and the cause of the error must be resolved: <ul style="list-style-type: none"> • One or more SIBs (belonging to the fabric plane) in the Online or Spare states has transitioned to the Check state. Check state of the SIB can be caused by link errors or destination errors. • Fault: Fabric plane is in alarmed state if one or more SIBs belonging to the plane are in the Fault state. A SIB can be in the Fault state because of the following reasons: <ul style="list-style-type: none"> • On-board fabric ASIC is not operational. • Fiber optic connector faults. • FPC connector faults. • SIB midplane connector faults. • Link errors have exceeded the threshold. 	none
Link Errors	(TX Matrix Plus routers with 3D SIBs only) indicate the number of links which are marked faulty because the errors on them have crossed threshold.	none
Cable Errors	(TX Matrix Plus routers with 3D SIBs only) Indicate the number of mandatory cables that are not connected, or in up state for that plane	none
Destination Errors	(TX Matrix Plus routers with 3D SIBs only) Indicates the number of destinations that are not reachable on this plane.	none
Uptime	(TX Matrix Plus, and T1600 or T4000 routers in a routing matrix only)—Time the fabric plane has been up and running.	none

Table 72: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
PLANE number	<p>State of the fabric plane:</p> <ul style="list-style-type: none"> • Online: Fabric plane is operational and running and links on the SIB are operational. • Offline: Fabric plane state is Offline because the plane does not have 4 or more F2S and 1 F13 online. • Empty: Fabric plane state is Empty if all SIBs in the plane are absent. • Spare: Fabric plane is redundant and can be operational if the operational fabric plane encounters an error. • Check: Fabric plane is in alarmed state due to the following reasons and the cause of the error must be resolved: <ul style="list-style-type: none"> • One or more SIBs (belonging to the fabric plane) in the Online or Spare states has transitioned to the Check state. Check state of the SIB can be caused because of link errors or destination errors. • Fault: Fabric plane is in alarmed state if one or more SIBs belonging to the plane are in the Fault state. A SIB can be in the Fault state because of the following reasons: <ul style="list-style-type: none"> • On-board fabric ASIC is not operational. • Fiber optic connector faults. • FPC connector faults. • SIB midplane connector faults. • Link errors have exceeded the threshold. 	extensive
SIB F13/F2S slot-number	<p>State of the TXP-F13 SIB or TXP-F2S SIB:</p> <ul style="list-style-type: none"> • Activating—Transitional state when the SIB is transitioning to the Online or Spare state. • Deactivating—Transitional state when the SIB is going offline. • Online—SIB is operational and running. • Offline—SIB is powered down. • Spare—SIB is redundant and will move to active state if one of the working SIBs fails to pass traffic. • Empty—No SIB is present. • Fault—SIB is in alarmed state because of the following reasons and the cause of the error must be resolved: <ul style="list-style-type: none"> • On-board fabric ASIC is not operational. • Fiber optic connector faults. • FPC connector faults. • SIB midplane connector faults. • Link errors have exceeded the threshold • Check—SIB is in alarmed state where the SIB is partially operational because of link or destination errors. Only a SIB that is Online or Spare can transition to the Check state. <p>NOTE: If a SIB is not inserted properly, the SIB cannot transition to the Online or Spare state, and therefore cannot transition to the Check state.</p>	extensive

Table 72: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
SIB F13 slot-number Odd/Even	State of the TXP-F13 SIB even and odd port connection optical links from the TX Matrix Plus router (SFC) to the router (LCC) in the routing matrix. The left four ports on the SFC are labeled Even and provide connections to one even-numbered LCC—LCC0 or LCC2. The right four ports on the SFC are labeled Odd and provide connections to one odd-numbered LCC—LCC1 or LCC3.	extensive
LCC number, SIB slot-number	State of the SIB on the LCC that is connected to the Even or Odd port on the TXP-F13 SIB faceplate: <ul style="list-style-type: none"> • Links ok—Links between the TXP-F13 SIB on the SFC and the LCC are active. • Links error—One or more links between the TXP-F13 SIB on the SFC and the LCC, have experienced an error, but the affected links remain operational. • Unused—No SIB is present. 	extensive
SG number Port number	State of the SG chip ports on the LCC: <ul style="list-style-type: none"> • Links ok—Link is active. • Link error—Link is operational with errors. • Link error crc saturated—CRC has exceeded the rate threshold and reached saturation without optical issues—that is, a cable has not been cut, removed, or otherwise experienced an error. • Link error crc saturated with optical errors—CRC has exceeded the rate threshold and reached saturation with optical issues—that is, a cable has been cut, removed, or otherwise experienced an error. • Unused—Port is not in use. 	extensive
SIB F2S slot-number	State of the intra-chassis links between the TXP-F2S and TXP-F13 SIBs.	extensive

Fabric Management SIB State Output Fields for the show chassis fabric plane extensive Command on a TX Matrix Plus Router

Table 72: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
SIB slot-number	<p>State of the SIBs on the T1600/T4000 router (LCC) in the routing matrix:</p> <ul style="list-style-type: none"> • Activating—Transitional state when the SIB is coming online. • Deactivating—Transitional state when the SIB is going offline. • Connected—SIBs on an LCC are connected and trained, but are either not online or are spare, because the plane on the the TX Matrix Plus router (SFC) is still offline. The LCC SIB transitions to the Connected state when the F13 SIB to which it connects is online but the SFC plane (to which the LCC SIB connects) is offline for some reason; for instance, when there are insufficient number of F2 SIBs in the plane. • Disconnected—If an F13 SIB on the TX Matrix Plus router (SFC) goes offline, then the SIBs on the LCCs connected to the F13 SIB get disconnected. On the TX Matrix Plus router with 3D SIBs, the LCC SIB is also disconnected if the F13 SIB is online, but none of the cables are connected or trained. The Disconnected state is valid only for SIBs on an LCC. An LCC SIB transitions to the Disconnected state when the F13 SIB to which it connects goes Offline, irrespective of the state of the SFC plane. SFC Error—If an F13 SIB on the TX Matrix Plus router (SFC) transitions to the Fault state (because of link errors, for instance), and if an LCC SIB connected to the F13 SIB comes online, the LCC SIB transitions to the SFC Error state. This state indicates that the F13 SIB to which the LCC SIB is connected has errors. <p>NOTE: The Connected, Disconnected, and SFC Error states are applicable only to the SIBs on an LCC.</p> <ul style="list-style-type: none"> • Online—SIB is operational and running. • Offline—SIB is powered down. • Spare—SIB is redundant and will move to active state if one of the working SIBs fails to pass traffic. • Empty—No SIB is present. • Fault—SIB is in alarmed state where the SIB's plane is not operational for the following reasons: <ul style="list-style-type: none"> • On-board fabric ASIC is not operational. • Fiber optic connector faults. • FPC connector faults. • SIB midplane connector faults. • Link errors have exceeded the threshold • Check—SIB is in alarmed state where the SIB is partially operational because of link or destination errors. Only a SIB that is Online or Spare can transition to the Check state. <p>NOTE: If a SIB is not inserted properly, the SIB cannot transition to the Online or Spare state, and therefore cannot transition to the Check state.</p>	extensive

Table 72: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
LCC SIB Link State	State of the LCC SIB link: <ul style="list-style-type: none">• Links ok—Link is active.• Links error—A link error has occurred, but the link remains operational.• Unused—SIB is not in use.	extensive
SG number Port number	State of the SG chip ports on the LCC: <ul style="list-style-type: none">• Links ok—Link is active.• Link error—Link is operational with errors.• Link error crc saturated—CRC has exceeded the rate threshold and reached saturation without optical issues—that is, a cable has not been cut, removed, or otherwise experienced an error.• Link error crc saturated with optical errors—CRC has exceeded the rate threshold and reached saturation with optical issues—that is, a cable has been cut, removed, or otherwise experienced an error.• Unused—Port is not in use.	extensive

show chassis fabric plane-location

Syntax	show chassis fabric plane-location
Syntax (MX Series Routers)	show chassis fabric plane-location <all-members> <local> <member <i>member-id</i> >
Syntax (MX2010 3D Universal Edge Routers)	show chassis fabric plane-location
Syntax (MX2020 3D Universal Edge Routers)	show chassis fabric plane-location
Syntax (TX Matrix Plus Router)	show chassis fabric plane-location
Release Information	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	<p>(M120, MX Series routers, and EX8200 switches only) Display the Control Board (CB) location of each plane. This command can be used on the master Routing Engine or the backup Routing Engine. For information about the meaning of “CBs” and “fabric plane” on the switches, see EX Series Switches Hardware and CLI Terminology Mapping.</p> <p>(TX Matrix Plus routers only) Display the SIB location of each fabric plane.</p> <p>(PTX Series Packet Transport Switches only) Display the fabric plane location of each SIB.</p> <p>(MX2010 and MX2020 Routers only) Display the fabric plane location of each Switch Fabric Board (SFB).</p>
Options	<p>all-members—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in all member routers in the Virtual Chassis configuration.</p> <p>local—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the local Virtual Chassis member.</p> <p>member <i>member-id</i>—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the specified member in the Virtual Chassis configuration. Replace <i>member-id</i> with a value of 0 or 1.</p>
Required Privilege Level	view

Output Fields Table 73 on page 612 lists the output fields for the **show chassis fabric plane-location** command. Output fields are listed in the approximate order in which they appear.

Table 73: show chassis fabric plane-location Output Fields

Field Name	Field Description
Plane <i>n</i>	Plane number. (PTX Series Packet Transport Switches only) Plane numbers associated with the SIB. (MX2010 and MX2020 Routers only) Plane numbers associated with the SFB.
Control Board <i>n</i>	Control board number.
SFC ABS-SIB-F13	(TX Matrix Plus routers only) Switch Interface Board (SIB) slot number on the F13 SIB.
SFC ABS-SIB-F2S	(TX Matrix Plus routers only) SIB slot number on the F2S SIB.
LCC ST-SIB-L	(TX Matrix Plus routers only) Line-card chassis (LCC) SIB slot number.
SFC SIB F13	(TX Matrix Plus routers with 3D SIBs only) Switch Interface Board (SIB) slot number on the F13 SIB.
SFC SIB F2S	(TX Matrix Plus routers with 3D SIBs only) SIB slot number on the F2S SIB.
LCC SIB	(TX Matrix Plus routers with 3D SIBs only) Line-card chassis (LCC) SIB slot number.
SIB	(PTX Series Packet Transport Switches only) SIB number.
Switch Fabric Board <i>n</i>	(MX2010 and MX2020 Routers only) SFB number.

Sample Output

show chassis fabric reachability

Syntax	show chassis fabric reachability <detail>
Release Information	Command introduced before Junos OS Release 11.4. Command introduced in Junos OS Release 12.1 for MX240, MX840, and MX960 routers. Command introduced in Junos OS Release 12.1X48R4 for PTX Series Packet Transport Switches.
Description	(M320, MX240, MX480, MX960, and T Series routers only) Display the current state of fabric destination reachability. Additionally, display the details of the automated actions taken by the system to stop blackholing and attempt healing, and the final resolution of the actions.
Options	none —Display the state of fabric destination reachability for M320, MX240, MX480, MX960, T640, and T1600 routers, based on periodic reachability checks. Display the system's action phase sequences to stop blackholing and attempt healing, and the final resolution. detail —(Optional) Display the details of the actions carried out by the system in the different action phases and the final resolution.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show chassis fabric unreachable-destinations on page 662
List of Sample Output	show chassis fabric reachability on page 621 show chassis fabric reachability detail on page 621 show chassis fabric reachability (PTX5000 system) on page 622
Output Fields	The table lists the output fields for the show chassis fabric reachability command. Output fields are listed in the approximate order in which they appear.

Table 74: show chassis fabric reachability Output Fields

Field Name	Field Description	Level of Output
Fabric reachability status	Display the reachability status of the fabric. <ul style="list-style-type: none"> • Enabled destinations transitioned to unreachable, Fabric down action in progress—Some enabled destinations that were originally reachable have become unreachable. The system is trying to stop the fabric down condition and attempt healing. • Enabled destinations reachable—The enabled destinations are reachable. • Unreachable destinations healed—The unreachable destinations are healed and are reachable. • Unreachable destinations removed—The unreachable destinations are removed. • Unreachable destinations present—Unreachable destinations are present in the system. • Unreachable destinations present due to FPC restart disable configuration—Unreachable destinations are present as a result of user configuration set to disable FPC restart. 	All levels
Unreachable destinations	Number of FPCs that have unreachable destinations.	All levels
Detected on	Date and time when unreachable destinations are detected.	All levels
Reason	Reason for the destination turning unreachable. <ul style="list-style-type: none"> • Single FPC error—A single bad FPC is not reachable over the fabric. • Fabric plane error—Multiple FPCs are not able to forward traffic over the fabric planes. 	All levels
Fabric reachability action	Action taken to handle the unreachable destination. <ul style="list-style-type: none"> • Plane Action—The healing is attempted only for the fabric planes. • SIB Action—(PTX Series system only) The healing is attempted only for the SIBs. • Plane and FPC Action—The healing is attempted both for the fabric planes and the FPCs. • SIB and FPC Action—(PTX Series system only) The healing is attempted both for the SIBs and the FPCs. • FPC Action—The healing is attempted only for the bad FPCs. 	All levels
Acting on	Current action is being performed on: <ul style="list-style-type: none"> • Single FPC error—The current operation is for healing the single bad FPC. • Fabric Plane error—The current operation is for healing the fabric planes. 	All levels

Table 74: show chassis fabric reachability Output Fields (*continued*)

Field Name	Field Description	Level of Output
Initial phase	Starting phase for the healing action. <ul style="list-style-type: none"> • Plane restart—The fabric planes are restarted. • SIB restart—(PTX Series system only) The SIBs are restarted. • Plane and FPC restart—Both the fabric planes and affected FPCs are restarted. • SIB and FPC restart—(PTX Series system only) SIBs and affected FPCs are restarted. 	All levels
Current phase	Current phase for the healing action. <ul style="list-style-type: none"> • Plane restart—The fabric planes are restarted. • SIB restart—(PTX Series system only) The SIBs are restarted. • Plane and FPC restart—Both the fabric planes and affected FPCs are restarted. • SIB and FPC restart—(PTX Series system only) Both the SIBs and affected FPCs are restarted. • FPC offline—The FPCs are turned offline because the previously mentioned healing processes have failed. 	All levels
Action started	Date and time when the system fabric down healing attempt is started.	All levels
Plane restart phase	The status of the plane restart phase. <ul style="list-style-type: none"> • Completed—The plane restart phase is completed. • In progress—The plane restart phase is in progress. 	detail
Phase started	Date and time when the plane restart phase is started.	detail
Planes restarted	List of plane numbers restarted by the system.	detail
Planes timed out	List of plane numbers that have timed out waiting to be restarted by the system.	detail
Planes being offlined / onlined	Planes that are turned offline or turned online by the system, with date and time.	detail
Phase completed	Date and time when the plane restart phase is completed.	detail
Plane and FPC Restart Phase	Status of the plane and FPC restart phase. <ul style="list-style-type: none"> • Completed—The plane and FPC restart phase is completed. • In progress—The plane and FPC restart phase is in progress. 	detail
Phase started	Date and time when the plane and FPC restart phase is started.	detail
FPC Offline Started	Date and time when the FPC offline action is started.	detail
Offlined FPCs	List of FPCs that are turned offline by the system.	detail

Table 74: show chassis fabric reachability Output Fields (*continued*)

Field Name	Field Description	Level of Output
FPCs timed out	List of FPCs that have timed out waiting to be turned offline by the system.	detail
FPC being offlined	FPC that is being turned offline by the system, with date and time.	detail
FPC Offline completed	Date and time when the FPC offline action is completed.	detail
Plane restarting started	Date and time when the plane restart action is started.	detail
Planes restarted	List of planes restarted by the system.	detail
Planes being offlined / onlined	Planes that are currently being turned offline or turned online by the system, with date and time.	detail
Plane restarting completed	Date and time when the plane restarting action is completed.	detail
FPC online started	Date and time when FPC online action is started.	detail
Onlined FPCs	List of FPCs that are turned online by the system.	detail
FPCs timed out	FPCs that have timed out waiting to be turned online by the system.	detail
FPC being onlined	FPC that is being turned online by the system, with date and time.	detail
FPC Online completed	Date and time when the action of turning the FPCs online is completed.	detail
Phase Completed	Date and time when the plane and FPC restart phase is completed.	detail
Phase started	Date and time when the plane and FPC restart phase is started.	detail
FPC restart time	Date and time when the FPC restart action is started.	detail
FPC restarted	FPC that is restarted by the system, with date and time.	detail
Phase Completed	Date and time when the plane and FPC restart phase is completed.	detail
FPC Offline Phase	Status of the FPC offline phase. <ul style="list-style-type: none"> • Completed— The FPC offline phase is completed. • In progress—The FPC offline phase is currently in progress. 	detail
Phase started	Date and time when the FPC offline phase is started.	detail
FPC Offline started	Date and time when the FPC offline action is started.	detail
Offlined FPCs	List of FPCs turned offline by the system.	detail
FPCs timed out	List of FPCs that have timed out waiting to be turned offline by the system.	detail

Table 74: show chassis fabric reachability Output Fields (*continued*)

Field Name	Field Description	Level of Output
FPC being offlined	FPC that is being turned offline by the system, with date and time.	detail
FPC Offline completed	Date and time when the FPC offline action is completed.	detail
Phase Completed	Date and time when the FPC offline phase is completed.	detail
Action Completed	Date and time when the system fabric down healing attempt is completed.	All levels
Fabric reachability resolution	<p>Status after the healing actions are performed.</p> <ul style="list-style-type: none"> • Unreachable destinations healed after <i>phase name</i>—The unreachable destinations are healed after the healing actions are performed. The phase name indicates the last healing phase. • Unreachable destinations removed by FPCs <i>FPC number</i> offline—The unreachable destinations are removed by turning the FPCs offline. • Unreachable destinations present on FPC/PFE <i>FPC/PFE number</i>—The unreachable destinations are present on the FPCs or Packet Forwarding Engines and need to be acted upon. 	All levels

show chassis fabric summary

Syntax	show chassis fabric summary
Release Information	Command introduced in Junos OS Release 8.4. Command introduced in Junos OS Release 9.4 for EX Series switches. Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	(MX Series routers and EX8200 switches only) Display the state of all fabric planes and the elapsed uptime.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show chassis fabric summary (MX240 Router) on page 637 show chassis fabric summary (MX480 Router) on page 637 show chassis fabric summary (MX960 Router) on page 637 show chassis fabric summary (MX2010 Router) on page 637 show chassis fabric summary (MX2020 Router) on page 637 show chassis fabric summary (EX8200 Switch) on page 638 show chassis fabric summary (PTX Series Packet Transport Switch) on page 638
Output Fields	Table 77 on page 634 lists the output fields for the show chassis fabric summary command. Output fields are listed in the approximate order in which they appear.

Table 77: show chassis fabric summary Output Fields

Field Name	Field Description
Plane	(MX Series, MX2020 and MX2010 Routers only) Plane number.

Table 77: show chassis fabric summary Output Fields (*continued*)

Field Name	Field Description
State	<p>(MX Series) State of the SIB or FPC:</p> <ul style="list-style-type: none"> • Online—Switch Interface Board (SIB) is operational and running. <p>NOTE: On the Enhanced MX SCB with Trio MPC, a maximum of 4 planes are operational and running. On all the other SCBs with Trio MPC, all the planes are operational and running.</p> <ul style="list-style-type: none"> • Empty—SIB is powered down. • Check—SIB is in the Check state because of the following reasons: <ul style="list-style-type: none"> • SIB is not inserted properly. • Some destination errors are detected on the SIB. In this case, the Packet Forwarding Engine stops using the SIB to send traffic to the affected destination Packet Forwarding Engine. • Some link errors are detected on the channel between the SIB and a Packet Forwarding Engine. Link errors can be detected at initialization time or runtime: <ul style="list-style-type: none"> • Link errors caused by a link training failure at initialization time—The Packet Forwarding Engine does not use the SIB to send traffic. The show chassis fabric fpcs command shows Plane disabled as status for this link. • Link errors caused by CRC errors detected at runtime—The Packet Forwarding Engine continues to use the SIB to send traffic. The show chassis fabric fpcs command shows Link error as the status for this link. <p>NOTE: The Check state does not apply to PTX Series Packet Transport Switches because there are no SIBs in the Check state.</p> <p>For information about link and destination errors, issue the show chassis fabric fpcs commands.</p> <ul style="list-style-type: none"> • Spare—SIB is redundant and will move to active state if one of the working SIBs fails. <p>NOTE: Spare does not apply to PTX Series Packet Transport Switches because there are no spare SIBs in the device.</p> <p>(MX2010 and MX2020 Routers) State of the SFB.</p> <ul style="list-style-type: none"> • Online—Switch Fabric Board (SFB) is operational and running. • Offline—Switch Fabric Board (SFB) is powered down. • Check—Switch Fabric Board (SFB) is in the check state.
Errors	<p>(PTX Series only) Indicates whether there is any error on the SIB.</p> <ul style="list-style-type: none"> • None—No errors • Link Errors—Fabric link errors were found on the SIB RX link. • Cell drops—Fabric cell drops were found on the SIB ASIC. • Link, Cell drops—Both Link errors and cell drops were detected on at least one of the FPC's fabric links. <p>NOTE: The Errors column is empty only when the FPC or SIB is offline.</p>

Table 77: show chassis fabric summary Output Fields (*continued*)

Field Name	Field Description
Uptime	(MX Series, MX2010 and MX2020 Routers) Elapsed time the plane has been online.

Sample Output

show chassis fabric summary (MX240 Router)

```
user@host> show chassis fabric summary

show chassis fabric topology

Syntax	show chassis fabric topology <fcc <i>number</i> scc> <sib-slot>
Syntax (TX Matrix Router)	show chassis fabric topology <fcc <i>number</i> scc> <sib-slot>
Syntax (TX Matrix Plus Router)	show chassis fabric topology <fcc <i>number</i> sfc <i>number</i> > <sib-slot>
Syntax (T4000 Core Router)	show chassis fabric topology <sib-slot>
Syntax (PTX Series Packet Transport Switches)	show chassis fabric topology
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Description	(TX Matrix routers only) Display the state of the switching fabric topology for the Switch Interface Board (SIB) connection between the TX Matrix router and the T640 routers. (TX Matrix Plus routers only) Display the state of the switching fabric topology for the SIB connection between the TX Matrix Plus router and the connected routers. (T320, T640, T1600, and T4000 routers only) Display the state of the switching fabric topology for the connection between the Switch Interface Board (SIB) and the FPCs. (PTX Series Packet Transport Switches only) Display the input-output link topology.
Options	none —(TX Matrix routers only) Display the state of the switching fabric topology for the Switch Interface Board (SIB) connection between the TX Matrix router and the T640 routers. (TX Matrix Plus routers only) Display the state of the switching fabric topology for the SIB connection between the TX Matrix Plus router and the connected routers. (T320, T640, T1600, and T4000 routers only) Display the state of the switching fabric topology for the connection between the Switch Interface Board (SIB) and the FPCs. fcc <i>number</i> —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the fabric topology state for a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the fabric topology state for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

scc—(TX Matrix routers only) (Optional) Display the fabric topology state for the TX Matrix router (or switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display the fabric topology for the switch-fabric chassis. Replace *number* with 0.

sib-slot—(Optional) Display the fabric topology state for a specified SIB slot. Replace *sib-slot* with a value from 0 through 4. On a TX Matrix Plus router, replace *sib-slot* with a value from 0 through 15.

Output Fields [Table 78 on page 640](#) lists the output fields for the **show chassis fabric topology** command. Output fields are listed in the approximate order in which they appear.

Table 78: show chassis fabric topology Output Fields

Field Name	Field Description
in-links	Fabric topology for receive side links.
out-links	Fabric topology for transmit side links.

Table 78: show chassis fabric topology Output Fields (*continued*)

Field Name	Field Description
state	<p>State of the fabric link:</p> <ul style="list-style-type: none"> • RESET—Link between the SIB and the FPC/DPC is powered down on purpose. This is done in all non-dual Packet Forwarding Engine–based boards. • UP—Link between the SIB and the FPC/DCP is up and running. • DOWN—Link between the SIB and the FPC/DCP is powered down. • FAULT—The SIB is in the alarmed state, in which the SIB's plane is not operational for one or more of the following reasons: <ul style="list-style-type: none"> • On-board F-chip is not operational. • Fiber-optic connector faults. • FPC connector faults. • SIB midplane connector faults. <p>NOTE: The following state descriptions are applicable only to PTX Series Packet Transport Switches.</p> <ul style="list-style-type: none"> • OK—The link between the SIB and the FPC is operational. • Down—The link between the SIB and the FPC is powered down. • Error—The CCL link between the SIB and FPC is not operational for one or more of the following reasons: <ul style="list-style-type: none"> • FPC midplane connector failure. • SIB midplane connector failure. • CCL link CRC error.

Table 78: show chassis fabric topology Output Fields (*continued*)

Out-Links: and In-Links (TX Matrix Plus router only)	<p>State of the links from the F13 SIB to the LCC or vice-versa. Out-Links indicate Tx links. In-Links indicate an Rx link. The following additional fields are displayed for each SIB:</p> <ul style="list-style-type: none"> • VCSEL Status—Optical (VCSEL channel) link status for the corresponding electrical (HSL2) link. The states include: <ul style="list-style-type: none"> • OK—Optical signal power is good. • Error—Internal error. • LOS—Loss of Signal detected. • High Cur—The Tx Bias-current is higher than threshold on this channel. This is applicable only to Tx Channels. • Low Cur—The Tx Bias-current is lower than threshold on this channel. This is applicable only to Tx Channels. • HSL2 Channel—HSL2 is the electrical link used to connect ASICs to the in-link and out-link. The channel number corresponds to the link and varies based on the ASIC or configuration.
---	---

- **HSL2 Status** —The status of the HSL2 Channel. Includes the following states:
 - **Up**—Channel is up.
 - **Down**—Channel is down.
 - **Reset**—Channel has been reset.
 - **Fault**—Channel has faults.

The following is a sample output with description of the fields displayed in the output for Out-Links:

Out-Links:

=====

SF_30_13_FB_A(21,09) -> FPC7_B_SG(3,3,6)_FB_A(18,09) OK 203 Up

- **SF_30_13**—Name of the ASIC, with Fabric F1 or F3 mode. In this case, 3 is the F3 direction and is used in the Tx path and 0 identifies the serial link on the SF chip (in this case, link goes to sf-3 chip number 0). You can also have F1 mode and Rx path instead.
- **FB_A (21, 09)**—Fiber bundle A, with VCSEL unit number 21 within the SIB, and channel number 9 within the unit number.
- **FPC7_B_SG(3,3,6)**—FPC 7, with bottom Packet Forwarding Engine (T for top PFE and B for bottom PFE), SG ASIC, with number 3 and port number 3, with HSL2 link number with the SIB as 6.
- **FB_A(18, 09)**—Fiber Bundle, with VCSEL unit number 18 within the SIB, and VCSEL channel number 9 within the unit number.

The following is a sample output with description of the fields displayed in the output for In-Links:

In-Links:

=====

FPC0_T_SG(0,0,0)_FB_D(04,11) -> SF_10_00_FB_D(01,11) OK 0 Up

- **FPC0**—FPC 0.
- **T**—Top Packet Forwarding Engine.
- **SG (0, 0, 0)**—SG ASIC with port number 0 and link 0.
- **FB_D (04,11)**—Fiber Bundle D with VCSEL 4, channel 11.
- **SF_10**—Indicates F1 mode chip number 0 and Rx path.
- **SF_10_00_FB_D(01,11)**—Indicates F1 mode chip number 0 and Rx path with port 0, fiber bundle D, with VCSEL 1, channel 11.

Table 78: show chassis fabric topology Output Fields (*continued*)

Out-links and In-links (TX Matrix Plus router with 3D SIBs only)	State of the links from the F13 SIB to the SFC/LCC or vice-versa. Out-Links indicate Tx links. In-Links indicate an Rx link. The following additional fields are displayed for each SIB:			
	<ul style="list-style-type: none"> Description of the fields displayed in the output for In-links and Out-links for SFC: 			
	In-links	State	Out-links	State
	CXP0_Evn->F13_SIB0_XF2,04_0	Up	F13_SIB0_XF2,04_0->CXP0_Evn	Up

- CXP0_Evn**—CXP optics with type of port bits such as even or odd. In this case, it indicates CXP optics with even port bit number 0.
- F13_SIB0**—Name of the SFC data plane SIB with the SIB number. In this case, it indicates F13 SIB with number 0.
- XF2,04_0**—Name of the ASIC with port and subchannel number. In this case, it Indicates XF2 chip with port number 4 and subchannel number 0.

- Description of the fields displayed in the output for **In-links** and **Out-links** for LCC:

State	In-links	State	Out-links	State
	CXP0_Evn->LCC_SIB0_XF3,10_0	Up	LCC_SIB0_XF3,10_0->CXP0_Evn	Up

- CXP0_Evn**—CXP optics with the type of port bits such as even or odd. In this case, it indicates CXP optics with even port bit number 0.
- LCC_SIB0**—LCC SIB number. In this case, it indicates LCC SIB with number 0.
- XF3,10_0**—Name of the ASIC with port and subchannel number. In this case, it Indicates XF3 with port number 10 and subchannel number 0.

show chassis fabric unreachable-destinations

Syntax	show chassis fabric unreachable-destinations
Release Information	Command introduced before Junos OS Release 11.4. Command introduced in Junos OS Release 12.1 for MX240, MX840, and MX960 routers. Command introduced in Junos OS Release 12.1X48R4 for PTX Series Packet Transport Switches.
Description	(M320, MX240, MX480, MX960, and T Series routers only) Display the list of destinations that have transitioned from a reachable state to an unreachable state.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show chassis fabric reachability on page 616
List of Sample Output	show chassis fabric unreachable-destinations on page 663
Output Fields	The table lists the output fields for the show chassis fabric unreachable-destinations command. Output fields are listed in the approximate order in which they appear.

Table 79: show chassis fabric unreachable-destinations Output Fields

Field Name	Field Description
Flexible PIC Concentrator (FPC) number	Source FPC number where unreachable destinations are present.
Packet Forwarding Engine number	Source Packet Forwarding Engine number where unreachable destinations are present.
Destination error on Packet Forwarding Engine	List of destination FPCs <i>FPC number</i> /Packet Forwarding Engines <i>Packet Forwarding Engine number</i> that are not reachable from the source FPCs <i>FPC number</i> /Packet Forwarding Engines <i>Packet Forwarding Engine number</i> over the fabric.

Sample Output

```
show chassis fabric unreachable-destinations
user@host> show chassis fabric unreachable-destinations
Fabric management unreachable destinations:
FPC 2
  PFE 0
    Destination error on PFEs      2/0 3/0 3/1 7/0
FPC 3
  PFE 0
    Destination error on PFEs      2/0 3/0 3/1 7/0
FPC 3
  PFE 1
    Destination error on PFEs      2/0 3/0 3/1 7/0
FPC 7
  PFE 0
    Destination error on PFEs      2/0 3/0 3/1 7/0
```

show chassis feb

Syntax	show chassis feb
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.2 for the ACX Series Universal Access Routers.
Description	(ACX Series routers, and M5, M10, and M120 routers only) Display Forwarding Engine Board (FEB) status information.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis feb on page 188 • show chassis fabric feb on page 518 • show chassis fpc-feb-connectivity on page 708 • feb • Switching Control Board Redundancy
List of Sample Output	show chassis feb (M10 Router) on page 666 show chassis feb (M120 Router) on page 666 show chassis feb detail (M120 Router) on page 666 show chassis feb detail (ACX2000 Universal Access Router) on page 667 show chassis feb detail (ACX1000 Universal Access Router) on page 667
Output Fields	Table 80 on page 664 lists the output fields for the show chassis feb command. Output fields are listed in the approximate order in which they appear.

Table 80: show chassis feb

Field Name	Field Description
State	State of the FEB: <ul style="list-style-type: none"> • Offline—FEB is powered down. • Online—FEB is operational and running. • Check—FEB is in alarmed state where the Switch Interface Board (SIB) plane is partially operational for the following reasons: <ul style="list-style-type: none"> • FEB is not inserted properly. • Two or more links between the FEB and Packet Forwarding Engine fail.
Temp (C) or Intake temperature	Temperature of the air passing by the FEB, in degrees Celsius or in both degrees Celsius and degrees Fahrenheit.

Table 80: show chassis feb (continued)

Field Name	Field Description
CPU Utilization (%)	Percentage of CPU being used: <ul style="list-style-type: none"> • Total—Total percentage of CPU being used by the FEB processor. • Interrupt—Of the total CPU being used by the FEB processor, the percentage being used for interrupts.
Memory DRAM (MB)	Total DRAM, in megabytes, available to the FEB processor.
Utilization (%)	Percentage of memory utilization: <ul style="list-style-type: none"> • Heap—Percentage of heap space (dynamic memory) being used by the FEB processor. If this number exceeds 80 percent, you might experience a software problem (memory leak). • Buffer—Percentage of buffer space being used by the FPC processor for buffering internal messages.
Exhaust A temperature	Temperature of the air flowing past Exhaust A.
Exhaust B temperature	Temperature of the air flowing past Exhaust B.
Total DDR DRAM	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FEB CPU.
Total RLD RAM	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FEB CPU.
Start time (Detail output only)	Time when the Routing Engine detected that the FEB was running.
Uptime (Detail output only)	How long the Routing Engine has been connected to the FEB, and therefore, how long the Flexible PIC Concentrator (PIC) has been up and running.

Sample Output

show chassis feb (M10 Router)

```
user@host> show chassis feb
FEB status:
  Temperature          27 degrees C / 80 degrees F

Syntax (EX Series Switches)	show chassis firmware <detail>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.4 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced for EX8200 switches in Junos OS Release 10.2 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.
Description	On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

Options **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

all-members—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

scc—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

sfc number—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

detail—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

Output Fields [Table 81 on page 670](#) lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

Table 81: show chassis firmware Output Fields

Field Name	Field Description
Part	(MX Series, MX2010, and MX2020 routers) Chassis part name.
Type	(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: ROM or O/S . On switches: uboot or loader .

Table 81: show chassis firmware Output Fields (*continued*)

Field Name	Field Description
Version	(MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.
FPC	(<i>detail</i> option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.
Boot	(<i>detail</i> option only) Version of the SYSPLD.
PoE	(<i>detail</i> option only) Version of the PoE firmware.
PFE-<number>	(<i>detail</i> option only) Version of the PFE used in the switch.
PHY-	(<i>detail</i> option only) Version of the physical layer device (PHY) used in the switch.
microcode	(<i>detail</i> option only) Microcode of the physical layer devices (PHY) used in the switch.
uboot	(<i>detail</i> option only) Version of the u-boot used in the switch.
loader	(<i>detail</i> option only) Version of the loader used in the switch.

show chassis forwarding

Syntax	show chassis forwarding
Release Information	Current—Command introduced before Junos OS Release 7.4. Now—Command introduced in Junos OS Release 7.4. Support for Branch SRX Series added in Junos OS Release 10.1
Description	Display status of the forwarding process (fwdd). This command is supported on J Series and Branch SRX Series Services Gateways.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show chassis feb on page 664 • request chassis feb on page 188 • Configuring FEB Redundancy on the M120 Router • CFEB Overview
List of Sample Output	show chassis forwarding on page 680
Output Fields	Table 82 on page 679 lists the output fields for the show chassis forwarding command. Output fields are listed in the approximate order in which they appear.

Table 82: show chassis forwarding Output Fields

Field Name	Field Description
FWWD status	<p>Forwarding status:</p> <ul style="list-style-type: none"> • State: <ul style="list-style-type: none"> • Online—FWDD is operational and running. • Offline—FWDD is not running. • Microkernel CPU utilization—Percentage of microkernel CPU being used by the forwarding process. • Real-time threads CPU utilization—Percentage of CPU being used by the forwarding process. • Heap utilization—Percentage of heap space (dynamic memory) being used by the forwarding process. If this number exceeds 80 percent, there may be a software problem (memory leak). • Buffer utilization—Percentage of buffer space being used by the forwarding process for buffering internal messages. • Uptime—How long the forwarding process has been up and running.

Sample Output

**show chassis
forwarding**

```
user@host> show chassis forwarding
FWDD status:
  State                               Online
  Microkernel CPU utilization         10 percent
  Real-time threads CPU utilization    4 percent
  Heap utilization                     26 percent
  Buffer utilization                   0 percent
  Uptime:                             1 day, 1 hour, 30 minutes, 11 seconds
```

show chassis fpc

Syntax	show chassis fpc <detail <slot>> <pic-status <slot>>

Syntax (PTX Series Packet Transport Switches)	show chassis fpc <detail <fpc-slot>> <pic-status <fpc-slot>> <fpc-slot>
Syntax (ACX Series Universal Access Routers)	show chassis fpc <detail <fpc-slot>> <pic-status <fpc-slot>> <fpc-slot>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Description Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

Options **none**—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached routers in the routing matrix.

NOTE: In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
```

Utilization (%)	Temp	CPU	Utilization (%)	Memory
Slot State	(C)	Total	Interrupt	DRAM (MB) Heap
Buffer				
0 Empty				
1 Empty				
2 Empty				
3 Empty				
4 Empty				
5 Offline	---	Hard FPC error---		
6 Empty				
7 Online	26	4	0	1024 0
32				

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
4 alarms currently active
```

Alarm time	Class	Description
2011-03-24 00:52:51 UTC	Major	FPC 5 Hard errors
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:51:26 UTC	Minor	Loss of communication with Backup RE

NOTE: On T4000 routers, when you include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation the alarms.

The following sample output shows the FPC status after the **enhanced-mode** statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
```

	Temp	CPU Utilization (%)	Memory
Utilization (%)			
Slot State	(C)	Total	Interrupt
Buffer		DRAM (MB)	Heap
0 offline	---	FPC misconfiguration---	
1 offline	---	FPC misconfiguration---	
2 offline	---	FPC misconfiguration---	
3 Empty			
4 Empty			
5 Online	66	50	0
27			2816 29

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
3 alarms currently active
Alarm time      Class  Description
2011-03-24 00:52:51 PST Major  FPC 1 misconfig
2011-03-24 00:52:31 PST Major  FPC 2 misconfig
2011-03-24 00:52:31 PST Major  FPC 3 misconfig
```

detail—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see ***fpc-slot*** or ***slot***).

all-members—(MX Series routers only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

fpc-slot—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only)—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the **lcc *number*** option (the recommended method), replace ***fpc-slot*** with a value from **0** through **7**. Otherwise, replace ***fpc-slot*** with a value from **0** through **31**. Likewise, on a TX Matrix Plus router, if you specify the number of the specified router (line-card chassis)

by using the **lcc number** option (the recommended method), replace **fpc-slot** with a value from 0 through 7. Otherwise, replace **fpc-slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace **fpc-slot** with a value from 0 through 5.
- MX80 router—Replace **fpc-slot** with a value from 0 through 1.
- MX240 router—Replace **fpc-slot** with a value from 0 through 2.
- MX480 router—Replace **fpc-slot** with a value from 0 through 5.
- MX-960 router—Replace **fpc-slot** with a value from 0 through 11.
- MX2010 router—Replace **fpc-slot-number** with a value from 0 through 9.
- MX2020 router—Replace **fpc-slot-number** with a value from 0 through 19.
- Other routers—Replace **fpc-slot** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace **fpc-slot** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace **fpc-slot** with a value from 0 through 9.
 - EX6210 switches—Replace **fpc-slot** with a value from 0 through 9.
 - EX8208 switches—Replace **fpc-slot** with a value from 0 through 7.
 - EX8216 switches—Replace **fpc-slot** with a value from 0 through 15.
- QFX Series:
 - QFX3500 switches—Replace **fpc-slot** with 0.
 - QFabric systems—Replace **fpc-slot** with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Switches:
 - PTX5000 Packet Transport Switch—Replace **fpc-slot** with a value from 0 through 7.
- ACX Series Universal Access Routers:
 - ACX1000 and ACX2000 Universal Access Routers—Replace **fpc-slot** with 0.

local—(MX Series routers only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

node-device name—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

pic-status—(Optional) Display status information for all PICs or for the PIC in the specified slot (see *fpc-slot*).

NOTE: On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the `show chassis fpc` command with the `pic-status` option, the CLI displays the string “Not Supported” for 10x10GE(LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0   Online      E2-FPC Type 1
  PIC 0   Online      1x G/E SFP, 1000 BASE
  PIC 1   Online      Adaptive Services-II
  PIC 2   Online      1x G/E IQ, 1000 BASE
  PIC 3   Online      1x G/E IQ, 1000 BASE
Slot 1   Online      FPC Type 3-ES
  PIC 0   Present     UNUSED- Not Supported
Slot 2   Online      FPC Type 4-ES
  PIC 0   Offline     4x OC-192 SONET XFP
  PIC 1   Present     10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4   Offline     FPC Type 1-ES
Slot 5   Offline     FPC Type 2-ES
Slot 6   Online      E2-FPC Type 3
  PIC 0   Online      1x OC-192 SONET XFP
  PIC 1   Online      4x OC-48 SONET
  PIC 2   Online      4x OC-48 SONET
  PIC 3   Online      MultiServices 500
Slot 7   Online      FPC Type 4-ES
  PIC 0   Online      4x 10GE (LAN/WAN) XFP
  PIC 1   Online      4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (`/var/log/messages`) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr  5 08:47:36  router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see [PSN-2010-03-696](https://www.juniper.net/psn/2010-03-696).

lcc number—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Output Fields [Table 83 on page 688](#) lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

Table 83: show chassis fpc Output Fields

Field Name	Field Description	Level of Output
Slot or Slot State	Slot number and state. The state can be one of the following conditions: <ul style="list-style-type: none"> • Dead—Held in reset because of errors. • Diag—Slot is being ignored while the FPC is running diagnostics. • Dormant—Held in reset. • Empty—No FPC is present. • Offline—(PTX Series Packet Transport Switches only) One of the following two states is displayed: <ul style="list-style-type: none"> • FPC offlined due to unreachable destinations • FPC Offlined due to degraded FPC action • Online—FPC is online and running. • Present—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either Hardware Not Supported or Hardware Not In Right Slot. The FPC is coming up but not yet online. • Probed—Probe is complete; awaiting restart of the Packet Forwarding Engine. • Probe-wait—Waiting to be probed. 	all levels
Logical slot	Slot number.	all levels
Temp (C) or Temperature	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels all levels
Temperature (PTX Series)	On PTX Series Packet Transport Switches, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: <ul style="list-style-type: none"> • Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC. • Temperature (Intake)—Temperature of the air flowing into the chassis. • Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B). • Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC. • Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC. 	detail
Total CPU Utilization (%)	Total percentage of CPU being used by the FPC's processor.	all levels
Interrupt CPU Utilization (%)	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
Memory DRAM (MB)	Total DRAM, in megabytes, available to the FPC's processor.	none specified

Table 83: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
Heap Utilization (%)	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak). NOTE: On MX Series routers in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.	none specified
Buffer Utilization (%)	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
Total CPU DRAM	Amount of DRAM available to the FPC's CPU.	detail
Total RLDRAM	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	detail
Total DDR DRAM	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	detail
Total SRAM	Amount of static RAM (SRAM) used by the FPC's CPU.	detail
Total SDRAM	Total amount of memory used for storing packets and notifications.	detail
I/O Manager ASICs information	I/O Manager version number, manufacturer, and part number.	detail
Start time	Time when the Routing Engine detected that the FPC was running.	detail
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	detail
PIC type	(pic-status output only) Type of PIC.	none specified

show chassis fpc-feb-connectivity

Syntax	show chassis fpc-feb-connectivity
Release Information	Command introduced in Junos OS Release 8.0.
Description	(M120 router only) Display the Flexible PIC Concentrator (FPC) and Forwarding Engine Board (FEB) mapping and their respective states.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis fpc on page 190 • show chassis fpc on page 681 • show chassis fabric fpcs on page 524 • Configuring the Junos OS to Resynchronize FPC Sequence Numbers with Active FPCs when an FPC Comes Online • MX960 Flexible PIC Concentrator Description
List of Sample Output	show chassis fpc-feb-connectivity on page 709
Output Fields	Table 84 on page 708 lists the output fields for the show chassis fpc-feb-connectivity command. Output fields are listed in the approximate order in which they appear.

Table 84: show chassis fpc-feb-connectivity Output Fields

Field Name	Field Description
FPC	Slot number of the Flexible PIC Concentrator (FPC).
FPC type	Type of FPC: Type 1 , Type 2 , Type 3 , or cFPC .
FPC state	<p>State of the FPC. State can be any of the following:</p> <ul style="list-style-type: none"> • Announce offline—Intermediate state where FPC is going down but is not offline and the Chassis manager acknowledges that the FPC is in the process of going offline. • Announce online—Intermediate state where FPC is coming up but is not online and the Chassis manager acknowledges that the FPC is in the process of coming online. • Empty—No FPC is present. • Offline—FPC is powered down. • Online—FPC is online and running. • Present—The chassis process has detected the FPC, but the FPC is either not supported by the current version of the Junos OS or FPC is coming up but is not online. • Ready—FPC is in transition state.
Connected FEB	Slot number of the Forwarding Engine Board (FEB) connected to the FPC or None if the FPC is not connected to a FEB.

Table 84: show chassis fpc-feb-connectivity Output Fields (*continued*)

Field Name	Field Description
FEB state	<p>State of the FEB. State can be any of the following:</p> <ul style="list-style-type: none"> • Announce offline—Intermediate state where FEB is going down but is not offline and the Chassis manager acknowledges that the FEB is in the process of going offline. • Announce online—Intermediate state where FEB is coming up but is not online and the Chassis manager acknowledges that the FEB is in the process of coming online. • Empty—No FEB is present. • Offline—FEB is powered down. • Online—FEB is online and running. • Present—The chassis process has detected the FEB, but the FEB is either not supported by the current version of the Junos OS or FEB is coming up but is not online. • Ready—FEB is in transition state.
Link status	<p>Status of the link connecting the R-FEB and R-FPC:</p> <ul style="list-style-type: none"> • Error • Misconfiguration—Configuration between the R-FEB and the F-FPC is incorrect. • OK

Description	<p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <i>number</i> is always 0. On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <i>number</i> equals the member ID, from 0 through 9. On EX8208 and EX8216 switches—Refers to a line card; FPC <i>number</i> equals the slot number for the line card. <p>On a QFX3500 standalone switch, both the FPC and FPC <i>number</i> are always 0.</p> <p>On Type 5 FPC on T4000 routers, there are no top temperature sensor or bottom temperature sensor parameters. Instead, fan intake temperature sensor and fan exhaust temperature sensors parameters are displayed.</p>
Options	<p>none—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.</p> <p>clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).</p> <p>detail—(Optional) Include RAM and disk information in output.</p> <p>extensive—(Optional) Display ID EEPROM information.</p> <p>all-members—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.</p>

interconnect-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

member *member-id*—(MX Series routers only) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

node-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

scc—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

Additional Information The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines:

Table 85: Routing Engines Displaying DIMM Information

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

Output Fields Table 86 on page 715 lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 86: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	<p>Chassis component:</p> <ul style="list-style-type: none"> (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. See EX Series Switches Hardware and CLI Terminology Mapping. (MX Series routers)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller. (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB. (QFX Series)—Information about the chassis, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal). (MX2010 and MX2020 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays. 	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels

Table 86: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
Assb ID or Assembly ID	(extensive keyword only) Identification number that describes the FRU hardware.	extensive
Assembly Version	(extensive keyword only) Version number of the FRU hardware.	extensive
Assembly Flags	(extensive keyword only) Flags.	extensive
FRU model number	(clei-models , extensive , and models keyword only) Model number of the FRU hardware component.	none specified
CLEI code	(clei-models and extensive keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: 0x00 (version 0), 0x01 (version 1), or 0x02 (version 2).	extensive
Description	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> • Type of power supply. • Type of PIC. If the PIC type is not supported on the current software release, the output states Hardware Not Supported. • Type of FPC: FPC Type 1, FPC Type 2, FPC Type 3, FPC Type 4, or FPC TypeOC192. <p>On EX Series switches, a brief description of the FPC.</p> <p>On the J Series routers, the FPC type corresponds to the Physical Interface Module (PIM). The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> • 2x FE—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM • 4x FE—4-port Fast Ethernet ePIM • 1x GE Copper—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port) • 1x GE SFP—SFP Gigabit Ethernet ePIM (one fiber port) • 4x GE Base PIC—Four built-in Gigabit Ethernet ports on a J4350 or J6350 chassis (fixed PIM) • 2x Serial—Dual-port serial PIM • 2x T1—Dual-port T1 PIM • 2x E1—Dual-port E1 PIM • 2x CTIE1—Dual-port channelized T1/E1 PIM • 1x T3—T3 PIM (one port) • 1x E3—E3 PIM (one port) • 4x BRI S/T—4-port ISDN BRI S/T PIM 	All levels

Table 86: show chassis hardware Output Fields (*continued*)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> • 4x BRI U—4-port ISDN BRI U PIM • 1x ADSL Annex A—ADSL 2/2+ Annex A PIM (one port, for POTS) • 1x ADSL Annex B—ADSL 2/2+ Annex B PIM (one port, for ISDN) • 2x SHDSL (ATM)—G SHDSL PIM (2-port two-wire module or 1-port four-wire module) • 1x TGM550—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog LINE ports, and two analog TRUNK ports) • 1x DS1 TIM510—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup) • 4x FXS, 4x FXO, TIM514—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog LINE ports and four analog TRUNK ports) • 4x BRI TIM521—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports) • Crypto Accelerator Module—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services • MPC M 16x 10GE—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: LX, SX, LH, or T. • LCD description for EX Series switches (except EX2200 switches). • MPC2—1-port MPC2 that supports two separate slots for MICs. • MPC3E—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs. • 100GBASE-LR4, pluggable CFP optics • Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy. • Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs). • LCD description for MX Series routers

show chassis in-service-upgrade

Syntax `show chassis in-service-upgrade`

Release Information Command introduced in Junos OS Release 9.0.
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Description Display the status of Flexible PIC Concentrators (FPCs) and their corresponding PICs after the most recent unified in-service software upgrade (ISSU). This command must be issued on the master Routing Engine.

NOTE: Only Intelligent Queuing (IQ) PICs are displayed by this command output. Unified ISSU status for other PIC types is controlled internally by the FPC.

Options This command has no options.

show chassis location

Syntax	show chassis location
Syntax (TX Matrix Router)	show chassis location <fpc interface (by-name <i>name</i> by-slot fpc number lcc number) lcc number scc>
Syntax (TX Matrix Plus Router)	show chassis location <fpc interface (by-name <i>name</i> by-slot fpc number lcc number) lcc number sfc number>
Syntax (MX Series Router)	show chassis location <all-members> <local> <member <i>member-id</i> >
Syntax (QFX Series)	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
Options	<p>none—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.</p> <p>all-members—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.</p> <p>fpc—(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).</p> <p>interconnect-device <i>name</i>—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.</p> <p>interface by-name <i>name</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.</p> <p>interface by-slot fpc number lcc number—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a</p>

TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace **number** with a value from **0** through **7**.
- For **lcc**, replace **number** with a value from **0** through **7**.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

member member-id—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

node-device name—(QFabric systems only) (Optional) Display the physical location of the Node device.

scc—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

sfc—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

Required Privilege Level view

Output Fields Table 89 on page 834 lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

Table 89: show chassis location Output Fields

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31. On TX Matrix Plus router with 3D SIBs the value is 0 through 63.
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.

Syntax (MX2020 3D Universal Edge Routers)	show chassis mac-addresses
Syntax (QFX Series)	show chassis mac-addresses <interconnect-device <i>name</i> > <node-group <i>name</i> >
Syntax (ACX Series Universal Access Routers)	show chassis mac-addresses
Release Information	Command introduced before JUNOS Release 7.4. Command introduced in JUNOS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	Display the media access control (MAC) addresses for the router, switch chassis, or switch.
Options	none —(TX Matrix, TX Matrix Plus routers, and the QFX Series) Display the MAC addresses for the router chassis or switch. On a TX Matrix router, display MAC addresses on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display MAC addresses on the TX Matrix Plus router and its attached routers. all-members —(MX Series routers only) (Optional) Display the MAC addresses for all the member routers of the Virtual Chassis configuration. interconnect-device <i>name</i> —(QFabric systems only) (Optional) Display the MAC addresses for the Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display MAC addresses for a specified T640 router (line-card chassis) that is connected to the TX Matrix Plus router. On a TX Matrix Plus router, display MAC addresses for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the MAC addresses for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the MAC addresses for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-group *name*—(QFabric systems only) (Optional) Display the MAC addresses for the specified Node group.

scc—(TX Matrix routers only) (Optional) Display MAC addresses for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display MAC addresses for the TX Matrix Plus router (or switch-fabric chassis).

List of Sample Output	show chassis network services on page 842 show chassis network services (MX2010 Router) on page 842 show chassis network services (MX2020 Router) on page 842
Output Fields	Table 91 on page 842 lists the output fields for the show chassis network services command. Output fields are listed in the approximate order in which they appear.

Table 91: show chassis network services Output Fields

Field Name	Field Description
Network Services Mode	Network services mode configured for the MX Series router: <ul style="list-style-type: none"> • IP—IP Network Services mode. • Ethernet—Ethernet Network Services mode. • enhanced-ip—Enhanced IP Network Services mode • enhanced-ethernet—Enhanced Ethernet Network Services mode

Sample Output

show chassis network services user@host> show chassis network services
Network Services Mode: IP

show chassis network services (MX2010 Router) user@host> show chassis network services
Network Services Mode: Enhanced-IP

show chassis network services (MX2020 Router) user@host> show chassis network services
Network Services Mode: Enhanced-IP

show chassis pic

Syntax	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
Syntax (TX Matrix and TX Matrix Plus Routers)	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> <fcc <i>number</i>></code>
Syntax (MX Series Routers)	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> <all-members> <local> <member <i>member-id</i>></code>
Syntax (MX2010 3D Universal Edge Routers)	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
Syntax (MX2020 3D Universal Edge Routers)	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
Syntax (QFX Series)	<code>show chassis pic <interconnect-device <i>name</i> (fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i>)> <node-device <i>name</i> pic-slot <i>slot-number</i>></code>
Syntax (ACX Series Universal Access Routers)	<code>show chassis pic fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
Description	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
Options	<p>fpc-slot <i>slot-number</i>—Display information about the PIC in this particular FPC slot:</p> <ul style="list-style-type: none"> On a TX Matrix router, if you specify the number of the T640 router by using the fcc <i>number</i> option (the recommended method), replace <i>slot-number</i> with a value from 0 through 7. Otherwise, replace <i>slot-number</i> with a value from 0 through 31. <p>Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the fcc <i>number</i> option (the recommended method), replace <i>slot-number</i> with a value from 0 through 7. Otherwise, replace <i>slot-number</i> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre>user@host> show chassis pic fpc-slot 1 fcc 1 pic-slot 1 user@host> show chassis pic fpc-slot 9 pic-slot 1</pre>

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
 - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
 - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
 - QFX3500 switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
 - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

all-members—(MX Series routers only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

interconnect-device name—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display PIC information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot *slot-number*—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

Output Fields Table 92 on page 846 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 92: show chassis pic Output Fields

Field Name	Field Description
Type	<p>PIC type.</p> <p>NOTE: On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as MIC-3D-1STM64-XFP and with the SONET framing mode, the type is displayed as MIC-3D-1OC192-XFP. By default, the 1-port OC192/STM64 MICs displays the type as MIC-3D-1OC192-XFP.</p>
ASIC type	Type of ASIC on the PIC.
State	<p>Status of the PIC. State is displayed only when a PIC is in the slot.</p> <ul style="list-style-type: none"> • Online— PIC is online and running. • Offline—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: Layer-2 or Layer-3 .
Port Number	Port number for the PIC.

Table 92: show chassis pic Output Fields (*continued*)

Field Name	Field Description
Cable Type	Type of cable connected to the port: LH , LX , or SX .
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	Port-level information for the PIC. <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction
PIC Port Information (MX960 Router Bidirectional Optics)	Port-level information for the PIC. <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> • BX10-10-km bidirectional optics. • BX40-40-km bidirectional optics. • SFP-LX-40-km SFP optics. • Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.
PIC Port Information (Next-Generation SONET/SDH SFP)	Port-level information for the next-generation SONET/SDH SFP PIC. <ul style="list-style-type: none"> • Port—Port number. • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. • Fiber type—Type of fiber: SM (single-mode) or MM (multimode). • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.
Multirate Mode	Rate-selectability status for the MIC: Enabled or Disabled .
Channelization	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

show chassis power-ratings

Syntax	show chassis power-ratings
Release Information	Command introduced in Junos OS Release 8.4.
Description	(J Series routers only) Display the low-power consumption, high-power consumption, and heat dissipation ratings of the router. Low-power consumption, high-power consumption, and heat dissipation values are represented in nondimensional tokens.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show chassis power-ratings on page 858 show chassis power-ratings (Power Management Disabled) on page 858
Output Fields	Table 93 on page 856 lists the output fields for the show chassis power-ratings command. Output fields are listed in the approximate order in which they appear.

Table 93: show chassis power-ratings Output Fields

Field Name	Field Description
Device	Physical Interface Module (PIM) slot. (PIM slot numbers appear as FPC numbers in the output.)
Total Tokens	Maximum number of low-power, high-power, and heat tokens available for the router: <ul style="list-style-type: none">• Low Power—Maximum number of low-power consumption tokens available for the router.• High Power—Maximum number of high-power consumption tokens available for the router.• Heat—Maximum number of heat tokens available for the router.

Table 93: show chassis power-ratings Output Fields (*continued*)

Field Name	Field Description
<i>FPC number</i>	<p>PIM slot number and power and heat information for the PIM in this slot:</p> <ul style="list-style-type: none"> • Low Power—PIM low-power consumption. The number of low-power tokens used by the PIM. • High Power—PIM high-power consumption. The number of high-power tokens used by the PIM. • Heat—The number of PIM heat dissipation tokens used by this PIM. • Ratings—Status of the PIM slot. The status of the slot is based on either the configuration of the slot or the power use and heat dissipation of the PIM in that slot: <p>NOTE: The request chassis fpc command has no effect on the status of the PIM slot.</p> <ul style="list-style-type: none"> • OK—The PIM in this PIM slot can be brought online. • Exceeded—The PIM cannot be brought online because the PIM slot has been disabled by J Series power management. The PIM in this PIM slot exceeds the maximum number of low-power tokens, high-power tokens, or heat tokens. • Empty—No PIM is installed in the PIM slot. • Cfg offline—The PIM cannot be brought online because the PIM slot has been disabled by the set chassis fpc offline command.
Tokens Used	<p>Total number of low-power, high-power, and heat tokens used by the router:</p> <ul style="list-style-type: none"> • Low Power—The total number of low-power tokens used by the router. • High Power—The total number of high-power tokens used by the router. • Heat—Number of heat tokens used by the router. • Ratings—If blank, J Series power management is enabled. No Power Mgmt indicates that J Series power management has been disabled by the set chassis disable_power_management command. <p>NOTE: Use extreme caution when disabling J Series power management. To prevent equipment damage, do not install a combination of PIMs that exceeds the power and heat capacity of the router when J Series power management is disabled.</p>

show chassis power

Syntax	show chassis power
Syntax (MX Series Router)	show chassis power <all-members> <local> <member <i>member-id</i> >
Syntax (MX2020 3D Universal Edge Routers)	show chassis power
Syntax (PTX Series)	show chassis power <detail>
Syntax (MX2010 3D Universal Edge Routers)	show chassis power
Release Information	Command introduced in Junos OS Release 10.0. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	<p>(MX Series 3D Universal Edge Routers and PTX Series Packet Transport Switches only)</p> <p>Display power limits and usage information for the AC or DC power sources.</p> <ul style="list-style-type: none"> On the MX Series 3D Universal Edge Routers, power is supplied by Power Entry Modules (PEMs). <div style="margin-top: 20px;">  <p>NOTE: The new high-capacity (4100 W) enhanced DC PEM on MX960 routers includes a new design that can condition the input voltage. This results in the output voltage differing from the input voltage. The earlier generation of DC PEMs coupled the input power directly to the output, thereby making it safe to assume that the output voltage was equal to the input voltage.</p> </div> <ul style="list-style-type: none"> On the MX2020 3D Universal Edge Routers, the power system consists of three components: the power supply modules (PSMs), the power distribution module (PDM), and the power midplane. The power feed is connected to the PDM. The PDM delivers power to the power midplane. The power midplane supplies power to the PSMs. The MX2020 router chassis provides 3+3 (2500W/80A) or 4+4 (2100W/60A) PSM redundancy for the critical FRUs with two power zones. On the MX2010 3D Universal Edge Routers, the power system consists of three components: the power supply modules (PSMs), the power distribution module (PDM), and the power midplane. The power feed is connected to the PDM. The PDM delivers power to the power midplane. The power midplane supplies power to the PSMs. Unlike

the MX2020 router chassis, the MX2010 router chassis does not provide redundancy for the critical FRUs because there is only one power zone.

- On the PTX Series Packet Transport Switches, power is supplied by power distribution units (PDUs). Each PDU contains up to four Power Supply Modules (PSMs).

Options **none**—Display basic power usage information for the AC and DC power sources.

all-members—(MX Series routers only) (Optional) Display power usage information for all members of the Virtual Chassis configuration.

detail—(PTX Series only) (Optional) Include power usage for specific FRUs.

local—(MX Series routers only) (Optional) Display power usage information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display power usage information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

show chassis psd

Syntax `show chassis psd`

Release Information Command introduced in Junos OS Release 9.1.

Description (Root System Domain [RSD] only) Display information about Protected System Domains (PSDs). A PSD is initially created by the RSD configuration. An RSD and PSDs are supported on a T320 or T640 router, or a T1600 routing node, or a TX Matrix Plus Platform that is interconnected with the JCS1200 platform.

NOTE: RSD configuration is not supported on a routing matrix based on TX Matrix Plus router with 3D SIBs.

Options This command has no options.

Additional Information For more information about PSDs, RSDs, and the JCS1200 platform, see the *Junos OS Protected System Domain Configuration Guide*.

Required Privilege Level view

Output Fields [Table 96 on page 873](#) lists the output fields for the `show chassis psd` command. Output fields are listed in the approximate order in which they appear.

Table 96: show chassis psd Output Fields

Field Name	Field Description
Slot Description	PSD identification.
State	PSD status: <ul style="list-style-type: none"> • Online—PSD is online and running. • Offline—PSD is powered down.
Uptime	Length of time that the PSD has been up and running.

Sample Output

`show chassis psd`

{master}

user@host> `show chassis psd`

Slot	Description	State	Uptime
1		Online	12 hours, 19 minutes, 51 seconds
2		Online	2 hours, 18 minutes, 17 seconds
3		Online	12 hours, 19 minutes, 51 seconds

show chassis redundancy feb

Syntax	show chassis redundancy feb <errors> <redundancy-group <i>group-name</i> >
Release Information	Command introduced in Junos OS Release 8.2.
Description	(M120 routers only) Display information about the status of configured Forwarding Engine Board (FEB) redundancy groups.
Options	<p>none—Display information about the status of all configured FEB redundancy groups.</p> <p>redundancy-group <i>group-name</i>—(Optional) Display information about the specified configured redundancy group.</p> <p>errors—(Optional) Display information about any errors encountered on the components in configured redundancy groups or on links between a FEB and a Flexible PIC Concentrator (FPC).</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis redundancy feb slot on page 205 • Configuring FEB Redundancy on the M120 Router • Switching Control Board Redundancy
List of Sample Output	<p>show chassis redundancy feb on page 876</p> <p>show chassis redundancy feb redundancy-group grp1 on page 876</p> <p>show chassis redundancy feb redundancy-group grp0 errors on page 876</p>
Output Fields	Table 97 on page 875 lists the output fields for the show chassis redundancy feb command. Output fields are listed in the approximate order in which they appear.

Table 97: show chassis redundancy feb Output Fields

Field name	Field Description
Group	Name of configured redundancy group.
FEB	Slot number of each FEB included in redundancy groups.
State	State of each FEB: <ul style="list-style-type: none"> • Online—FEB is online and running. • Offline—FEB is powered down.
Priority	(Standard and redundancy-group option) Status of FEB in the redundancy group: Backup , Primary , Other , or null.

Table 97: show chassis redundancy feb Output Fields (*continued*)

Field name	Field Description
Connected FPCs	(Standard and redundancy-group option) Slot number of each FPC connected to the FEB. The status Check is displayed when an error might have occurred.
Redundancy State	(Standard and redundancy-group option) Status of the FEB: <ul style="list-style-type: none"> • Active—FEB is currently active. • Ready—Backup FEB is ready for a switchover • Not Ready—Backup FEB is not ready for a switchover.
Auto-failover	(Standard and redundancy-group option) Automatic failover status of redundancy group: Enabled or Disabled .
Switch-reason	(Standard and redundancy-group option) Reason a switchover occurred to the backup FEB in the redundancy group.
Hard error: Yes	(errors option only) Displayed when a hard error occurs on a FEB.
FPC	(errors option only) Slot number and status of FPC: link ok or link error .
Fabric plane	(errors option only) Slot number and status of fabric plane.

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release in 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	Display the status of the Routing Engine.

Options **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

all-members—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

bios—(Optional) Display the (BIOS) firmware version.

interconnect-device *number*—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

node-device *number*—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

scc—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

slot—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace *slot* with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

Output Fields [Table 98 on page 880](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 98: show chassis routing-engine Output Fields

Field Name	Field Description
Slot	(Systems with single and multiple Routing Engines) Slot number.
Current state	(Systems with multiple Routing Engines) Current state of the Routing Engine: Master , Backup , or Disabled .
Election priority	(Systems with multiple Routing Engines) Election priority for the Routing Engine: Master or Backup .
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	Temperature of the CPU.

Table 98: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
DRAM	Total DRAM available to the Routing Engine's processor. Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.
Memory utilization	Percentage of Routing Engine memory being used.
CPU utilization	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"> • User—Percentage of CPU time being used by user processes. • Background—Percentage of CPU time being used by background processes. • Kernel—Percentage of CPU time being used by kernel processes. • Interrupt—Percentage of CPU time being used by interrupts. • Idle—Percentage of CPU time that is idle.
Model	Routing Engine model number.
Serial ID	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
Start time	Time at which the Routing Engine started running.
Uptime	How long the Routing Engine has been running.
Routing Engine BIOS Version	BIOS version being run by the Routing Engine.

Table 98: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Last reboot reason	<p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> • power cycle/failure—Halt of the Routing Engine using the halt command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the request system halt command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard. • watchdog—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered. • reset-button reset—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine. • power-button hard power off—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the request system power-off command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software. • misc hardware reason—Reboot due to miscellaneous hardware reasons. • thermal shutdown—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations. • hard disk failure—Reboot due to a hard disk or solid-state drive (SSD) failure. • reset from debugger—Reboot due to reset from the debugger. • chassis control reset—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the restart chassis-control command. • bios auto recovery reset—Reboot due to a BIOS auto-recovery reset. • could not be determined—Reboot due to an undetermined reason. • Router rebooted after a normal shutdown—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the request system reboot command. You can enter this command to reboot the chassis or specific Routing Engines.
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

Sample Output

show chassis
routing-engine (M5
Router)

```
user@host> show chassis routing-engine
Routing Engine status:
  Temperature                25 degrees C / 77 degrees F
  DRAM                       768 MB
  Memory utilization          21 percent
  CPU utilization:
    User                      0 percent
    Background                0 percent
    Kernel                    0 percent
    Interrupt                 0 percent
    Idle                      100 percent
  Model                       RE-2.0
  Serial ID                   31000007349bf701
  Start time                  2003-12-04 09:42:17 PST
  Uptime                      26 days, 1 hour, 12 minutes, 27 seconds
  Last reboot reason          Router rebooted after a normal shutdown
  Load averages:             1 minute   5 minute   15 minute
                              0.00        0.01        0.00
```

show chassis scb

Syntax	show chassis scb
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40 router only) Display System Control Board (SCB) status information.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Checklist for Monitoring the SCB
List of Sample Output	show chassis scb on page 899
Output Fields	Table 99 on page 898 lists the output fields for the show chassis scb command. Output fields are listed in the approximate order in which they appear.

Table 99: show chassis scb Output Fields

Field Name	Field Description
Temperature	Temperature of the air passing by the SCB, in degrees Celsius.
CPU utilization	Total percentage of CPU being used by the SCB's processor.
Interrupt utilization	Of the total CPU being used by the SCB's processor, the percentage being used for interrupts.
Heap utilization	Percentage of heap space being used by the SCB's processor.
Buffer utilization	Percentage of buffer space being used by the SCB's processor.
DRAM	Total DRAM available to the SCB's processor.
Start time	Time when the SCB started running.
Uptime	How long the SCB has been running.
Internet Processor memory	Information about the memory of the Internet Processor ASIC on the SCB: <ul style="list-style-type: none"> IP routes—Number of IP routes known to the Internet Processor. MPLS routes—Number of MPLS routes known to the Internet Processor. SRAM banks enabled—Which SRAM banks are enabled. SRAM size—Size of SCB SRAM, in bytes. SRAM used—Amount of SRAM used, in bytes. SRAM utilization—Percentage of SRAM used.

Sample Output

`show chassis scb`

```
user@host> show chassis scb
SCB status:
  Temperature:          30 Centigrade
  CPU utilization:      5 percent
  Interrupt utilization: 0 percent
  Heap utilization:     0 percent
  Buffer utilization:    2 percent
  DRAM:                 64 Mbytes
  Start time:           1998-10-28 18:35:46 UTC
  Uptime:               6 minutes, 16 seconds
Internet Processor memory:
  IP routes:            16
  MPLS routes:          1
  SRAM banks enabled:   [ 1 1 1 1 ]
  SRAM size:            4 Mbytes
  SRAM used:            256 bytes
  SRAM utilization:     0 percent
```

show chassis sfm

Syntax	<code>show chassis sfm</code> <code><detail <sfm-slot>></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e and M160 routers only) Display Switching and Forwarding Module (SFM) status information.
Options	<p>none—Display standard status information about all SFMs.</p> <p>detail—(Optional) Display detailed SFM status information.</p> <p>sfm-slot—(Optional) Display status information about the SFM in the specified slot only. For the M40e router, replace sfm-slot with 0 or 1. For the M160 router, replace sfm-slot with a value from 0 through 3.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • request chassis sfm on page 213 • request chassis sfm master switch on page 214 • Switching the Global Master and Backup Roles in a Virtual Chassis Configuration
List of Sample Output	show chassis sfm (M160 Router) on page 902 show chassis sfm detail (M40e Router) on page 902 show chassis sfm detail (M160 Router) on page 902
Output Fields	Table 100 on page 900 lists the output fields for the show chassis sfm command. Output fields are listed in the approximate order in which they appear.

Table 100: show chassis sfm Output Fields

Field Name	Field Description	Level of Output
Slot	Slot number.	All levels
State	Status of the SFM. State can be any of the following: <ul style="list-style-type: none"> • Online—SFM is online and running. • Online-Standby (M40e router only)—SFM is online, operating as Standby. • Offline—SFM is powered down. • Empty—No SFM is present. 	All levels
Reason	If the status is Offline , reason for this state.	All levels
Temp	Temperature of air passing by the SFM, in degrees Celsius.	none specified
CPU Utilization (%)	Information about CPU usage.	none specified

Table 100: show chassis sfm Output Fields (*continued*)

Field Name	Field Description	Level of Output
Total	Total percentage of the CPU being used by the SFM's processor.	All levels
Interrupt	Of the total CPU being used by the SFM's processor, the percentage being used for interrupts.	All levels
Memory Utilization	Information about memory usage.	none specified
DRAM	Total DRAM available to the SFM's processor, in megabytes (MB).	All levels
Heap	Percentage of heap space (dynamic memory) being used by the SFM's processor. If this number exceeds 80 percent, it might indicate a software problem (memory leak).	All levels
Buffer	Percentage of buffer space being used by the SFM's processor for buffering internal messages.	All levels
SPP Temperature	Temperature of air passing by the Switch Plane Processor card, in degrees Celsius and Fahrenheit	detail
SPR Temperature	Temperature of air passing by the Switch Plane Router card, in degrees Celsius and Fahrenheit.	detail
Total CPU DRAM	Total amount of CPU DRAM being used by the SFM's processor.	detail
Total SSRAM	Total amount of SSRAM being used by the SFM's processor.	detail
Internet processor II	(M160 router only) Processor type.	detail
Start time	Time this SFM became active.	detail
Uptime	How long the SFM has been up and running.	detail
Packet scheduling mode	(M160 router only) Enabled or disabled.	detail

Output Fields Table 101 on page 904 lists the output fields for the **show chassis sibs** command. Output fields are listed in the approximate order in which they appear.

Table 101: show chassis sibs Output Fields

Field Name	Field Description
Slot	SIB slot number.
Type	(TX Matrix Plus router only) SIB type.
Uptime	How long the SIB has been up and running.
State	SIB status: <ul style="list-style-type: none"> • Activating—SIB is coming online; this is a transitional state. • Deactivating—SIB is going offline; this is a transitional state.

Table 101: show chassis sibs Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none"> • Connected—SIBs on a T1600 router are connected and trained but are either not online or are spare, because the plane on the TX Matrix Plus router (or switch-fabric chassis) is still offline. • Disconnected—SIBs on all T640 routers on the TX Matrix router (switch-card chassis) are in the Disconnected state, because a SIB on the SCC has gone offline. Likewise, SIBs on all T1600 routers on the TX Matrix Plus router (or switch-fabric chassis) are in the Disconnected state, because a SIB on the SFC has gone offline. On the TX Matrix Plus router with 3D SIBs, the LCC SIB is also disconnected if the F13 SIB is online, but none of the cables are connected or trained. • Online—SIB is operational and running. • Offline—SIB is powered down. <p>NOTE: If a SIB transitions to the Offline state, the command displays an appropriate reason in the output. For instance, if the SIB is taken offline using the request chassis sib command, the show chassis sibs command displays --- Offlined by cli command --- in the output.</p> <ul style="list-style-type: none"> • Spare—SIB is redundant and will move to active state if one of the working SIBs fails to pass traffic. <p>NOTE: Spare does not apply to PTX Series Packet Transport Switches, as there are no spare SIBs.</p> <ul style="list-style-type: none"> • Empty—No SIB is present. • Fault—SIB is in an alarmed state in which the SIB's plane is not operational for one of the following reasons: <ul style="list-style-type: none"> • Onboard fabric ASIC is not operational. • Fiber-optic connector faults. • FPC connector faults. • SIB midplane connector faults. • Check—SIB is in an alarmed state due to link errors or destination errors. A SIB can transition to the Check state from the online or spare state. The Check state can be caused by the following reasons: <ul style="list-style-type: none"> • Unsupported FPC installed on a router. • SIB not inserted properly (such as bent pins). • Destination errors are detected on the SIB. In this case, the Packet Forwarding Engine stops using the SIB to send traffic to the affected destination Packet Forwarding Engine. When a Packet Forwarding Engine cannot be reached on that plane or SIB, a destination error is reported against that SIB. <p>NOTE: For SIBs in the Check state, the output displays some additional information:</p> <ul style="list-style-type: none"> • In Junos OS Release 9.6 and later, the Check state message shows the number of Packet Forwarding Engines in the plane having destination errors. For example, Check (10 destination errors) indicates 10 Packet Forwarding Engines cannot be reached on

Table 101: show chassis sibs Output Fields (*continued*)

Field Name	Field Description
	<p>that particular SIB. If there are no destination errors, and if the SIB transitions to the Check state because of link errors only, the Check state message shows Check (0 destination errors).</p> <ul style="list-style-type: none"> In Junos OS Release 9.5 and earlier, the Check state message shows Check (destination errors) if there are Packet Forwarding Engines with destination errors in this plane. However, it does not show the number of Packet Forwarding Engines having destination errors. If there are no destination errors and if the SIB transitions to the Check state because of link errors only, the Check state message shows Check (no destination errors). <p>If the SIB is in a Check state, because of destination errors, the CLI displays an additional line in the output, use "show chassis fabric fpcs" and "show chassis fabric sibs" for more details.</p> <ul style="list-style-type: none"> Link errors are detected on the channel between the SIB and a Packet Forwarding Engine. Link errors can be detected at initialization time or runtime: <ul style="list-style-type: none"> Link errors caused by a link training failure at initialization time—The Packet Forwarding Engine does not use the SIB to send traffic. The show chassis fabric fpcs command shows Plane disabled as status for this link. Link errors caused by CRC errors detected at runtime—The Packet Forwarding Engine continues to use the SIB to send traffic. The show chassis fabric fpcs command shows Link error as the status for this link. <p>NOTE: The Check state does not apply to PTX Series Packet Transport Switches.</p> <ul style="list-style-type: none"> SFC Error—If an F13 SIB on the TX Matrix Plus router (SFC) transitions to the Fault state (for instance, because of link errors), and then if an LCC SIB (connected to the F13 SIB) comes online, the LCC SIB transitions to the SFC Error state. This state indicates that the F13 SIB to which the LCC SIB is connected has errors. <p>NOTE: The Connected, Disconnected, and SFC Error states are only applicable to the SIBs on an LCC.</p> <ul style="list-style-type: none"> Invalid—The specific SIB slot is not valid for 4-LCC chassis configuration. See the <i>TX Matrix Plus Hardware Guide</i> for more information about the supported SIB slots. <p>NOTE: The Invalid state is applicable to TX Matrix Plus routers only.</p>
Fabric links	<p>Indicates status of fabric links on the SIB.</p> <ul style="list-style-type: none"> Active—All fabric links on SIB are active. Errors detected on the SIB's fabric links, if any, are reported in the Errors column. Unused—All fabric links on the SIB are not used for fabric traffic.
Errors	<p>Indicates if there is any error on the SIB.</p> <ul style="list-style-type: none"> None—No errors Link Errors—Fabric link errors were found on SIB RX link.

Table 101: show chassis sibs Output Fields (*continued*)

Field Name	Field Description
	<ul style="list-style-type: none">• Cell drops—Fabric cell drops were found on the SIB ASIC.• Link Errors, Cell drops—Both link errors and cell drops were detected on at least one of the SIB's fabric links.
Link Errors	indicate the number of links which are marked faulty because the errors on them have crossed threshold.
Cable Errors	Indicate the number of mandatory cables that are not connected, or in up state for that plane
Destination Errors	Indicate the number of destinations that are not reachable on this plane.

Sample Output

show chassis sibs (T640 Router)

```
user@host> show chassis sibs
Slot  State                      Uptime
0     Empty
1     Offline                    --- Offlined by cli command ---
2     Check (21 destination errors) 1 day, 1 hour, 32 minutes, 55 seconds
3     Check (0 destination errors)  1 day, 1 hour, 32 minutes, 45 seconds
4     Empty
```

use "show chassis fabric fpcs" and "show chassis fabric sibs" for more details

show chassis sibs (T4000 Router)

```
user@host> show chassis sibs

Syntax	show chassis spmb
Syntax (T4000 Routers)	show chassis spmb <sibs>
Syntax (TX Matrix Routers)	show chassis spmb <sibs> <lcc <i>number</i> scc>
Syntax (TX Matrix Plus Routers)	show chassis spmb <sibs> <lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. sibs option introduced for the T1600 and TX Matrix Plus routers in Junos OS Release 9.6. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	(T Series routers, MX2010 and MX2020 routers only) Display Switch Processor Mezzanine Board (SPMB) status information.
Options	<p>none—(TX Matrix, TX Matrix Plus router , MX2010, and MX2020 routers only) On a TX Matrix router, display SPMB status for the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display SPMB status for the TX Matrix Plus router and its attached routers. On MX2010 and MX2020 routers, display the SPMB status for the routers.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display information about the SPMB on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display information about the SPMB on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>scc—(TX Matrix routers only) (Optional) Display information about the SPMB on the TX Matrix router (switch-card chassis).</p>

sfc number—(TX Matrix Plus router only) (Optional) Display information about the SPMB on the TX Matrix Plus router (switch-fabric chassis). Replace **number** with **0**.

sibs—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix Plus router, display information about the SIBs on the TX Matrix router (switch-card chassis). On a TX Matrix Plus router, display information about the SIBs on The TX Matrix Plus router (switch-fabric chassis). The **sibs** option has the following sub-options:

lcc number (TX Matrix, TX Matrix Plus router only) (Optional) On a TX Matrix router, display information about the SIBs on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display information about the SIBs on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

scc number—(TX Matrix routers only) (Optional) Display information about the SIBs on the TX Matrix router (switch-card chassis). Replace **number** variable with **0**.

sfc number—(TX Matrix Plus router only) (Optional) Display information about the SIBs on the TX Matrix Plus router (switch-fabric chassis). Replace **number** variable with **0**.

Output Fields Table 102 on page 916 lists the output fields for the **show chassis spmb** command. Output fields are listed in the approximate order in which they appear.

Table 102: show chassis spmb Output Fields

Field Name	Field Description
Slot	SPMB slot number: 0 or 1.
State	SPMB status: <ul style="list-style-type: none"> • Online—SPMB is operational and running. • Offline—SPMB is powered down.
Total CPU Utilization (%)	Total percentage of CPU being used by the SPMB processor.
Interrupt CPU Utilization (%)	Of the total CPU being used by the SPMB processor, the percentage being used for interrupts.
Memory Heap Utilization (%)	Percentage of heap space (dynamic memory) being used by the FPC processor. If this number exceeds 80 percent, there may be a software problem (memory leak).
Buffer Utilization (%)	Percentage of buffer space being used by the SPMB processor for buffering internal messages.
Start time	Time at which the SPMB last came online.
Uptime	How long the SPMB has been up and running.

show chassis spmb sibs

Syntax	show chassis spmb sibs
Syntax (TX Matrix Router)	show chassis spmb sibs <lcc <i>number</i> scc>
Syntax (TX Matrix Plus Router)	show chassis spmb sibs <lcc <i>number</i> sfc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.
Description	(T Series routers only) Display Switch Processor Mezzanine Board (SPMB) Switch Interface Board (SIB) status information.
Options	<p>none—(TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, display the SIB status for the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display the SIB status for the TX Matrix Plus router and its attached routers.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display SIB status information for a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display SIB status information for a specified router (line-card chassis) that is connected to a TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>scc—(TX Matrix router only) (Optional) Display SIB status information for the TX Matrix router (switch-card chassis).</p> <p>sfc—(TX Matrix Plus router only) (Optional) Display SIB status information for the TX Matrix Plus router (or switch-fabric chassis).</p>
Additional Information	On a T Series router, you can use either this command or the show chassis sibs command to produce the same output. The show chassis sibs command is supported on the M320 router and on the T Series routers.

show chassis ssb

Syntax	<code>show chassis ssb</code> <code><slot></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M20 routers only) Display status information about the System and Switch Board (SSB).
Options	<p>none—Display information about all SSBs.</p> <p>slot—(Optional) Display information about the SSB in the specified slot. Replace slot with 0 or 1.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> request chassis ssb master switch on page 223
List of Sample Output	show chassis ssb on page 931
Output Fields	Table 104 on page 930 lists the output fields for the <code>show chassis ssb</code> command. Output fields are listed in the approximate order in which they appear.

Table 104: show chassis ssb Output Fields

Field Name	Field Description
Failover	Number of times mastership has changed.
Slot	SSB slot number.
State	<p>Current state of the SSB in this slot. State can be any one of the following:</p> <ul style="list-style-type: none"> Master—SSB is online, operating as master. Backup—SSB running as backup. Empty—No SSB is present.
Temperature	Temperature of the air passing by the SSB, in degrees Celsius.
CPU utilization	Total percentage of the CPU being used by the SSB's processor.
Interrupt utilization	Of the total CPU being used by the SSB's processor, the percentage being used for interrupts.
Heap utilization	Percentage of heap space being used by the SSB's processor.
Buffer utilization	Percentage of buffer space being used by the SSB's processor.
DRAM	Total DRAM available to the SSB's processor.

Table 104: show chassis ssb Output Fields (*continued*)

Field Name	Field Description
Start time	Time when the SSB started running.
Uptime	How long the SSB has been up and running.

show chassis synchronization

Syntax	<code>show chassis synchronization</code> <code><extensive></code> <code><backup master></code>
Release Information	Command introduced in Junos OS Release 7.6 for M320 routers. Command introduced in Junos OS Release 8.3 for M40e routers. Command introduced in Junos OS Release 9.3 for M120 routers. Command introduced in Junos OS Release 10.2 for T320, T640, and T1600 routers. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.2 for ACX Series routers.
Description	(ACX Series, M320, M40e, M120, T320, T640, and T1600 routers and PTX Series Packet Transport Switches only) Display information about the external clock source currently used for chassis synchronization.
Options	extensive —(Optional) Display clock synchronization information in detail. backup —(Optional) Display clock synchronization information about the backup clock. master —(Optional) Display clock synchronization information about the master clock.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• request chassis synchronization switch on page 225• Configuring Clock Synchronization Interface for MX Series Routers• show chassis synchronization (MX Series Routers) on page 936• Supported Time Synchronization Standard• Configuring External Clock Synchronization for ACX Series Routers

Output Fields	Table 105 on page 933 lists the output fields for the show chassis synchronization command. Output fields are listed in the approximate order in which they appear. show chassis synchronization show chassis synchronization show chassis synchronization

Table 105: show chassis synchronization Output Fields

Field Name	Field Description
Current state	Indicates current status of external clock sources: <ul style="list-style-type: none"> • backup—Source is currently the backup clock source. • master—Source is currently the master clock source. • Online-Master—(PTX Series Packet Transport Switches) Source is the master clock. Source is online. • Online-Standby—(PTX Series Packet Transport Switches) Source is the standby (backup) clock. Source is online.
Current clock state	Indicates current source of external synchronization: <ul style="list-style-type: none"> • internal—Source is providing its own clocking. • locked to master CB—(M320, M40e, and M120 routers) Source is locked to master clock source. • locked to master SCG—(T320, T640, and T1600 routers) Source is locked to master clock source. • locked to master CCG—(PTX Series Packet Transport Switches) Source is locked to master clock source.
Selected for	Number of seconds this clock has been the master or backup clock source.
Selected since	Timestamp for establishment as master or backup clock source.
Deviation (in ppm)	Difference in clock timing, in parts per million (ppm).
Last deviation (in ppm)	Previous difference in clock timing, if any, in ppm.
Configured sources	Information about clock sources eligible for selection as master clock.
Source	Information about external clock sources.
Priority	Indicates priority of external clock sources: <ul style="list-style-type: none"> • primary—Source is a primary reference. • secondary—Source is a secondary reference.
Deviation (in ppm)	Current difference in clock timing, in ppm: <ul style="list-style-type: none"> • measuring—Establishing source deviation. • number—Deviation in ppm.
Last deviation (in ppm)	Previous difference in clock timing, in ppm: <ul style="list-style-type: none"> • number—Deviation in ppm.
Status	Indicates status of external sources: <ul style="list-style-type: none"> • present—Source is configured and present. • qualified—Source is eligible for synchronization source.

show chassis synchronization (MX Series Routers)

Syntax	show chassis synchronization <clock-module <(re0 re1 routing-engine (backup both local master other))>> <extensive> <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 10.4. clock-module option introduced in Junos OS Release 12.2.
Description	Display information about clocks used for chassis synchronization.

NOTE: The Switch Control Board (SCB) framer in MX Series routers supports only the first generation synchronization status message (SSM) format. Therefore, whenever the router needs to transmit an SSM value of ST3E or TNC, an SSM value of ST3 is transmitted.

However, note that on the Synchronous Ethernet interface, an ESMC packet with the unadjusted SSM is transmitted. The term unadjusted here means:

- When you configure the **receive-quality** statement in the [edit chassis synchronization selection-mode] hierarchy level, the originally received SSM value ST3E or TNC (corresponding to the currently active Synchronous Ethernet clock interface) is transmitted.
- When you configure the **configured quality** statement in the [edit chassis synchronization selection-mode] hierarchy level, the originally configured SSM value of ST3E or TNC (corresponding to the currently active Synchronous Ethernet clock interface) is transmitted.

Note that when the Synchronous Ethernet interface receives an SSM value of either ST3E or TNC, the SCB framer does not recognize either of these SSM codes and therefore it reports that the Do Not Use (DNU) quality value has been received.

Options	clock-module —(MX240, MX480, and MX960 routers with Enhanced MX Switch Control Board only) (Optional) Display clock module information. You can optionally specify one of these Routing Engine qualifiers: re0 —Routing Engine 0 re1 —Routing Engine 1 routing-engine (backup both local master other) —Routing Engine type extensive —(Optional) Display clock synchronization information in detail. interface <i>interface-name</i> —(Optional) Display clock synchronization information for the specified interface.

Output Fields [Table 106 on page 937](#) lists the output fields for the **show chassis synchronization** command. Output fields are listed in the approximate order in which they appear.

Table 106: show chassis synchronization Output Fields

Field Name	Field Description	Level of Output
Current clock status	Indicates the current status of chassis synchronization: <ul style="list-style-type: none"> • Locked—Clock is operational. • Holdover—Clock is not operational. • Freerun—Clock is locked to the free-run local oscillator. 	none
Clock locked to	Indicates whether the clock is locked to either the primary source or the secondary source.	none
Configured sources	Heading for the list of interfaces configured for chassis synchronization and their subsequent status indicators.	none

Table 106: show chassis synchronization Output Fields (*continued*)

Field Name	Field Description	Level of Output
Source name	Indicates the configured interface that is the source. The external source name indicates the external clock interface.	none
Configured Priority	Indicates the priority configured for the interface.	none
Interface Status	Indicates the status of the interface as primary , secondary , or n/a (external).	none
Configured quality	Indicates the configured quality of the interface. <ul style="list-style-type: none"> prs—Primary reference source—Stratum 1 st2—Stratum 2 tnc—Transit node clock st3e—Stratum 3E st3—Stratum 3 smc—SONET minimum clock st4—Stratum 4 prc—Primary reference clock ssu-a—Synchronization supply unit A ssu-b—Synchronization supply unit B sec—SDH equipment clock 	none
Interface	Indicates the configured interface: <ul style="list-style-type: none"> ge-fpc/pic/port—Indicates the interface type and which FPC, PIC, and port are configured. 	extensive
Status	Indicates the synchronization status of the indicated interface, as follows: <ul style="list-style-type: none"> Primary—This interface is the selected primary chassis clock source. Secondary—This interface is the selected secondary chassis clock source. n/a—This interface is not a selected clock source. 	extensive
Index	Unique numeric identifier for the established Synchronous Ethernet configuration.	extensive
Clock source state	Indicates the status of the Synchronous Ethernet clock source: <ul style="list-style-type: none"> Clk qualified—The Synchronous Ethernet clock source is qualified. n/a—The Synchronous Ethernet clock source is not qualified. 	extensive
Priority	Indicates the configured priority. The range is from 1 through 5. The following values indicate whether the parameter is not specified or undefined: <ul style="list-style-type: none"> Default(8)—The parameter is not specified. -—The parameter is undefined or out of range. 	extensive

Table 106: show chassis synchronization Output Fields (*continued*)

Field Name	Field Description	Level of Output
Configured QL	Indicates the configured source interface quality level (QL), which is dependent on the source interface and option. The following quality levels are supported and the configured QL is indicated: <ul style="list-style-type: none"> • prs st2 tnc st3e st3 smc st4—Network option I QLs • prc ssu-a ssu-b sec—Network option II QLs 	extensive
ESMC QL	Indicates the configured Ethernet Synchronization Message Channel (ESMC) quality level: <ul style="list-style-type: none"> • DNU—Network option I source • DSU—Network option II source 	extensive
Clock source type	Indicates that the configured chassis synchronization clock source is one of the following types: <ul style="list-style-type: none"> • ifd—Uses the free-run local oscillator. • extern—Uses a configured qualified clock source. 	extensive
Clock Event	Indicates the event clock status: <ul style="list-style-type: none"> • Clock locked—Clock is established. • n/a—Clock is not established. 	extensive
Configuration flags	Indicates Ext for external interface configuration	
Kernel flags	Indicates the Synchronous Ethernet software operational status: <ul style="list-style-type: none"> • Up—The Synchronous Ethernet software is operational for the configured interface. • pri—The source is the selected primary clock source. • Dn—The Synchronous Ethernet software is not operational for the configured interface. 	extensive
Ineligibility reason	Indicates the reason the interface is ineligible for the Synchronous Ethernet operation, including the following: <ul style="list-style-type: none"> • Link Down—The link between the Synchronous Ethernet interfaces is not operational. • Not restored—The Synchronous Ethernet link has not yet been restored because it is waiting for the specified wait-to-restore time to elapse. • Forbidden slot—Slot 10 is not supported. • Interface unit missing—The unit parameter is not set or is invalid. • Locked—The paired interface is not available. • No cfg—Synchronous Ethernet is not configured. • RX Disabled—The receiving interface is disabled. • Undefined/invalid QL—The QL mode is not specified in the configuration or, if specified, is not supported. • System initialization in progress—The remote system is performing initialization and not currently available for synchronization. • Unsupported interface—The configured interface does not support Synchronous Ethernet. 	extensive

Table 106: show chassis synchronization Output Fields (*continued*)

Field Name	Field Description	Level of Output
Clock module on	Indicates whether the clock module is on the Switch Control Board SCB0 or SCB1 .	clock-module
Current role	Indicates the role of the clock module: <ul style="list-style-type: none"> master—The clock module is on the primary SCB, which is the active chassis clock source. backup—The clock module is on the backup SCB, which mirrors the state of the active clock. 	clock-module
Current state	Indicates the state of the clock module: <ul style="list-style-type: none"> freerun—The clock module is in free-run mode. When the system starts up, the default clock module state is free-run. acquiring-lock on—The clock module is attempting to acquire a lock on the specified clock source. locked to—The clock module is locked to the specified clock source. holdover on—The clock module is in holdover mode on the specified clock source. Prior to the specified clock source becoming invalid, the clock module was locked on the source and holdover data was collected. holdover—The clock module has transitioned into holdover prior to locking on a valid clock source and collecting holdover data. 	clock-module
Monitored clock sources	Displays information about monitored clock sources.	clock-module
Interface	Indicates the interface type and which FPC, PIC, and port are configured: <ul style="list-style-type: none"> external—External clock source ge-fpc/pic/port—Line Synchronous Ethernet or PTP slave xe-fpc/pic/port—Line Synchronous Ethernet or PTP slave 	clock-module
Type	Indicates the type of clock source: <ul style="list-style-type: none"> t1—BITS T1 framed e1—BITS E1 framed 2048khz—BITS unframed 2048 KHz frequency source syncE—Synchronous Ethernet frequency source ptp—PTP slave source ptp-hybrid—PTP slave source using Synchronous Ethernet for frequency 	clock-module
Status	Indicates the status of the clock source: <ul style="list-style-type: none"> failed—The clock source is in the failed state. qualifying—The clock source is being qualified. qualified—The clock source is qualified and can be selected as the chassis clock source. qualified-selected—The clock source is qualified and selected as the chassis clock source. 	clock-module

Release Information	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc command introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	Display chassis temperature threshold settings, in degrees Celsius.
Options	none —Display the temperature threshold details. all-members —(MX Series routers only) (Optional) Display the chassis temperature threshold settings of all member routers in the Virtual Chassis configuration. interconnect-device <i>name</i> —(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Interconnect device. lcc <i>number</i> —(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the temperature threshold details of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the temperature threshold details of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the local Virtual Chassis member.

member *member-id*—(MX Series routers only) (Optional) Display the chassis temperature threshold settings of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display the chassis temperature threshold settings of the Node device.

scc—(TX Matrix routers only) (Optional) Display the temperature threshold details of the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus routers only) (Optional) On TX Matrix Plus routers, display the temperature threshold details of the TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* with 0.

Output Fields Table 107 on page 946 lists the output fields for the **show chassis temperature-thresholds** command. Output fields are listed in the approximate order in which they appear.

Table 107: show chassis temperature-thresholds Output Fields

Field name	Field Description
Item	Chassis component. If per FRU per slot thresholds are configured, the components about which information is displayed include the chassis, the Routing Engines, FPCs, and FEBs. If per FRU per slot thresholds are not configured, the components about which information is displayed include the chassis and the Routing Engines.
Fan speed	<p>NOTE: On the QFX3500 switch and QFX3600 switch, there are four fan speeds: low, medium-low, medium-high, and high. The fan speed changes at the threshold when going from a low speed to a higher speed. When the fan speed changes from a higher speed to a lower speed, the temperature changes two degrees below the threshold.</p> <p>Temperature threshold settings, in degrees Celsius, for the fans to operate at normal and high speeds.</p> <ul style="list-style-type: none"> • Normal—The fans operate at normal speed if the component is at or below this temperature and all the fans are present and functioning normally. <p>NOTE: On a TX Matrix Plus router with 3D SIBs, the threshold temperature at the XF junction is set to 70°C for Normal fan speed, which is less than or equal to 4800 RPM.</p> <ul style="list-style-type: none"> • High—The fans operate at high speed if the component has exceeded this temperature or a fan has failed or is missing. <p>NOTE: On a TX Matrix Plus router with 3D SIBs, the threshold temperature at the XF junction is set to 75°C for High fan speed, which is greater than or equal to 5000 RPM.</p> <p>NOTE: For MX480 Routers, there are three fan speeds: Low, Medium, and High.</p> <p>An alarm is not triggered until the temperature exceeds the threshold settings for a yellow alarm or a red alarm.</p>
Yellow alarm	<p>Temperature threshold settings, in degrees Celsius, that trigger a yellow alarm.</p> <ul style="list-style-type: none"> • Normal—The temperature that must be exceeded on the component to trigger a yellow alarm when the fans are running at full speed. • Bad fan—The temperature that must be exceeded on the component to trigger a yellow alarm when one or more fans have failed or are missing.
Red alarm	<p>Temperature threshold settings, in degrees Celsius, that trigger a red alarm.</p> <ul style="list-style-type: none"> • Normal—The temperature that must be exceeded on the component to trigger a red alarm when the fans are running at full speed. • Bad fan—The temperature that must be exceeded on the component to trigger a red alarm when one or more fans have failed or are missing.
Fire Shutdown	(T4000 routers, TX Matrix Plus router with 3D SIBs, and PTX Series Packet Transport Switches only)—Temperature threshold settings, in degrees Celsius, for the network device to shut down.

show chassis zones

Syntax	show chassis zones <detail>
Syntax (QFX Series)	show chassis zones <detail> <interconnect-device <i>name</i> >
Release Information	Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
Description	(QFabric systems only) Display the status of the two cooling system zones on the Interconnect device. Zone 1 consists of eight (0 – 7) front cards, which are cooled by two fan trays. Zone 2 consists of two control boards and eight rear cards, which are cooled by eight (0 – 7) fan trays. On MX2010 and MX2020 routers, display the status of the cooling system zones of the chassis. Zone 0 consists of the Control Board, ten (0–9) FPCs, and their respective PICs, Switch Fabric Boards, and Adapter Cards. Zone 1 consists of the Routing Engine, Control Board, and Switch Processor Mezzanine Boards.
Options	<p>detail—(MX2010 and MX2020 routers only) (Optional) Display detailed status of the cooling system zones.</p> <p>detail <i>device-name</i>— (QFabric systems only) (Optional) Display detailed status of the two cooling systems on the Interconnect device.</p> <p>interconnect-device <i>name</i>— (QFabric systems only) (Optional) Display the status of the cooling zones on the Interconnect device.</p>
Required Privilege Level	view

Output Fields	Table 108 on page 962 lists the output fields for the show chassis zones command. Output fields are listed in the approximate order in which they appear.

Table 108: show chassis zones Output Fields

Field Name	Field Description
Slot	FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0 .
Beacon State	Status of the beacon state: <ul style="list-style-type: none"> Off—The beacon is OFF. On—The beacon is ON.
show chassis zones command output fields for MX2020 and MX2010 routers:	
Driving FRU	Field replacable unit (FRU).
Temperature	Temperature of the specified FRU in degrees Celsius and degrees Fahrenheit.
Condition	Condition of the specified FRU. Condition can be HIGH TEMP , WARM TEMP , OK , and Offline .
Num Fans Missing	Number of fans or fan trays missing.
Num Fans Failed	Number of fans or fan trays that have failed.
Fan Duty Cycle	Fan duty cycle value.
show chassis zones detail command output fields for MX2020 and MX2010 routers:	
Item	Chassis component: <ul style="list-style-type: none"> Information about the chassis, Routing Engines, Control Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).
Measurement	Fan tray speed utilization in percentage.
Status	Status of the specified item. Status can be OK , Absent , or Offline .

show chassis zones (PTX Series Packet Transport Switches)

Syntax	<code>show chassis zones</code> <code><detail></code>
Release Information	Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Switches.
Description	(PTX5000 Packet Transport Switch only) Display the status of the two cooling system zones of the chassis. Zone 0 consists of the Routing Engine, Control Board, SIB, PMB, and the CCG, and is cooled by the vertical fan tray. Zone 1 consists of the eight (0–7) FPCs, and their respective PICs, and is cooled by the horizontal fan trays. The vertical fan tray is located at the front of the chassis. One horizontal fan tray is located at the front top of the chassis, and another is located at the front bottom of the chassis.
Options	detail —(Optional) Display status of each FRU and fan belonging to the cooling system zones.
Required Privilege Level	view

CHAPTER 8

Command-Line Interface Operational Mode Commands

Table 110 on page 969 summarizes the command-line interface (CLI) commands you can use to perform and monitor CLI management functions. Commands are listed in alphabetical order.

Table 110: CLI Operational Mode Commands

Task	Command
Clear the logical system view and return to a full router view.	<code>clear cli logical-system</code>
Set the CLI to complete partial command entries.	<code>set cli complete-on-space</code>
Set the current working directory.	<code>set cli directory</code>
Set the maximum time that an individual session can be idle before the user is logged off the router.	<code>set cli idle-timeout</code>
Set the CLI to the specified logical routing instance.	<code>set cli logical-system</code>
Set the CLI prompt.	<code>set cli prompt</code>
Set the CLI to prompt you to restart the router after a software upgrade.	<code>set cli restart-on-upgrade</code>
Set the number of lines on the screen.	<code>set cli screen-length</code>
Set the number of characters on a line.	<code>set cli screen-width</code>
Set the terminal type.	<code>set cli terminal</code>
Timestamp CLI output.	<code>set cli timestamp</code>
Set the system date and time.	<code>set date</code>
Display all CLI settings.	<code>show cli</code>

Table 110: CLI Operational Mode Commands (*continued*)

Task	Command
Display login permissions for the current user.	show cli authorization
Display the current working directory.	show cli directory
Display a list of previous CLI commands.	show cli history

NOTE: For information about how to configure CLI parameters, see the CLI User Guide.

For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Baseline Network Operations Guide*.

clear cli logical-system

Syntax	clear cli logical-system
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear the logical system view and return to a full router view. In a logical system view, the output of the command displays information related to the logical system only.
Options	This command has no options.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• set cli logical-system on page 975• Logical Systems Configuration Guide
List of Sample Output	clear cli logical-system on page 971
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
clear cli logical-system  user@host:1r1> clear cli logical-system

                           Cleared default logical system

                           user@host>
```

set cli complete-on-space

Syntax	set cli complete-on-space (off on)
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the command-line interface (CLI) to complete a partial command entry when you type a space or a tab. This is the default behavior of the CLI.
Options	off —Turn off command completion. on —Allow either a space or a tab to be used for command completion.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• CLI User Interface Overview• show cli on page 983
List of Sample Output	set cli complete-on-space on page 972
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli complete-on-space

In the following example, pressing the Spacebar changes the partial command entry from **com** to **complete-on-space**. The example shows how adding the keyword **off** at the end of the command disables command completion.

```
user@host> set cli com<Space>
user@host>set cli complete-on-space off
Disabling complete-on-space
```

set cli directory

Syntax	set cli directory <i>directory</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the current working directory.
Options	<i>directory</i> —Pathname of the working directory.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">CLI User Interface Overviewshow cli directory on page 988
List of Sample Output	set cli directory on page 973
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

<code>set cli directory</code>	<pre>user@host> set cli directory /var/home/regress Current directory: /var/home/regress</pre>
--------------------------------	---

set cli idle-timeout

Syntax	set cli idle-timeout < <i>minutes</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the maximum time that an individual session can be idle before the user is logged off the router or switch.
Options	<i>minutes</i> —(Optional) Maximum idle time. The range of values, in minutes, is 0 through 100,000. If you do not issue this command, and the user's login class does not specify this value, the user is never forced off the system after extended idle times. Setting the value to 0 disables the timeout.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• CLI User Interface Overview• show cli on page 983
List of Sample Output	set cli idle-timeout on page 974
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
set cli idle-timeout      user@host> set cli idle-timeout 60
                          Idle timeout set to 60 minutes
```

set cli logical-system

Syntax	set cli logical-system <i>logical-system</i>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Set the CLI to the specified logical system view.
Options	<i>logical-system</i> —logical system name.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• clear cli logical-system on page 971• Logical Systems Configuration Guide
List of Sample Output	set cli logical-system on page 975
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

set cli logical-system	user@host> set cli logical-system log-router-A logical system: log-router-A user@host:log-router-A>
-------------------------------	---

set cli prompt

Syntax	set cli prompt <i>string</i>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set the prompt so that it is displayed within the CLI.
Options	<i>string</i> —CLI prompt string. To include spaces in the prompt, enclose the string in quotation marks. By default, the string is <i>username@hostname</i> .
Required Privilege Level	view

----------------	--

set cli restart-on-upgrade

Syntax	set cli restart-on-upgrade string (off on)
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	For an individual session, set the CLI to prompt you to restart the router or switch after upgrading the software.
Options	off —Disables the prompt. on —Enables the prompt.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• CLI User Interface Overview• show cli on page 983

-------------------------------	---

set cli screen-length

Syntax	<code>set cli screen-length <i>length</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Set terminal screen length.
Options	<i>length</i> —Number of lines of text that the terminal screen displays (0 through 10,000). The default is 24.
Additional Information	The point at which the ---(more)--- prompt appears on the screen is a function of this setting and the settings for the <code>set cli screen-width</code> and <code>set cli terminal</code> commands.
Required Privilege Level	view

show cli

Syntax	show cli
Syntax (QFX Series)	show cli <authorization> <directory> <history <i>count</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display configured CLI settings.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli on page 984
Output Fields	Table 111 on page 983 lists the output fields for the show cli command. Output fields are listed in the approximate order in which they appear.

Table 111: show cli Output Fields

Field Name	Field Description
CLI complete-on-space	Capability to complete a partial command entry when you type a space or a tab: on or off .
CLI idle-timeout	Maximum time that an individual session can be idle before the user is logged out from the router or switch. When this feature is enabled, the number of minutes is displayed. Otherwise, the state is disabled .
CLI restart-on-upgrade	CLI is set to prompt you to restart the router or switch after upgrading the software: on or off .
CLI screen-length	Number of lines of text that the terminal screen displays.
CLI screen-width	Number of characters in a line on the terminal screen.
CLI terminal	Terminal type.
CLI is operating in	Mode: enhanced .
CLI timestamp	Date and time format for the timestamp. If the timestamp is not set, the state is disabled .
CLI working directory	Pathname of the working directory.

Sample Output

`show cli`

```
user@host> show cli
CLI complete-on-space set to on
CLI idle-timeout disabled
CLI restart-on-upgrade set to on
CLI screen-length set to 47
CLI screen-width set to 132
CLI terminal is 'vt100'
CLI is operating in enhanced mode
CLI timestamp disabled
CLI working directory is '/var/home/regress'
```

show cli authorization

Syntax	show cli authorization
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the permissions for the current user.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli authorization on page 987
Output Fields	Table 112 on page 985 lists the output fields for the show cli authorization command. In the table, all possible permissions are displayed and output fields are listed in alphabetical order.

Table 112: show cli authorization Output Fields

Field Name	Field Description
access	Can view access configuration information.
access-control	Can modify access configuration.
admin	Can view user account information.
admin-control	Can modify user account information.
clear	Can clear learned network information.
configure	Can enter configuration mode.
control	Can modify any configuration.
edit	Can edit configuration files.
field	Reserved for field (debugging) support.
firewall	Can view firewall configuration information.
firewall-control	Can modify firewall configuration information.
floppy	Can read from and write to removable media.
flow-tap	Can view flow-tap configuration information.

Table 112: show cli authorization Output Fields (*continued*)

Field Name	Field Description
flow-tap-control	Can configure flow-tap configuration information.
idp-profiler-operation	Can configure Profiler data.
interface	Can view interface configuration information.
interface-control	Can modify interface configuration information.
maintenance	Can perform system maintenance.
network	Can access the network by entering the ping , ssh , telnet , and traceroute commands.
pgcp-session-mirroring	Can view Packet Gateway Control Protocol session mirroring configuration.
pgcp-session-mirroring-control	Can modify Packet Gateway Control Protocol session mirroring configuration all-control.
reset	Can reset or restart interfaces and system processes.
rollback	Can roll back to previous configurations.
routing	Can view routing configuration information.
routing-control	Can modify routing configuration information.
secret	Can view passwords and authentication keys in the configuration.
secret-control	Can modify passwords and authentication keys in the configuration.
security	Can view security configuration information.
security-control	Can modify security configuration information.
shell	Can start a local shell.
snmp	Can view SNMP configuration information.
snmp-control	Can modify SNMP configuration information.
system	Can view system configuration information.
system-control	Can modify system configuration information.
trace	Can view trace file settings information.

Table 112: show cli authorization Output Fields (*continued*)

Field Name	Field Description
trace-control	Can modify trace file settings information.
view	Can view current values and statistics.
view-configuration	Can view all configuration information (not including secrets).

Sample Output

show cli authorization

```

user@host> show cli authorization
Current user: 'remote' login: 'user' class ''
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network information
  configure  -- Can enter configuration mode
  control    -- Can modify any configuration
  edit       -- Can edit full files
  field      -- Special for field (debug) support
  floppy     -- Can read and write from the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret configuration
  secret-control-- Can modify secret configuration
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration
  access     -- Can view access configuration
  access-control-- Can modify access configuration
  view-configuration-- Can view all configuration (not including secrets)
  flow-tap   -- Can view flow-tap configuration
  flow-tap-control-- Can configure flow-tap service
Individual command authorization:
  Allow regular expression: none
  Deny regular expression: none
  Allow configuration regular expression: none
  Deny configuration regular expression: none

```

show cli directory

Syntax	show cli directory
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the current working directory.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show cli directory on page 988
Output Fields	Table 113 on page 988 lists the output fields for the show cli directory command. Output fields are listed in the approximate order in which they appear.

Table 113: show cli directory Output Fields

Field Name	Field Description
Current directory	Pathname of the current working directory.

Sample Output

show cli directory	user@host> show cli directory Current directory: /var/home/regress
---------------------------	---

show cli history

Syntax	<code>show cli history</code> <code><count></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display a list of previous CLI commands.
Options	none —Display all previous CLI commands. count —(Optional) Maximum number of commands to display.
Required Privilege Level	view
List of Sample Output	show cli history on page 989
Output Fields	Table 114 on page 989 lists the output fields for the show cli history command. Output fields are listed in the approximate order in which they appear.

Table 114: show cli history Output Fields

Field Name	Field Description
<i>timestamp</i>	Time at which the command was entered.
<i>command-syntax</i>	Command that was entered.

Sample Output

```
show cli history
user@host> show cli history
11:14:14 -- show arp
11:22:10 -- show cli authorization
11:27:12 -- show cli history
```

CHAPTER 9

File Management Operational Mode Commands

Table 115 on page 991 summarizes the command-line interface (CLI) commands you can use to perform and monitor file management functions. Commands are listed in alphabetical order.

Table 115: File Management Operational Mode Commands

Task	Command
Remove contents of a log file.	<code>clear log</code>
Archive files or archive and compress files.	<code>file archive</code>
Calculate checksum using MD5 has algorithm.	<code>file checksum md5</code>
Calculate checksum using Secure Hash Algorithm SHA1.	<code>file checksum sha1</code>
Calculate checksum using Secure Hash Algorithm SHA-256.	<code>file checksum sha-256</code>
Compare two files.	<code>file compare</code>
Copy files.	<code>file copy</code>
Delete files.	<code>file delete</code>
List files and directories on the router.	<code>file list</code>
Rename files.	<code>file rename</code>
Display the contents of a file.	<code>file show</code>
List log files, display log file contents, and display information about users who have logged in to the router.	<code>show log</code>

.....

NOTE: See also the `monitor list`, `monitor start`, and `monitor stop` commands, which are documented in *Real-Time Router Monitoring Operational Mode Commands*.

For information about how to configure file parameters, see the Junos OS System Basics Configuration Guide.

For information about related tasks performed by network operations center (NOC) personnel, see the *Junos Baseline Network Operations Guide*.

.....

clear log

Syntax	<code>clear log <i>filename</i></code> <code><all></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Remove contents of a log file.
Options	<i>filename</i> —Name of the specific log file to delete. <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show log on page 1011
List of Sample Output	clear log on page 993
Output Fields	See file list for an explanation of output fields.

Sample Output

clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel      26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel      57 Sep 15 03:44 /var/log/sampled
total 1

```

file archive

Syntax	<code>file archive destination <i>destination</i> source <i>source</i> <compress></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
Options	<p>destination <i>destination</i>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none">• For archived files—The suffix .tar• For archived and compressed files—The suffix .tgz <p>source <i>source</i>—Source of the original file or files. Specify the source as a URL or filename.</p> <p>compress—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix .tgz.</p>
Required Privilege Level	maintenance
List of Sample Output	file archive (Multiple Files) on page 995 file archive (Single File) on page 995 file archive (with Compression) on page 995
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file archive (Multiple Files)

The following sample command archives all message files in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

file archive (Single File)

The following sample command archives one message file in the local directory **/var/log/messages** as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

file checksum md5

Syntax	<code>file checksum md5 <pathname> filename</code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Calculate the Message Digest 5 (MD5) checksum of a file.
Options	pathname —(Optional) Path to a filename. filename —Name of a local file for which to calculate the MD5 checksum.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i>• file checksum sha-256 on page 998• file checksum sha1 on page 997• op on page 1188
List of Sample Output	file checksum md5 on page 996
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file checksum md5 user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5

file checksum sha1

Syntax	<code>file checksum sha1 <pathname> filename</code>
Release Information	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
Options	<p>pathname—(Optional) Path to a filename.</p> <p>filename—Name of a local file for which to calculate the SHA-1 checksum.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i> • Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i> • Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i> • Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i> • file checksum md5 on page 996 • file checksum sha-256 on page 998 • op on page 1188
List of Sample Output	file checksum sha1 on page 997
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
file checksum sha1      user@host> file checksum sha1 /var/db/scripts/opscript.slax

SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

file checksum sha-256

Syntax	<code>file checksum sha-256 <pathname> filename</code>
Release Information	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
Options	pathname —(Optional) Path to a filename. filename —Name of a local file for which to calculate the SHA-256 checksum.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Configuring Checksum Hashes for a Commit Script in the <i>Junos OS Configuration and Operations Automation Guide</i>• Configuring Checksum Hashes for an Event Script in the <i>Junos OS Configuration and Operations Automation Guide</i>• Configuring Checksum Hashes for an Op Script in the <i>Junos OS Configuration and Operations Automation Guide</i>• Executing an Op Script from a Remote Site in the <i>Junos OS Configuration and Operations Automation Guide</i>• file checksum md5 on page 996• file checksum sha1 on page 997• op on page 1188
List of Sample Output	file checksum sha-256 on page 998
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
file checksum sha-256  user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

file compare

Syntax	<pre>file compare (files <i>filename filename</i>) <context unified> <ignore-white-space></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> • Default—In the first line of output, c means lines were changed between the two files, d means lines were deleted between the two files, and a means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (<) in front of output lines refers to the first file. A right angle bracket (>) in front of output lines refers to the second file. • Context—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-). • Unified—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.
Options	<p>files <i>filename</i>—Names of two local files to compare.</p> <p>context—(Optional) Display output in context format.</p> <p>ignore-white-space—(Optional) Ignore changes in the amount of white space.</p> <p>unified—(Optional) Display output in unified format.</p>
Required Privilege Level	none
List of Sample Output	<p>file compare files on page 1000</p> <p>file compare files context on page 1000</p> <p>file compare files unified on page 1000</p> <p>file compare files unified ignore-white-space on page 1000</p>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<          full-name "File 1";
---
>          full-name "File 2";

file copy

Syntax	<code>file copy <i>source destination</i></code> <code><source-address <i>address</i>></code>
Release Information	Command introduced before Junos OS Release 7.4. source-address option added in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
Description	Copy files from one place to another on the local router or switch or between the local router or switch and a remote system.
Options	source —Source of the original file. Specify this as a URL or filename. destination —Destination of the copied file. Specify this as a URL or filename. If you are copying a file to the current directory (your home directory on the local router or switch) and are not renaming the file, specify the destination with a period (.). source-address <i>address</i> —(Optional) Source IP host address. This option is useful for specifying the source address of a secure copy (scp) file transfer.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• Format for Specifying Filenames and URLs in Junos OS CLI Commands• Default Directories for Junos OS File Storage on the Router or Switch
List of Sample Output	file copy (A File from the Router or Switch to a PC) on page 1002 file copy (A Configuration File Between Routing Engines) on page 1002 file copy (A Log File Between Routing Engines) on page 1003 file copy (A File from the TX Matrix Plus Router to a T1600 or T4000 Router Connected to the TX Matrix Plus Router) on page 1003
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file copy (A File from the Router or Switch to a PC)	<pre>user@host> file copy /var/tmp/rpd.core.4 berry:/c/junipero/tmp ...transferring.file..... 0 KB 0.3 kB/s ETA: 00:00:00 100%</pre>
file copy (A Configuration File)	The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

Between Routing Engines)

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

file copy (A Log File Between Routing Engines)

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

file copy (A File from the TX Matrix Plus Router to a T1600 or T4000 Router Connected to the TX Matrix Plus Router)

The following sample command copies a text file from Routing Engine 1 on the switch-fabric chassis sfc0 to Routing Engine 1 on the line-card chassis lcc0:

```
user@host> file copy sfc0-re1:/tmp/sample.txt lcc0-re1:/var/tmp
```

file delete

Syntax	<code>file delete <i>filename</i></code> <code><purge></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Delete a file on the local router or switch.
Options	<i>filename</i> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued. <i>purge</i> —(Optional) Overwrite regular files before deleting them.
Required Privilege Level	maintenance
List of Sample Output	file delete on page 1004 file delete (Routing Matrix) on page 1004
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

file list

Syntax	file list <detail recursive> <filename>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display a list of files on the local router or switch.
Options	<p>none—Display a list of all files for the current directory.</p> <p>detail recursive—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p>filename—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
Additional Information	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the file list command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the file list command.
Required Privilege Level	maintenance
List of Sample Output	file list on page 1006 file list (Routing Matrix) on page 1006
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp

file rename

Syntax	<code>file rename <i>source destination</i></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Rename a file on the local router or switch.
Options	<i>destination</i> —New name for the file. <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
Required Privilege Level	maintenance
List of Sample Output	file rename on page 1008 file rename (Routing Matrix) on page 1008
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file rename

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

file rename (Routing Matrix)

The following example lists the files in **/var/tmp**, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz

user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd.rr
syslogd.core-tarball.0.tgz
```

file show

Syntax	<code>file show <i>filename</i></code> <code><encoding (base64 raw)></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display the contents of a file.
Options	<i>filename</i> —Name of a file. For a routing matrix, the filename must include the chassis information. encoding (base64 raw) —(Optional) Encode file contents with base64 encoding or show raw text.
Required Privilege Level	maintenance
List of Sample Output	file show on page 1010 file show (Routing Matrix) on page 1010
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.

    while ($j < $n)
        #printf "%x %x ",&$ch[$j],$ch[$j]
        printf "%x ",$ch[$j]
        set $j = $j + 1
        if (!($j % 16))
            printf "\n"
        end
    end
end
end
```

show log

Syntax	show log <filename user <username>>
Syntax (QFabric System)	show log <filename>
Syntax (TX Matrix Routers)	show log <all-lcc lcc <i>number</i> scc> <filename user <username>>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	List log files, display log file contents, or display information about users who have logged in to the router or switch.
Options	<p>none—List all log files.</p> <p><all-lcc lcc <i>number</i> scc>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).</p> <p>filename—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.</p> <p>user <username>—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include <i>username</i>, display logging information about the specified user.</p>
Required Privilege Level	trace
List of Sample Output	show log on page 1012 show log filename on page 1012 show log filename (QFabric System) on page 1012 show log user on page 1013

Packet Forwarding Engine Operational Mode Commands

Table 116 on page 1015 summarizes the command-line interface (CLI) commands you can use to perform and monitor Packet Forwarding Engine management functions. Commands are listed in alphabetical order.

Table 116: Packet Forwarding Engine Operational Mode Commands

Task	Command
Display Packet Forwarding Engine Compact Forwarding Engine Board (CFEB) status and statistics information.	<code>show pfe cfeb</code>
Display Packet Forwarding Engine Forwarding Engine Board (FEB) status and statistics information.	<code>show pfe feb</code>
Display Packet Forwarding Engine statistics for the specified Flexible PIC Concentrator (FPC).	<code>show pfe fpc</code>
(J Series router only) Display Packet Forwarding Engine forwarding process (fwdd) status and statistics information.	<code>show pfe fwdd</code>
(Routing matrix only) Display Packet Forwarding Engine information for the specified router (line-card chassis).	<code>show pfe lcc</code>
Display Packet Forwarding Engine next-hop information.	<code>show pfe next-hop</code>
(M320 and T320 routers, and T-640 only) Display Packet Forwarding Engine resource and L-chip SRAM memory usage statistics.	<code>show pfe resource usage memory</code>
Display the routes in the Packet Forwarding Engine forwarding table.	<code>show pfe route</code>
(M40 routers only) Display Packet Forwarding Engine System Control Board (SCB) status and statistics information.	<code>show pfe scb</code>
(M40e and M160 routers only) Display Packet Forwarding Engine Switching and Forwarding Module (SFM) status and statistics information.	<code>show pfe sfm</code>

Table 116: Packet Forwarding Engine Operational Mode Commands (*continued*)

Task	Command
(M20 routers only) Display Packet Forwarding Engine System and Switch Board (SSB) status and statistics information.	<code>show pfe ssb</code>
Display Packet Forwarding Engine direct memory access (DMA) statistics.	<code>show pfe statistics dma</code>
Display Packet Forwarding Engine error statistics.	<code>show pfe statistics error</code>
Display IPv4 Packet Forwarding Engine statistics.	<code>show pfe statistics ip</code>
Display Packet Forwarding Engine IPv6 statistics.	<code>show pfe statistics ip6</code>
Display Packet Forwarding Engine notification statistics.	<code>show pfe statistics notification</code>
Display Packet Forwarding Engine polled I/O (PIO) statistics.	<code>show pfe statistics pio</code>
Display Packet Forwarding Engine traffic statistics.	<code>show pfe statistics traffic</code>
Display Packet Forwarding Engine traffic statistics for Bidirectional Forwarding Detection (BFD).	<code>show pfe statistics traffic protocol bfd</code>
Display Packet Forwarding Engine traffic statistics for connectivity fault management (CFM).	<code>show pfe statistics traffic protocol cfm</code>
Display Packet Forwarding Engine traffic statistics for link fault management (LFM).	<code>show pfe statistics traffic protocol lfm</code>
Display Packet Forwarding Engine status information.	<code>show pfe terse</code>
Display Packet Forwarding Engine version information.	<code>show pfe version</code>

NOTE: For information about how to configure PFE parameters, see the Junos OS System Basics Configuration Guide.

show pfe cfep

Syntax	show pfe cfep
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M7i routers only) Display Packet Forwarding Engine Compact Forwarding Engine Board (CFEB) status and statistics information.
Options	This command has no options.
Required Privilege Level	admin
List of Sample Output	show pfe cfep on page 1019
Output Fields	Table 117 on page 1017 lists the output fields for the show pfe cfep command. Output fields are listed in the approximate order in which they appear.

Table 117: show pfe cfep Output Fields

Field Name	Field Description
CFEB status	<p>Status of CFEB:</p> <ul style="list-style-type: none"> Slot—CFEB slot number. State—Status of the CFEB: <ul style="list-style-type: none"> Online—CFEB is online and running. Offline—CFEB is powered down. Last State Change—Date and time the CFEB state last changed. Uptime (total)—How long the Routing Engine has been connected to the CFEB and, therefore, how long the Flexible PIC Concentrator (FPC) has been up and running. Failures—Number of PFE Peer detach failures. Pending—Number of messages waiting to be sent. Policer Drop Probability—Current policer drop probability. The default is high, and can be configured using the policer-drop-probability-low statement.
Peer message type receive qualifiers	<ul style="list-style-type: none"> Message Type—IPC Message Type. For example, interface and nexthop. Receive Qualifier – Message receive qualifier for a peer (non-None only): <ul style="list-style-type: none"> All Only this slot Selective slot

Table 117: show pfe cfeb Output Fields (*continued*)

Field Name	Field Description
PFE listener statistics	PFE listener statistics: <ul style="list-style-type: none"> • Open—Number of times a peer was opened. • Close—Number of times a peer was closed. • Sleep—Number of times a thread slept. • Wakeup—Number of times wakeup was issued. • Resync Request—Number of resync requests. • Resync Done—Number of successful resyncs. • Resync Fail—Number of failed resyncs. • Resync Time—Time the resync last happened.
PFE IPC statistics	<ul style="list-style-type: none"> • type—IPC Message Type. • TX Messages—Number of Tx messages. • RX Messages—Number of Rx messages.
PFE socket-buffer mbuf depth	<ul style="list-style-type: none"> • bucket—Bucket number. • count—Number of messages in the bucket.
PFE socket-buffer bytes pending transmit	<ul style="list-style-type: none"> • bucket—Bucket number. • count—Number of bytes pending transmit.

show pfe feb

Syntax	show pfe feb
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M5 and M10 routers only) Display Packet Forwarding Engine Forwarding Engine Board (FEB) status and statistics information.
Options	This command has no options.
Required Privilege Level	admin
List of Sample Output	show pfe feb on page 1024 show pfe feb on page 1026
Output Fields	Table 118 on page 1022 lists the output fields for the show pfe feb command. Output fields are listed in the approximate order in which they appear.

Table 118: show pfe feb Output Fields

Field Name	Field Description
FEB status	<p>Status of FEB:</p> <ul style="list-style-type: none"> Slot—FEB slot number. State—State of the FEB: <ul style="list-style-type: none"> Offline—FEB is powered down. Online—FEB is operational and running. Check—FEB is in alarmed state where the Switch Interface Board (SIB) plane is partially operational for the following reasons: <ul style="list-style-type: none"> FEB is not inserted properly. Two or more links between the FEB and Packet Forwarding Engine fail. Last State Change—Date and time the CFEB state last changed. Uptime (total)—How long the Routing Engine has been connected to the FEB and, therefore, how long the Flexible PIC Concentrator (FPC) has been up and running. Failures—Number of PFE Peer detach failures. Pending—Number of messages waiting to be sent. Policer Drop Probability—Current policer drop probability. The default is high, and can be configured using the policer-drop-probability-low statement.
Peer message type receive qualifiers	<ul style="list-style-type: none"> Message Type—IPC Message Type. For example, interface and nexthop. Receive Qualifier – Message receive qualifier for a peer (non-None only): <ul style="list-style-type: none"> All Only this slot Selective slot

Table 118: show pfe feb Output Fields (*continued*)

Field Name	Field Description
PFE listener statistics	PFE listener statistics: <ul style="list-style-type: none"> • Open—Number of times a peer was opened. • Close—Number of times a peer was closed. • Sleep—Number of times a thread slept. • Wakeup—Number of times wakeup was issued. • Resync Request—Number of resync requests. • Resync Done—Number of successful resyncs. • Resync Fail—Number of failed resyncs. • Resync Time—Time the resync last happened.
PFE IPC statistics	<ul style="list-style-type: none"> • type—IPC Message Type. • TX Messages—Number of Tx messages. • RX Messages—Number of Rx messages.
PFE socket-buffer mbuf depth	<ul style="list-style-type: none"> • bucket—Bucket number. • count—Number of messages in the bucket.
PFE socket-buffer bytes pending transmit	<ul style="list-style-type: none"> • bucket—Bucket number. • count—Number of bytes pending transmit.

show pfe fpc

Syntax	show pfe fpc <i>slot</i> <detail extensive>
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe fpc <lcc <i>number</i> >
Syntax (MX Series Router)	show pfe fpc <i>slot</i> <detail extensive> <all-members> <local> <member <i>member-id</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display Packet Forwarding Engine statistics for the specified Flexible PIC Concentrator (FPC).
Options	<p>slot—FPC slot number. Replace slot with a value from 0 through 2.</p> <p>detail extensive—(Optional) Display the specified level of detail.</p> <p>all-members—(MX Series routers only) (Optional) Display Packet Forwarding Engine statistics for the specified FPC in all members of the Virtual Chassis configuration.</p> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, lcc number represents the slot number of the router (or line-card chassis) that houses the FPC.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>local—(MX Series routers only) (Optional) Display Packet Forwarding Engine statistics for the specified FPC in the local Virtual Chassis member.</p> <p>member member-id—(MX Series routers only) (Optional) Display Packet Forwarding Engine statistics for the specified FPC in the specified member of the Virtual Chassis configuration. Replace member-id with a value of 0 or 1.</p>

Output Fields [Table 119 on page 1030](#) lists the output fields for the **show pfe fpc** command. Output fields are listed in the approximate order in which they appear.

Table 119: show pfe fpc Output Fields

Field Name	Field Description
FPC 1 status	<p>Status of FPC 1:</p> <ul style="list-style-type: none"> Slot—FPC slot number – 1. State—State of FPC1: <ul style="list-style-type: none"> Dead—Held in reset because of errors. Diag—Slot is being ignored while the FPC is running diagnostics. Dormant—Held in reset. Empty—No FPC is present. Online—FPC is online and running. Present—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either Hardware Not Supported or Hardware Not in Right Slot. The FPC is coming up but not yet online. Probed—Probe is complete; awaiting restart of the Packet Forwarding Engine (PFE). Probe-wait—Waiting to be probed. Last State Change—Date and time the FPC state last changed. Uptime—How long the Routing Engine has been connected to the FEB and, therefore, how long the Flexible PIC Concentrator (FPC) has been up and running. Failures—Number of PFE Peer detach failures. Pending—Number of messages waiting to be sent. Route Memory Enhanced—Reallocation of the jtree memory on the Packet Forwarding Engine to allocate more memory for routing tables. Can be configured with the route-memory-enhanced statement.
PFE listener statistics	<p>PFE listener statistics:</p> <ul style="list-style-type: none"> Open—Number of times a peer was opened. Close—Number of times a peer was closed. Sleep—Number of times a thread slept. Wakeup—Number of times wakeup was issued. Resync Request—Number of resync requests. Resync Done—Number of successful resyncs. Resync Fail—Number of failed resyncs. Resync Time—Time the resync last happened.
PFE IPC statistics	<ul style="list-style-type: none"> type—IPC Message Type. TX Messages—Number of Tx messages. RX Messages—Number of Rx messages.

Table 119: show pfe fpc Output Fields (*continued*)

Field Name	Field Description
GFPC 0 status	Status of GFPC 0: <ul style="list-style-type: none"> Slot—GFPC slot number – 0. State—State of GFPC. Last State Change—Date and time the GFPC state last changed.
Peer message type receive qualifiers [non-NONE(s) only]	<ul style="list-style-type: none"> IPC Msg Type—IPC Message Type. For example, interface, nexthop. Receive Qualifier—Message receive qualifier for a peer (non-NONE(s) only):
IFSTATE BITS SET	IFSTATE clients that have registered to receive the message types this slot is listening to.
PFE listener statistics	PFE listener statistics: <ul style="list-style-type: none"> Open—Number of times a peer was opened. Close—Number of times a peer was closed. Sleep—Number of times a thread slept. Wakeup—Number of times wakeup was issued. Resync Request—Number of resync requests. Resync Done—Number of successful resyncs. Resync Fail—Number of failed resyncs. Resync Time—Time the resync last happened.
PFE IPC statistics	<ul style="list-style-type: none"> type—IPC Message Type. TX Messages—Number of Tx messages. RX Messages—Number of Rx messages.
PFE socket-buffer mbuf depth	<ul style="list-style-type: none"> bucket—Bucket number. count—Number of messages in the bucket.
PFE socket-buffer bytes pending transmit	<ul style="list-style-type: none"> bucket—Bucket number. count—Number of bytes pending transmit.
GFPC 2 status	Status of GFPC 2: <ul style="list-style-type: none"> Slot—GFPC slot number – 2. State—State of GFPC. Last State Change—Date and time the GFPC state last changed. Route Memory Enhanced—Reallocation of the jtree memory on the Packet Forwarding Engine to allocate more memory for routing tables. Can be configured with the route-memory-enhanced statement.

Table 119: show pfe fpc Output Fields (*continued*)

Field Name	Field Description
XDPC status	<p>XDPC status:</p> <ul style="list-style-type: none">• Slot—Present or empty.• State—Online or offline.• Last State Change—Date and time the DPC state last changed.• Uptime (total)—Length of time the DPC has been online.• Failures—Number of DPC failures.• Pending—Number of messages waiting to be sent.• Route Memory Enhanced—Reallocation of the jtree memory on the Packet Forwarding Engine to allocate more memory for routing tables. Can be configured with the route-memory-enhanced statement.• Policer Drop Probability—Current policer drop probability. The default is high, and can be configured using the policer-drop-probability-low statement.

show pfe lcc

Syntax (TX Matrix and TX Matrix Plus Router) `show pfe lcc number`

Release Information Command introduced before Junos OS Release 7.4.

Description (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, display Packet Forwarding Engine status and statistics for the specified T640 router (or line-card chassis). On a TX Matrix Plus router, display Packet Forwarding Engine status and statistics for the specified router (or line-card chassis).

Options **lcc *number***—On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, the slot number of the router (or line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

show pfe next-hop

Syntax	show pfe next-hop <interface <i>interface-name</i> >
Syntax (TX Matrix and TX Matrix Plus Routers)	show pfe next-hop <fpc <i>slot</i> > <interface <i>interface-name</i> > <lcc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Display Packet Forwarding Engine next-hop information.
Options	<p>none—Display all Packet Forwarding Engine next-hop information.</p> <p>fpc <i>slot</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot. On a TX Matrix router, if you specify the number of a T640 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot</i> with a value from 0 through 7. Otherwise, replace <i>slot</i> with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot</i> with a value from 0 through 7. Otherwise, replace <i>slot</i> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show pfe next-hop fpc 1 lcc 1 user@host> show pfe next-hop fpc 9 </pre> <p>interface <i>interface-name</i>—(Optional) Display the Packet Forwarding Engine next-hop interface.</p> <p>lcc <i>number</i>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (or line-card chassis) that houses the FPC. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

show pfe route

Syntax	<pre>show pfe route <<inet6 ip iso> <prefix prefix> <table <table-name> <index index> <prefix prefix>>> <mpls> <summary></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show pfe route <<inet6 ip> <prefix prefix> <table <table-name> <index index> <prefix prefix>>> <mpls> <summary></pre>
Syntax (TX Matrix and TX Matrix Plus Routers)	<pre>show pfe route <fpc slot> <<inet6 ip iso> <prefix prefix> <table <table-name> <index index> <prefix prefix>>> <lcc number> <mpls> <summary></pre>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.

Description Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.

NOTE: The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the `show route forwarding table` command. For more information, see the Junos OS Operational Mode Commands.

Options **none**—Display all Packet Forwarding Engine forwarding table information.

fpc slot—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

index *index*—(Optional) Display table index.

inet6—(Optional) Display Packet Forwarding Engine IPv6 routes.

ip—(Optional) Display Packet Forwarding Engine IPv4 routes.

iso —(Optional) Display ISO version routing tables.

lcc *number*—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

mpls—(Optional) Display Packet Forwarding Engine MPLS information.

prefix *prefix*—(Optional) IPv4 or IPv6 prefix for which to show table entries.

summary—(Optional) Display summary of Packet Forwarding Engine information.

table <*table-name*>—(Optional) Display table information.

Required Privilege Level

show pfe statistics dma

Syntax	show pfe statistics dma
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe statistics dma <fpc slot> <lcc number>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display Packet Forwarding Engine direct memory access (DMA) statistics.
Options	<p>none—Display all Packet Forwarding Engine direct memory access statistics.</p> <p>fpc slot—(TX Matrix and TX Matrix Plus routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot.</p> <p>On a TX Matrix router, if you specify the number of a T640 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show pfe statistics dma fpc 1 lcc 1 user@host> show pfe statistics dma fpc 9 </pre> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display statistics for a specific router (or line-card chassis) that is connected to a TX Matrix router.</p> <p>Replace number with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

show pfe statistics error

Syntax	show pfe statistics error
Syntax (EX Series Switch)	show pfe statistics error <fpc slot>
Syntax (TX Matrix and TX Matrix Plus Routers)	show pfe statistics error <fpc slot> <lcc number>
Release Information	Command introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.2 for EX Series switches.
Description	Display Packet Forwarding Engine error statistics. For EX Series switches, the show pfe statistics error command is supported only on EX8200 switches.
Options	<p>none—Display all Packet Forwarding Engine error statistics.</p> <p>fpc slot—(TX Matrix and TX Matrix Plus routers, and EX Series switches only) (Optional) Display error statistics for a Flexible PIC Concentrator (FPC) slot. On a TX Matrix router, if you specify the number of a T640 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show pfe statistics error fpc 1 lcc 1 user@host> show pfe statistics error fpc 9 </pre> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display error statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix. On a TX Matrix Plus router, display error statistics for a specific router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace number with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

Output Fields [Table 120 on page 1080](#) lists the output fields for the **show pfe statistics error** command for EX8200 switches only. Output fields are listed in the approximate order in which they appear.

Table 120: show pfe statistics error Output Fields

Field Name	Field Description
Memory Type	Memory types for which parity and error correction code (ECC) errors are displayed: <ul style="list-style-type: none"> • Ingress DSU — Ingress data service unit (DSU) • Egress DSU — Egress DSU • CSU0 — Channel service unit (CSU) 0 • LPM0 — Longest prefix match (LPM) 0
Parity errors	Number of parity error packets for different types of memory.
ECC errors	Number of ECC errors for different types of memory.

show pfe statistics ip

Syntax	<code>show pfe statistics ip</code> <code><icmp options></code>
Syntax (TX Matrix and TX Matrix Plus Router)	<code>show pfe statistics ip</code> <code><fpc slot></code> <code><icmp options></code> <code><lcc number></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display IPv4 Packet Forwarding Engine statistics.
Options	<p>none—Display all IPv4 Packet Forward Engine statistics.</p> <p>fpc slot—(TX Matrix and TX Matrix Plus routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot. On a TX Matrix router, if you specify the number of a T640 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. For example, the following commands have the same result:</p> <pre>user@host> show pfe statistics ip fpc 1 lcc 1 user@host> show pfe statistics ip fpc 9</pre> <p>icmp—(Optional) Display Packet Forwarding Engine IP ICMP statistics.</p> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display error statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display error statistics for a specified router (or line-card chassis) that is connected to a TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none">• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>options—(Optional) Display Packet Forwarding Engine IP options statistics.</p>

Required Privilege Level	admin
List of Sample Output	show pfe statistics ip icmp on page 1086 show pfe statistics ip options on page 1086
Output Fields	Table 121 on page 1085 lists the output fields for the show pfe statistics ip command. Output fields are listed in the approximate order in which they appear.

Table 121: show pfe statistics ip Output Fields

Field Name	Field Description
ICMP Statistics	<p>ICMP statistics, including the following:</p> <ul style="list-style-type: none"> requests—Number of ICMP notifications sent to the PFE. If a throttler is configured, the number of notifications might not reflect all requests made. (See the throttled icmps field description.) network unreachable—When route lookups fail, ICMP packets are sent to the source. These packets are ICMP Type=Destination Unreachable (3) and ICMP Code=Network Unreachable (0). ttl expired—Number of notifications processed as a result of time-to-live (TTL) expiration packets. ttl captured—Number of TTL expired packets sent by PFE interfaces to the Routing Engine. redirects—Number of ICMP errors sent with Type=Redirect (5). mtu exceeded—Number of ICMP errors sent with Type=Source Quench (4). icmp/option handoffs—Number of packets that the PFE hardware requests the PFE software to process.
ICMP errors	<p>ICMP errors, including the following:</p> <ul style="list-style-type: none"> unknown unreachable—Unknown code (greater than 16) found for an unknown unreachable type ICMP error. unsupported ICMP type—Any ICMP type other than UNREACH, REDIRECT, TIME_EXCEED, and PARAM_PROB. unprocessed redirects—When trying to find the neighbor to send redirects to, the PFE could not find the next-hop information. invalid ICMP type—Any ICMP type other than UNREACH, REDIRECT, TIME_EXCEED, and PARAM_PROB. invalid protocol—An incorrect protocol was detected by the ICMP processor. bad input interface ifl—The PFE software cannot map the interface index supplied by the chips to a proper data structure in the microkernel. throttled icmps—Number of requests dropped because of rate limiting by the PFE. runs—Number of packets for which the IP header length is less than the minimum length that is supported.
ICMP Discards	<p>ICMP discard statistics, including the following:</p> <ul style="list-style-type: none"> multicasts—ICMP packets are not sent for link-layer multicast packets. These are counted as invalid source addresses (not a unicast address or all zeros). bad source addresses—ICMP packets were received from an invalid source address (not a unicast address or all zeros). bad dest addresses—ICMP packets were sent to an invalid destination address (not a unicast address or all zeros). IP fragments—ICMP responses are sent only for the first fragments. The rest do not receive a response. This is the count for ICMP requests that receive no response. ICMP errors—Number of ICMP error packets.

Sample Output

```
show pfe statistics ip icmp      user@host> show pfe statistics ip icmp
icmp                             ICMP Statistics:
                                0 requests
                                0 network unreachable
                                0 ttl expired
                                0 ttl captured
                                0 redirects
                                0 mtu exceeded
                                0 icmp/option handoffs
                                ICMP Errors:
                                0 unknown unreachable
                                0 unsupported ICMP type
                                0 unprocessed redirects
                                0 invalid ICMP type
                                0 invalid protocol
                                0 bad input interface
                                0 throttled icmps
                                0 runts
                                ICMP Discards:
                                0 multicasts
                                0 bad source addresses
                                0 bad dest addresses
                                0 IP fragments
                                0 ICMP errors

show pfe statistics ip options  user@host> show pfe statistics ip options
options                          IP Option Values:

                                0 bad option pointers
                                0 source route frames dropped
                                188 frames queued
                                1126 frames dropped
```

show pfe statistics ip6

Syntax	show pfe statistics ip6 <icmp>
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe statistics ip6 <fpc slot> <icmp> < lcc number>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display Packet Forwarding Engine IPv6 statistics.
Options	<p>none—Display all Packet Forwarding Engine IPv6 statistics.</p> <p>fpc slot—(TX Matrix and TX Matrix Plus router only) (Optional) Display statistics for a Flexible PIC Concentrator slot. On a TX Matrix router, if you specify the number of a T640 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of a T1600 router by using the lcc number option (the recommended method), replace slot with a value from 0 through 7. Otherwise, replace slot with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show pfe statistics ip6 fpc 1 lcc 1 user@host> show pfe statistics ip6 fpc 9 </pre> <p>icmp—(Optional) Display Packet Forwarding Engine IP ICMP statistics.</p> <p>lcc number—(TX Matrix and TX Matrix Plus router only) (Optional) On a TX Matrix router, display statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display statistics for a specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

show pfe statistics pio

Syntax	show pfe statistics pio
Syntax (TX Matrix Router)	show pfe statistics pio <fpc <i>slot</i> > < lcc <i>number</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display Packet Forwarding Engine polled I/O (PIO) statistics.
Options	<p>none—(TX Matrix routers only) Display statistics about the Packet Forwarding Engine polled I/O on the TX Matrix routers and its attached T640 routers.</p> <p>fpc <i>slot</i>—(TX Matrix routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot. If you specify the number of a T640 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot</i> with a value from 0 through 7. Otherwise, replace <i>slot</i> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show pfe statistics pio fpc 1 lcc 1 user@host> show pfe statistics pio fpc 9 </pre> <p>lcc <i>number</i>—(TX Matrix routers only) (Optional) Display statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. Replace <i>number</i> with a value from 0 through 3.</p>
Required Privilege Level	admin
List of Sample Output	show pfe statistics pio on page 1094 show pfe statistics pio lcc (Routing Matrix) on page 1094

Sample Output

```
show pfe statistics pio    user@host> show pfe statistics pio
PIO Statistics:
    8542732 PIO read requests

show pfe statistics traffic

Syntax	show pfe statistics traffic <fpc slot>
Syntax (EX Series Switches)	show pfe statistics traffic <voq <fpc slot>>
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe statistics traffic <fpc slot> < lcc number>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.2 for EX Series switches.
Description	Display Packet Forwarding Engine traffic statistics.
Options	<p>none—Display statistics about PFE traffic. On the TX Matrix router, display statistics about PFE traffic for all its attached T640 routers. On the TX Matrix Plus router, display statistics about PFE traffic for all its attached routers</p> <p>fpc slot—(T Series and M320 routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot. On a TX Matrix router, if you specify the number of a T640 router by using the lcc number option (the recommended method), replace <i>slot</i> with a value from 0 through 7. Otherwise, replace <i>slot</i> with a value from 0 through 31. On a TX Matrix Plus router, if you specify the number of a T1600 router by using the lcc number option (the recommended method), replace <i>slot</i> with a value from 0 through 7. Otherwise, replace <i>slot</i> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show pfe statistics traffic fpc 1 lcc 1 user@host> show pfe statistics traffic fpc 9 </pre> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display statistics for a specific router (or line-card chassis) that is connected to the TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

voq <fpc slot>—(EX8200 switches and EX8200 Virtual Chassis only) (Optional) Display statistics for virtual output queue (VOQ) drops for all FPC slots or for a particular FPC slot. See EX8208 Switch Hardware and CLI Terminology Mapping or EX8216 Switch Hardware and CLI Terminology Mapping.

Output Fields [Table 123 on page 1096](#) lists the output fields for the **show pfe statistics traffic** command. Output fields are listed in the approximate order in which they appear.

Table 123: show pfe statistics traffic Output Fields

Field Name	Field Description
Packet Forwarding Engine Traffic statistics	Information about Packet Forwarding Engine traffic: <ul style="list-style-type: none"> • Input Packets—Number and rate of input packets. • Output Packets—Number and rate of output packets.
Packet Forwarding Engine Local Traffic statistics	Information about Packet Forwarding Engine local traffic: <ul style="list-style-type: none"> • Local packets input—Number of local input packets. • Local packets output—Number of local output packets. • Software input high drops—Number of software input high-priority drops. • Software input medium drops—Number of software input medium-priority drops. • Software input low drops—Number of software input low-priority drops. • Software output drops—Number of software output drops. • Hardware input drops—Number of hardware input drops.

Table 123: show pfe statistics traffic Output Fields (*continued*)

Field Name	Field Description
Packet Forwarding Engine Local Protocol statistics	<p>Information about the Packet Forwarding Engine Local Protocol:</p> <ul style="list-style-type: none"> • HDLC keepalives—Number of HDLC keepalive packets. • ATM OAM—Number of Asynchronous Transfer Mode (ATM) Operation, Administration, and Maintenance (OAM) packets. • Frame Relay LMI—Number of Frame Relay Local Management Interface (LMI) packets. • PPP LCP/NCP—Number of Point-to-Point Protocol (PPP) Link Control Protocol (LCP) or Network Control Protocol (NCP) packets. • OSPF hello—Number of Open Shortest Path First (OSPF) hello packets. • OSPF3 hello—Number of Open Shortest Path First version 3 (OSPFv3) hello packets. • RSVP hello—Number of Reservation Setup Protocol (RSVP) hello packets. • LDP hello—Number of Label Distribution Protocol (LDP) hello packets. • BFD—Number of Bidirectional Forwarding Detection Protocol (BFD) hello packets. • IS-IS IIH—Number of Intermediate System-to-Intermediate System Hello (IIH) packets. • LACP—Number of Link Aggregation Control Protocol (LACP) packets. • ARP—Number of Address Resolution Protocol (ARP) packets. • ETHER OAM—Number of Ethernet OAM packets. • Unknown—Number of unknown packets not matching any of the packet types listed above.
Packet Forwarding Engine Hardware Discard statistics	<p>Information about Packet Forwarding Engine hardware discards:</p> <ul style="list-style-type: none"> • Timeout—Number of packets discarded because of timeouts. • Truncated key—Number of packets discarded because of truncated keys. • Bits to test—Number of bits to test. • Data error—Number of packets discarded because of data errors. • Stack underflow—Number of packets discarded because of stack underflows. • Stack overflow—Number of packets discarded because of stack overflows. • Normal discard—Number of packets discarded because of discard routes. Packets are dropped silently without being further processed by the host. Normal discards are reported when packets match a firewall filter term that has an action of discard or when the final result of the route look-up is a next hop of discard. • Extended discard—Number of packets discarded because of illegal next hops. Packets are dropped silently but are also sent to the Routing Engine for further processing. Extended discards are reported when packets match a firewall filter term that has an action of discard and an additional action that requires Routing Engine processing, such as log, count, sample, or syslog. • Invalid interface—Number of packets discarded because of invalid incoming interfaces. • Info cell drops—Number of information cell drops. • Fabric drops—Number of fabric drops.
VOQ unit	(EX8200 Switch and EX8200 Virtual Chassis) Information about VOQ. A Packet Forwarding Engine supports two VOQ counter sets.
Tail drops	(EX8200 Switch and EX8200 Virtual Chassis) Number of descriptors or buffers dropped by the VOQ to avoid tail-drop congestion.
Drops due to ECC error	(EX8200 Switch and EX8200 Virtual Chassis) Number of descriptors or buffers dropped by the VOQ because of error correction code (ECC) failure.

Table 123: show pfe statistics traffic Output Fields (*continued*)

Field Name	Field Description
Drops due to device disabled	(EX8200 Switch and EX8200 Virtual Chassis) Number of descriptors or buffers dropped by the VOQ because of device-enabled filtering.

Sample Output

**show pfe statistics
traffic**

```

user@host> show pfe statistics traffic
Packet Forwarding Engine traffic statistics:
  Input  packets:          102682          5 pps
  Output packets:          58033          4 pps
Packet Forwarding Engine local traffic statistics:
  Local packets input      :          44628
  Local packets output     :          46146
  Software input control plane drops :          0
  Software input high drops :          0
  Software input medium drops :          0
  Software input low drops  :          0
  Software output drops    :          0
  Hardware input drops     :          0
Packet Forwarding Engine local protocol statistics:
  HDLC keepalives         :          0
  ATM OAM                  :          0
  Frame Relay LMI         :          0
  PPP LCP/NCP             :          5597
  OSPF hello               :          3195
  OSPF3 hello              :          0
  RSVP hello               :          0
  LDP hello                :          7478
  BFD                      :          0
  IS-IS IIH                :          0
  LACP                     :          0
  ARP                      :          0
  ETHER OAM                :          0
  Unknown                  :          8
Packet Forwarding Engine hardware discard statistics:
  Timeout                  :          0
  Truncated key             :          0
  Bits to test              :          0
  Data error                :          0
  Stack underflow           :          0
  Stack overflow            :          0
  Normal discard            :          0
  Extended discard          :          0
  Invalid interface         :          0
  Info cell drops           :          39
  Fabric drops              :          0
Packet Forwarding Engine Input IPv4 Header Checksum Error and Output MTU Error
statistics:
  Input Checksum           :          0
  Output MTU                :          0

show pfe statistics traffic protocol bfd

Syntax	show pfe statistics traffic protocol bfd <fpc slot>
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe statistics traffic protocol bfd <fpc slot> <lcc number>
Release Information	Command introduced in Junos OS Release 8.4.
Description	Display Packet Forwarding Engine traffic protocol statistics for Bidirectional Forwarding Detection hello packets.
Options	<p>None—Display all Packet Forwarding Engine traffic protocol BFD statistics.</p> <p>fpc slot—(M320 and MX960 routers, and T Series routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot.</p> <p>user@host> show pfe statistics traffic protocol bfd fpc 1</p> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display statistics for a specific router (or line-card chassis) that is connected to a TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>user@host> show pfe statistics traffic protocol bfd fpc 1 lcc 1</p>
Required Privilege Level	admin
List of Sample Output	show pfe statistics traffic protocol bfd on page 1104
Output Fields	Table 124 on page 1103 lists the output fields for the show pfe statistics traffic protocol bfd command. Output fields are listed in the approximate order in which they appear.

Table 124: show pfe statistics traffic protocol bfd Output Fields

Field Name	Field Description
Packets with invalid interface	Number of packets discarded because of invalid interface.
Packets with invalid address family	Number of packets discarded because of invalid address family.
Packets with bad IP checksum	Number of packets discarded because of bad IP checksum.
Packets with bad IP options	Number of packets discarded because of bad IP options.
Packets with bad IP length	Number of packets discarded because of bad IP length.
Packets with bad udp checksum	Number of packets discarded because of bad UDP checksum.
Packets with bad udp length	Number of packets discarded because of bad UDP length.
Packets with bad udp ports	Number of packets discarded because of bad UDP ports.
Packets with no logical interface	(T640 and M20 routers only) Number of packets discarded because of nonavailability of logical interface.
Packets with prefix length mismatch	(T640 and M20 routers only) Number of packets discarded because of prefix length mismatch.
Packets received	Number of packets received.
Packets absorbed	Number of packets absorbed.
Packets failed to transmit	Number of packets discarded because of transmission failure.
Packets receive failures	Number of packet receive failures.
Packets allocation failures	Number of packet allocation failures.

Sample Output

**show pfe statistics
traffic protocol bfd**

user@host> **show pfe statistics traffic protocol bfd**

```
BFD protocol statistics:
Packets with invalid interface      : 0
Packets with invalid address family : 0
Packets with bad IP checksum        : 0
Packets with bad IP options         : 0
Packets with bad IP length          : 0
Packets with bad udp checksum       : 0
Packets with bad udp length         : 0
Packets with bad udp ports          : 0
Packets with no logical interface   : 0
Packets with prefix length mismatch : 0
Packets received                    : 0
Packets absorbed                    : 0
Packets failed to transmit          : 0
Packets receive failures            : 0
Packets allocation failures         : 0
```

show pfe statistics traffic protocol cfm

Syntax	show pfe statistics traffic protocol cfm <fpc slot >
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe statistics traffic protocol cfm <fpc slot > <lcc number>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Display Packet Forwarding Engine traffic protocol statistics for connectivity fault management (CFM).
Options	<p>None—Display all PFE traffic protocol CFM statistics.</p> <p>fpc slot—(M320 and MX960 routers, and T Series routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot.</p> <p>user@host> show pfe statistics traffic protocol cfm fpc 1</p> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix routers. On a TX Matrix Plus router, display statistics for a specific router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>user@host> show pfe statistics traffic protocol cfm fpc 1 lcc 1</p>
Required Privilege Level	admin
List of Sample Output	show pfe statistics traffic protocol cfm on page 1106
Output Fields	Table 125 on page 1106 lists the output fields for the show pfe statistics traffic protocol cfm command. Output fields are listed in the approximate order in which they appear.

Table 125: show pfe statistics traffic protocol cfm Output Fields

Field Name	Field Description
Packets transmitted	Number of packets transmitted.
Packets failed to transmit	Number of packets that were not transmitted.
Packets received	Number of packets received.
Packets sent to RE	Number of packets sent to the Routing Engine.
Packets absorbed	Number of packets absorbed.
Packets with invalid length	Number of packets with invalid length.
Packets with sequence number	Number of packets with a sequence number.
Packets dropped (Invalid)	Number of invalid packets dropped.

Sample Output

```
show pfe statistics  
traffic protocol cfm
```

```
user@host> show pfe statistics traffic protocol cfm
```

```
CFM protocol statistics:  
Packets transmitted      : 0  
Packets failed to transmit : 0  
Packets received         : 0  
Packets send to RE       : 0  
Packets absorbed         : 0  
Packets with invalid length : 0  
Packets with sequence number : 0  
Packets dropped (Invalid) : 0
```

show pfe statistics traffic protocol lfm

Syntax	show pfe statistics traffic protocol lfm <fpc slot >
Syntax (TX Matrix and TX Matrix Plus Router)	show pfe statistics traffic protocol lfm <fpc slot> <lcc number>
Release Information	Command introduced in Junos OS Release 8.5
Description	Display Packet Forwarding Engine traffic protocol link fault management (LFM) statistics.
Options	<p>none—Display all PFE traffic protocol LFM statistics.</p> <p>fpc slot—(M320 and MX960 routers, and T Series routers only) (Optional) Display statistics for a Flexible PIC Concentrator (FPC) slot.</p> <p>user@host> show pfe statistics traffic protocol lfm fpc 1</p> <p>lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display statistics for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display statistics for a specified router (or line-card chassis) that is connected to a TX Matrix Plus router. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> • 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix. • 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. • 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. • 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. <p>user@host> show pfe statistics traffic protocol lfm fpc 1 lcc 1</p>
Required Privilege Level	admin
List of Sample Output	show pfe statistics traffic protocol lfm on page 1108
Output Fields	Table 126 on page 1107 lists the output fields for the show pfe statistics traffic protocol lfm command. Output fields are listed in the approximate order in which they appear.

Table 126: show pfe statistics traffic protocol lfm Output Fields

Field Name	Field Description
Packets transmitted	Number of packets transmitted.

Table 126: show pfe statistics traffic protocol lfm Output Fields (continued)

Field Name	Field Description
Packets failed to transmit	Number of packets that were not transmitted.
Packets received	Number of packets received.
Packets send to RE	Number of packets sent to the Routing Engine.
Packets absorbed	Number of packets absorbed.
Packets dropped (Invalid)	Number of invalid packets dropped.

Sample Output

**show pfe statistics
traffic protocol lfm**

```
user@host> show pfe statistics traffic protocol lfm
```

```
user@host> show pfe statistics traffic protocol lfm
```

```
LFM protocol statistics:
  Packets transmitted      : 0
  Packets failed to transmit : 0
  Packets received         : 0
  Packets send to RE       : 0
  Packets absorbed         : 0
  Packets dropped (Invalid) : 0
```

show pfe resource usage memory

Syntax show pfe resource usage memory
<extensive | brief>
<fpc <0..n>>

Release Information Command introduced in Junos OS Release 9.3.

Description (M320 and T320 routers, and T-640 only) Display Packet Forwarding Engine resource and L-chip SRAM memory usage statistics.

NOTE: On M320 routers, this command is not supported for the following FPCs:

- M320 E3-FPC Type 1
- M320 E3-FPC Type 2
- M320 E3-FPC Type 3

Options **brief | extensive**—(Optional) Display the specified level of output.

fpc slot—(Optional) Display L-chip-based FPC SRAM usage statistics for a Flexible PIC Concentrator (FPC) slot.

user@host> show pfe resource usage memory fpc 1

Required Privilege Level admin

List of Sample Output [show pfe resource usage memory on page 1112](#)

Output Fields [Table 127 on page 1111](#) lists the output fields for the **show pfe resource usage memory** command. Output fields are listed in the approximate order in which they appear.

Table 127: show pfe resource usage memory Output Fields

Field Name	Field Description
Resource Name	Name of the resource, including: <ul style="list-style-type: none"> • FPC • Pfe
Free	Free L-chip SRAM memory.
Inuse	L-chip SRAM memory that is currently in use.
Total	Total of Free and Inuse memory.
%Use	Percentage of Total L-chip memory that is in use.

Sample Output

Remote System Access Operational Mode Commands

Table 128 on page 1115 summarizes the command-line interface (CLI) commands you can use to access remote systems. Commands are listed in alphabetical order.

Table 128: Remote System Access Operational Mode Commands

Task	Command
Open an SSH connection to a remote system.	<code>ssh</code>
Open a telnet session to a remote system.	<code>telnet</code>

NOTE: To configure SSH and Telnet parameters, see the Junos OS System Basics Configuration Guide.

ssh

Syntax	<code>ssh host</code> <code><bypass-routing></code> <code><inet inet6></code> <code><interface interface-name></code> <code><logical-system logical-system-name></code> <code><routing-instance routing-instance-name></code> <code><source address></code> <code><v1 v2></code>
Syntax (EX Series Switch and the QFX Series)	<code>ssh host</code> <code><bypass-routing></code> <code><inet inet6></code> <code><interface interface-name></code> <code><routing-instance routing-instance-name></code> <code><source address></code> <code><v1 v2></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
Description	Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the ssh command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons: <pre>ssh address 'cli-command1 ; cli-command2 '</pre>
Options	host —Name or address of the remote system. bypass-routing —(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it. inet inet6 —(Optional) Create an IPv4 or IPv6 connection, respectively. interface interface-name —(Optional) Interface name for the SSH session. (This option does not work when default-address-selection is configured at the [edit system] hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.) logical-system logical-system-name —(Optional) Name of a particular logical system for the SSH attempt. routing-instance routing-instance-name —(Optional) Name of the routing instance for the SSH attempt.

source address—(Optional) Source address of the SSH connection.

v1 | v2—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

Additional Information To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. For details, see the .

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

% ...
```

telnet

Syntax	<code>telnet <i>host</i></code> <code><8bit></code> <code><bypass-routing></code> <code><inet inet6></code> <code><interface <i>interface-name</i>></code> <code><logical-system <i>logical-system-name</i>></code> <code><no-resolve></code> <code><port <i>port-number</i>></code> <code><routing-instance <i>routing-instance-name</i>></code> <code><source <i>source-address</i>></code>
Syntax (EX Series Switches)	<code>telnet <i>host</i></code> <code><8bit></code> <code><bypass-routing></code> <code><inet inet6></code> <code><interface <i>interface-name</i>></code> <code><no-resolve></code> <code><port <i>port-number</i>></code> <code><routing-instance <i>routing-instance-name</i>></code> <code><source <i>source-address</i>></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Open a telnet session to a remote system. Type Ctrl+] to escape from the telnet session to the telnet command level, and then type quit to exit from telnet.
Options	<p><i>host</i>—Name or address of the remote system.</p> <p>8bit—(Optional) Use an 8-bit data path.</p> <p>bypass-routing—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p>inet inet6—(Optional) Open an IPv4 or IPv6 session, respectively.</p> <p>interface <i>interface-name</i>—(Optional) Interface name for the telnet session. (This option does not work when default-address-selection is configured at the [edit system] hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)</p> <p>logical-system <i>logical-system-name</i>—(Optional) Name of a particular logical system for the telnet attempt.</p> <p>no-resolve—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.</p> <p>port <i>port-number</i>—(Optional) Port number or service name on the remote system.</p>

routing-instance *routing-instance-name*—(Optional) Name of the routing instance for the telnet attempt.

source *source-address*—(Optional) Source address of the telnet connection.

Additional Information You can limit the number of times a user can attempt to enter a password while logging in through telnet. To specify the number of times a user can attempt to enter a password to log in through telnet, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the Junos OS System Basics Configuration Guide.

Simple Network Management Protocol Operational Mode Commands

Table 129 on page 1121 summarizes the command-line interface (CLI) commands that allow you to monitor the Simple Network Management Protocol (SNMP). Commands are listed in alphabetical order.

Table 129: SNMP Operational Commands

Task	Command
Clear history of SNMP.	<code>clear snmp history</code>
Clear SNMP statistics.	<code>clear snmp statistics</code>
Spoof (mimic) the behavior of an SNMP trap.	<code>request snmp spoof-trap</code>
Display information about health monitor alarms.	<code>show snmp health-monitor</code>
Display statistics about SNMP informs.	<code>show snmp inform-statistics</code>
Display local Management Information Base (MIB) object values through the command-line interface (CLI).	<code>show snmp mib</code>
Display information about Remote Monitoring (RMON) alarms and events.	<code>show snmp rmon</code>
Display statistics about SNMP packets sent and received.	<code>show snmp statistics</code>
Display SNMP version 3 statistics.	<code>show snmp v3</code>

NOTE: For information about how to configure SNMP, see the Network Management Configuration Guide.

clear snmp statistics

Syntax	clear snmp statistics
