Documentation and Release Notes

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

Supported Platforms

For the features described in this document, the following platforms are supported:

- M Series
- T Series
- MX Series
- J Series

Using the Examples in This Manual

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

Documentation Conventions

Table 1 on page xv defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.

Table 2 on page xv defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	<ul style="list-style-type: none">Introduces or emphasizes important new terms.Identifies guide names.Identifies RFC and Internet draft titles.	<ul style="list-style-type: none">A policy <i>term</i> is a named structure that defines match conditions and actions.<i>Junos OS CLI User Guide</i>RFC 1997, <i>BGP Communities Attribute</i>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none">To configure a stub area, include the stub statement at the[edit protocols ospf area area-id] hierarchy level.The console port is labeled CONSOLE.
< > (angle brackets)	Enclose optional keywords or variables.	stub <default-metric <i>metric</i>>;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Enclose a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identify a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none">In the Logical Interfaces box, select All Interfaces.To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>
- Download the latest versions of software and review release notes: <http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://www.juniper.net/alerts/>

- Join and participate in the Juniper Networks Community Forum:
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

Understanding Junos VPN Site Secure

Junos VPN Site Secure is a suite of IPsec features supported on multiservices line cards (MS-DPC, MS-MPC, and MS-MIC), and was referred to as IPsec services in Junos releases earlier than 13.2. In Junos OS Release 13.2 and later, the term IPsec features is used exclusively to refer to the IPsec implementation on Adaptive Services and Encryption Services PICs. This topic provides you an overview of Junos VPN Site Secure, and has the following sections:

NOTE:

For a list of the IPsec and IKE standards supported by the Junos OS, see the *Junos OS Hierarchy and RFC Reference*.

- [IPsec on page 3](#)
- [Security Associations on page 4](#)
- [IKE on page 4](#)
- [Comparison of IPsec on ES PICs and Junos VPN Site Secure on Multiservices Line Cards on page 4](#)

IPsec

The IPsec architecture provides a security suite for the IP version 4 (IPv4) and IP version 6 (IPv6) network layers. The suite provides such functionality as authentication of origin, data integrity, confidentiality, replay protection, and nonrepudiation of source. In addition to IPsec, the Junos OS also supports the Internet Key Exchange (IKE), which defines mechanisms for key generation and exchange, and manages security associations (SAs).

IPsec also defines a security association and key management framework that can be used with any network-layer protocol. The SA specifies what protection policy to apply to traffic between two IP-layer entities. IPsec provides secure tunnels between two peers.

Security Associations

To use IPsec security services, you create SAs between hosts. An SA is a simplex connection that enables two hosts to communicate with each other securely by means of IPsec. There are two types of SAs:

- Manual SAs require no negotiation; all values, including the keys, are static and specified in the configuration. Manual SAs statically define the security parameter index (SPI) values, algorithms, and keys to be used, and require matching configurations on both ends of the tunnel. Each peer must have the same configured options for communication to take place.
- Dynamic SAs require additional configuration. With dynamic SAs, you configure IKE first and then the SA. IKE creates dynamic security associations; it negotiates SAs for IPsec. The IKE configuration defines the algorithms and keys used to establish the secure IKE connection with the peer security gateway. This connection is then used to dynamically agree upon keys and other data used by the dynamic IPsec SA. The IKE SA is negotiated first and then used to protect the negotiations that determine the dynamic IPsec SAs.

IKE

IKE is a key management protocol that creates dynamic SAs; it negotiates SAs for IPsec. An IKE configuration defines the algorithms and keys used to establish a secure connection with a peer security gateway.

IKE performs the following tasks:

- Negotiates and manages IKE and IPsec parameters.
- Authenticates secure key exchange.
- Provides mutual peer authentication by means of shared secrets (not passwords) and public keys.
- Provides identity protection (in main mode).

Two versions of the IKE protocol (IKEv1 and IKEv2) are supported now. IKE negotiates security attributes and establishes shared secrets to form the bidirectional IKE SA. In IKE, inbound and outbound IPsec SAs are established and the IKE SA secures the exchanges. Starting with Junos OS Release 11.4, both IKEv1 and IKEv2 are supported by default on all M Series, MX Series, and T Series routers. IKE also generates keying material, provides Perfect Forward Secrecy, and exchanges identities.

Comparison of IPsec on ES PICs and Junos VPN Site Secure on Multiservices Line Cards

[Table 3 on page 5](#) compares the top-level configuration of IPsec features on the ES PIC interfaces, and IPsec on the Adaptive Services PICs and Junos VPN Site Secure on Multiservices Line Cards.

Table 3: Statement Equivalents for ES and AS Interfaces

ES PIC Configuration	AS and MultiServices Line Cards Configuration
[edit security ipsec] proposal {...}	[edit services ipsec-vpn ipsec] proposal {...}
[edit security ipsec] policy {...}	[edit services ipsec-vpn ipsec] policy {...}
[edit security ipsec] security-association sa-dynamic {...}	[edit services ipsec-vpn rule <i>rule-name</i>] term <i>term-name</i> match-conditions {...} then dynamic {...}
[edit security ipsec] security-association sa-manual {...}	[edit services ipsec-vpn rule <i>rule-name</i>] term <i>term-name</i> match-conditions {...} then manual {...}
[edit security ike] proposal {...}	[edit services ipsec-vpn ike] proposal {...}
[edit security ike] policy {...}	[edit services ipsec-vpn ike] policy {...}
Not available	[edit services ipsec-vpn] rule-set {...}
Not available	[edit services ipsec-vpn] service-set {...}
[edit interfaces es- <i>fpc/pic/port</i>] tunnel source <i>address</i>	[edit services ipsec-vpn service-set <i>set-name</i>] ipsec-vpn local-gateway <i>address</i>
[edit interfaces es- <i>fpc/pic/port</i>] tunnel destination <i>address</i>	[edit services ipsec-vpn rule <i>rule-name</i>] remote-gateway <i>address</i>

NOTE: Although many of the same statements and properties are valid on both platforms (MultiServices and ES), the configurations are not interchangeable. You must commit a complete configuration for the PIC type that is installed in your router.

Authentication Algorithms

Authentication is the process of verifying the identity of the sender. Authentication algorithms use a shared key to verify the authenticity of the IPsec devices. The Junos OS uses the following authentication algorithms:

- Message Digest 5 (MD5) uses a one-way hash function to convert a message of arbitrary length to a fixed-length message digest of 128 bits. Because of the conversion process, it is mathematically infeasible to calculate the original message by computing it backwards from the resulting message digest. Likewise, a change to a single character in the message will cause it to generate a very different message digest number.

To verify that the message has not been tampered with, the Junos OS compares the calculated message digest against a message digest that is decrypted with a shared key. The Junos OS uses the MD5 hashed message authentication code (HMAC) variant that provides an additional level of hashing. MD5 can be used with authentication header (AH), Encapsulating Security Payload (ESP), and Internet Key Exchange (IKE).

- Secure Hash Algorithm 1 (SHA-1) uses a stronger algorithm than MD5. SHA-1 takes a message of less than 264 bits in length and produces a 160-bit message digest. The large message digest ensures that the data has not been changed and that it originates from the correct source. The Junos OS uses the SHA-1 HMAC variant that provides an additional level of hashing. SHA-1 can be used with AH, ESP, and IKE.
- SHA-256, SHA-384, and SHA-512 (sometimes grouped under the name SHA-2) are variants of SHA-1 and use longer message digests. The Junos OS supports the SHA-256 version of SHA-2, which can process all versions of Advanced Encryption Standard (AES), Data Encryption Standard (DES), and Triple DES (3DES) encryption.

Related Documentation

- [Understanding Junos VPN Site Secure on page 3](#)
- [Encryption Algorithms on page 6](#)

Encryption Algorithms

Encryption encodes data into a secure format so that it cannot be deciphered by unauthorized users. Like authentication algorithms, a shared key is used with encryption algorithms to verify the authenticity of the IPsec devices. The Junos OS uses the following encryption algorithms:

- Data Encryption Standard cipher-block chaining (DES-CBC) is a symmetric secret-key block algorithm. DES uses a key size of 64 bits, where 8 bits are used for error detection and the remaining 56 bits provide encryption. DES performs a series of simple logical operations on the shared key, including permutations and substitutions. CBC takes the first block of 64 bits of output from DES, combines this block with the second block, feeds this back into the DES algorithm, and repeats this process for all subsequent blocks.
- Triple DES-CBC (3DES-CBC) is an encryption algorithm that is similar to DES-CBC, but provides a much stronger encryption result because it uses three keys for 168-bit

(3 x 56-bit) encryption. 3DES works by using the first key to encrypt the blocks, the second key to decrypt the blocks, and the third key to re-encrypt the blocks.

- Advanced Encryption Standard (AES) is a next-generation encryption method based on the Rijndael algorithm developed by Belgian cryptographers Dr. Joan Daemen and Dr. Vincent Rijmen. It uses a 128-bit block and three different key sizes (128, 192, and 256 bits). Depending on the key size, the algorithm performs a series of computations (10, 12, or 14 rounds) that include byte substitution, column mixing, row shifting, and key addition. The use of AES in conjunction with IPsec is defined in RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*.

IPsec Protocols

IPsec protocols determine the type of authentication and encryption applied to packets that are secured by the router. The Junos OS supports the following IPsec protocols:

- **AH**—Defined in RFC 2402, AH provides connectionless integrity and data origin authentication for IPv4 and IPv6 packets. It also provides protection against replays. AH authenticates as much of the IP header as possible, as well as the upper-level protocol data. However, some IP header fields might change in transit. Because the value of these fields might not be predictable by the sender, they cannot be protected by AH. In an IP header, AH can be identified with a value of **51** in the **Protocol** field of an IPv4 packet and the **Next Header** field of an IPv6 packet. An example of the IPsec protection offered by AH is shown in [Figure 1 on page 8](#).

NOTE: AH is not supported on the T Series, M120, and M320 routers.

Figure 1: AH Protocol

Header format

Byte 0	Byte 1	Byte 2	Byte 3
Next header	Payload length	Reserved	
Security Parameters Index (SPI)			
Sequence number			
Authentication data (variable)			

Original IPv4 packet before AH is applied

Original IP header	TCP header	Data
--------------------	------------	------

IPv4 packet after AH transport mode is applied

Original IP header	AH header	TCP header	Data
Authenticating			

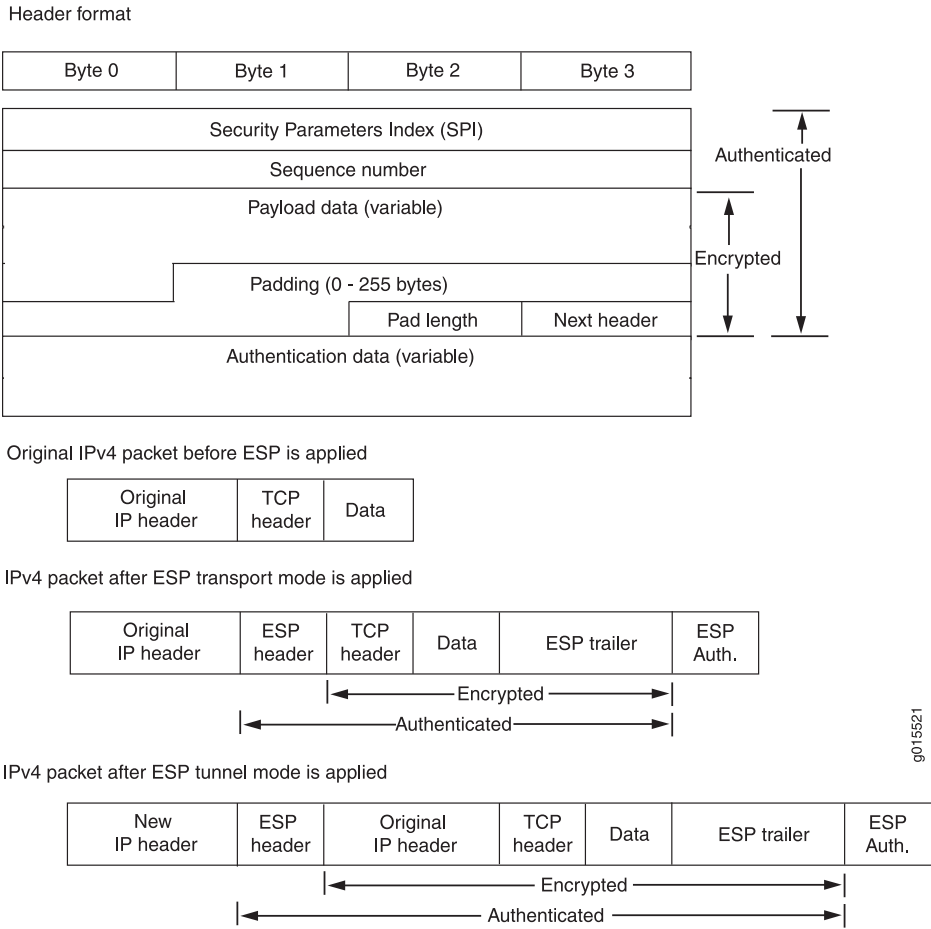

IPv4 packet after AH tunnel mode is applied

New IP header	AH header	Original IP header	TCP header	Data
Authenticating				

g015522

- ESP—Defined in RFC 2406, ESP can provide encryption and limited traffic flow confidentiality, or connectionless integrity, data origin authentication, and an anti-replay service. In an IP header, ESP can be identified a value of **50** in the **Protocol** field of an IPv4 packet and the **Next Header** field of an IPv6 packet. An example of the IPsec protection offered by ESP is shown in [Figure 2 on page 9](#).

Figure 2: ESP Protocol

- Bundle—When you compare AH with ESP, there are some benefits and shortcomings in both protocols. ESP provides a decent level of authentication and encryption, but does so only for part of the IP packet. Conversely, although AH does not provide encryption, it does provide authentication for the entire IP packet. Because of this, the Junos OS offers a third form of IPsec protocol called a protocol bundle. The bundle option offers a hybrid combination of AH authentication with ESP encryption.

Service Sets

The Adaptive Services PIC supports two types of service sets when you configure IPsec tunnels. Because they are used for different purposes, it is important to know the differences between these service set types.

- Next-hop service set—Supports multicast and multicast-style dynamic routing protocols (such as OSPF) over IPsec. Next-hop service sets allow you to use *inside* and *outside* logical interfaces on the Adaptive Services PIC to connect with multiple routing instances. They also allow the use of Network Address Translation (NAT) and stateful firewall capabilities. However, next-hop service sets do not monitor Routing Engine traffic by default and require configuration of multiple service sets to support traffic from multiple interfaces.
- Interface service set—Applied to a physical interface and similar to a stateless firewall filter. They are easy to configure, can support traffic from multiple interfaces, and can monitor Routing Engine traffic by default. However, they cannot support dynamic routing protocols or multicast traffic over the IPsec tunnel.

In general, we recommend that you use next-hop service sets because they support routing protocols and multicast over the IPsec tunnel, they are easier to understand, and the routing table makes forwarding decisions without administrative intervention.

CHAPTER 2

Glossary

- [Terms and Acronyms on page 11](#)

Terms and Acronyms

A

Adaptive Services PIC	A next-generation Physical Interface Card (PIC) that provides IPSec services and other services, such as Network Address Translation (NAT) and stateful firewall, on M Series and T Series platforms.
Advanced Encryption Standard (AES)	A next-generation encryption method that is based on the Rijndael algorithm and uses a 128-bit block, three different key sizes (128, 192, and 256 bits), and multiple rounds of processing to encrypt data.
authentication header (AH)	A component of the IPSec protocol used to verify that the contents of a packet have not changed (data integrity), and to validate the identity of the sender (data source authentication). For more information about AH, see RFC 2402.

C

certificate authority (CA)	A trusted third-party organization that generates, enrolls, validates, and revokes digital certificates. The CA guarantees the identity of a user and issues public and private keys for message encryption and decryption.
certificate revocation list (CRL)	A list of digital certificates that have been invalidated before their expiration date, including the reasons for their revocation and the names of the entities that have issued them. A CRL prevents usage of digital certificates and signatures that have been compromised.
cipher block chaining (CBC)	A cryptographic method that encrypts blocks of ciphertext by using the encryption result of one block to encrypt the next block. Upon decryption, the validity of each block of ciphertext depends on the validity of all the preceding ciphertext blocks. For more information on how to use CBC with DES and ESP to provide confidentiality, see RFC 2405.

D

Data Encryption Standard (DES)	An encryption algorithm that encrypts and decrypts packet data by processing the data with a single shared key. DES operates in increments of 64-bit blocks and provides 56-bit encryption.
---------------------------------------	---

digital certificate Electronic file that uses private and public key technology to verify the identity of a certificate creator and distribute keys to peers.

E

Encapsulating Security Payload (ESP) A component of the IPSec protocol used to encrypt data in an IPv4 or IPv6 packet, provide data integrity, and ensure data source authentication. For more information about ESP, see RFC 2406.

ES PIC A PIC that provides first-generation encryption services and software support for IPSec on M Series and T Series platforms.

H

Hashed Message Authentication Code (HMAC) A mechanism for message authentication using cryptographic hash functions. HMAC can be used with any iterative cryptographic hash function, such as MD5 or SHA-1, in combination with a secret shared key. For more information on HMAC, see RFC 2104.

I

Internet Key Exchange (IKE) Establishes shared security parameters for any hosts or routers using IPSec. IKE establishes the SAs for IPSec. For more information about IKE, see RFC 2407.

M

Message Digest 5 (MD5) An authentication algorithm that takes a data message of arbitrary length and produces a 128-bit message digest. For more information, see RFC 1321.

P

Perfect Forward Secrecy (PFS) Provides additional security by means of a Diffie-Hellman shared secret value. With PFS, if one key is compromised, previous and subsequent keys are secure because they are not derived from previous keys.

public key infrastructure (PKI) A trust hierarchy that enables users of a public network to securely and privately exchange data through the use of public and private cryptographic key pairs that are obtained and shared with peers through a trusted authority.

R

registration authority (RA) A trusted third-party organization that acts on behalf of a CA to guarantee the identity of a user.

Routing Engine A PCI-based architectural portion of a Junos OS-based router that handles the routing protocol process, the interface process, some of the chassis components, system management, and user access.

S

Secure Hash Algorithm 1 (SHA-1) An authentication algorithm that takes a data message of less than 264 bits in length and produces a 160-bit message digest. For more information on SHA-1, see RFC 3174.

Secure Hash Algorithm 2 (SHA-2)	A successor to the SHA-1 authentication algorithm that includes a group of SHA-1 variants (SHA-224, SHA-256, SHA-384, and SHA-512). SHA-2 algorithms use larger hash sizes and are designed to work with enhanced encryption algorithms such as AES.
security association (SA)	Specifications that must be agreed upon between two network devices before IKE or IPSec are allowed to function. SAs primarily specify protocol, authentication, and encryption options.
Security Association Database (SADB)	A database where all SAs are stored, monitored, and processed by IPSec.
Security Parameter Index (SPI)	An identifier that is used to uniquely identify an SA at a network host or router.
Security Policy Database (SPD)	A database that works with the SADB to ensure maximum packet security. For inbound packets, IPSec checks the SPD to verify if the incoming packet matches the security configured for a particular policy. For outbound packets, IPSec checks the SPD to see if the packet needs to be secured.
Simple Certificate Enrollment Protocol (SCEP)	A protocol that supports CA and registration authority (RA) public key distribution, certificate enrollment, certificate revocation, certificate queries, and certificate revocation list (CRL) queries.
T	
Triple Data Encryption Standard (3DES)	An enhanced DES algorithm that provides 168-bit encryption by processing data three times with three different keys.

PART 2

Configuration

- [Configuration Tasks for Junos VPN Site Secure on page 19](#)
- [Examples on page 59](#)
- [Configuration Statements on page 143](#)

CHAPTER 3

Junos VPN Site Secure Configuration Guidelines

- [Minimum Security Association Configurations on page 17](#)

Minimum Security Association Configurations

The following sections show the minimum configurations necessary to set up security associations (SAs) for IPsec services:

- [Minimum Manual SA Configuration on page 17](#)
- [Minimum Dynamic SA Configuration on page 17](#)

Minimum Manual SA Configuration

To define a manual SA configuration, you must include at least the following statements at the `[edit services ipsec-vpn rule rule-name term term-name then manual]` hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual]
direction (inbound | outbound | bidirectional) {
  authentication {
    algorithm (hmac-md5-96 | hmac-sha1-96);
    key (ascii-text key | hexadecimal key);
  }
  encryption {
    algorithm algorithm;
    key (ascii-text key | hexadecimal key);
  }
  protocol (ah | esp | bundle);
  spi spi-value;
}
```

Minimum Dynamic SA Configuration

To define a dynamic SA configuration, you must include at least the following statements at the `[edit services ipsec-vpn]` hierarchy level:

```
[edit services ipsec-vpn]
ike {
  proposal proposal-name {
```

```
authentication-algorithm (md5 | sha1 | sha-256);
authentication-method pre-shared-keys;
dh-group (group1 | group2 | group5 | group14);
encryption-algorithm algorithm;
}
policy policy-name {
  proposals [ ike-proposal-names ];
  pre-shared-key (ascii-text key | hexadecimal key);
  version (1 | 2);
  mode (aggressive | main);
}
}
ipsec {
  policy policy-name {
    proposals [ ipsec-proposal-names ];
  }
  proposal proposal-name {
    authentication-algorithm (hmac-md5-96 | hmac-sha1-96);
    encryption-algorithm algorithm;
    protocol (ah | esp | bundle);
  }
}
```

NOTE:

- Starting with Junos OS Release 11.4, both IKEv1 and IKEv2 are supported by default on all M Series, MX Series, and T Series routers. The `version` statement at the `[edit services ipsec-vpn ike policy name]` hierarchy level allows you to configure the specific IKE version to be supported.
 - The `mode` statement at the `[edit services ipsec-vpn ike policy name]` hierarchy level is required only if the `version` option is set to 1.
-

You must also include the `ipsec-policy` statement at the `[edit services ipsec-vpn rule rule-name term term-name then dynamic]` hierarchy level.

Configuring Security Associations

To use IPsec services, you create a security association (SA) between hosts. An SA is a simplex connection that enables two hosts to communicate with each other securely using IPsec.

NOTE: Both OSPFv2 and OSPFv3 support IPsec authentication. However, dynamic or tunnel mode IPsec SAs are not supported for OSPFv3. If you add SAs into OSPFv3 by including the `ipsec-sa` statement at the `[edit protocols ospf3 area area-number interface interface-name]` hierarchy level, your configuration commit fails. For more information about OSPF authentication and other OSPF properties, see the [Junos OS Routing Protocols Configuration Guide](#).

You can configure two types of SAs:

- **Manual**—Requires no negotiation; all values, including the keys, are static and specified in the configuration. As a result, each peer must have the same configured options for communication to take place.

- **Dynamic**—Specifies proposals to be negotiated with the tunnel peer. The keys are generated as part of the negotiation and therefore do not need to be specified in the configuration. The dynamic SA includes one or more **proposal** statements that prioritizes a list of protocols and algorithms to be negotiated with the peer.

This section includes the following topics:

- [Configuring Manual Security Associations on page 20](#)
- [Configuring Dynamic Security Associations on page 24](#)
- [Clearing Security Associations on page 25](#)

Configuring Manual Security Associations

Manual SAs require no negotiation; all values, including the keys, are static and specified in the configuration. As a result, each peer must have the same configured options for communication to take place. Manual SAs are best suited for small, static networks where the distribution, maintenance, and tracking of keys are not difficult.

To configure a manual IPsec security association, include the following statements at the `[edit services ipsec-vpn rule rule-name term term-name then manual]` hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual]
direction (inbound | outbound | bidirectional) {
  authentication {
    algorithm (hmac-md5-96 | hmac-sha-256-128 | hmac-sha1-96);
    key (ascii-text key | hexadecimal key);
  }
  auxiliary-spi auxiliary-spi-value;
  encryption {
    algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
    key (ascii-text key | hexadecimal key);
  }
  protocol (ah | esp | bundle);
  spi spi-value;
}
```

To configure manual SA statements, do the following:

- [Configuring the Direction for IPsec Processing on page 20](#)
- [Configuring the Protocol for a Manual IPsec SA on page 21](#)
- [Configuring the Security Parameter Index on page 22](#)
- [Configuring the Auxiliary Security Parameter Index on page 22](#)
- [Configuring Authentication for a Manual IPsec SA on page 22](#)
- [Configuring Encryption for a Manual IPsec SA on page 23](#)

Configuring the Direction for IPsec Processing

The **direction** statement specifies inbound or outbound IPsec processing. If you want to define different algorithms, keys, or security parameter index (SPI) values for each direction, you configure the **inbound** and **outbound** options. If you want the same attributes in both directions, use the **bidirectional** option.

To configure the direction of IPsec processing, include the **direction** statement at the **[edit services ipsec-vpn rule *rule-name* term *term-name* then manual]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual]
  direction (inbound | outbound | bidirectional) {
  ...
}
```

The following two examples illustrate this:

- Example: Using Different Configuration for the Inbound and Outbound Directions

Define different algorithms, keys, and security parameter index values for each direction:

```
[edit services ipsec-vpn rule rule-name term term-name then manual]
  direction bidirectional {
    protocol ah;
    spi 20001;
    authentication {
      algorithm hmac-md5-96;
      key ascii-text 123456789012abcd;
    }
  }
  direction outbound {
    protocol esp;
    spi 24576;
    encryption {
      algorithm 3des-cbc;
      key ascii-text 12345678901234567890abcd;
    }
  }
}
```

- Example: Using the Same Configuration for the Inbound and Outbound Directions

Define one set of algorithms, keys, and security parameter index values that is valid in both directions:

```
[edit services ipsec-vpn rule rule-name term term-name then manual]
  direction bidirectional {
    protocol ah;
    spi 20001;
    authentication {
      algorithm hmac-md5-96;
      key ascii-text 123456789012abcd;
    }
  }
}
```

Configuring the Protocol for a Manual IPsec SA

IPsec uses two protocols to protect IP traffic: Encapsulating Security Payload (ESP) and authentication header (AH). The AH protocol is used for strong authentication. A third option, **bundle**, uses AH authentication and ESP encryption; it does not use ESP authentication because AH provides stronger authentication of IP packets.

To configure the IPsec protocol, include the **protocol** statement and specify the **ah**, **esp**, or **bundle** option at the **[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]
protocol (ah | bundle | esp);
```

Configuring the Security Parameter Index

An SPI is an arbitrary value that uniquely identifies which SA to use at the receiving host. The sending host uses the SPI to identify and select which SA to use to secure every packet. The receiving host uses the SPI to identify and select the encryption algorithm and key used to decrypt packets.

NOTE: Each manual SA must have a unique SPI and protocol combination. Use the auxiliary SPI when you configure the **protocol** statement to use the **bundle** option.

To configure the SPI, include the **spi** statement and specify a value (from 256 through 16,639) at the **[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]
spi spi-value;
```

Configuring the Auxiliary Security Parameter Index

Use the auxiliary SPI when you configure the **protocol** statement to use the **bundle** option.

NOTE: Each manual SA must have a unique SPI and protocol combination.

To configure the auxiliary SPI, include the **auxiliary-spi** statement and specify a value (from 256 through 16,639) at the **[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]
auxiliary-spi auxiliary-spi-value;
```

Configuring Authentication for a Manual IPsec SA

To configure an authentication algorithm, include the **authentication** statement and specify an authentication algorithm and a key at the **[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]
authentication {
  algorithm (hmac-md5-96 | hmac-sha1-96 | hmac-sha-256-128)
  key (ascii-text key | hexadecimal key);
}
```

The algorithm can be one of the following:

- **hmac-md5-96**—Hash algorithm that authenticates packet data. It produces a 128-bit authenticator value and a 96-bit digest.
- **hmac-sha1-96**—Hash algorithm that authenticates packet data. It produces a 160-bit authenticator value and a 96-bit digest.
- **hmac-sha-256-128**—Hash algorithm that authenticates packet data. It produces a 256-bit authenticator value 256-bit digest, truncated to 128 bits.

The key can be one of the following:

- **ascii-text**—ASCII text key. With the **hmac-md5-96** option, the key contains 16 ASCII characters. With the **hmac-sha1-96** option, the key contains 20 ASCII characters.
- **hexadecimal**—Hexadecimal key. With the **hmac-md5-96** option, the key contains 32 hexadecimal characters. With the **hmac-sha1-96** option, the key contains 40 hexadecimal characters.

Configuring Encryption for a Manual IPsec SA

To configure IPsec encryption, include the **encryption** statement and specify an algorithm and key at the **[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then manual direction direction]
  encryption {
    algorithm algorithm;
    key (ascii-text key | hexadecimal key);
  }
```

The algorithm can be one of the following:

- **des-cbc**—Encryption algorithm that has a block size of 8 bytes; its key size is 64 bits long.
- **3des-cbc**—Encryption algorithm that has a block size of 24 bytes; its key size is 192 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

NOTE: For a list of Data Encryption Standard (DES) encryption algorithm weak and semiweak keys, see RFC 2409, *The Internet Key Exchange (IKE)*. The AES encryption algorithms use a software implementation that has much lower throughput, so DES remains the recommended option. For reference information on AES encryption, see RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*.

For **3des-cbc**, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

If you configure an authentication proposal but do not include the encryption statement, the result is NULL encryption. Certain applications expect this result. If you configure no specific authentication or encryption values, the Junos OS uses the default values of **sha1** for the authentication and **3des-cbc** for the encryption.

The key can be one of the following:

- **ascii-text**—ASCII text key. With the **des-cbc** option, the key contains 8 ASCII characters. With the **3des-cbc** option, the key contains 24 ASCII characters.
- **hexadecimal**—Hexadecimal key. With the **des-cbc** option, the key contains 16 hexadecimal characters. With the **3des-cbc** option, the key contains 48 hexadecimal characters.

NOTE: You cannot configure encryption when you use the AH protocol.

Configuring Dynamic Security Associations

You configure dynamic SAs with a set of proposals that are negotiated by the security gateways. The keys are generated as part of the negotiation and therefore do not need to be specified in the configuration. The dynamic SA includes one or more proposals, which allow you to prioritize a list of protocols and algorithms to be negotiated with the peer.

To enable a dynamic SA, follow these steps:

1. Configure Internet Key Exchange (IKE) proposals and IKE policies associated with these proposals.
2. Configure IPsec proposals and an IPsec policy associated with these proposals.
3. Associate an SA with an IPsec policy by configuring the **dynamic** statement.

To configure a dynamic SA, include the **dynamic** statement and specify an IPsec policy name at the **[edit services ipsec-vpn rule *rule-name* term *term-name* then]** hierarchy level. The **ike-policy** statement is optional unless you use the preshared key authentication method.

```
[edit services ipsec-vpn rule rule-name term term-name then]
dynamic {
  ike-policy policy-name;
  ipsec-policy policy-name;
}
```

NOTE: If you want to establish a dynamic SA, the attributes in at least one configured IPsec and IKE proposal must match those of its peer.

Clearing Security Associations

You can set up the router software to clear IKE or IPsec SAs automatically when the corresponding services PIC restarts or is taken offline. To configure this property, include the **clear-ike-sas-on-pic-restart** or **clear-ipsec-sas-on-pic-restart** statement at the **[edit services ipsec-vpn]** hierarchy level:

```
[edit services ipsec-vpn]
clear-ike-sas-on-pic-restart;
clear-ipsec-sas-on-pic-restart;
```

After you add this statement to the configuration, all the IKE or IPsec SAs corresponding to the tunnels in the PIC will be cleared when the PIC restarts or goes offline.

Related Documentation

- [Configuring IPsec Policies on page 37](#)
- [Configuring IPsec Proposals on page 35](#)
- [Configuring IKE Policies on page 29](#)
- [Configuring IKE Proposals on page 25](#)

Configuring IKE Proposals

Dynamic security associations (SAs) require IKE configuration. With dynamic SAs, you configure IKE first, and then the SA. IKE creates the dynamic SAs and negotiates them for IPsec. The IKE configuration defines the algorithms and keys used to establish the secure IKE connection with the peer security gateway.

You can configure one or more IKE proposals. Each proposal is a list of IKE attributes to protect the IKE connection between the IKE host and its peer.

To configure an IKE proposal, include the **proposal** statement and specify a name at the **[edit services ipsec-vpn ike]** hierarchy level:

```
[edit services ipsec-vpn ike]
proposal proposal-name {
  authentication-algorithm (md5 | sha1 | sha-256);
  authentication-method (pre-shared-key | rsa-signatures);
  dh-group (group1 | group2 | group5 | group14 | group19 | group20);
  encryption-algorithm algorithm;
  lifetime-seconds seconds;
```

```
}
```

This section includes the following topics:

- [Configuring the Authentication Algorithm for an IKE Proposal on page 26](#)
- [Configuring the Authentication Method for an IKE Proposal on page 26](#)
- [Configuring the Diffie-Hellman Group for an IKE Proposal on page 27](#)
- [Configuring the Encryption Algorithm for an IKE Proposal on page 28](#)
- [Configuring the Lifetime for an IKE SA on page 28](#)
- [Example: Configuring an IKE Proposal on page 29](#)

Configuring the Authentication Algorithm for an IKE Proposal

To configure the authentication algorithm for an IKE proposal, include the **authentication-algorithm** statement at the **[edit services ipsec-vpn ike proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ike proposal proposal-name]  
authentication-algorithm (md5 | sha1 | sha-256);
```

The authentication algorithm can be one of the following:

- **md5**—Produces a 128-bit digest.
- **sha1**—Produces a 160-bit digest.
- **sha-256**—Produces a 256-bit digest.

NOTE: For reference information on Secure Hash Algorithms (SHAs), see Internet draft [draft-eastlake-sha2-02.txt](#), *Secure Hash Algorithms (SHA and HMAC-SHA)* (expires July 2006).

Configuring the Authentication Method for an IKE Proposal

To configure the authentication method for an IKE proposal, include the **authentication-method** statement at the **[edit services ipsec-vpn ike proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ike proposal proposal-name]  
authentication-method (dsa-signatures | pre-shared-keys | rsa-signatures);
```

NOTE: In IKEv1, the authentication method for SAs is negotiated with the remote peer based on the type of authentication method configured in the IKE proposal. In IKEv2, such a negotiation is not performed with the remote peer. Instead, each IKE peer uses the authentication method that is locally configured for them.

For SAs in IKEv2, the authentication method is the default value as IKEv1 if an authentication method is not configured in the IKE proposal. If you are configuring an authentication method for IKEv2, you must have the same authentication method configured for all proposals referenced in the policy.

The authentication method can be one of the following:

- **pre-shared-keys**—A key derived from an out-of-band mechanism; the key authenticates the exchanges
- **rsa-signatures**—Public key algorithm (supports encryption and digital signatures)

Configuring the Diffie-Hellman Group for an IKE Proposal

Diffie-Hellman is a public-key cryptography scheme that allows two parties to establish a shared secret over an insecure communications channel. It is also used within IKE to establish session keys.

To configure the Diffie-Hellman group for an IKE proposal, include the **dh-group** statement at the `[edit services ipsec-vpn ike proposal proposal-name]` hierarchy level:

```
[edit services ipsec-vpn ike proposal proposal-name]  
  dh-group (group1 | group2 | group5 | group14 | group19 | group20);
```

The group can be one of the following:

- **group1**—Specifies that IKE uses the 768-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group2**—Specifies that IKE uses the 1024-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group5**—Specifies that IKE uses the 1536-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group14**—Specifies that IKE uses the 2048-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group19**—Specifies that IKE uses the 256-bit random Elliptic Curve Diffie-Hellman Group when performing the new Diffie-Hellman exchange.
- **group20**—Specifies that IKE uses the 384-bit random Elliptic Curve Diffie-Hellman Group when performing the new Diffie-Hellman exchange.

Using a Diffie-Hellman group based on a greater number of bits results a more secure IKE tunnel than using a group based on fewer bits. However, this additional security might require additional processing time.

Configuring the Encryption Algorithm for an IKE Proposal

To configure the encryption algorithm for an IKE proposal, include the **encryption-algorithm** statement at the **[edit services ipsec-vpn ike proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ike proposal proposal-name]  
  encryption-algorithm algorithm;
```

The encryption algorithm can be one of the following:

- **3des-cbc**—Cipher block chaining encryption algorithm with a key size of 24 bytes; its key size is 192 bits long.
- **des-cbc**—Cipher block chaining encryption algorithm with a key size of 8 bytes; its key size is 56 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

NOTE: For a list of Data Encryption Standard (DES) encryption algorithm weak and semiweak keys, see RFC 2409, *The Internet Key Exchange (IKE)*. The AES encryption algorithms use a software implementation that has much lower throughput, so DES remains the recommended option.

For 3des-cbc, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

If you configure an authentication proposal but do not include the encryption statement, the result is NULL encryption. Certain applications expect this result. If you configure no specific authentication or encryption values, the Junos OS uses the default values of sha1 for the authentication and 3des-cbc for the encryption.

Configuring the Lifetime for an IKE SA

The **lifetime-seconds** statement sets the lifetime of an IKE SA. When the IKE SA expires, it is replaced by a new SA (and SPI) or the IPsec connection is terminated.

To configure the lifetime for an IKE SA, include the **lifetime-seconds** statement at the **[edit services ipsec-vpn ike proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ike proposal proposal-name]  
  lifetime-seconds seconds;
```

By default, the IKE SA lifetime is 3600 seconds. The range is from 180 through 86,400 seconds.

NOTE: In IKEv1, the lifetime for SAs is negotiated with the remote peer based on the type of lifetime configured in the IKE proposal. In IKEv2, such a negotiation is not performed with the remote peer. Instead, each IKE peer uses the lifetime that is locally configured for them.

For SAs in IKEv2, the lifetime is either the default value as IKEv1 (if another lifetime is not configured in the IKE proposal) or all IKEv2 proposals in the IKE policy must be configured with the same lifetime value.

NOTE: For IKE proposals, there is only one SA lifetime value, specified by the Junos OS. IPsec proposals use a different mechanism.

Example: Configuring an IKE Proposal

Configure an IKE proposal:

```
[edit services ipsec-vpn ike]
proposal ike-proposal {
  authentication-method pre-shared-keys;
  dh-group group1;
  authentication-algorithm sha1;
  encryption-algorithm 3des-cbc;
}
```

- [Configuring IKE Policies on page 29](#)
- [Configuring IPsec Policies on page 37](#)
- [Configuring Security Associations on page 19](#)

Configuring IKE Policies

An IKE policy defines a combination of security parameters (IKE proposals) to be used during IKE negotiation. It defines a peer address and the proposals needed for that connection. Depending on which authentication method is used, it defines the preshared key for the given peer or the local certificate. During the IKE negotiation, IKE looks for an IKE policy that is the same on both peers. The peer that initiates the negotiation sends all its policies to the remote peer, and the remote peer tries to find a match.

A match is made when both policies from the two peers have a proposal that contains the same configured attributes. If the lifetimes are not identical, the shorter lifetime between the two policies (from the host and peer) is used. The configured preshared key must also match its peer.

Starting with Junos OS Release 11.4, both IKEv1 and IKEv2 are supported by default on all M Series, MX Series, and T Series routers. You can configure the specific IKE phase to be supported for the negotiation. However, if only IKEv1 is supported, the Junos OS rejects

IKEv2 negotiations. Similarly, if only IKEv2 is supported, the Junos OS rejects all IKEv1 negotiations.

The key management process (kmd) daemon determines which version of IKE is used in a negotiation. If kmd is the IKE initiator, it uses IKEv1 by default and retains the configured version for negotiations. If kmd is the IKE responder, it accepts connections from both IKEv1 and IKEv2.

You can create multiple, prioritized proposals at each peer to ensure that at least one proposal matches a remote peer's proposal.

First, you configure one or more IKE proposals; then you associate these proposals with an IKE policy. You can also prioritize a list of proposals used by IKE in the **policy** statement by listing the proposals you want to use, from first to last.

To configure an IKE policy, include the **policy** statement and specify a policy name at the **[edit services ipsec-vpn ike]** hierarchy level:

```
[edit services ipsec-vpn ike]
policy policy-name {
  description description;
  local-certificate identifier;
  local-id (ipv4_addr ipv4-address | ipv6_addr ipv6-address | key-id identifier);
  version (1 | 2);
  mode (aggressive | main);
  pre-shared-key (ascii-text key | hexadecimal key);
  proposals [ proposal-names ];
  remote-id {
    any-remote-id;
    ipv4_addr [ values ];
    ipv6_addr [ values ];
    key_id [ values ];
  }
  respond-bad-spi max-responses;
}
```

This section includes the following topics:

- [Configuring the IKE Phase on page 30](#)
- [Configuring the Mode for an IKE Policy on page 31](#)
- [Configuring the Proposals in an IKE Policy on page 31](#)
- [Configuring the Preshared Key for an IKE Policy on page 31](#)
- [Configuring the Local Certificate for an IKE Policy on page 32](#)
- [Configuring the Description for an IKE Policy on page 33](#)
- [Configuring Local and Remote IDs for IKE Phase 1 Negotiation on page 33](#)
- [Example: Configuring an IKE Policy on page 34](#)

Configuring the IKE Phase

Starting with Junos OS Release 11.4, both IKEv1 and IKEv2 are supported by default on all M Series, MX Series, and T Series routers. You can configure the specific IKE phase to

be supported for the negotiation. However, if only IKEv1 is supported, the Junos OS rejects IKEv2 negotiations. Similarly, if only IKEv2 is supported, the Junos OS rejects all IKEv1 negotiations.

To configure the IKE phase used, include the **version** statement at the **[edit services ipsec-vpn ike policy *policy-name*]** hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]  
version (1 | 2);
```

Configuring the Mode for an IKE Policy

IKE policy has two modes: aggressive and main. By default, main mode is enabled. Main mode uses six messages, in three exchanges, to establish the IKE SA. (These three steps are IKE SA negotiation, a Diffie-Hellman exchange, and authentication of the peer.) Main mode also allows a peer to hide its identity.

Aggressive mode also establishes an authenticated IKE SA and keys. However, aggressive mode uses half the number of messages, has less negotiation power, and does not provide identity protection. The peer can use the aggressive or main mode to start IKE negotiation; the remote peer accepts the mode sent by the peer.

NOTE: The mode configuration is required only if the **version** option is set to 1.

To configure the mode for an IKE policy, include the **mode** statement and specify **aggressive** or **main** at the **[edit services ipsec-vpn ike policy *policy-name*]** hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]  
mode (aggressive | main);
```

Configuring the Proposals in an IKE Policy

The IKE policy includes a list of one or more proposals associated with an IKE policy.

To configure the proposals in an IKE policy, include the **proposals** statement and specify one or more proposal names at the **[edit services ipsec-vpn ike policy *policy-name*]** hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]  
proposals [ proposal-names ];
```

Configuring the Preshared Key for an IKE Policy

When you include the **authentication-method pre-shared-keys** statement at the **[edit services ipsec-vpn ike proposal *proposal-name*]** hierarchy level, IKE policy preshared keys authenticate peers. You must manually configure a preshared key, which must match that of its peer. The preshared key can be an ASCII text (alphanumeric) key or a hexadecimal key.

To configure the preshared key in an IKE policy, include the **pre-shared-key** statement and a key at the **[edit services ipsec-vpn ike policy *policy-name*]** hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]  
pre-shared-key (ascii-text key | hexadecimal key);
```

The key can be one of the following:

- **ascii-text**—ASCII text key. With the **des-cbc** option, the key contains 8 ASCII characters. With the **3des-cbc** option, the key contains 24 ASCII characters.
- **hexadecimal**—Hexadecimal key. With the **des-cbc** option, the key contains 16 hexadecimal characters. With the **3des-cbc** option, the key contains 48 hexadecimal characters.

Configuring the Local Certificate for an IKE Policy

When you include the **authentication-method rsa-signatures** statement at the **[edit services ipsec-vpn ike proposal proposal-name]** hierarchy level, public key infrastructure (PKI) digital certificates authenticate peers. You must identify a local certificate that is sent to the peer during the IKE authentication phase.

To configure the local certificate for an IKE policy, include the **local-certificate** statement at the **[edit services ipsec-vpn ike policy policy-name]** hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]  
local-certificate identifier;
```

The **local-certificate** statement specifies the identifier used to obtain the end entity's certificate from the certification authority. Configuring it in an IKE policy allows you the flexibility of using a separate certificate with each remote peer if that is needed. You must also specify the identity of the certification authority by configuring the **ca-profile** statement at the **[edit security pki]** hierarchy level; for more information, see the [Junos OS System Basics Configuration Guide](#).

You can use the configured profiles to establish a set of trusted certification authorities for use with a particular service set. This enables you to configure separate service sets for individual clients to whom you are providing IP services; the distinct service sets provide logical separation of one set of IKE sessions from another, using different local gateway addresses, or *virtualization*. To configure the set of trusted certification authorities, include the **trusted-ca** statement at the **[edit services service-set service-set-name ipsec-vpn-options]** hierarchy level:

```
[edit services service-set service-set-name ipsec-vpn-options]  
trusted-ca ca-profile;
```

See the following to configure a certificate revocation list:

- [Configuring a Certificate Revocation List on page 32](#)

Configuring a Certificate Revocation List

A certificate revocation list (CRL) contains a list of digital certificates that have been cancelled before their expiration date. When a participating peer uses a digital certificate, it checks the certificate signature and validity. It also acquires the most recently issued CRL and checks that the certificate serial number is not on that CRL.

NOTE: By default, certificate revocation list verification is enabled. You can disable CRL verification by including the `disable` statement at the `[edit security pki ca-profile ca-profile-name revocation-check]` hierarchy level.

By default, if the router either cannot access the Lightweight Directory Access Protocol (LDAP) URL or retrieve a valid certificate revocation list, certificate verification fails and the IPsec tunnel is not established. To override this behavior and permit the authentication of the IPsec peer when the CRL is not downloaded, include the `disable on-download-failure` statement at the `[edit security pki ca-profile ca-profile-name revocation-check crl]` hierarchy level.

To use the CA certificate revocation list, you include statements at the `[edit security pki ca-profile ca-profile-name revocation-check]` hierarchy level. For details, see the *Junos OS System Basics Configuration Guide*.

Configuring the Description for an IKE Policy

To specify an optional text description for an IKE policy, include the `description` statement at the `[edit services ipsec-vpn ike policy policy-name]` hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]
description description;
```

Configuring Local and Remote IDs for IKE Phase 1 Negotiation

You can optionally specify local identifiers for use in IKE phase 1 negotiation. If the `local-id` statement is omitted, the local gateway address is used.

To specify one or more local IDs, include the `local-id` statement at the `[edit services ipsec-vpn ike policy policy-name]` hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]
local-id (ipv4_addr ipv4-address | ipv6_addr ipv6-address | key-id identifier);
```

You can also specify remote gateway identifiers for which the IKE policy is used. The remote gateway address in which this policy is defined is added by default.

To specify one or more remote IDs, include the `remote-id` statement at the `[edit services ipsec-vpn ike policy policy-name]` hierarchy level:

```
[edit services ipsec-vpn ike policy policy-name]
remote-id {
  any-remote-id;
  ipv4_addr [ values ];
  ipv6_addr [ values ];
  key_id [ values ];
}
```

The `any-remote-id` option allows any remote address to connect. This option is supported only in dynamic endpoints configurations and cannot be configured along with specific values.

Example: Configuring an IKE Policy

Define two IKE policies: **policy 10.1.1.2** and **policy 10.1.1.1**. Each policy is associated with **proposal-1** and **proposal-2**. The following configuration uses only IKEv1 for negotiation.

```
[edit services ipsec-vpn]
ike {
  proposal proposal-1 {
    authentication-method pre-shared-keys;
    dh-group group1;
    authentication-algorithm sha1;
    encryption-algorithm 3des-cbc;
    lifetime-seconds 1000;
  }
  proposal proposal-2 {
    authentication-method pre-shared-keys;
    dh-group group2;
    authentication-algorithm md5;
    encryption-algorithm des-cbc;
    lifetime-seconds 10000;
  }
  proposal proposal-3 {
    authentication-method rsa-signatures;
    dh-group group2;
    authentication-algorithm md5;
    encryption-algorithm des-cbc;
    lifetime-seconds 10000;
  }
  policy 10.1.1.2 {
    mode main;
    proposals [ proposal-1 proposal-2 ];
    pre-shared-key ascii-text example-pre-shared-key;
  }
  policy 10.1.1.1 {
    local-certificate certificate-file-name;
    local-key-pair private-public-key-file;
    mode aggressive;
    proposals [ proposal-2 proposal-3 ]
    pre-shared-key hexadecimal 0102030abbcd;
  }
}
```

NOTE: Updates to the current IKE proposal and policy configuration are not applied to the current IKE SA; updates are applied to new IKE SAs.

If you want the new updates to take immediate effect, you must clear the existing IKE security associations so that they will be reestablished with the changed configuration. For information about how to clear the current IKE security association, see the [Junos OS System Basics and Services Command Reference](#).

 - [Configuring IPsec Proposals on page 35](#)
 - [Configuring Security Associations on page 19](#)

Configuring IPsec Proposals

An IPsec proposal lists protocols and algorithms (security services) to be negotiated with the remote IPsec peer.

To configure an IPsec proposal, include the **proposal** statement and specify an IPsec proposal name at the **[edit services ipsec-vpn ipsec]** hierarchy level:

```
[edit services ipsec-vpn ipsec]
proposal proposal-name {
  authentication-algorithm (hmac-md5-96 | hmac-sha1-96);
  description description;
  encryption-algorithm algorithm;
  lifetime-seconds seconds;
  protocol (ah | esp | bundle);
}
```

This section discusses the following topics:

- [Configuring the Authentication Algorithm for an IPsec Proposal on page 35](#)
- [Configuring the Description for an IPsec Proposal on page 36](#)
- [Configuring the Encryption Algorithm for an IPsec Proposal on page 36](#)
- [Configuring the Lifetime for an IPsec SA on page 36](#)
- [Configuring the Protocol for a Dynamic SA on page 37](#)

Configuring the Authentication Algorithm for an IPsec Proposal

To configure the authentication algorithm for an IPsec proposal, include the **authentication-algorithm** statement at the **[edit services ipsec-vpn ipsec proposal proposal-name]** hierarchy level:

```
[edit services ipsec-vpn ipsec proposal proposal-name]
authentication-algorithm (hmac-md5-96 | hmac-sha1-96);
```

The authentication algorithm can be one of the following:

- **hmac-md5-96**—Hash algorithm that authenticates packet data. It produces a 128-bit digest. Only 96 bits are used for authentication.
- **hmac-sha1-96**—Hash algorithm that authenticates packet data. It produces a 160-bit digest. Only 96 bits are used for authentication.

Configuring the Description for an IPsec Proposal

To specify an optional text description for an IPsec proposal, include the **description** statement at the **[edit services ipsec-vpn ipsec proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ipsec proposal proposal-name]  
description description;
```

Configuring the Encryption Algorithm for an IPsec Proposal

To configure encryption algorithm for an IPsec proposal, include the **encryption-algorithm** statement at the **[edit services ipsec-vpn ipsec proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ipsec proposal proposal-name]  
encryption-algorithm algorithm;
```

The encryption algorithm can be one of the following:

- **3des-cbc**—Encryption algorithm that has a block size of 24 bytes; its key size is 192 bits long.
- **des-cbc**—Encryption algorithm that has a block size of 8 bytes; its key size is 48 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

NOTE: For a list of Data Encryption Standard (DES) encryption algorithm weak and semiweak keys, see RFC 2409, *The Internet Key Exchange (IKE)*. The AES encryption algorithms use a software implementation that has much lower throughput, so DES remains the recommended option.

For **3des-cbc**, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

If you configure an authentication proposal but do not include the encryption statement, the result is NULL encryption. Certain applications expect this result. If you configure no specific authentication or encryption values, the Junos OS uses the default values of **sha1** for the authentication and **3des-cbc** for the encryption.

Configuring the Lifetime for an IPsec SA

When a dynamic IPsec SA is created, two types of lifetimes are used: hard and soft. The hard lifetime specifies the lifetime of the SA. The soft lifetime, which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This allows the key management system to negotiate a new SA before the hard lifetime expires.

NOTE: In IKEv1, the lifetime for SAs is negotiated with the remote peer based on the type of lifetime configured in the IPsec proposal. In IKEv2, such a negotiation is not performed with the remote peer. Instead, each IKE peer uses the lifetime that is locally configured for them.

For SAs in IKEv2, the lifetime is either the default value as IKEv1 (if another lifetime is not configured in the IPsec proposal) or all IKEv2 proposals in the IPsec policy must be configured with the same lifetime value.

To configure the hard lifetime value, include the **lifetime-seconds** statement and specify the number of seconds at the **[edit services ipsec-vpn ipsec proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ipsec proposal proposal-name]
lifetime-seconds seconds;
```

The default lifetime is 28,800 seconds. The range is from 180 through 86,400 seconds.

The soft lifetime values are as follows:

- Initiator: Soft lifetime = Hard lifetime – 135 seconds.
- Responder: Soft lifetime = Hard lifetime – 90 seconds.

Configuring the Protocol for a Dynamic SA

The **protocol** statement sets the protocol for a dynamic SA. IPsec uses two protocols to protect IP traffic: ESP and AH. The ESP protocol can support authentication, encryption, or both. The AH protocol is used for strong authentication. AH also authenticates the IP packet. The **bundle** option uses AH authentication and ESP encryption; it does not use ESP authentication because AH provides stronger authentication of IP packets.

To configure the protocol for a dynamic SA, include the **protocol** statement and specify the **ah**, **esp**, or **bundle** option at the **[edit services ipsec-vpn ipsec proposal *proposal-name*]** hierarchy level:

```
[edit services ipsec-vpn ipsec proposal proposal-name]
protocol (ah | esp | bundle);
```

Related Documentation

- [Configuring IKE Proposals on page 25](#)
- [Configuring IKE Policies on page 29](#)
- [Configuring Security Associations on page 19](#)

Configuring IPsec Policies

An IPsec policy defines a combination of security parameters (IPsec proposals) used during IPsec negotiation. It defines Perfect Forward Secrecy (PFS) and the proposals needed for the connection. During the IPsec negotiation, IPsec looks for a proposal that

is the same on both peers. The peer that initiates the negotiation sends all its policies to the remote peer, and the remote peer tries to find a match.

A match is made when both policies from the two peers have a proposal that contains the same configured attributes. If the lifetimes are not identical, the shorter lifetime between the two policies (from the host and peer) is used.

You can create multiple, prioritized IPsec proposals at each peer to ensure that at least one proposal matches a remote peer's proposal.

First, you configure one or more IPsec proposals; then you associate these proposals with an IPsec policy. You can prioritize a list of proposals used by IPsec in the **policy** statement by listing the proposals you want to use, from first to last.

To configure an IPsec policy, include the **policy** statement, and specify the policy name and one or more proposals to associate with the policy, at the **[edit services ipsec-vpn ipsec]** hierarchy level:

```
[edit services ipsec-vpn ipsec]
policy policy-name {
  description description;
  perfect-forward-secrecy {
    keys (group1 | group2 | group5 | group14);
  }
  proposals [ proposal-names ];
}
```

This section includes the following topics related to configuring an IPsec policy:

- [Configuring the Description for an IPsec Policy on page 38](#)
- [Configuring Perfect Forward Secrecy on page 38](#)
- [Configuring the Proposals in an IPsec Policy on page 39](#)
- [IPsec Policy for Dynamic Endpoints on page 39](#)
- [Example: Configuring an IPsec Policy on page 39](#)

Configuring the Description for an IPsec Policy

To specify an optional text description for an IPsec policy, include the **description** statement at the **[edit services ipsec-vpn ipsec policy policy-name]** hierarchy level:

```
[edit services ipsec-vpn ipsec policy policy-name]
description description;
```

Configuring Perfect Forward Secrecy

Perfect Forward Secrecy (PFS) provides additional security by means of a Diffie-Hellman shared secret value. With PFS, if one key is compromised, previous and subsequent keys are secure because they are not derived from previous keys. This statement is optional.

To configure PFS, include the **perfect-forward-secrecy** statement and specify a Diffie-Hellman group at the **[edit services ipsec-vpn ipsec policy policy-name]** hierarchy level:

```
[edit services ipsec-vpn ipsec policy policy-name]
perfect-forward-secrecy {
  keys (group1 | group2 | group5 | group14);
}
```

The key can be one of the following:

- **group1**—Specifies that IKE use the 768-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group2**—Specifies that IKE use the 1024-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group5**—Specifies that IKE use the 1536-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.
- **group14**—Specifies that IKE use the 2048-bit Diffie-Hellman prime modulus group when performing the new Diffie-Hellman exchange.

The higher numbered groups provide more security than the lowered numbered groups, but require more processing time.

Configuring the Proposals in an IPsec Policy

The IPsec policy includes a list of one or more proposals associated with an IPsec policy.

To configure the proposals in an IPsec policy, include the **proposals** statement and specify one or more proposal names at the **[edit services ipsec-vpn ipsec policy policy-name]** hierarchy level:

```
[edit services ipsec-vpn ipsec policy policy-name]
proposals [ proposal-names ];
```

IPsec Policy for Dynamic Endpoints

An IPsec policy for dynamic endpoints defines a combination of security parameters (IPsec proposals) used during IPsec negotiation between dynamic peer security gateways, in which the remote ends of tunnels do not have a statically assigned IP address. During the IPsec negotiation, the IPsec policy looks for an IPsec proposal that is the same on both peers. The peer that initiates the negotiation sends all its policies to the remote peer, and the remote peer tries to find a match. A match is made when the policies from the two peers have a proposal that contains the same configured attributes. If the lifetimes are not identical, the shorter lifetime between the two policies (from the host and peer) is used.

If no policy is set, any policy proposed by the dynamic peer is accepted.

Example: Configuring an IPsec Policy

Define an IPsec policy, **dynamic policy-1**, that is associated with two proposals (**dynamic-1** and **dynamic-2**):

```
[edit services ipsec-vpn ipsec]
proposal dynamic-1 {
  protocol esp;
```

```

authentication-algorithm hmac-md5-96;
encryption-algorithm 3des-cbc;
lifetime-seconds 6000;
}
proposal dynamic-2 {
protocol esp;
authentication-algorithm hmac-sha1-96;
encryption-algorithm 3des-cbc;
lifetime-seconds 6000;
}
policy dynamic-policy-1 {
perfect-forward-secrecy {
keys group1;
}
}
proposals [ dynamic-1 dynamic-2 ];
}

```

NOTE: Updates to the current IPsec proposal and policy configuration are not applied to the current IPsec SA; updates are applied to new IPsec SAs.

If you want the new updates to take immediate effect, you must clear the existing IPsec security associations so that they will be reestablished with the changed configuration. For information about how to clear the current IPsec security association, see the [Junos OS System Basics and Services Command Reference](#).

Related Documentation

- [Configuring IKE Proposals on page 25](#)
- [Configuring IKE Policies on page 29](#)
- [Configuring Security Associations on page 19](#)

Configuring IPsec Rules

To configure an IPsec rule, include the **rule** statement and specify a rule name at the **[edit services ipsec-vpn]** hierarchy level:

```

[edit services ipsec-vpn]
rule rule-name {
match-direction (input | output);
term term-name {
from {
destination-address address;
ipsec-inside-interface interface-name;
source-address address;
}
then {
anti-replay-window-size bits;
backup-remote-gateway address;
clear-dont-fragment-bit;
}
}
}

```

```

dynamic {
    ike-policy policy-name;
    ipsec-policy policy-name;
}
initiate-dead-peer-detection;
manual {
    direction (inbound | outbound | bidirectional) {
        authentication {
            algorithm (hmac-md5-96 | hmac-sha1-96);
            key (ascii-text key | hexadecimal key);
        }
        auxiliary-spi spi-value;
        encryption {
            algorithm algorithm;
            key (ascii-text key | hexadecimal key);
        }
        protocol (ah | bundle | esp);
        spi spi-value;
    }
}
no-anti-replay;
remote-gateway address;
syslog;
tunnel-mtu bytes;
}
}

```

Each IPsec rule consists of a set of terms, similar to a firewall filter.

A term consists of the following:

- **from** statement—Specifies the match conditions and applications that are included and excluded.
- **then** statement—Specifies the actions and action modifiers to be performed by the router software.

The following sections explain how to configure the components of IPsec rules:

- [Configuring Match Direction for IPsec Rules on page 41](#)
- [Configuring Match Conditions in IPsec Rules on page 42](#)
- [Configuring Actions in IPsec Rules on page 43](#)

Configuring Match Direction for IPsec Rules

Each rule must include a **match-direction** statement that specifies whether the match is applied on the input or output side of the interface. To configure where the match is applied, include the **match-direction (input | output)** statement at the **[edit services ipsec-vpn rule *rule-name*]** hierarchy level:

```

[edit services ipsec-vpn rule-name]
match-direction (input | output);

```

The match direction is used with respect to the traffic flow through the AS or Multiservices PIC. When a packet is sent to the PIC, direction information is carried along with it.

With an interface service set, packet direction is determined by whether a packet is entering or leaving the interface on which the service set is applied.

With a next-hop service set, packet direction is determined by the interface used to route the packet to the AS or Multiservices PIC. If the inside interface is used to route the packet, the packet direction is input. If the outside interface is used to direct the packet to the PIC, the packet direction is output.

On the AS or Multiservices PIC, a flow lookup is performed. If no flow is found, rule processing is performed. All rules in the service set are considered. During rule processing, the packet direction is compared against rule directions. Only rules with direction information that matches the packet direction are considered.

Configuring Match Conditions in IPsec Rules

To configure the match conditions in an IPsec rule, include the **from** statement at the **[edit services ipsec-vpn rule *rule-name* term *term-name*]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name]  
  from {  
    destination-address address;  
    ipsec-inside-interface interface-name;  
    source-address address;  
  }
```

You can use either the source address or the destination address as a match condition, in the same way that you would configure a firewall filter; for more information, see the [Junos OS Routing Policy Configuration Guide](#).

IPsec services support both IPv4 and IPv6 address formats. If you do not specifically configure either the source address or destination address, the default value **0.0.0.0/0** (IPv4 ANY) is used. To use IPv6 ANY (**0::0/128**) as either the source or destination address, you must configure it explicitly.

For next-hop-style service sets only, the **ipsec-inside-interface** statement allows you to assign a logical interface to the tunnels established as a result of this match condition. The **inside-service-interface** statement that you can configure at the **[edit services service-set *name* next-hop-service]** hierarchy level allows you to specify .1 and .2 as inside and outside interfaces. However, you can configure multiple adaptive services logical interfaces with the **service-domain inside** statement and use one of them to configure the **ipsec-inside-interface** statement.

The Junos OS evaluates the criteria you configure in the **from** statement. If multiple link-type tunnels are configured within the same next-hop-style service set, the **ipsec-inside-interface** value enables the rule lookup module to distinguish a particular tunnel from other tunnels in case the source and destination addresses for all of them are **0.0.0.0/0** (ANY-ANY).

NOTE: When you configure the `ipsec-inside-interface` statement, interface-style service sets are not supported.

A special situation is provided by a term containing an “any-any” match condition (usually because the **from** statement is omitted). If there is an any-any match in a tunnel, a flow is not needed, because all flows within this tunnel use the same security association (SA) and packet selectors do not play a significant role. As a result, these tunnels will use packet-based IPsec. This strategy saves some flow resources on the PIC, which can be used for other tunnels that need a flow-based service.

The following configuration example shows an any-any tunnel configuration with no **from** statement in **term-1**. Missing selectors in the **from** clause result in a packet-based IPsec service.

```
services {
  ipsec-vpn {
    rule rule-1 {
      term term-1 {
        then {
          remote-gateway 10.1.0.1;
          dynamic {
            ike-policy ike_policy;
            ipsec-policy ipsec_policy;
          }
        }
      }
    }
    match-direction input;
  }
  .....
}
```

Flowless IPsec service is provided to link-type tunnels with an any-any matching, as well as to dynamic tunnels with any-any matching in both dedicated and shared mode.

For link-type tunnels, a mixture of flowless and flow-based IPsec is supported within a service set. If a service set includes some terms with any-any matching and some terms with selectors in the **from** clause, packet-based service is provided for the any-any tunnels and flow-based service is provided for the other tunnels with selectors.

For non link-type tunnels, if a service set contains both any-any terms and selector-based terms, flow-based service is provided to all the tunnels.

Configuring Actions in IPsec Rules

To configure actions in an IPsec rule, include the **then** statement at the **[edit services ipsec-vpn rule *rule-name* term *term-name*]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name]
then {
  anti-replay-window-size bits;
  backup-remote-gateway address;
  clear-dont-fragment-bit;
```

```

dynamic {
    ike-policy policy-name;
    ipsec-policy policy-name;
}
initiate-dead-peer-detection;
manual {
    direction (inbound | outbound | bidirectional) {
        authentication {
            algorithm (hmac-md5-96 | hmac-sha1-96);
            key (ascii-text key | hexadecimal key);
        }
        auxiliary-spi spi-value;
        encryption {
            algorithm algorithm;
            key (ascii-text key | hexadecimal key);
        }
        protocol (ah | bundle | esp);
        spi spi-value;
    }
}
no-anti-replay;
remote-gateway address;
syslog;
tunnel-mtu bytes;
}

```

The principal IPsec actions are to configure a dynamic or manual SA:

- You configure a dynamic SA by including the **dynamic** statement at the **[edit services ipsec-vpn rule *rule-name* term *term-name* then]** hierarchy level and referencing policies you have configured at the **[edit services ipsec-vpn ipsec]** and **[edit services ipsec-vpn ike]** hierarchy levels.
- You configure a manual SA by including the **manual** statement at the **[edit services ipsec-vpn rule *rule-name* term *term-name* then]** hierarchy level.

You can configure the following additional properties:

- [Enabling IPsec Packet Fragmentation on page 44](#)
- [Configuring Destination Addresses for Dead Peer Detection on page 45](#)
- [Configuring or Disabling IPsec Anti-Replay on page 46](#)
- [Enabling System Log Messages on page 46](#)
- [Specifying the MTU for IPsec Tunnels on page 47](#)

Enabling IPsec Packet Fragmentation

To enable fragmentation of IP version 4 (IPv4) packets in IPsec tunnels, include the **clear-dont-fragment-bit** statement at the **[edit services ipsec-vpn rule *rule-name* term *term-name* then]** hierarchy level:

```

[edit services ipsec-vpn rule rule-name term term-name then]
clear-dont-fragment-bit;

```

Setting the **clear-dont-fragment-bit** statement clears the Don't Fragment (DF) bit in the packet header, regardless of the packet size. If the packet size exceeds the tunnel maximum transmission unit (MTU) value, the packet is fragmented before encapsulation. For IPsec tunnels, the default MTU value is 1500 regardless of the interface MTU setting.

Configuring Destination Addresses for Dead Peer Detection

To specify the remote address to which the IPsec traffic is directed, include the **remote-gateway** statement at the **[edit services ipsec-vpn rule rule-name term term-name then]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
remote-gateway address;
```

To specify a backup remote address, include the **backup-remote-gateway** statement at the **[edit services ipsec-vpn rule rule-name term term-name then]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
backup-remote-gateway address;
```

These two statements support both IPv4 and IPv6 address formats.

Configuring the **backup-remote-gateway** statement enables the dead peer detection (DPD) protocol, which monitors the tunnel state and remote peer availability. When the primary tunnel defined by the **remote-gateway** statement is active, the backup tunnel is in standby mode. If the DPD protocol determines that the primary remote gateway address is no longer reachable, a new tunnel is established to the backup address.

If there is no incoming traffic from a peer during a defined interval of 10 seconds, the router detects a tunnel as inactive. A global timer polls all tunnels every 10 seconds and the Adaptive Services (AS) or Multiservices Physical Interface Card (PIC) sends a message listing any inactive tunnels. If a tunnel becomes inactive, the router takes the following steps to fail over to the backup address:

1. The adaptive services message triggers the DPD protocol to send a hello message to the peer.
2. If no acknowledgment is received, two retries are sent at 2-second intervals, and then the tunnel is declared dead.
3. Failover takes place if the tunnel is declared dead or there is an IPsec Phase 1 negotiation timeout. The primary tunnel is put in standby mode and the backup becomes active.
4. If the negotiation to the backup tunnel times out, the router switches back to the primary tunnel. If both peers are down, it tries the failover six times. It then stops failing over and reverts to the original configuration, with the primary tunnel active and the backup in standby mode.

You can also enable triggering of DPD hello messages without configuring a backup remote gateway by including the **initiate-dead-peer-detection** statement at the **[edit services ipsec-vpn rule rule-name term term-name then]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
initiate-dead-peer-detection;
```

The monitoring behavior is the same as described for the **backup-remote-gateway** statement. This configuration enables the router to initiate DPD hellos when a backup IPsec gateway does not exist, and clean up the IKE and IPsec SAs in case the IKE peer is not reachable.

If the DPD protocol determines that the primary remote gateway address is no longer reachable, a new tunnel is established to the backup address. However, when you configure **initiate-dead-peer-detection** without a backup remote gateway address and the DPD protocol determines that the primary remote gateway address is no longer reachable, the tunnel is declared dead and IKE and IPsec SAs are cleaned up.

For more information on the DPD protocol, see RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*.

Configuring or Disabling IPsec Anti-Replay

To configure the size of the IPsec antireplay window, include the **anti-replay-window-size** statement at the **[edit services ipsec-vpn rule rule-name term term-name then]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
  anti-replay-window-size bits;
```

anti-replay-window-size can take values in the range from 64 through 4096 bits. The default value is 64 bits for AS PICs and 128 bits for Multiservices PICs and DPCs. AS PICs can support a maximum replay window size of 1024 bits, whereas Multiservices PICs and DPCs can support a maximum replay window size of 4096 bits. When the software is committing an IPsec configuration, the key management process (kmd) is unable to differentiate between the service interface types. As a result, if the maximum antireplay window size exceeds 1024 for AS PICs, the commit succeeds and no error message is produced. However, the software internally sets the antireplay window size for AS PICs to 1024 bits even if the configured value of the **anti-replay-window-size** is larger.

To disable the IPsec antireplay feature, include the **no-anti-replay** statement at the **[edit services ipsec-vpn rule rule-name term term-name then]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
  no-anti-replay;
```

By default, antireplay service is enabled. Occasionally this can cause interoperability issues with other vendors' equipment.

Enabling System Log Messages

To record an alert in the system logging facility, include the **syslog** statement at the **[edit services ipsec-vpn rule rule-name term term-name then]** hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
  syslog;
```

Specifying the MTU for IPsec Tunnels

To configure a specific maximum transmission unit (MTU) value for IPsec tunnels, include the `tunnel-mtu` statement at the `[edit services ipsec-vpn rule rule-name term term-name then]` hierarchy level:

```
[edit services ipsec-vpn rule rule-name term term-name then]
tunnel-mtu bytes;
```

NOTE: The `tunnel-mtu` setting is the only place you need to configure an MTU value for IPsec tunnels. Inclusion of an `mtu` setting at the `[edit interfaces sp-fpc/pic/port unit logical-unit-number family inet]` hierarchy level is not supported.

Related Documentation

- [Configuring IPsec Rule Sets on page 47](#)
- [Configuring Security Associations on page 19](#)

Configuring IPsec Rule Sets

The `rule-set` statement defines a collection of IPsec rules that determine what actions the router software performs on packets in the data stream. You define each rule by specifying a rule name and configuring terms. Then, you specify the order of the rules by including the `rule-set` statement at the `[edit services ipsec-vpn]` hierarchy level with a `rule` statement for each rule:

```
[edit services ipsec-vpn]
rule-set rule-set-name {
  rule rule-name;
}
```

The router software processes the rules in the order in which you specify them in the configuration. If a term in a rule matches the packet, the router performs the corresponding action and the rule processing stops. If no term in a rule matches the packet, processing continues to the next rule in the rule set. If none of the rules match the packet, the packet is dropped by default.

Configuring Dynamic Endpoints for IPsec Tunnels

IPsec tunnels can also be established using *dynamic peer* security gateways, in which the remote ends of tunnels do not have a statically assigned IP address. Since the remote address is not known and might be pulled from an address pool each time the remote host reboots, establishment of the tunnel relies on using IKE `main` mode with either preshared global keys or digital certificates that accept any remote identification value. Both policy-based and link-type tunnels are supported:

- Policy-based tunnels used shared mode.
- Link-type or routed tunnels use dedicated mode. Each tunnel allocates a service interface from a pool of interfaces configured for the dynamic peers. Routing protocols can be configured to run on these service interfaces to learn routes over the IPsec tunnel that is used as a link in this scenario.

This section includes the following topics:

- [Authentication Process on page 48](#)
- [Implicit Dynamic Rules on page 48](#)
- [Reverse Route Insertion on page 49](#)
- [Configuring an IKE Access Profile on page 50](#)
- [Referencing the IKE Access Profile in a Service Set on page 51](#)
- [Configuring the Interface Identifier on page 52](#)
- [Default IKE and IPsec Proposals on page 52](#)

Authentication Process

The remote (dynamic peer) initiates the negotiations with the local (Juniper Networks) router. The local router uses the default IKE and IPsec policies to match the proposals sent by the remote peer to negotiate the security association (SA) values. Implicit proposals contain a list of all the supported transforms that the local router expects from all the dynamic peers.

If preshared key authentication is used, the preshared key is global for a service set. When seeking the preshared key for the peer, the local router matches the peer's source address against any explicitly configured preshared keys in that service set. If a match is not found, the local router uses the global preshared key for authentication. This key is the one configured in the IKE access profile referenced by the service set.

Phase 2 of the authentication matches the *proxy identities* of the protected hosts and networks sent by the peer against a list of configured proxy identities. The accepted proxy identity is used to create the dynamic rules for encrypting the traffic. You can configure proxy identities by including the **allowed-proxy-pair** statement in the IKE access profile. If no entry matches, the negotiation is rejected.

If you do not configure the **allowed-proxy-pair** statement, the default value **ANY(0.0.0.0/0)-ANY** is applied, and the local router accepts any proxy identities sent by the peer. Both IPv4 and IPv6 addresses are accepted, but you must configure all IPv6 addresses manually.

Once the phase 2 negotiation completes successfully, the router builds the dynamic rules and inserts the reverse route into the routing table using the accepted proxy identity.

Implicit Dynamic Rules

After successful negotiation with the dynamic peer, the key management process (kmd) creates a dynamic rule for the accepted phase 2 proxy and applies it on the local AS or Multiservices PIC. The source and destination addresses are specified by the accepted

proxy. This rule is used to encrypt traffic directed to one of the end hosts in the phase 2 proxy identity.

The dynamic rule includes an **ipsec-inside-interface** value, which is the interface name assigned to the dynamic tunnel. The **source-address** and **destination-address** values are accepted from the proxy ID. The **match-direction** value is **input** for next-hop-style service sets.

NOTE: You do not configure this rule; it is created by the key management process (kmd).

Rule lookup for static tunnels is unaffected by the presence of a dynamic rule; it is performed in the order configured. When a packet is received for a service set, static rules are always matched first.

Dynamic rules are matched after the rule match for static rules has failed.

Response to dead peer detection (DPD) hello messages takes place the same way with dynamic peers as with static peers. Initiating DPD hello messages from dynamic peers is not supported.

Reverse Route Insertion

Static routes are automatically inserted into the route table for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities.

Each route is created based on the remote proxy network and mask sent by the peer and is inserted in the relevant route table after successful phase 1 and phase 2 negotiations.

The route preference for each static reverse route is 1. This value is necessary to avoid conflict with similar routes that might be added by the routing protocol process (rpd).

No routes are added if the accepted remote proxy address is the default (0.0.0.0/0). In this case you can run routing protocols over the IPsec tunnel to learn routes and add static routes for the traffic you want to be protected over this tunnel.

For next-hop-style service sets, the reverse routes include next hops pointing to the locations specified by the **inside-service-interface** statement.

The route table in which to insert these routes depends on where the **inside-service-interface** location is listed. If these interfaces are present in a VPN routing and forwarding (VRF) instance, then routes are added to the corresponding VRF table; otherwise, the routes are added to **inet.0**.

NOTE: Reverse route insertion takes place only for tunnels to dynamic peers. These routes are added only for next-hop-style service sets.

Configuring an IKE Access Profile

You can configure only one tunnel profile per service set for all dynamic peers. The configured preshared key in the profile is used for IKE authentication of all dynamic peers terminating in that service set. Alternatively, you can include the **ike-policy** statement to reference an IKE policy you define with either specific identification values or a wildcard (the **any-remote-id** option). You configure the IKE policy at the **[edit services ipsec-vpn ike]** hierarchy level.

The IKE tunnel profile specifies all the information needed to complete the IKE negotiation. Each protocol has its own statement hierarchy within the client statement to configure protocol-specific attribute value pairs, but only one client configuration is allowed for each profile. The following is the configuration at the **[edit access]** hierarchy level; for more information on access profiles, see the *Junos OS Administration Library for Routing Devices*.

```
[edit access]
profile profile-name {
  client * {
    ike {
      allowed-proxy-pair {
        remote remote-proxy-address local local-proxy-address;
      }
      pre-shared-key (ascii-text key-string | hexadecimal key-string);
      ike-policy policy-name;
      interface-id <string-value>;
      ipsec-policy ipsec-policy;
    }
  }
}
```

NOTE: For dynamic peers, the Junos OS supports the IKE main mode with either the preshared key method of authentication or an IKE access profile that uses a local digital certificate.

- In preshared key mode, the IP address is used to identify a tunnel peer to get the preshared key information. The client value * (wildcard) means that configuration within this profile is valid for all dynamic peers terminating within the service set accessing this profile.
- In digital certificate mode, the IKE policy defines which remote identification values are allowed.

The following statements make up the IKE profile:

- **allowed-proxy-pair**—During phase 2 IKE negotiation, the remote peer supplies its network address (**remote**) and its peer's network address (**local**). Since multiple dynamic tunnels are authenticated through the same mechanism, this statement must include the list of possible combinations. If the dynamic peer does not present a valid combination, the phase 2 IKE negotiation fails.

By default, **remote 0.0.0.0/0 local 0.0.0.0/0** is used if no values are configured. Both IPv4 and IPv6 address formats are supported in this configuration, but there are no default IPv6 addresses. You must specify even **0::0/0**.

- **pre-shared-key**—Key used to authenticate the dynamic peer during IKE phase 1 negotiation. This key is known to both ends through an out-of-band secure mechanism. You can configure the value either in **hexadecimal** or **ascii-text** format. It is a mandatory value.
- **ike-policy**—Policy that defines the remote identification values corresponding to the allowed dynamic peers; can contain a wildcard value **any-remote-id** for use in dynamic endpoint configurations only.
- **interface-id**—Interface identifier, a mandatory attribute used to derive the logical service interface information for the session.
- **ipsec-policy**—Name of the IPsec policy that defines the IPsec policy information for the session. You define the IPsec policy at the **[edit services ipsec-vpn ipsec policy policy-name]** hierarchy level. If no policy is set, any policy proposed by the dynamic peer is accepted.

Referencing the IKE Access Profile in a Service Set

To complete the configuration, you need to reference the IKE access profile configured at the **[edit access]** hierarchy level. To do this, include the **ike-access-profile** statement at the **[edit services service-set name ipsec-vpn-options]** hierarchy level:

```
[edit services service-set name]
ipsec-vpn-options {
  local-gateway address;
  ike-access-profile profile-name;
}
next-hop-service {
  inside-service-interface interface-name;
  outside-service-interface interface-name;
}
```

The **ike-access-profile** statement must reference the same name as the **profile** statement you configured for IKE access at the **[edit access]** hierarchy level. You can reference only one access profile in each service set. This profile is used to negotiate IKE and IPsec security associations with dynamic peers only.

NOTE: If you configure an IKE access profile in a service set, no other service set can share the same **local-gateway** address.

Also, you must configure a separate service set for each VRF instance. All interfaces referenced by the **ipsec-inside-interface** statement within a service set must belong to the same VRF instance.

Configuring the Interface Identifier

You can configure an interface identifier for a group of dynamic peers, which specifies which adaptive services logical interface(s) take part in the dynamic IPsec negotiation. By assigning the same interface identifier to multiple logical interfaces, you can create a pool of interfaces for this purpose. To configure an interface identifier, include the **ipsec-interface-id** statement and the **dedicated** or **shared** statement at the **[edit interfaces interface-name unit logical-unit-number dial-options]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number dial-options]
ipsec-interface-id identifier;
(dedicated | shared);
```

Specifying the interface identifier in the **dial-options** statement makes this logical interface part of the pool identified by the **ipsec-interface-id** statement.

NOTE: Only one interface identifier can be specified at a time. You can include the **ipsec-interface-id** statement or the **l2tp-interface-id** statement, but not both.

If you configure **shared** mode, it enables one logical interface to be shared across multiple tunnels. The **dedicated** statement specifies that the logical interface is used in a dedicated mode, which is necessary when you are configuring an IPsec link-type tunnel. You must include the **dedicated** statement when you specify an **ipsec-interface-id** value.

Default IKE and IPsec Proposals

The software includes implicit default IKE and IPsec proposals to match the proposals sent by the dynamic peers. The values are shown in [Table 4 on page 52](#); if more than one value is shown, the first value is the default.

NOTE: RSA certificates are not supported with dynamic endpoint configuration.

Table 4: Default IKE and IPsec Proposals for Dynamic Negotiations

Statement Name	Values
Implicit IKE Proposal	
authentication-method	pre-shared keys

Table 4: Default IKE and IPsec Proposals for Dynamic Negotiations (*continued*)

Statement Name	Values
dh-group	group1, group2, group5, group14
authentication-algorithm	sha1, md5, sha-256
encryption-algorithm	3des-cbc, des-cbc, aes-128, aes-192, aes-256
lifetime-seconds	3600 seconds
Implicit IPsec Proposal	
protocol	esp, ah, bundle
authentication-algorithm	hmac-sha1-96, hmac-md5-96
encryption-algorithm	3des-cbc, des-cbc, aes-128, aes-192, aes-256
lifetime-seconds	28,800 seconds (8 hours)

Tracing Junos VPN Site Secure Operations

NOTE: Junos VPN Site Secure is a suite of IPsec features supported on multiservices line cards (MS-DPC, MS-MPC, and MS-MIC), and was previously referred to as IPsec services.

Trace operations track IPsec events and record them in a log file in the `/var/log` directory. By default, this file is named `/var/log/kmd`.

To trace IPsec operations, include the **traceoptions** statement at the **[edit services ipsec-vpn]** hierarchy level:

```
[edit services ipsec-vpn]
traceoptions {
  file <filename> <files number> <match regular-expression> <size bytes> <world-readable |
  no-world-readable>;
  flag flag;
  level level;
```

```
    no-remote-trace;  
}
```

You can specify the following IPsec tracing flags:

- **all**—Trace everything.
- **certificates**—Trace certificates events.
- **database**—Trace security associations database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.
- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **snmp**—Trace SNMP operations.
- **timer**—Trace internal timer events.

The **level** statement sets the key management process (kmd) tracing level. The following values are supported:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

This section includes the following topics:

- [Disabling IPsec Tunnel Endpoint in Traceroute on page 54](#)
- [Tracing IPsec PKI Operations on page 55](#)

Disabling IPsec Tunnel Endpoint in Traceroute

If you include the **no-ipsec-tunnel-in-traceroute** statement at the **[edit services ipsec-vpn]** hierarchy level, the IPsec tunnel is not treated as a next hop and the time to live (TTL) is not decremented. Also, if the TTL reaches zero, an ICMP time exceeded message is not generated.

```
[edit services ipsec-vpn]  
  no-ipsec-tunnel-in-traceroute;
```

NOTE: This functionality is also provided by the `passive-mode-tunneling` statement. You can use the `no-ipsec-tunnel-in-traceroute` statement in specific scenarios in which the IPsec tunnel should not be treated as a next hop and passive mode is not desired.

Tracing IPsec PKI Operations

Trace operations track IPsec PKI events and record them in a log file in the `/var/log` directory. By default, this file is named `/var/log/pkid`.

To trace IPsec PKI operations, include the `traceoptions` statement at the `[edit security pki]` hierarchy level:

```
[edit security pki]
traceoptions {
  file filename <files number> <match regular-expression> <size maximum-file-size>
    <world-readable | no-world-readable>;
  flag flag (all | certificate-verification | enrollment | online-crl-check);
}
```

You can specify the following PKI tracing flags:

- **all**—Trace everything.
- **certificates**—Trace certificates events.
- **database**—Trace security associations database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.
- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **snmp**—Trace SNMP operations.
- **timer**—Trace internal timer events.

Configuring Junos VPN Site Secure Using Junos OS Extension Provider Package

Junos OS Release 11.4 and later enable you to configure Junos VPN Site Secure using Junos OS Extension Provider Package. Junos VPN Site Secure is supported on all M Series, T Series, and MX Series routers that have Multiservices 100, Multiservices 400 PICs, Multiservices DPCs, MS-MICs or MS-MPCs installed on them.

NOTE: Junos VPN Site Secure was referred to as IPsec services in Junos releases earlier than 13.2. In Junos OS Release 13.2 and later, the term IPsec features is used exclusively to refer to the IPsec implementation on Adaptive Services and Encryption Services PICs.

Junos OS extension provider package was variously referred to as Junos Services Framework (JSF), MP-SDK, and eJunos in release earlier than 12.3.

Junos VPN Site Secure has the following limitations:

- Junos VPN Site Secure supports only policies negotiated between dynamic peer security gateways in which the remote ends of tunnels do not have a statically assigned IP address (dynamic endpoints).
- Encapsulating Security Payload (ESP) is the only protocol that is supported for protecting IP traffic.
- Junos VPN Site Secure does not support IPv6.

To enable Junos VPN Site Secure using Junos OS Extension Provider Package, configure the **object-cache-size**, **policy-db-size**, and **package** statements at the **[edit chassis fpc slot-number pic pic-number adaptive-services service-package extension-provider]** hierarchy level. For the IPsec plugin on the Services SDK, **package-name** in the **package package-name** statement is **jservices-ipsec**.

NOTE: The following configuration is not required on the MS-MIC and MS-MPC because Junos VPN Site Secure comes preinstalled and preconfigured on the MS-MIC and MS-MPC.

The following example shows how to enable IPsec for the Services SDK on the adaptive services interface:

```
chassis fpc 1 {
  pic 2 {
    adaptive-services {
      service-package {
        extension-provider {
          control-cores 1;
          data-cores 7;
          object-cache-size 1280;
          policy-db-size 64;
        }
      }
    }
  }
}
```

```
        package jservices-crypto-base;
        package jservices-ipsec;
    }
}
}
```

Configure the inside and outside interfaces for next-hop-style service sets:

```
service-set abc {
  next-hop-service {
    inside-service-interface ms-0/2/0.1; # Name and logical unit number of the service
    interface associated with the service set applied inside the network.
    outside-service-interface ms-0/2/0.2; # Name and logical unit number of the service
    interface associated with the service set applied outside the network.
  }
}
```

Example: Configuring Manual SAs

This example shows how to create an IPsec tunnel by using manual security associations (SAs), and contains the following sections:

- [Requirements on page 59](#)
- [Overview and Topology on page 59](#)
- [Configuration on page 60](#)
- [Verification on page 71](#)

Requirements

This example uses the following hardware and software components:

- Four M Series, MX Series, or T Series routers with multiservices interfaces installed in them.
- Junos OS Release 9.4 and later.

No special configuration beyond device initialization is required before you can configure this feature.

Overview and Topology

A security association (SA) is a simplex connection that enables two hosts to securely communicate with each other by means of IPsec. There are two types of SAs: manual SA and dynamic SA. This example explains a manual SA configuration.

Manual SAs require no negotiation; all values, including the keys, are static and specified in the configuration. Manual SAs use statically defined security parameter index (SPI) values, algorithms, and keys, and require matching configurations on both ends of the tunnel. Each peer must have the same configured options for communication to take place.

Manual SAs are best suited for small, static networks where the distribution, maintenance, and tracking of keys are not difficult.

Figure 3 on page 60 shows an IPsec topology that contains a group of four routers: Routers 1, 2, 3, and 4.

Figure 3: Manual SA Topology

Routers 2 and 3 establish an IPsec tunnel by using a multiservices PIC and manual SA settings. Routers 1 and 4 provide basic connectivity and are used to verify that the IPsec tunnel is operational.

Configuration

This example uses four routers, and involves the following configurations:

- Routers 1 and 4 are configured for basic OSPF connectivity with Routers 2 and 3 respectively.
- Routers 2 and 3 are configured for OSPF connectivity with Routers 1 and 4 respectively. Routers 2 and 3 are also configured to create an IPsec tunnel by using manual SAs between these two routers. To direct traffic to the IPsec tunnel through the multiservices interface, next-hop style service sets are configured on Routers 2 and 3, and the multiservices interfaces that are configured as the IPsec inside interface are added to the OSPF configuration on the respective routers.

NOTE: The interface types shown in this example are for indicative purpose only. For example, you can use so- interfaces instead of ge- and sp- instead of ms-.

Configuring Router 1

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 1.

```
set interfaces ge-1/0/1 description "to R2 ge-1/0/1"
set interfaces ge-1/0/1 unit 0 family inet address 10.1.12.2/30
set interfaces lo0 unit 0 family inet address 10.0.0.1/32
set protocols ospf area 0.0.0.0 interface ge-1/0/1.0
set protocols ospf area 0.0.0.0 interface lo0.0
set routing-options router-id 10.0.0.1
```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router 1 for OSPF connectivity with Router 2:

1. Configure an Ethernet interface and loopback interface.

```
[edit interfaces]
user@router1# set ge-1/0/1 description "to R2 ge-1/0/1"
user@router1# set ge-1/0/1 unit 0 family inet address 10.1.12.2/30
user@router1# set lo0 unit 0 family inet address 10.0.0.1/32
```
2. Specify the OSPF area and associate the interfaces with the OSPF area.

```
[edit protocols]
user@router1# set ospf area 0.0.0.0 interface ge-1/0/1.0
user@router1# set ospf area 0.0.0.0 interface lo0.0
```
3. Configure the router ID.

```
[edit routing-options]
user@router1# set router-id 10.0.0.1
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```
user@router1# show interfaces
interfaces {
  ...
  ge-1/0/1 {
    description "to R2 ge-1/0/1";
    unit 0 {
      family inet {
        address 10.1.12.2/30;
      }
    }
  }
}
```

```

    }
    lo0 {
        unit 0 {
            family inet {
                address 10.0.0.1/32;
            }
        }
    }
    ...
}

user@router1# show protocols ospf
ospf {
    area 0.0.0.0 {
        interface ge-1/0/1.0;
        interface lo0.0;
    }
}

user@router1# show routing-options
routing-options {
    router-id 10.0.0.1;
}

```

Configuring Router 2

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 2.

Configuring Interfaces and OSPF Connectivity (with Router 1 and Router 3) on Router 2

```

set interfaces ge-1/0/0 unit 0 description "to R3 ge-1/0/0"

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF connectivity and IPsec tunnel parameters on Router 2:

1. Configure interface properties. In this step, you configure two Ethernet interfaces (ge-1/0/0 and ge-1/0/1), a loopback interface, and a multiservices interface (ms-1/2/0).

```

[edit interfaces]
user@router2# set ge-1/0/0 unit 0 description "to R3 ge-1/0/0"
user@router2# set ge-1/0/0 unit 0 family inet address 10.1.15.1/30
user@router2# set ge-1/0/1 unit 0 description "to R1 ge-1/0/0"
user@router2# set ge-1/0/1 unit 0 family inet address 10.1.12.1/30
user@router2# set ms-1/2/0 unit 0 family inet
user@router2# set ms-1/2/0 unit 1 family inet
user@router2# set ms-1/2/0 unit 1 service-domain inside
user@router2# set ms-1/2/0 unit 2 family inet
user@router2# set ms-1/2/0 unit 2 service-domain outside
user@router2# set lo0 unit 0 family inet address 10.0.0.2/32

```

2. Specify the OSPF area and associate the interfaces with the OSPF area.

```

[edit protocols]
user@router2# set ospf area 0.0.0.0 interface ge-1/0/1.0
user@router2# set ospf area 0.0.0.0 interface lo0.0
user@router2# set ospf area 0.0.0.0 interface ms-1/2/0.1

```

3. Configure the router ID.

```

[edit routing-options]
user@router2# set router-ID 10.0.0.2

```

4. Configure an IPsec rule. In this step, you configure an IPsec rule and specify manual SA parameters, such as the remote-gateway address, authentication and encryption properties, and so on.

```

[edit services ipsec-vpn]
user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
  remote-gateway 10.1.15.2
user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
  manual direction bidirectional protocol esp
user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
  manual direction bidirectional spi 261
user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
  manual direction bidirectional authentication algorithm hmac-sha1-96

```

```

user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional authentication key ascii-text
demokeyipsecmanualsa
user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional encryption algorithm des-cbc
user@router2# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional encryption key ascii-text manualsa
user@router2# set rule demo-rule-r1-manual-sa match-direction input

```

5. Configure a next-hop style service set, specify the local-gateway address, and associate the IPsec VPN rule with the service set.

```

[edit services]
user@router2# set service-set demo-ss-manual-sa next-hop-service
inside-service-interface ms-1/2/0.1
user@router2# set service-set demo-ss-manual-sa next-hop-service
outside-service-interface ms-1/2/0.2
user@router2# set service-set demo-ss-manual-sa ipsec-vpn-options local-gateway
10.1.15.1
user@router2# set service-set demo-ss-manual-sa ipsec-vpn-rules
demo-rule-r1-manual-sa

```

6. Commit the configuration.

```

[edit]
user@router2# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, **show routing-options**, and **show services** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

Configuring Router 3

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 3.

```

set interfaces ge-1/0/1 unit 0 description "to R4 ge-1/0/1"
set interfaces ge-1/0/0 unit 0 family inet address 10.1.56.1/30
set interfaces ge-1/0/0 unit 0 description "to R2 ge-1/0/0"
set interfaces ge-1/0/0 unit 0 family inet address 10.1.15.2/30
set interfaces ms-1/2/0 unit 0 family inet
set interfaces ms-1/2/0 unit 1 family inet
set interfaces ms-1/2/0 unit 1 service-domain inside
set interfaces ms-1/2/0 unit 2 family inet
set interfaces ms-1/2/0 unit 2 service-domain outside
set interfaces lo0 unit 0 family inet address 10.0.0.3/32
set protocols ospf area 0.0.0.0 interface ge-1/0/1.0
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ms-1/2/0.1
set routing-options router-id 10.0.0.3
set services ipsec-vpn rule demo-rule-r1-manual-sa term demo-term-manual-sa then
  remote-gateway 10.1.15.1
set services ipsec-vpn rule demo-rule-r1-manual-sa term demo-term-manual-sa then
  manual direction bidirectional protocol esp
set services ipsec-vpn rule demo-rule-r1-manual-sa term demo-term-manual-sa then

set services service-set demo-ss-manual-sa ipsec-vpn-options local-gateway 10.1.15.2
set services service-set demo-ss-manual-sa ipsec-vpn-rules demo-rule-r1-manual-sa

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF connectivity and IPsec tunnel parameters on Router 3:

1. Configure interface properties. In this step, you configure two Ethernet interfaces (ge-1/0/0 and ge-1/0/1), a loopback interface, and a multiservices interface (ms-1/2/0).

```

[edit interfaces]
user@router3# set ge-1/0/0 unit 0 description "to R4 ge-1/0/0"
user@router3# set ge-1/0/0 unit 0 family inet address 10.1.56.1/30
user@router3# set ge-1/0/1 unit 0 description "to R2 ge-1/0/1"
user@router3# set ge-1/0/1 unit 0 family inet address 10.1.15.2/30
user@router3# set ms-1/2/0 unit 0 family inet
user@router3# set ms-1/2/0 unit 1 family inet
user@router3# set ms-1/2/0 unit 1 service-domain inside
user@router3# set ms-1/2/0 unit 2 family inet
user@router3# set ms-1/2/0 unit 2 service-domain outside
user@router3# set lo0 unit 0 family inet address 10.0.0.3/32

```

2. Specify the OSPF area and associate the interfaces with the OSPF area.

```

[edit protocols]
user@router3# set ospf area 0.0.0.0 interface ge-1/0/1.0
user@router3# set ospf area 0.0.0.0 interface lo0.0
user@router3# set ospf area 0.0.0.0 interface ms-1/2/0.1

```

3. Configure a router ID.

```

[edit routing-options]
user@router3# set router-id 10.0.0.3

```

4. Configure an IPsec rule. In this step, you configure an IPsec rule and specify manual SA parameters, such as the remote-gateway address, authentication and encryption properties, and so on.

```

[edit services ipsec-vpn]
user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
remote-gateway 10.1.15.1
user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional protocol esp
user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional spi 261
user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional authentication algorithm hmac-sha1-96
user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional authentication key ascii-text
demokeyipsecmanualsa
user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional encryption algorithm des-cbc

```

```

user@router3# set rule demo-rule-r1-manual-sa term demo-term-manual-sa then
manual direction bidirectional encryption key ascii-text manualsa
user@router3# set rule demo-rule-r1-manual-sa match-direction input

```

5. Configure a next-hop style service set, specify the local-gateway address, and associate the IPsec VPN rule with the service set.

```

[edit services]
user@router3# set service-set demo-ss-manual-sa next-hop-service
inside-service-interface ms-1/2/0.1
user@router3# set service-set demo-ss-manual-sa next-hop-service
outside-service-interface ms-1/2/0.2
user@router3# set service-set demo-ss-manual-sa ipsec-vpn-options local-gateway
10.1.15.2
user@router3# set service-set demo-ss-manual-sa ipsec-vpn-rules
demo-rule-r1-manual-sa

```

6. Commit the configuration.

```

[edit]
user@router3# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, **show routing-options**, and **show services** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

user@router3# show interfaces
interfaces {
  ge-1/0/1 {

Configuring Router 4

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 4.

```

set interfaces ge-1/0/1 description "to R3 ge-1/0/1"
set interfaces ge-1/0/1 unit 0 family inet address 10.1.56.2/30
set interfaces lo0 unit 0 family inet address 10.0.0.4/32
set protocols ospf area 0.0.0.0 interface ge-1/0/1.0
set protocols ospf area 0.0.0.0 interface lo0.0
set routing-options router-id 10.0.0.4

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To set up OSPF connectivity with Router 3

1. Configure the interfaces. In this step, you configure an Ethernet interface (ge-1/0/1) and a loopback interface.

```

user@router4# set interfaces ge-1/0/1 description "to R3 ge-1/0/1"
user@router4# set interfaces ge-1/0/1 unit 0 family inet address 10.1.56.2/30
user@router4# set interfaces lo0 unit 0 family inet address 10.0.0.4/32

```

2. Specify the OSPF area and associate the interfaces with the OSPF area.

```

user@router4# set protocols ospf area 0.0.0.0 interface ge-1/0/1.0
user@router4# set protocols ospf area 0.0.0.0 interface lo0.0

```

3. Configure the router ID.

```

[edit routing-options]
user@router4# set router-id 10.0.0.4

```

4. Commit the configuration.

```

[edit]
user@router4# commit

```

Results

From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

user@router4# show interfaces
interfaces {
  ge-1/0/1 {
    description "to R3 ge-1/0/1";
    unit 0 {
      family inet {
        address 10.1.56.2/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 10.0.0.4/32;
      }
    }
  }
}

user@router4# show routing-options
routing-options {
  router-id 10.0.0.4;
}

user@router4# show protocols ospf
protocols {
  ospf {
    area 0.0.0.0 {
      interface lo0.0;
      interface ge-1/0/1.0;
    }
  }
}

```

Verification

To confirm that the manual SA configuration is working properly, perform the following tasks:

- [Verifying Traffic Flow Through the IPsec Tunnel on page 71](#)
- [Verifying the Security Associations on Router 2 on page 72](#)
- [Verifying the Security Associations on Router 3 on page 73](#)

Verifying Traffic Flow Through the IPsec Tunnel

Purpose Verify that the IPsec tunnel carries traffic between Router 1 and Router 4.

Action Issue a **ping** command from Router 1 to **lo0** on Router 4.

```

user@router1> ping 10.0.0.4
PING 10.0.0.4 (10.0.0.4): 56 data bytes
64 bytes from 10.0.0.4: icmp_seq=0 ttl=254 time=1.375 ms
64 bytes from 10.0.0.4: icmp_seq=1 ttl=254 time=18.375 ms
64 bytes from 10.0.0.4: icmp_seq=2 ttl=254 time=1.120 ms
^C
--- 10.0.0.4 ping statistics ---

```

3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.120/6.957/18.375/8.075 ms

Meaning The output shows that Router 1 is able to reach Router 4 over the IPsec tunnel.

Verifying the Security Associations on Router 2

Purpose Verify that the security associations are active on Router 2 and that the traffic is flowing over the IPsec tunnel.

- Action**
- To verify that the security associations are active, Issue **show services ipsec-vpn ipsec security-associations detail** on Router 2.

```
user@router2> show services ipsec-vpn ipsec security-associations detail
Service set: demo-ss-manual-sa
Rule: demo-rule-r1-manual-sa, Term: demo-term-manual-sa,
Tunnel index: 1
Local gateway: 10.1.15.1, Remote gateway: 10.1.15.2
Local identity: ipv4_subnet(any:0,[0..7]=10.0.0.0/8)
Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Direction: inbound, SPI: 261, AUX-SPI: 0
Mode: tunnel, Type: manual, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: des-cbc
Anti-replay service: Disabled
Direction: outbound, SPI: 261, AUX-SPI: 0
Mode: tunnel, Type: manual, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: des-cbc
Anti-replay service: Disabled
```

- To verify that traffic is traveling over the bidirectional IPsec tunnel, issue **show services ipsec-vpn ipsec statistics** on Router 2.

```
user@router2# show services ipsec-vpn ipsec statistics
PIC: ms-1/2/0, Service set: demo-ss-manual-sa
sESP Statistics:
Encrypted bytes: 1616
Decrypted bytes: 1560
Encrypted packets: 20
Decrypted packets: 19
AH Statistics:
Input bytes: 0
Output bytes: 0
Input packets: 0
Output packets: 0
Errors:
AH authentication failures: 0, Replay errors: 0
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0
```

Meaning The **show services ipsec-vpn ipsec security-associations detail** command output shows the SA properties that you configured.

The **show services ipsec-vpn ipsec statistics** command output shows the traffic flow over the IPsec tunnel.

Verifying the Security Associations on Router 3

Purpose Verify the security associations and flow of traffic over the IPsec tunnel.

- Action**
- To verify that the security associations are active, Issue **show services ipsec-vpn ipsec security-associations detail** on Router 3.

```
user@router3> show services ipsec-vpn ipsec security-associations detail
Service set: demo-ss-manual-sa
Rule: demo-rule-r1-manual-sa, Term: demo-term-manual-sa,
Tunnel index: 1
Local gateway: 10.1.15.2, Remote gateway: 10.1.15.1
Local identity: ipv4_subnet(any:0,[0..7]=10.0.0.0/8)
Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Direction: inbound, SPI: 261, AUX-SPI: 0
Mode: tunnel, Type: manual, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: des-cbc
Anti-replay service: Disabled
Direction: outbound, SPI: 261, AUX-SPI: 0
Mode: tunnel, Type: manual, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: des-cbc
Anti-replay service: Disabled
```

- To verify that traffic is traveling over the bidirectional IPsec tunnel, issue **show services ipsec-vpn ipsec statistics** on Router 3.

```
user@router3# show services ipsec-vpn ipsec statistics
PIC: ms-1/2/0, Service set: demo-ss-manual-sa
ESP Statistics:
Encrypted bytes: 1560
Decrypted bytes: 1616
Encrypted packets: 19
Decrypted packets: 20
AH Statistics:
Input bytes: 0
Output bytes: 0
Input packets: 0
Output packets: 0
Errors:
AH authentication failures: 0, Replay errors: 0
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0
```

Meaning The **show services ipsec-vpn ipsec security-associations detail** command output shows the SA properties that you configured.

The **show services ipsec-vpn ipsec statistics** command output shows the traffic flow over the IPsec tunnel.

Example: Configuring Dynamically Assigned Policy Based Tunnels

This example shows how to configure dynamically assigned policy-based tunnels and contains the following sections.

- [Requirements on page 74](#)
- [Overview and Topology on page 74](#)
- [Configuration on page 75](#)
- [Verification on page 79](#)

Requirements

This example uses the following hardware and software components:

- Three M Series, MX Series or T Series routers.
- Junos OS Release 9.4 or later.

Overview and Topology

An IPsec policy for dynamic endpoints defines a combination of security parameters (IPsec proposals) used during IPsec negotiation between dynamic peer security gateways, in which the remote ends of tunnels do not have a statically assigned IP address.

A policy based VPN is a configuration with a specific VPN tunnel referenced in a policy which acts as a Tunnel. You use a Policy-based VPN if the remote VPN device is a non-Juniper device and if you must access only one subnet or one network at the remote site, across the VPN.

This example explains the IPsec dynamic endpoint tunneling topology as shown in [Figure 4 on page 75](#).

Before you configure dynamically assigned tunnels, be sure you have:

- A local network N-1 connected to a security gateway SG-1. The exit points must have a Juniper Networks router to terminate the static and dynamic peer endpoints. The tunnel termination address on SG-1 is 10.1.1.1 and the local network address is 172.16.1.0/24.
- Two remote peer routers that obtain addresses from an ISP pool and run an RFC-compliant IKE. The remote network N-2 has the address 172.16.2.0/24 and is connected to the security gateway SG-2 with the tunnel termination address 10.2.2.2. The remote network N-3 has the address 172.16.3.0/24 and is connected to the security gateway SG-3 with the tunnel termination address 10.3.3.3.

Figure 4: IPsec Dynamic Endpoint Tunneling Topology

Configuration

To configure dynamically assigned policy based tunnels, perform these tasks:

NOTE: The interface types shown in this example are for indicative purpose only. For example, you can use so- interfaces instead of ge- and sp- instead of ms-.

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of SGI router.

Configuring Interfaces

```

set interfaces ms-0/0/0 unit 0 family inet
set interfaces ms-0/0/0 unit 1 family inet
set interfaces ms-0/0/0 unit 1 service-domain inside
set interfaces ms-0/0/0 unit 1 dial-options ipsec-interface-id demo-ipsec-interface-id
set interfaces ms-0/0/0 unit 1 dial-options mode shared
set interfaces ms-0/0/0 unit 2 family inet
set interfaces ms-0/0/0 unit 2 service-domain outside

```

Configuring Access Profile

```

set access profile demo-access-profile client * ike allowed-proxy-pair remote 172.16.2.0/24
local 172.16.1.0/24
set access profile demo-access-profile client * ike allowed-proxy-pair remote 172.16.3.0/24
local 172.16.1.0/24
set access profile demo-access-profile client * ike ascii-text keyfordynamicpeers
set access profile demo-access-profile client * ike interface-id demo-ipsec-interface-id

```

Configuring Service Set

```

set services service-set demo-service-set next-hop-service inside-service-interface
ms-0/0/0.1
set services service-set demo-service-set next-hop-service outside-service-interface
ms-0/0/0.2

```

Configuring IPsec Properties

```

set services ipsec-vpn ipsec proposal ipsec_proposal_demo1 protocol esp
set services ipsec-vpn ipsec proposal ipsec_proposal_demo1 authentication-algorithm
  hmac-sha1-96
set services ipsec-vpn ipsec proposal ipsec_proposal_demo1 encryption-algorithm
  3des-cbc
set services ipsec-vpn ipsec policy demo2 perfect-forward-secrecy keys group2
set services ipsec-vpn ipsec policy demo2 proposals ipsec_proposal_demo1
set services ipsec-vpn ike proposal ike_proposal_demo1 authentication-method
  pre-shared-keys
set services ipsec-vpn ike proposal ike_proposal_demo1 dh-group group2
set services ipsec-vpn ike policy ike_policy_demo1 version 2
set services ipsec-vpn ike policy ike_policy_demo1 proposals ike_proposal_demo1
set services ipsec-vpn ike policy ike_policy_demo1 pre-shared-key ascii-text keyfordemo1

```

Configuring Routing Instances

```

set routing-instances demo-vrf instance-type vrf
set routing-instances demo-vrf ms-0/0/0.1
set routing-instances demo-vrf ms-0/0/0.2

```

Configuring a Next-Hop SGI Service-Set**Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy.

1. Configure the interfaces.

```

[edit interfaces]
user@router1# set interfaces ms-0/0/0 unit 0 family inet
user@router1# set interfaces ms-0/0/0 unit 1 family inet
user@router1# set interfaces ms-0/0/0 unit 1 service-domain inside
user@router1# set interfaces ms-0/0/0 unit 1 dial-options ipsec-interface-id
  demo-ipsec-interface-id
user@router1# set interfaces ms-0/0/0 unit 1 dial-options mode shared
user@router1# set interfaces ms-0/0/0 unit 2 family inet
user@router1# set interfaces ms-0/0/0 unit 2 service-domain outside

```

2. Configure the access profile.

```

[edit access]
user@router1# set profile demo-access-profile client * ike allowed-proxy-pair remote
  172.16.2.0/24 local 172.16.1.0/24
user@router1# set profile demo-access-profile client * ike ascii-text
  keyfordynamicpeers
user@router1# set profile demo-access-profile client * ike interface-id
  demo-ipsec-interface-id

```

3. Configure the services set.

```

[edit services]
user@router1# set service-set demo-service-set next-hop-service
  inside-service-interface ms-0/0/0.1
user@router1# set service-set demo-service-set next-hop-service
  outside-service-interface ms-0/0/0.2

```

4. Configure the IPsec properties.

```

[edit services ipsec-vpn]
user@router1# set ipsec proposal ipsec_proposal_demo1 protocol esp

```

```

user@router1#set ipsec proposal ipsec_proposal_demo1 authentication-algorithm
hmac-sha1-96
user@router1#set ipsec proposal ipsec_proposal_demo1 encryption-algorithm
3des-cbc
user@router1#set ipsec policy demo2 perfect-forward-secrecy keys group2
user@router1#set ipsec policy demo2 proposals ipsec_proposal_demo1
user@router1#set ike proposal ike_proposal_demo1 authentication-method
pre-shared-keys
user@router1#set ike proposal ike_proposal_demo1 dh-group group2
user@router1#set ike policy ike_policy_demo1 version 2
user@router1#set ike policy ike_policy_demo1 proposals ike_proposal_demo1
user@router1#set ike policy ike_policy_demo1 pre-shared-key ascii-text keyfordemo1

```

5. Configure the routing instances.

```

[edit routing-instances]
user@router1# set demo-vrf instance-type vrf
user@router1# set demo-vrf ms-0/0/0.1
user@router1# set demo-vrf ms-0/0/0.2

```

Results

From configuration mode of Router 1, confirm your configuration by entering the **show interfaces**, **show access**, and **show services** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

interfaces {
  ms-0/0/0 {
    unit 0 {
      family inet;
    }
    unit 1 {
      family inet;
      service-domain inside;
      dial-options {
        ipsec-interface-id demo-ipsec-interface-id;
        mode shared;
      }
    }
    unit 2 {
      family inet;
      service-domain outside;
    }
  }
}
access {
  profile demo-access-profile client * {
    ike {
      allowed-proxy-pair {
        remote 172.16.2.0/24 local 172.16.1.0/24; #Set for Network 2 connected to Network
        1
        remote 172.16.3.0/24 local 172.16.1.0/24; #Set for Network 3 connected to Network
        1
      }
      pre-shared-key {
        ascii-text keyfordynamicpeers;
      }
    }
  }
}

```

```
    }
    interface-id demo-ipsec-interface-id;
  }
}
services {
  service-set demo-service-set {
    next-hop-service {
      inside-service-interface ms-0/0/0.1;
      outside-service-interface ms-0/0/0.2;
    }
    ipsec-vpn-options {
      local-gateway 1.1.1.1;
      ike-access-profile demo-access-profile;
    }
  }
}
ipsec-vpn {
  ipsec {
    proposal ipsec_proposal_demo1 {
      protocol esp;
      authentication-algorithm hmac-sha1-96;
      encryption-algorithm 3des-cbc;
    }
    policy demo2 {
      perfect-forward-secrecy {
        keys group2;
      }
      proposals ipsec_proposal_demo1;
    }
  }
  ike {
    proposal ike_proposal_demo1 {
      authentication-method pre-shared-keys;
      dh-group group2;
    }
    policy ike_policy_demo1 {
      version 2;
      proposals ike_proposal_demo1;
      pre-shared-key ascii-text "$9$jokmT69pRhrz3hrev7Nik"; ## SECRET-DATA
    }
  }
}
}
routing-instances {
  demo-vrf {
    instance-type vrf;
    interface ms-0/0/0.1;
    interface ms-0/0/0.2;
  }
}
```

Verification

Verifying That the Next-Hop SGI Service Set with Policy-Based Tunnels Is Created

Purpose Verify that the next-hop SGI service set with policy-based tunnels is created.

Action From operational mode, enter the **show route** command.

```
user@router1> show route
demo-vrf.inet.0: .... # Routing instance
172.11.0.0/24 *[Static/1]..
> via ms-0/0/0.1
172.12.0.0/24 *[Static/1]..
> via ms-0/0/0.1
```

From operational mode, enter the **show services ipsec-vpn ipsec security-associations detail**

```
user@router1>show services ipsec-vpn ipsec security-associations detail
rule: junos-dynamic-rule-0
term: term-0
local-gateway-address : 10.1.1.1 #Tunnel termination address on SG-1
remote-gateway-address: 10.2.2.2 #Tunnel termination address on SG-2
source-address : 0.0.0.0/0
destination-address : 0.0.0.0/0
ipsec-inside-interface: ms-0/0/0.1
term: term-1
local-gateway-address : 10.1.1.1 #Tunnel termination address on SG-1
remote-gateway-address: 10.3.3.3 #Tunnel termination address on SG-3
source-address : 0.0.0.0/0
destination-address : 0.0.0.0/0
IPsec Properties
ipsec-inside-interface: ms-0/0/0.1
match-direction: input
```

Meaning The **show services ipsec-vpn ipsec security-associations detail** command output shows the properties that you configured.

Related Documentation

- [Understanding Junos VPN Site Secure on page 3](#)

- [Configuring IKE Policies on page 29](#)
- [Tracing Junos VPN Site Secure Operations on page 53](#)

Example: Configuring IKE Dynamic SAs

This example shows how to configure IKE dynamic SAs and contains the following sections.

- [Requirements on page 80](#)
- [Overview and Topology on page 80](#)

- [Configuration on page 81](#)
- [Verification on page 92](#)

Requirements

This example uses the following hardware and software components:

- Four M Series, MX Series, or T Series routers with multiservices interfaces installed in them.
- Junos OS Release 9.4 or later.

No special configuration beyond device initiation is required before you can configure this feature.

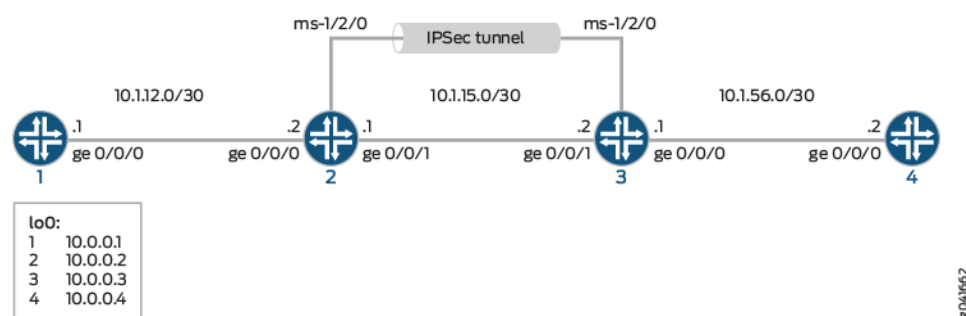

Overview and Topology

A security association (SA) is a simplex connection that enables two hosts to securely communicate with each other by means of IPsec.

Dynamic SAs are best suited for large-scale, geographically distributed networks where manual distribution, maintenance, and tracking of keys are difficult tasks. Dynamic SAs are configured with a set of proposals that are negotiated by the security gateways. The keys are generated as part of the negotiation and do not need to be specified in the configuration. A dynamic SA includes one or more proposals that allow you to prioritize a list of protocols and algorithms to be negotiated with the peer.

[Figure 5 on page 80](#) shows an IPsec topology that contains a group of four routers. This configuration requires Routers 2 and 3 to establish an IPsec tunnel by using an IKE dynamic SA, enhanced authentication, and encryption. Routers 1 and 4 provide basic connectivity and are used to verify that the IPsec tunnel is operational.

Figure 5: IKE Dynamic SAs

NOTE: When you do not specify an IKE proposal, an IPsec proposal, and an IPsec policy on a MultiServices PIC, the Junos OS defaults to the highest level of encryption and authentication. As a result, the default authentication protocol is ESP, the default authentication mode is HMAC-SHA1-96, and the default encryption mode is 3DES-CBC.

Configuration

To configure IKE dynamic SA, perform these tasks:

NOTE: The interface types shown in this example are for indicative purpose only. For example, you can use `so-` interfaces instead of `ge-` and `sp-` instead of `ms-`.

Configuring Router 1

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 1.

```
set interfaces ge-0/0/0 description "to R2 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.12.2/30
set interfaces lo0 unit 0 family inet address 10.0.0.1/32
set routing-options router-id 10.0.0.1
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.0 interface lo0.0
```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router 1 for OSPF connectivity with Router 2:

1. Configure an Ethernet interface and a loopback interface.

```
[edit interfaces]
user@router1# set ge-0/0/0 description "to R2 ge-0/0/0"
user@router1# set ge-0/0/0 unit 0 family inet address 10.1.12.2/30
user@router1# set lo0 unit 0 family inet address 10.0.0.1/32
```
2. Specify the OSPF area and associate the interfaces with the OSPF area.

```
[edit interfaces]
user@router1# set ospf area 0.0.0.0 interface ge-0/0/0.0
user@router1# set ospf area 0.0.0.0 interface lo0.0
```
3. Configure the router ID.

```
[edit routing-options]
user@router1# set router-id 10.0.0.1
```
4. Commit the configuration.

```
[edit]
user@router1# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```
user@router1# show interfaces
interfaces {
  ge-0/0/0 {
    description "To R2 ge-0/0/0";
    unit 0 {
      family inet {
        address 10.1.12.2/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 10.0.0.1/32;
      }
    }
  }
}

user@router1# show protocols ospf
protocols {
  ospf {
    area 0.0.0.0 {
      interface ge-0/0/0.0;
      interface lo0.0;
    }
  }
}

user@router1# show routing-options
routing-options {
  router-id 10.0.0.1;
}
```

Configuring Router 2

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 2.

```
set interfaces ge-0/0/0 description "to R1 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.12.1/30
set interfaces ge-0/0/1 description "to R3 ge-0/0/1"
set interfaces ge-0/0/1 unit 0 family inet address 10.1.15.1/30
set interfaces ms-1/2/0 services-options syslog host local services info
set interfaces ms-1/2/0 unit 0 family inet
```

```

set interfaces ms-1/2/0 unit 1 family inet
set interfaces ms-1/2/0 unit 1 service-domain inside
set interfaces ms-1/2/0 unit 2 family inet
set interfaces ms-1/2/0 unit 2 service-domain outside
set interfaces lo0 unit 0 family inet address 10.0.0.2/32
set protocols ospf area 0.0.0.0 interface ge-0/0/0.0
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ms-1/2/0.1
set routing-options router-id 10.0.0.2

    ms-1/2/0.2
set services service-set demo-service-set ipsec-vpn-options local-gateway 10.1.15.1
set services service-set demo-service-set ipsec-vpn-rules rule-ike

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF connectivity and IPsec tunnel parameters on Router 2:

1. Configure interface properties. In this step, you configure two Ethernet interfaces (ge-1/0/0 and ge-1/0/1), a loopback interface, and a multiservices interface (ms-1/2/0).

```

[edit interfaces]
user@router2# set ge-0/0/0 description "to R1 ge-0/0/0"
user@router2# set ge-0/0/0 unit 0 family inet address 10.1.12.1/30
user@router2# set ge-0/0/1 description "to R3 ge-0/0/1"
user@router2# set ge-0/0/1 unit 0 family inet address 10.1.15.1/30
user@router2# set ms-1/2/0 services-options syslog host local services info
user@router2# set ms-1/2/0 unit 0 family inet
user@router2# set ms-1/2/0 unit 1 family inet
user@router2# set ms-1/2/0 unit 1 service-domain inside
user@router2# set ms-1/2/0 unit 2 family inet
user@router2# set ms-1/2/0 unit 2 service-domain outside

```

```
user@router2# set lo0 unit 0 family inet address 10.0.0.2/32
```

- Specify the OSPF area and associate the interfaces with the OSPF area.

```
[edit protocols]
```

```
user@router2# set ospf area 0.0.0.0 interface ge-0/0/0.0
```

```
user@router2# set ospf area 0.0.0.0 interface lo0.0
```

```
user@router2# set ospf area 0.0.0.0 interface ms-1/2/0.1
```

- Configure the router ID.

```
[edit routing-options]
```

```
user@router2# set router-ID 10.0.0.2
```

- Configure an IPsec rule. In this step, you configure an IPsec rule, specify manual SA parameters, such as the remote gateway address, authentication and encryption properties, and so on.

NOTE: By default, Junos OS uses IKE policy version 1.0. Junos OS Release 11.4 and later also support IKE policy version 2.0 which you must configure at [edit services ipsec-vpn ike policy *policy-name* pre-shared].

```
[edit services ipsec-vpn]
```

```
user@router2# set rule rule-ike term term-ike then remote-gateway 10.1.15.2
```

```
user@router2# set rule rule-ike term term-ike then dynamic ike-policy  
ike-demo-policy
```

```
user@router2# set rule rule-ike term term-ike then dynamic ipsec-policy  
ipsec-demo-policy
```

```
user@router2# set rule match-direction input
```

```
user@router2# set ike proposal ike-demo-proposal authentication-method  
pre-shared-keys
```

```
user@router2# set ike proposal ike-demo-proposal dh-group group2
```

```
user@router2# set ike policy ike-demo-policy pre-shared proposals demo-proposal
```

```
user@router2# set ike policy ike-demo-policy pre-shared pre-shared-key ascii-text  
keyfordemo
```

```
user@router2# set ipsec proposal ipsec-demo-proposal protocol esp
```

```
user@router2# set ipsec proposal ipsec-demo-proposal authentication-algorithm  
hmac-sha1-96
```

```
user@router2# set ipsec proposal ipsec-demo-proposal encryption-algorithm  
3des-cbc
```

```
user@router2# set ipsec policy ipsec-demo-policy perfect-forward-secrecy keys  
group2
```

```
user@router2# set ipsec proposals ipsec-demo-proposal
```

- Configure a next-hop style service set, specify the local-gateway address, and associate the IPsec VPN rule with the service set.

```
[edit services]
```

```
user@router2# set service-set demo-service-set next-hop-service  
inside-service-interface ms-1/2/0.1
```

```
user@router2# set service-set demo-service-set next-hop-service  
outside-service-interface ms-1/2/0.2
```

```
user@router2# set service-set demo-service-set ipsec-vpn-options local-gateway  
10.1.15.1
```

```
user@router2# set service-set demo-service-set ipsec-vpn-rules rule-ike
```

6. Commit the configuration.

```
[edit]
user@router2# commit
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, **show routing-options**, and **show services** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF connectivity and IPsec tunnel parameters on Router 3:

1. Configure interface properties. In this step, you configure two Ethernet interfaces (ge-1/0/0 and ge-1/0/1), a loopback interface, and a multiservices interface (ms-1/2/0).

```

[edit interfaces]
user@router3# set ge-0/0/0 description "to R4 ge-0/0/0"
user@router3# set ge-0/0/0 unit 0 family inet address 10.1.56.1/30
user@router3# set ge-0/0/1 description "to R2 ge-0/0/1"
user@router3# set ge-0/0/1 unit 0 family inet address 10.1.15.2/30
user@router3# set ms-1/2/0 services-options syslog host local services info
user@router3# set ms-1/2/0 unit 0 family inet
user@router3# set ms-1/2/0 unit 1 family inet
user@router3# set ms-1/2/0 unit 1 service-domain inside
user@router3# set ms-1/2/0 unit 2 family inet
user@router3# set ms-1/2/0 unit 2 service-domain outside
user@router3# set lo0 unit 0 family inet address 10.0.0.3/32

```
2. Specify the OSPF area and associate the interfaces with the OSPF area.

```

[edit protocols]
user@router3# set ospf area 0.0.0.0 interface ge-0/0/0.0
user@router3# set ospf area 0.0.0.0 interface lo0.0
user@router3# set ospf area 0.0.0.0 interface ms-1/2/0.1

```
3. Configure a router ID.

```

[edit routing-options]
user@router3# set router-id 10.0.0.3

```
4. Configure an IPsec rule. In this step, you configure an IPsec rule and specify manual SA parameters, such as the remote gateway address, authentication and encryption properties, and so on.

```

[edit services ipsec-vpn]
user@router3# set rule rule-ike term term-ike then remote-gateway 10.1.15.1
user@router3# set rule rule-ike term term-ike then dynamic ike-policy
  ike-demo-policy

```

```

user@router3# set rule rule-ike term term-ike then dynamic ipsec-policy
ipsec-demo-policy
user@router3# set rule match-direction input
user@router3# set ike proposal ike-demo-proposal authentication-method
pre-shared-keys
user@router3# set ike proposal ike-demo-proposal dh-group group2
user@router3# set ike policy ike-demo-policy pre-shared proposals demo-proposal
user@router3# set ike policy ike-demo-policy pre-shared pre-shared-key ascii-text
keyfordemo
user@router3# set ipsec proposal ipsec-demo-proposal protocol esp
user@router3# set ipsec proposal ipsec-demo-proposal authentication-algorithm
hmac-sha1-96
user@router3# set ipsec proposal ipsec-demo-proposal encryption-algorithm
3des-cbc
user@router3# set ipsec policy ipsec-demo-policy perfect-forward-secrecy keys
group2
user@router3# set ipsec proposals ipsec-demo-proposal

```

5. Configure a next-hop style service set, specify the local-gateway address, and associate the IPsec VPN rule with the service set.

```

[edit services]
user@router3# set service-set demo-service-set next-hop-service
inside-service-interface ms-1/2/0.1
user@router3# set service-set demo-service-set next-hop-service
outside-service-interface ms-1/2/0.2
user@router3# set service-set demo-service-set ipsec-vpn-options local-gateway
10.1.15.2
user@router3# set service-set demo-service-set ipsec-vpn-rules rule-ike

```

6. Commit the configuration.

```

[edit]
user@router3# commit

```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, **show routing-options**, and **show services** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

Configuring Router 4

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 4.

```

set interfaces ge-0/0/0 description "to R3 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.56.2/30
set interfaces lo0 unit 0 family inet address 10.0.0.4/32
set protocols ospf area 0.0.0.0 interface ge-0/0/0.0
set protocols ospf area 0.0.0.0 interface lo0.0
set routing-options router-id 10.0.0.4

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To set up OSPF connectivity with Router 4

1. Configure the interfaces. In this step, you configure an Ethernet interface (ge-1/0/1) and a loopback interface.

```

user@router4# set interfaces ge-0/0/0 description "to R3 ge-0/0/0"

```

```
user@router4# set interfaces ge-0/0/0 unit 0 family inet address 10.1.56.2/30
user@router4# set interfaces lo0 unit 0 family inet address 10.0.0.4/32
```

2. Specify the OSPF area and associate the interfaces with the OSPF area.

```
user@router4# set protocols ospf area 0.0.0.0 interface ge-0/0/0
user@router4# set protocols ospf area 0.0.0.0 interface lo0.0
```

3. Configure the router ID.

```
[edit routing-options]
user@router4# set router-id 10.0.0.4
```

Results From configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```
user@router4# show interfaces
interfaces {
  ge-0/0/0 {
    description "To R3 ge-0/0/0";
    unit 0 {
      family inet {
        address 10.1.56.2/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 10.0.0.4/32;
      }
    }
  }
}

user@router4# show protocols ospf
protocols {
  ospf {
    area 0.0.0.0 {
      interface ge-0/0/0.0;
      interface lo0.0;
    }
  }
}

user@router4# show routing-options
routing-options {
  router-id 10.0.0.4;
}
```

Verification

Verifying Your Work on Router 1

Purpose Verify proper operation of Router 1.

Action From operational mode, enter **ping 10.1.56.2** command to the ge-0/0/0 interface on Router 4 to send traffic across the IPsec tunnel

```
user@router1>ping 10.1.56.2
PING 10.1.56.2 (10.1.56.2): 56 data bytes
64 bytes from 10.1.56.2: icmp_seq=0 ttl=254 time=1.351 ms
64 bytes from 10.1.56.2: icmp_seq=1 ttl=254 time=1.187 ms
64 bytes from 10.1.56.2: icmp_seq=2 ttl=254 time=1.172 ms
64 bytes from 10.1.56.2: icmp_seq=3 ttl=254 time=1.154 ms
64 bytes from 10.1.56.2: icmp_seq=4 ttl=254 time=1.156 ms
^C
--- 10.1.56.2 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.154/1.204/1.351/0.074 ms
```

Meaning The output shows that Router 1 is able to reach Router 4 over the IPsec tunnel.

Verifying Your Work on Router 2

Purpose Verify that the IKE SA negotiation is successful.

Action From operational mode, enter the **show services ipsec-vpn ike security-associations** command.

```
user@router2>show services ipsec-vpn ike security-associations
Remote Address State Initiator cookie Responder cookie Exchange type
10.1.15.2 Matured 03075bd3a0000003 4bff26a5c7000003 Main
```

To verify that the IPsec security association is active, issue the **show services ipsec-vpn ipsec security-associations detail** command. Notice that the SA contains the default settings inherent in the MultiServices PIC, such as ESP for the protocol and HMAC-SHA1-96 for the authentication algorithm.

From operational mode, enter the **show services ipsec-vpn ipsec security-associations detail** command.

```
user@router2> show services ipsec-vpn ipsec security-associations detail
Service set: demo-service-set
Rule: rule-ike, Term: term-ike, Tunnel index: 1
Local gateway: 10.1.15.1, Remote gateway: 10.1.15.2
Local identity: ipv4_subnet(any:0,[0..7]=10.1.12.0/24)
Remote identity: ipv4_subnet(any:0,[0..7]=10.1.56.0/24)
Direction: inbound, SPI: 2666326758, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 26863 seconds
Hard lifetime: Expires in 26998 seconds
Anti-replay service: Enabled, Replay window size: 64
Direction: outbound, SPI: 684772754, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 26863 seconds
Hard lifetime: Expires in 26998 seconds
Anti-replay service: Enabled, Replay window size: 64
```

To verify that traffic is traveling through the bidirectional IPsec tunnel, issue the **show services ipsec-vpn statistics** command:

From operational mode, enter the **show services ipsec-vpn statistics** command.

```
user@router2> show services ipsec-vpn ipsec statistics
PIC: ms-1/2/0, Service set: demo-service-set
ESP Statistics:
Encrypted bytes: 2248
Decrypted bytes: 2120
Encrypted packets: 27
Decrypted packets: 25
AH Statistics:
Input bytes: 0
Output bytes: 0
Input packets: 0
Output packets: 0
Errors:
AH authentication failures: 0, Replay errors: 0
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0
```

Meaning The **show services ipsec-vpn ipsec security-associations detail** command output shows the SA properties that you configured.

The **show services ipsec-vpn ipsec statistics** command output shows the traffic flow over the IPsec tunnel.

Verifying Your Work on Router 3

Purpose Verify that the IKE SA negotiation is successful on Router 3.

Action From operational mode, enter the **show services ipsec-vpn ike security-associations** command. To be successful, the SA on Router 3 must contain the same settings you specified on Router 2.

```
user@router3>show services ipsec-vpn ike security-associations
Remote Address State Initiator cookie Responder cookie Exchange type
10.1.15.1 Matured 03075bd3a0000003 4bff26a5c7000003 Main
```

To verify that the IPsec SA is active, issue the **show services ipsec-vpn ipsec security-associations detail** command. To be successful, the SA on Router 3 must contain the same settings you specified on Router 2.

From operational mode, enter the **show services ipsec-vpn ipsec security-associations detail** command.

```
user@router3>show services ipsec-vpn ipsec security-associations detail
Service set: demo-service-set
Rule: rule-ike, Term: term-ike, Tunnel index: 1
Local gateway: 10.1.15.2, Remote gateway: 10.1.15.1
Local identity: ipv4_subnet(any:0,[0..7]=10.1.56.0/24)
Remote identity: ipv4_subnet(any:0,[0..7]=10.1.12.0/24)
Direction: inbound, SPI: 684772754, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 26598 seconds
```

```

Hard lifetime: Expires in 26688 seconds
Anti-replay service: Enabled, Replay window size: 64
Direction: outbound, SPI: 2666326758, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 26598 seconds
Hard lifetime: Expires in 26688 seconds
Anti-replay service: Enabled, Replay window size: 64

```

To verify that traffic is traveling through the bidirectional IPsec tunnel, issue the **show services ipsec-vpn statistics** command:

From operational mode, enter the **show services ipsec-vpn ike security-associations** command.

```

user@router3>show services ipsec-vpn ipsec statistics
PIC: ms-1/2/0, Service set: demo-service-set
ESP Statistics:
  Encrypted bytes: 2120
  Decrypted bytes: 2248
  Encrypted packets: 25
  Decrypted packets: 27
AH Statistics:
  Input bytes: 0
  Output bytes: 0
  Input packets: 0
  Output packets: 0
Errors:
  AH authentication failures: 0, Replay errors: 0
  ESP authentication failures: 0, ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0

```

Meaning The **show services ipsec-vpn ipsec security-associations detail** command output shows the SA properties that you configured.

The **show services ipsec-vpn ipsec statistics** command output shows the traffic flow over the IPsec tunnel.

Verifying Your Work on Router 4

Purpose Verify that the IKE SA negotiation is successful.

Action From operational mode, enter **ping 10.1.12.2** command to the ge-0/0/0 interface on Router 1 to send traffic across the IPsec tunnel.

```

user@router4>ping 10.1.12.2
PING 10.1.12.2 (10.1.12.2): 56 data bytes
64 bytes from 10.1.12.2: icmp_seq=0 ttl=254 time=1.350 ms
64 bytes from 10.1.12.2: icmp_seq=1 ttl=254 time=1.161 ms
64 bytes from 10.1.12.2: icmp_seq=2 ttl=254 time=1.124 ms
64 bytes from 10.1.12.2: icmp_seq=3 ttl=254 time=1.142 ms
64 bytes from 10.1.12.2: icmp_seq=4 ttl=254 time=1.139 ms
64 bytes from 10.1.12.2: icmp_seq=5 ttl=254 time=1.116 ms
^C
--- 10.1.12.2 ping statistics ---
6 packets transmitted, 6 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.116/1.172/1.350/0.081 ms

```

To confirm that traffic travels through the IPsec tunnel, issue the **traceroute** command to the ge-0/0/0 interface on Router 1. Notice that the physical interface between Routers 2 and 3 is not referenced in the path; traffic enters the IPsec tunnel through the adaptive services IPsec inside interface on Router 3, passes through the loopback interface on Router 2, and ends at the ge-0/0/0 interface on Router 1.

From operational mode, enter the **traceroute 10.1.12.2**.

```
user@router4>traceroute 10.1.12.2
traceroute to 10.1.12.2 (10.1.12.2), 30 hops max, 40 byte packets
 1 10.1.15.2 (10.1.15.2) 0.987 ms 0.630 ms 0.563 ms
 2 10.0.0.2 (10.0.0.2) 1.194 ms 1.058 ms 1.033 ms
 3 10.1.12.2 (10.1.12.2) 1.073 ms 0.949 ms 0.932 ms
```

Meaning The **ping 10.1.12.2** output shows that Router 4 is able to reach Router 1 over the IPsec tunnel.

The **traceroute 10.1.12.2** output shows that traffic travels the IPsec tunnel.

Example: IKE Dynamic SA Configuration with Digital Certificates

This example shows how to configure IKE dynamic SA with digital certificates and contains the following sections.

- [Requirements on page 96](#)
- [Overview on page 97](#)
- [Configuration on page 97](#)
- [Verification on page 110](#)

Requirements

This example uses the following hardware and software components:

- Four M Series, MX Series, or T Series routers with multiservices interfaces installed in them.
- Junos OS Release 9.4 or later.

Before you configure this example you must request a CA certificate, create a local certificate, and load these digital certificates into the router. For details, see *Requesting for and installing a digital certificates on your router*

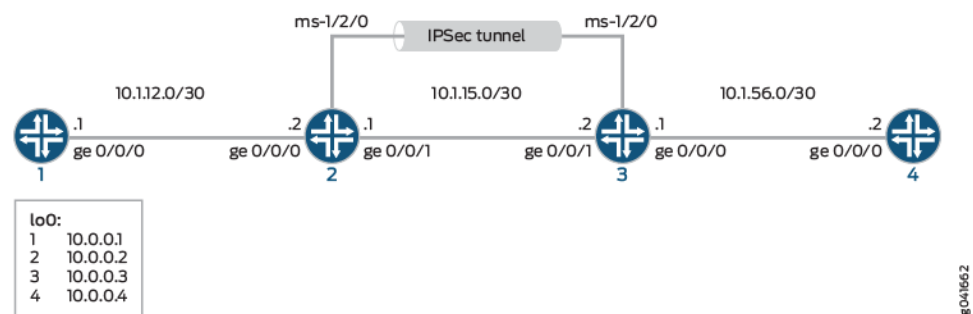

Overview

A security association (SA) is a simplex connection that enables two hosts to securely communicate with each other using IPsec. This example explains IKE dynamic SA configuration with digital certificates. The use of digital certificates provides additional security to your IKE tunnel. Using default values in the Services PIC, you do not need to configure an IPsec proposal or IPsec policy. However, you must configure an IKE proposal that specifies the use of digital certificates, reference the IKE proposal and local certificate in an IKE policy, and apply the CA profile to the service set.

Figure 6 on page 97 shows an IPsec topology containing a group of four routers. This configuration requires Routers 2 and 3 to establish an IKE-based IPsec tunnel by using digital certificates in place of preshared keys. Routers 1 and 4 provide basic connectivity and are used to verify that the IPsec tunnel is operational.

Topology

Figure 6: MS PIC IKE Dynamic SA Topology Diagram

Configuration

To configure IKE dynamic SA with digital certificates, perform these tasks:

NOTE: The interface types shown in this example are for indicative purpose only. For example, you can use so- interfaces instead of ge- and sp- instead of ms-.

Configuring Router 1

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 1.

```
set interfaces ge-0/0/0 description "to R2 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.12.2/30
set interfaces lo0 unit 0 family inet address 10.0.0.1/32
set routing-options router-id 10.0.0.1
set protocols ospf area 0.0.0.0 interface ge-0/0/0
set protocols ospf area 0.0.0.0 interface lo0.0
```

**Step-by-Step
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router 1 for OSPF connectivity with Router 2:

1. Configure an Ethernet interface and the loopback interface.

```
[edit interfaces]
user@router1# set ge-0/0/0 description "to R2 ge-0/0/0"
user@router1# set ge-0/0/0 unit 0 family inet address 10.1.12.2/30
user@router1# set lo0 unit 0 family inet address 10.0.0.1/32
```
2. Specify the OSPF area and associate the interfaces with the OSPF area.

```
[edit protocols]
user@router1# set ospf area 0.0.0.0 interface ge-0/0/0.0
user@router1# set ospf area 0.0.0.0 interface lo0.0
```
3. Configure the router ID.

```
[edit routing-options]
user@router1# set router-id 10.0.0.1
```
4. Commit the configuration.

```
[edit]
user@router1# commit
```

Results

From the configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@router1# show interfaces
interfaces {
  ge-0/0/0 {
    description "To R2 ge-0/0/0";
    unit 0 {
      family inet {
        address 10.1.12.2/30;
      }
    }
  }
  lo0 {
    unit 0 {
      family inet {
        address 10.0.0.1/32;
      }
    }
  }
}
```

```

    }
}

user@router1# show protocols ospf
protocols {
  ospf {
    area 0.0.0.0 {
      interface ge-0/0/0.0;
      interface lo0.0;
    }
  }
}

user@router1# show routing-options
routing-options {
  router-id 10.0.0.1;
}

```

Configuring Router 2

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 2.

```

set interfaces ge-0/0/0 description "to R1 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.12.1/30
set interfaces ge-0/0/1 description "to R3 ge-0/0/1"
set interfaces ge-0/0/1 unit 0 family inet address 10.1.15.1/30
set interfaces ms-1/2/0 services-options syslog host local services info

set services service-set demo-service-set ipsec-vpn-options local-gateway 10.1.15.1
set services service-set demo-service-set ipsec-vpn-rules rule-ike

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure OSPF connectivity and IPsec tunnel parameters on Router 2:

1. Configure interface properties. In this step, you configure two Ethernet interfaces (ge-1/0/0 and ge-1/0/1), the loopback interface and a multiservices interface (ms-1/2/0).

```

[edit interfaces]
user@router2# set ge-0/0/0 description "to R1 ge-0/0/0"
user@router2# set ge-0/0/0 unit 0 family inet address 10.1.12.1/30
user@router2# set ge-0/0/1 description "to R3 ge-0/0/1"
user@router2# set ge-0/0/1 unit 0 family inet address 10.1.15.1/30
user@router2# set ms-1/2/0 services-options syslog host local services info
user@router2# set ms-1/2/0 unit 0 family inet
user@router2# set ms-1/2/0 unit 1 family inet
user@router2# set ms-1/2/0 unit 1 service-domain inside
user@router2# set ms-1/2/0 unit 2 family inet
user@router2# set ms-1/2/0 unit 2 service-domain outside
user@router2# set lo0 unit 0 family inet address 10.0.0.2/32

```
2. Specify the OSPF area and associate the interfaces with the OSPF area.

```

[edit protocols]
user@router2# set ospf area 0.0.0.0 interface ge-0/0/0.0
user@router2# set ospf area 0.0.0.0 interface lo0.0
user@router2# set ospf area 0.0.0.0 interface ms-1/2/0.1

```
3. Configure the router ID.

```

[edit routing-options]
user@router2# set router-ID 10.0.0.2

```
4. Configure an IKE proposal and policy. To enable an IKE proposal for digital certificates, include the **rsa-signatures** statement at the **[edit services ipsec-vpn ike proposal proposal-name authentication-method]** hierarchy level. To reference the local certificate in the IKE policy, include the **local-certificate** statement at the **[edit services ipsec-vpn ike policy policy-name]** hierarchy level. To identify the CA or RA in the service set, include the **trusted-ca** statement at the **[edit services service-set service-set-name ipsec-vpn-options]** hierarchy level.

NOTE: For information about creating and installing digital certificates, see *Requesting for and installing a digital certificates on your router*

```
[edit services ipsec-vpn]
user@router2# set ike proposal ike-demo-proposal authentication-method
    rsa-signatures
user@router2# set ike policy ike-digital-certificates proposals ike-demo-proposal
user@router2# set ike policy ike-digital-certificates local-id fqdn router2.juniper.net
user@router2# set ike policy ike-digital-certificates local-certificate local-entrust2
user@router2# set ike policy ike-digital-certificates remote-id fqdn router3.juniper.net
```

5. Configure an IPsec proposal and policy. Also, set the **established-tunnels** knob to **immediately**.

```
[edit services ipsec-vpn]
user@router2# set ipsec proposal ipsec-demo-proposal protocol esp
user@router2# set ipsec proposal ipsec-demo-proposal authentication-algorithm
    hmac-sha1-96
user@router2# set ipsec proposal ipsec-demo-proposal encryption-algorithm
    3des-cbc
user@router2# set ipsec policy ipsec-demo-policy perfect-forward-secrecy keys
    group2
user@router2# set ipsec proposals ipsec-demo-proposal
user@router2# set establish-tunnels immediately
```

6. Configure an IPsec rule.

```
[edit services ipsec-vpn]
user@router2# set rule rule-ike term term-ike then remote-gateway 10.1.15.2
user@router2# set rule rule-ike term term-ike then dynamic ike-policy
    ike-digital-certificates
user@router2# set rule rule-ike term term-ike then dynamic ipsec-policy
    ipsec-demo-policy
user@router2# set rule match-direction input
```

7. Configure a next-hop style service set, specify the local-gateway address, and associate the IPsec VPN rule with the service set.

```
[edit services]
user@router2# set service-set demo-service-set next-hop-service
    inside-service-interface ms-1/2/0.1
user@router2# set service-set demo-service-set next-hop-service
    outside-service-interface ms-1/2/0.2
user@router2# set service-set demo-service-set ipsec-vpn-options trusted-ca
    entrust
user@router2# set service-set demo-service-set ipsec-vpn-options local-gateway
    10.1.15.1
user@router2# set service-set demo-service-set ipsec-vpn-rules rule-ike
```

8. Commit the configuration.

```
[edit]
user@router2# commit
```

Results From the configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, **show routing-options**, and **show services** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```
user@router2# show interfaces
interfaces {
  ge-0/0/0 {
    description "To R1 ge-0/0/0";
    unit 0 {
      family inet {
        address 10.1.12.1/30;
      }
    }
  }
  ge-0/0/1 {
    description "To R3 ge-0/0/1";
    unit 0 {
      family inet {
        address 10.1.15.1/30;
      }
    }
  }
  ms-1/2/0 {
    services-options {

            protocol esp;
            authentication-algorithm hmac-sha1-96;
            encryption-algorithm 3des-cbc;
        }
        policy demo-policy {
            perfect-forward-secrecy {
                keys group2;
            }
            proposals ipsec-demo-proposal;
        }
        establish-tunnels immediately;
    }
    service-set service-set-dynamic-demo-service-set {
        next-hop-service {
            inside-service-interface ms-1/2/0.1;
            outside-service-interface ms-1/2/0.2;
        }
    }
}

```

```

        ipsec-vpn-options {
            trusted-ca entrust;
            local-gateway 10.1.15.1;
        }
        ipsec-vpn-rules rule-ike;
    }
}

```

Configuring Router 3

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 3.

```

set interfaces ge-0/0/0 description "to R4 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.56.1/30
set interfaces ge-0/0/1 description "to R2 ge-0/0/1"
set interfaces ge-0/0/1 unit 0 family inet address 10.1.15.2/30
set interfaces ms-1/2/0 services-options syslog host local services info
set interfaces ms-1/2/0 unit 0 family inet
set interfaces ms-1/2/0 unit 1 family inet
set interfaces ms-1/2/0 unit 1 service-domain inside
set interfaces ms-1/2/0 unit 2 family inet
set interfaces ms-1/2/0 unit 2 service-domain outside
set interfaces lo0 unit 0 family inet address 10.0.0.3/32
set protocols ospf area 0.0.0.0 interface ge-0/0/0.0
set protocols ospf area 0.0.0.0 interface lo0.0
set protocols ospf area 0.0.0.0 interface ms-1/2/0.1
set routing-options router-id 10.0.0.3
set services ipsec-vpn rule rule-ike term term-ike then remote-gateway 10.1.15.1
set services ipsec-vpn rule rule-ike term term-ike then dynamic ike-policy
    ike-digital-certificates
set services ipsec-vpn rule rule-ike term term-ike then dynamic ipsec-policy
    ipsec-demo-policy
set services ipsec-vpn rule match-direction input
set services ipsec-vpn ike proposal ike-demo-proposal authentication-method
    rsa-signatures
set services ipsec-vpn ike policy ike-digital-certificates proposals ike-demo-proposal
set services ipsec-vpn ike policy ike-digital-certificates local-id fqdn router3.juniper.net
set services ipsec-vpn ike policy ike-digital-certificates local-certificate local-entrust3
set services ipsec-vpn ike policy ike-digital-certificates remote-id fqdn router2.juniper.net
set services ipsec-vpn ipsec proposal ipsec-demo-proposal protocol esp
set services ipsec-vpn ipsec proposal ipsec-demo-proposal authentication-algorithm
    hmac-sha1-96
set services ipsec-vpn ipsec proposal ipsec-demo-proposal encryption-algorithm 3des-cbc
set services ipsec-vpn ipsec policy ipsec-demo-policy perfect-forward-secrecy keys
    group2
set services ipsec-vpn ipsec proposals ipsec-demo-proposal
set services ipsec-vpn establish-tunnels immediately
set services service-set demo-service-set next-hop-service inside-service-interface
    ms-1/2/0.1
set services service-set demo-service-set next-hop-service outside-service-interface
    ms-1/2/0.2

```

```

set services service-set demo-service-set ipsec-vpn-options trusted-ca entrust
set services service-set demo-service-set ipsec-vpn-options local-gateway 10.1.15.2
set services service-set demo-service-set ipsec-vpn-rules rule-ike

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

NOTE: If the IPsec peers do not have a symmetrical configuration containing all the necessary components, they cannot establish a peering relationship. You need to request a CA certificate, create a local certificate, load these digital certificates into the router, and reference them in your IPsec configuration. For information about digital certification, see *Requesting for and installing a digital certificates on your router*

To configure OSPF connectivity and IPsec tunnel parameters on Router 3:

1. Configure interface properties. In this step, you configure two Ethernet interfaces (ge-1/0/0 and ge-1/0/1), the loopback interface, and a multiservices interface (ms-1/2/0).

```

[edit interfaces]
user@router3# set ge-0/0/0 description "to R4 ge-0/0/0"
user@router3# set ge-0/0/0 unit 0 family inet address 10.1.56.1/30
user@router3# set ge-0/0/1 description "to R2 ge-0/0/1"
user@router3# set ge-0/0/1 unit 0 family inet address 10.1.15.2/30
user@router3# set ms-1/2/0 services-options syslog host local services info
user@router3# set ms-1/2/0 unit 0 family inet
user@router3# set ms-1/2/0 unit 1 family inet
user@router3# set ms-1/2/0 unit 1 service-domain inside
user@router3# set ms-1/2/0 unit 2 family inet
user@router3# set ms-1/2/0 unit 2 service-domain outside
user@router3# set lo0 unit 0 family inet address 10.0.0.3/32

```

2. Specify the OSPF area, associate the interfaces with the OSPF area.

```

[edit protocols]
user@router3# set ospf area 0.0.0.0 interface ge-0/0/0.0
user@router3# set ospf area 0.0.0.0 interface lo0.0
user@router3# set ospf area 0.0.0.0 interface ms-1/2/0.1

```

3. Configure a router ID.

```

[edit routing-options]
user@router3# set router-id 10.0.0.3

```

4. Configure an IKE proposal and policy. To enable an IKE proposal for digital certificates, include the **rsa-signatures** statement at the **[edit services ipsec-vpn ike proposal proposal-name authentication-method]** hierarchy level. To reference the local certificate in the IKE policy, include the **local-certificate** statement at the **[edit services ipsec-vpn ike policy policy-name]** hierarchy level. To identify the CA or RA in the service set, include the **trusted-ca** statement at the **[edit services service-set service-set-name ipsec-vpn-options]** hierarchy level.

NOTE: For information about creating and installing digital certificates, see *Requesting for and installing a digital certificates on your router*

```
[edit services ipsec-vpn]
user@router3# set ike proposal ike-demo-proposal authentication-method
rsa-signatures
user@router3# set ike policy ike-digital-certificates proposals ike-demo-proposal
user@router3# set ike policy ike-digital-certificates local-id fqdn router2.juniper.net
user@router3# set ike policy ike-digital-certificates local-certificate local-entrust2
user@router3# set ike policy ike-digital-certificates remote-id fqdn router3.juniper.net
```

5. Configure an IPsec proposal. Also, set the **established-tunnels** knob to **immediately**.

```
[edit services ipsec-vpn]
user@router3# set ipsec proposal ipsec-demo-proposal protocol esp
user@router3# set ipsec proposal ipsec-demo-proposal authentication-algorithm
hmac-sha1-96
user@router3# set ipsec proposal ipsec-demo-proposal encryption-algorithm
3des-cbc
user@router3# set ipsec policy ipsec-demo-policy perfect-forward-secrecy keys
group2
user@router3# set ipsec proposals ipsec-demo-proposal
user@router3# set establish-tunnels immediately
```

6. Configure an IPsec rule.

```
[edit services ipsec-vpn]
user@router3# set rule rule-ike term term-ike then remote-gateway 10.1.15.2
user@router3# set rule rule-ike term term-ike then dynamic ike-policy
ike-digital-certificates
user@router3# set rule rule-ike term term-ike then dynamic ipsec-policy
ipsec-demo-policy
user@router3# set rule match-direction input
```

7. Configure a next-hop style service set, specify the local-gateway address, and associate the IPsec VPN rule with the service set.

```
[edit services]
user@router3# set service-set demo-service-set next-hop-service
inside-service-interface ms-1/2/0.1
user@router3# set service-set demo-service-set next-hop-service
outside-service-interface ms-1/2/0.2
user@router3# set service-set demo-service-set ipsec-vpn-options trusted-ca
entrust
user@router3# set service-set demo-service-set ipsec-vpn-options local-gateway
10.1.15.2
user@router3# set service-set demo-service-set ipsec-vpn-rules rule-ike
```

8. Commit the configuration.

```
[edit]
user@router3# commit
```

Results From the configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, **show routing-options**, and **show services** commands. If the output

does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

user@router3# show interfaces
interfaces {
  ge-0/0/0 {
    description "To R4 ge-0/0/0";
    unit 0 {
      family inet {
        address 10.1.56.1/30;
      }
    }
  }

}

```

Configuring Router 4

CLI Quick Configuration To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI, at the [edit] hierarchy level, of Router 4.

```

set interfaces ge-0/0/0 description "to R3 ge-0/0/0"
set interfaces ge-0/0/0 unit 0 family inet address 10.1.56.2/30
set interfaces lo0 unit 0 family inet address 10.0.0.4/32
set protocols ospf area 0.0.0.0 interface ge-0/0/0.0
set protocols ospf area 0.0.0.0 interface lo0.0
set routing-options router-id 10.0.0.4

```

Step-by-Step Procedure The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To set up OSPF connectivity with Router 4

1. Configure the interfaces. In this step, you configure an Ethernet interface (ge-1/0/1) and the loopback interface.

```

[edit interfaces]
user@router4# set ge-0/0/0 description "to R3 ge-0/0/0"
user@router4# set ge-0/0/0 unit 0 family inet address 10.1.56.2/30
user@router4# set lo0 unit 0 family inet address 10.0.0.4/32

```

2. Specify the OSPF area and associate the interfaces with the OSPF area.

```

[edit protocols]
user@router4# set ospf area 0.0.0.0 interface ge-0/0/0
user@router4# set ospf area 0.0.0.0 interface lo0.0

```

3. Configure the router ID.

```

[edit routing-options]
user@router4# set router-id 10.0.0.4

```

Results From the configuration mode, confirm your configuration by entering the **show interfaces**, **show protocols ospf**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration

```

user@router4# show interfaces
interfaces {
  ge-0/0/0 {
    description "To R3 ge-0/0/0";

```

```

        unit 0 {
            family inet {
                address 10.1.56.2/30;
            }
        }
    }
    lo0 {
        unit 0 {
            family inet {
                address 10.0.0.4/32;
            }
        }
    }
}

user@router4# show protocols ospf
protocols {
    ospf {
        area 0.0.0.0 {
            interface ge-0/0/0.0;
            interface lo0.0;
        }
    }
}

user@router4# show routing-options
routing-options {
    router-id 10.0.0.4;
}

```

Verification

Verifying Your Work on Router 1

Purpose On Router 1, verify ping command to the so-0/0/0 interface on Router 4 to send traffic across the IPsec tunnel.

Action From operational mode, enter **ping 10.1.56.2**.

```

user@router1>ping 10.1.56.2
PING 10.1.56.2 (10.1.56.2): 56 data bytes
64 bytes from 10.1.56.2: icmp_seq=0 ttl=254 time=1.351 ms
64 bytes from 10.1.56.2: icmp_seq=1 ttl=254 time=1.187 ms
64 bytes from 10.1.56.2: icmp_seq=2 ttl=254 time=1.172 ms
64 bytes from 10.1.56.2: icmp_seq=3 ttl=254 time=1.154 ms
64 bytes from 10.1.56.2: icmp_seq=4 ttl=254 time=1.156 ms
^C
--- 10.1.56.2 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.154/1.204/1.351/0.074 ms

```

If you ping the loopback address of Router 4, the operation succeeds because the address is part of the OSPF network configured on Router 4.

```

user@router1>ping 10.0.0.4
PING 10.0.0.4 (10.0.0.4): 56 data bytes
64 bytes from 10.0.0.4: icmp_seq=0 ttl=62 time=1.318 ms
64 bytes from 10.0.0.4: icmp_seq=1 ttl=62 time=1.084 ms

```

```
64 bytes from 10.0.0.4: icmp_seq=2 ttl=62 time=3.260 ms
^C
--- 10.0.0.4 ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.084/1.887/3.260/0.975 ms
```

Verifying Your Work on Router 2

Purpose To verify that matched traffic is being diverted to the bidirectional IPsec tunnel, view the IPsec statistics:

Action From operational mode, enter the **show services ipsec-vpn ipsec statistics**.

```
user@router2>show services ipsec-vpn ipsec statistics
PIC: sp-1/2/0, Service set: service-set-dynamic-demo-service-set
ESP Statistics:
Encrypted bytes: 162056
Decrypted bytes: 161896
Encrypted packets: 2215
Decrypted packets: 2216
AH Statistics:
Input bytes: 0
Output bytes: 0
Input packets: 0
Output packets: 0
Errors:
AH authentication failures: 0, Replay errors: 0
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0
```

To verify that the IKE SA negotiation is successful, issue the **show services ipsec-vpn ike security-associations** command:

From operational mode, enter the **show services ipsec-vpn ike security-associations**

```
user@router2> show services ipsec-vpn ike security-associations
Remote Address State Initiator cookie Responder cookie Exchange type
10.1.15.2 Matured d82610c59114fd37 ec4391f76783ef28 Main
```

To verify that the IPsec security association is active, issue the **show services ipsec-vpn ipsec security-associations detail** command. Notice that the SA contains the default settings inherent in the Services PIC, such as ESP for the protocol and HMAC-SHA1-96 for the authentication algorithm.

From operational mode, enter the **show services ipsec-vpn ipsec security-associations detail**

```
user@router2> show services ipsec-vpn ipsec security-associations detail
Service set: service-set-dynamic-demo-service-set
Rule: rule-ike, Term: term-ike, Tunnel index: 1
Local gateway: 10.1.15.1, Remote gateway: 10.1.15.2
IPsec inside interface: sp-1/2/0.1
Local identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
Direction: inbound, SPI: 857451461, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 9052 seconds
Hard lifetime: Expires in 9187 seconds
```

```
Anti-replay service: Enabled, Replay window size: 64
Direction: outbound, SPI: 1272330309, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 9052 seconds
Hard lifetime: Expires in 9187 seconds
Anti-replay service: Enabled, Replay window size: 64
```

To display the digital certificates that are used to establish the IPsec tunnel, issue the `show services ipsec-vpn certificates` command:

From operational mode, enter the **show services ipsec-vpn certificates**

```
user@router2> show services ipsec-vpn certificates
Service set: service-set-dynamic-demo-service-set, Total entries: 3
Certificate cache entry: 3
Flags: Non-root Trusted
Issued to: router3.juniper.net, Issued by: juniper
Alternate subject: router3.juniper.net
Validity:
Not before: 2005 Nov 21st, 23:33:58 GMT
Not after: 2008 Nov 22nd, 00:03:58 GMT
Certificate cache entry: 2
Flags: Non-root Trusted
Issued to: router2.juniper.net, Issued by: juniper
Alternate subject: router2.juniper.net
Validity:
Not before: 2005 Nov 21st, 23:28:22 GMT
Not after: 2008 Nov 21st, 23:58:22 GMT

Validity:
Not before: 2005 Oct 18th, 23:54:22 GMT
Not after: 2025 Oct 19th, 00:24:22 GMT
```

To display the CA certificate, issue the `show security pki ca-certificate detail` command. Notice that there are three separate certificates: one for certificate signing, one for key encipherment, and one for the CA's digital signature.

From operational mode, enter the **show security pki ca-certificate detail**

```
user@router2> show security pki ca-certificate detail

Use for key: Digital signature

```

To display the local certificate request, issue the `show security pki certificate-request` command:

From operational mode, enter the **show security pki certificate-request**

```
user@router2> show security pki certificate-request
Certificate identifier: local-entrust2
Issued to: router2.juniper.net
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed
```

To display the local certificate, issue the `show security pki local-certificate` command:

From operational mode, enter the **show security pki local-certificate**

```
user@router2> show security pki local-certificate
Certificate identifier: local-entrust2
Issued to: router2.juniper.net, Issued by: juniper
Validity:
Not before: 2005 Nov 21st, 23:28:22 GMT

```

Verifying Your Work on Router 3

Purpose To verify that matched traffic is being diverted to the bidirectional IPsec tunnel, view the IPsec statistics:

Action From operational mode, enter the **show services ipsec-vpn ipsec statistics**.

```
user@router3>show services ipsec-vpn ipsec statistics
PIC: sp-1/2/0, Service set: service-set-dynamic-demo-service-set
ESP Statistics:
Encrypted bytes: 161896
Decrypted bytes: 162056
Encrypted packets: 2216
Decrypted packets: 2215
AH Statistics:
Input bytes: 0
Output bytes: 0
Input packets: 0
Output packets: 0
Errors:
AH authentication failures: 0, Replay errors: 0
ESP authentication failures: 0, ESP decryption failures: 0
Bad headers: 0, Bad trailers: 0
```

To verify that the IKE SA negotiation is successful, issue the `show services ipsec-vpn ike security-associations` command. To be successful, the SA on Router 3 must contain the same settings you specified on Router 2.

From operational mode, enter the **show services ipsec-vpn ike security-associations**.

```
user@router3>show services ipsec-vpn ike security-associations
Remote Address State Initiator cookie Responder cookie Exchange type
10.1.15.1 Matured d82610c59114fd37 ec4391f76783ef28 Main
```

To verify that the IPsec SA is active, issue the `show services ipsec-vpn ipsec security-associations detail` command. To be successful, the SA on Router 3 must contain the same settings you specified on Router 2.

From operational mode, enter the **show services ipsec-vpn ipsec security-associations detail**.

```
user@router3>show services ipsec-vpn ipsec security-associations detail
Service set: service-set-dynamic-demo-service-set
Rule: rule-ike, Term: term-ike, Tunnel index: 1
Local gateway: 10.1.15.2, Remote gateway: 10.1.15.1
IPsec inside interface: sp-1/2/0.1

Issued to: router3.juniper.net
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed

```

To display the local certificate, issue the `show security pki local-certificate` command:

From operational mode, enter the **show security pki local-certificate**.

```

user@router3>show security pki local-certificate
Certificate identifier: local-entrust3
Issued to: router3.juniper.net, Issued by: juniper
Validity:
Not before: 2005 Nov 21st, 23:33:58 GMT
Not after: 2008 Nov 22nd, 00:03:58 GMT
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed

```

Verifying Your Work on Router 4

Purpose On Router 4, issue a ping command to the so-0/0/0 interface on Router 1 to send traffic across the IPsec tunnel.

Action From operational mode, enter **ping 10.1.12.2**.

```

user@router4>ping 10.1.12.2
PING 10.1.12.2 (10.1.12.2): 56 data bytes
64 bytes from 10.1.12.2: icmp_seq=0 ttl=254 time=1.350 ms
64 bytes from 10.1.12.2: icmp_seq=1 ttl=254 time=1.161 ms
64 bytes from 10.1.12.2: icmp_seq=2 ttl=254 time=1.124 ms
64 bytes from 10.1.12.2: icmp_seq=5 ttl=254 time=1.116 ms
^C
--- 10.1.12.2 ping statistics ---

```

```
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 1.116/1.172/1.350/0.081 ms
```

The final way you can confirm that traffic travels over the IPsec tunnel is by issuing the `traceroute` command to the `so-0/0/0` interface on Router 1. Notice that the physical interface between Routers 2 and 3 is not referenced in the path; traffic enters the IPsec tunnel through the adaptive services IPsec inside interface on Router 3, passes through the loopback interface on Router 2, and ends at the `so-0/0/0` interface on Router 1.

From operational mode, enter the **`traceroute 10.1.12.2`**.

```
user@router4>traceroute 10.1.12.2
traceroute to 10.1.12.2 (10.1.12.2), 30 hops max, 40 byte packets
 1 10.1.15.2 (10.1.15.2) 0.987 ms 0.630 ms 0.563 ms
 2 10.0.0.2 (10.0.0.2) 1.194 ms 1.058 ms 1.033 ms
 3 10.1.12.2 (10.1.12.2) 1.073 ms 0.949 ms 0.932 ms
```

Example: Configuring Statically Assigned IPsec Tunnels over a VRF Instance

This example shows how to configure a statically assigned IPsec tunnel over a VRF instance, and contains the following sections:

- [Requirements on page 118](#)
- [Overview on page 119](#)
- [Configuration on page 119](#)
- [Verification on page 124](#)

Requirements

This example uses the following hardware and software components:

- M Series, MX Series, or T Series router that is configured as a provider edge router.
- Junos OS Release 9.4 and later.

No special configuration beyond device initialization is required before you can configure this feature.

Overview

Junos OS enables you to configure statically assigned IPsec tunnels on Virtual Routing and Forwarding (VRF) instances. Ability to configure IPsec tunnels on VRF instances enhances network segmentation and security. You can have multiple customer tunnels configured on the same PE router over VRF instances. Each VRF instance acts as logical router with an exclusive routing table.

Configuration

This example shows the configuration of an IPsec tunnel over a VRF instance on a provider edge router, and provides step-by-step instructions for completing the required configuration.

This section contains:

- [Configuring the Provider Edge Router on page 119](#)
- [Results on page 122](#)

Configuring the Provider Edge Router

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit] hierarchy level.

```
set interfaces ge-0/3/0 unit 0 family inet address 10.6.6.6/32

```

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a statically assigned IPsec tunnel on a VRF instance:

1. Configure the interfaces. In this step, you configure two Ethernet (**ge**) interfaces, one services interface (**ms**-), and also the service-domain properties for the logical interfaces of the services interface. Note that the logical interface that is marked as the inside interface applies the configured service on the traffic, whereas the one that is marked as the outside interface acts as the egress point for the traffic on which the inside interface has applied the service.

```

[edit interfaces]
user@PE1# set ge-0/3/0 unit 0 family inet address 10.6.6.6/32
user@PE1# set ge-1/1/0 description "teller ge-0/1/0"
user@PE1# set ge-1/1/0 unit 0 family inet address 10.21.1.1/16
user@PE1# set ms-1/2/0 unit 0 family inet address 10.7.7.7/32
user@PE1# set ms-1/2/0 unit 1 family inet
user@PE1# set ms-1/2/0 unit 1 service-domain inside
user@PE1# set ms-1/2/0 unit 2 family inet
user@PE1# set ms-1/2/0 unit 2 service-domain outside

```

2. Configure a routing policy to specify route import and export criteria for the VRF instance. The import and export policies defined in this step are referenced from the routing-instance configuration in the next step.

```

[edit policy-options]
user@PE1# set policy-statement vpn-export then community add vpn-community
user@PE1# set policy-statement vpn-export then accept
user@PE1# set policy-statement vpn-import term a from community vpn-community
user@PE1# set policy-statement vpn-import term a then accept
user@PE1# set community vpn-community members target:100:20

```

3. Configure a routing instance and specify the routing-instance type as **vrf**. Apply the import and export policies defined in the previous step to the routing instance, and specify a static route to send the IPsec traffic to the inside interface (**ms-1/2/0.1**) configured in the first step.

```
[edit routing-instance]
user@PE1# set vrf instance-type vrf
user@PE1# set vrf interface ge-0/3/0.0
user@PE1# set vrf interface ms-1/2/0.1
user@PE1# set vrf route-distinguisher 192.168.0.1:1
user@PE1# set vrf vrf-import vpn-import
user@PE1# set vrf vrf-export vpn-export
user@PE1# set vrf routing-options static route 10.0.0.0/0 next-hop ge-0/3/0.0
user@PE1# set vrf routing-options static route 10.11.11.1/32 next-hop ge-0/3/0.0
user@PE1# set vrf routing-options static route 10.8.8.1/32 next-hop ms-1/2/0.1
```

4. Configure IKE and IPsec proposals and policies, and a rule to apply the IKE policy on the incoming traffic..

NOTE: By default, Junos OS uses IKE policy version 1.0. Junos OS Release 11.4 and later also support IKE policy version 2.0 which you must configure at [edit services ipsec-vpn ike policy policy-name pre-shared].

```
[edit services]

5. Configure a next-hop style service set. Note that you must configure the inside and outside interfaces that you configured in the first step as the **inside-service-interface** and **outside-service-interface** respectively.

```
[edit services]
user@PE1# set service-set demo-service-set next-hop-service
  inside-service-interface ms-1/2/0.1
user@PE1# set service-set demo-service-set next-hop-service
  outside-service-interface ms-1/2/0.2
user@PE1# set service-set demo-service-set ipsec-vpn-options local-gateway
  10.21.1.1
user@PE1# set service-set demo-service-set ipsec-vpn-rules demo-rule
```

6. Commit the configuration.

```
[edit]
user@PE1# commit
```

Results

From the configuration mode of Router 1, confirm your configuration by entering the **show interfaces**, **show policy-options**, **show routing-instances**, **show services ipsec-vpn**, and **show services service-set** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

Example: Configuring Junos VPN Site Secure on MS MIC and MS-MPC

NOTE: You can follow the same procedure and use the same configuration given in this example, to configure Junos VPN Site Secure (previously known as IPsec features) on MS-MPCs.

This example contains the following sections:

- [Requirements on page 124](#)
- [Overview on page 125](#)
- [Configuration on page 125](#)
- [Verification on page 133](#)

Requirements

This example uses the following hardware and software components:

- Two MX Series routers with MS-MICs

- Junos OS Release 13.2 or later

Overview

Junos OS, Release 13.2, extends support for Junos VPN Site Secure (formerly known as IPsec features) to the newly-introduced Multiservices MIC and MPC (MS-MIC and MS-MPC) on MX Series routers. The Junos OS extension-provider packages come preinstalled and preconfigured on the MS-MIC and MS-MPC.

The following Junos VPN Site Secure features are supported on the MS-MIC and MS-MPC in Release 13.2:

- Dynamic End Points (DEP)
- Encapsulating Security Payload (ESP) protocol
- Dead Peer Detection (DPD) trigger messages
- Sequence Number Rollover notifications
- Static IPsec tunnels with next-hop-style and interface-style service sets

However, in Junos OS, Release 13.2, the Junos VPN Site Secure support on the MS-MIC and MS-MPC is limited to IPv4 traffic.

This example shows configuration of two routers, Router 1 and Router 2, that have an IPsec VPN tunnel configured between them.

While configuring the routers, note the following points:

- The IP address you configure for **source-address** under the **[edit services ipsec-vpn rule *name* term *term* from]** hierarchy level on Router 1 must be the same as the IP address you configure for **destination-address** under the same hierarchy on Router 2, and vice versa.
- The IP address of the **remote-gateway** you configure under the **[edit services ipsec-vpn rule *name* term *term* then]** hierarchy level should match the IP address of the **local-gateway** you configure under the **[edit services service-set *name* ipsec-vpn-options]** hierarchy level of Router 2, and vice versa.

Configuration

This section contains:

- [Configuring Router 1 on page 127](#)
- [Configuring Router 2 on page 130](#)

CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

Configuring Interfaces      set interfaces ms-4/0/0 unit 0 family inet

Configuring Router 1

Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

NOTE: Starting with Release 13.2, the Junos OS extension-provider packages come preinstalled on multiservices MICs and MPCs (MS-MICs and MS-MPCs). The adaptive-services configuration at the [edit chassis fpc number pic number] hierarchy level is preconfigured on these cards.

1. Configure the interface properties.

```

user@router1# set interfaces ms-4/0/0 unit 0 family inet
user@router1# set interfaces ms-4/0/0 unit 1 family inet

```

```

user@router1# set interfaces ms-4/0/0 unit 1 family inet6
user@router1# set interfaces ms-4/0/0 unit 1 service-domain inside
user@router1# set interfaces ms-4/0/0 unit 2 family inet
user@router1# set interfaces ms-4/0/0 unit 2 family inet6
user@router1# set interfaces ms-4/0/0 unit 2 service-domain outside
user@router1# set interfaces xe-0/2/0 unit 0 family inet address 10.0.1.1/30

```

2. Configure IPsec properties.

```

user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 term term11 from
source-address 30.0.0.0/16
user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 term term11 from
destination-address 80.0.0.0/16
user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 term term11 then
remote-gateway 10.0.1.2
user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 term term11 then
dynamic ike-policy ike_policy_ms_4_0_0
user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 term term11 then
dynamic ipsec-policy ipsec_policy_ms_4_0_0
user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 term term11 then
anti-replay-window-size 4096
user@router1# set services ipsec-vpn rule vpn_rule_ms_4_0_01 match-direction
input
user@router1# set services ipsec-vpn ipsec proposal ipsec_proposal_ms_4_0_0
protocol esp
user@router1# set services ipsec-vpn ipsec proposal ipsec_proposal_ms_4_0_0
authentication-algorithm hmac-sha1-96
user@router1# set services ipsec-vpn ipsec proposal ipsec_proposal_ms_4_0_0
encryption-algorithm 3des-cbc
user@router1# set services ipsec-vpn ipsec policy ipsec_policy_ms_4_0_0
perfect-forward-secrecy keys group2
user@router1# set services ipsec-vpn ipsec policy ipsec_policy_ms_4_0_0 proposals
ipsec_proposal_ms_4_0_0
user@router1# set services ipsec-vpn ike proposal ike_proposal_ms_4_0_0
authentication-method pre-shared-keys
user@router1# set services ipsec-vpn ike proposal ike_proposal_ms_4_0_0 dh-group
group2
user@router1# set services ipsec-vpn ike policy ike_policy_ms_4_0_0 version 2
user@router1# set services ipsec-vpn ike policy ike_policy_ms_4_0_0 proposals
ike_proposal_ms_4_0_0
user@router1# set services ipsec-vpn ike policy ike_policy_ms_4_0_0 pre-shared-key
ascii-text secret-key

```

3. Configure a service set.

```

user@router1# set services service-set ipsec_ss_ms_4_0_01 next-hop-service
inside-service-interface ms-4/0/0.1
user@router1# set services service-set ipsec_ss_ms_4_0_01 next-hop-service
outside-service-interface ms-4/0/0.2
user@router1# set services service-set ipsec_ss_ms_4_0_01 ipsec-vpn-options
local-gateway 10.0.1.1
user@router1# set services service-set ipsec_ss_ms_4_0_01 ipsec-vpn-rules
vpn_rule_ms_4_0_01

```

4. Configure routing options.

```

user@router1# set routing-options static route 80.0.0.0/16 next-hop ms-4/0/0.1

```

Results From the configuration mode of Router 1, confirm your configuration by entering the **show interfaces**, **show services ipsec-vpn**, and **show services service-set** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@router1# show interfaces
ms-4/0/0 {
  unit 0 {
    family inet;
  }
  unit 1 {
    family inet;
    family inet6;
    service-domain inside;
  }
  unit 2 {
    family inet;
    family inet6;
    service-domain outside;
  }
}
xe-0/2/0 {
  unit 0 {
    family inet {
      address 10.0.1.1/30;
    }
  }
}

user@router1# show services ipsec-vpn

Configuring Router 2

Step-by-Step Procedure

1. Configure the interfaces.

```

user@router2# set interfaces ms-1/0/0 services-options inactivity-non-tcp-timeout 600
user@router2# set interfaces ms-1/0/0 unit 0 family inet
user@router2# set interfaces ms-1/0/0 unit 1 family inet
user@router2# set interfaces ms-1/0/0 unit 1 family inet6
user@router2# set interfaces ms-1/0/0 unit 1 service-domain inside
user@router2# set interfaces ms-1/0/0 unit 2 family inet
user@router2# set interfaces ms-1/0/0 unit 2 family inet6
user@router2# set interfaces ms-1/0/0 unit 2 service-domain outside
user@router2# set interfaces ge-2/0/0 unit 0 family inet address 10.0.1.2/30
      
```
2. Configure IPsec properties.

```

user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 term term11 from source-address 80.0.0.0/16
user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 term term11 from destination-address 30.0.0.0/16
user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 term term11 then remote-gateway 10.0.1.1
user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 term term11 then dynamic ike-policy ike_policy_ms_5_2_0
      
```

```

user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 term term11 then
dynamic ipsec-policy ipsec_policy_ms_5_2_0
user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 term term11 then
anti-replay-window-size 4096
user@router2# set services ipsec-vpn rule vpn_rule_ms_5_2_01 match-direction
input
user@router2# set services ipsec-vpn ipsec proposal ipsec_proposal_ms_5_2_0
protocol esp
user@router2# set services ipsec-vpn ipsec proposal ipsec_proposal_ms_5_2_0
authentication-algorithm hmac-sha1-96
user@router2# set services ipsec-vpn ipsec proposal ipsec_proposal_ms_5_2_0
encryption-algorithm 3des-cbc
user@router2# set services ipsec-vpn ipsec policy ipsec_policy_ms_5_2_0
perfect-forward-secrecy keys group2
user@router2# set services ipsec-vpn ipsec policy ipsec_policy_ms_5_2_0 proposals
ipsec_proposal_ms_5_2_0
user@router2# set services ipsec-vpn ike proposal ike_proposal_ms_5_2_0
authentication-method pre-shared-keys
user@router2# set services ipsec-vpn ike proposal ike_proposal_ms_5_2_0 dh-group
group2
user@router2# set services ipsec-vpn ike policy ike_policy_ms_5_2_0 version 2
user@router2# set services ipsec-vpn ike policy ike_policy_ms_5_2_0 proposals

user@router2# set services ipsec-vpn ike policy ike_policy_ms_5_2_0 pre-shared-key
ascii-text "$9$ JokmT69pRhrz3hrev7Nik."
user@router2# set services ipsec-vpn establish-tunnels immediately

```

3. Configure a service set.

```

user@router2# set services service-set ipsec_ss_ms_5_2_01 next-hop-service
inside-service-interface ms-1/0/0.1
user@router2# set services service-set ipsec_ss_ms_5_2_01 next-hop-service
outside-service-interface ms-1/0/0.2
user@router2# set services service-set ipsec_ss_ms_5_2_01 ipsec-vpn-options
local-gateway 10.0.1.2
user@router2# set services service-set ipsec_ss_ms_5_2_01 ipsec-vpn-rules
vpn_rule_ms_5_2_01

```

4. Configure routing options.

```

user@router2# set routing-options static route 30.0.0.0/16 next-hop ms-1/0/0.1

```

Results From the configuration mode of Router 2, confirm your configuration by entering the **show interfaces**, **show services ipsec-vpn**, and **show services service-set** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

Verification

- [Verifying Tunnel Creation on page 133](#)
- [Verifying Traffic Flow Through the DEP Tunnel on page 134](#)
- [Verifying IPsec Security Associations for the Service Set on page 135](#)

Verifying Tunnel Creation

Purpose Verify that Dynamic End Points are created.

Action Run the following command on Router 1:

```
user@router1 >show services ipsec-vpn ipsec security-associations detail
Service set: ipsec_ss_ms_4_0_01, IKE Routing-instance: default

Rule: vpn_rule_ms_4_0_01, Term: term11, Tunnel index: 1
Local gateway: 10.0.1.1, Remote gateway: 10.0.1.2
IPSec inside interface: ms-4/0/0.1, Tunnel MTU: 1500
Local identity: ipv4_subnet(any:0,[0..7]=30.0.0.0/16)
Remote identity: ipv4_subnet(any:0,[0..7]=80.0.0.0/16)

Direction: inbound, SPI: 112014862, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 24556 seconds
Hard lifetime: Expires in 25130 seconds
Anti-replay service: Enabled, Replay window size: 4096

Direction: outbound, SPI: 1469281276, AUX-SPI: 0
Mode: tunnel, Type: dynamic, State: Installed
Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
Soft lifetime: Expires in 24556 seconds
Hard lifetime: Expires in 25130 seconds
Anti-replay service: Enabled, Replay window size: 4096
```

Meaning The output shows that the IPSec SAs are up on the router with their state as Installed. The IPSec tunnel is up and ready to send traffic over the tunnel.

Verifying Traffic Flow Through the DEP Tunnel

Purpose Verify traffic flow across the newly-created DEP tunnel.

Action Run the following command on Router 2:

```
user@router2> show services ipsec-vpn ipsec statistics
PIC: ms-1/0/0, Service set: ipsec_ss_ms_5_2_01

ESP Statistics:
  Encrypted bytes:      153328
  Decrypted bytes:      131424
  Encrypted packets:    2738
  Decrypted packets:    2738
AH Statistics:
  Input bytes:          0
  Output bytes:         0
  Input packets:        0
  Output packets:       0
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0
```

Verifying IPsec Security Associations for the Service Set

Purpose Verify that the security associations configured for the service set are functioning correctly.

Action Run the following command on Router 2:

```
user@router2> show services ipsec-vpn ipsec security-associations ipsec_ss_ms_5_2_01
Service set: ipsec_ss_ms_5_2_01, IKE Routing-instance: default
```

```
Rule: vpn_rule_ms_5_2_01, Term: term11, Tunnel index: 1
Local gateway: 10.0.1.2., Remote gateway: 10.0.1.1
IPSec inside interface: ms-1/0/0.1, Tunnel MTU: 1500
Direction SPI      AUX-SPI      Mode      Type      Protocol
inbound  1612447024  0          tunnel    dynamic   ESP
outbound 1824720964  0          tunnel    dynamic   ESP
```

Multitask Example: Configuring IPsec Services

The following example-based instructions show how to configure IPsec services. The configuration involves defining an IKE policy, an IPsec policy, IPsec rules, trace options, and service sets.

This topic includes the following tasks:

1. [Configuring the IKE Proposal on page 135](#)
2. [Configuring the IKE Policy \(and Referencing the IKE Proposal\) on page 136](#)
3. [Configuring the IPsec Proposal on page 137](#)
4. [Configuring the IPsec Policy \(and Referencing the IPsec Proposal\) on page 137](#)
5. [Configuring the IPsec Rule \(and Referencing the IKE and IPsec Policies\) on page 138](#)
6. [Configuring IPsec Trace Options on page 139](#)
7. [Configuring the Access Profile \(and Referencing the IKE and IPsec Policies\) on page 140](#)
8. [Configuring the Service Set \(and Referencing the IKE Profile and the IPsec Rule\) on page 141](#)

Configuring the IKE Proposal

The IKE proposal configuration defines the algorithms and keys used to establish the secure IKE connection with the peer security gateway. For more information about IKE proposals, see *Configuring IKE Proposals*.

To define the IKE proposal:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit services ipsec-vpn
```
2. Configure the authentication method, which is **pre-shared keys** in this example:

```
[edit services ipsec-vpn]
user@host# set ike proposal test-IKE-proposal authentication-method pre-shared-keys
```

3. Configure the Diffie-Hellman Group and specify a name—for example, **group1**:

```
[edit services ipsec-vpn]
user@host# set ike proposal test-IKE-proposal dh-group group1
```

4. Configure the authentication algorithm, which is **sha1** in this example:

```
[edit services ipsec-vpn]
user@host# set ike proposal test-IKE-proposal authentication-algorithm sha1
```

5. Configure the encryption algorithm, which is **aes-256-cbc** in this example:

```
[edit services ipsec-vpn]
user@host# set ike proposal test-IKE-proposal encryption-algorithm aes-256-cbc
```

The following sample output shows the configuration of the IKE proposal:

```
[edit services ipsec-vpn]
user@host# show ike
proposal test-IKE-proposal {
  authentication-method pre-shared-keys;
  dh-group group1;
  authentication-algorithm sha1;
  encryption-algorithm aes-256-cbc;
}
```

Configuring the IKE Policy (and Referencing the IKE Proposal)

The IKE policy configuration defines the proposal, mode, addresses, and other security parameters used during IKE negotiation. For more information about IKE policies, see *Configuring IKE Policies*.

To define the IKE policy and reference the IKE proposal:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit services ipsec-vpn
```

2. Configure the IKE first phase mode—for example, **main**:

```
[edit services ipsec-vpn]
user@host# set ike policy test-IKE-policy mode main
```

3. Configure the proposal, which is **test-IKE-proposal** in this example:

```
[edit services ipsec-vpn]
user@host# set ike policy test-IKE-policy proposals test-IKE-proposal
```

4. Configure the local identification with an IPv4 address—for example, **192.168.255.2**:

```
[edit services ipsec-vpn]
user@host# set ike policy test-IKE-policy local-id ipv4_addr 192.168.255.2
```

5. Configure the preshared key in ASCII text format, which is **TEST** in this example:

```
[edit services ipsec-vpn]
user@host# set ike policy test-IKE-policy pre-shared-key ascii-text TEST
```

The following sample output shows the configuration of the IKE policy:

```
[edit services ipsec-vpn]
user@host# show ike
policy test-IKE-policy {
    mode main;
    proposals test-IKE-proposal;
    local-id ipv4_addr 192.168.255.2;
    pre-shared-key ascii-text TEST;
}
```

Configuring the IPsec Proposal

The IPsec proposal configuration defines the protocols and algorithms (security services) that are required to negotiate with the remote IPsec peer. For more information about IPsec proposals, see *Configuring IPsec Proposals*.

To define the IPsec proposal:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit services ipsec-vpn
```

2. Configure the IPsec protocol for the proposal—for example, **esp**:

```
[edit services ipsec-vpn]
user@host# set ipsec proposal test-IPsec-proposal protocol esp
```

3. Configure the authentication algorithm for the proposal, which is **hmac-sha1-96** in this example:

```
[edit services ipsec-vpn]
user@host# set ipsec proposal test-IPsec-proposal authentication-algorithm
hmac-sha1-96
```

4. Configure the encryption algorithm for the proposal, which is **aes-256-cbc** in this example:

```
[edit services ipsec-vpn]
user@host# set ipsec proposal test-IPsec-proposal encryption-algorithm aes-256-cbc
```

The following sample output shows the configuration of the IPsec proposal:

```
[edit services ipsec-vpn]
user@host# show ike
proposal test-IPsec-proposal {
    protocol esp;
    authentication-algorithm hmac-sha1-96;
    encryption-algorithm aes-256-cbc;
}
```

Configuring the IPsec Policy (and Referencing the IPsec Proposal)

The IPsec policy configuration defines a combination of security parameters (IPsec proposals) used during IPsec negotiation. It defines PFS and the proposals needed for the connection. For more information about IPsec policies, see *Configuring IPsec Policies*.

To define the IPsec policy and reference the IPsec proposal:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit services ipsec-vpn
```

2. Configure the keys for perfect forward secrecy in the IPsec policy—for example, **group1**:

```
[edit services ipsec-vpn]
user@host# set ipsec policy test-IPsec-policy perfect-forward-secrecy keys group1
```

3. Configure a set of IPsec proposals in the IPsec policy—for example, **test-IPsec-proposal**:

```
[edit services ipsec-vpn]
user@host# set ipsec policy test-IPsec-policy proposals test-IPsec-proposal
```

The following sample output shows the configuration of the IPsec policy:

```
[edit services ipsec-vpn]
user@host# show ipsec policy test-IPsec-policy
perfect-forward-secrecy {
    keys group1;
}
proposals test-IPsec-proposal;
```

Configuring the IPsec Rule (and Referencing the IKE and IPsec Policies)

The IPsec rule configuration defines the direction that specifies whether the match is applied on the input or output side of the interface. The configuration also consists of a set of terms that specify the match conditions and applications that are included and excluded and also specify the actions and action modifiers to be performed by the router software. For more information about IPsec rules, see *Configuring IPsec Rules*.

To define the IPsec rule and reference the IKE and IPsec policies:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit services ipsec-vpn
```

2. Configure the IP destination address for the IPsec term in the IPsec rule—for example, **192.168.255.2/32**:

```
[edit services ipsec-vpn]
user@host# set rule test-IPsec-rule term 10 from destination-address 192.168.255.2/32
```

3. Configure the remote gateway address for the IPsec term in the IPsec rule—for example, **0.0.0.0**:

```
[edit services ipsec-vpn]
user@host# set rule test-IPsec-rule term 10 then remote-gateway 0.0.0.0
```

4. Configure a dynamic security association for IKE policy for the IPsec term in the IPsec rule, which is **test-IKE-policy** in this example:

```
[edit services ipsec-vpn]
user@host# set rule test-IPsec-rule term 10 then dynamic ike-policy test-IKE-policy
```

5. Configure a dynamic security association for IKE proposal for the IPsec term in the IPsec rule, which is **test-IPsec-proposal** in this example:

```
[edit services ipsec-vpn]
user@host# set rule test-IPsec-rule term 10 then dynamic ipsec-policy test-IPsec-policy
```

6. Configure a direction for which the rule match is being applied in the IPsec rule—for example, **input**:

```
[edit services ipsec-vpn]
user@host# set rule test-IPsec-rule match-direction input
```

The following sample output shows the configuration of the IPsec rule:

```
[edit services ipsec-vpn]
user@host# show rule test-IPsec-rule
term 10 {
  from {
    destination-address {
      192.168.255.2/32;
    }
  }
  then {
    remote-gateway 0.0.0.0;
    dynamic {
      ike-policy test-IKE-policy;
      ipsec-policy test-IPsec-policy;
    }
  }
}
match-direction input;
```

Configuring IPsec Trace Options

The IPsec trace options configuration tracks IPsec events and records them in a log file in the **/var/log** directory. By default, this file is named **/var/log/kmd**. For more information about IPsec rules, see *Tracing IPsec Operations*.

To define the IPsec trace options:

1. In configuration mode, go to the following hierarchy level:

```
user@host# edit services ipsec-vpn
```

2. Configure the trace file, which is **ipsec.log** in this example:

```
[edit services ipsec-vpn]
user@host# set traceoptions file ipsec.log
```

3. Configure all the tracing parameters with the option **all** in this example:

```
[edit services ipsec-vpn]
user@host# set traceoptions flag all
```

The following sample output shows the configuration of the IPsec trace options:

```
[edit services ipsec-vpn]
user@host# show traceoptions
file ipsec.log;
flag all;
```

Configuring the Access Profile (and Referencing the IKE and IPsec Policies)

The access profile configuration defines the access profile and references the IKE and IPsec policies. For more information about access profile, see *Configuring an IKE Access Profile*.

To define the access profile and reference the IKE and IPsec policies:

1. In configuration mode, go to the following hierarchy level:

```
user@host# [edit access]
```

2. Configure the list of local and remote proxy identity pairs with the **allowed-proxy-pair** option. In this example, **10.0.0.0/24** is the IP address for local proxy identity and **10.0.1.0/24** is the IP address for remote proxy identity:

```
[edit access]
user@host# set profile IKE-profile-TEST client * ike allowed-proxy-pair local
10.0.0.0/24 remote 10.0.1.0/24
```

3. Configure the IKE policy—for example, **test-IKE-policy**:

```
[edit access]
user@host# set profile IKE-profile-TEST client * ike ike-policy test-IKE-policy
```

4. Configure the IPsec policy—for example, **test-IPsec-policy**:

```
[edit access]
user@host# set profile IKE-profile-TEST client * ike ipsec-policy test-IPsec-policy
```

5. Configure the identity of logical service interface pool, which is **TEST-intf** in this example:

```
[edit access]
user@host# set profile IKE-profile-TEST client * ike interface-id TEST-intf
```

The following sample output shows the configuration of the access profile:

```
[edit access]
user@host# show
profile IKE-profile-TEST {
  client * {
    ike {
      allowed-proxy-pair local 10.0.0.0/24 remote 10.0.1.0/24;
      ike-policy test-IKE-policy;
      ipsec-policy test-IPsec-policy; # new statement
      interface-id TEST-intf;
    }
  }
}
```

Configuring the Service Set (and Referencing the IKE Profile and the IPsec Rule)

The service set configuration defines IPsec service sets that require additional specifications and references the IKE profile and the IPsec rule. For more information about IPsec service sets, see *Configuring IPsec Service Sets*.

To define the service set configuration with the next-hop service sets and IPsec VPN options:

1. In configuration mode, go to the following hierarchy level:

```
user@host# [edit services]
```

2. Configure a service set with parameters for next hop service interfaces for the inside network—for example, **sp-1/2/0.1**:

```
[edit services]
```

```
user@host# set service-set TEST next-hop-service inside-service-interface sp-1/2/0.1
```

3. Configure a service set with parameters for next hop service interfaces for the outside network—for example, **sp-1/2/0.2**:

```
[edit services]
```

```
user@host# set service-set TEST next-hop-service outside-service-interface sp-1/2/0.2
```

4. Configure the IPsec VPN options with the address and routing instance for the local gateway—for example, **192.168.255.2**:

```
[edit services]
```

```
user@host# set service-set TEST ipsec-vpn-options local-gateway 192.168.255.2
```

5. Configure the IPsec VPN options with the IKE access profile for dynamic peers, which is **IKE-profile-TEST** in this example:

```
[edit services]
```

```
user@host# set service-set TEST ipsec-vpn-options ike-access-profile IKE-profile-TEST
```

6. Configure a service set with IPsec VPN rules, which is **test-IPsec-rule** in this example:

```
[edit services]
```

```
user@host# set service-set TEST ipsec-vpn-rules test-IPsec-rule
```

The following sample output shows the configuration of the service set configuration referencing the IKE profile and the IPsec rule:

```
[edit services]user@host# show service-set TEST
next-hop-service {
    inside-service-interface sp-1/2/0.1;
    outside-service-interface sp-1/2/0.2;
}
ipsec-vpn-options {
    local-gateway 192.168.255.2;
    ike-access-profile IKE-profile-TEST;
}
ipsec-vpn-rules test-IPsec-rule;
```

CHAPTER 6

Configuration Statements

- [IPsec Hierarchy Level](#) on page 143

IPsec Hierarchy Level

To configure IP Security (IPsec) services, include the following statements at the **[edit services ipsec-vpn]** hierarchy level:

```
[edit services ipsec-vpn]
clear-ike-sas-on-pic-restart;
clear-ipsec-sas-on-pic-restart;
establish-tunnels (immediately | on-traffic);
ike {
  proposal proposal-name {
    authentication-algorithm (md5 | sha1 | sha-256 | sha-384);
    authentication-method ( pre-shared-keys | rsa-signatures);
    description description;
    dh-group (group1 | group2 | group5 | group14 | group19 | group20);
    encryption-algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
    lifetime-seconds seconds;
  }
  policy policy-name {
    description description;
    local-certificate identifier;
    local-id (ipv4_addr ipv4-address | ipv6_addr ipv6-address | key-id identifier | fqdn fqdn);
    version (1 | 2);
    mode (aggressive | main);
    pre-shared-key (ascii-text key | hexadecimal key);
    proposals [ proposal-names ];
    remote-id {
      any-remote-id;
      ipv4_addr [ values ];
      ipv6_addr [ values ];
      key_id [ values ];
      fqdn [ values ];
    }
  }
}
ipsec {
  proposal proposal-name {
    authentication-algorithm (hmac-md5-96 | hmac-sha-256-128 | hmac-sha1-96);
    description description;
```

```

    encryption-algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
    lifetime-seconds seconds;
    protocol (ah | esp | bundle);
  }
  policy policy-name {
    description description;
    perfect-forward-secrecy {
      keys (group1 | group2 | group5 | group14 | group19 | group20);
    }
    proposals [ proposal-names ];
  }
}
rule rule-name {
  match-direction (input | output);
  term term-name {
    from {
      destination-address address;
      ipsec-inside-interface interface-name;
      source-address address;
    }
    then {
      anti-replay-window-size bits;
      backup-remote-gateway address;
      clear-dont-fragment-bit;
      dynamic {
        ike-policy policy-name;
        ipsec-policy policy-name;
      }
      dead-peer-detection {
        interval seconds ;
        threshold number ;
      }
      initiate-dead-peer-detection;
      manual {
        direction (inbound | outbound | bidirectional) {
          authentication {
            algorithm (hmac-md5-96 | hmac-sha1-96 | hmac-sha-256-128);
            key (ascii-text key | hexadecimal key);
          }
          auxiliary-spi spi-value;
          encryption {
            algorithm (3des-cbc | aes-128-cbc | aes-192-cbc | aes-256-cbc | des-cbc);
            key (ascii-text key | hexadecimal key);
          }
          protocol (ah | bundle | esp);
          spi spi-value;
        }
      }
      no-anti-replay;
      remote-gateway address;
      syslog;
      tunnel-mtu bytes;
    }
  }
}
rule-set rule-set-name {

```

```

    [ rule rule-names ];
  }
  no-ipsec-tunnel-in-traceroute;
  traceoptions {
    file {
      files number;
      size bytes;
    }
    flag flag;
    level level;
  }

```

anti-replay-window-size (Services IPsec VPN)

Syntax	<code>anti-replay-window-size <i>bits</i>;</code>
Hierarchy Level	[edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then]
Release Information	Statement introduced in Junos OS Release 10.0.
Description	Specify the size of the IPsec antireplay window.
Options	<p>bits—Size of the antireplay window, in bits.</p> <p>Default: 64 bits (AS PICs), 128 bits (Multiservices PICs and DPCs)</p> <p>Range: 64 through 4096 bits</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

encryption

Syntax	<pre> encryption { algorithm <i>algorithm</i>; key (ascii-text <i>key</i> hexadecimal <i>key</i>); } </pre>
Hierarchy Level	[edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then manual direction <i>direction</i>]
Release Information	Statement introduced before Junos OS Release 7.4. aes-128-cbc , aes-192-cbc , and aes-256-cbc options added in Junos OS Release 7.6.
Description	Configure an encryption algorithm and key for manual SA.

Options **algorithm**—Type of encryption algorithm. The algorithm can be one of the following:

- **des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 48 bits long.
- **3des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 192 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

NOTE: For **3des-cbc**, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

key—Type of encryption key. The key can be one of the following:

- **ascii-text**—ASCII text key. Following are the key lengths, in ASCII characters, for the different encryption options:
 - **des-cbc** option, 8 ASCII characters
 - **3des-cbc** option, 24 ASCII characters
 - **aes-128-cbc** option, 16 ASCII characters
 - **aes-192-cbc** option, 24 ASCII characters
 - **aes-256-cbc** option, 32 ASCII characters
- **hexadecimal**—Hexadecimal key. Following are the key lengths, in hexadecimal characters, for the different encryption options:
 - **des-cbc** option, 16 hexadecimal characters
 - **3des-cbc** option, 48 hexadecimal characters
 - **aes-128-cbc** option, 32 hexadecimal characters
 - **aes-192-cbc** option, 48 hexadecimal characters

- **aes-256-cbc** option, 64 hexadecimal characters

Required Privilege Level system—To view this statement in the configuration.
system-control—To add this statement to the configuration.

proposals

Syntax	<pre>proposals [<i>proposal-names</i>];</pre>
Hierarchy Level	[edit services ipsec-vpn ike policy <i>policy-name</i>], [edit services ipsec-vpn ipsec policy <i>policy-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Define a list of proposals to include in the IKE or IPsec policy.
Options	<i>proposal-names</i> —List of IKE or IPsec proposal names.
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Configuring IKE Proposals on page 25• Configuring IPsec Proposals on page 35

protocol

Syntax	<code>protocol (ah esp bundle);</code>
Hierarchy Level	[edit services ipsec-vpn ipsec proposal <i>proposal-name</i>], [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then manual direction <i>direction</i>]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Define an IPsec protocol for a dynamic or manual SA.
Options	ah —Authentication Header protocol. esp —Encapsulating Security Payload protocol. bundle —AH and ESP protocol.
Required Privilege Level	admin —To view this statement in the configuration. admin-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Security Associations on page 19

remote-gateway

Syntax	<code>remote-gateway <i>address</i>;</code>
Hierarchy Level	[edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Define the remote address to which the IPsec traffic is directed.
Options	<i>address</i> —Remote IPv4 or IPv6 address.
Required Privilege Level	admin —To view this statement in the configuration. admin-control —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring IPsec Rules on page 40

remote-id

Syntax	<pre>remote-id { any-remote-id; ipv4_addr [<i>values</i>]; ipv6_addr [<i>values</i>]; key_id [<i>values</i>]; }</pre>
Hierarchy Level	[edit services ipsec-vpn ikepolicy <i>policy-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. ipv6_addr option added in Junos OS Release 7.6. any-remote-id option added in Junos OS Release 8.2.
Description	Define the remote identification values to which the IKE policy applies.
Options	<p>any-remote-id—Allow any remote address to connect. This option is supported only in dynamic configurations and cannot be configured with specific values.</p> <p>ipv4_addr [<i>values</i>]—Define one or more IPv4 address identification values.</p> <p>ipv6_addr [<i>values</i>]—Define one or more IPv6 address identification values.</p> <p>key_id [<i>values</i>]—Define one or more key identification values.</p> <p>fqdn <i>fqdn</i>—Fully-qualified domain name.</p>
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

------------------------------	---

traceoptions (PKI)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <match <i>regular-expression</i>> <size <i>maximum-file-size</i>> <world-readable no-world-readable>; flag <i>flag</i>; } </pre>
Hierarchy Level	[edit security pki]
Description	Configure security public key infrastructure (PKI) trace options. To specify more than one trace option, include multiple flag statements. Trace option output is recorded in the <code>/var/log/pkid</code> file.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the file statement, you must specify a filename.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file (for example, pkid) reaches its maximum size, it is renamed pkid.0, then pkid.1, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 2 files</p> <p>flag—Trace operation to perform. To specify more than one trace operation, include multiple flag statements:</p> <ul style="list-style-type: none"> all—Trace with all flags enabled. certificate-verification—Trace PKI certificate verification events. online-crl-check—Trace PKI online certificate revocation list (CRL) events. enrollment—PKI certificate enrollment tracing. <p>match <i>regular-expression</i>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p>size <i>maximum-file-size</i>—(Optional) Maximum size of each trace file, in kilobytes (KB). If you specify a maximum file size, you also must specify a maximum number of trace files with the files <i>number</i> option.</p> <p>Default: 1024 KB</p> <p>world-readable no-world-readable—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The world-readable option enables any user to read the file. To explicitly set the default behavior, use the no-world-readable option.</p>

Required Privilege trace—To view this statement in the configuration.
Level trace-control—To add this statement to the configuration.

Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear security pki ca-certificate all

```
user@host> clear security pki ca-certificate all
```

clear security pki certificate-request

Syntax	clear security pki certificate-request (all certificate-id <i>certificate-id-name</i>)
Release Information	Command introduced in Junos OS Release 7.5.
Description	Delete manually generated local digital certificate requests from the router.
Options	<p>all—Delete all local digital certificate requests from the router.</p> <p>certificate-id <i>certificate-id-name</i>—Delete the specified local digital certificate and corresponding public/private key pair.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show security pki certificate-request on page 212

```

clear services ipsec-vpn ipsec security-associations

Syntax	<code>clear services ipsec-vpn security-associations</code> <code><peer-address-name></code> <code><remote-gateway remote-gateway-address></code> <code><service-set-name></code> <code><tunnel-index tunnel-index-number></code>
Release Information	Command introduced before Junos OS Release 7.4. remote-gateway , service-set-name , and tunnel-index options added in Junos OS Release 8.4.
Description	(Adaptive services interfaces only) Clear IP Security (IPsec) security associations. You can combine the options for greater specificity.
Options	<p>peer-address-name—(Optional) Clear only the security association specified by the peer address.</p> <p>remote-gateway remote-gateway-address—(Optional) Clear only the security association specified by the remote gateway address.</p> <p>service-set-name—(Optional) Clear only the security association specified by the service-set name.</p> <p>tunnel-index tunnel-index-number—(Optional) Clear only the security association specified by the tunnel index number.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show services ipsec-vpn ipsec security-associations on page 226
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear services ipsec-vpn ipsec security-associations

```
user@host> clear services ipsec-vpn ipsec security-associations
```

request security pki ca-certificate enroll

Syntax	<code>request security pki ca-certificate enroll ca-profile <i>ca-profile-name</i></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Request a digital certificate from a certificate authority (CA) online by using the Simple Certificate Enrollment Protocol (SCEP).
Options	<code>ca-profile <i>ca-profile-name</i></code> —CA profile name.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"> • clear security pki ca-certificate on page 186 • show security pki ca-certificate on page 208
List of Sample Output	request security pki ca-certificate enroll on page 195
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request security pki ca-certificate enroll

```

user@host> request security pki ca-certificate enroll ca-profile entrust
Received following certificates:
Certificate: C=us, O=juniper, CN=First Officer
Fingerprint: 46:71:15:34:f0:a6:41:76:65:81:33:4f:68:47:c4:df:78:b8:e3:3f
Certificate: C=us, O=juniper, CN=First Officer
Fingerprint: bc:78:87:9b:a7:91:13:20:71:db:ac:b5:56:71:42:ad:1a:b6:46:17
Certificate: C=us, O=juniper
Fingerprint: 00:8e:6f:58:dd:68:bf:25:0a:e3:f9:17:70:d6:61:f3:53:a7:79:10
Do you want to load the above CA certificate ? [yes,no] (no) yes

```

request security pki ca-certificate load

Syntax	<code>request security pki ca-certificate load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Manually load a certificate authority (CA) digital certificate from a specified location.
Options	<p>ca-profile <i>ca-profile-name</i>—Load the specified CA profile.</p> <p>filename <i>path/filename</i>—Directory location and filename of the CA digital certificate.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• clear security pki ca-certificate on page 186• show security pki ca-certificate on page 208
List of Sample Output	request security pki ca-certificate load on page 196
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request security pki ca-certificate load

```
user@host> request security pki ca-certificate load ca-profile ca-private filename pki-file
```

request security pki ca-certificate verify

Syntax	<code>request security pki ca-certificate verify ca-profile <i>ca-profile-name</i></code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Verify the digital certificate installed for the specified certificate authority (CA).
Options	ca-profile <i>ca-profile-name</i> —Name of the local digital certificate identifier.
Required Privilege Level	maintenance
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki ca-certificate verify ca-profile ca1 (CRL not downloaded)
user@host> request security pki ca-certificate verify ca-profile ca1
```

```
CA certificate ca1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

request security pki crt load

Syntax	<code>request security pki crt load ca-profile <i>ca-profile-name</i> filename <i>path/filename</i></code>
Release Information	Command introduced in Junos OS Release 8.1.
Description	Manually install a certificate revocation list (CRL) on the router from a specified location.
Options	<code>ca-profile <i>ca-profile-name</i></code> —Load the specified certificate authority (CA) profile. <code>filename <i>path/filename</i></code> —Directory location and filename of the CRL.
Required Privilege Level	maintenance
List of Sample Output	request security pki crt load on page 198
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request security pki crt load

```
user@host> request security pki crt load ca-profile ca-private filename pki-file
```

request security pki generate-certificate-request

Syntax	request security pki generate-certificate-request certificate-id <i>certificate-id-name</i> domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i> <email <i>email-address</i> > <filename (<i>path</i> terminal)> <ip-address <i>ip-address</i> >
Release Information	Command introduced in Junos OS Release 7.5.
Description	Manually generate a local digital certificate request in the Public-Key Cryptography Standards #10 (PKCS-10) format.
Options	<p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> • CN—Common name • OU—Organizational unit name • O—Organization name • ST—State • C—Country <p>email <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p>filename (<i>path</i> terminal)—(Optional) Location where the local digital certificate request should be placed or the login terminal.</p> <p>ip-address <i>ip-address</i>—(Optional) IP address of the router.</p>
Required Privilege Level	maintenance

request security pki generate-key-pair

Syntax	<code>request security pki generate-key-pair certificate-id <i>certificate-id-name</i> <size (512 1024 2048)></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Generate a Public Key Infrastructure (PKI) public and private key pair for a local digital certificate.
Options	certificate-id <i>certificate-id-name</i> —Name of the local digital certificate and the public/private key pair. size —(Optional) Key pair size. The key pair size can be 512 , 1024 , or 2048 bits.
Required Privilege Level	maintenance
List of Sample Output	request security pki generate-key-pair on page 201
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request security pki generate-key-pair

```
user@host> request security pki generate-key-pair certificate-id billy size 2048
Generated key pair billy, key size 2048 bits
```

request security pki local-certificate enroll

Syntax	<code>request security pki local-certificate enroll ca-profile <i>ca-profile-name</i> certificate-id <i>certificate-id-name</i> challenge-password <i>password</i> domain-name <i>domain-name</i> subject <i>subject-distinguished-name</i> <email <i>email-address</i>> <ip-address <i>ip-address</i>></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Request that a certificate authority (CA) enroll and install a local digital certificate online by using the Simple Certificate Enrollment Protocol (SCEP).
Options	<p>ca-profile <i>ca-profile-name</i>—CA profile name.</p> <p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>challenge-password <i>password</i>—Password set by the administrator and normally obtained from the SCEP enrollment webpage of the CA. The password is 16 characters in length.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none">• CN—Common name• OU—Organizational unit name• O—Organization name• ST—State• C—Country <p>email <i>email-address</i>—(Optional) E-mail address of the certificate holder.</p> <p>ip-address <i>ip-address</i>—(Optional) IP address of the router.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• show security pki local-certificate on page 216
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> request security pki local-certificate enroll certificate-id r3-entrust-scep ca-profile  
entrust domain-name router3.juniper.net subject "CN=router3,OU=Engineering,O=juniper,C=US"  
challenge-password 123
```

Certificate enrollment has started. To view the status of your enrollment, check the public key infrastructure log (pkid) log file at /var/log/pkid. Please save the challenge-password for revoking this certificate in future. Note that this password is not stored on the router.

request security pki local-certificate generate-self-signed

Syntax	<code>request security pki local-certificate generate-self-signed certificate-id <i>certificate-id-name</i> domain-name <i>domain-name</i> ip-address <i>ip-address</i> email <i>email-address</i> subject <i>subject-distinguished-name</i></code>
Release Information	Command introduced in Junos OS Release 9.1.
Description	Manually generate a self-signed certificate for the given distinguished name.
Options	<p>certificate-id <i>certificate-id-name</i>—Name of the local digital certificate and the public/private key pair.</p> <p>domain-name <i>domain-name</i>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p>email <i>email-address</i>—E-mail address of the certificate holder.</p> <p>ip-address <i>ip-address</i>—IP address of the router.</p> <p>subject <i>subject-distinguished-name</i>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none">• CN—Common name• OU—Organizational unit name• O—Organization name• ST—State• C—Country
Required Privilege Level	<code>maintenance</code> <code>security</code>
Related Documentation	<ul style="list-style-type: none">• show security pki local-certificate on page 216
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

```
user@host> request security pki local-certificate generate-self-signed certificate-id self-cert  
subject cn=abc domain-name juniper.net email mholmes@juniper.net  
Self-signed certificate generated and loaded successfully
```

request security pki local-certificate load

Syntax	<code>request security pki local-certificate load certificate-id <i>certificate-id-name</i> filename <i>path</i></code>
Release Information	Command introduced in Junos OS Release 7.5.
Description	Manually load a local digital certificate from a specified location.
Options	<p>certificate-id <i>certificate-id-name</i>—Name of the public/private key pair mapped to the local digital certificate.</p> <p>filename <i>path/filename</i>—Directory location and filename of the local digital certificate provided by the CA.</p>
Required Privilege Level	maintenance
List of Sample Output	request security pki local-certificate load on page 205
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request security pki local-certificate load

```
user@host> request security pki local-certificate load filename /tmp/router2-cert certificate-id
local-entrust2
Local certificate local-entrust2 loaded successfully
```

request security pki local-certificate verify

Syntax	request security pki local-certificate verify certificate-id <i>certificate-id-name</i>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Verify the validity of the local digital certificate identifier.
Options	certificate-id <i>certificate-id-name</i> —Display the specified certificate identifier name.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• show security pki local-certificate on page 216
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate-id bme1 (not downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
```

```
Local certificate bme1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

You receive the following response after the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate bme1 (downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
Local certificate bme1 verification success
```

request services ipsec-vpn ipsec switch tunnel

Syntax	<code>request services ipsec-vpn ipsec switch tunnel local-gateway <i>address</i> remote-gateway <i>address</i></code> <code><routing-instance <i>instance-name</i>></code>
Release Information	Command introduced before Junos OS Release 7.4. routing-instance option added in Release 8.1.
Description	(Adaptive services interface only) Manually switch between primary and backup IP Security (IPsec) tunnels.
Options	local-gateway <i>address</i> —Gateway address of the local system. remote-gateway <i>address</i> —Gateway address of the remote system. routing-instance <i>instance-name</i> —(Optional) VRF instance associated with local gateway address.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show services ipsec-vpn ipsec security-associations on page 226
List of Sample Output	request services ipsec-vpn ipsec switch tunnel on page 207
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request services ipsec-vpn ipsec switch tunnel

```
user@host> request services ipsec-vpn ipsec switch tunnel local-gateway 10.1.1.1 remote gateway 10.100.10.1
```

show security pki ca-certificate

Syntax	show security pki ca-certificate <brief detail> <ca-profile <i>ca-profile-name</i> >
Release Information	Command introduced in Junos OS Release 7.5.
Description	Display information about certificate authority (CA) digital certificates installed in the router.
Options	<p>none—(Same as brief) Display information about all CA digital certificates.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>ca-profile <i>ca-profile-name</i>—(Optional) Display information about only the specified CA profile.</p>
Required Privilege Level	view
List of Sample Output	show security pki ca-certificate on page 209 show security pki ca-certificate detail on page 210
Output Fields	Table 5 on page 208 lists the output fields for the show security pki ca-certificate command. Output fields are listed in the approximate order in which they appear.

Table 5: show security pki ca-certificate Output Fields

Field Name	Field Description	Level of Output
Certificate identifier	Name of the digital certificate.	All levels
Certificate version	Revision number of the digital certificate.	detail
Serial number	Unique serial number of the digital certificate.	detail
Issued by	Authority that issued the digital certificate.	none brief
Issued to	Device that was issued the digital certificate.	none brief
Issuer	Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> • Common name—Name of the authority. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. 	detail

Table 5: show security pki ca-certificate Output Fields (*continued*)

Field Name	Field Description	Level of Output
Subject	Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> • Common name—Name of the requestor. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. 	detail
Validity	Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> • Not before—Start time when the digital certificate becomes valid. • Not after—End time when the digital certificate becomes invalid. 	All levels
Public key algorithm	Encryption algorithm used with the private key, such as rsaEncryption(1024 bits) .	All levels
Signature algorithm	Encryption algorithm that the CA used to sign the digital certificate, such as sha1WithRSAEncryption .	detail
Fingerprint	Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.	detail
Distribution CRL	Distinguished name information and the URL for the certificate revocation list (CRL) server.	detail
Use for key	Use of the public key, such as Certificate signing , CRL signing , Digital signature , or Key encipherment .	detail

Sample Output

Output Fields	Table 6 on page 212 lists the output fields for the show security pki certificate-request command. Output fields are listed in the approximate order in which they appear.

Table 6: show security pki certificate-request Output Fields

Field Name	Field Description	Level of Output
Certificate identifier	Name of the digital certificate.	All levels
Certificate version	Revision number of the digital certificate.	detail
Issued to	Device that was issued the digital certificate.	none brief
Subject	Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> • Common name—Name of the authority. • Organization—Organization of origin. • Organizational unit—Department within an organization. • State—State of origin. • Country—Country of origin. 	detail
Alternate subject	Domain name or IP address of the device related to the digital certificate.	detail

Table 6: show security pki certificate-request Output Fields (*continued*)

Field Name	Field Description	Level of Output
Validity	Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> • Not before—Time when the digital certificate becomes valid. • Not after—End time when the digital certificate becomes invalid. 	All levels
Public key algorithm	Encryption algorithm used with the private key, such as rsaEncryption(1024 bits) .	All levels
Public key verification status	Public key verification status: Failed or Passed . The detail output also provides the verification hash.	All levels
Fingerprint	Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.	detail
Use for key	Use of the public key, such as Certificate signing , CRL signing , Digital signature , or Key encipherment .	detail

Sample Output

show security pki certificate-request

```

user@host> show security pki certificate-request
Certificate identifier: local-microsoft-2
Issued to: router2.juniper.net
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed

```

show services ipsec-vpn ike security-associations

Syntax	show services ipsec-vpn ike security-associations <brief detail> <peer-address>
Release Information	Command introduced before Junos OS Release 7.4. Statistics for Internet Key Exchange (IKE) security associations for each services PIC introduced in Junos OS Release 12.1.
Description	(Adaptive services interface only) Display information for Internet Key Exchange (IKE) security associations. If no security association is specified, the information for all security associations is displayed.
Options	none —(same as brief) Display standard information for all IPsec security associations. brief detail —(Optional) Display the specified level of output. peer-address —(Optional) Display information about a particular security association address.
Required Privilege Level	view
List of Sample Output	show services ipsec-vpn ike security-associations on page 224 show services ipsec-vpn ike security-associations detail on page 225
Output Fields	Table 10 on page 222 lists the output fields for the show services ipsec-vpn ike security-associations command. Output fields are listed in the approximate order in which they appear.

Table 10: show services ipsec-vpn ike security-associations Output Fields

Field Name	Field Description	Level of Output
IKE peer	Remote end of the IKE negotiation.	detail
Role	Part played in the IKE session. The router triggering the IKE negotiation is the initiator, and the router accepting the first IKE exchange packets is the responder.	detail
Remote Address	Responder's address.	none specified
State	State of the IKE security association: <ul style="list-style-type: none"> • Matured—IKE security association is established. • Not matured—The IKE security association is in the process of negotiation. 	none specified
Initiator cookie	When the IKE negotiation is triggered, a random number is sent to the remote node.	All levels

Table 10: show services ipsec-vpn ike security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Responder cookie	<p>The remote node generates its own random number and sends it back to the initiator as a verification that the packets were received.</p> <p>Of the numerous security services available, protection against denial of service (DoS) is one of the most difficult to address. A “cookie” or anticlogging token (ACT) is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie’s authenticity. An exchange prior to CPU-intensive public key operations can thwart some DoS attempts (such as simple flooding with invalid IP source addresses).</p>	All levels
Exchange type	<p>Specifies the number of messages in an IKE exchange, and the payload types that are contained in each message. Each exchange type provides a particular set of security services, such as anonymity of the participants, perfect forward secrecy of the keying material, and authentication of the participants. Junos OS supports two types of exchanges:</p> <ul style="list-style-type: none"> • Main—The exchange is done with six messages. Main encrypts the payload, protecting the identity of the neighbor. • Aggressive—The exchange is done with three messages. Aggressive does not encrypt the payload, leaving the identity of the neighbor unprotected. • IKEv2—The exchange is negotiated using IKE version 2. 	All levels
PIC	The services PIC for which the IKE security associations are displayed.	All levels
Authentication method	Type of authentication determines which payloads are exchanged and when they are exchanged. The Junos OS supports only pre-shared keys .	detail
Local	Prefix and port number of the local end.	detail
Remote	Prefix and port number of the remote end.	detail
Lifetime	Number of seconds remaining until the IKE security association expires.	detail
Algorithms	<p>Header for the IKE algorithms output.</p> <ul style="list-style-type: none"> • Authentication—(detail output only) Type of authentication algorithm used: md5 or sha1 • Encryption—(detail output only) Type of encryption algorithm used: des-cbc, 3des-cbc, or None. • Pseudo random function—Function that generates highly unpredictable random numbers: hmac-md5 or hmac-sha1. 	detail
Traffic statistics	<p>Number of bytes and packets received and transmitted on the IKE security association.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the IKE security association. • Input packets, Output packets—Number of packets received and transmitted on the IKE security association. 	detail

Table 10: show services ipsec-vpn ike security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Flags	Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> caller notification sent—Caller program notified about the completion of the IKE negotiation. waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. waiting for policy manager—Negotiation is waiting for a response from the policy manager. 	detail
IPsec security associates	Number of IPsec security associations created and deleted with this IKE security association.	detail
Phase 2 negotiations in progress	Number of phase 2 negotiations in progress and status information: <ul style="list-style-type: none"> Negotiation type—Type of phase 2 negotiation. The Junos OS currently supports quick mode. Message ID—Unique identifier for a phase 2 negotiation. Local identity—Identity of the local phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>. Remote identity—Identity of the remote phase 2 negotiation. The format is <i>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</i>. Flags—Notification to the key management process of the status of the IKE negotiation: <ul style="list-style-type: none"> caller notification sent—Caller program notified about the completion of the IKE negotiation. waiting for done—Negotiation is done. The library is waiting for the remote end retransmission timers to expire. waiting for remove—Negotiation has failed. The library is waiting for the remote end retransmission timers to expire before removing this negotiation. waiting for policy manager—Negotiation is waiting for a response from the policy manager. 	detail

show services ipsec-vpn ipsec security-associations

Syntax	show services ipsec-vpn ipsec security-associations <brief detail extensive> <service-set <i>service-set-name</i> >
Release Information	Command introduced before Junos OS Release 7.4.
Description	(Adaptive services interface only) Display IPsec security associations for the specified service set. If no service set is specified, the security associations for all service sets are displayed.
Options	<p>none—Display standard information about IPsec security associations for all service sets.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>service-set <i>service-set-name</i>—(Optional) Display information about a particular service set.</p>
Required Privilege Level	view
List of Sample Output	show services ipsec-vpn ipsec security associations extensive on page 228
Output Fields	Table 11 on page 226 lists the output fields for the show services ipsec-vpn ipsec security-associations command. Output fields are listed in the approximate order in which they appear.

Table 11: show services ipsec-vpn ipsec security-associations Output Fields

Field Name	Field Description	Level of Output
Service set	Name of the service set for which the IPsec security associations are defined. If appropriate, includes the outside service interface VRF name.	All levels
Rule	Name of the rule set applied to the security association.	detail extensive
Term	Name of the IPsec term applied to the security association.	detail extensive
Tunnel index	Numeric identifier of the specific IPsec tunnel for the security association.	detail extensive
Local gateway	Gateway address of the local system.	All levels
Remote gateway	Gateway address of the remote system.	All levels
IPsec inside interface	Name of the logical interface hosting the IPsec tunnels.	All levels
Tunnel MTU	MTU of the IPsec tunnel.	All levels
Local identity	Prefix and port number of the local end.	All levels

Table 11: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Remote identity	Prefix and port number of the remote end.	All levels
Primary remote gateway	IP address of the configured primary remote peer.	All levels
Backup remote gateway	IP address of the configured backup remote peer.	All levels
State	State of the primary or backup interface: Active , Offline , or Standby . Both ES PICs are initialized to Offline . For primary and backup peers, State can be Active or Standby . If both peers are in a state of Standby , no connection exists yet between the two peers.	All levels
Failover counter	Number of times a PIC switched between primary and backup interfaces, or the number of times the tunnel switched between the primary and remote peers since the software has been activated.	All levels
Direction	Direction of the security association: inbound or outbound .	All levels
SPI	Value of the security parameter index.	All levels
AUX-SPI	Value of the auxiliary security parameter index. <ul style="list-style-type: none">When the value of Protocol is AH or ESP, AUX-SPI is always 0.When the value of Protocol is AH+ESP, AUX-SPI is always a positive integer.	All levels
Mode	Mode of the security association: <ul style="list-style-type: none">transport—Protects single host-to-host protections.tunnel—Protects connections between security gateways.	detail extensive
Type	Type of security association: <ul style="list-style-type: none">manual—Security parameters require no negotiation. They are static, and are configured by the user.dynamic—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode.	detail extensive
State	Status of the security association: <ul style="list-style-type: none">Installed—The security association is installed in the security association database. (For transport mode security associations, the value of State must always be Installed.)Not installed—The security association is not installed in the security association database.	detail extensive
Protocol	Protocol supported: <ul style="list-style-type: none">transport mode supports Encapsulation Security Protocol (ESP) or Authentication Header (AH).tunnel mode supports ESP or AH+ESP.	All levels

Table 11: show services ipsec-vpn ipsec security-associations Output Fields (*continued*)

Field Name	Field Description	Level of Output
Authentication	Type of authentication used: hmac-md5-96 , hmac-sha1-96 , or none .	detail extensive
Encryption	Type of encryption algorithm used: aes-cbc (128 bits) , aes-cbc (192 bits) , aes-cbc (256 bits) , des-cbc , 3des-cbc , or None .	detail
Soft lifetime Hard lifetime	Each lifetime of a security association has two display options, hard and soft, one of which must be present for a dynamic security association. The hard lifetime specifies the lifetime of the SA. The soft lifetime, which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This information allows the key management system to negotiate a new SA before the hard lifetime expires. <ul style="list-style-type: none"> • Expires in seconds seconds—Number of seconds left until the security association expires. • Expires in kilobytes kilobytes—Number of kilobytes left until the security association expires. 	detail extensive
Anti-replay service	State of the service that prevents packets from being replayed: Enabled or Disabled .	detail extensive
Replay window size	Configured size, in packets, of the antireplay service window: 32 or 64 . The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. If the replay window size is 0 , antireplay service is disabled.	detail

Sample Output

show services ipsec-vpn ipsec security associations extensive

```

user@host> show services ipsec-vpn ipsec security-associations extensive
Service set: service-set-1
  Rule: _junos_, Term: term-1, Tunnel index: 1
  Local gateway: 101.101.101.2, Remote gateway: 14.14.14.4
  IPSec inside interface: sp-2/0/0.1 Local identity:
  ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
  Remote identity: ipv4_subnet(any:0,[0..7]=0.0.0.0/0)
  Primary remote gateway: 101.101.101.1, State: Standby
  Backup remote gateway: 14.14.14.4, State: Active
  Failover counter: 1

  Direction: inbound, SPI: 3743521590, AUX-SPI: 0
  Mode: tunnel, Type: dynamic, State: Installed
  Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
  Soft lifetime: Expires in 23043 seconds
  Hard lifetime: Expires in 23178 seconds
  Anti-replay service: Enabled, Replay window size: 64

  Direction: outbound, SPI: 2551045240, AUX-SPI: 0
  Mode: tunnel, Type: dynamic, State: Installed
  Protocol: ESP, Authentication: hmac-sha1-96, Encryption: 3des-cbc
  Soft lifetime: Expires in 23043 seconds

```

Hard lifetime: Expires in 23178 seconds
Anti-replay service: Enabled, Replay window size: 64

show services ipsec-vpn ipsec statistics

Syntax	<pre>show services ipsec-vpn ipsec statistics <brief detail> <remote-gw remote-peer-address> <service-set service-set-name></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>New fields added in Junos OS Release 10.0.</p>
Description	(Adaptive services interface only) Display IPsec statistics for the specified service set. If no service set is specified, the statistics for all service sets are displayed.
Options	<p>none—Display standard IPsec statistics for all service sets.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>remote-gw remote-peer-address—(Optional) Display IPsec statistics for an individual IPsec tunnel and an individual remote host.</p> <p>service-set service-set-name—(Optional) Display information about a particular service set.</p>
Required Privilege Level	view
List of Sample Output	<p>show services ipsec-vpn ipsec statistics detail on page 232</p> <p>show services ipsec-vpn ipsec statistics remote-gw on page 232</p>
Output Fields	Table 12 on page 230 lists the output fields for the show services ipsec-vpn ipsec statistics command. Output fields are listed in the approximate order in which they appear.

Table 12: show services ipsec-vpn ipsec statistics Output Fields

Field Name	Field Description	Level of Output
PIC	The physical interface on which the IPsec tunnel is configured.	All levels
Service set	Name of the service set for which the IPsec tunnel is defined.	All levels
Local gateway	Gateway address of the local system.	All levels
Remote gateway	Gateway address of the remote system.	All levels
Tunnel index	Numeric identifier of the specific IPsec tunnel for the security association.	All levels

Table 12: show services ipsec-vpn ipsec statistics Output Fields (*continued*)

Field Name	Field Description	Level of Output
ESP statistics	Encapsulation Security Payload (ESP) statistics: <ul style="list-style-type: none"> • Encrypted bytes—Total number of bytes encrypted by the local system across the IPsec tunnel. • Decrypted bytes—Total number of bytes decrypted by the local system across the IPsec tunnel. • Encrypted packets—Total number of packets encrypted by the local system across the IPsec tunnel. • Decrypted packets—Total number of packets decrypted by the local system across the IPsec tunnel. 	All levels
AH Statistics	Authentication Header statistics: <ul style="list-style-type: none"> • Input bytes—Total number of bytes received by the local system across the IPsec tunnel. • Output bytes—Total number of bytes transmitted by the local system across the IPsec tunnel. • Input packets—Total number of packets received by the local system across the IPsec tunnel. • Output packets—Total number of packets transmitted by the local system across the IPsec tunnel. 	All levels
Errors	<ul style="list-style-type: none"> • AH authentication failures—Number of authentication header (AH) failures. An AH failure occurs when there is a mismatch of the authentication header in a packet transmitted across an IPsec tunnel. • ESP authentication failures—Number of Encapsulation Security Payload (ESP) failures. An ESP failure occurs when there is an authentication mismatch in ESP packets. • ESP Decryption failures—Number of ESP decryption failures. • Bad headers—Number of invalid headers detected. • Bad trailers—Number of invalid trailers detected. • Replay before window drops—Number of replay errors. A replay error is generated when a duplicate packet is received within the replay window. • Replayed pkts—Number of packets replayed. • IP integrity errors—Number of IP integrity errors. • Exceeds tunnel MTU—Number of times the tunnel maximum transmission unit (MTU) value was exceeded. • Rule lookup failures—Number of rule lookup failures. • No SA errors—Number of errors resulting from a missing security association (SA). • Flow errors—Number of flow errors. • Misc errors—Number of miscellaneous errors. 	All levels

Sample Output

show services ipsec-vpn ipsec statistics detail

```
user@host> show services ipsec-vpn ipsec statistics
PIC: sp-0/2/0, Service set: ss0

ESP Statistics:
  Encrypted bytes:          0
  Decrypted bytes:         0
  Encrypted packets:       0
  Decrypted packets:       0
AH Statistics:
  Input bytes:             168
  Output bytes:            168
  Input packets:           2
  Output packets:          2
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0
```

show services ipsec-vpn ipsec statistics remote-gw

```
user@host> show services ipsec-vpn ipsec statistics remote-gw 22.22.2.1
PIC: sp-3/1/0, Service set: service-set-2
Local gateway: 22.22.1.1, Remote gateway: 22.22.2.1, Tunnel index: 2
ESP Statistics:
  Encrypted bytes:          0
  Decrypted bytes:         0
  Encrypted packets:       0
  Decrypted packets:       0
AH Statistics:
  Input bytes:             0
  Output bytes:            0
  Input packets:           0
  Output packets:          0
Errors:
  AH authentication failures: 0
  ESP authentication failures: 0
  ESP decryption failures: 0
  Bad headers: 0, Bad trailers: 0
  Replay before window drops: 0, Replayed pkts: 0
  IP integrity errors: 0, Exceeds tunnel MTU: 0
  Rule lookup failures: 0, No SA errors: 0
  Flow errors: 0, Misc errors: 0
```

CHAPTER 8

RFCs

- [Supported IPsec and IKE Standards on page 233](#)

Supported IPsec and IKE Standards

On routers equipped with one or more Adaptive Services PICs (both standalone and integrated versions) or Multiservices PICs or DPCs, the Canada and U.S. version of Junos OS substantially supports the following RFCs, which define standards for IP Security (IPsec) and Internet Key Exchange (IKE).

- RFC 2085, *HMAC-MD5 IP Authentication with Replay Prevention*
- RFC 2401, *Security Architecture for the Internet Protocol* (obsoleted by RFC 4301)
- RFC 2402, *IP Authentication Header* (obsoleted by RFC 4302)
This RFC is not supported on the ES PIC.
- RFC 2403, *The Use of HMAC-MD5-96 within ESP and AH*
- RFC 2404, *The Use of HMAC-SHA-1-96 within ESP and AH* (obsoleted by RFC 4305)
- RFC 2405, *The ESP DES-CBC Cipher Algorithm With Explicit IV*
- RFC 2406, *IP Encapsulating Security Payload (ESP)* (obsoleted by RFC 4303 and RFC 4305)
- RFC 2407, *The Internet IP Security Domain of Interpretation for ISAKMP* (obsoleted by RFC 4306)
- RFC 2408, *Internet Security Association and Key Management Protocol (ISAKMP)* (obsoleted by RFC 4306)
- RFC 2409, *The Internet Key Exchange (IKE)* (obsoleted by RFC 4306)
- RFC 2410, *The NULL Encryption Algorithm and Its Use With IPsec*
- RFC 2451, *The ESP CBC-Mode Cipher Algorithms*
- RFC 2460, *Internet Protocol, Version 6 (IPv6)*
- RFC 3193, *Securing L2TP using IPsec*
- RFC 3602, *The AES-CBC Cipher Algorithm and Its Use with IPsec*
- RFC 3947, *Negotiation of NAT-Traversal in the IKE*

- RFC 3948, *UDP Encapsulation of IPsec ESP Packets*
- RFC 4301, *Security Architecture for the Internet Protocol*
- RFC 4302, *IP Authentication Header*

This RFC is not supported on the ES PIC.

- RFC 4303, *IP Encapsulating Security Payload (ESP)*
- RFC 4305, *Cryptographic Algorithm Implementation Requirements for Encapsulating Security Payload (ESP) and Authentication Header (AH)*
- RFC 4306, *Internet Key Exchange (IKEv2) Protocol*
- RFC 4307, *Cryptographic Algorithms for Use in the Internet Key Exchange Version 2 (IKEv2)*
- RFC 4308, *Cryptographic Suites for IPsec*

NOTE: Only Suite VPN-A is supported in Junos OS.

- RFC 4835, *Cryptographic Algorithm Implementation Requirements for Encapsulating Security Payload (ESP) and Authentication Header (AH)*
- RFC 5996, *Internet Key Exchange Protocol Version 2 (IKEv2)*

Junos OS partially supports the following RFCs for IPsec and IKE:

- RFC 3526, *More Modular Exponential (MODP) Diffie-Hellman groups for Internet Key Exchange (IKE)*
- RFC 5114, *Additional Diffie-Hellman Groups for Use with IETF Standards*
- RFC 5903, *Elliptic Curve Groups modulo a Prime (ECP Groups) for IKE and IKEv2*

The following RFCs and Internet draft do not define standards, but provide information about IPsec, IKE, and related technologies. The IETF classifies them as “Informational.”

- RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*
- RFC 2412, *The OAKLEY Key Determination Protocol*
- RFC 3706, *A Traffic-Based Method of Detecting Dead Internet Key Exchange (IKE) Peers*
- Internet draft draft-eastlake-sha2-02.txt, *US Secure Hash Algorithms (SHA and HMAC-SHA)* (expires July 2006)
