## group (Dynamic IGMP Interface)

**Syntax** For group configuration with a source, use the following syntax:

```
group ip-address {
  source ip-address;
}
```

For group configuration without a source, use the following syntax:

```
group group;
```

**Hierarchy Level** [edit dynamic-profiles *profile-name* protocols **igmp interface** *interface-name* **static**],

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** When configuring with a source address, configure the IGMP multicast group address that receives data on an interface and a source address for certain packets. For configuration without a source address, configure only the IGMP multicast group address that receives data on an interface.

**Options** *ip-address*—Group IP address.

*group*—Name of group.

**NOTE:** You must specify a unique address for each group.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- For information about configuring static group membership, see “Enabling IGMP Static Group Membership” in the Multicast Protocols Configuration Guide

## group (Dynamic MLD Interface)

---

**Syntax**    `group multicast-group-address {  
              exclude;  
              group-count number;  
              group-increment increment;  
              source ip-address {  
                  source-count number;  
                  source-increment increment;  
              }  
          }`

**Hierarchy Level**    [edit dynamic-profiles *profile-name* protocols **mld interface** *interface-name* **static**]

**Release Information**    Statement introduced in Junos OS Release 10.1.

**Description**    The MLD multicast group address and (optionally) the source address for the multicast group being dynamically configured on an interface.

**Options**    *multicast-group-address*—Address of the group.

.....  
**NOTE:** You must specify a unique address for each group.  
.....

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**    • Enabling MLD Static Group Membership

## group (Static Subscribers)

**Syntax**

```
group group-name {
    access-profile profile-name;
    dynamic-profile profile-name {
        aggregate-clients (merge | replace);
    }
    authentication {

services [static-subscribers](#)],  
[edit routing-instances *routing-instances-name* system services [static-subscribers](#)],  
[edit system services [static-subscribers](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure a static subscriber group with values that override the values configured at the [\[edit system services static-subscribers\]](#) hierarchy level for subscribers outside the group. Includes the subscriber access and dynamic profiles, the authentication parameters that trigger the Access-Request message to AAA for static subscribers in the group, and the statically configured interfaces that form the group.

**NOTE:** The logical system and routing instance in which the group is configured must match the logical system and routing instance where the static interfaces are configured.

**Options** *group-name*—Name of a group that defines authentication parameters for static subscribers to override the global authentication configuration.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## group-profile (Group Profile)

---

**Syntax**    `group-profile profile-name {  
          l2tp {  
            interface-id interface-id;  
            lcp-renegotiation;  
            local-chap;  
            maximum-sessions-per-tunnel number;  
          }  
          ppp {  
            cell-overhead;  
            encapsulation-overhead bytes;  
            framed-pool pool-id;  
            idle-timeout seconds;  
            interface-id interface-id;  
            keepalive seconds;  
            ppp-options {  
              chap;  
              pap;  
            }  
            primary-dns primary-dns;  
            primary-wins primary-wins;  
            secondary-dns secondary-dns;  
            secondary-wins secondary-wins;  
          }  
        }`

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure the group profile.

.....  
**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.  
.....

**Options**    *profile-name*—Name assigned to the group profile.

The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of MLD memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>The immediate-leave setting enables host tracking, meaning that the device keeps track of the hosts that send join messages. This allows MLD to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending MLD group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the MLD leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both MLD version 1 and MLD version 2.</p> <div><p><b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the router only knows about the one interested host and does not know about the others.</p></div> |

## inet (Subscriber Secure Policy)

---

**Syntax**    `inet {  
              drop-policy rule-name {  
                  from {  
                      apply-groups group-name;  
                      apply-groups-except group-name;  
                      destination-address address;  
                      destination-port port-number;  
                      dscp dscp-value;  
                      protocol protocol;  
                      source-address address;  
                      source-port port-number;  
                  }  
              }  
          }`

**Hierarchy Level**    [edit services [radius-flow-tap policy policy-name](#)]

**Release Information**    Statement introduced in Junos OS Release 12.3.

**Description**    Specify the inet family for the policy that is applied to mirrored packets sent to a mediation device.

The remaining statements are explained separately.

**Required Privilege Level**    flow-tap—To view this statement in the configuration.  
                                  flow-tap-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | For dynamic VLAN interfaces, configure the IEEE 802.1Q TPID value to rewrite for the inner tag. All TPIDs you include in input and output VLAN maps must be among those you specify at the [edit <b>interfaces</b> <i>interface-name</i> <b>giether-options</b> <b>ethernet-switch-profile</b> <b>tag-protocol-id</b> <i>tpids</i> ] hierarchy level. |
| <b>Default</b>                  | If the <b>inner-tag-protocol-id</b> statement is not configured, the TPID value is 0x8100.                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <b>tpids</b> —TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal format.                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                               |

| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                 | <p><b>access</b>—Defines the connectivity role of the routing instance in a Layer 2 Wholesale network as an access routing instance. When defined for this role, the same process occurs as in a Layer 3 Wholesale network—when the first packet is received from a given client, authentication for the client initiates with an external entity (for example, RADIUS). If authentication is successful, a logical interface is created with the appropriate outer and inner VLAN tags for that client.</p> <p><b>nni</b>—Defines the connectivity role of the routing instance in a Layer 2 Wholesale network as a network to network interface (NNI) routing instance. When defined for this role, only outer VLAN tags are learned. In addition, when the NNI routing instance receives a response from the ISP, the packets are forwarded to the appropriate client, provided the packet has the same two tags that were verified during authentication.</p> |
| <div>  <p><b>NOTE:</b> If you connect an access node or MSAN device to a router participating in the Layer 2 Wholesale network in an NNI role, you must create a new routing instance of type <code>l2backhaul-vpn</code> with an instance role of type <code>access</code> for that connection.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## interface (DHCP Local Server)

**Syntax** interface *interface-name* {  
 exclude;  
 overrides {  
 client-discover-match <option60-and-option82>;  
 interface-client-limit *number*;  
 no-arp;  
 rapid-commit;  
 }  
 service-profile *dynamic-profile-name*;  
 trace;  
 upto *upto-interface-name*;  
 }

**Hierarchy Level** [edit system services dhcp-local-server *group group-name*],  
 [edit system services dhcp-local-server *dhcpv6 group group-name*]  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system  
 services *dhcp-local-server ...*],  
 [edit logical-systems *logical-system-name* system services *dhcp-local-server ...*],  
 [edit routing-instances *routing-instance-name* system services *dhcp-local-server ...*]

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Options **upto** and **exclude** introduced in Junos OS Release 9.1.

**Description** Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the **interface *interface-name*** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP relay agent.

**NOTE:** DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see the JUNOS® MX Series 3D Universal Edge Routers Solutions, Release 13.1.

**Options** **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

***interface-name***—Name of the interface. You can repeat this option multiple times.

***upto-interface-name***—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the ***upto-interface-name*** must be the same as the device name of the ***interface-name***.

The remaining statements are explained separately.

**Release Information** Statement introduced in Junos OS Release 8.3.  
 Options **upto** and **exclude** introduced in Junos OS Release 9.1.  
 Support at the [edit ... **dhcpv6**] hierarchy levels introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the **interface *interface-name*** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the [edit ... **dhcpv6**] hierarchy levels to configure DHCPv6 support.

EX Series switches do not support DHCPv6.

**NOTE:** DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For

additional information about how to configure IRB, see the JUNOS® MX Series 3D Universal Edge Routers Solutions, Release 13.1.

**Options** **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

**interface-name**—Name of the interface. You can repeat this option multiple times.

**overrides**—Override the specified default configuration settings for the interface. The **overrides** statement is described separately.

**upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interface (Dynamic IGMP)

---

**Syntax**    `interface interface-name {  
              accounting;  
              disable;  
              group-policy;  
              immediate-leave  
              no-accounting;  
              oif-map;  
              passive;  
              promiscuous-mode;  
              ssm-map ssm-map-name;  
              static {  
                  group group {  
                      source source;  
                  }  
              }  
              version version;  
          }`

**Hierarchy Level**    [edit dynamic-profiles *profile-name* protocols `igmp`]

**Release Information**    Statement introduced in Junos OS Release 9.2.

**Description**    Enable IGMP on an interface and configure interface-specific properties.

**Options**    *interface-name*—Variable for the interface. Specify the interface variable (\$junos-interface-name) to indicate that the dynamic profile chooses an interface for the accessing DHCP client.

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

## interface (Dynamic MLD)

---

**Syntax**    `interface`*interface-name* {  
          `disable`;  
          (`accounting` | `no-accounting`);  
          `group-policy`;  
          `immediate-leave`;  
          `oif-map`;  
          `passive`;  
          `ssm-map` *ssm-map-name*;  
          `static` {  
            `group` *mcast-group-address* {  
              `exclude`;  
              `group-count` *number*;  
              `group-increment` *increment*;  
              `source` *ip-address* {  
                `source-count` *number*;  
                `source-increment` *increment*;  
              }  
            }  
          }  
          `version` *version*;  
          }

**Hierarchy Level**    [edit dynamic-profiles *profile-name* protocols [mld](#)]

**Release Information**    Statement introduced in Junos OS Release 10.1.

**Description**    Enable MLD on a dynamic interface and configure interface-specific properties.

**Options**    *interface-name*—Variable for the interface. Specify the interface variable (\$junos-interface-name) to indicate that the dynamic profile chooses an interface for the accessing client.

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**    • Enabling MLD

## interface (Dynamic Router Advertisement)

---

**Syntax**    `interface interface-name {  
              current-hop-limit number;  
              default-lifetime seconds;  
              (managed-configuration | no-managed-configuration);  
              max-advertisement-interval seconds;  
              min-advertisement-interval seconds;  
              (other-stateful-configuration | no-other-stateful-configuration);  
              prefix prefix {  
                  (autonomous | no-autonomous);  
                  (on-link | no-on-link);  
                  preferred-lifetime seconds;  
                  valid-lifetime seconds;  
              }  
              reachable-time milliseconds;  
              retransmit-timer milliseconds;  
          }`

**Hierarchy Level**    [edit dynamic-profiles protocols router-advertisement]

**Release Information**    Statement introduced in Junos OS Release 10.1.

**Description**    Dynamically configure router advertisement properties on an interface. To dynamically configure interface properties, include the *\$junos-interface-name* dynamic variable for the interface name.

**Options**    *interface-name*—Name of an interface. Specify the *\$junos-interface-name* dynamic variable or the full, static interface name, including the physical and logical address components.

**NOTE:** Even though you can specify the static interface name when defining the interface, we recommend using dynamic variable when configuring this statement.

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**    • Example: Configuring IPv6 Interfaces and Enabling Neighbor Discovery

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a modified version of the interface name is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message. The interface name is modified by replacing the "/" character with the "-" character. For example, ge-0/1/2.50 is converted to ge-0-1-2.50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>         | Set the maximum number of DHCP subscribers per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Set the maximum number of DHCP (or DHCPv6) subscribers per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## interface-set (Dynamic VLAN Interface Sets Association)

```
Syntax  interface-set interface-set-name {
        interface interface-name {
            unit logical-unit-number {
                advisory-options {
                    downstream-rate rate;
                    upstream-rate rate;
                }
            }
        }
    }
```

**Hierarchy Level** [edit dynamic-profiles *profile-name* [interfaces](#)]

**Release Information** Statement introduced in Junos OS Release 12.2.

**Description** For MX Series routers with MPC/MIC modules that face the access side of the network, associate an agent circuit identifier (ACI) interface set with a dynamic VLAN subscriber interface for DHCP or PPPoE subscribers. To associate an ACI interface set with a dynamic subscriber interface, you must include the **interface-set** stanza in the dynamic profile that defines the logical subscriber interface.

An ACI interface set is a logical collection of subscriber interfaces that originate at the same household or on the same access-loop port.

**Options**

- interface-set-name*—Name of the ACI interface set, which is represented in a dynamic profile for a subscriber interface by the Junos OS predefined variable `$junos-interface-set-name`.

The remaining statements are explained separately.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

| <b>Syntax</b>              | <pre>interface-traceoptions {<br/>    file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i> &gt; &lt;size <i>maximum-file-size</i>&gt;<br/>    &lt;world-readable   no-world-readable&gt;;<br/>    flag <i>flag</i>;<br/>    level (all   error   info   notice   verbose   warning);<br/>    no-remote-trace;<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Hierarchy Level</b>     | [edit system processes dhcp-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | <p>Configure extended DHCP tracing operations that can be enabled on a specific interface or group of interfaces.</p> <p>Replaces deprecated <b>interface-traceoptions</b> statements at the [edit forwarding-options dhcp-relay] and [edit system services dhcp-local-server] hierarchy levels.</p> <p>To enable the tracing operation on the specific interfaces, you use the <b>interface <i>interface-name</i> trace</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all events</li><li>• <b>packet</b>—Trace packet and option decoding operations</li><li>• <b>state</b>—Trace changes in state</li></ul> <p><b>level</b>—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Match messages of all levels.</li><li>• <b>error</b>—Match error messages.</li><li>• <b>info</b>—Match informational messages.</li><li>• <b>notice</b>—Match notice messages about conditions requiring special handling.</li></ul> |

- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.

- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

## interfaces (Subscriber Secure Policy)

**Syntax** `interfaces interface-name;`

**Hierarchy Level** [edit services [radius-flow-tap](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Specify tunnel interfaces that are used to send mirrored packets to a mediation device.

**Options** *interface-name*—Name of the interface.

**Required Privilege Level** flow-tap—To view this statement in the configuration.  
flow-tap-control—To add this statement to the configuration.

## interfaces (ANCP)

---

**Syntax**    interfaces {  
              **interface-set** *interface-set-name* {  
                  **access-identifier** *identifier-string*;  
                  **neighbor** *ip-address*;  
                  **underlying-interface** *underlying-interface-name*;  
              }  
              **interface-name** {  
                  **access-identifier** *identifier-string*  
                  **neighbor** *ip-address*;  
              }  
          }

**Hierarchy Level**    [edit protocols **ancp**]

**Release Information**    Statement introduced in Junos OS Release 9.4.

**Description**    Identify the subscribers whose traffic is reported and shaped by ANCP.

**Options**    **interface-name**—Name of a logical interface supporting a single VLAN that carries traffic to the subscriber identified by the access-loop circuit identifier.

The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

## interfaces (Dynamic CoS Definition)

```
Syntax  interfaces {
        interface-name {
            unit logical-unit-number {
                classifiers {
                    dscp (classifier-name | default);
                    dscp-ipv6 (classifier-name | default);
                    ieee-802.1 (classifier-name | default) vlan-tag (inner | outer)
                    inet-precedence (classifier-name | default);
                }
                output-traffic-control-profile (profile-name | $junos-cos-traffic-control-profile);
                rewrite-rules {
                    dscp (rewrite-name | default);
                    dscp-ipv6 (rewrite-name | default);
                    ieee-802.1 (rewrite-name | default) vlan-tag (outer | outer-and-inner);
                    inet-precedence (rewrite-name | default);
                }
            }
        }
    }
```

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name* [class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure interface-specific CoS properties for incoming packets.

**Options** *interface-name*—Either the specific name of the interface you want to assign to the dynamic profile or the interface variable (\$junos-interface-*ifd-name*). The interface variable is dynamically replaced with the interface the client accesses when connecting to the router.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Define interfaces for dynamic profiles.

**Options** *interface-name*—The interface variable (`$junos-interface-ifd-name`). The interface variable is dynamically replaced with the interface the DHCP client accesses when connecting to the router.

**NOTE:** Though we do not recommend it, you can also enter the specific name of the interface you want to assign to the dynamic profile.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the Unisphere-IPv4-release-control VSA in RADIUS messages. When enabled, the BNG includes Unisphere-lpv4-release-control VSA in the Access-Request that is sent during on-demand IP address allocation and in the immediate Interim-Accounting messages that are sent to report an address change. Disabled by default, there is no effect when on-demand IP address allocation or deallocation is not configured. An change takes effect immediately. It is optional to specify the message, but if specified, the message is inserted into Unisphere-lpv4-release-control VSA. Otherwise, a default value (NO MESSAGE) is be inserted into the VSA. |

| <b>Description</b>              | Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.                                       |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                           |

## ip-reassembly (L2TP)

---

**Syntax**    `ip-reassembly {  
                  service-set service-set-name;  
                  }`

**Hierarchy Level**    [edit services [l2tp](#)]

**Release Information**    Statement introduced in Junos OS Release 13.1.

**Description**    Associate the reassembly service-set with the L2TP service.

**NOTE:** The service set must be defined at the [edit services] hierarchy level.

**Options**    `service-set service-set-name`—Identifies the service set to be associated with the L2TP service.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

**Related Documentation**

- [IP Packet Fragment Reassembly for L2TP Overview on page 369](#)
- [Configuring IP Inline Reassembly for L2TP on page 388](#)

## ip-reassembly

---

**Syntax**    `ip-reassembly {  
              profile profile-name  
              rule rule-name{  
                  match-direction direction  
              };  
          }`

**Hierarchy Level**    [edit services]

**Release Information**    Statement introduced in Junos OS Release 13.1.

**Description**    Configure the IP reassembly parameters to be applied to the L2TP server.

.....  
**NOTE:** Inline IP reassembly configuration does not require you to configure the **profile** statement. The **profile** configuration is used when IP reassembly is configured on services PICs.  
.....

**Options**    **profile *profile-name***—Name of the IP reassembly profile.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Related Documentation**

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:</p> <ul style="list-style-type: none"><li>• Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.</li><li>• Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.</li></ul> |
| <b>Default</b>                  | The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | Configure the authentication key for the security association, in either HEX or ASCII format. The resulting 128-bit key is specified as a hexadecimal number with each character in the range 0x0–0xF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Configure the L2TP network server (LNS) so it renegotiates the link control protocol (LCP) with the PPP client. When LCP renegotiation is disabled, LNS uses the pre-negotiated LCP parameters between the L2TP access concentrator (LAC) and PPP client to set up the session. When LCP renegotiation is enabled, authentication is also renegotiated. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | Specify that the logical system name be concatenated with the username during the subscriber authentication process. No logical system name is concatenated if the configuration is in the default logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that the name of the logical system is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Specify a loss priority to which to apply a drop profile in a dynamic profile. The drop profile map sets the drop profile for a specific PLP and protocol type. The inputs for the map are the PLP designation and the protocol type. The output is the drop profile.                                                                                                               |
| <b>Options</b>                  | <p><b>any</b>—The drop profile applies to packets with any PLP.</p> <p><b>high</b>—The drop profile applies to packets with high PLP.</p> <p><b>medium-high</b>—The drop profile applies to packets with medium-high PLP.</p> <p><b>medium-low</b>—The drop profile applies to packets with medium-low PLP.</p> <p><b>low</b>—The drop profile applies to packets with low PLP.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.                                                                                                                                                                                                                                            |
| <b>Description</b>              | Dynamically configure the MAC address variable for an access-internal route for unnumbered interfaces such as DHCP subscriber interfaces.                                                                                                                                                |
| <b>Options</b>                  | <i>address</i> —Either the specific MAC address you want to assign to the access-internal route or the MAC address variable ( <code>\$junos-subscriber-mac-address</code> ). The MAC address variable is dynamically replaced with the value supplied by DHCP when a subscriber logs in. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                      |

## map (Domain Map)

**Syntax**

```
map domain-map-name {
    aaa-logical-system logical-system-name {
        aaa-routing-instance routing-instance-name;
    }
    aaa-routing-instance routing-instance-name;
    access-profile profile-name;
    address-pool pool-name;
    dynamic-profile profile-name;
    padn destination-address {
        mask destination-mask;
        metric route-metric;
    }
    strip-domain;
    target-logical-system logical-system-name {
        target-routing-instance routing-instance-name;
    }
    target-routing-instance routing-instance-name;
    tunnel-profile profile-name;
}
```

**Hierarchy Level** [edit access [domain](#)]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Specify the domain map to use to map options and parameters to subscriber sessions based on the subscriber domain.

**Options** *domain-map-name*—Name of the domain map. The name is the same as the subscriber domain to which it will apply. For example, for the username `user1@xyz.com`, the domain map name is `xyz.com`.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.</p> <p>The router uses the <b>max-sessions</b> value for a PPPoE service name table entry in conjunction with the <b>max-sessions</b> value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.</p> |
| <b>Options</b>                  | <p><b>number</b>—Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.</p> <p>For information about scaling values for PPPoE interfaces, access the <i>Subscriber Management Scaling Values (XLS)</i> spreadsheet from the Downloads box on the <i>Junos OS Subscriber Management</i> pathway page for the current release.</p>                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the <b>max-sessions</b> statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.</p>                                                                                                                                                                                                            |
| <b>Default</b>                  | If you do not include the <b>max-sessions-vsa-ignore</b> statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the <b>max-sessions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the <a href="#">transmit-interval</a> <a href="#">minimal-interval</a> and <a href="#">minimum-receive-interval</a> statements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## mld (Dynamic Profiles)

---

**Syntax**    mld {  
              interface *interface-name* {  
                  disable;  
                  (accounting | no-accounting);  
                  group-policy;  
                  immediate-leave;  
                  oif-map;  
                  passive;  
                  ssm-map *ssm-map-name*;  
                  static {  
                      group *mcast-group-address* {  
                          exclude;  
                          group-count *number*;  
                          group-increment *increment*;  
                          source *ip-address* {  
                              source-count *number*;  
                              source-increment *increment*;  
                          }  
                      }  
                  }  
                  version *version*;  
              }  
          }

**Hierarchy Level**    [edit dynamic-profiles *profile-name* protocols]

**Release Information**    Statement introduced in Junos OS Release 10.1.

**Description**    Configure interface-specific MLD values on dynamic interfaces.

**Options**    The statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

**Related Documentation**    • Enabling MLD

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Check whether the packet has a source address with a corresponding prefix in the routing table. If a corresponding prefix is not found, unicast reverse path forwarding (RPF) loose mode does not accept the packet. Unlike strict mode, loose mode does not check whether the interface expects to receive a packet with a specific source address prefix. |
| <b>Default</b>                  | If you do not include this statement, unicast RPF is in strict mode.                                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                     |

## multicast (Dynamic Routing Options)

**Syntax**    multicast {  
                   interface *interface-name* {  
                     no-qos-adjust;  
                   }  
           }

**Hierarchy Level**    [edit dynamic-profiles *profile-name* **routing-options**],  
                           [edit dynamic-profiles *profile-name* routing-instances *routing-instance-name* **routing-options**]

**NOTE:** You cannot apply a scope policy to a specific routing instance. That is, all scoping policies are applied to all routing instances. However, the **scope** statement does apply individually to a specific routing instance.

**Release Information**    Statement introduced in Junos OS Release 9.6.

**Description**            Dynamically configure interface-specific multicast routing options properties.  
                               The remaining statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                       routing-control—To add this statement to the configuration.

**Related Documentation**    • Example: Configuring the Multicast Forwarding Cache

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify the character that the router uses as a separator between the concatenated values in the NAS-Port-ID string. The router uses the delimiter when you configure more than one value in the <b>nas-port-id-format</b> statement.                                                                                       |
| <b>Default</b>                  | The hash (#) character.                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <b><i>delimiter-character</i></b> —Character used for the delimiter.                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                             |

## nas-port-options (RADIUS Options)

**Syntax** `nas-port-options nas-port-options-name {  
     nas-port-extended-format {  
         adapter-width width;  
         ae-width width;  
         port-width width;  
         slot-width width;  
         stacked;  
         stacked-vlan-width width;  
         vlan-width width;  
     }  
     nas-port-type port-type;  
     stacked-vlan-ranges (any | low-outer-tag–high-outer-tag),any;  
     vlan-ranges (any | low-tag–high-tag);  
 }`

**Hierarchy Level** [edit interfaces *interface-name* *radius-options*]

**Description** Create a NAS-Port options definition to configure the NAS-Port-Type (61) RADIUS IETF attribute, and an extended format for the NAS-Port (5) RADIUS IETF attribute, on a per-physical interface, per-VLAN, or per-stacked VLAN (S-VLAN) basis. Each NAS-Port options definition includes the NAS-Port extended format, the NAS-Port-Type, and either the VLAN range of subscribers or the S-VLAN range of subscribers to which the definition applies.

**NOTE:** You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

**Options** *nas-port-options-name*—Name of the NAS-Port options definition.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## nas-port-type (Subscriber Management)

---

**Syntax**    `nas-port-type {  
              ethernet {  
                  port-type;  
              }  
          }`

**Hierarchy Level**    [edit access profile *profile-name* radius [options](#)]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Specify the port type used to authenticate subscribers. The router includes the port type in RADIUS attribute 61 (NAS-Port-Type attribute).

**NOTE:** This statement is ignored if the [ethernet-port-type-virtual](#) statement is included in the same access profile.

**Default**    The router uses a port type of **ethernet**.

**Options**    **port-type**—One of the following port types:

- **value**—A value from 0-65535
- **adsl-cap**—Asymmetric DSL, carrierless amplitude phase (CAP) modulation
- **adsl-dmt**—Asymmetric DSL, discrete multitone (DMT)
- **async**—Asynchronous
- **cable**—Cable
- **ethernet**—Ethernet

## neighbor (Associate with ANCP Access Identifier)

---

**Syntax** neighbor *ip-address*;

**Hierarchy Level** [edit protocols ancp [interfaces](#) *interface-name*],  
[edit protocols ancp interfaces [interface-set](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Associate an ANCP neighbor with the access-loop circuit identifier (ACI) configured for the interface or interface set.

**Options** *ip-address*—IP address of the ANCP neighbor.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation** [• Configuring ANCP on page 1274](#)

## network-element (Diameter Base Protocol)

---

**Syntax**    `network-element element-name {  
                  forwarding {  
                    route dne-route-name {  
                      destination realm realm-name <host hostname> ;  
                      function function-name <partition partition-name>;  
                      metric route-metric;  
                    }  
                  }  
                  function function-name;  
                  peer peer-name {  
                    priority priority-number;  
                  }  
                }`

**Hierarchy Level**    [edit [diameter](#)]

**Release Information**    Statement introduced in Junos OS Release 9.6.

**Description**    Specify the transport layer Diameter configuration. The Diameter network element includes a list of routes reachable through the Diameter instance, associated functions, and prioritized Diameter peers.

**Options**    *element-name*—Name of the network element.  
  
The remaining statements are explained separately.

**Required Privilege**    admin—To view this statement in the configuration.  
**Level**    admin-control—To add this statement to the configuration.

| Description              | Specify interface names or a service interface pool for the forwarding next-hop service set. You cannot specify both a service interface pool and an inside or outside interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options                  | <p><b>inside-service-interface <i>interface-name.unit-number</i></b>—Name and logical unit number of the service interface associated with the service set applied inside the network.</p> <p><b>outside-service-interface <i>interface-name.unit-number</i></b>—Name and logical unit number of the service interface associated with the service set applied outside the network.</p> <p><b>outside-service-interface-type <i>interface-type</i></b>—Identifies the interface type of the service interface associated with the service set applied outside the network. For inline IP reassembly, set the interface type to local.</p> <p><b>service-interface-pool <i>name</i></b>—Name of the pool of logical interfaces configured at the [edit services service-interface-pools pool <i>pool-name</i>] hierarchy level. You can configure a service interface pool only if the service set has a PGCP rule configured. The service set cannot contain any other type of rule.</p> |
|                          | <div><p><b>NOTE:</b> <b>service-interface-pool</b> is not applicable for IP reassembly configuration on L2TP.</p></div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Usage Guidelines         | See Configuring Service Sets to be Applied to Services Interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | Explicitly disable automatic binding of received DHCP request messages that have no entry in the database ( <i>stray</i> requests). Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** Beginning with Junos OS Release 10.4, automatic binding of stray requests is enabled by default. In Junos OS Release 10.3 and earlier releases, automatic binding of stray requests is disabled by default.

| <b>Description</b>              | On MX Series routers with MPC/MIC interfaces, enable propagation of the Ethernet IEEE 802.1ag Operation, Administration, and Maintenance (OAM) state of a static single-tagged service VLAN (S-VLAN) logical interface to the dynamic or static double-tagged customer VLAN (C-VLAN) logical interface and associated subscriber interfaces configured on the S-VLAN. The static S-VLAN logical interface must be configured with Ethernet OAM connectivity fault management (CFM) on a Gigabit Ethernet, 10-Gigabit Ethernet, or aggregated Ethernet physical interface. The C-VLAN logical interface must have the same S-VLAN (outer) tag as the S-VLAN logical interface. |

| <b>Description</b>              | Allocates and de-allocates an IPv4 address after initial PPP authentication for a subscriber who does not have an existing IPv4 address and can be configured at either the interface level or at the system level. Disabled by default. When configured at the interface level, dynamic profile changes take effect only for any new subscriber logins. Changes for static PPP IFLs logs out the subscriber. When configured at the system level, globally enables an on-demand-ip-address for PPP subscribers. If configured at both the interface level and the system level, the system level configuration takes precedence and changes take effect only for new subscriber logins. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Specify the option 82 that is concatenated with the username during the subscriber authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Specify a list of match criteria used to determine which named address range in the address-assignment pool to use. The extended DHCP local server matches this information to the match criteria specified in the client PDUs. For example, for option 82 match criteria, the server matches the option 82 value in the user PDU to the specified option 82 string and uses the named range associated with the string.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | <p>Configure the Password Authentication Protocol (PAP). Use PAP authentication as a means to provide a simple method for the peer to establish its identity using a two-way handshake. This is done only upon initial link establishment.</p> <p>After the link is established, an ID and password pair is repeatedly sent by the peer to the authenticator until authentication is acknowledged or the connection is terminated.</p> <div><p><b>BEST PRACTICE:</b> On inline service (si) interfaces for L2TP, only the <b>pap</b> statement itself is typically used for subscriber management. We recommend that you leave the subordinate statements at their default values.</p></div> |
|                                 | <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Specify the password that is sent to AAA for user login for all static subscribers on interfaces configured at the <b>[edit system services static-subscribers interface]</b> hierarchy level, or for the subscribers in a specified group. The group version of the statement takes precedence over the global version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>password-string</b>—String that defines the password.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | For a two-rate three-color policer, configure the peak burst size (PBS) as a number of bytes. The PBS defines the maximum number of bytes of unused peak bandwidth capacity that can be accumulated. The accumulated bandwidth allows for moderate periods of bursting traffic that exceeds the peak information rate (PIR) and the committed burst size (CBS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                 | <div> <b>NOTE:</b> When you include the <code>peak-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>peak-information-rate</code> statements at the same hierarchy level.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                 | <p>Two-rate three-color policers use a <i>dual-rate dual token bucket algorithm</i> to measure traffic against two rate limits.</p> <ul style="list-style-type: none"><li>• A traffic flow is categorized green if it conforms to both the committed information rate (CIR) and the CBS-bounded accumulation of available committed bandwidth capacity.</li><li>• A traffic flow is categorized yellow if exceeds the CIR and CBS but conforms to the PIR. Packets in a yellow flow are marked with <b>medium-high</b> packet loss priority (PLP) and then passed through the interface.</li><li>• A traffic flow is categorized red if exceeds the PIR and the PBS-bounded accumulation of available peak bandwidth capacity. Packets in a red traffic flow are marked with <b>high</b> PLP and then either passed through the interface or optionally discarded.</li></ul> |
| <b>Options</b>                  | <b>bytes</b> —Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).<br><b>Range:</b> 1500 through 100,000,000,000 bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Configure an aggregate policer for a physical interface.</p> <p>A physical interface policer can be a two-color or three-color policer. When you apply physical interface policer, to different protocol families on the same logical interface, the protocol families share the same policer instance. This means that rate limiting is performed aggregately for the protocol families for which the policer is applied. This feature enables you to use a single policer instance to perform aggregate policing for different protocol families on the same physical interface. If you want a policer instance to be associated with a protocol family, the corresponding physical interface filter needs to be applied to that protocol family. The policer is not automatically applied to all protocol families configured on the physical interface.</p> <p>In contrast, with logical interface policers there are multiple separate policer instances.</p>                                                                                                  |

| Description         | Configure policer rate limits and actions. When included at the [edit <a href="#">firewall</a> ] hierarchy level, the <b>policer</b> statement creates a template, and you do not have to configure a policer individually for every firewall filter or interface. To activate a policer, you must include the <b>policer-action</b> modifier in the <b>then</b> statement in a firewall filter term or on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Options             | <p><b><i>policer-action</i></b>—One or more actions to take:</p> <ul style="list-style-type: none"><li>• <b>discard</b>—Discard traffic that exceeds the rate limits.</li><li>• <b>forwarding-class <i>class-name</i></b>—Specify the particular forwarding class.</li><li>• <b>loss-priority</b>—Set the packet loss priority (PLP) to <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, or <b>high</b>.</li><li>• <b>out-of-profile</b>—On J Series routers with strict priority queuing, prevent starvation of other queues by rate limiting the data stream entering the strict priority queue, marking the packets that exceed the rate limit as out-of-profile, and dropping the out-of-profile packets if the physical interface is congested.</li></ul> <p><b><i>policer-name</i></b>—Name that identifies the policer. The name can contain letters, numbers, and hyphens (-), and can be up to 255 characters long. To include spaces in the</p> |

name, enclose it in quotation marks (" "). Policer names cannot begin with an underscore in the form `__*`.

**then**—Actions to take on matching packets.

The remaining statements are explained separately.

                }  
            }  
        }  
    }
```

**Hierarchy Level** [edit services [radius-flow-tap](#)]

**Release Information** Statement introduced in Junos OS Release 12.3.

**Description** Specify the policy that is applied to mirrored packets sent to a mediation device.

**Options** *policy-name*—Name of the policy from which to drop traffic.

The remaining statements are explained separately.

**Required Privilege** flow-tap—To view this statement in the configuration.

**Level** flow-tap-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit **dynamic-profiles** *profile-name* **interfaces**]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Configure the dynamic PPPoE logical interface in a dynamic profile. When the router creates a dynamic PPPoE logical interface on an underlying Ethernet interface configured with PPPoE (**ppp-over-ether**) encapsulation, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

The remaining statements are explained separately.

## pppoe-underlying-options (Dynamic VLAN Interface Sets)

---

**Syntax**    pppoe-underlying-options {  
                  max-sessions number;  
                  }

**Hierarchy Level**    [edit dynamic-profiles *profile-name* interfaces **interface-set** "\$junos-interface-set-name"]

**Release Information**    Statement introduced in Junos OS Release 12.2.

**Description**    Configure PPPoE-specific interface properties in the dynamic profile that defines the agent circuit identifier (ACI) interface set. An ACI interface set is a logical collection of subscriber interfaces that originate at the same household or on the same access-loop port. Configuring PPPoE-specific interface properties for an ACI interface set enables you to apply these attributes to all subscribers on a per-household basis.

The remaining statement is explained separately.

**NOTE:** When you configure PPPoE-specific interface properties for an ACI interface set, only the max-sessions statement is currently supported.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** On interfaces with PPP encapsulation, configure PPP-specific interface properties.

For ATM2 IQ interfaces only, you can configure CHAP on the logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:

- **atm-ppp-llc**—PPP over AAL5 LLC encapsulation.
- **atm-ppp-vc-mux**—PPP over AAL5 multiplex encapsulation.

**BEST PRACTICE:** On inline service (si) interfaces for L2TP, only the **chap** and **pap** statements are typically used for subscriber management. We recommend that you leave the other statements subordinate to **ppp-options**—including those subordinate to **chap** and **pap**—at their default values.

The remaining statements are explained separately.

| <b>Description</b>              | Apply a precedence to a dynamic filter. Only the Internet Protocol version 4 (IPv4) protocol family is currently supported for dynamic PPPoE logical interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <b><i>precedence</i></b> —Precedence value for the filter. The lower the precedence value, the higher the precedence.<br><b>Range:</b> 0 through 250<br><b>Default:</b> 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Specify the preference for a tunnel. You can specify up to 8 levels of preference, and you can assign the same preference to a maximum of 31 tunnels. When you define multiple preferences for a destination, you increase the probability of a successful connection.</p> <p>This value can be overridden by RADIUS attribute Tunnel-Preference [83].</p> |
| <b>Options</b>                  | <p><b><i>number</i></b>—Number that indicates the order in which the router attempts to connect to the destination. Zero is the highest level of preference.</p> <p><b>Range:</b> 0 through 2000</p> <p><b>Default:</b> 2000</p>                                                                                                                              |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.1R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Specify the length of time, in seconds, that the DHCPv6 server keeps the IPv6 prefix active. The DHCPv6 server sends this value to the client (router).</p> <p>If a value for the <b>preferred-lifetime</b> statement is configured along with a value for the <b>maximum-lease-time</b> statement, or if the configured value of the <b>preferred-lifetime</b> statement is higher than the value of the <b>valid-lifetime</b> statement, a commit error occurs. If a value for the <b>preferred-lifetime</b> statement is not configured, Junos OS uses the same value as the <b>maximum-lease-time</b> or <b>valid-lifetime</b> statement. If neither the <b>maximum-lease-time</b> nor <b>valid-lifetime</b> statement is configured, Junos OS uses the default value of 86,400 seconds.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Length of time, in seconds, that the DHCPv6 server keeps the IPv6 prefix active.</p> <p><b>Range:</b> 30 through 4,294,967,295 seconds</p> <p><b>Default:</b> 86,400 (24 hours)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | <p>Add a prefix to the base option 82 Agent Circuit ID information in DHCP packets destined for a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name. Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to configure DHCPv6 support.</p> <p>If you include only the hostname, only the logical system name, or only the routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with stacked virtual LANs (S-VLANs) is one of the following:</p> <pre> host-name:(fe   ge)-fpc/pic/port:svlan-id-vlan-id logical-system-name:(fe   ge)-fpc/pic/port:svlan-id-vlan-id routing-instance-name:(fe   ge)-fpc/pic/port:svlan-id-vlan-id </pre> <p>If you include both the logical system name and the routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs is as follows:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

*logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

If you include the hostname, logical system name, and routing instance name in the prefix, the format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs is as follows:

*host-name/logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

For Fast Ethernet or Gigabit Ethernet interfaces that use virtual LANs (VLANs) but not S-VLANs, only the **vlan-id** value appears in the Agent Circuit ID format. For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs or S-VLANs, neither the **vlan-id** value nor the **svlan-id** value appears.

**Options**    *prefix*—Any of the following:

- **host-name**—Prepend the hostname of the router configured with the **host-name** statement at the **[edit system]** hierarchy level to the Agent Circuit ID information.
- **logical-system-name**—Prepend the name of the logical system to the Agent Circuit ID information.
- **routing-instance-name**—Prepend the name of the routing instance to the Agent Circuit ID information.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit access]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure PPP CHAP, or a profile and its subscriber access, L2TP, or PPP properties.

**Options** *profile-name*—Name of the profile.

For CHAP, the name serves as the mapping between peer identifiers and CHAP secret keys. This entity is queried for the secret key whenever a CHAP challenge or response is received.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Enable DHCP relay proxy mode on the extended DHCP relay. Proxy mode supports all extended DHCP relay functionality.</p> <p>The extended DHCP relay proxy is not supported for the J Series routers DHCP server. Also, you cannot configure both the DHCP relay proxy and the extended DHCP local server on the same interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | For dynamic VLAN interfaces, specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag. If you include the <b>push</b> statement in the configuration, you must also include the pop statement at the [edit <code>dynamic-profiles profile-name interfaces interface-name unit logical-unit-number output-vlan-map</code> ] hierarchy level. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | The client is deleted when a RADIUS-initiated disconnect is received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Hierarchy Level** [edit services]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Assign parameters that are used with subscriber secure policy mirroring.

The remaining statements are explained separately.

**Required Privilege Level** flow-tap—To view this statement in the configuration.  
flow-tap-control—To add this statement to the configuration.

| <b>Description</b>              | Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | Rapid commit support is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 8.3.<br/> Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.</p> <p>If you enable insertion of option 82 information in DHCP packets, you must specify at least the <b>circuit-id</b> statement to include the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option.</p> <p>You can use the <b>relay-option-82</b> statement and its subordinate statements at the <b>[edit forwarding-options dhcp-relay]</b> hierarchy level to control insertion of option 82 information globally, or at the <b>[edit forwarding-options dhcp-relay group group-name]</b> hierarchy level to control insertion of option 82 information for a named group of interfaces.</p> <p>To restore the default behavior (option 82 information is not inserted into DHCP packets), use the <b>delete relay-option-82</b> statement.</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.<br/> interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Relay DHCP client packets to the specified group of DHCP servers when you use the DHCP relay selective processing feature. You can configure the relay operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <i>relay-server-group</i> —Name of DHCP server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Configure the replay protection method. The Identification field enables the home agent to verify that a registration message has been recently generated by the mobile node, rather than replayed by an attacker from a previous registration. You can specify a timestamp tolerance for the mobile node, which causes the request to be rejected if the tolerance is exceeded, or you can specify that the tolerance be taken from the value configured on the home agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>                  | If you do not configure the replay protection method, then the timestamp tolerance is taken from the home agent by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                  |
| <b>Description</b>              | (M120, M320, and MX Series routers) Configure the number of requests the router can send per second to all configured RADIUS servers collectively. By limiting the flow of requests from the router to the RADIUS servers, you can prevent the RADIUS servers from being flooded with requests. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Use in conjunction with the <b>dynamic-profile</b> statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>routing-instance</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>routing-instance</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>routing-instance-name</i></b> —Name of the routing instance in which the router instantiates the dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## routing-instances

---

**Syntax** `routing-instances routing-instance-name {  
    interface interface-name;  
}`

**Hierarchy Level** [edit **dynamic-profiles**],

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Dynamically configure an additional routing entity for a router.

**Options** *routing-instance-name*—The routing instance variable (*\$junos-routing-instance*). The routing instance variable is dynamically replaced with the routing instance the accessing client uses when connecting to the router.

**NOTE:** Though we do not recommend it, you can also enter a specific name for the routing instance, a maximum of 31 characters.

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## routing-options (Dynamic Profiles)

---

**Syntax**

```
routing-options {  
  access {  
    route prefix {  
      next-hop next-hop;  
      metric route-cost;  
      preference route-distance;  
      tag route-tag;  
    }  
  }  
  access-internal {  
    route subscriber-ip-address {  
      qualified-next-hop underlying-interface {  
        mac-address address;  
      }  
    }  
  }  
  multicast {  
    interface interface-name {  
      no-qos-adjust;  
    }  
  }  
}
```

**Hierarchy Level** [edit [dynamic-profiles profile-name](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure protocol-independent routing properties in a dynamic profile.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## rule

---

**Syntax**

```
rule rule-name {  
  match-direction (input | output | input-output);  
  term term-name {  
    from {  
      application [junos-http, junos-https, junos-httpproxy];  
      destination-address address <except>;  
      destination-prefix-list list-name <except>;  
    }  
    then {  
      accept;  
      rewrite {  
        destination-address address;  
        destination-port port;  
      }  
      syslog;  
    }  
  }  
}
```

**Hierarchy Level** [edit services [captive-portal-content-delivery](#)]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Specify the rule the router uses when applying this service.

**Options** *rule-name*—Identifier for the collection of terms that constitute this rule.  
The remaining statements are explained separately.

**Required Privilege Level** services—To view this statement in the configuration.  
services—control—To add this statement to the configuration.

| <b>Description</b>              | Send a release message to the DHCP (or DHCPv6) server whenever DHCP relay or relay proxy deletes a client. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## service-device-pool (L2TP)

|                            |                                                                                    |
|----------------------------|------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>service-device-pool <i>pool-name</i>;</code>                                 |
| <b>Hierarchy Level</b>     | <code>[edit services l2tp <b>tunnel-group</b> <i>name</i>]</code>                  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.                                     |
| <b>Description</b>         | Assign a pool of service interfaces to the tunnel group to balance traffic across. |

**NOTE:** The service interface configuration is required for static LNS sessions. Either the service interface configuration or the service device pool configuration can be used for dynamic LNS sessions.

| <b>Description</b>              | Define the filter to be applied to traffic before it is accepted for service processing. Configuration of a service filter is optional; if you include the <b>service-set</b> statement without a <b>service-filter</b> definition, the router software assumes that the match condition is true and selects the service set for processing automatically. Only the Internet Protocol version 4 (IPv4) protocol family is currently supported for dynamic PPPoE logical interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <i>filter-name</i> —Identifies the filter to be applied in service processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.5.</p> <p>Support at the [edit <i>dynamic-profiles profile-name interfaces pp0 unit "\$junos-interface-unit" family family service input</i>] and [edit <i>dynamic-profiles profile-name interfaces pp0 unit "\$junos-interface-unit" family family service output</i>] hierarchy levels introduced in Junos OS Release 10.1.</p>                                                                                                                                                  |
| <b>Description</b>              | <p>Define one or more service sets in a dynamic profile. Service sets are applied to an interface. If you define multiple service sets, the router software evaluates the filters in the order in which they appear in the configuration. Only the Internet Protocol version 4 (IPv4) protocol family is currently supported for dynamic PPPoE logical interfaces.</p>                                                                                                                                                           |
| <b>Options</b>                  | <p><i>service-set-name</i>—Name of the service set.</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Configure a shaping rate for a logical interface or a scheduler. The sum of the shaping rates for all logical interfaces on the physical interface can exceed the physical interface bandwidth. This practice is known as oversubscription of the peak information rate (PIR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>rate</b>—Peak rate in bits per second (bps). You can specify the value as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).<br/> <b>Range:</b> 1000 through 160,000,000,000 bps</p> <p><b>predefined-variable</b>—One of the following Junos predefined variables. The variable is replaced with a value obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.</p> <ul style="list-style-type: none"> <li><b>\$junos-cos-shaping-rate</b>—Variable for the shaping rate that is specified for the logical interface. Use this variable at the [edit <a href="#">dynamic-profiles profile-name class-of-service traffic-control-profiles profile-name</a>] hierarchy level.</li> <li><b>\$junos-cos-scheduler-shaping-rate</b>—Variable for the shaping rate that is specified for a scheduler. Use this variable at the [edit <a href="#">dynamic-profiles profile-name class-of-service schedulers scheduler-name</a>] hierarchy level.</li> </ul> <p><b>burst-size bytes</b>—(Optional) Maximum burst size, in bytes.<br/> <b>Range:</b> 0 through 1,000,000,000</p> <p><b>\$junos-cos-shaping-rate-burst</b>—(Optional) Variable for the burst-size that is specified for the shaping rate. Use this variable at the [edit <a href="#">dynamic-profiles profile-name class-of-service traffic-control-profile</a>] hierarchy level.</p> |

| <b>Description</b>              | Configure the router to temporarily prevent (lock out) a failed or short-lived (also known as short-cycle) PPPoE subscriber session from reconnecting for a default or configurable period of time. You can optionally override the default lockout time, 1 through 300 seconds (5 minutes), by specifying the minimum lockout time and maximum lockout time as part of the <b>short-cycle-protection</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>lockout-time-min <i>minimum-seconds</i></b>—(Optional) Minimum lockout time for failed or short-lived PPPoE subscriber sessions. The <i>minimum-seconds</i> value must be less than or equal to the <i>maximum-seconds</i> value. Setting <i>minimum-seconds</i> and <i>maximum-seconds</i> to the same value causes the lockout time to become fixed at that value.</p> <p><b>Range:</b> 1 through 86400 (24 hours)</p> <p><b>Default:</b> 1</p> <p><b>lockout-time-max <i>maximum-seconds</i></b>—(Optional) Maximum lockout time for failed or short-lived PPPoE subscriber sessions. The <i>maximum-seconds</i> value must be equal to or greater than the <i>minimum-seconds</i> value. Setting <i>maximum-seconds</i> and <i>minimum-seconds</i> to the same value causes the lockout time to become fixed at that value.</p> <p><b>Range:</b> 1 through 86400 (24 hours)</p> <p><b>Default:</b> 300 (5 minutes)</p>                                                 |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Logical systems support introduced in Junos OS Release 9.3.<br>Support at the [edit <a href="#">dynamic-profiles ... three-color-policer</a> <i>name</i> ] hierarchy level introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | <p>Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |
| Required Privilege Level | firewall—To view this statement in the configuration.<br>firewall-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## stacked-vlan-ranges (RADIUS Options)

|                            |                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | stacked-vlan-ranges (any   <i>low-outer-tag-high-outer-tag</i> ),any;                                            |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> radius-options <b>nas-port-options</b> <i>nas-port-options-name</i> ]     |
| <b>Release Information</b> | Statement introduced in Junos OS Release 12.3.                                                                   |
| <b>Description</b>         | Configure the stacked VLAN (S-VLAN) range of subscribers to which the named NAS-Port options definition applies. |

**NOTE:** You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

**Options** **any**—Entire S-VLAN range representing all S-VLAN IDs. The inner tag (S-VLAN ID) of the S-VLAN range must be configured as **any** to represent all inner VLAN ID tags.

**low-outer-tag**—Outer VLAN ID tag representing the lower limit of the S-VLAN range.

**Range:** 1 through 4094

**high-outer-tag**—Outer VLAN ID tag representing the upper limit of the S-VLAN range.

**Range:** 1 through 4094

**NOTE:** To specify a single outer VLAN ID tag, set **low-outer-tag** and **high-outer-tag** to the same value.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description              | <p>Configure a partial match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured partial match string with the option-specific string received in DHCP client packets. If there is an partial left-to-right match, DHCP performs the action you define for the match criteria.</p> <p>The option-specific string in the DHCP client packets can contain a superset of the specified ASCII or hexadecimal match string, provided that the leftmost characters of the option-specific string entirely match the characters in the configured match string.</p> <p>You can configure an unlimited number of match strings. If you have multiple partial match configurations, the longest match rule applies. For example, DHCP relay agent matches the string "test123" before it matches the string "test". Match strings do not support wildcard attributes.</p> <p>The <b>local-server-group</b> option is not supported for DHCPv6 relay agent.</p> |
| Options                  | <p><b><i>ascii-string</i></b>—ASCII string of 1 through 255 alphanumeric characters.</p> <p><b><i>hexadecimal-string</i></b>—Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## static (Dynamic MLD Interface)

---

**Syntax**

```
static {  
  group multicast-group-address {  
    exclude;  
    group-count number;  
    group-increment increment;  
    source ip-address {  
      source-count number;  
      source-increment increment;  
    }  
  }  
}
```

**Hierarchy Level** [edit dynamic-profiles *profile-name* protocols [mld interface](#) *interface-name*]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Test multicast forwarding on an interface.

The remaining statements are explained separately.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

**Related Documentation**

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | Accept solicit messages from clients that do not support reconfiguration and permit them to bind.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Configure a non-default logical system and optionally a non-default routing instance for the subscriber's interface in a domain map.</p> <p>You use the <a href="#">target-routing-instance</a> statement at the [edit access domain map <i>domain-map-name</i>] hierarchy level to configure a non-default routing instance for the default logical system.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> Subscriber management is supported in the default logical system only. The <a href="#">target-logical-system</a> statement is for future extensions of subscriber management and is not supported in current Junos OS releases.</p> </div> |
| <b>Default</b>                  | Default logical system for the subscriber..                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Configure egress data for a logical interface to be sent across a single member link in an aggregated Ethernet bundle. A backup link is provisioned with CoS scheduling resources in the event that the primary assigned link goes down. The aggregated Ethernet interface must be configured without link protection.                                                               |

| <b>Description</b>              | Define terms for fast update filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>action</b>—(Optional) An action to take if conditions match. If you do not specify an action, the packets that match the conditions in the <b>from</b> statement are accepted.</p> <p><b>action-modifiers</b>—(Optional) One or more actions to perform on a packet.</p> <p><b>from</b>—(Optional) Match packet fields to values. If not included, all packets are considered to match and the actions and action modifiers in the <b>then</b> statement are taken.</p> <p><b>match-conditions</b>—One or more conditions to make a match.</p> <p><b>only-at-create</b>—(Optional) Specify that the term is added only when the fast update filter is first created. No subsequent changes can be made to the term in the filter. Use this option only for terms that do not include subscriber-specific data in their match conditions, such as common or default terms (for example, counting the default drop packets).</p> <p><b>term-name</b>—Name that identifies the term. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b>then</b>—(Optional) Actions to take on matching packets. If not included and a packet matches all the conditions in the <b>from</b> statement, the packet is accepted.</p> |

| <b>Description</b>              | Specify the threshold for detecting the adaptation of the transmit interval. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, <i>Authentication for DHCP Messages</i>, section 4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure the LNS to reflect the IP ToS value in the inner IP header to the outer IP header. When CoS rewrite rules are also configured ([ <b>edit class-of-service interfaces</b> <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> <b>rewrite-rules</b> ]), the rewrite is performed only on the inner IP ToS; the outer IP TOS value is not affected. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                             |

| <b>Description</b>         | Configure tracing options for the general authentication service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>address-assignment</b>—Trace address-assignment pool events</li><li>• <b>all</b>—Trace all tracing operations</li><li>• <b>configuration</b>—Trace configuration events</li><li>• <b>framework</b>—Trace authentication framework events</li><li>• <b>gx-plus</b>—Trace Gx-Plus events</li><li>• <b>jsrc</b>—Trace JSRC events</li><li>• <b>ldap</b>—Trace LDAP authentication events</li><li>• <b>local-authentication</b>—Trace local authentication events</li><li>• <b>radius</b>—Trace RADIUS authentication events</li></ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to</p> |

indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Required Privilege</b> | trace—To view this statement in the configuration.        |
| <b>Level</b>              | trace-control—To add this statement to the configuration. |

| <b>Description</b>         | Define tracing operations for ANCP processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. Include the <b>disable</b> option after a flag to disable tracing for that flag. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li><li>• <b>config</b>—Trace configuration events.</li><li>• <b>cos</b>—Trace class-of-service events.</li><li>• <b>general</b>—Trace general flow.</li><li>• <b>packet</b>—Trace ANCP packet transmit and receive operations.</li><li>• <b>process</b>—Trace process internals.</li><li>• <b>protocol</b>—Trace protocol events.</li><li>• <b>restart</b>—Trace process restart flow</li><li>• <b>routing-socket</b>—Trace routing socket events.</li><li>• <b>session</b>—Trace connection events and flow.</li><li>• <b>startup</b>—Trace ANCP startup events and flow.</li><li>• <b>subscriber</b>—Trace subscriber events.</li><li>• <b>timer</b>—Trace timer processing.</li></ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> |

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

## traceoptions (Captive Portal Content Delivery)

---

**Syntax** traceoptions {  
    file *filename* <files *number*> <match *regular-expression*> <size *size*> <world-readable |  
        no-world-readable>;  
    flag configuration;  
    flag general;  
    flag gres;  
    flag rtsock;  
    flag statistics;  
    flag "all";  
    no-remote-trace;  
}

**Hierarchy Level** [edit [services \(captive-portal-content-delivery\)](#)captive-portal-content-delivery]

**Release Information** Statement introduced in Junos OS Release 10.4.  
Support at the [edit [services captive-portal-content-delivery](#)] hierarchy level introduced in Junos OS Release 10.4.

**Description** Define tracing operations for captive-portal-content-delivery processes.

**Options** file *filename*—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`. Ensure that filenames are unique for each logical system or routing instance in which Mobile IP is configured.

**NOTE:** Global messages (common to all logical systems and routing instances) are always saved in `/var/log/mipd`. Messages that are specific to a logical system or routing instance are never saved in `/var/log/mipd`. If you do not configure a trace filename for a logical system or routing instance, then nothing is traced for that entity.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace home agent state machine operations.
- **general**—Trace general operations.
- **gres**—Trace graceful routing switchover operations.
- **rtsock**—Trace routing socket operations.
- **statistics**—Trace statistics operations.

**Required Privilege Level**    trace—To view this statement in the configuration.  
                                      trace-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>     | [edit system processes dhcp-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | <p>Define global tracing operations for extended DHCP local server and extended DHCP relay agent processes.</p> <p>Replaces deprecated <b>traceoptions</b> statements at the [edit forwarding-options dhcp-relay] and [edit system services dhcp-local-server] hierarchy levels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all events.</li><li>• <b>auth</b>—Trace authentication events.</li><li>• <b>database</b>—Trace database events.</li><li>• <b>fwd</b>—Trace firewall process events.</li><li>• <b>general</b>—Trace miscellaneous events.</li><li>• <b>ha</b>—Trace high availability-related events.</li><li>• <b>interface</b>—Trace interface operations.</li><li>• <b>io</b>—Trace I/O operations.</li><li>• <b>packet</b>—Trace packet and option decoding operations.</li><li>• <b>performance</b>—Trace performance measurement operations.</li><li>• <b>profile</b>—Trace profile operations.</li><li>• <b>rpd</b>—Trace routing protocol process events.</li></ul> |

- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database events.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

**level**—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access, allowing only the user **root** and users who have the Junos OS **maintenance** permission to access the trace files.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Hierarchy Level</b>     | [edit system processes diameter-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Define tracing options for Diameter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations</li><li>• <b>application</b>—Trace Diameter application interface events</li><li>• <b>configuration</b>—Trace configuration events</li><li>• <b>daemon</b>—Trace Diameter daemon level events</li><li>• <b>diameter-instance</b>—Trace Diameter instance events</li><li>• <b>dne</b>—Trace Diameter network element events</li><li>• <b>framework</b>—Trace Diameter framework events</li><li>• <b>memory-management</b>—Trace memory management events</li><li>• <b>messages</b>—Trace Diameter messages</li><li>• <b>node</b>—Trace Diameter node events</li><li>• <b>peer</b>—Trace Diameter peer events</li></ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Match all levels.</li><li>• <b>error</b>—Match error conditions.</li></ul> |

- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Syntax</b>              | <pre>traceoptions {<br/>  debug-level <i>level</i>;<br/>  file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i> &gt; &lt;size <i>maximum-file-size</i>&gt;<br/>    &lt;world-readable   no-world-readable&gt;;<br/>  filter {<br/>    protocol <i>name</i>;<br/>    user-name <i>username</i>;<br/>  }<br/>  flag <i>flag</i>;<br/>  interfaces <i>interface-name</i> {<br/>    debug-level <i>level</i>;<br/>    flag <i>flag</i>;<br/>  }<br/>  level (all   error   info   notice   verbose   warning);<br/>  no-remote-trace;<br/>}</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Hierarchy Level</b>     | [edit services <a href="#">l2tp</a> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | Define tracing operations for L2TP processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>debug-level <i>level</i></b>—Trace level for PPP, L2TP, RADIUS, and UDP; this option does not apply to L2TP on MX Series routers:</p> <ul style="list-style-type: none"><li>• <b>detail</b>—Trace detailed debug information.</li><li>• <b>error</b>—Trace error information.</li><li>• <b>packet-dump</b>—Trace packet decoding information.</li></ul> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>filter protocol <i>name</i></b>—Additional filter for the specified protocol; this option does not apply to L2TP on MX Series routers:</p> <ul style="list-style-type: none"><li>• <b>l2tp</b></li><li>• <b>ppp</b></li><li>• <b>radius</b></li><li>• <b>udp</b></li></ul> |

**filter user-name** *username*—Additional filter for the specified username; this option does not apply to L2TP on MX Series routers.

**flag** *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace configuration events.
- **events**—Trace interface events.
- **general**—Trace general events.
- **gres**—Trace GRES events.
- **init**—Trace daemon initialization.
- **ipc-rx**—Trace IPC receive events.
- **ipc-tx**—Trace IPC transmit events.
- **memory**—Trace memory management code.
- **message**—Trace message processing code.
- **packet-error**—Trace packet error events.
- **parse**—Trace parsing events.
- **protocol**—Trace L2TP events.
- **receive-packets**—Trace received L2TP packets.
- **routing-process**—Trace routing process interactions.
- **routing-socket**—Trace routing socket events.
- **session-db**—Trace session database interactions.
- **states**—Trace state machine events.
- **timer**—Trace timer events.
- **transmit-packets**—Trace transmitted L2TP packets.
- **tunnel**—Trace tunnel events.

**interfaces *interface-name***—Apply L2TP traceoptions to a specific services interface. This option does not apply to L2TP on MX Series routers.

- **debug-level *level***—Trace level for the interface; this option does not apply to L2TP on MX Series routers:
  - **detail**—Trace detailed debug information.
  - **error**—Trace error information.
  - **extensive**—Trace all PIC debug information.
- **flag *flag***—Tracing operation to perform for the interface. This option does not apply to L2TP on MX Series routers. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:
  - **all**—Trace everything.
  - **ipc**—Trace L2TP Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
  - **packet-dump**—Dump each packet content based on debug level.
  - **protocol**—Trace L2TP, PPP, and multilink handling.
  - **system**—Trace packet processing on the PIC.

**level**—Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

| Release Information | Statement introduced in Junos OS Release 9.3.<br>Support at the <code>[edit logical-systems <i>logical-system-name</i> ...]</code> , <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instances-name</i> ...]</code> , and <code>[edit routing-instances <i>routing-instances-name</i> ...]</code> hierarchy levels introduced in Junos OS Release 9.5. |
| Description         | Define tracing operations for Mobile IP processes.                                                                                                                                                                                                                                                                                                                                         |
| Options             | <b>file <i>filename</i></b> — Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code> . Ensure that filenames are unique for each logical system or routing instance in which Mobile IP is configured.                                                                       |

**NOTE:** Global messages (common to all logical systems and routing instances) are always saved in `/var/log/mipd`. Messages that are specific to a logical system or routing instance are never saved in `/var/log/mipd`. If you do not configure a trace filename for a logical system or routing instance, then nothing is traced for that entity.

**files *number***—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **authentication**—Trace authentication operations.
- **binding**—Trace bindings.

- **event**—Trace events.
- **ha-fsm**—Trace home agent state machine operations.
- **home-agent**—Trace home agent operations.
- **interface-database**—Trace interface database operations.
- **packet**—Trace packet decoding operations.
- **protocol**—Trace protocol operations.
- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database events.
- **signal**—Trace signal operations.
- **subscriber**—Trace subscriber events.
- **timer**—Trace timer events.
- **trace**—Trace changes in tracing.
- **tunnel**—Trace tunneling operations.
- **user-interface**—Trace user interface events.

**level**—Specify level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **size***k* to specify KB, **size***m* to specify MB, or **size***g* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | Define tracing operations for PTSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>peer</b>—Trace SRC peer events.</li> <li>• <b>pic</b>—Trace PIC events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>session</b>—Trace session events.</li> </ul> <p><b>disable</b>—Disable this trace flag.</p> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> |

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Define tracing operations for static subscriber processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>authentication</b>—Trace authentication events.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>gres</b>—Trace GRES events.</li> <li>• <b>profile</b>—Trace dynamic profile events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>statistics</b>—Trace statistics events.</li> <li>• <b>subscriber</b>—Trace subscriber events.</li> </ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match all levels.</li> </ul> |

- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                                 |                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | trace—To view this statement in the configuration.                                                                 |
|                                 | trace-control—To add this statement to the configuration.                                                          |

| <b>Description</b>         | Define tracing operations for subscriber management interface processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>issu</b>—Trace unified ISSU events.</li> <li>• <b>server</b>—Trace server events.</li> <li>• <b>session-db</b>—Trace session database interactions.</li> <li>• <b>ui</b>—Trace user interface events.</li> </ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files</b> option.</p> <p><b>Syntax:</b> <b>sizek</b> to specify KB, <b>sizem</b> to specify MB, or <b>sizeg</b> to specify GB</p> <p><b>Range:</b> 10240 through 1073741824</p> <p><b>Default:</b> 128 KB</p> |

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege** trace—To view this statement in the configuration.  
**Level** trace-control—To add this statement to the configuration.

| <b>Description</b>         | Define tracing operations for subscriber management session database replication processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>mirror</b>—Trace mirroring events.</li> <li>• <b>replication</b>—Trace database replication events.</li> <li>• <b>server</b>—Trace server events.</li> <li>• <b>session-db</b>—Trace session database interactions.</li> <li>• <b>ui</b>—Trace user interface events.</li> </ul> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>no-remote-trace</b>—Disable remote tracing.</p> <p><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to</p> |

indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

## traffic-control-profiles (Dynamic CoS Definition)

---

**Syntax** `traffic-control-profiles profile-name {  
    adjust-minimum rate;  
    delay-buffer-rate (percent percentage | rate);  
    excess-rate (percent percentage | proportion value | percent $junos-cos-excess-rate);  
    excess-rate-high (percent percentage | proportion value);  
    excess-rate-low (percent percentage | proportion value);  
    guaranteed-rate (percent percentage | rate) <burst-size bytes>;  
    overhead-accounting (frame-mode | cell-mode) <bytes byte-value>;  
    scheduler-map map-name;  
    shaping-rate (percent percentage | rate | predefined-variable) <burst-size bytes>;  
}`

**Hierarchy Level** [edit [dynamic-profiles \*profile-name\* class-of-service](#)]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure traffic shaping and scheduling profiles.

**Options** *profile-name*—Name of the traffic-control profile.  
  
The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | Specify the transmit rate or percentage for a scheduler in a dynamic profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>                  | If you do not include this statement, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 5, 0, 0, 0, and 0 percent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>rate</b>—Transmission rate, in bps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).<br/><b>Range:</b> 3200 through 160,000,000,000 bps</p> <p><b>percent <i>percentage</i></b>—Percentage of transmission capacity. A percentage of zero drops all packets in the queue.<br/><b>Range:</b> 0 through 100 percent</p> <p><b>remainder</b>—Use remaining rate available.</p> <p><b>\$junos-cos-scheduler-tx</b>—Junos predefined variable that is replaced with the transmission rate obtained from the RADIUS server when a subscriber authenticates over the interface to which the dynamic profile is attached.</p> <p><b>exact</b>—(Optional) Enforce the exact transmission rate. Under sustained congestion, a rate-controlled queue that goes into negative credit fills up and eventually drops packets. Make sure this value never exceeds the rate-controlled amount.</p> <p><b>rate-limit</b>—(Optional) Limit the transmission rate to the rate-controlled amount during congestion. In contrast to the <b>exact</b> option, when there is no congestion, the scheduler with the <b>rate-limit</b> option shares unused bandwidth above the rate-controlled amount.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Enable processing of DHCP client packets that have a gateway IP address (giaddr) of 0 (zero) and contain option 82 information. By default, the DHCP relay agent treats such packets as if they originated at an untrusted source, and drops them without further processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Configure a two-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), peak information rate (PIR), and peak burst size (PBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but are within the PIR or the PBS are assigned medium-high loss priority (yellow). Packets that exceed the PIR and the PBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | Specify the method that determines the connection speed values sent from the LAC to the LNS in Incoming-Call-Connected (ICCN) messages. The transmit speed is conveyed in AVP 24 (Tx Connect Speed ) and the receive speed is conveyed in AVP 38 (Rx Connect Speed). Both values are in bits per seconds (BPS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | <b>static</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b><i>method</i></b>—Method used to derive the connection speed values.</p> <ul style="list-style-type: none"><li>• <b>ancp</b>—The speed is derived from the configured ANCP value for the underlying interface. You can change this rate after a subscriber has logged in, but those changes do not affect the actual rate used by the LNS. The <b>ancp</b> method gets the highest preference among the methods configured.</li><li>• <b>pppoe-ia-tags</b>—PPPoE IA tags sent from the DSLAM to the LAC. This speed value transmitted when a subscriber logs in and it cannot be subsequently changed. This value is used when the <b>ancp</b> value is not available. This speed does not apply to the subscribers that are already logged in; it is effective only for subscribers that log in after this setting has been saved. AVP 24 is the value of Actual-Data-Rate-Downstream (VSA 26-129). AVP 38 is the value of Actual-Data-Rate-Upstream (VSA 26-130), and is sent only when the VSA values differ.</li></ul> <div><p><b>NOTE:</b> This rate does not affect the subscribers already logged in; however, new subscribers inherit the new rate.</p></div> <ul style="list-style-type: none"><li>• <b>static</b>—The speed is derived from the recommended (advisory) shaping rate configured on the PPPoE logical interface underlying the subscriber interface. If the advisory speed is not configured on the underlying interface, then the actual port speed is used. The default method, when no other methods yield a value, is the <b>static</b> method or the advisory speed method. If the advisory speed is not configured, then the actual port speed is used. For ge and xe interfaces, the speed value is set to 10,000,000 and for ae interfaces, the speed value is set to 0 and sent in both AVP 24 and AVP 38.</li></ul> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | In a dynamic profile, configure the underlying interface on which the router creates the dynamic PPPoE logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <b><i>interface-name</i></b> —Variable used to specify the name of the underlying interface on which the PPPoE logical interface is dynamically created. In the <b>underlying-interface <i>interface-name</i></b> statement for dynamic PPPoE logical interfaces, you must use the predefined variable <b>\$junos-underlying-interface</b> in place of <b><i>interface-name</i></b> . When the router creates the dynamic PPPoE interface, the <b>\$junos-underlying-interface</b> predefined variable is dynamically replaced with the name of the underlying interface supplied by the network when the subscriber logs in. |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Hierarchy Level** [edit [dynamic-profiles profile-name](#) [interfaces demux0](#)]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Configure a dynamic logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—Either the specific unit number of the interface or the unit number variable (`$junos-interface-unit`). The variable is used to specify the unit of the interface when a new demux interface is dynamically created. The static unit number variable is dynamically replaced with the unit number that DHCP supplies when the subscriber logs in.

The remaining statements are explained separately.

## unit (Dynamic PPPoE)

---

**Syntax**

```
unit logical-unit-number {
  keepalives interval seconds;
  no-keepalives;
  pppoe-options {
    underlying-interface interface-name;
    server;
  }
  ppp-options {
    authentication [ authentication-protocols ];
    chap {
      challenge-length minimum minimum-length maximum maximum-length;
    }
    pap;
  }
  family inet {
    unnumbered-address interface-name destination address;
    address address;
    service {
      input {
        service-set service-set-name {
          service-filter filter-name;
        }
        post-service-filter filter-name;
      }
      output {
        service-set service-set-name {
          service-filter filter-name;
        }
      }
    }
  }
  filter {
    input filter-name {
      precedence precedence;
    }
    output filter-name {
      precedence precedence;
    }
  }
  filter {
    input filter-name;
    output filter-name;
  }
}
```

**Hierarchy Level** [edit [dynamic-profiles profile-name interfaces pp0](#)]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** In a dynamic profile, configure a logical unit number for the dynamic PPPoE logical interface. You must configure a logical interface to be able to use the router.

**Options**    *logical-unit-number*—Variable used to specify the unit number when the PPPoE logical interface is dynamically created. In the **unit** *logical-unit-number* statement for dynamic PPPoE logical interfaces, you must use the predefined variable **\$junos-interface-unit** in place of *logical-unit-number*. The **\$junos-interface-unit** predefined variable is dynamically replaced with the unit number supplied by the router when the subscriber logs in.

The remaining statements are explained separately.

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options**    *logical-unit-number*—The specific unit number of the interface you want to assign to the dynamic profile, or one of the following Junos OS predefined variables:

- **\$junos-underlying-interface-unit**—For static VLANs, the unit number variable. The static unit number variable is dynamically replaced with the client unit number when the client session begins. The client unit number is specified by the DHCP when it accesses the subscriber network.
- **\$junos-interface-unit**—The unit number variable on a dynamic underlying VLAN interface for which you want to enable the creation of dynamic VLAN subscriber interfaces based on agent circuit identifier information.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br><b>\$junos-preferred-source-address</b> variable support added in Junos OS Release 9.6.<br>Support for the <b>\$junos-loopback-interface</b> predefined variable introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the <b>\$junos-loopback-interface-address</b> predefined variable.</p> <p>You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>interface-name</b>—Name of the interface from which the local address is derived. Use the <b>\$junos-loopback-interface</b> dynamic variable to dynamically apply a loopback interface. The loopback interface used is based on the routing instance of the subscriber. The specified interface must have a logical unit number and a configured IP address, and must not be an unnumbered interface.</p> <p><b>preferred-source-address address</b>—(Optional) Secondary IP address of the donor loopback interface. Use the <b>\$junos-preferred-source-address</b> dynamic variable to dynamically apply a preferred source address to the unnumbered Ethernet interface. When you use the dynamic variable, the address that is selected resides in the same network as the IP address of the subscriber. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Release Information** Statement introduced in Junos OS Release 9.6.  
 Support at the [edit ... **dhcpv6**] hierarchy levels introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Use the textual interface description instead of the interface identifier when creating the agent-circuit-id suboption of the DHCP relay agent option 82. Use the statement at the [edit ... **dhcpv6**] hierarchy levels to configure DHCPv6 support.

If you specify that the textual description is used and no description is configured for the interface, DHCP relay defaults to using the interface identifier. The textual description is configured using the **description** statement at the [edit interfaces *interface-name*] hierarchy level.

**NOTE:** By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description is longer than 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.</p> <p>Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a string is included as the beginning of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <b><i>user-prefix-string</i></b> —String that begins the username. The string can include the following characters: a through z, A through Z, 0 through 9, "-", or ".".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Configure the username that the router passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router accesses the local authentication service only and does not use external authentication services, such as RADIUS.</p> <p>The statements are explained separately. The <a href="#">option-60</a> and <a href="#">option-82</a> statements are not supported in the DHCPv6 hierarchy levels. The <a href="#">client-id</a>, <a href="#">relay-agent-interface-id</a>, <a href="#">relay-agent-remote-id</a> and <a href="#">relay-agent-subscriber-id</a> statements are supported in the DHCPv6 hierarchy levels only.</p>                              |

**Release Information** Statement introduced in Junos OS Release 9.1.  
 Support at the [edit ... [dhcpv6](#)] hierarchy levels introduced in Junos OS Release 11.4.

**Description** Configure the username that the router passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router accesses the local authentication service only and does not use external authentication services, such as RADIUS. Use the statement at the [edit...[dhcpv6](#)] hierarchy levels to configure DHCPv6 support.

The following statements are not supported in the DHCPv6 hierarchy levels:

- **mac-address**
- **option-60**
- **option-82**

The following statements are supported in the DHCPv6 hierarchy levels only:

- **relay-agent-interface-id**
- **relay-agent-remote-id**
- **relay-agent-subscriber-id**

The remaining statements are explained separately.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.1R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify the length of time, in seconds, that the DHCPv6 server keeps the IPv6 prefix valid. The DHCPv6 server sends this value to the client (router).</p> <p>If you configure a value for the <b>valid-lifetime</b> statement along with a value for the <b>maximum-lease-time</b> statement, or if the configured value of the <b>valid-lifetime</b> statement is less than the value of the <b>preferred-lifetime</b> statement, a commit error occurs. If a value for the <b>valid-lifetime</b> statement is not configured, Junos OS uses the same value as the <b>maximum-lease-time</b> or <b>preferred-lifetime</b> statement. If neither the <i>maximum-lease-time</i> nor <b>preferred-lifetime</b> statement is configured, Junos OS uses the default value of 86,400 seconds.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Length of time, in seconds, that the DHCPv6 server keeps the IPv6 prefix valid.</p> <p><b>Range:</b> 30 through 4,294,967,295 seconds</p> <p><b>Default:</b> 86,400 (24 hours)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## version (Dynamic IGMP Interface)

---

|                            |                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>version version;</code>                                                                      |
| <b>Hierarchy Level</b>     | [edit dynamic-profiles <i>profile-name</i> protocols <b>igmpinterface</b> <i>interface-name</i> ]  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2.                                                      |
| <b>Description</b>         | Specify the version of IGMP.                                                                       |
| <b>Options</b>             | <b>version</b> —IGMP version number.<br><b>Range:</b> 1, 2, or 3<br><b>Default:</b> IGMP version 2 |

**NOTE:** Routers running different versions of IGMP negotiate the lowest common version of IGMP that is supported by hosts on their subnet and operate in that version.

If you have already configured the router to use IGMP version 1 and then configure it to use IGMP version 2, the router continues to use IGMP version 1 for up to 6 minutes and then uses IGMP version 2.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2.                                                                                                                                                  |
| <b>Description</b>         | For Fast Ethernet and Gigabit Ethernet interfaces and aggregated Ethernet interfaces configured for VPLS, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface. |

**NOTE:** For Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet interfaces supporting VPLS, the Junos OS supports a subset of the IEEE 802.1Q standard for channelizing an Ethernet interface into multiple logical interfaces, allowing many hosts to be connected to the same Gigabit Ethernet switch, but preventing them from being in the same routing or bridging domain.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Configure the router's <b>authd</b> process to wait for an Acct-On-Ack response message from RADIUS before sending new authentication and accounting updates to the RADIUS server. This configuration ensures that when a new subscriber session starts, the authentication and accounting information for the new session does not get deleted when RADIUS clears previously existing session state information. |

| <b>Description</b>              | Specify that the router chooses among multiple tunnels that share the same preference level by considering the maximum sessions configured per tunnel. The tunnel configured with the highest maximum number of sessions in the preference level has the highest weight. This tunnel is selected until the maximum number of sessions for the tunnel is reached. Then the router selects the tunnel with the next higher weight to establish connections until that tunnel's maximum session limit is reached, and so on. |

## wins-server (Access)

---

|                                 |                                                                                                                                      |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | wins-server {<br><i>ipv4-address</i> ;<br>}                                                                                          |
| <b>Hierarchy Level</b>          | [edit access address-assignment pool <i>pool-name</i> family inet <a href="#">dhcp-attributes</a> ]                                  |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0.                                                                                        |
| <b>Description</b>              | Specify one or more NetBIOS name servers (NBNS) that the client uses to resolve NetBIOS names. This is equivalent to DHCP option 44. |
| <b>Options</b>                  | <i>ipv4-address</i> —IP address of each NetBIOS name server; add them to the configuration in order of preference.                   |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                      |
